#### Confidentiality status

This document is Open Access. This document has no restriction on distribution.

#### Feedback on this Application Note

If you have any comments on this Application Note, please send email to [errata@arm.com](mailto:errata@arm.com) giving:

- the document title
- the document number
- the page number(s) to which your comments refer
- an explanation of your comments.

General suggestions for additions and improvements are also welcome.

# 1 Introduction

## 1.1 Purpose of this application note

This application note discusses the operation of an example design for a LogicTile Express 20MG (V2F-1XV7). It examines the contents of the V2F-1XV7, the system interconnect, the clock structure, and specifics of the programmer’s model directly relevant to V2F-1XV7 operation.

Having read this application note, the user should be in a position to debug and analyze the operation of the provided example design. He also should be able to make changes to the example design, connect his own AXI or AHB based masters, and AXI, AHB or APB slaves.

## 1.2 Overview of hardware platform

**Figure 1-1 V2F-1XV7 and V2P-CA9 daughterboards on a V2M-P1 motherboard**

The example design is intended to work on a Motherboard Express uATX (V2M-P1) with a CoreTile Express A9x4 (V2P-CA9) mounted on Site 1 and LogicTile Express 20MG (V2F-1XV7) mounted on Site 2.

## 2 Getting Started

The steps below show you how to set up the hardware platform and copy the necessary configuration files to the V2M-P1 motherboard USB Flash disk and program the LogicTile Express FPGA image.

1. Mount the V2P-CA9 daughterboard on site 1 and the V2F-1XV7 daughterboard on site 2 of the V2M-P1 motherboard as described in:

### Quick Start Guide for the Versatile Express Family - Adding Daughterboards.

2. Connect USB, UART0, and power cables, and power up the boards as described in:

### Quick Start Guide for the Versatile Express Family - Powering up the System.

3. After the host computer has recognized the motherboard Micro-SD card as a USB mass storage device, you must copy the application note boardfiles on to the card. If this application note was obtained from a Versatile Express DVD, the easiest way to copy the boardfiles on to the card is to follow the system recovery procedure given in the release notes supplied with the DVD.

If you don't have the Versatile Express DVD, you must add the boardfiles to the existing contents of your motherboard Micro-SD card by copying the `boardfiles/SITE2/HBI0247*/AN306` directories from the application note into the `/SITE2/HBI0247*` directories on the motherboard Micro-SD card. For a revision B V2F-1XV7 board, copy the `boardfiles/SITE2/HBI0247B/AN306` directory from the application note into `/SITE2/HBI0247B` on the motherboard Micro-SD card. For a revision C V2F-1XV7 board, copy the `boardfiles/SITE2/HBI0247C/AN306` directory from the application note into `/SITE2/HBI0247C` on the motherboard Micro-SD card.

4. Edit the `board.txt` file located in `/SITE2/HBI0247B/` or `/SITE2/HBI0247C/` on the motherboard Micro-SD card. You must modify the APPNOTE field in `board.txt` to comment out the line containing ANxxx and uncomment the line containing AN306. (Note: The bitfiles for the revision B and the revision C boards are not identical).

For a revision B V2F-1XV7 board, the APPNOTE field should look like this after editing:

```
[APPLICATION NOTE]
;APPNOTE: ANxxx\axxxrxpx.txt      ;Please select the required application note
APPNOTE: AN306\a306r0p1.txt
;APPNOTE: AN307\a307r1p1.txt
```

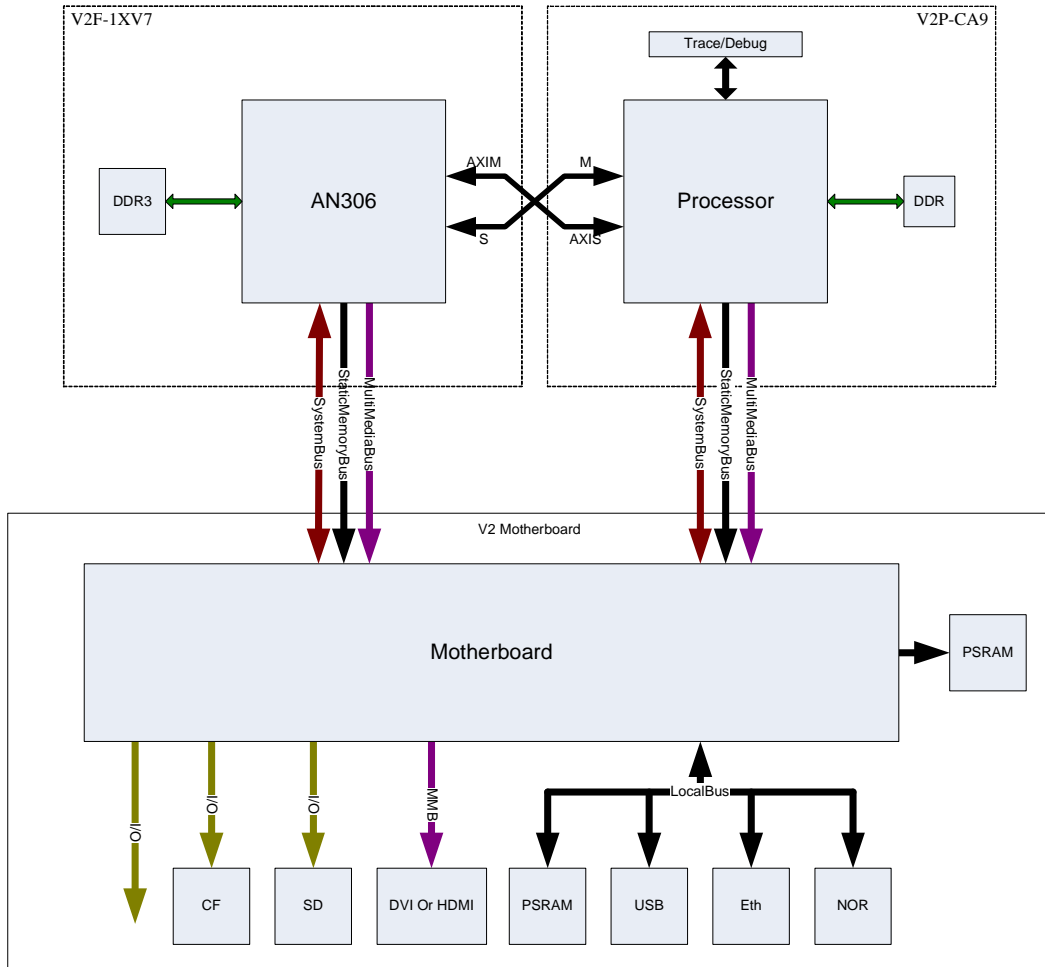

For a revision C V2F-1XV7 board, the APPNOTE field should look like this after editing:

```
[APPLICATION NOTE]
;APPNOTE: ANxxx\axxxrxpx.txt      ;Please select the required application note
APPNOTE: AN306\a306r1p0.txt
;APPNOTE: AN307\a307r2p0.txt
```

5. Power cycle the boards by pressing the black button and then the red button. The application note bitfile will be uploaded to the V2F-1XV7 FPGA.
6. The system will now be fully configured and ready for use.

### 3 System architecture

This system is an AXI (AMBA 3.0) based system. The example V2F-1XV7 image exposes one muxed 64 bit AXI master port, “External Muxed Slave” (EMS) and one muxed 64 bit AXI slave port, “External Muxed Master” (EMM) to the V2P-CA9 daughterboard. It also makes connections to the Static Memory Bus, Multimedia Bus, System Bus to the V2M-P1 motherboard.

**Figure 3-1 Block level architecture**

Note that the direction of the arrows indicates the direction of control, i.e. it points from the Master to the Slave. AXI buses contain signals going in both directions.

### 3.1 AN306 architecture

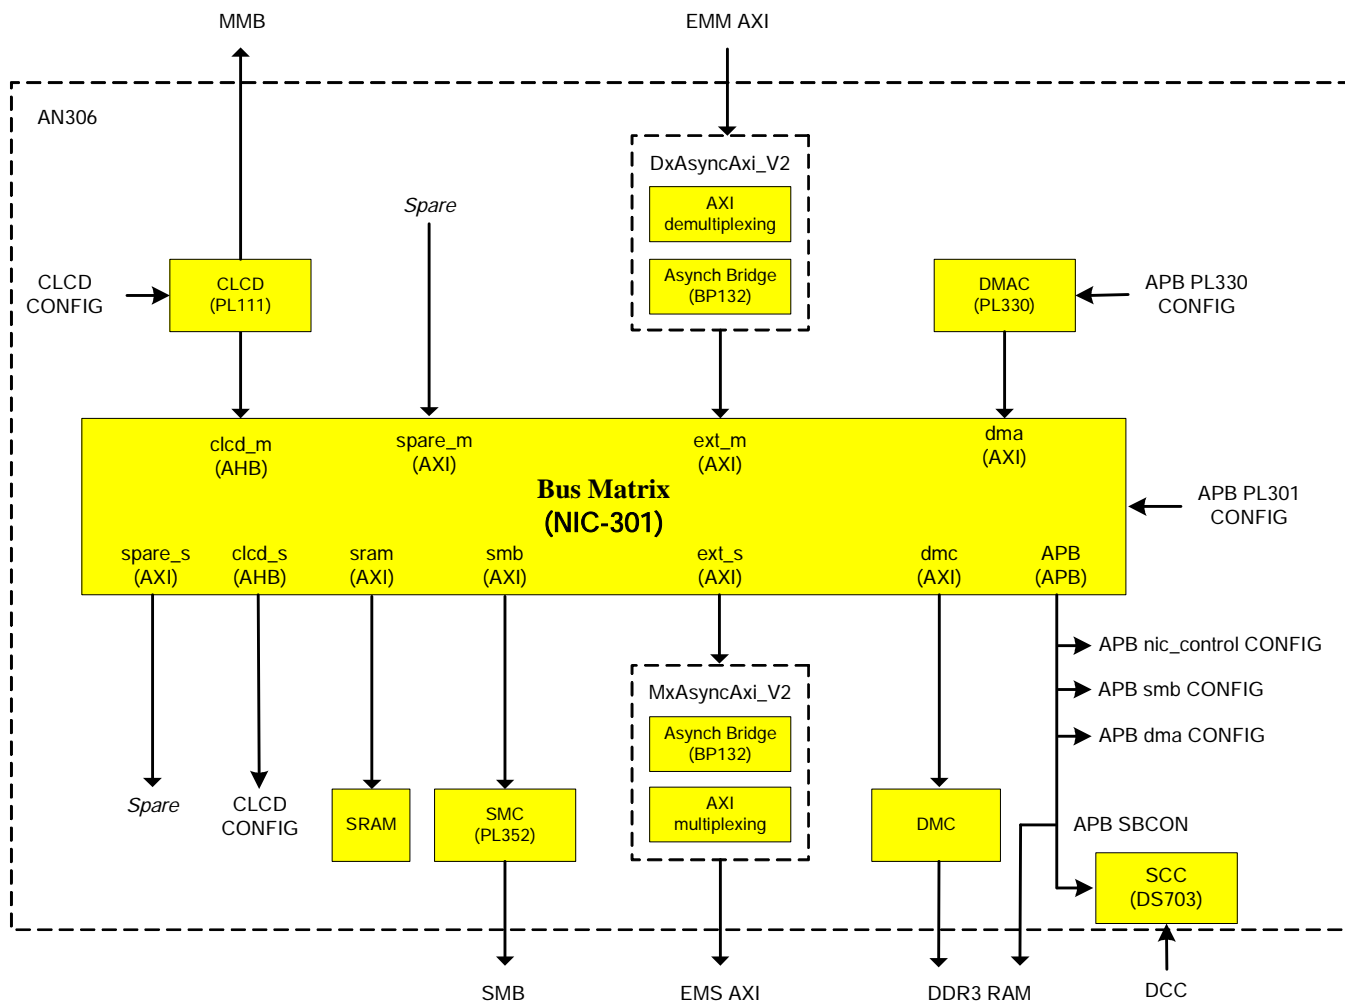

Figure 3-2 AN306 Architecture

### 3.2 Module functionality

The function of each of these blocks is as follows:

#### NIC301 Bus Matrix

This provides the interconnect structure. It allows any of the 2 AXI and 1 AHB slave ports to connect to one of the 4 AXI, 1 AHB and 1 APB master ports without blocking the other masters (unless they both try to access the same slave).

It also contains the decoder mapping to determine the address map, and a scheme to determine priority of competing masters to a single slave.

The NIC301 Bus Matrix blocks all accesses to the EMS AXI master port from the EMM AXI slave port. It prevents AXI transactions loops and reduces the number of EMS AXI master port ID bits.

See the **CoreLink™ Network Interconnect NIC-301 Technical Reference Manual** for more information.

### PL111 CLCD

This is a Color Liquid Crystal Display controller. The ARM PrimeCell PL111 is used in this design. See the **PrimeCell Color LCD Controller (PL111) Technical Reference Manual** for more information.

The CLCD signals are connected via MultiMedia Bus (MMB) to a DVI Multiplexor on the V2M-P1 motherboard. The multiplexer selects the source to supply video to the DVI-I connector as either:

- the MMB bus from the V2P-CA9
- the MMB bus from the application note
- the CLCD controller in the V2M-P1 motherboard.

For information how configure the DVI multiplexor see **Motherboard Express µATX V2M-P1 Technical Reference Manual** on page 2-15.

### DxAsyncAxi\_V2

This block provides an AXI demux block which demultiplexes the 2:1 muxed 64 bit EMM AXI bus and an asynchronous bridge (BP132) to allow the multiplexed bus to operate in a different clock domain. It increases the internal operating frequency and introduces minimum three clock cycles of latency.

### PL330 DMAC

This is a Direct Memory Access Controller. The ARM PrimeCell PL330 is used in this design. For more information please refer to the **PrimeCell® DMA Controller (PL330) Technical Reference Manual**.

### PL354 SMC

This is a Static Memory Controller. The ARM PrimeCell PL354 is used in this design. See the **PrimeCell Static Memory Controller (PL350 series) Technical Reference Manual** for more information.

### MxAsyncAxi\_V2

This block provides an asynchronous bridge (BP132) to allow the multiplexed bus to operate in a different clock domain than the internal system domain. It also includes an AXI 2:1 mux block which multiplexes the 64 bit External Slave AXI bus. The asynchronous bridge increases the internal operating frequency and introduces a minimum of three clock cycles of latency.

### DMC

The DMC (Dynamic Memory Controller) is a Xilinx core instantiated in the design. The edf is not included and must be regenerated by the user if rebuilding the design.

### SCC

This is example of a Serial Configuration Controller (SCC). The SCC provides a standard serial interface to a V2F-1XV7 Daughterboard Configuration Controller (DCC). The DCC uses this interface by issuing commands to receive/transmit information from/to the SCC registers in the FPGA.

All DCC defined commands have been supported. The SCC enables identification and of systems, passes DCM lock status to V2M-P1 motherboard reset controller as well to light the V2F-1XV7 daughterboard LEDs and update an internal register according to the states of the V2F-1XV7 switches. The SCC also provides two general purpose user registers which value can be uploaded during power up sequence from configuration file.

---

For more information about DCC interface and commands please refer to **LogicTile Express 20MG TRM**.

The SCC registers are also accessible via APB bus which allows to access SCC registers via AN306 bus matrix. For programming model see **5.2 SCC registers**.

### 3.3 Modules revision

Module	Revision
NIC301 Bus Matrix	R2p1
PL111 CLCD	r0p2
DxAsynchAxi_V2	r0p0
PL330 DMAC	r0p0
PL354 SMC	r2p1
MxAsynchAxi_V2	r0p0
SCC	r0p0

**Table 1 Modules revision in AN306 r1p0**

### 3.4 Clock architecture

The clock architecture is carefully designed to minimize the skew (difference) in the clock edge position between different components across the system. The DCMs and clock loops on V2F-1XV7 have been used to achieve that.

For the maximum and default frequencies of clocks please refer to **8.1 Default, minimum and maximum operating frequencies**.

For information how to set up and change OSC0-OSC5 clocks frequency on please refer to **Motherboard Express uATX TRM**.

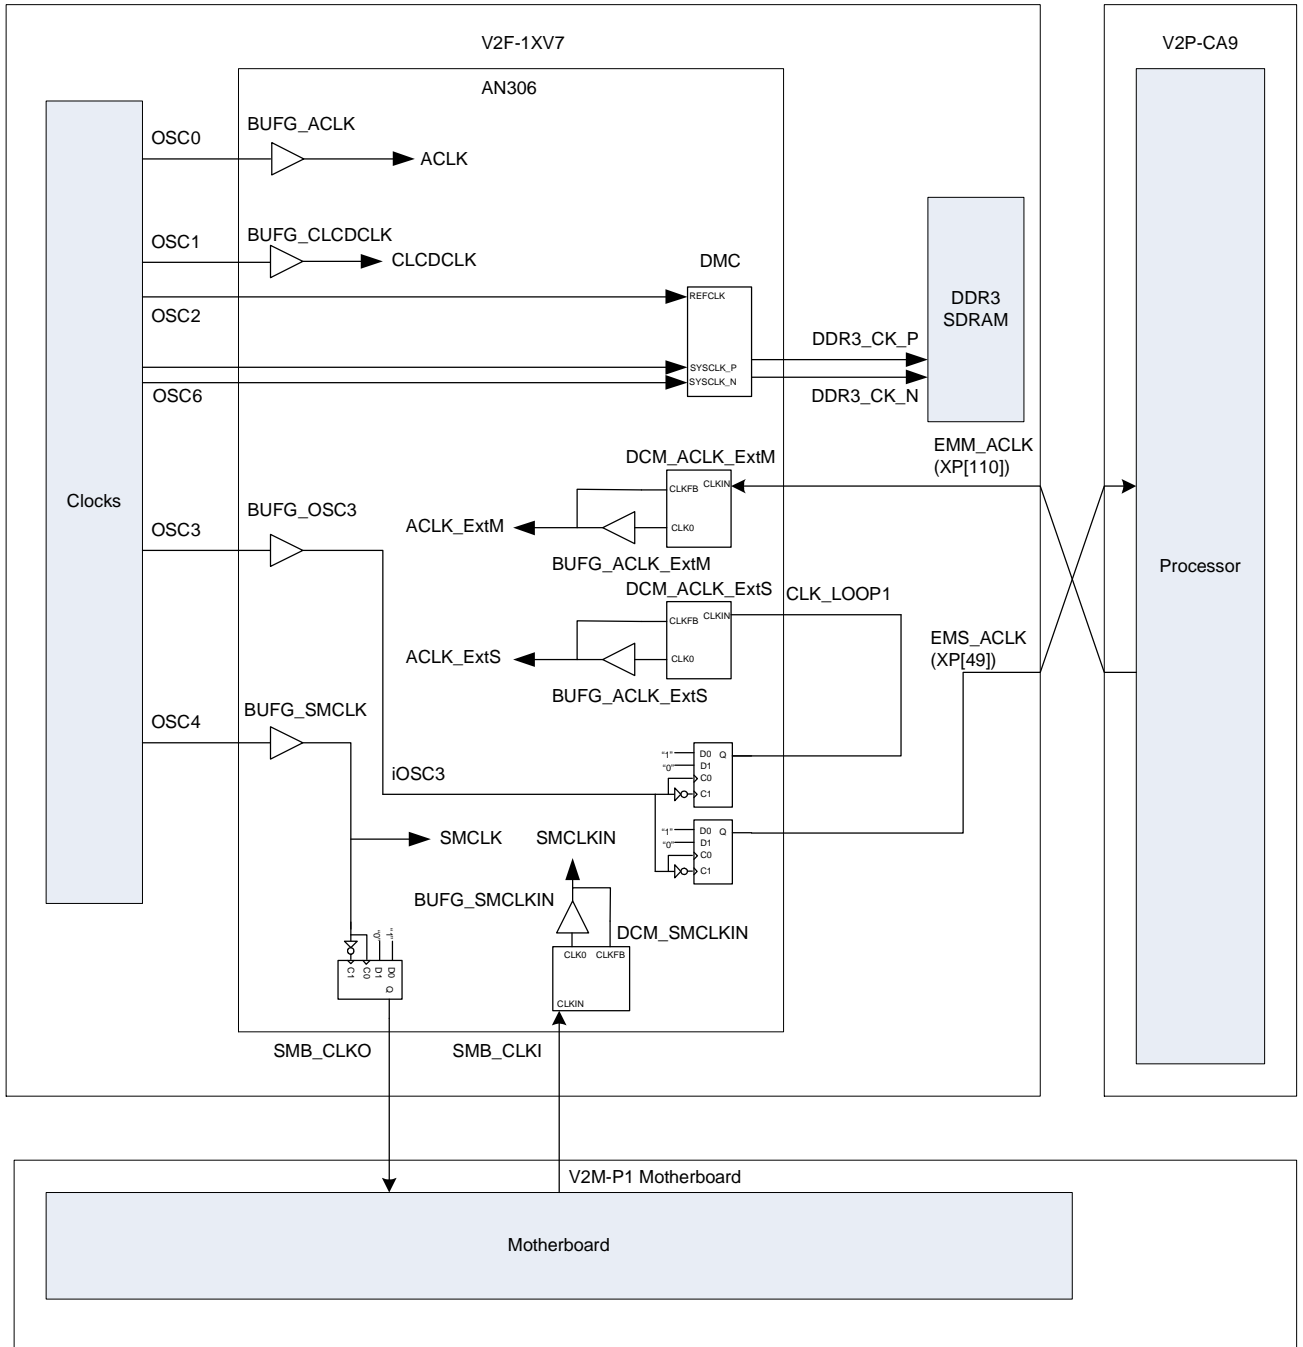

Figure 3-3 Clock architecture for AN306

There are 5 clock domains in this design:

### **AN306 AXI System Bus**

The Example Internal AXI System Bus is clocked by ACLK. The ACLK is generated through a MMCM from OSC0. The Internal AXI System Bus clock domain includes:

- Bus Matrix
- DMA Controller
- DMC controller AXI bus
- CLCD controller AHB buses
- SMC AXI bus
- De-multiplexing AXI master bus, multiplexing AXI slave bus
- APB subsystem

### **CLCD**

CLCDCLK is directly connected to OSC1. It is reference clock for the CLCD controller. The frequency of this clock must be adjusted to match target screen resolution.

### **External AXI Slave Bus**

The External AXI Slave Bus is clocked by OSC3. The clock loop LOOP1 and ExtS\_DLL are used to de-skew internal ACLK\_ExtS and external EMS\_ACLK clocks.

### **Static Memory Bus**

The SMCLK is used to drive Static Memory Controller and Static Memory bus. The SMCLK is directly connected to OSC4. The SMCLKIN feedback clock is used to register data from Static memory bus slave implemented on V2 Motherboard.

### **External AXI Master Bus**

The External AXI Slave Bus is clocked by EMM\_ACLK provided by V2P-CA9 daughterboard.

### 3.5 Interrupt architecture

There are 4 interrupts sources generated by AN306 which are connected to V2P-CA9 daughterboard interrupt controller via the V2M-P1 motherboard. The interrupts signals have been inverted in AN306 top level and V2M-P1 motherboard to provide the correct polarity for the interrupt controller in the Cortex-A9 MPCore test chip on V2P-CA9.

Signal	Source	V2M-P1 int	V2P-CA9 int
Clcdintr	CLCD	SB_INT[0]	INTSOURCE[36]
smc_int	SMC	SB_INT[1]	INTSOURCE[37]
dma_int[0]	DMAC	SB_INT[2]	INTSOURCE[38]
dma_int[1]	DMAC	SB_INT[3]	INTSOURCE[39]

**Table 2 Interrupts**

### 3.6 Reset architecture

The reset signal CB\_nRST from the motherboard is synchronized to the correct clock domains to reset all the peripherals in the V2 FPGA Daughterboard.

The reset signal nPLLRESET from the DCC controller is used to reset DCMs during power-up sequence.

The reset signal CB\_nPOR is not used in this design.

---

## 4 Hardware description

### 4.1 V2F-1XV7 wrapper (V2F\_1XV7\_wrapper)

This level defines the mapping from the V2F-1XV7 XN, XP and XS busses into their functional allocations. The wrapper contains also clock structure and ties off static pins.

### 4.2 AN306 top level (AN306\_toplevel)

This level connects all the Application Note components together. This includes all the major modules as shown in **Figure 3-2 AN306 Architecture**. The RTL is provided so modules can be added and removed.

Therefore all modules except SCC are or include high value AXI blocks, there are only provided as .NGC netlists.

Two constrain files (xcd) are included.

### 4.3 AXI multiplexing scheme

DDR registers have been used to implement 2:1 multiplexing and demultiplexing to reduce the pin count for the two AXI buses for implementation on the X header.

The registers are part of the AXI asynchronous bridge logic therefore multiplexing does not introduce any extra latency to the AXI bus.

The xVALID and xREADY signals on AXI are not multiplexed in this way due to their timing requirements and are passed directly between devices.

For multiplexed AXI timing requirements please refer to **8.2 AXI timing requirements**.

The multiplexing and demultiplexing blocks are provided as NGC netlist.

## 4.4 Header HDRX pin allocation

The two AXI buses connect to the HDRX as shown. Multiplexed AXI slave bus EMM connects via HDRX header to AXI External Master and multiplexed AXI master bus EMS connects via header HDRX to AXI External Slave.

### 4.4.1 Multiplexed AXI master bus

## 5 Programmer's model

The example design for a V2F-20MG provides

- SCC memory mapped registers,
- DMC SDRAM,
- Static memory bus (SMB) to V2M-P1 motherboard
- Multimedia bus (MMB) to V2M-P1 motherboard
- AXI master bus to V2P-CA9 daughterboard slave port.
- Note that the AXI master from V2P-CA9 cannot access the V2P-CA9 slave port via the V2F-1XV7. Only the DMA and CLCD controllers in the V2F-1XV7 can access the V2P-CA9 slave port.

### 5.1 Example AXI memory map

Memory Start	Memory End	Size	Bus	AN306
0x0000_0000	0x03FF_FFFF	64MB	dmc	DMC
0x0400_0000	0xDFFF_FFFF	3520MB	ext_s	AXI External Slave
0xE000_0000	0xE00F_FFFF	1MB	APB	SCC registers
0xE010_0000	0xE01F_FFFF	1MB	APB	NIC301
0xE020_0000	0xE02F_FFFF	1MB	APB	PL352
0xE030_0000	0xE03F_FFFF	1MB	APB	PL330
0xE040_0000	0xE04F_FFFF	1MB	APB	DDR3 SPD EEPROM
0xE050_0000	0xE05F_FFFF	1MB	-	Reserved
0xE060_0000	0xE0FF_FFFF	10MB	-	Reserved
0xE100_0000	0xE10F_FFFF	1MB	clcd_s	CLCD controller
0xE110_0000	0xE1FF_FFFF	15MB	-	Reserved
0xE200_0000	0xE2FF_FFFF	16MB	spare_s	SPARE SLAVE
0xE300_0000	0xE3FF_FFFF	16MB	sram	SRAM
0xE400_0000	0xE41F_FFFF	2MB	smb	Motherboard VRAM (2MB aliased)
0xE420_0000	0xE42F_FFFF	1MB	smb	Motherboard Ethernet (1MB aliased)
0xE430_0000	0xE43F_FFFF	1MB	smb	Motherboard USB (1MB aliased)
0xE440_0000	0xE7FF_FFFF	60MB	smb	Motherboard VRAM (4MB aliased)
0xE800_0000	0xEBFF_FFFF	64MB	smb	Motherboard Peripherals
0xEC00_0000	0xEFFF_FFFF	64MB	-	Reserved
0xF000_0000	0xFFFF_FFFF	256MB	dmc	DMC

Table 8 Memory map

## 5.2 SCC registers

Table 4-3.1 shows the location of the SCC registers in the example design. The addresses shown are on APB bus offsets from the SCC base address 0xE000\_0000.

Offset address	Name	Reset value	SIF Type	APB Type	Size	Function
0x000	SCC_USER0	0XXXXXXXXX	R/W	R/W	32	R/W register
0x004	SCC_USER1	0XXXXXXXXX	R/W	R/W	32	R/W register
0x100	SCC_DLLLOCK	0FFFX000X	R/W	R	32	DLL locked
0x104	SCC_LED	0x0000000F	R	R/W	8	User LEDs control register
0x108	SCC_SW	0x000000XX	R/W	R	8	User Switches register
0xFF8	SCC_AID	0XXXXX0302	R/W	R	32	Auxiliary ID
0xFFC	SCC_ID	0x41X0306X	R/W	R	32	System ID

**Table 9 Serial Configuration Control registers**

### 5.2.1 SCC\_USERx registers

The registers SCC\_USER0 and SCC\_USER1 (at offset 0x000-0x004) are general purpose user registers initialized during power up sequence by values from daughter board configuration file. In existing AN306 build these registers can be used for any purpose by software.

Bits	Name	Access	Function	Default
[31:0]	SCC_USERx[31:0]	Read/write	General purpose registers configured during power up from configuration file	hXXXXXXXX

**Table 10 SCCCTRL\_CFGx bit pattern**

### 5.2.2 DLL lock register

The lock register SCC\_DLLLOCK (at offset 0x100) indicated if all DLLs in system have been locked.

Bits	Name	Access	Function	Default
[31:24]	DLL LOCK MASK[7:0]	Read	These bits indicate if the DLL locked is masked.	8'b11111111
[23:16]	DLL LOCK[7:0]	Read	These bits indicate if the DLLs are locked or unlocked: b0 = unlocked b1 = locked	8'b111xxxx
[15:1]	Reserved	Reserved	Reserved	15'b0
[0]	LOCKED	Read	This bit indicates if all enabled DLLs are locked: b0 = unlocked b1 = locked	1'bx

**Table 11 SCC\_DLLLOCK bit pattern**

### 5.2.3 User LEDs control register

The SCC\_LED register (at offset 0x104) controls the 8 of user LEDs on the V2F-1XV7 daughterboard.

Writing the value b11111111 will light all 8 LED's. LED's can be lit individually for example writing b00000011 will light only the LED0 and LED1.

Bits	Name	Access	Function	Default
[31:8]	Reserved	Read	Reserved	hXXXXXX
[7:0]	LED[7:0]	Read/Write	These bits control LEDs	h0f

**Table 12 SCC\_LED bit pattern**

### 5.2.4 User switches register

The SCC\_SW register (at offset 0x108) indicates state of the 8 of user switches on the V2F-1XV7 daughterboard.

Bits	Name	Access	Function	Default
[31:8]	Reserved	Read	Reserved	hXXXXXX
[7:0]	SW[7:0]	Read	These bits indicate state of user switches	hXX

**Table 13 SCC\_SW bit pattern**

### 5.2.5 SCC\_AID register

The SCC\_AID register (at offset 0xff8) includes the 16-bit SCC registers description.

Bits	Name	Access	Function	Default
[31:24]	Build	Read	FPGA build number	hXX
[23:16]	Reserved	Read	Reserved	hXX
[15:11]	Reserved	Read	Reserved	5'b00000
[10]	SWREGP	Read	These bits indicate if SCC_SW register have been implemented	1'b1
[9]	LEDREGP	Read	These bits indicate if SCC_LED register have been implemented	1'b1
[8]	DLLREGP	Read	These bits indicate if DLL lock register have been implemented	1'b1
[7:0]	USERREGN	Read	These bits indicate number of SCC_USERx register	h02

**Table 14 SCC\_AID bit pattern**

### 5.2.6 SCC\_ID registers

The SCC\_ID register (at offset 0xffc) includes the 32-bit AN identification.

Bits	Name	Access	Function	Default
[31:24]	Implementor	Read	Implementor ID	h41
[23:20]	Variant	Read	Variant Number	hX
[19:16]	Architecture	Read	Architecture. Have to be 0x0 for Application Notes.	h00
[15:4]	AN	Read	Application Note number	h306
[3:0]	Revision	Read	Revision number	hX

**Table 15 SCC\_ID bit pattern**

### 5.3 Reserved and undefined memory

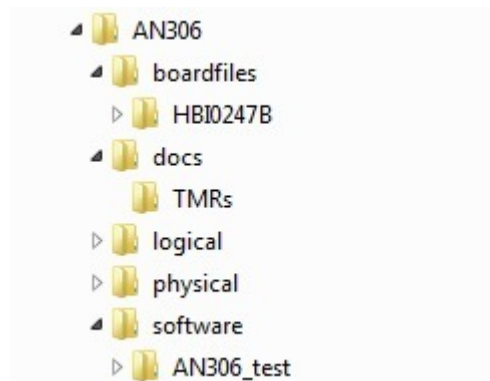

If reserved memory is accessed, it will be caught by the AXI bus matrix and return a decode error ('DECERR') which generates a data abort. The only exception to this is the APB subsystem, which has 13 spare PSEL signals for expansion. If this address range is accessed the AXItoAPB bridge will return an 'OKAY' response.

## 6 RTL

Only the top level and SCC RTL files are included. AXI components are supplied as netlists. However Amba Designer XML configuration files are provided for that components to allow rebuild them.

Example files are provided to allow building the system with Xilinx Vivado tools.

### 6.1 Directory structure

The application note has directories. These are:

- boardfiles: The files are required to program the design into a V2F-1XV7.
- docs : Related documents including this document.
- logical : All the verilog RTL for this design.
- physical : Synthesis and place and route (P&R) scripts and builds for target board.
- software : ARM code to run on the AN306 application note.

### 6.2 Logical

The logical directory contains all the verilog supplied with this application note. It contains also Amba Designer XML configuration files which can be used to regenerate verilog for ARM PrimeCell used in the example design.

The top level for this system is in V2F\_1XV7\_wrapper.

### 6.3 Physical

The physical directory contains pre-synthesised components. The function of each block is shown earlier in **3.2 Module functionality**.

Each PrimeCell or other large IP block has its own directory (for example pl111\_clcd\_r0p2).

The physical directory contains the scripts for the tools used in the build process.

For tool revision used to build App Note please refer to **/docs/readme.txt** file.

## 6.4 Building the App Note using Unix

The Xilinx DDR controller is not supplied and needs to be rebuilt if modifications are made to the design. For V2F-1XV7 revision C, the DDR controller can be rebuilt from the IP catalog in Vivado 2012.04. For V2F-1XV7 revision B, please contact ARM support for assistance with rebuilding the DDR controller.

The following table details the settings required by CoreGen.

Refer to the `run_vivado_201n.m.tcl`<sup>1</sup> script in `AN306/physical/an306_toplevel/xilinx_revx/scripts`<sup>2</sup> directory for the path to the `.edf`.

DDR controller for revision C board - Vivado 2012.04 (MIG 1.8)	
<b>CORE Generator Options:</b>	
Target Device	xc7v2000t-flg1925
Speed Grade	-1
HDL	verilog
Synthesis Tool	VIVADO
<b>MIG Output Options:</b>	
Module Name	mig_7series_v1_8_a_0
No of Controllers	1
<b>FPGA Options:</b>	
System Clock Type	Single-Ended
Reference Clock Type	Differential
Debug Port	OFF
Internal Vref	disabled
IO Power Reduction	ON
XADC instantiation in MIG	Enabled
<b>Extended FPGA Options:</b>	
DCI for DQ,DQS/DQS#,DM	enabled
Internal Termination (HR Banks)	50 Ohms
<b>Controller Options</b>	
Memory	DDR3_SDRAM
Interface	AXI
Design Clock Frequency	2500 ps (400.0 MHz)
Phy to Controller Clock Ratio	4:1
Input Clock Period	10000 ps
VCC_AUX IO	1.8V
Memory Type	SODIMMs
Memory Part	MT8KTF51264HZ-1G6
Memory Voltage	1.5V
Data Width	128
ECC	Disabled
Data Mask	Enabled
ORDERING	Strict

<sup>1</sup> Where *n.m* is Xilinx Vivado version and revision.

<sup>2</sup> Where *x* is the V2F-1XV7 daughterboard revision.

<b>Memory Options:</b>	
Burst Length (MR0[1:0])	8 - Fixed
Read Burst Type (MR0[3])	Sequential
CAS Latency (MR0[6:4])	7
Output Drive Strength (MR1[5,1])	RZQ/7
Rtt_NOM - ODT (MR1[9,6,2])	RZQ/4
Rtt_WR - Dynamic ODT (MR2[10:9])	Dynamic ODT off
Memory Address Mapping	BANK_ROW_COLUMN
Bank Selections:	
Reference_Clock:	
SignalName: clk_ref_p/n	PadLocation: AT15/AU15(CC_P/N) Bank: 32
System_Clock:	
SignalName: sys_clk_i	PadLocation: AU12/(MRCC_P) Bank: 31
System_Control:	
SignalName: sys_rst	PadLocation: No connect
SignalName: init_calib_complete	PadLocation: No connect
SignalName: tg_compare_error	PadLocation: No connect

**Table 16 Xilinx DDR Coregen settings**

To build the App Note using Unix run the make\_vivado.scr batch file in the following directory: /physical/an306\_toplevel/xilinx\_revx/scripts<sup>1</sup>.

This synthesizes the design and runs place and route on the design pulling in pre synthesized components.

A programmable bit file is generated under /physical/an306\_toplevel/xilinx\_revx/netlist<sup>1</sup> and copied to boardfiles/SITE2/HBI0247x/AN306<sup>1</sup> as a306ryp0.bit<sup>2</sup>.

## 6.5 Using the new bitfile

To use the new a306ryp0.bit<sup>2</sup> bitfile, the file must be copied to the SITE2/HBI0247x/AN306<sup>1</sup> on V2M-P1 USB Flash drive directory.

The board.txt text file located at /SITE2/HBI0247x<sup>1</sup> in V2M-P1 USB Flash disk have to be edited and APPNOTE field must be modified to AN306\ a306ryp0.txt<sup>2</sup>.

<sup>1</sup> Where *x* is the V2F-1XV7 daughterboard revision.

<sup>2</sup> Where *y* is AN306 design revision.

## 7 Example software

Example software (AN306\_test) is provided to verify the example design and the V2F-1XV7 daughterboard hardware.

C and assembly language source files are included.

After the Versatile Express system is configured you can upload and execute the example software using a debugger connected to the V2P-CA9 processor board.

The example code communicates with the user via the debugger's console window. It operates as follows:

1. Reads the identification register to ensure that the software is being executed on the correct system.
2. Initialises SMC.
3. Detects presence of DDR3 SODIMM (serial presence-detect (SPD) EEPROM).
4. Tests the FPGA SRAM for sequential write/read and random write/read for word, half-word and byte accesses.
5. Tests the Static Memory bus by writing reading to V2M-P1 Motherboard VRAM.
6. Tests the DDR3 SDRAM for sequential write/read and random write/read for word, half-word and byte accesses.
7. Tests the DMA controller, AXI bus to External slave, and interrupt signal from DMA.
8. Tests the CLCD and Multimedia Bus.

Note that to test VGA, a DVI-D or HDMI monitor which supports VGA resolution must be connected to the V2M-P1 DVI-I connector.

## 8 I/O Timing Requirements

All of these specific timing requirements refer to the r0p0 revision of the AN306. All units are in nano-seconds “ns” and have been rounded to a worst case value.

Signals with setup, hold and clock to data values are bidirectional signals or have been grouped by function in the table.

### 8.1 Default, minimum and maximum operating frequencies

Clock source	Clock signal	Clock domain	Default Freq	Min Freq	Max Freq
OSC0	ACLK	AN306 AXI System Bus	80MHz	30MHz	100MHz
OSC1	CLCDCLK	CLCD	23.75MHz	2MHz	62.5MHz
OSC2 (rev B)	DDRSYSCLK	DDR System clock	77.6MHz	77.6MHz	77.6MHz
OSC2 (rev C)	DDRSYSCLK	DDR System clock	100MHz	100MHz	100MHz
OSC3	ACLK_ExtS/EMS_ACLK	Ext AXI Slave Bus	33MHz	25MHz	33MHz
OSC4	SMCLK/SMCLKIN	Static Memory Bus	40MHz	32MHz	50MHz
OSC6	DDR REF CLK	DDR REF clock	200MHz	200MHz	200MHz
EMM_ACLK	ACLK_ExtM	Ext AXI Master Bus	-	33MHz	33MHz

Table 17 Default and maximum operating frequencies

### 8.2 AXI timing requirements

Figure 8-1 AXI timing requirements

Dir	Name	Description	Value
Inputs	tmsis [ns]	Max multiplexed inputs setup to clock	1.1
	tmih [ns]	Max multiplexed inputs hold to clock	3.8
	tis [ns]	Max non multiplexed inputs setup to clock	12.1
	tih [ns]	Max non multiplexed input hold to clock	3.8
Outputs	tmov [ns]	Max clock to multiplexed data valid	11.8
	tmoh [ns]	Min clock to multiplexed data invalid	3.1
	tov [ns]	Max clock to non multiplexed outputs valid	17.7
	toh [ns]	Min clock to non multiplexed outputs invalid	3.7

Table 18 AXI Slave Input/Output timing to EMM\_ACLK clock input

Dir	Name	Description	Value
Inputs	t <sub>mis</sub> [ns]	Max multiplexed inputs setup to clock	-1.1
	t <sub>mih</sub> [ns]	Max multiplexed inputs hold to clock	5.1
	t <sub>is</sub> [ns]	Max non multiplexed inputs setup to clock	13.9
	t <sub>ih</sub> [ns]	Max non multiplexed input hold to clock	4.7
Outputs	t <sub>mov</sub> [ns]	Max clock to multiplexed data valid	11.5
	t <sub>moh</sub> [ns]	Min clock to multiplexed data invalid	3
	t <sub>ov</sub> [ns]	Max clock to non multiplexed outputs valid	26.5
	t <sub>oh</sub> [ns]	Min clock to non multiplexed outputs invalid	5.2

Table 19 AXI Master Input/Output timing to EMS\_ACLK clock output

### 8.3 MMB signals timing.

Figure 8-2 MMB Outputs Timing

Dir	Name	Description	Value
Outputs	t <sub>ov</sub> [ns]	Max rising edge of MMB_IDCLK to data valid	6
	t <sub>oh</sub> [ns]	Min rising edge of MMB_IDCLK to data invalid	-2

Table 20 MMB Output timing

### 8.4 SMB signals timing.

Figure 8-3 SMB Inputs and Outputs Timing

Dir	Name	Description	Value
Inputs	t <sub>is</sub> [ns]	Max inputs setup to rising edge of SMCLKIN	7
	t <sub>ih</sub> [ns]	Max inputs hold to rising edge of SMCLKIN	12.5
Outputs	t <sub>ov</sub> [ns]	Max rising edge of SMCLKOUT to data valid	21
	t <sub>oh</sub> [ns]	Min rising edge of SMCLKOUT to data invalid	2

Table 21 SMB Input/Output timing
