AMEVCNTR0\<n\>, Activity Monitors Event Counter Registers 0, n = 0 - 15

The AMEVCNTR0\<n\> characteristics are:

**Purpose**

Provides access to the architected activity monitor event counters.

**Configuration**

AArch32 System register AMEVCNTR0\<n\> bits [63:0] are architecturally mapped to AArch64 System register AMEVCNTR0\<n\>\_EL0[63:0].

AArch32 System register AMEVCNTR0\<n\> bits [63:0] are architecturally mapped to External register AMEVCNTR0\<n\>[63:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR0\<n\> are UNDEFINED.

**Attributes**

AMEVCNTR0\<n\> is a 64-bit register.

**Field descriptions**

The AMEVCNTR0\<n\> bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     | ACNT |

ACNT, bits [63:0]

Architected activity monitor event counter n.

Value of architected activity monitor event counter n, where n is the number of this register and is a number from 0 to 15.

If FEAT_AMUv1p1 is implemented, HCR\_EL2.AMVOFFEN is 1, SCR\_EL3.AMVOFFEN is 1, HCR\_EL2.\{E2H, TGE\} is not \{1,1\}, and EL2 is using AArch64 and is implemented in the current Security state, access to these registers at EL0 or EL1 return (PCount\<63:0\> - AMEVCNTRV0\<n\>_EL2<63:0>).

PCount is the physical count returned when AMEVCNTR0\<n\> is read from EL2 or EL3.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

On a Cold reset, this field resets to 0.

**Accessing the AMEVCNTR0\<n\>**

If \<n\> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVCNTR0\<n\> are UNDEFINED.

---

**Note**
AMCGCR.CG0NC identifies the number of architected activity monitor event counters.

Accesses to this register use the following encodings:

\[
\text{MRRC}\{<c>\}{<q>} \quad \text{coproc}, \quad \{#\}<\text{opc1}>, \quad <\text{Rt}>, \quad <\text{Rt2}>, \quad <\text{CRm}>
\]

**ACNT, bits [63:0]**

Auxiliary activity monitor event counter n.

Value of auxiliary activity monitor event counter n, where n is the number of this register and is a number from 0 to 15.

If FEAT_AMUv1p1 is implemented, HCR_EL2.AMVOFFEN is 1, SCR_EL3.AMVOFFEN is 1, HCR_EL2.{E2H, TGE} is not {1,1}, EL2 is using AArch64 and is implemented in the current Security state, and AMCR_EL0.CG1RZ is 0, reads to these registers at EL0 or EL1 return (PCount<63:0> - AMEVCNTVOFF1<n>_EL2<63:0>).

PCount is the physical count returned when AMEVCTR1<n> is read from EL2 or EL3.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

On a Cold reset, this field resets to 0.

**Accessing the AMEVCNTR1<n>**

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVCNTR1<n> are UNDEFINED.

---

**Note**
AMCGCR.CG1NC identifies the number of auxiliary activity monitor event counters.

Accesses to this register use the following encodings:

AMEVTYPER0<n>, Activity Monitors Event Type Registers 0, n = 0 - 15

The AMEVTYPER0<n> characteristics are:

**Purpose**

Provides information on the events that an architected activity monitor event counter AMEVCNTR0<n> counts.

**Configuration**

AArch32 System register AMEVTYPER0<n> bits [31:0] are architecturally mapped to AArch64 System register AMEVTYPER0<n>_EL0[31:0].

AArch32 System register AMEVTYPER0<n> bits [31:0] are architecturally mapped to External register AMEVTYPER0<n>[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER0<n> are UNDEFINED.

**Attributes**

AMEVTYPER0<n> is a 32-bit register.

**Field descriptions**

The AMEVTYPER0<n> bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
<td></td>
</tr>
<tr>
<td>30 - 16</td>
<td>evtCount</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**evtCount, bits [15:0]**

Event to count. The event number of the event that is counted by the architected activity monitor event counter AMEVCNTR0<n>. The value of this field is architecturally mandated for each architected counter.

The following table shows the mapping between required event numbers and the corresponding counters:

<table>
<thead>
<tr>
<th>evtCount</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x0011</td>
<td>Processor frequency cycles</td>
<td>When n == 0</td>
</tr>
<tr>
<td>0x4004</td>
<td>Constant frequency cycles</td>
<td>When n == 1</td>
</tr>
<tr>
<td>0x0008</td>
<td>Instructions retired</td>
<td>When n == 2</td>
</tr>
<tr>
<td>0x4005</td>
<td>Memory stall cycles</td>
<td>When n == 3</td>
</tr>
</tbody>
</table>

**Accessing the AMEVTYPER0<n>**

If <n> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVTYPER0<n> are UNDEFINED.

**Note**
AMCGC CR identifies the number of architected activity monitor event counters.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}\{<q>\} \text{<coproc>}, \{#\text{<opc1>}, \text{<Rt>}, \text{<CRn>}, \text{<CRm>}, \{#\text{<opc2>}}\}
\]

Bits [31:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the auxiliary activity monitor event counter AMEVCNTR1<n>.

It is IMPLEMENTATION DEFINED what values are supported by each counter.

If software writes a value to this field which is not supported by the corresponding counter AMEVCNTR1<n>, then:

- It is UNPREDICTABLE which event will be counted.
- The value read back is UNKNOWN.

The event counted by AMEVCNTR1<n> might be fixed at implementation. In this case, the field is read-only and writes are UNDEFINED.

If the corresponding counter AMEVCNTR1<n> is enabled, writes to this register have UNPREDICTABLE results.

Accessing the AMEVTYPER1<n>

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVTYPER1<n> are UNDEFINED.
**Note**

AMCGCR.CG1NC identifies the number of auxiliary activity monitor event counters.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}\{<q>\} <\text{coproc}>, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}\{, \{#\}<\text{opc2}\}\}
\]

AMUSERENR, Activity Monitors User Enable Register

The AMUSERENR characteristics are:

**Purpose**

Global user enable register for the activity monitors. Enables or disables EL0 access to the activity monitors. AMUSERENR is applicable to both the architected and the auxiliary counter groups.

**Configuration**

AArch32 System register AMUSERENR bits [31:0] are architecturally mapped to AArch64 System register AMUSERENR_EL0[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMUSERENR are UNDEFINED.

**Attributes**

AMUSERENR is a 32-bit register.

**Field descriptions**

The AMUSERENR bit assignments are:

APSR, Application Program Status Register

The APSR characteristics are:

**Purpose**

Hold program status and control information.

**Configuration**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to APSR are UNDEFINED.

**Attributes**

APSR is a 32-bit register.

**Field descriptions**

The APSR bit assignments are:

```
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| N  | Z  | C  | V  | Q  | RES0| GE | RES0| RES1| RES0|
```

**N, bit [31]**

Negative condition flag. Set to \( [31] \) of the result of the last flag-setting instruction. If the result is regarded as a two’s complement signed integer, then \( N \) is set to 1 if the result was negative, and \( N \) is set to 0 if the result was positive or zero.

**Z, bit [30]**

Zero condition flag. Set to 1 if the result of the last flag-setting instruction was zero, and to 0 otherwise. A result of zero often indicates an equal result from a comparison.

**C, bit [29]**

Carry condition flag. Set to 1 if the last flag-setting instruction resulted in a carry condition, for example an unsigned overflow on an addition.

**V, bit [28]**

Overflow condition flag. Set to 1 if the last flag-setting instruction resulted in an overflow condition, for example a signed overflow on an addition.

**Q, bit [27]**

Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

**Bits [26:20]**

Reserved, RES0.
**GE, bits [19:16]**

Greater than or Equal flags, for parallel addition and subtraction.

**Bits [15:5]**

Reserved, RES0.

**Bit [4]**

Reserved, RES1.

**Bits [3:0]**

Reserved, RES0.

It is permitted that, on a read of APSR:

- Bit[22] returns the value of PSTATE.PAN
- Bit[9] returns the value of PSTATE.E.
- Bit[4:0] returns the value of PSTATE.M[4:0]

---

**Note**

This is an exception to the general rule that an UNKNOWN field must not return information that cannot be obtained, at the current Privilege level, by an architected mechanism.

---

For more information see 'The Application Program Status Register, APSR'.

**Accessing the APSR**

APSR can be read using the MRS instruction and written using the MSR (register) or MSR (immediate) instructions.
ATS12NSOPR, Address Translate Stages 1 and 2 Non-secure Only PL1 Read

The ATS12NSOPR characteristics are:

**Purpose**

Performs stage 1 and 2 address translations as defined for PL1 and the Non-secure state, with permissions as if reading from the given virtual address.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ATS12NSOPR are **UNDEFINED**.

**Attributes**

ATS12NSOPR is a 32-bit System instruction.

**Field descriptions**

The ATS12NSOPR input value bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Input address for translation**

Bits [31:0]

Input address for translation. The resulting address can be read from the **PAR**.

This System instruction takes a VA as input. The resulting address is the PA that is the output address of the stage 2 translation.

**Executing the ATS12NSOPR instruction**

Accesses to this instruction use the following encodings:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

ATS1CPR, Address Translate Stage 1 Current state PL1 Read

The ATS1CPR characteristics are:

**Purpose**

Performs stage 1 address translation as defined for PL1 and the current Security state, with permissions as if reading from the given virtual address.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ATS1CPR are UNDEFINED.

**Attributes**

ATS1CPR is a 32-bit System instruction.

**Field descriptions**

The ATS1CPR input value bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

ATS1CPRP, Address Translate Stage 1 Current state
PL1 Read PAN

The ATS1CPRP characteristics are:

**Purpose**

Performs a stage 1 address translation at PL1 and in the current Security state, where the value of PSTATE.PAN determines if a read from a location will generate a permission fault for a privileged access.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level and FEAT_PAN2 is implemented. Otherwise, direct accesses to ATS1CPRP are UNDEFINED.

**Attributes**

ATS1CPRP is a 32-bit System instruction.

**Field descriptions**

The ATS1CPRP input value bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

BPIALL, Branch Predictor Invalidate All

The BPIALL characteristics are:

**Purpose**

Invalidate all entries from branch predictors.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to BPIALL are UNDEFINED.

In an implementation where the branch predictors are architecturally invisible, this instruction can execute as a NOP.

**Attributes**

BPIALL is a 32-bit System instruction.

**Field descriptions**

This instruction has no applicable fields.

The value in the register specified by \(<Rt>\) is ignored.

**Executing the BPIALL instruction**

The PE ignores the value of \(<Rt>\). Software does not have to write a value to this register before issuing this instruction.

When \(\text{HCR.FB} = 1\) at Non-secure EL1 this instruction executes as a BPIALLIS.

Accesses to this instruction use the following encodings:

\[
\text{MCR\{<c>\}{<q>} <coproc>, \{#\}<opc1>, <Rt>, <CRn>, <CRm>{, \{#\}<opc2>}
\]

BPIMVA, Branch Predictor Invalidate by VA

The BPIMVA characteristics are:

**Purpose**

Invalidate virtual address from branch predictors.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to BPIMVA are UNDEFINED.

In an implementation where the branch predictors are architecturally invisible, this instruction can execute as a NOP.

**Attributes**

BPIMVA is a 32-bit System instruction.

**Field descriptions**

The BPIMVA input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Virtual address to use</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Virtual address to use.

**Executing the BPIMVA instruction**

Accesses to this instruction use the following encodings:

MCR{<c>}{<q>} {coproc}, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>
<th>coproc</th>

elsif PSTATE.EL == EL3 then
  BPIMVA(R[t]);
CCSIDR, Current Cache Size ID Register

The CCSIDR characteristics are:

**Purpose**

Provides information about the architecture of the currently selected cache.

When FEAT_CCIDX is implemented, this register is used in conjunction with CCSIDR2.

**Configuration**

AArch32 System register CCSIDR bits [31:0] are architecturally mapped to AArch64 System register CCSIDR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CCSIDR are UNDEFINED.

The implementation includes one CCSIDR for each cache that it can access. CSSELR and the Security state select which Cache Size ID Register is accessible.

**Attributes**

CCSIDR is a 32-bit register.

**Field descriptions**

The CCSIDR bit assignments are:

**When FEAT_CCIDX is implemented:**

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

**Associativity, bits [23:3]**

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

**LineSize, bits [2:0]**

(Log₂(Number of bytes in cache line)) - 4. For example:

For a line length of 16 bytes: Log₂(16) = 4, LineSize entry = 0. This is the minimum line length.

**Note**

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.
For a line length of 32 bytes: \( \log_2(32) = 5 \), LineSize entry = 1.

**Otherwise:**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| UNKNOWN | NumSets | Associativity | LineSize |

**Note**

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

**Bits [31:28]**

Reserved, UNKNOWN.

**NumSets, bits [27:13]**

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

**Associativity, bits [12:3]**

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

**LineSize, bits [2:0]**

\( \log_2(\text{Number of bytes in cache line}) \) - 4. For example:

For a line length of 16 bytes: \( \log_2(16) = 4 \), LineSize entry = 0. This is the minimum line length.

For a line length of 32 bytes: \( \log_2(32) = 5 \), LineSize entry = 1.

**Accessing the CCSIDR**

If CSSEL R Level is programmed to a cache level that is not implemented, then on a read of the CCSIDR the behavior is **CONSTRAINED UNPREDICTABLE**, and can be one of the following:

- The CCSIDR read is treated as NOP.
- The CCSIDR read is **UNDEFINED**.
- The CCSIDR read returns an **UNKNOWN** value.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}\{<q>\} \ <\text{coproc}>\, \{\#\}<\text{opc1}>\, \,<\text{Rt}>\, \,<\text{CRn}>\, \,<\text{CRm}>\{, \{\#\}<\text{opc2}>\}
\]

The CFPRCTX characteristics are:

**Purpose**

Control Flow Prediction Restriction by Context applies to all Control Flow Prediction Resources that predict execution based on information gathered within the target execution context or contexts.

When this instruction is complete and synchronized, control flow prediction does not permit later speculative execution within the target execution context to be observable through side channels.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

**Note**

This instruction does not require the invalidation of prediction structures so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level and FEAT_SPECRES is implemented. Otherwise, direct accesses to CFPRCTX are UNDEFINED.

**Attributes**

CFPRCTX is a 32-bit System instruction.

**Field descriptions**

The CFPRCTX input value bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:28]**

Reserved, RES0.

**GVMID, bit [27]**

Execution of this instruction applies to all VMIDs or a specified VMID.

<table>
<thead>
<tr>
<th>GVMID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Applies to specified VMID for an EL0 or EL1 target execution context.</td>
</tr>
<tr>
<td>0b1</td>
<td>Applies to all VMIDs for an EL0 or EL1 target execution context.</td>
</tr>
</tbody>
</table>
For target execution contexts other than EL0 or EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

**NS, bit [26]**

Security State.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure state.</td>
</tr>
</tbody>
</table>

If the instruction is executed in Non-secure state, this field has an Effective value of 1.

**EL, bits [25:24]**

Exception Level. Indicates the Exception level of the target execution context.

<table>
<thead>
<tr>
<th>EL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1.</td>
</tr>
<tr>
<td>0b10</td>
<td>EL2.</td>
</tr>
</tbody>
</table>

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

**VMID, bits [23:16]**

Only applies when bit[27] is 0 and the target execution context is either:

- EL1.
- EL0 when (HCR_EL2.E2H==0 or HCR_EL2.TGE==0) or EL2 is using AArch32 state.

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and (HCR_EL2.E2H==0 or HCR_EL2.TGE==0 or ELUsingAArch32(EL2)), this field is treated as the current VMID.

When the instruction is executed at EL0 and (HCR_EL2.E2H==1 and HCR_EL2.TGE==1 and !ELUsingAArch32(EL2)), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

**Bits [15:9]**

Reserved, RES0.

**GASID, bit [8]**

Execution of this instruction applies to all ASIDs or a specified ASID.

<table>
<thead>
<tr>
<th>GASID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Applies to specified ASID for an EL0 target execution context.</td>
</tr>
<tr>
<td>0b1</td>
<td>Applies to all ASID for an EL0 target execution context.</td>
</tr>
</tbody>
</table>

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field is treated as 0.
ASID, bits [7:0]

Only applies for an EL0 target execution context and when bit[8] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

Executing the CFPRCTX instruction

Accesses to this instruction use the following encodings:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

        CFPRCTX(R[t]);
```
The CLIDR characteristics are:

**Purpose**

Identifies the type of cache, or caches, that are implemented at each level and can be managed using the architected cache maintenance instructions that operate by set/way, up to a maximum of seven levels. Also identifies the Level of Coherence (LoC) and Level of Unification (LoU) for the cache hierarchy.

**Configuration**

AArch32 System register CLIDR bits [31:0] are architecturally mapped to AArch64 System register CLIDR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CLIDR are UNDEFINED.

**Attributes**

CLIDR is a 32-bit register:

**Field descriptions**

The CLIDR bit assignments are:

<td>L2 cache is the highest Inner Cacheable level.</td>
</tr>
<tr>
<td>0b11</td>
<td>L3 cache is the highest Inner Cacheable level.</td>
</tr>
</tbody>
</table>

**LoUU, bits [29:27]**

Level of Unification Uniprocessor for the cache hierarchy.

**Note**

When FEAT_S2FWB is implemented, the architecture requires that this field is zero so that no levels of data cache need to be cleaned in order to manage coherency with instruction fetches.

**LoC, bits [26:24]**

Level of Coherence for the cache hierarchy.
LoUIS, bits [23:21]

Level of Unification Inner Shareable for the cache hierarchy.

Note

When FEAT_S2FWB is implemented, the architecture requires that this field is zero so that no levels of data cache need to be cleaned in order to manage coherency with instruction fetches.

Ctype<n>, bits [3(n-1)+2:3(n-1)], for n = 7 to 1

Cache Type fields. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy. Possible values of each field are:

<table>
<thead>
<tr>
<th>Ctype&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>No cache.</td>
</tr>
<tr>
<td>0b001</td>
<td>Instruction cache only.</td>
</tr>
<tr>
<td>0b010</td>
<td>Data cache only.</td>
</tr>
<tr>
<td>0b011</td>
<td>Separate instruction and data caches.</td>
</tr>
<tr>
<td>0b100</td>
<td>Unified cache.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If software reads the Cache Type fields from Ctype1 upwards, once it has seen a value of 000, no caches that can be managed using the architected cache maintenance instructions that operate by set/way exist at further-out levels of the hierarchy. So, for example, if Ctype3 is the first Cache Type field with a value of 000, the values of Ctype4 to Ctype7 must be ignored.

**Accessing the CLIDR**

Accesses to this register use the following encodings:

\[
\text{MRC\{<c>\}{<q>} <coproc>, \{#<opc1>, <Rt>, <CRn>, <CRm}\{, \{#<opc2}\}}
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b001</td>
<td>0b0000</td>
<td>0b0000</td>
<td>0b001</td>
</tr>
</tbody>
</table>

CNTFRQ, Counter-timer Frequency register

The CNTFRQ characteristics are:

**Purpose**

This register is provided so that software can discover the frequency of the system counter. It must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

**Configuration**

AArch32 System register CNTFRQ bits [31:0] are architecturally mapped to AArch64 System register CNTFRQ_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTFRQ are UNDEFINED.

**Attributes**

CNTFRQ is a 32-bit register.

**Field descriptions**

The CNTFRQ bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Clock frequency</td>
</tr>
</tbody>
</table>

Bits [31:0]

Clock frequency. Indicates the system counter clock frequency, in Hz.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTFRQ**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>

if IsHighestEL(PSTATE.EL) then
  CNTFRQ = R[t];
else
  UNDEFINED;
The CNTHCTL characteristics are:

**Purpose**

Controls the generation of an event stream from the physical counter, and access from Non-secure EL1 modes to the physical counter and the Non-secure EL1 physical timer.

**Configuration**

AArch32 System register CNTHCTL bits [31:0] are architecturally mapped to AArch64 System register CNTHCTL_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTHCTL are **UNDEFINED**.

If EL2 is not implemented, this register is **RES0** from EL3.

**Attributes**

CNTHCTL is a 32-bit register.

**Field descriptions**

The CNTHCTL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | EVNTIS | RES0 | EVNTI | EVNTDIR | EVNTEN | PL1PCEN | PL1PCTEN |

**Bits [31:18]**

Reserved, RES0.

**EVNTIS, bit [17]**

**When FEAT_ECV is implemented:**

Controls the scale of the generation of the event stream.

<table>
<thead>
<tr>
<th>EVNTIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CNTHCTL.EVNTI field applies to CNTPCT[15:0].</td>
</tr>
<tr>
<td>0b1</td>
<td>The CNTHCTL.EVNTI field applies to CNTPCT[23:8].</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Bits [16:8]**

Reserved, RES0.
**EVNTI, bits [7:4]**

Selects which bit of the counter register `CNTPCT` is the trigger for the event stream generated from that counter, when that stream is enabled.

If FEAT_ECV is implemented, and CNTHCTL.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of the counter register `CNTPCT` is the trigger.

Otherwise, this field selects a trigger bit in the range 0 to 15 of the counter register.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**EVNTDIR, bit [3]**

Controls which transition of the counter register `CNTPCT` trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

<table>
<thead>
<tr>
<th>EVNTDIR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A 0 to 1 transition of the trigger bit triggers an event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A 1 to 0 transition of the trigger bit triggers an event.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**EVNTEN, bit [2]**

Enables the generation of an event stream from the counter register `CNTPCT`:

<table>
<thead>
<tr>
<th>EVNTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disables the event stream.</td>
</tr>
<tr>
<td>0b1</td>
<td>Enables the event stream.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**PL1PCEN, bit [1]**

Traps Non-secure EL0 and EL1 accesses to the physical timer registers to Hyp mode.

<table>
<thead>
<tr>
<th>PL1PCEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL0 and EL1 accesses to the <code>CNTP_CTL</code>, <code>CNTP_CVAL</code>, and <code>CNTP_TVAL</code> are trapped to Hyp mode, unless the it is trapped by <code>CNTKCTL.PL0PTEN</code>.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**PL1PCTEN, bit [0]**

Traps Non-secure EL0 and EL1 accesses to the physical counter register to Hyp mode.

<table>
<thead>
<tr>
<th>PL1PCTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL0 and EL1 accesses to the <code>CNTPCT</code> are trapped to Hyp mode, unless it is trapped by <code>CNTKCTL.PL0PCTEN</code>.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Accessing the CNTHCTL

Accesses to this register use the following encodings:

\[
\text{MRC}{\langle c \rangle}{\langle q \rangle} \langle \text{coproc} \rangle, \{\#\} \langle \text{opc1} \rangle, \langle \text{Rt} \rangle, \langle \text{CRn} \rangle, \langle \text{CRm} \rangle, \{\#\} \langle \text{opc2} \rangle
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b100</td>
<td>0b1110</td>
<td>0b0001</td>
<td>0b000</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then UNDEFINED;
elsif PSTATE.EL == EL1 then UNDEFINED;
elsif PSTATE.EL == EL2 then return CNTHCTL;
elsif PSTATE.EL == EL3 then return CNTHCTL;

\[
\text{MCR}{\langle c \rangle}{\langle q \rangle} \langle \text{coproc} \rangle, \{\#\} \langle \text{opc1} \rangle, \langle \text{Rt} \rangle, \langle \text{CRn} \rangle, \langle \text{CRm} \rangle, \{\#\} \langle \text{opc2} \rangle
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b100</td>
<td>0b1110</td>
<td>0b0001</td>
<td>0b000</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then UNDEFINED;
elsif PSTATE.EL == EL1 then UNDEFINED;
elsif PSTATE.EL == EL2 then CNTHCTL = R[t];
elsif PSTATE.EL == EL3 then CNTHCTL = R[t];
The CNTHP_CTL characteristics are:

**Purpose**

Control register for the Hyp mode physical timer.

**Configuration**

AArch32 System register CNTHP_CTL bits [31:0] are architecturally mapped to AArch64 System register CNTHP_CTL_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTHP_CTL are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

CNTHP_CTL is a 32-bit register.

**Field descriptions**

The CNTHP_CTL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 | ISTATUS | IMASK | ENABLE |

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>
For more information, see the description of the ISTATUS bit.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally **UNKNOWN** value.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from **CNTHP_TVAL** continues to count down.

---

**Note**

Disabling the output signal might be a power-saving option.

---

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

### Accessing the CNTHP_CTL

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>

The CNTHP_CVAL characteristics are:

**Purpose**

Holds the compare value for the Hyp mode physical timer.

**Configuration**

AArch32 System register CNTHP_CVAL bits [63:0] are architecturally mapped to AArch64 System register CNTHP_CVAL_EL2[63:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTHP_CVAL are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

CNTHP_CVAL is a 64-bit register.

**Field descriptions**

The CNTHP_CVAL bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| CompareValue |
| CompareValue |

**CompareValue, bits [63:0]**

Holds the EL2 physical timer CompareValue.

When CNTPCT.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHP_CTL.ISTATUS is set to 1.
- If CNTHP_CTL.IMASK is 0, an interrupt is generated.

When CNTHP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The CNTHP_TVAL characteristics are:

**Purpose**

Holds the timer value for the Hyp mode physical timer.

**Configuration**

AArch32 System register CNTHP_TVAL bits [31:0] are architecturally mapped to AArch64 System register CNTHP_TVAL_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTHP_TVAL are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

CNTHP_TVAL is a 32-bit register.

**Field descriptions**

The CNTHP_TVAL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| TimerValue |

**TimerValue, bits [31:0]**

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If CNTHP_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHP_CTL.ENABLE is 1, the value returned is (CNTHP_CVAL - CNTPCT).

On a write of this register, CNTHP_CVAL is set to (CNTPCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CNTHP_CVAL) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHP_CTL.ISTATUS is set to 1.
- If CNTHP_CTL.IMASK is 0, an interrupt is generated.

When CNTHP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count, so the TimerValue view appears to continue to count down.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

CNTHPS_CTL, Counter-timer Secure Physical Timer Control Register (EL2)

The CNTHPS_CTL characteristics are:

**Purpose**

Provides AArch32 access from EL0 to the Secure EL2 physical timer.

**Configuration**

AArch32 System register CNTHPS_CTL bits [31:0] are architecturally mapped to AArch64 System register CNTHPS_CTL_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHPS_CTL are **UNDEFINED**.

**Attributes**

CNTHPS_CTL is a 32-bit register.

**Field descriptions**

The CNTHPS_CTL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>30</td>
<td>ISTATUS</td>
</tr>
<tr>
<td>29</td>
<td>IMASK</td>
</tr>
<tr>
<td>28</td>
<td>ENABLE</td>
</tr>
<tr>
<td>27</td>
<td></td>
</tr>
<tr>
<td>26</td>
<td></td>
</tr>
<tr>
<td>25</td>
<td></td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td>23</td>
<td></td>
</tr>
<tr>
<td>22</td>
<td></td>
</tr>
<tr>
<td>21</td>
<td></td>
</tr>
<tr>
<td>20</td>
<td></td>
</tr>
<tr>
<td>19</td>
<td></td>
</tr>
<tr>
<td>18</td>
<td></td>
</tr>
<tr>
<td>17</td>
<td></td>
</tr>
<tr>
<td>16</td>
<td></td>
</tr>
<tr>
<td>15</td>
<td></td>
</tr>
<tr>
<td>14</td>
<td></td>
</tr>
<tr>
<td>13</td>
<td></td>
</tr>
<tr>
<td>12</td>
<td></td>
</tr>
<tr>
<td>11</td>
<td></td>
</tr>
<tr>
<td>10</td>
<td></td>
</tr>
<tr>
<td>9</td>
<td></td>
</tr>
<tr>
<td>8</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the CNTHPS_CTL.ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the CNTHPS_CTL.ENABLE bit is 0, the ISTATUS field is **UNKNOWN**.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>

For more information, see the description of the ISTATUS bit.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from **CNTHPS_TVAL_EL2** continues to count down.

---

**Note**

Disabling the output signal might be a power-saving option.

---

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the CNTHPS_CTL**

This register is accessed using the encoding for **CNTP_CTL**.

Accesses to this register use the following encodings:

\[ \text{MRC} \{<c>\} \{<q>\} \text{ coproc, } \{#\text{ opc1}\}, \text{ <Rt>, <CRn>, <CRm}\{, \{#\text{ opc2}\}} \]

<table>

**CompareValue, bits [63:0]**

Holds the EL2 physical timer CompareValue.

When CNTHPS_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHPS_CTL_EL2.ISTATUS is set to 1.
- If CNTHPS_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHPS_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTHPS_CVAL**

This register is accessed using the encoding for CNTP_CVAL.

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
    if !ELUsingAArch32(EL1) && !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '1') && CNTKCTL_EL1.EL0PTEN == '0' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x04);
    else
        AArch64.AArch32SystemAccessTrap(EL1, 0x04);
    endif
else
    if !ELUsingAArch32(EL2) && HCR_EL2.<E2H,TGE> == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x04);
    elsif ELUsingAArch32(EL2) && CNTKCTL.PL0PTEN == '0' then
        AArch32.TakeHypTrapException(0x00);
    else
        UNDEFINED;
    endif
endif
else

CNTHPS_TVAL, Counter-timer Secure Physical Timer TimerValue Register (EL2)

The CNTHPS_TVAL characteristics are:

**Purpose**

Provides AArch32 access from EL0 to the timer value for the Secure EL2 physical timer.

**Configuration**

AArch32 System register CNTHPS_TVAL bits [31:0] are architecturally mapped to AArch64 System register CNTHPS_TVAL_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHPS_TVAL are **UNDEFINED**.

**Attributes**

CNTHPS_TVAL is a 32-bit register.

**Field descriptions**

The CNTHPS_TVAL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| TimerValue |

**TimerValue, bits [31:0]**

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If CNTHPS_CTL_EL2.ENABLE is 0, the value returned is **UNKNOWN**.
- If CNTHPS_CTL_EL2.ENABLE is 1, the value returned is (CNTHPS_CVAL_EL2 - CNTPCT_EL0).

On a write of this register, CNTHPS_CVAL_EL2 is set to (CNTPCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHPS_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CNTHPS_CVAL_EL2) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHPS_CTL_EL2.ISTATUS is set to 1.
- If CNTHPS_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHPS_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the CNTHPS_TVAL**

This register is accessed using the encoding for CNTP_TVAL.

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
  if !ELUsingAArch32(EL1) && !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '1') && CNTKCTL_EL1.EL0PTEN == '0' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
  else
    AArch64.AArch32SystemAccessTrap(EL1, 0x03);
  endif
elseif EL2Enabled() && HCR_EL2.TGE == '1' then
  AArch64.AArch32SystemAccessTrap(EL2, 0x03);
else
  UNDEFINED;
endif

if PSTATE.EL == EL1 then
  if !ELUsingAArch32(EL2) && HCR_EL2.E2H == '0' && CNTKCTL_EL2.EL1PCEN == '0' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
  else
    AArch64.AArch32SystemAccessTrap(EL1, 0x03);
  endif
elseif EL2Enabled() && HCR_EL2.<E2H,TGE> == '10' && CNTKCTL_EL2.EL0PTEN == '0' then
  AArch64.AArch32SystemAccessTrap(EL2, 0x03);
else
  UNDEFINED;
endif

if PSTATE.EL == EL2 then
  if HaveEL(EL3) && ELUsingAArch32(EL3) then
    return CNTP_TVAL_NS;

      CNTP_TVAL_S = R[t];
    else
      CNTP_TVAL_NS = R[t];

CNTHV_CTL, Counter-timer Virtual Timer Control register (EL2)

The CNTHV_CTL characteristics are:

Purpose

Provides AArch32 access to the control register for the EL2 virtual timer.

Configuration

AArch32 System register CNTHV_CTL bits [31:0] are architecturally mapped to AArch64 System register CNTHV_CTL_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_VHE is implemented. Otherwise, direct accesses to CNTHV_CTL are UNDEFINED.

Attributes

CNTHV_CTL is a 32-bit register.

Field descriptions

The CNTHV_CTL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>ISTATUS</td>
</tr>
<tr>
<td>29</td>
<td>IMASK</td>
</tr>
<tr>
<td>28</td>
<td>ENABLE</td>
</tr>
</tbody>
</table>

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>

For more information, see the description of the ISTATUS bit.
ENABLE, bit [0]

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from `CNTHV_TVAL` continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

---

Accessing the CNTHV_CTL

This register is accessed using the encoding for `CNTV_CTL`.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#<\text{opc1}\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#<\text{opc2}\}}
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b111</td>
<td>0b000</td>
<td>0b110</td>
<td>0b001</td>
<td></td>
</tr>
</tbody>
</table>

CNTHV_CVAL, Counter-timer Virtual Timer CompareValue register (EL2)

The CNTHV_CVAL characteristics are:

**Purpose**

Provides AArch32 access to the compare value for the EL2 virtual timer.

**Configuration**

AArch32 System register CNTHV_CVAL bits [63:0] are architecturally mapped to AArch64 System register `CNTHV_CVAL_EL2[63:0]`.

This register is present only when FEAT_VHE is implemented. Otherwise, direct accesses to CNTHV_CVAL are **UNDEFINED**.

**Attributes**

CNTHV_CVAL is a 64-bit register.

**Field descriptions**

The CNTHV_CVAL bit assignments are:

**CompareValue, bits [63:0]**

Holds the EL2 virtual timer CompareValue.

When `CNTHV_CTL_ENABLE` is 1, the timer condition is met when `(CNTVCT - CompareValue)` is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- `CNTHV_CTL.ISTATUS` is set to 1.
- If `CNTHV_CTL.IMASK` is 0, an interrupt is generated.

When `CNTHV_CTL_ENABLE` is 0, the timer condition is not met, but `CNTVCT` continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are `RES0`.

The value of this field is treated as zero-extended in all counter calculations.

**Accessing the CNTHV_CVAL**

Accesses to this register use the following encodings:

```
MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>CRm</th>

The CNTHV_TVAL characteristics are:

### Purpose

Provides AArch32 access to the timer value for the EL2 virtual timer.

### Configuration

AArch32 System register CNTHV_TVAL bits [31:0] are architecturally mapped to AArch64 System register CNTHV_TVAL_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_VHE is implemented. Otherwise, direct accesses to CNTHV_TVAL are **UNDEFINED**.

### Attributes

CNTHV_TVAL is a 32-bit register.

### Field descriptions

The CNTHV_TVAL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| TimerValue |

### TimerValue, bits [31:0]

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If **CNTHV_CTL**.ENABLE is 0, the value returned is **UNKNOWN**.
- If **CNTHV_CTL**.ENABLE is 1, the value returned is (**CNTHV_CVAL** - **CNTVCT**).

On a write of this register, **CNTHV_CVAL** is set to (**CNTVCT** + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When **CNTHV_CTL**.ENABLE is 1, the timer condition is met when (**CNTVCT** - **CNTHV_CVAL**) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- **CNTHV_CTL**.ISTATUS is set to 1.
- If **CNTHV_CTL**.IMASK is 0, an interrupt is generated.

When **CNTHV_CTL**.ENABLE is 0, the timer condition is not met, but **CNTVCT** continues to count, so the TimerValue view appears to continue to count down.

### Accessing the CNTHV_TVAL

This register is accessed using the encoding for **CNTV_TVAL**.

Accesses to this register use the following encodings:
if `PSTATE.EL == EL0` then

CNTHVS_CTL, Counter-timer Secure Virtual Timer Control Register (EL2)

The CNTHVS_CTL characteristics are:

Purpose

Provides AArch32 access from EL0 to the Secure EL2 virtual timer.

Configuration

AArch32 System register CNTHVS_CTL bits [31:0] are architecturally mapped to AArch64 System register CNTHVS_CTL_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHVS_CTL are undefined.

Attributes

CNTHVS_CTL is a 32-bit register.

Field descriptions

The CNTHVS_CTL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| RES0 | ISTATUS | IMASK | ENABLE |

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is unknown.

This bit is read-only.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>

For more information, see the description of the ISTATUS bit.
**ENABLE, bit [0]**

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from \texttt{CNTHVS_TVAL} continues to count down.

---

**Note**

Disabling the output signal might be a power-saving option.

---

**Accessing the CNTHVS_CTL**

This register is accessed using the encoding for \texttt{CNTV_CTL}.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}\{<q>\} \text{<coproc>}, \{#\langle opc1 \rangle\}, \{<Rt>\}, \{<CRn>\}, \{<CRm>\}\{, \{#\langle opc2 \rangle\}\}
\]

<table>
<thead>
<tr>
<th>\text{coproc}</th>
<th>\text{opc1}</th>
<th>\text{CRn}</th>
<th>\text{CRm}</th>
<th>\text{opc2}</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b0000</td>
<td>0b1110</td>
<td>0b0011</td>
<td>0b001</td>
</tr>
</tbody>
</table>

The CNTHVS_CVAL characteristics are:

**Purpose**

Provides AArch32 access to the compare value for the Secure EL2 virtual timer.

**Configuration**

AArch32 System register CNTHVS_CVAL bits [63:0] are architecturally mapped to AArch64 System register CNTHVS_CVAL_EL2[63:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHVS_CVAL are UNDEFINED.

**Attributes**

CNTHVS_CVAL is a 64-bit register.

**Field descriptions**

The CNTHVS_CVAL bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| CompareValue | CompareValue |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |

**CompareValue, bits [63:0]**

Holds the EL2 virtual timer CompareValue.

When CNTHVS_CTL_ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHVS_CTL_ISTATUS is set to 1.
- If CNTHVS_CTL.IMASK is 0, an interrupt is generated.

When CNTHVS_CTL_ENABLE is 0, the timer condition is not met, but CNTVCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

**Accessing the CNTHVS_CVAL**

This register is accessed using the encoding for CNTV_CVAL.

Accesses to this register use the following encodings:

```
MRRC{<c>}{<q>} <coproc>, {#<opc1>, <Rt>, <Rt2>, <CRm>
```

```markdown

**TimerValue, bits [31:0]**

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If CNTHVS_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHVS_CTL.ENABLE is 1, the value returned is (CNTHVS_CVAL - CNTVCT).

On a write of this register, CNTHVS_CVAL is set to (CNTVCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHVS_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CNTHVS_CVAL) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHVS_CTL.ISTATUS is set to 1.
- If CNTHVS_CTL.IMASK is 0, an interrupt is generated.

When CNTHVS_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count, so the TimerValue view appears to continue to count down.

**Accessing the CNTHVS_TVAL**

This register is accessed using the encoding for CNTV_TVAL.

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
  if !ELUsingAArch32(EL1) && !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && CNTKCTL_EL1.EL0VTEN == '0' then
    AArch64.AArch32SystemAccessTrap(EL1, 0x03);
  elseif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.<E2H,TGE> == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
  else
    UNDEFINED;
  endif
else
  if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.<E2H,TGE> == '11' && CNTKCTL_EL2.EL0VTEN == '0' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
  elseif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.<E2H,TGE> != '11' && CNTHCTL_EL2.EL0VTEN == '0' then

CNTKCTL, Counter-timer Kernel Control register

The CNTKCTL characteristics are:

**Purpose**

Controls the generation of an event stream from the virtual counter, and access from EL0 modes to the physical counter, virtual counter, EL1 physical timers, and the virtual timer.

**Configuration**

AArch32 System register CNTKCTL bits [31:0] are architecturally mapped to AArch64 System register CNTKCTL_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTKCTL are UNDEFINED.

**Attributes**

CNTKCTL is a 32-bit register.

**Field descriptions**

The CNTKCTL bit assignments are:

<table>

</tbody>
</table>

**Bits [31:18]**

Reserved, RES0.

**EVNTIS, bit [17]**

When FEAT_ECV is implemented:

Controls the scale of the generation of the event stream.

<table>
<thead>
<tr>
<th>EVNTIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CNTKCTL.EVNTI field applies to CNTVCT[15:0].</td>
</tr>
<tr>
<td>0b1</td>
<td>The CNTKCTL.EVNTI field applies to CNTVCT[23:16].</td>
</tr>
</tbody>
</table>

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [16:10]**

Reserved, RES0.
**PLOPTEN, bit [9]**

Traps PL0 accesses to the physical timer registers to Undefined mode.

<table>
<thead>
<tr>
<th>PLOPTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PL0 accesses to the <strong>CNTP_CTL</strong>, <strong>CNTP_CVAL</strong>, and <strong>CNTP_TVAL</strong> registers are trapped to Undefined mode.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**PLOVTEN, bit [8]**

Traps PL0 accesses to the virtual timer registers to Undefined mode.

<table>
<thead>
<tr>
<th>PLOVTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PL0 accesses to the <strong>CNTV_CTL</strong>, <strong>CNTV_CVAL</strong>, and <strong>CNTV_TVAL</strong> registers are trapped to Undefined mode.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**EVNTI, bits [7:4]**

Selects which bit of the counter register **CNTVCT** is the trigger for the event stream generated from that counter, when that stream is enabled.

If FEAT_ECV is implemented, and CNTKCTL.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of the counter register **CNTVCT**.

Otherwise, this field selects a trigger bit in the range 0 to 15 of the counter register.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**EVNTDIR, bit [3]**

Controls which transition of the counter register **CNTVCT** trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

<table>
<thead>
<tr>
<th>EVNTDIR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A 0 to 1 transition of the trigger bit triggers an event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A 1 to 0 transition of the trigger bit triggers an event.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**EVNTEN, bit [2]**

Enables the generation of an event stream from the counter register **CNTVCT**:

<table>
<thead>
<tr>
<th>EVNTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disables the event stream.</td>
</tr>
<tr>
<td>0b1</td>
<td>Enables the event stream.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**PLOVCTEN, bit [1]**

Traps PL0 accesses to the frequency register and virtual counter register to Undefined mode.

<table>
<thead>
<tr>
<th>PLOVCTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PL0 accesses to the <strong>CNTVCT</strong> are trapped to Undefined mode.</td>
</tr>
<tr>
<td></td>
<td>PL0 accesses to the <strong>CNTFRQ</strong> register are trapped to Undefined mode, if CNTKCTL.PL0PCTEN is also 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**PLOPCTEN, bit [0]**

Traps PL0 accesses to the frequency register and physical counter register to Undefined mode.

<table>
<thead>
<tr>
<th>PLOPCTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PL0 accesses to the CNTPCT are trapped to Undefined mode.</td>
</tr>
<tr>
<td></td>
<td>PL0 accesses to the CNTFREQ register are trapped to</td>
</tr>
<tr>
<td></td>
<td>Undefined mode, if CNTKCTL.PL0VCTEN is also 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTKCTL**

Accesses to this register use the following encodings:

\[
\text{MRC\{<c>\}{<q>} <coproc>, \{#\}<opc1>, <Rt>, <CRn>, <CRm>\{, \{#\}<opc2>\}}
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b1110</td>
<td>0b0001</td>
<td>0b000</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  return CNTKCTL;
elsif PSTATE.EL == EL2 then
  return CNTKCTL;
elsif PSTATE.EL == EL3 then
  return CNTKCTL;

\[
\text{MCR\{<c>\}{<q>} <coproc>, \{#\}<opc1>, <Rt>, <CRn>, <CRm>\{, \{#\}<opc2>\}}
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b1110</td>
<td>0b0001</td>
<td>0b000</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  CNTKCTL = R[t];
elsif PSTATE.EL == EL2 then
  CNTKCTL = R[t];
elsif PSTATE.EL == EL3 then
  CNTKCTL = R[t];

Copyright © 2010-2020 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.
The CNTP_CTL characteristics are:

**Purpose**

Control register for the EL1 physical timer.

**Configuration**

AArch32 System register CNTP_CTL bits [31:0] are architecturally mapped to AArch64 System register CNTP_CTL_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTP_CTL are UNDEFINED.

**Attributes**

CNTP_CTL is a 32-bit register.

**Field descriptions**

The CNTP_CTL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | ISTATUS | IMASK | ENABLE |

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>

For more information, see the description of the ISTATUS bit.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from \textit{CNTP\_TVAL} continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

On a Warm reset, this field resets to 0.

**Accessing the CNTP\_CTL**

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>\!, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#\}<\text{opc2}>
\]

CNTP_CTL, Counter-timer Physical Timer Control register
CNTP_CVAL, Counter-timer Physical Timer CompareValue register

The CNTP_CVAL characteristics are:

**Purpose**

Holds the compare value for the EL1 physical timer.

**Configuration**

AArch32 System register CNTP_CVAL bits [63:0] are architecturally mapped to AArch64 System register CNTP_CVAL_EL0[63:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTP_CVAL are **UNDEFINED**.

**Attributes**

CNTP_CVAL is a 64-bit register.

**Field descriptions**

The CNTP_CVAL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>CompareValue</td>
</tr>
<tr>
<td>62</td>
<td>CompareValue</td>
</tr>
<tr>
<td>...</td>
<td>...</td>
</tr>
<tr>
<td>0</td>
<td>CompareValue</td>
</tr>
</tbody>
</table>

**CompareValue, bits [63:0]**

Holds the EL1 physical timer CompareValue.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTP_CTL.ISTATUS is set to 1.
- If CNTP_CTL.IMASK is 0, an interrupt is generated.

When CNTP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are **RES0**.

The value of this field is treated as zero-extended in all counter calculations.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the CNTP_CVAL**

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
  if !ELUsingAArch32(EL1) && !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && CNTKCTL_EL1.EL0PTEN == '0' then

CNTP_TVAL, Counter-timer Physical Timer TimerValue register

The CNTP_TVAL characteristics are:

**Purpose**

Holds the timer value for the EL1 physical timer.

**Configuration**

AArch32 System register CNTP_TVAL bits [31:0] are architecturally mapped to AArch64 System register CNTP_TVAL_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTP_TVAL are UNDEFINED.

**Attributes**

CNTP_TVAL is a 32-bit register.

**Field descriptions**

The CNTP_TVAL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| TimerValue |

**TimerValue, bits [31:0]**

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If CNTP_CTL,ENABLE is 0, the value returned is UNKNOWN.
- If CNTP_CTL,ENABLE is 1, the value returned is (CNTP_CVAL - CNTPCT).

On a write of this register, CNTP_CVAL is set to (CNTPCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTP_CTL,ENABLE is 1, the timer condition is met when (CNTPCT - CNTP_CVAL) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTP_CTL,ISTATUS is set to 1.
- If CNTP_CTL,IMASK is 0, an interrupt is generated.

When CNTP_CTL,ENABLE is 0, the timer condition is not met, but CNTPCT continues to count, so the TimerValue view appears to continue to count down.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTP_TVAL**

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
  if !ELUsingAArch32(EL1) &amp;&amp; !ELUsingAArch32(EL2) &amp;&amp; HCR_EL2.E2H == '11' &amp;&amp; CNTHCTL_EL1.E1PTEN == '0' then

CNTPCTSS, Counter-timer Self-Synchronized Physical Count register

The CNTPCTSS characteristics are:

**Purpose**

Holds the 64-bit physical count value.

**Configuration**

AArch32 System register CNTPCTSS bits [63:0] are architecturally mapped to AArch64 System register CNTPCTSS_EL0[63:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_ECV is implemented. Otherwise, direct accesses to CNTPCTSS are UNDEFINED.

All reads to the CNTPCTSS occur in program order relative to reads to CNTPCT or CNTPCTSS.

This register is a self-synchronised view of the CNTPCT counter, and cannot be read speculatively.

**Attributes**

CNTPCTSS is a 64-bit register.

**Field descriptions**

The CNTPCTSS bit assignments are:

<table>

CNTV_CTL, Counter-timer Virtual Timer Control register

The CNTV_CTL characteristics are:

**Purpose**

Control register for the virtual timer.

**Configuration**

AArch32 System register CNTV_CTL bits [31:0] are architecturally mapped to AArch64 System register CNTV_CTL_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTV_CTL are UNDEFINED.

**Attributes**

CNTV_CTL is a 32-bit register.

**Field descriptions**

The CNTV_CTL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>30</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>29</td>

<tr>
<td>18</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>17</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>16</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>15</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>14</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>13</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>12</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>11</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>10</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>9</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>8</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>7</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>6</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>5</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>4</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>3</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>2</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>1</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>0</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>

For more information, see the description of the ISTATUS bit.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTV_TVAL continues to count down.

---

**Note**

Disabling the output signal might be a power-saving option.

---

On a Warm reset, this field resets to 0.

**Accessing the CNTV_CTL**

Accesses to this register use the following encodings:

\[
\text{MRC\{<c}\}{<q}> \text{<coproc>, \{#<opc1>, <Rt>, <CRn>, <CRm>{, \{#<opc2>}\}}

**CompareValue, bits [63:0]**

Holds the EL1 virtual timer CompareValue.

When CNTV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTV_CTL.ISTATUS is set to 1.
- If CNTV_CTL.IMASK is 0, an interrupt is generated.

When CNTV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTV_CVAL**

Accesses to this register use the following encodings:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

CNTV_TVAL, Counter-timer Virtual Timer TimerValue register

The CNTV_TVAL characteristics are:

**Purpose**

Holds the timer value for the virtual timer.

**Configuration**

AArch32 System register CNTV_TVAL bits [31:0] are architecturally mapped to AArch64 System register CNTV_TVAL_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTV_TVAL are UNDEFINED.

**Attributes**

CNTV_TVAL is a 32-bit register.

**Field descriptions**

The CNTV_TVAL bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>

<td></td>
<td>TimerValue</td>
</tr>
</tbody>
</table>

**TimerValue, bits [31:0]**

The TimerValue view of the virtual timer.

On a read of this register:

- If CNTV_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTV_CTL.ENABLE is 1, the value returned is (CNTV_CVAL - CNTVCT).

On a write of this register, CNTV_CVAL is set to (CNTVCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CNTP_CVAL) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTV_CTL.ISTATUS is set to 1.
- If CNTV_CTL.IMASK is 0, an interrupt is generated.

When CNTV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count, so the TimerValue view appears to continue to count down.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTV_TVAL**

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then

The CNTVCT characteristics are:

**Purpose**

Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value minus the virtual offset visible in CNTVOFF.

**Configuration**

AArch32 System register CNTVCT bits [63:0] are architecturally mapped to AArch64 System register CNTVCT_EL0[63:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTVCT are UNDEFINED.

The value of this register is the same as the value of CNTPCT in the following conditions:

- When EL2 is not implemented.
- When EL2 is implemented and is using AArch64, HCR_EL2.E2H, TGE is {1, 1}, and this register is read from Non-secure EL0.

All reads to the CNTVCT occur in program order relative to reads to CNTVCTSS or CNTVCT.

**Attributes**

CNTVCT is a 64-bit register.

**Field descriptions**

The CNTVCT bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

CNTVCTSS, Counter-timer Self-Synchronized Virtual Count register

The CNTVCTSS characteristics are:

**Purpose**

Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value visible in `CNTPCT` minus the virtual offset visible in `CNTVOFF`.

**Configuration**

AArch32 System register CNTVCTSS bits [63:0] are architecturally mapped to AArch64 System register `CNTVCTSS_EL0[63:0]`.

This register is present only when AArch32 is supported at any Exception level and FEAT_ECV is implemented. Otherwise, direct accesses to CNTVCTSS are **UNDEFINED**.

All reads to the CNTVCTSS occur in program order relative to reads to `CNTVCT` or CNTVCTSS.

This register is a self-synchronised view of the `CNTVCT` counter, and cannot be read speculatively.

**Attributes**

CNTVCTSS is a 64-bit register.

**Field descriptions**

The CNTVCTSS bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td><strong>Self-Synchronized Virtual count value</strong></td>
</tr>
<tr>
<td>31</td>
<td><strong>Self-Synchronized Virtual count value</strong></td>
</tr>
</tbody>
</table>

**Bits [63:0]**

Self-Synchronized Virtual count value.

**Accessing the CNTVCTSS**

Accesses to this register use the following encodings:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

<table>

CNTVOFF, Counter-timer Virtual Offset register

The CNTVOFF characteristics are:

**Purpose**

Holds the 64-bit virtual offset. This is the offset between the physical count value visible in **CNTPCT** and the virtual count value visible in **CNTVCT**.

**Configuration**

AArch32 System register CNTVOFF bits [63:0] are architecturally mapped to AArch64 System register **CNTVOFF_EL2[63:0]**.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTVOFF are **UNDEFINED**.

If EL2 is not implemented, this register is **RES0** from EL3 and the virtual counter uses a fixed virtual offset of zero.

**Note**

When EL2 is implemented and is using AArch64, if **HCR_EL2.{E2H, TGE}** is \{1, 1\}, the virtual counter uses a fixed virtual offset of zero when **CNTVCT** is read from Non-secure EL0.

**Attributes**

CNTVOFF is a 64-bit register.

**Field descriptions**

The CNTVOFF bit assignments are:

<table>

</tbody>
</table>

**Bits [63:0]**

Virtual offset.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are **RES0**.

The value of this field is treated as zero-extended in all counter calculations.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the CNTVOFF**

Accesses to this register use the following encodings:

```
MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>CRm</th>
<th>opc1</th>

elsif PSTATE.EL == EL2 then
    CNTVOFF = R[t2]:R[t];
elsif PSTATE.EL == EL3 then
    CNTVOFF = R[t2]:R[t];
CONTEXTIDR, Context ID Register

The CONTEXTIDR characteristics are:

**Purpose**

Identifies the current Process Identifier and, when using the Short-descriptor translation table format, the Address Space Identifier.

The value of the whole of this register is called the Context ID and is used by:

- The debug logic, for Linked and Unlinked Context ID matching.
- The trace logic, to identify the current process.

The significance of this register is for debug and trace use only.

**Configuration**

AArch32 System register CONTEXTIDR bits [31:0] are architecturally mapped to AArch64 System register CONTEXTIDR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CONTEXTIDR are undefined.

The register format depends on whether address translation is using the Long-descriptor or the Short-descriptor translation table format.

**Attributes**

CONTEXTIDR is a 32-bit register.

**Field descriptions**

The CONTEXTIDR bit assignments are:

**When TTBCR.EAE == 0:**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**PROCID**, bits [31:8]

Process Identifier. This field must be programmed with a unique value that identifies the current process.

On a Warm reset, this field resets to an architecturally unknown value.

**ASID**, bits [7:0]

Address Space Identifier. This field is programmed with the value of the current ASID.

On a Warm reset, this field resets to an architecturally unknown value.

**When TTBCR.EAE == 1:**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**PROCID**
**PROCID, bits [31:0]**

Process Identifier. This field must be programmed with a unique value that identifies the current process.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the CONTEXTIDR**

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} \text{ <coproc>, \{#}\text{<opc1>}, <Rt>, <CRn>, <CRm}\{, \{#\text{<opc2>}}\}

      CP15ISB();

CPACR, Architectural Feature Access Control Register

The CPACR characteristics are:

**Purpose**

Controls access to trace, and to Advanced SIMD and floating-point functionality from EL0, EL1, and EL3.

In an implementation that includes EL2, the CPACR has no effect on instructions executed at EL2.

**Configuration**

AArch32 System register CPACR bits [31:0] are architecturally mapped to AArch64 System register CPACR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CPACR are UNDEFINED.

Bits in the NSACR control Non-secure access to the CPACR fields. See the field descriptions for more information.

**Note**

In the register field descriptions, controls are described as applying at specified Privilege levels. This is because, in Secure state, a PL1 control:

- Applies to execution in a Secure EL3 mode when EL3 is using AArch32.
- Applies to execution in a Secure EL1 mode when EL3 is using AArch64.

See ‘Security state, Exception levels, and AArch32 execution privilege’.

**Attributes**

CPACR is a 32-bit register.

**Field descriptions**

The CPACR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>

</tr>
</tbody>
</table>

**ASEDIS, bit [31]**

Disables PL0 and PL1 execution of Advanced SIMD instructions.

<table>
<thead>
<tr>
<th>ASEDIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control permits execution of Advanced SIMD instructions at PL0 and PL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>All instruction encodings that are Advanced SIMD instruction encodings, but are not also floating-point instruction encodings, are UNDEFINED at PL0 and PL1.</td>
</tr>
</tbody>
</table>

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0. Otherwise, it is IMPLEMENTATION DEFINED whether this field is implemented as a RW field. If it is not implemented as a RW field, it is RAZ/WI.

If EL3 is implemented and is using AArch32, and the value of NSACR.NSASEDIS is 1, this field behaves as RAO/WI in Non-secure state, regardless of its actual value. This applies even if the field is implemented as RAZ/WI.
For the list of instructions affected by this field, see 'Controls of Advanced SIMD operation that do not apply to floating-point operation'.

See the description of CPACR.cp10 for a list of other controls that can disable or trap execution of Advanced SIMD instructions in AArch32 state.

On a Warm reset, this field resets to 0.

Bits [30:29]

Reserved, RES0.

TRCDIS, bit [28]

Traps PL0 and PL1 System register accesses to all implemented trace registers to Undefined mode.

<table>
<thead>
<tr>
<th>TRCDIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on PL0 and PL1 System register accesses to trace registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>PL0 and PL1 System register accesses to all implemented trace registers are trapped to Undefined mode.</td>
</tr>
</tbody>
</table>

If the implementation does not include a PE trace unit, or does not include a System register interface to the PE trace unit registers, this field is RES0. Otherwise, it is IMPLEMENTATION DEFINED whether this field is implemented as a RW field. If it is not implemented as a RW field, it is RAZ/WI.

If EL3 is implemented and is using AArch32, and the value of NSACR.NSTRCDIS is 1, this field behaves as RAO/WI in Non-secure state, regardless of its actual value. This applies even if the field is implemented as RAZ/WI.

Note

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the PE trace unit implements FEAT_ETMv4, EL0 accesses to the trace registers are UNDEFINED.
- The architecture does not provide traps on trace register accesses through the optional memory-mapped external debug interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:24]

Reserved, RES0.

cp11, bits [23:22]

The value of this field is ignored. If this field is programmed with a different value to the cp10 field then this field is UNKNOWN on a direct read of the CPACR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

In Non-secure state, if EL3 is implemented and is using AArch32, when the value of NSACR.cp10 is 0, this field behaves as RAZ/WI, regardless of its actual value.

On a Warm reset, this field resets to 0.

cp10, bits [21:20]

Defines the access rights for the floating-point and Advanced SIMD functionality. Possible values of the field are:
<table>
<thead>
<tr>
<th>cp10</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>PL0 and PL1 accesses to floating-point and Advanced SIMD registers or instructions are UNDEFINED.</td>
</tr>
<tr>
<td>0b01</td>
<td>PL0 accesses to floating-point and Advanced SIMD registers or instructions are UNDEFINED.</td>
</tr>
<tr>
<td>0b10</td>
<td>Reserved. The effect of programming this field to this value is CONSTRAINED UNPREDICTABLE. See 'Handling of System register control fields for Advanced SIMD and floating-point operation'.</td>
</tr>
<tr>
<td>0b11</td>
<td>This control permits full access to the floating-point and Advanced SIMD functionality from PL0 and PL1.</td>
</tr>
</tbody>
</table>

The floating-point and Advanced SIMD features controlled by these fields are:

- Execution of any floating-point or Advanced SIMD instruction.
- Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
- Any access to the FPSCR, FPSID, MVFR0, MVFR1, MVFR2, or FPEXC System registers.

**Note**

The CPACR has no effect on floating-point and Advanced SIMD accesses from PL2. These can be disabled by the HCPTR.TCP10 field.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

In Non-secure state, if EL3 is implemented and is using AArch32, when the value of NSACR.cp10 is 0, this field behaves as RAZ/WI, regardless of its actual value.

Execution of floating-point and Advanced SIMD instructions in AArch32 state can be disabled or trapped by the following controls:

- CPACR.cp10, or, if executing at EL0, CPACR_EL1.FPEN.
- FPEXC.EN.
- If executing in Non-secure state:
  - HCPTR.TCP10, or if EL2 is using AArch64, CPTR_EL2.TFP.
  - NSACR.cp10, or if EL3 is using AArch64, CPTR_EL3.TFP.
- For Advanced SIMD instructions only:
  - CPACR.ASEDIS.
  - If executing in Non-secure state, HCPTR.TASE and NSACR.NSTRCDIS.

See the descriptions of the controls for more information.

On a Warm reset, this field resets to 0.

**Bits [19:0]**

Reserved, RES0.

**Accessing the CPACR**

Accesses to this register use the following encodings:

\[
\text{MRC} \{<c>\} \{<q>\} \text{<coproc>}, \{#\text{<opc1>\}, \text{<Rt>\}, \text{<CRn>\}, \text{<CRm>\}, \{#\text{<opc2>\}}
\]

The CPPRCTX characteristics are:

**Purpose**

Cache Prefetch Prediction Restriction by Context applies to all Cache Allocation Resources that predict cache allocations based on information gathered within the target execution context or contexts.

When this instruction is complete and synchronized, cache prefetch prediction does not permit later speculative execution within the target execution context to be observable through side channels.

This instruction applies to all:

- Instruction caches.
- Data caches.
- TLB prefetching hardware used by the executing PE that applies to the supplied context or contexts.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

**Note**

This instruction does not require the invalidation of Cache Allocation Resources so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level and FEAT_SPECRES is implemented. Otherwise, direct accesses to CPPRCTX are UNDEFINED.

**Attributes**

CPPRCTX is a 32-bit System instruction.

**Field descriptions**

The CPPRCTX input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>GVMIDNS</td>
</tr>
<tr>
<td>29</td>
<td>EL</td>
</tr>
<tr>
<td>28</td>
<td>VMID</td>
</tr>
<tr>
<td>27</td>
<td>RES0</td>
</tr>
<tr>
<td>26</td>
<td>GASID</td>
</tr>
<tr>
<td>25</td>
<td>ASID</td>
</tr>
</tbody>
</table>

**Bits [31:28]**

Reserved, RES0.

**GVMID, bit [27]**

Execution of this instruction applies to all VMIDs or a specified VMID.
For target execution contexts other than EL0 or EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, then this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

**NS, bit [26]**

Security State.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure state.</td>
</tr>
</tbody>
</table>

If the instruction is executed in Non-secure state, this field is treated as 1.

**EL, bits [25:24]**

Exception Level. Indicates the Exception level of the target execution context.

<table>
<thead>
<tr>
<th>EL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>EL0.</td>
</tr>
<tr>
<td>0b01</td>
<td>EL1.</td>
</tr>
<tr>
<td>0b10</td>
<td>EL2.</td>
</tr>
<tr>
<td>0b11</td>
<td>EL3.</td>
</tr>
</tbody>
</table>

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

**VMID, bits [23:16]**

Only applies when bit[27] is 0 and the target execution context is either:

- EL1.
- EL0 when (HCR_EL2.E2H==0 or HCR_EL2.TGE==0) or EL2 is using AArch32 state.

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and (HCR_EL2.E2H==0 or HCR_EL2.TGE==0 or ELUsingAArch32(EL2)), this field is treated as the current VMID.

When the instruction is executed at EL0 and (HCR_EL2.E2H==1 and HCR_EL2.TGE==1 and !ELUsingAArch32(EL2)), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

**Bits [15:9]**

Reserved, RES0.

**GASID, bit [8]**

Execution of this instruction applies to all ASIDs or a specified ASID.

<table>
<thead>
<tr>
<th>GASID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Applies to specified ASID for an EL0 target execution context.</td>
</tr>
<tr>
<td>0b1</td>
<td>Applies to all ASID for an EL0 target execution context.</td>
</tr>
</tbody>
</table>

CPPRCTX, Cache Prefetch Prediction Restriction by Context
For target execution contexts other than EL0, this field is \texttt{RES0}.

If the instruction is executed at EL0, this field has an Effective value of 0.

**ASID, bits [7:0]**

Only applies for an EL0 target execution context and when bit[8] is 0.

Otherwise, this field is \texttt{RES0}.

When the instruction is executed at EL0, this field is treated as the current ASID.

**Executing the CPPRCTX instruction**

Accesses to this instruction use the following encodings:

\[
\text{MCR}\{<c>\}{<q>} \{coproc\}, \{#<opc1>\}, \{<Rt>\}, \{<CRn>\}, \{<CRm>\}, \{#<opc2>\}
\]

<table>

          AArch64.AArch32SystemAccessTrap(EL2, 0x03);
        else
          AArch32.TakeHypTrapException(0x03);
      else
        EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T7 == '1' then
          AArch64.AArch32SystemAccessTrap(EL2, 0x03);
        else
          CPPRCTX(R[t]);
  else
    PSTATE.EL == EL2 then
      CPPRCTX(R[t]);
    else
      PSTATE.EL == EL3 then
        CPPRCTX(R[t]);
CPSR, Current Program Status Register

The CPSR characteristics are:

**Purpose**

Holds PE status and control information.

**Configuration**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CPSR are UNDEFINED.

**Attributes**

CPSR is a 32-bit register.

**Field descriptions**

The CPSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>N</td>
</tr>
<tr>
<td>30</td>
<td>Z</td>

</tbody>
</table>

**N, bit [31]**

Negative condition flag. Set to bit[31] of the result of the last flag-setting instruction. If the result is regarded as a two's complement signed integer, then N is set to 1 if the result was negative, and N is set to 0 if the result was positive or zero.

**Z, bit [30]**

Zero condition flag. Set to 1 if the result of the last flag-setting instruction was zero, and to 0 otherwise. A result of zero often indicates an equal result from a comparison.

**C, bit [29]**

Carry condition flag. Set to 1 if the last flag-setting instruction resulted in a carry condition, for example an unsigned overflow on an addition.

**V, bit [28]**

Overflow condition flag. Set to 1 if the last flag-setting instruction resulted in an overflow condition, for example a signed overflow on an addition.

**Q, bit [27]**

Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

**Bits [26:24]**

Reserved, RES0.

**SSBS, bit [23]**
When FEAT_SSBS is implemented:

Speculative Store Bypass Safe.

Prohibits speculative loads or stores which might practically allow a cache timing side channel.

A cache timing side channel might be exploited where a load or store uses an address that is derived from a register that is being loaded from memory using a load instruction speculatively read from a memory location. If PSTATE.SSBS is enabled, the address derived from the load instruction might be from earlier in the coherence order than the latest store to that memory location with the same virtual address.

<table>
<thead>
<tr>
<th>SSBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hardware is not permitted to load or store speculatively in the manner described.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hardware is permitted to load or store speculatively in the manner described.</td>
</tr>
</tbody>
</table>

The value of this bit is usually set to the value described by the SCTLR.DSSBS bit on exceptions to any mode except Hyp mode, and the value described by HSCTLR.DSSBS on exceptions to Hyp mode.

On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never.

<table>
<thead>
<tr>
<th>PAN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The translation system is the same as Armv8.0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Disables privileged read and write accesses to addresses accessible at EL0.</td>
</tr>
</tbody>
</table>

The value of this bit is usually preserved on taking an exception, except in the following situations:

- When the target of the exception is EL1, and the value of the SCTLR.SPAN bit for the current Security state is 0, this bit is set to 1.
- When the target of the exception is EL3, from Secure state, and the value of the Secure SCTLR.SPAN is 0, this bit is set to 1.
- When the target of the exception is EL3, from Non-secure state, this bit is set to 0 regardless of the value of the Secure SCTLR.SPAN bit.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

Data Independent Timing.
The values of the data supplied in any of its
The architecture makes no statement about the timing properties of any instructions.

The architecture requires that:

- The timing of every load and store instruction is insensitive to the value of the data being loaded or stored.
- For certain data processing instructions, the instruction takes a time which is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- For certain data processing instructions, the response of the instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

The timing of every load and store instruction is insensitive to the value of the data being loaded or stored.

- For certain data processing instructions, the instruction takes a time which is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

  - The values of the NZCV flags.

<table>
<thead>
<tr>
<th>DIT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The architecture makes no statement about the timing properties of any instructions.</td>
</tr>
<tr>
<td>0b1</td>
<td>The architecture requires that:</td>
</tr>
</tbody>
</table>

- The timing of every load and store instruction is insensitive to the value of the data being loaded or stored.
- For certain data processing instructions, the instruction takes a time which is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- For certain data processing instructions, the response of the instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

The processing instructions affected by this bit are:

- All cryptographic instructions. These instructions are:
  - AESD, AESE, AESIMC, AESMC, SHA1C, SHA1H, SHA1M, SHA1P, SHA1SU0, SHA1SU1, SHA256H, SHA256H2, SHA256SU0, and SHA256SU1.

- A subset of those instructions which use the general-purpose register file. For these instructions, the effects of CPSR.DIT apply only if they do not use R15 as either their source or destination and pass their condition execution check. The instructions are:

- A subset of those instructions which use the general-purpose register file. For these instructions, the effects of CPSR.DIT do not depend on these instructions passing their condition execution check. These instructions are:
  - ADC (immediate), ADC (register), ADCS (immediate), ADCS (register), ADD (immediate), ADD (register), ADDS (immediate), ADDS (register), AND (immediate), AND (register), ANDS (immediate), ANDS (register), ASR (immediate), ASR (register), ASRS (immediate), ASRS (register), BIC (immediate), BIC (register), BICS (immediate), BICS (register), EOR (immediate), EOR (register), EORS (immediate), EORS (register), LSL (immediate), LSL (register), LSLS (immediate), LSLS (register), LSR (immediate), LSR (register), LSLS (immediate), LSLS (register), MOV (immediate), MOV (register), MOV (register), MOV (register), MOV (register), MOV (register), MVN (immediate), MVN (register), MVNS (immediate), MVNS (register), MVNS (immediate), MVNS (register), ORR (immediate), ORR (register), ORR (register), ORRS (immediate), ORRS (register), ROR (immediate), RORS (register), RSB (immediate), RSB (register), RSB (register), RSC (immediate), RSC (register), RSC (register), RSCS (register), SBC (immediate), SBC (register), SBCS (immediate), SBCS (register), SUB (immediate), SUB (register), SUBS (immediate), and SUBS (register).

- A subset of those instructions which use the SIMD&FP register file. For these instructions, the effects of CPSR.DIT do not depend on whether they tagged or condition execution check. These instructions are:
  - CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CW, VABA*, VABD*, VABS, VACGE, VACGT, VACLE, VAECTL, VADD (integer), VADDH, VADDL, VADDW, VAND, VBIC, VBIF, VBIT, VBLS, VCGE, VCOT, VCLE, VCLS, VCLT, VCLZ, VCMP, VCMPE, VCNT, VDUP, VEOR, VEXT, VHADD, VHADD, VHSH, VMAX (integer), VMIN (integer), VMIA (integer), VMLA (integer), VMAL, VMAS (integer), VMLS, VMOV, VMOV, VMOV, VMVNN, VMUL (integer and polynomial), VMULL (integer and polynomial), VMU, VMUG, VORN, VORR, VPADAL, VPADD (integer), VPADDL, VPMAX (integer), VPVMAX (integer), VPVMAX (integer), and VMU.
VPMIN (integer), VRADDHN, VREV*, VRHADD, VRSHL, VRSHR, VRSHRN, VRSRA, VRSUBHN, VSELEQ, VSELGE, VSELG, VSELVS, VSHL, VSHLL, VSHR, VSLI, VSRA, VSRI, VSUB (integer), VSUBHN, VSUBL, VSUBW, VSWP, VTBL, VTBX, VTRN, VTST, VUZP, and VZIP

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [20]

Reserved, RES0.

GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

Bits [15:10]

Reserved, RES0.

E, bit [9]

Endianness state bit. Controls the load and store endianness for data accesses:

<table>
<thead>
<tr>
<th>E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Little-endian operation</td>
</tr>
<tr>
<td>0b1</td>
<td>Big-endian operation</td>
</tr>
</tbody>
</table>

Instruction fetches ignore this bit.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

A, bit [8]

SError interrupt mask bit. The possible values of this bit are:

<table>
<thead>
<tr>
<th>A</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Exception not masked.</td>
</tr>
<tr>
<td>0b1</td>
<td>Exception masked.</td>
</tr>
</tbody>
</table>

I, bit [7]

IRQ mask bit. The possible values of this bit are:

<table>
<thead>
<tr>
<th>I</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Exception not masked.</td>
</tr>
<tr>
<td>0b1</td>
<td>Exception masked.</td>
</tr>
</tbody>
</table>
F, bit [6]

FIQ mask bit. The possible values of this bit are:

<table>
<thead>
<tr>
<th>F</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Exception not masked.</td>
</tr>

</tbody>
</table>

Accessing the CPSR

CPSR can be read using the MRS instruction and written using the MSR (register) or MSR (immediate) instructions.
CSSELR, Cache Size Selection Register

The CSSELR characteristics are:

Purpose

Selects the current Cache Size ID Register, `CSSIDR`, by specifying the required cache level and the cache type, which is either instruction cache or data cache.

If `FEAT_CCIDX` is implemented, CSSELR also selects the current `CSSIDR2`.

Configuration

AArch32 System register CSSELR bits [31:0] are architecturally mapped to AArch64 System register `CSSELR_EL1[31:0]`.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CSSELR are UNDEFINED.

Attributes

CSSELR is a 32-bit register.

Field descriptions

The CSSELR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td>Reserved</td>
</tr>
<tr>
<td>30</td>
<td>Level</td>
<td>Cache level of required cache.</td>
</tr>
<tr>
<td>29</td>
<td>28</td>
<td></td>
</tr>
<tr>
<td>27</td>
<td>26</td>
<td></td>

<td>0</td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:4]

Reserved, RES0.

Level, bits [3:1]

Cache level of required cache. Permitted values are:

<table>
<thead>
<tr>
<th>Level</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Level 1 cache.</td>
</tr>
<tr>
<td>0b001</td>
<td>Level 2 cache.</td>
</tr>
<tr>
<td>0b010</td>
<td>Level 3 cache.</td>
</tr>
<tr>
<td>0b011</td>
<td>Level 4 cache.</td>
</tr>
<tr>
<td>0b100</td>
<td>Level 5 cache.</td>
</tr>
<tr>
<td>0b101</td>
<td>Level 6 cache.</td>
</tr>
<tr>
<td>0b110</td>
<td>Level 7 cache.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If CSSELR.Level is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

InD, bit [0]

Instruction not Data bit. Permitted values are:
CSSELR, Cache Size Selection Register

<table>
<thead>
<tr>
<th>InD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Data or unified cache.</td>
</tr>
<tr>
<td>0b1</td>
<td>Instruction cache.</td>
</tr>
</tbody>
</table>

If CSSELR.Level is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR is **UNKNOWN**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

## Accessing the CSSELR

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#\}<\text{opc2}>
\]

### Table 1

        CSSELR_NS = R[t];
The CTR characteristics are:

**Purpose**

Provides information about the architecture of the caches.

**Configuration**

AArch32 System register CTR bits [31:0] are architecturally mapped to AArch64 System register `CTR_EL0[31:0]`. This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CTR are UNDEFINED.

**Attributes**

CTR is a 32-bit register.

**Field descriptions**

The CTR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES1| RES0| DIC| IDC| CWG| ERG| DminLine| L1Ip| RES0| IminLine|

**Bit [31]**

Reserved, RES1.

**Bit [30]**

Reserved, RES0.

**DIC, bit [29]**

Instruction cache invalidation requirements for data to instruction coherence.

<table>
<thead>
<tr>
<th>DIC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Instruction cache invalidation to the Point of Unification is required for data to instruction coherence.</td>
</tr>
<tr>
<td>0b1</td>
<td>Instruction cache invalidation to the Point of Unification is not required for data to instruction coherence.</td>
</tr>
</tbody>
</table>

**IDC, bit [28]**

Data cache clean requirements for instruction to data coherence. The meaning of this bit is:

<table>
<thead>
<tr>
<th>IDC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Data cache clean to the Point of Unification is required for instruction to data coherence, unless CLIDR.LoC == 0b000 or (CLIDR.LoUIS == 0b000 &amp;&amp; CLIDR.LoUU == 0b000).</td>
</tr>
<tr>
<td>0b1</td>
<td>Data cache clean to the Point of Unification is not required for instruction to data coherence.</td>
</tr>
</tbody>
</table>
**CWG, bits [27:24]**

Cache writeback granule. $\log_2$ of the number of words of the maximum size of memory that can be overwritten as a result of the eviction of a cache entry that has had a memory location in it modified.

A value of $0b0000$ indicates that this register does not provide Cache writeback granule information and either:

- The architectural maximum of 512 words (2KB) must be assumed.
- The Cache writeback granule can be determined from maximum cache line size encoded in the Cache Size ID Registers.

Values greater than $0b1001$ are reserved.

Arm recommends that an implementation that does not support cache write-back implements this field as $0b0001$. This applies, for example, to an implementation that supports only write-through caches.

**ERG, bits [23:20]**

Exclusives reservation granule. $\log_2$ of the number of words of the maximum size of the reservation granule that has been implemented for the Load-Exclusive and Store-Exclusive instructions.

The use of the value $0b0000$ is deprecated.

The value $0b0001$ and values greater than $0b1001$ are reserved.

**DminLine, bits [19:16]**

$\log_2$ of the number of words in the smallest cache line of all the data caches and unified caches that are controlled by the PE.

**L1Ip, bits [15:14]**

Level 1 instruction cache policy. Indicates the indexing and tagging policy for the L1 instruction cache. Possible values of this field are:

<table>
<thead>
<tr>
<th>L1Ip</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>VMID aware Physical Index, Physical tag (VPIPT)</td>
</tr>
<tr>
<td>0b01</td>
<td>ASID-tagged Virtual Index, Virtual Tag (AIIVT)</td>
</tr>
<tr>
<td>0b10</td>
<td>Virtual Index, Physical Tag (VIFT)</td>
</tr>
<tr>
<td>0b11</td>
<td>Physical Index, Physical Tag (PIPT)</td>
</tr>
</tbody>
</table>

The value $0b00$ is permitted only in an implementation that includes FEAT_VPIPT, otherwise the value is reserved.

The value $0b01$ is not permitted in Armv8.

**Bits [13:4]**

Reserved, RES0.

**IminLine, bits [3:0]**

$\log_2$ of the number of words in the smallest cache line of all the instruction caches that are controlled by the PE.

**Accessing the CTR**

Accesses to this register use the following encodings:

```
MRC{<c}<{q} <coproc>, {#<opc1>, <Rt>, <CRn>, <CRm>{, {#<opc2>}}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b0000</td>
<td>0b0000</td>
<td>0b001</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID2 == '1' then

DACR, Domain Access Control Register

The DACR characteristics are:

**Purpose**

Defines the access permission for each of the sixteen memory domains.

**Configuration**

AArch32 System register DACR bits [31:0] are architecturally mapped to AArch64 System register DACR32_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DACR are UNDEFINED.

This register has no function when TTBCR.EAE is set to 1, to select the Long-descriptor translation table format.

**Attributes**

DACR is a 32-bit register.

**Field descriptions**

The DACR bit assignments are:

<table>
<thead>
<tr>
<th>D&lt;n&gt;, bits [2n+1:2n], for n = 15 to 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>D15</td>
</tr>
</tbody>
</table>

Domain n access permission, where n = 0 to 15. Permitted values are:

<table>
<thead>
<tr>
<th>D&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>No access. Any access to the domain generates a Domain fault.</td>
</tr>
<tr>
<td>0b01</td>
<td>Client. Accesses are checked against the permission bits in the translation tables.</td>
</tr>
<tr>
<td>0b11</td>
<td>Manager. Accesses are not checked against the permission bits in the translation tables.</td>
</tr>
</tbody>
</table>

The value 0b10 is reserved.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the DACR**

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>

DBGAUTHSTATUS, Debug Authentication Status register

The DBGAUTHSTATUS characteristics are:

**Purpose**

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

**Configuration**

AArch32 System register DBGAUTHSTATUS bits [31:0] are architecturally mapped to AArch64 System register DBGAUTHSTATUS_EL1[31:0].

AArch32 System register DBGAUTHSTATUS bits [31:0] are architecturally mapped to External register DBGAUTHSTATUS_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGAUTHSTATUS are UNDEFINED.

This register is required in all implementations.

**Attributes**

DBGAUTHSTATUS is a 32-bit register.

**Field descriptions**

The DBGAUTHSTATUS bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

DBGBCR<n>, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n> characteristics are:

**Purpose**

Holds control information for a breakpoint. Forms breakpoint n together with value register DBGVR<n>. If EL2 is implemented and this breakpoint supports Context matching, DBGVR<n> can be associated with a Breakpoint Extended Value Register DBGBXVR<n> for VMID matching.

**Configuration**

AArch32 System register DBGBCR<n> bits [31:0] are architecturally mapped to AArch64 System register DBGBCR<n>_EL1[31:0].

AArch32 System register DBGBCR<n> bits [31:0] are architecturally mapped to External register DBGBCR<n>_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGBCR<n> are UNDEFINED.

If breakpoint n is not implemented then accesses to this register are UNDEFINED.

**Attributes**

DBGBCR<n> is a 32-bit register.

**Field descriptions**

The DBGBCR<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 |

When the E field is zero, all the other fields in the register are ignored.

**Bits [31:24]**

Reserved, RES0.

**BT, bits [23:20]**

Breakpoint Type. Possible values are:
<table>
<thead>
<tr>
<th>BT</th>
<th>Meaning</th>

<td>As 0b1110 with linking enabled.</td>
</tr>
</tbody>
</table>

For more information on Breakpoints and their constraints, see 'Breakpoint exceptions' and 'Reserved **DBGBCR<n>**.BT values'.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**LBN, bits [19:16]**

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an **UNKNOWN** value.

This field is ignored when the value of **DBGBCR<n>**.E is 0.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**SSC, bits [15:14]**

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields.

For more information, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' and 'Reserved **DBGBCR<n>**.{SSC, HMC, PMC} values'.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**HMC, bit [13]**

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the SSC, bits [15:14] description.
For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [12:9]**

Reserved, RES0.

**BAS, bits [8:5]**

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints, the permitted values are:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Match instruction at</th>
<th>Constraint for debuggers</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0011</td>
<td>DBGBV&lt;n&gt;</td>
<td>Use for T32 instructions</td>
</tr>
<tr>
<td>0b1100</td>
<td>DBGBV&lt;n&gt;+2</td>
<td>Use for T32 instructions</td>
</tr>
<tr>
<td>0b1111</td>
<td>DBGBV&lt;n&gt;</td>
<td>Use for A32 instructions</td>
</tr>
</tbody>
</table>

All other values are reserved. For more information, see 'Reserved DBGBCR<n>.BAS values'.

For more information on using the BAS field in Address Match breakpoints, see 'Using the BAS field in Address Match breakpoints'.

For Address mismatch breakpoints in an AArch32 stage 1 translation regime, the permitted values are:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Step instruction at</th>
<th>Constraint for debuggers</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>-</td>
<td>Use for a match anywhere breakpoint</td>
</tr>
<tr>
<td>0b0011</td>
<td>DBGBV&lt;n&gt;</td>
<td>Use for T32 instructions</td>
</tr>
<tr>
<td>0b1100</td>
<td>DBGBV&lt;n&gt;+2</td>
<td>Use for T32 instructions</td>
</tr>
<tr>
<td>0b1111</td>
<td>DBGBV&lt;n&gt;</td>
<td>Use for A32 instructions</td>
</tr>
</tbody>
</table>

All other values are reserved. For more information, see 'Reserved DBGBCR<n>.BAS values'.

For more information on using the BAS field in address mismatch breakpoints, see 'Using the BAS field in Address Match breakpoints'.

For Context matching breakpoints, this field is RES1 and ignored.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [4:3]**

Reserved, RES0.

**PMC, bits [2:1]**

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the DBGBCR<n>.SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**E, bit [0]**

Enable breakpoint **DBGBV<n>**. Possible values are:
Meaning

<table>
<thead>
<tr>
<th>E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Breakpoint disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Breakpoint enabled.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

The DBGBVR<n> characteristics are:

**Purpose**

Holds a value for use in breakpoint matching, either the virtual address of an instruction or a context ID. Forms breakpoint n together with control register DBGBCR<n>. If EL2 is implemented and this breakpoint supports Context matching, DBGBVR<n> can be associated with a Breakpoint Extended Value Register DBGBXVR<n> for VMID matching.

**Configuration**

AArch32 System register DBGBVR<n> bits [31:0] are architecturally mapped to AArch64 System register DBGBVR<n>_EL1[31:0].

AArch32 System register DBGBVR<n> bits [31:0] are architecturally mapped to External register DBGBVR<n>_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGBVR<n> are UNDEFINED.

How this register is interpreted depends on the value of DBGBCR<n>.BT.

- When DBGBCR<n>.BT == 0b0x0x, this register holds a virtual address.
- When DBGBCR<n>.BT == 0bxx1x, this register holds a Context ID.

For other values of DBGBCR<n>.BT, this register is RES0.

Some breakpoints might not support Context ID comparison. For more information, see the description of the DBGDIDR.CTX_CMPs field.

If breakpoint n is not implemented then accesses to this register are UNDEFINED.

**Attributes**

DBGBVR<n> is a 32-bit register.

**Field descriptions**

The DBGBVR<n> bit assignments are:

When DBGBCR<n>.BT == 0b0x0x:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| VA[31:2] |    |    | RES0 |

VA[31:2], bits [31:2]

- Bits[31:2] of the address value for comparison.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [1:0]**

Reserved, RES0.
When DBGBCR\textsubscript{n}.BT == 0b001x:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ContextID |

ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against CONTEXTIDR\_EL2 when all of the following are true:

- FEAT\_VHE is implemented or FEAT\_Debugv8p2 is implemented.
- HCR\_EL2.\{E2H, TGE\} is \{1,1\}.
- The PE is executing at EL0.
- EL2 is using AArch64 and is enabled in the current Security state.

Otherwise, the value is compared against CONTEXTIDR.

On a Cold reset, this field reset to an architecturally UNKNOWN value.

When DBGBCR\textsubscript{n}.BT == 0b101x and EL2 is implemented:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ContextID |

ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR\textsubscript{n}.BT == 0bx11x, EL2 is implemented and (FEAT\_VHE is implemented or FEAT\_Debugv8p2 is implemented):

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ContextID |

ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the DBGBVR\textsubscript{n>}

Accesses to this register use the following encodings:

DBGBXVR<n>, Debug Breakpoint Extended Value Registers, n = 0 - 15

The DBGBXVR<n> characteristics are:

**Purpose**

Holds a value for use in breakpoint matching, to support VMID matching. Used in conjunction with a control register DBGBCR<n> and a value register DBGBVR<n>, where EL2 is implemented and breakpoint n supports Context matching.

**Configuration**

AArch32 System register DBGBXVR<n> bits [31:0] are architecturally mapped to AArch64 System register DBGBVR<n>_EL1[63:32].

AArch32 System register DBGBXVR<n> bits [31:0] are architecturally mapped to External register DBGBVR<n>_EL1[63:32].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGBXVR<n> are UNDEFINED.

How this register is interpreted depends on the value of DBGBCR<n>.BT.

- When DBGBCR<n>.BT == 0b10xx, this register holds a VMID.
- When DBGBCR<n>.BT == 0b11xx, this register holds a Context ID.

For other values of DBGBCR<n>.BT, this register is RES0.

Accesses to this register are UNDEFINED in any of the following cases:

- Breakpoint n is not implemented.
- Breakpoint n does not support Context matching.
- EL2 is not implemented.

For more information, see the description of the DBGDIDR.CTX_CMPs field.

**Attributes**

DBGBXVR<n> is a 32-bit register.

**Field descriptions**

The DBGBXVR<n> bit assignments are:

**When DBGBCR<n>.BT == 0b10xx and EL2 is implemented:**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>RES0</td>
</tr>
<tr>
<td>15-8</td>
<td>VMID[15:8]</td>
</tr>
<tr>
<td>7-0</td>
<td>VMID[7:0]</td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.
VMID[15:8], bits [15:8]

When FEAT_VMID16 is implemented and VTCR_EL2.VS == 1:

Extension to VMID[7:0]. See VMID[7:0] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [7:0]

VMID value for comparison. The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- VTCR_EL2.VS is 0.
- FEAT_VMID16 is not implemented.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>.BT == 0b11xx and EL2 is implemented:

<table>

</tr>
</tbody>
</table>

ContextID2, bits [31:0]

When FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented:

Context ID value for comparison against CONTEXTIDR_EL2.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DBGCLAIMCLR, Debug CLAIM Tag Clear register

The DBGCLAIMCLR characteristics are:

**Purpose**

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0.

The architecture does not define any functionality for the CLAIM tag bits.

---

**Note**

CLAIM tags are typically used for communication between the debugger and target software.

---

Used in conjunction with the DBGCLAIMSET register.

**Configuration**

AArch32 System register DBGCLAIMCLR bits [31:0] are architecturally mapped to AArch64 System register DBGCLAIMCLR_EL1[31:0].

AArch32 System register DBGCLAIMCLR bits [31:0] are architecturally mapped to External register DBGCLAIMCLR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGCLAIMCLR are **UNDEFINED**.

An implementation must include eight CLAIM tag bits.

**Attributes**

DBGCLAIMCLR is a 32-bit register.

**Field descriptions**

The DBGCLAIMCLR bit assignments are:

<table>
<thead>
<tr>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes.
Implementations must ignore writes.

**CLAIM, bits [7:0]**

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.

Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

On a Cold reset, this field resets to 0.

DBGCLAIMSET, Debug CLAIM Tag Set register

The DBGCLAIMSET characteristics are:

**Purpose**

Used by software to set the CLAIM tag bits to 1.

The architecture does not define any functionality for the CLAIM tag bits.

**Note**

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the DBGCLAIMCLR register.

**Configuration**

AArch32 System register DBGCLAIMSET bits [31:0] are architecturally mapped to AArch64 System register DBGCLAIMSET_EL1[31:0].

AArch32 System register DBGCLAIMSET bits [31:0] are architecturally mapped to External register DBGCLAIMSET_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGCLAIMSET are UNDEFINED.

An implementation must include eight CLAIM tag bits.

**Attributes**

DBGCLAIMSET is a 32-bit register.

**Field descriptions**

The DBGCLAIMSET bit assignments are:

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |

DBGDCCINT, DCC Interrupt Enable Register

The DBGDCCINT characteristics are:

**Purpose**

Enables interrupt requests to be signaled based on the DCC status flags.

**Configuration**

AArch32 System register DBGDCCINT bits [31:0] are architecturally mapped to AArch64 System register MDCCINT_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDCCINT are **UNDEFINED**.

**Attributes**

DBGDCCINT is a 32-bit register.

**Field descriptions**

The DBGDCCINT bit assignments are:

<table>

</tbody>
</table>

**Bit [31]**

Reserved, RES0.

**RX, bit [30]**

DCC interrupt request enable control for DTRRX. Enables a common COMMIRQ interrupt request to be signaled based on the DCC status flags.

<table>
<thead>
<tr>
<th>RX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No interrupt request generated by DTRRX.</td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupt request will be generated on RXfull == 1.</td>
</tr>
</tbody>
</table>

If legacy COMMRX and COMMTX signals are implemented, then these are not affected by the value of this bit.

On a Warm reset, this field resets to 0.

**TX, bit [29]**

DCC interrupt request enable control for DTRTX. Enables a common COMMIRQ interrupt request to be signaled based on the DCC status flags.

<table>
<thead>
<tr>
<th>TX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No interrupt request generated by DTRTX.</td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupt request will be generated on TXfull == 0.</td>
</tr>
</tbody>
</table>

If legacy COMMRX and COMMTX signals are implemented, then these are not affected by the value of this bit.

On a Warm reset, this field resets to 0.
Bits [28:0]

Reserved, RES0.

DBGDEVID, Debug Device ID register 0

The DBGDEVID characteristics are:

**Purpose**

Adds to the information given by the DBGDIDR by describing other features of the debug implementation.

**Configuration**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDEVID are UNDEFINED.

This register is required in all implementations.

**Attributes**

DBGDEVID is a 32-bit register.

**Field descriptions**

The DBGDEVID bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-28</td>
<td>CIDMask</td>
</tr>
<tr>
<td>27-24</td>
<td>AuxRegs</td>
</tr>
<tr>
<td>23-20</td>
<td>DoubleLock</td>
</tr>
<tr>
<td>19-16</td>
<td>VirtExtns</td>
</tr>
<tr>
<td>15-12</td>
<td>VectorCatch</td>
</tr>
<tr>
<td>11-8</td>
<td>BPAddrMask</td>
</tr>
<tr>
<td>7-4</td>
<td>WPAddrMask</td>
</tr>
<tr>
<td>3-0</td>
<td>PCSample</td>
</tr>
</tbody>
</table>

**CIDMask, bits [31:28]**

Indicates the level of support for the Context ID matching breakpoint masking capability. Defined values are:

<table>
<thead>
<tr>
<th>CIDMask</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Context ID masking is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Context ID masking is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved. The value of this for Armv8 is 0b0000.

**AuxRegs, bits [27:24]**

Indicates support for Auxiliary registers. Permitted values for this field are:

<table>
<thead>
<tr>
<th>AuxRegs</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for External Debug Auxiliary Control Register, EDACR.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**DoubleLock, bits [23:20]**

OS Double Lock implemented. Defined values are:

<table>
<thead>
<tr>
<th>DoubleLock</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>OS Double Lock is not implemented. DBGOSDLR is RAZ/WI.</td>
</tr>
<tr>
<td>0b0001</td>
<td>OS Double Lock is implemented. DBGOSDLR is RW.</td>
</tr>
</tbody>
</table>

FEAT_DoubleLock implements the functionality identified by the value 0b0001.
All other values are reserved.

**VirtExtns, bits [19:16]**

Indicates whether EL2 is implemented. Defined values are:

<table>
<thead>
<tr>
<th>VirtExtns</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL2 is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EL2 is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**VectorCatch, bits [15:12]**

Defines the form of Vector Catch exception implemented. Defined values are:

<table>
<thead>
<tr>
<th>VectorCatch</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Address matching Vector Catch exception implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Exception matching Vector Catch exception implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**BPAddrMask, bits [11:8]**

Indicates the level of support for the instruction address matching breakpoint masking capability. Defined values are:

<table>
<thead>
<tr>
<th>BPAddrMask</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Breakpoint address masking might be implemented. If not implemented, DBGBCR&lt;8:4&gt; is RAZ/WI.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Breakpoint address masking is implemented.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Breakpoint address masking is not implemented. DBGBCR&lt;8:4&gt; is RES0.</td>
</tr>
</tbody>
</table>

All other values are reserved. The value of this for Armv8 is 0b1111.

**WPAddrMask, bits [7:4]**

Indicates the level of support for the data address matching watchpoint masking capability. Defined values are:

<table>
<thead>
<tr>
<th>WPAddrMask</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Watchpoint address masking might be implemented. If not implemented, DBGWCR&lt;7:4&gt;.MASK (Address mask) is RAZ/WI.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Watchpoint address masking is implemented.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Watchpoint address masking is not implemented. DBGWCR&lt;7:4&gt;.MASK (Address mask) is RES0.</td>
</tr>
</tbody>
</table>

All other values are reserved. The value of this for Armv8 is 0b0001.

**PCSample, bits [3:0]**

Indicates the level of PC Sample-based Profiling support using external debug registers. Defined values are:

<table>
<thead>
<tr>
<th>PCSample</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>PC Sample-based Profiling Extension is not implemented in the external debug registers space.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Only EDPICR and EDCICR are implemented. This option is only permitted if EL3 and EL2 are not implemented.</td>
</tr>
<tr>
<td>0b0011</td>
<td>EDPICR, EDCICR, and EDWICR are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

When FEAT_PCSRv8p2 is implemented, the only permitted value is 0b0000.
Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of PMDEVID PCSample.

Accessing the DBGDEVID

Accesses to this register use the following encodings:

MRC{<c>{<q}> }<coproc>,{<opcl>, <Rt>, <CRn>, <CRm>{, {#}<opc2}>

DBGDEVID1, Debug Device ID register 1

The DBGDEVID1 characteristics are:

**Purpose**

Adds to the information given by the DBGDIDR by describing other features of the debug implementation.

**Configuration**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDEVID1 are **UNDEFINED**.

This register is required in all implementations.

**Attributes**

DBGDEVID1 is a 32-bit register.

**Field descriptions**

The DBGDEVID1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>

</tr>
</tbody>
</table>

**Bits [31:4]**

Reserved, **RES0**.

**PCSROffset, bits [3:0]**

This field indicates the offset applied to PC samples returned by reads of **EDPCSR**. Permitted values of this field in Armv8 are:

<table>
<thead>
<tr>
<th>PCSROffset</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td><strong>EDPCSR</strong> is not implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td><strong>EDPCSR</strong> implemented. Samples have no offset applied and do not sample the instruction set state in AArch32 state.</td>
</tr>
</tbody>
</table>

When **FEAT_PCSRv8p2** is implemented, the only permitted value is 0b0000.

**Note**

**FEAT_PCSRv8p2** implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of **PMDEVID**. **PCSample**.

**Accessing the DBGDEVID1**

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then

  end if;
elsif PSTATE.EL == EL3 then
  return DBGDEVID2;
The DBGIDR characteristics are:

**Purpose**

Specifies which version of the Debug architecture is implemented, and some features of the debug implementation.

**Configuration**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGIDR are **UNDEFINED**.

If EL1 cannot use AArch32 then the implementation of this register is **OPTIONAL** and deprecated.

**Attributes**

DBGIDR is a 32-bit register.

**Field descriptions**

The DBGIDR bit assignments are:

<table>
<thead>
<tr>
<th>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15</th>
<th>14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>WRPs</td>
<td>BRPs</td>
</tr>
</tbody>
</table>

**WRPs, bits [31:28]**

The number of watchpoints implemented, minus 1.

Permitted values of this field are from 0b0001 for 2 implemented watchpoints, to 0b1111 for 16 implemented watchpoints.

The value of 0b0000 is reserved.

If AArch64 is implemented, this field has the same value as **ID_AA64DFR0_EL1**.WRPs.

**BRPs, bits [27:24]**

The number of breakpoints implemented, minus 1.

Permitted values of this field are from 0b0001 for 2 implemented breakpoint, to 0b1111 for 16 implemented breakpoints.

The value of 0b0000 is reserved.

If AArch64 is implemented, this field has the same value as **ID_AA64DFR0_EL1**.BRPs.

**CTX_CMPs, bits [23:20]**

The number of breakpoints that can be used for Context matching, minus 1.

Permitted values of this field are from 0b0000 for 1 Context matching breakpoint, to 0b1111 for 16 Context matching breakpoints.

The Context matching breakpoints must be the highest addressed breakpoints. For example, if six breakpoints are implemented and two are Context matching breakpoints, they must be breakpoints 4 and 5.

If AArch64 is implemented, this field has the same value as **ID_AA64DFR0_EL1**.CTX_CMPs.
**Version, bits [19:16]**

The Debug architecture version. Defined values are:

<table>
<thead>
<tr>
<th>Version</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>Armv6, v6 Debug architecture.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Armv6, v6.1 Debug architecture.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Armv7, v7 Debug architecture, with baseline CP14 registers implemented.</td>
</tr>
<tr>
<td>0b0100</td>
<td>Armv7, v7 Debug architecture, with all CP14 registers implemented.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Armv7, v7.1 Debug architecture.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Armv8, v8 Debug architecture.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Armv8.1, v8 Debug architecture, with Virtualization Host Extensions.</td>
</tr>
<tr>
<td>0b1000</td>
<td>Armv8.2, v8.2 Debug architecture.</td>
</tr>
<tr>
<td>0b1001</td>
<td>Armv8.4, v8.4 Debug architecture.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In any Armv8 implementation, the values 0b0001, 0b0010, 0b0011, 0b0100, and 0b0101 are not permitted.

- If FEAT_VHE is not implemented, the only permitted value is 0b0110.
- In an Armv8.0 implementation, the value 0b1000 or higher is not permitted.

**Bit [15]**

Reserved, RES1.

**nSUHD_imp, bit [14]**

In Armv7-A, was Secure User Halting Debug not implemented.

The value of this bit must match the value of the SE_imp bit.

**Bit [13]**

Reserved, RES0.

**SE_imp, bit [12]**

EL3 implemented. The meanings of the values of this bit are:

<table>
<thead>
<tr>
<th>SE_imp</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL3 not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL3 implemented.</td>
</tr>
</tbody>
</table>

The value of this bit must match the value of the nSUHD_imp bit.

**Bits [11:0]**

Reserved, RES0.

**Accessing the DBGDIDR**

Arm deprecates any access to this register from EL0.

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
  if Halted() & HaveEL(EL3) & & boolean IMPLEMENTATION_DEFINED "EL3 trap priority when SDD == '1'" & & !ELUsingAArch32(EL3) & & MDCR_EL3.TDA == '1' then

DBGDRAR, Debug ROM Address Register

The DBGDRAR characteristics are:

**Purpose**

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system. Armv8 deprecates any use of this register.

**Configuration**

AArch32 System register DBGDRAR bits [63:0] are architecturally mapped to AArch64 System register MDRAR_EL1[63:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDRAR are **UNDEFINED**.

DBGDRAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, bits [31:0] are read.

If EL1 cannot use AArch32 then the implementation of this register is **OPTIONAL** and deprecated.

**Attributes**

DBGDRAR is a 64-bit register.

**Field descriptions**

The DBGDRAR bit assignments are:

|   63  |   62  |   61  |   60  |   59  |   58  |   57  |   56  |   55  |   54  |   53  |   52  |   51  |   50  |   49  |   48  |   47  |   46  |   45  |   44  |   43  |   42  |   41  |   40  |   39  |   38  |   37  |   36  |   35  |   34  |   33  |   32  |
|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| RES0  | RES0  | ROMADDR[47:12] | RES0 | Valid |
| 31    | 30    | 29    | 28    | 27    | 26    | 25    | 24    | 23    | 22    | 21    | 20    | 19    | 18    | 17    | 16    | 15    | 14    | 13    | 12    | 11    | 10    |  9   |  8   |  7   |  6   |  5   |  4   |  3   |  2   |  1   |  0   |

**Bits [63:48]**

Reserved, RES0.

**ROMADDR[47:12], bits [47:12]**

Bits[47:12] of the ROM table physical address.

If the physical address size in bits (PAsize) is less than 48 then the register bits corresponding to ROMADDR [47:PAsize] are RES0.

Bits [11:0] of the ROM table physical address are zero.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is **IMPLEMENTATION DEFINED** whether the ROM table is also accessible in Secure memory.

If DBGDRAR.Valid == 0b00, then this field is **UNKNOWN**.
 Bits [11:2]  
Reserved, RES0.

Valid, bits [1:0]  
This field indicates whether the ROM Table address is valid.

<table>
<thead>
<tr>
<th>Valid</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>ROM Table address is not valid. Software must ignore ROMADDR.</td>
</tr>
<tr>
<td>0b11</td>
<td>ROM Table address is valid.</td>
</tr>
</tbody>
</table>

Other values are reserved.

Accessing the DBGDRAR

Accesses to this register use the following encodings:

The DBGDSAR characteristics are:

**Purpose**

In earlier versions of the Arm Architecture, this register defines the offset from the base address defined in DBGDRAR of the physical base address of the debug registers for the PE. Armv8 deprecates any use of this register.

**Configuration**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDSAR are **undefined**.

DBGDSAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, bits [31:0] are read.

If EL1 cannot use AArch32 then the implementation of this register is **optional** and deprecated.

**Attributes**

DBGDSAR is a 64-bit register.

**Field descriptions**

The DBGDSAR bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RES0 | RAZ |

Bits [63:2]

Reserved, RES0.

Bits [1:0]

Reserved, RAZ.

This field indicates whether the debug self address offset is valid. For ARMv8, this field is always 0b00, the offset is not valid.

**Accessing the DBGDSAR**

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#\}<\text{opc2}>
\]

The DBGDSCRext characteristics are:

**Purpose**
Main control register for the debug implementation.

**Configuration**
AArch32 System register DBGDSCRext bits [31:0] are architecturally mapped to AArch64 System register MDSCR_EL1[31:0].

AArch32 System register DBGDSCRext bits [15:2] are architecturally mapped to AArch32 System register DBGDSRint[15:2].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDSCRext are UNDEFINED.

This register is required in all implementations.

**Attributes**
DBGDSCRext is a 32-bit register.

**Field descriptions**
The DBGDSCRext bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| TFO | RXfull | TXfull | RES0 | RXOTXU | RES0 | INTdis | TDA | RES0 | SC2 | NS | SPNIdis | SPiDdis | MDBGen | HDE | RES0 | UDCCdis | RES0 | ERR | MOE | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 |

**TFO, bit [31]**
When FEAT_TRF is implemented:
Trace Filter override. Used for save/restore of EDSCR.TFO.

When the OS Lock is unlocked, DBGOSLSR.OSLK == 0, software must treat this bit as UNK/SBZP.

When the OS Lock is locked, DBGOSLSR.OSLK == 1, this bit holds the value of EDSCR.TFO. Reads and writes of this bit are indirect accesses to EDSCR.TFO.

Accessing this field has the following behavior:
- When DBGOSLSR.OSLK == 1, access to this field is RW.
- When DBGOSLSR.OSLK == 0, access to this field is RO.

**RXfull, bit [30]**
DTRRX full. Used for save/restore of EDSCR.RXfull.
When `DBGOSLSR.OSLK == 0`, software must treat this bit as UNK/SBZP.

When `DBGOSLSR.OSLK == 1`, this bit holds the value of `EDSCR.RXfull`. Reads and writes of this bit are indirect accesses to `EDSCR.RXfull`.

Arm deprecates use of this bit other than for save/restore. Use `DBGDSCRint` to access the DTRRX full status.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When `DBGOSLSR.OSLK == 1`, access to this field is **RW**.
- When `DBGOSLSR.OSLK == 0`, access to this field is **RO**.

**TXfull, bit [29]**

DTRTX full. Used for save/restore of `EDSCR.TXfull`.

When `DBGOSLSR.OSLK == 0`, software must treat this bit as UNK/SBZP.

When `DBGOSLSR.OSLK == 1`, this bit holds the value of `EDSCR.TXfull`. Reads and writes of this bit are indirect accesses to `EDSCR.TXfull`.

Arm deprecates use of this bit other than for save/restore. Use `DBGDSCRint` to access the DTRTX full status.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When `DBGOSLSR.OSLK == 1`, access to this field is **RW**.
- When `DBGOSLSR.OSLK == 0`, access to this field is **RO**.

**Bit [28]**

Reserved, RES0.

**RXO, bit [27]**

Used for save/restore of `EDSCR.RXO`.

When `DBGOSLSR.OSLK == 0`, software must treat this bit as UNK/SBZP.

When `DBGOSLSR.OSLK == 1`, this bit holds the value of `EDSCR.RXO`. Reads and writes of this bit are indirect accesses to `EDSCR.RXO`.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When `DBGOSLSR.OSLK == 1`, access to this field is **RW**.
- When `DBGOSLSR.OSLK == 0`, access to this field is **RO**.

**TXU, bit [26]**

Used for save/restore of `EDSCR.TXU`.

When `DBGOSLSR.OSLK == 0`, software must treat this bit as UNK/SBZP.

When `DBGOSLSR.OSLK == 1`, this bit holds the value of `EDSCR.TXU`. Reads and writes of this bit are indirect accesses to `EDSCR.TXU`.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When `DBGOSLSR.OSLK == 1`, access to this field is **RW**.
- When `DBGOSLSR.OSLK == 0`, access to this field is **RO**.
Bits [25:24]  
Reserved, RES0.

INTdis, bits [23:22]  
Used for save/restore of EDSCR.INTdis.  
When DBGOSLR.OSLK == 0, this field is RO, and software must treat it as UNK/SBZP.  
When DBGOSLR.OSLK == 1, this field is RW and holds the value of EDSCR.INTdis. Reads and writes of this field are indirect accesses to EDSCR.INTdis.  
The architected behavior of this field determines the value it returns after a reset.  
Accessing this field has the following behavior:  
• When DBGOSLR.OSLK == 1, access to this field is RW.  
• When DBGOSLR.OSLK == 0, access to this field is RO.

TDA, bit [21]  
Used for save/restore of EDSCR.TDA.  
When DBGOSLR.OSLK == 0, software must treat this bit as UNK/SBZP.  
When DBGOSLR.OSLK == 1, this bit holds the value of EDSCR.TDA. Reads and writes of this bit are indirect accesses to EDSCR.TDA.  
The architected behavior of this field determines the value it returns after a reset.  
Accessing this field has the following behavior:  
• When DBGOSLR.OSLK == 1, access to this field is RW.  
• When DBGOSLR.OSLK == 0, access to this field is RO.

Bit [20]  
Reserved, RES0.

SC2, bit [19]  
When FEAT_PCSRv8 is implemented, FEAT_VHE is implemented and FEAT_PCSRv8p2 is not implemented:  
Used for save/restore of EDSCR.SC2.  
When DBGOSLR.OSLK == 0, software must treat this bit as UNK/SBZP.  
When DBGOSLR.OSLK == 1, this bit holds the value of EDSCR.SC2. Reads and writes of this bit are indirect accesses to EDSCR.SC2.  
Accessing this field has the following behavior:  
• When DBGOSLR.OSLK == 1, access to this field is RW.  
• When DBGOSLR.OSLK == 0, access to this field is RO.

Otherwise:  
Reserved, RES0.

NS, bit [18]  
Non-secure status. Returns the inverse of IsSecure().
Arm deprecates use of this field.

Access to this field is RO.

**SPNIDdis, bit [17]**

*When EL3 is implemented:*

Secure privileged profiling disabled status bit.

<table>
<thead>
<tr>
<th>SPNIDdis</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Profiling allowed in Secure privileged modes.</td>
</tr>
<tr>
<td>0b1</td>
<td>Profiling prohibited in Secure privileged modes.</td>
</tr>
</tbody>
</table>

This field reads as 0 if any of the following applies, and reads as 1 otherwise:

- FEAT_Debugv8p2 is not implemented and ExternalSecureNoninvasiveDebugEnabled() returns TRUE.
- EL3 is using AArch32 and the value of SDCR.SPME is 1.
- EL3 is using AArch64 and the value of MDCR_EL3.SPME is 1.

Arm deprecates use of this field.

Access to this field is RO.

**Otherwise:**

Reserved, RES0.

**SPIDdis, bit [16]**

*When EL3 is implemented:*

Secure privileged AArch32 invasive self-hosted debug disabled status bit. The value of this bit depends on the value of SDCR.SPD and the pseudocode function AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled().

<table>
<thead>
<tr>
<th>SPIDdis</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Self-hosted debug enabled in Secure privileged AArch32 modes.</td>
</tr>
<tr>
<td>0b1</td>
<td>Self-hosted debug disabled in Secure privileged AArch32 modes.</td>
</tr>
</tbody>
</table>

This bit reads as 1 if any of the following is true and reads as 0 otherwise:

- EL3 is using AArch32 and SDCR.SPD has the value 0b10.
- EL3 is using AArch64 and MDCR_EL3.SPD32 has the value 0b10.
- EL3 is using AArch32, SDCR.SPD has the value 0b00, and AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled() returns FALSE.
- EL3 is using AArch64, MDCR_EL3.SPD32 has the value 0b00, and AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled() returns FALSE.

Arm deprecates use of this field.

Access to this field is RO.

**Otherwise:**

Reserved, RES0.

**MDBGen, bit [15]**

Monitor debug events enable. Enable Breakpoint, Watchpoint, and Vector Catch exceptions.
### MDBGen

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

### HDE, bit [14]

Used for save/restore of EDSCR.HDE.

When DBGOSLSR.OSLK == 0, software must treat this bit as UNK/SBZP.

When DBGOSLSR.OSLK == 1, this bit holds the value of EDSCR.HDE. Reads and writes of this bit are indirect accesses to EDSCR.HDE.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When DBGOSLSR.OSLK == 1, access to this field is RW.
- When DBGOSLSR.OSLK == 0, access to this field is RO.

### Bit [13]

Reserved, RES0.

### UDCCdis, bit [12]

Traps EL0 accesses to the DCC registers to Undefined mode.

<table>
<thead>
<tr>
<th>UDCCdis</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 accesses to the DBGDSCRint, DBGDTRRXint, DBGDTRTXint,DBGDIDR, DBGDSAR, and DBGDRAR are trapped to Undefined mode.</td>
</tr>
</tbody>
</table>

Note

All accesses to these registers are trapped, including LDC and STC accesses to DBGDTRTXint and DBGDTRRXint, and MRRC accesses to DBGDSAR and DBGDRAR.

Traps of EL0 accesses to the DBGDTRRXint and DBGDTRTXint are ignored in Debug state.

On a Warm reset, this field resets to 0.

### Bits [11:7]

Reserved, RES0.

### ERR, bit [6]

Used for save/restore of EDSCR.ERR.

When DBGOSLSR.OSLK == 0, software must treat this bit as UNK/SBZP.

When DBGOSLSR.OSLK == 1, this bit holds the value of EDSCR.ERR. Reads and writes of this bit are indirect accesses to EDSCR.ERR.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:
• When DBGOSLSR.OSLK == 1, access to this field is **RW**.
• When DBGOSLSR.OSLK == 0, access to this field is **RO**.

**MOE, bits [5:2]**

Method of Entry for debug exception. When a debug exception is taken to an Exception level using AArch32, this field is set to indicate the event that caused the exception:

<table>
<thead>
<tr>
<th>MOE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>Breakpoint.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Software breakpoint (BKPT) instruction.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Vector catch.</td>
</tr>
<tr>
<td>0b1010</td>
<td>Watchpoint.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [1:0]**

Reserved, **RES0**.

**Accessing the DBGDSCRext**

Individual fields within this register might have restricted accessibility when the OS lock is unlocked, **DBGOSLSR.OSLK == 0**. See the field descriptions for more detail.

Accesses to this register use the following encodings:

```plaintext
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

The DBGDSCRint characteristics are:

**Purpose**

Main control register for the debug implementation. This is an internal, read-only view.

**Configuration**

AArch32 System register DBGDSCRint bits [30:29] are architecturally mapped to AArch64 System register MDCCSR_EL0[30:29].

AArch32 System register DBGDSCRint bits [15:2] are architecturally mapped to AArch32 System register DBGDSCRext[15:2].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDSCRint are **UNDEFINED**.

This register is required in all implementations.

DBGDSCRint.\{NS, SPNIDdis, SPIDdis, MDBGen, UDCCdis, MOE\} are **UNKNOWN** when the register is accessed at EL0. However, although these values are not accessible at EL0 by instructions that are neither **UNPREDICTABLE** nor return **UNKNOWN** values, it is permissible for an implementation to return the values of DBGDSCRext.\{NS, SPNIDdis, SPIDdis, MDBGen, UDCCdis, MOE\} for these fields at EL0.

It is also permissible for an implementation to return the same values as defined for a read of DBGDSCRint at EL1 or above. (This is the case even if the implementation does not support AArch32 at EL1 or above.)

**Attributes**

DBGDSCRint is a 32-bit register.

**Field descriptions**

The DBGDSCRint bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | RXfull | TXfull | RES0 | NS | SPNIDdis | SPIDdis | MDBGen | RES0 | UDCCdis | RES0 | MOE | RES0 |

**Bit [31]**

Reserved, RES0.

**RXfull, bit [30]**

DTRRX full. Read-only view of the equivalent bit in the EDSCR.

**TXfull, bit [29]**

DTRTX full. Read-only view of the equivalent bit in the EDSCR.

**Bits [28:19]**

Reserved, RES0.
NS, bit [18]
Non-secure status.
Read-only view of the equivalent bit in the DBGDSCR. Arm deprecates use of this field.

SPNIdis, bit [17]
Secure privileged non-invasive debug disable.
Read-only view of the equivalent bit in the DBGDSCR. Arm deprecates use of this field.

SPIDdis, bit [16]
Secure privileged invasive debug disable.
Read-only view of the equivalent bit in the DBGDSCR. Arm deprecates use of this field.

MDBGen, bit [15]
Monitor debug events enable.
Read-only view of the equivalent bit in the DBGDSCR.

Bits [14:13]
Reserved, RES0.

UDCCdis, bit [12]
User mode access to Debug Communications Channel disable.
Read-only view of the equivalent bit in the DBGDSCR. Arm deprecates use of this field.

Bits [11:6]
Reserved, RES0.

MOE, bits [5:2]
Method of Entry for debug exception. When a debug exception is taken to an Exception level using AArch32, this field is set to indicate the event that caused the exception:

<table>
<thead>
<tr>
<th>MOE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Breakpoint</td>
</tr>
<tr>
<td>0b0001</td>

The DBGDTRRXext characteristics are:

**Purpose**

Used for save/restore of DBGDTRRXint. It is a component of the Debug Communications Channel.

**Configuration**

AArch32 System register DBGDTRRXext bits [31:0] are architecturally mapped to AArch64 System register OSDTRRX_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDTRRXext are UNDEFINED.

**Attributes**

DBGDTRRXext is a 32-bit register.

**Field descriptions**

The DBGDTRRXext bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| **Update DTRRX without side-effect** |

**Bits [31:0]**

Update DTRRX without side-effect.

Writes to this register update the value in DTRRX and do not change RXfull.

Reads of this register return the last value written to DTRRX and do not change RXfull.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the DBGDTRRXext**

Arm deprecates reads and writes of DBGDTRRXext through the System register interface when the OS Lock is unlocked, DBGOSLSR.OSLK == 0.

Accesses to this register use the following encodings:

\[
\text{MRC\{<c>\}{<q>}, \{#\}<opc1>, <Rt>, <CRn>, <CRm>{, \{#\}<opc2}>}
\]

DBGDTRRXnt, Debug Data Transfer Register, Receive

The DBGDTRRXnt characteristics are:

**Purpose**

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communications Channel.

**Configuration**

AArch32 System register DBGDTRRXnt bits [31:0] are architecturally mapped to AArch64 System register DBGDTRRX_EL0[31:0].

AArch32 System register DBGDTRRXnt bits [31:0] are architecturally mapped to External register DBGDTRRX_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDTRRXnt are UNDEFINED.

**Attributes**

DBGDTRRXnt is a 32-bit register.

**Field descriptions**

The DBGDTRRXnt bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

**Bits [31:0]**

Update DTRRX.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRRX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull is cleared to 0.

For the full behavior of the Debug Communications Channel, see ‘The Debug Communication Channel and Instruction Transfer Register’.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the DBGDTRRXnt**

Data can be stored to memory from this register using STC.

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

| coproc | opc1 | CRn | CRm | opc2 |

        end if;
    else
        return DBGDTRRXint;
    end if;
The DBGDTRTXext characteristics are:

**Purpose**

Used for save/restore of DBGDTRTXint. It is a component of the Debug Communication Channel.

**Configuration**

AArch32 System register DBGDTRTXext bits [31:0] are architecturally mapped to AArch64 System register OSDTRTX_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDTRTXext are `UNDEFINED`.

**Attributes**

DBGDTRTXext is a 32-bit register.

**Field descriptions**

The DBGDTRTXext bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Return DTRTX without side-effect**

**Bits [31:0]**

Return DTRTX without side-effect.

Reads of this register return the value in DTRTX and do not change TXfull.

 Writes of this register update the value in DTRTX and do not change TXfull.

For the full behavior of the Debug Communications Channel, see ‘The Debug Communication Channel and Instruction Transfer Register’.

On a Cold reset, this field resets to an architecturally `UNKNOWN` value.

**Accessing the DBGDTRTXext**

Arm deprecates reads and writes of DBGDTRTXext through the System register interface when the OS Lock is unlocked, DBGOSLSR.OSLK == 0.

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

DBGDTRTXint, Debug Data Transfer Register, Transmit

The DBGDTRTXint characteristics are:

**Purpose**

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communication Channel.

**Configuration**

AArch32 System register DBGDTRTXint bits [31:0] are architecturally mapped to AArch64 System register DBGDTRTX_EL0[31:0].

AArch32 System register DBGDTRTXint bits [31:0] are architecturally mapped to External register DBGDTRTX_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDTRTXint are UNDEFINED.

**Attributes**

DBGDTRTXint is a 32-bit register.

**Field descriptions**

The DBGDTRTXint bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Return DTRTX</td>
</tr>
<tr>
<td>30</td>
<td>Write to this register:</td>
</tr>
<tr>
<td>29</td>
<td>- If TXfull is set to 1, set DTRTX to UNKNOWN.</td>
</tr>
<tr>
<td>28</td>
<td>- If TXfull is set to 0, update the value in DTRTX.</td>
</tr>
<tr>
<td>27</td>
<td>After the write, TXfull is set to 1.</td>
</tr>
</tbody>
</table>

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the DBGDTRTXint**

Data can be loaded from memory into this register using 'LDC (immediate)' and 'LDC (literal)'.

Accesses to this register use the following encodings:

MCR{<c}>{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |

DBGOSECCR, Debug OS Lock Exception Catch Control Register

The DBGOSECCR characteristics are:

**Purpose**

Provides a mechanism for an operating system to access the contents of EDECCR that are otherwise invisible to software, so it can save/restore the contents of EDECCR over powerdown on behalf of the external debugger.

**Configuration**

AArch32 System register DBGOSECCR bits [31:0] are architecturally mapped to AArch64 System register OSECCR_EL1[31:0].

AArch32 System register DBGOSECCR bits [31:0] are architecturally mapped to External register EDECCR[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGOSECCR are UNDEFINED.

If DBGOSLSR.OSLK == 0 then DBGOSECCR returns an UNKNOWN value on reads and ignores writes.

**Attributes**

DBGOSECCR is a 32-bit register.

**Field descriptions**

The DBGOSECCR bit assignments are:

**When DBGOSLSR.OSLK == 1:**

DBGOSLAR, Debug OS Lock Access Register

The DBGOSLAR characteristics are:

**Purpose**

Provides a lock for the debug registers. The OS Lock also disables some debug exceptions and debug events.

**Configuration**

AArch32 System register DBGOSLAR bits [31:0] are architecturally mapped to AArch64 System register OSLAR_EL1[31:0].

AArch32 System register DBGOSLAR bits [31:0] are architecturally mapped to External register OSLAR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGOSLAR are UNDEFINED.

**Attributes**

DBGOSLAR is a 32-bit register.

**Field descriptions**

The DBGOSLAR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**OSLA, bits [31:0]**

OS Lock Access. Writing the value 0xC5ACCE55 to the DBGOSLAR sets the OS lock to 1. Writing any other value sets the OS lock to 0.

Use DBGOSLRSR.OSLK to check the current status of the lock.

**Accessing the DBGOSLAR**

Accesses to this register use the following encodings:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>

        end if
    else
        DBGOSLAR = R[t];
    end if
elsif PSTATE.EL == EL3 then
    DBGOSLAR = R[t];
The DBGOSLSR characteristics are:

**Purpose**

Provides status information for the OS Lock.

**Configuration**

AArch32 System register DBGOSLSR bits [31:0] are architecturally mapped to AArch64 System register OSLSR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGOSLSR are UNDEFINED.

The OS Lock status is also visible in the external debug interface through EDPRSR.

**Attributes**

DBGOSLSR is a 32-bit register.

**Field descriptions**

The DBGOSLSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>OSLM[1]</td>
</tr>
<tr>
<td>29</td>
<td>nTT</td>
</tr>
<tr>
<td>28</td>
<td>OSLK</td>
</tr>
<tr>
<td>27</td>
<td>OSLM[0]</td>
</tr>
<tr>
<td>26</td>
<td>8</td>
</tr>
<tr>
<td>25</td>
<td>7</td>
</tr>
<tr>
<td>24</td>
<td>6</td>
</tr>
<tr>
<td>23</td>
<td>5</td>
</tr>
<tr>
<td>22</td>
<td>4</td>
</tr>
<tr>
<td>21</td>
<td>3</td>
</tr>
<tr>
<td>20</td>
<td>2</td>
</tr>
<tr>
<td>19</td>
<td>1</td>
</tr>
<tr>
<td>18</td>
<td>0</td>
</tr>
</tbody>
</table>

- **RES0**: Reserved, RES0.

- **OSLM, bits [3, 0]**
  
  OS lock model implemented. Identifies the form of OS save and restore mechanism implemented.

<table>
<thead>
<tr>
<th>OSLM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>OS Lock not implemented.</td>
</tr>
<tr>
<td>0b10</td>
<td>OS Lock implemented.</td>
</tr>
</tbody>
</table>

  All other values are reserved. In an Armv8 implementation the value 0b00 is not permitted.

  The OSLM field is split as follows:

  - OSLM[1] is DBGOSLSR[3].
  - OSLM[0] is DBGOSLSR[0].

- **nTT, bit [2]**

  Not 32-bit access. This bit is always RAZ. It indicates that a 32-bit access is needed to write the key to the OS Lock Access Register.

- **OSLK, bit [1]**

  OS Lock Status. The possible values are:
### OSLK

<table>
<thead>
<tr>
<th>OSLK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>OS Lock unlocked.</td>
</tr>
<tr>
<td>0b1</td>
<td>OS Lock locked.</td>
</tr>
</tbody>
</table>

The OS Lock is locked and unlocked by writing to the OS Lock Access Register.

On a Cold reset, this field resets to 1.

### Accessing the DBGOSLSR

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#\}<\text{opc2}> \\
\]

   end if;
elsif PSTATE.EL == EL3 then
   return DBGOSLSR;
DBGPRCR, Debug Power Control Register

The DBGPRCR characteristics are:

**Purpose**

Controls behavior of the PE on powerdown request.

**Configuration**

AArch32 System register DBGPRCR bits [31:0] are architecturally mapped to AArch64 System register DBGPRCR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGPRCR are UNDEFINED.

Bit [0] of this register is mapped to EDPSCR, CORENPDRQ, bit [0] of the external view of this register.

The other bits in these registers are not mapped to each other.

**Attributes**

DBGPRCR is a 32-bit register.

**Field descriptions**

The DBGPRCR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | CORENPDRQ |

**Bits [31:1]**

Reserved, RES0.

**CORENPDRQ, bit [0]**

*When FEAT_DoPD is implemented:*

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

<table>
<thead>
<tr>
<th>CORENPDRQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If the system responds to a powerdown request, it powers down Core power domain.</td>
</tr>
<tr>
<td>0b1</td>
<td>If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.</td>
</tr>
</tbody>
</table>

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the Cold reset value on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see 'Core power domain power states'.

**Note**
 Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a Cold reset, if the powerup request is implemented and the powerup request has been asserted, this field is set to an IMPLEMENTATION DEFINED choice of 0 or 1. If the powerup request is not asserted, this field is set to 0.

Otherwise:

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

<table>
<thead>
<tr>
<th>CORENPDRQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If the system responds to a powerdown request, it powers down Core power domain.</td>
</tr>
<tr>
<td>0b1</td>
<td>If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.</td>
</tr>
</tbody>
</table>

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of EDPRCR.COREPURQ on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see 'Core power domain power states'.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a Cold reset, this field resets to the value in EDPRCR.COREPURQ.

Accessing the DBGPRCR

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} \text{<coproc>}, \{#\}<\text{opc1}>, \text{<Rt>}, \text{<CRn>}, \text{<CRm>}\{, \{#\}<\text{opc2}>\}

**NSF, bit [31]**

FIQ vector catch enable in Non-secure state.

The exception vector offset is 0x1C.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**NSI, bit [30]**

IRQ vector catch enable in Non-secure state.

The exception vector offset is 0x18.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [29]**

Reserved, RES0.

**NSD, bit [28]**

Data Abort vector catch enable in Non-secure state.

The exception vector offset is 0x10.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**NSP, bit [27]**

Prefetch Abort vector catch enable in Non-secure state.

The exception vector offset is 0x0C.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**NSS, bit [26]**

Supervisor Call (SVC) vector catch enable in Non-secure state.

The exception vector offset is 0x08.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**NSU, bit [25]**

Undefined Instruction vector catch enable in Non-secure state.

The exception vector offset is 0x04.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [24:16]**

Reserved, RES0.

**MF, bit [15]**

FIQ vector catch enable in Monitor mode.

The exception vector offset is 0x1C.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**MI, bit [14]**

IRQ vector catch enable in Monitor mode.

The exception vector offset is 0x18.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [13]**

Reserved, RES0.

**MD, bit [12]**

Data Abort vector catch enable in Monitor mode.

The exception vector offset is 0x10.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**MP, bit [11]**

Prefetch Abort vector catch enable in Monitor mode.
The exception vector offset is 0x0C.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**MS, bit [10]**

Secure Monitor Call (SMC) vector catch enable in Monitor mode.

The exception vector offset is 0x08.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [9:8]**

### DBGWCR<n>, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n> characteristics are:

**Purpose**

Holds control information for a watchpoint. Forms watchpoint n together with value register DBGWVR<n>.

**Configuration**

AArch32 System register DBGWCR<n> bits [31:0] are architecturally mapped to AArch64 System register DBGWCR<n>_EL1[31:0].

AArch32 System register DBGWCR<n> bits [31:0] are architecturally mapped to External register DBGWCR<n>_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGWCR<n> are UNDEFINED.

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

**Attributes**

DBGWCR<n> is a 32-bit register.

**Field descriptions**

The DBGWCR<n> bit assignments are:

```
| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0| MASK| RES0| WT  | LBN | SSC | HMC | BAS | LSC | PAC | E   |
```

When the E field is zero, all the other fields in the register are ignored.

**Bits [31:29]**

Reserved, RES0.

**MASK, bits [28:24]**

Address mask. Only objects up to 2GB can be watched using a single mask.

<table>
<thead>
<tr>
<th>MASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>No mask.</td>
</tr>
<tr>
<td>0b000001</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b000010</td>
<td>Reserved.</td>
</tr>
</tbody>
</table>

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from 0b00001 masking 3 address bits (0x00000007 mask for address) to 0b111111 masking 31 address bits (0x7FFFFFFF mask for address).
On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [23:21]**

Reserved, RES0.

**WT, bit [20]**

Watchpoint type. Possible values are:

<table>
<thead>
<tr>
<th>WT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Unlinked data address match.</td>
</tr>
<tr>
<td>0b1</td>
<td>Linked data address match.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**LBN, bits [19:16]**

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**SSC, bits [15:14]**

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

For more information, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions', and 'Reserved DBGBCR<n>.{SSC, HMC, PMC} values'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**HMC, bit [13]**

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**BAS, bits [12:5]**

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by DBGWVR<n> is being watched.

<table>
<thead>
<tr>
<th>BAS</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0bxxxxxxx1</td>
<td>Match byte at DBGWVR&lt;n&gt;</td>
</tr>
<tr>
<td>0bxxxxx1xx</td>
<td>Match byte at DBGWVR&lt;n&gt;+1</td>
</tr>
<tr>
<td>0bxxxx1xxx</td>
<td>Match byte at DBGWVR&lt;n&gt;+2</td>
</tr>
<tr>
<td>0bxxxx1xxxx</td>
<td>Match byte at DBGWVR&lt;n&gt;+3</td>
</tr>
</tbody>
</table>

In cases where DBGWVR<n> addresses a double-word:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Description, if DBGWVR&lt;n&gt;[2] == 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0bxx1xxxx</td>
<td>Match byte at DBGWVR&lt;n&gt;+4</td>
</tr>
<tr>
<td>0bx1xxxxxx</td>
<td>Match byte at DBGWVR&lt;n&gt;+5</td>
</tr>
<tr>
<td>0bx1xxxxxx</td>
<td>Match byte at DBGWVR&lt;n&gt;+6</td>
</tr>
<tr>
<td>0b1xxxxxxx</td>
<td>Match byte at DBGWVR&lt;n&gt;+7</td>
</tr>
</tbody>
</table>

The valid values for BAS are non-zero binary numbers all of whose set bits are contiguous. All other values are reserved and must not be used by software. See ‘Reserved DBGWCR<n>.BAS values’.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**LSC, bits [4:3]**

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

<table>
<thead>
<tr>
<th>LSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>Match instructions that load from a watchpointed address.</td>
</tr>
<tr>
<td>0b10</td>
<td>Match instructions that store to a watchpointed address.</td>
</tr>
<tr>
<td>0b11</td>
<td>Match instructions that load from or store to a watchpointed address.</td>
</tr>
</tbody>
</table>

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**PAC, bits [2:1]**

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and HMC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see ‘Execution conditions for which a watchpoint generates Watchpoint exceptions’.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**E, bit [0]**

Enable watchpoint n. Possible values are:

<table>
<thead>
<tr>
<th>E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Watchpoint disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Watchpoint enabled.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the DBGWCR<n>**

Accesses to this register use the following encodings:

\[

DBGWFAR, Debug Watchpoint Fault Address Register

The DBGWFAR characteristics are:

**Purpose**

Previously returned information about the address of the instruction that accessed a watchpointed address. Is now deprecated and RES0.

**Configuration**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGWFAR are UNDEFINED.

**Attributes**

DBGWFAR is a 32-bit register.

**Field descriptions**

The DBGWFAR bit assignments are:

<table>
<thead>
<tr>

DBGWVR<n>, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n> characteristics are:

**Purpose**

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register DBGWCR<n>.

**Configuration**

AArch32 System register DBGWVR<n> bits [31:0] are architecturally mapped to AArch64 System register DBGWVR<n>_EL1[31:0].

AArch32 System register DBGWVR<n> bits [31:0] are architecturally mapped to External register DBGWVR<n>_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGWVR<n> are UNDEFINED.

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

**Attributes**

DBGWVR<n> is a 32-bit register.

**Field descriptions**

The DBGWVR<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

| VA | RES0 |

VA, bits [31:2]

Bits[31:2] of the address value for comparison.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

**Accessing the DBGWVR<n>**

Accesses to this register use the following encodings:

DCCIMVAC, Data Cache line Clean and Invalidate by VA to PoC

The DCCIMVAC characteristics are:

**Purpose**

Clean and Invalidate data or unified cache line by virtual address to PoC.

**Configuration**

AArch32 System instruction DCCIMVAC performs the same function as AArch64 System instruction DCCIVAC.

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DCCIMVAC are UNDEFINED.

**Attributes**

DCCIMVAC is a 32-bit System instruction.

**Field descriptions**

The DCCIMVAC input value bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [31:0]**

Virtual address to use. No alignment restrictions apply to this VA.

**Executing the DCCIMVAC instruction**

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'AArch32 data cache maintenance instructions (DC*)'.

Accesses to this instruction use the following encodings:

```
MCR{<c>}{<q}> <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

DCCISW, Data Cache line Clean and Invalidate by Set/Way

The DCCISW characteristics are:

**Purpose**

Clean and Invalidate data or unified cache line by set/way.

**Configuration**

AArch32 System instruction DCCISW performs the same function as AArch64 System instruction DCCISW.

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DCCISW are UNDEFINED.

**Attributes**

DCCISW is a 32-bit System instruction.

**Field descriptions**

The DCCISW input value bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | SetWay |
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | Level | RES0 |

**SetWay, bits [31:4]**

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

A = Log2(ASSOCIATIVITY), L = Log2(LINELEN), B = (L + S), S = Log2(NSETS).

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

**Level, bits [3:1]**

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

**Bit [0]**

Reserved, RES0.

**Executing the DCCISW instruction**

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED
The instruction performs cache maintenance on one of:
- No cache lines.
- A single arbitrary cache line.
- Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings:

\[
\text{MCR}\{<c>\}{<q>}\ <\text{coproc}\},\ \{#\}<\text{opc1}\>,\ <\text{Rt}\>,\ <\text{CRn}\>,\ <\text{CRm}\>{,\ \{#\}<\text{opc2}\>}
\]

elsif PSTATE.EL == EL3 then
  DCCISW(R[t]);
DCCMVAC, Data Cache line Clean by VA to PoC

The DCCMVAC characteristics are:

**Purpose**

Clean data or unified cache line by virtual address to PoC.

**Configuration**

AArch32 System instruction DCCMVAC performs the same function as AArch64 System instruction DC.CVAC.

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DCCMVAC are UNDEFINED.

**Attributes**

DCCMVAC is a 32-bit System instruction.

**Field descriptions**

The DCCMVAC input value bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Virtual address to use**

Virtual address to use. No alignment restrictions apply to this VA.

**Executing the DCCMVAC instruction**

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'AArch32 data cache maintenance instruction (DC*)' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Accesses to this instruction use the following encodings:

\[
\text{MCR}<c>{q}<c> \text{<coproc>}, \{#<opc1>}, \text{<Rt>}, \text{<CRn>}, \text{<CRm>{, \{#<opc2>}}}

DCCMVAU, Data Cache line Clean by VA to PoU

The DCCMVAU characteristics are:

**Purpose**

Clean data or unified cache line by virtual address to PoU.

**Configuration**

AArch32 System instruction DCCMVAU performs the same function as AArch64 System instruction DC CVAU.

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DCCMVAU are undefined.

**Attributes**

DCCMVAU is a 32-bit System instruction.

**Field descriptions**

The DCCMVAU input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Virtual address to use</td>
<td>Bits [31:0] Virtual address to use. No alignment restrictions apply to this VA.</td>
</tr>
</tbody>
</table>

**Executing the DCCMVAU instruction**

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'AArch32 data cache maintenance instructions (DC*)'.

Accesses to this instruction use the following encodings:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>

DCCSW, Data Cache line Clean by Set/Way

The DCCSW characteristics are:

**Purpose**

Clean data or unified cache line by set/way.

**Configuration**

AArch32 System instruction DCCSW performs the same function as AArch64 System instruction DC CSW.

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DCCSW are UNDEFINED.

**Attributes**

DCCSW is a 32-bit System instruction.

**Field descriptions**

The DCCSW input value bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    | SetWay |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | Level | RES0 |

**SetWay, bits [31:4]**

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

A = \(\log_2(\text{ASSOCIATIVITY})\), \(L = \log_2(\text{LINELEN})\), \(B = (L + S)\), \(S = \log_2(\text{NSETS})\).

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

**Level, bits [3:1]**

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

**Bit [0]**

Reserved, RES0.

**Executing the DCCSW instruction**

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED
- The instruction performs cache maintenance on one of:
  - No cache lines.
Accesses to this instruction use the following encodings:

\[
\text{MCR\{<c>\}<q>} <\text{coproc}>\{\text{<opc1>}, \text{<Rt>}, \text{<CRn>}, \text{<CRm}>\}\{\text{<opc2>}}
\]

<table>

DCIMVAC, Data Cache line Invalidate by VA to PoC

The DCIMVAC characteristics are:

**Purpose**

Invalidate data or unified cache line by virtual address to PoC.

**Configuration**

AArch32 System instruction DCIMVAC performs the same function as AArch64 System instruction DC IVAC.

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DCIMVAC are **UNDEFINED**.

**Attributes**

DCIMVAC is a 32-bit System instruction.

**Field descriptions**

The DCIMVAC input value bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

Virtual address to use.

**Bits [31:0]**

Virtual address to use. No alignment restrictions apply to this VA.

**Executing the DCIMVAC instruction**

It is **IMPLEMENTATION DEFINED** whether, when this instruction is executed, it can generate a watchpoint. If this instruction can generate a watchpoint this is prioritized in the same way as other watchpoints.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see ‘AArch32 data cache maintenance instructions (DC*)’.

Accesses to this instruction use the following encodings:

MCR{<c>{<q}> <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}}

<table>
<thead>
<tr>

elsif PSTATE.EL == EL2 then
    DCIMVAC(R[t]);
else if PSTATE.EL == EL3 then
    DCIMVAC(R[t]);
The DCISW characteristics are:

**Purpose**

Invalidate data or unified cache line by set/way.

**Configuration**

AArch32 System instruction DCISW performs the same function as AArch64 System instruction DCISW. This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DCISW are UNDEFINED.

**Attributes**

DCISW is a 32-bit System instruction.

**Field descriptions**

The DCISW input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-2</td>
<td>SetWay</td>
<td>Contains two fields: Way, bits[31:32-A], the number of the way to operate on. Set, bits[B-1:L], the number of the set to operate on. Bits[L-1:4] are RES0.</td>
</tr>
<tr>
<td>3-1</td>
<td>Level</td>
<td>Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.</td>
</tr>
<tr>
<td>0</td>
<td>Bit</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

**SetWay, bits [31:4]**

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

A = \( \log_2(\text{ASSOCIATIVITY}) \), L = \( \log_2(\text{LINELEN}) \), B = (L + S), S = \( \log_2(\text{NSETS}) \).

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

**Level, bits [3:1]**

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

**Bit [0]**

Reserved, RES0.

**Executing the DCISW instruction**

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED
- The instruction performs cache maintenance on one of:
  - No cache lines.
A single arbitrary cache line.

Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>

  DCISW(R[t]);
DFAR, Data Fault Address Register

The DFAR characteristics are:

**Purpose**

Holds the virtual address of the faulting address that caused a synchronous Data Abort exception.

**Configuration**

AArch32 System register DFAR bits [31:0] are architecturally mapped to AArch64 System register FAR_EL1[31:0].

AArch32 System register DFAR bits [31:0] (S) are architecturally mapped to AArch32 System register HDFAR[31:0] when EL2 is implemented, EL3 is implemented and the highest implemented Exception level is using AArch32 state.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DFAR are UNDEFINED.

**Attributes**

DFAR is a 32-bit register.

**Field descriptions**

The DFAR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>VA of faulting address of synchronous Data Abort exception</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>30</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

VA of faulting address of synchronous Data Abort exception.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the DFAR**

Accesses to this register use the following encodings:

\[
MRC\{<c>\}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
\]

<table>
<thead>

elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        DFAR_S = R[t];
    else
        DFAR_NS = R[t];
DFSR, Data Fault Status Register

The DFSR characteristics are:

**Purpose**

Holds status information about the last data fault.

**Configuration**

AArch32 System register DFSR bits [31:0] are architecturally mapped to AArch64 System register ESR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DFSR are UNDEFINED.

The current translation table format determines which format of the register is used.

**Attributes**

DFSR is a 32-bit register.

**Field descriptions**

The DFSR bit assignments are:

**When TTBCR.EAE == 0:**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | FnV | AET | CM | ExT | WnR | FS[4] | LPAE | RES0 | Domain | FS[3:0] |

**Bits [31:17]**

Reserved, RES0.

**FnV, bit [16]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<table>
<thead>
<tr>
<th>FnV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>DFAR is valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>DFAR is not valid, and holds an UNKNOWN value.</td>
</tr>
</tbody>
</table>

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Data Abort exceptions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**AET, bits [15:14]**

**When FEAT_RAS is implemented:**

Asynchronous Error Type. When DFSC is 0b010001, describes the PE error state after taking the SError interrupt exception. Possible values are:
AET | Meaning
---|---
0b00 | Uncontainable (UC).
0b01 | Unrecoverable state (UEU).
0b10 | Restartable state (UEO).
0b11 | Recoverable state (UER).

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other aborts.

In the event of multiple errors taken as a single SError interrupt exception, the overall PE error state is reported.

**Note**

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**CM, bit [13]**

Cache maintenance fault. For synchronous faults, this bit indicates whether a cache maintenance instruction generated the fault. The possible values of this bit are:

<table>
<thead>
<tr>
<th>CM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Abort not caused by execution of a cache maintenance instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Abort caused by execution of a cache maintenance instruction, or on an address translation.</td>
</tr>
</tbody>
</table>

On a synchronous Data Abort on a translation table walk, this bit is UNKNOWN.

On an asynchronous fault, this bit is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**ExT, bit [12]**

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**WnR, bit [11]**

Write not Read bit. Indicates whether the abort was caused by a write or a read instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>WnR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Abort caused by a read instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Abort caused by a write instruction.</td>
</tr>
</tbody>
</table>

For faults on the cache maintenance and address translation System instructions in the (coproc==0b1111) encoding space this bit always returns a value of 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**FS, bits [10, 3:0]**

Fault status bits. Possible values of FS[4:0] are:

<table>
<thead>
<tr>
<th>FS</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00001</td>
<td>Alignment fault.</td>
<td></td>
</tr>
<tr>
<td>0b00010</td>
<td>Debug exception.</td>
<td></td>
</tr>
<tr>
<td>0b00011</td>
<td>Access flag fault, level 1.</td>
<td></td>
</tr>
<tr>
<td>0b00100</td>
<td>Fault on instruction cache maintenance.</td>
<td></td>
</tr>
<tr>
<td>0b00101</td>
<td>Translation fault, level 1.</td>
<td></td>
</tr>
<tr>
<td>0b00110</td>
<td>Access flag fault, level 2.</td>
<td></td>
</tr>
<tr>
<td>0b00111</td>
<td>Translation fault, level 2.</td>
<td></td>
</tr>
<tr>
<td>0b01000</td>
<td>Synchronous External abort, not on translation table walk.</td>
<td></td>
</tr>
<tr>
<td>0b01001</td>
<td>Domain fault, level 1.</td>
<td></td>
</tr>
<tr>
<td>0b01011</td>
<td>Domain fault, level 2.</td>
<td></td>
</tr>
<tr>
<td>0b01100</td>
<td>Synchronous External abort, on translation table walk, level 1.</td>
<td></td>
</tr>
<tr>
<td>0b01101</td>
<td>Permission fault, level 1.</td>
<td></td>
</tr>
<tr>
<td>0b01110</td>
<td>Synchronous External abort, on translation table walk, level 2.</td>
<td></td>
</tr>
<tr>
<td>0b01111</td>
<td>Permission fault, level 2.</td>
<td></td>
</tr>
<tr>
<td>0b10000</td>
<td>TLB conflict abort.</td>
<td></td>
</tr>
<tr>
<td>0b10100</td>
<td>IMPLEMENTATION DEFINED fault (Lockdown fault).</td>
<td></td>
</tr>
<tr>
<td>0b10101</td>
<td>IMPLEMENTATION DEFINED fault (Unsupported Exclusive access fault).</td>
<td></td>
</tr>
<tr>
<td>0b10110</td>
<td>SError interrupt.</td>
<td>When FEAT_RAS is not implemented</td>
</tr>
<tr>
<td>0b11000</td>
<td>SError interrupt, from a parity or ECC error on memory access.</td>
<td>When FEAT_RAS is not implemented</td>
</tr>
<tr>
<td>0b11001</td>
<td>Synchronous parity or ECC error on memory access, not on translation table walk.</td>
<td>When FEAT_RAS is not implemented</td>
</tr>
<tr>
<td>0b11100</td>
<td>Synchronous parity or ECC error on translation table walk, level 1.</td>
<td>When FEAT_RAS is not implemented</td>
</tr>
<tr>
<td>0b11110</td>
<td>Synchronous parity or ECC error on translation table walk, level 2.</td>
<td>When FEAT_RAS is not implemented</td>
</tr>
</tbody>
</table>

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Short-descriptor translation table lookup'.

The FS field is split as follows:

- FS[4] is DFSR[10].
- FS[3:0] is DFSR[3:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**LPAE, bit [9]**

On taking a Data Abort exception, this bit is set as follows:

<table>
<thead>
<tr>
<th>LPAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Using the Short-descriptor translation table formats.</td>
</tr>
<tr>
<td>0b1</td>
<td>Using the Long-descriptor translation table formats.</td>
</tr>
</tbody>
</table>

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Bit [8]

Reserved, RES0.

Domain, bits [7:4]

The domain of the fault address.

Arm deprecates any use of this field, see 'The Domain field in the DFSR'.

This field is UNKNOWN for certain faults where the DFSR is updated and reported using the Short-descriptor FSR encodings, see 'Validity of Domain field on faults that update the DFSR when using the Short-descriptor encodings'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

When TTBCR.EAE == 1:

Bits [31:17]

Reserved, RES0.

FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<table>
<thead>
<tr>
<th>FnV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>DFAR is valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>DFAR is not valid, and holds an UNKNOWN value.</td>
</tr>
</tbody>
</table>

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Data Abort exceptions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

AET, bits [15:14]

When FEAT_RAS is implemented:

Asynchronous Error Type. When DFSC is 0b010001, describes the PE error state after taking the SError interrupt exception. Possible values are:

<table>
<thead>
<tr>
<th>AET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Uncontainable (UC).</td>
</tr>
<tr>
<td>0b01</td>
<td>Unrecoverable state (UEU).</td>
</tr>
<tr>
<td>0b10</td>
<td>Restartable state (UEO).</td>
</tr>
<tr>
<td>0b11</td>
<td>Recoverable state (UER).</td>
</tr>
</tbody>
</table>

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other aborts.

In the event of multiple errors taken as a single SError interrupt exception, the overall PE error state is reported.

Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**CM, bit [13]**

Cache maintenance fault. For synchronous faults, this bit indicates whether a cache maintenance instruction generated the fault. The possible values of this bit are:

<table>
<thead>
<tr>
<th>CM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Abort not caused by execution of a cache maintenance instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Abort caused by execution of a cache maintenance instruction.</td>
</tr>
</tbody>
</table>

On a synchronous Data Abort on a translation table walk, this bit is **UNKNOWN**.

On an asynchronous fault, this bit is **UNKNOWN**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**ExT, bit [12]**

External abort type. This bit can be used to provide an **IMPLEMENTATION DEFINED** classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**WnR, bit [11]**

Write not Read bit. Indicates whether the abort was caused by a write or a read instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>WnR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Abort caused by a read instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Abort caused by a write instruction.</td>
</tr>
</tbody>
</table>

For faults on the cache maintenance and address translation System instructions in the (coproc==0b1111) encoding space this bit always returns a value of 1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [10]**

Reserved, RES0.

**LPAE, bit [9]**

On taking a Data Abort exception, this bit is set as follows:

<table>
<thead>
<tr>
<th>LPAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Using the Short-descriptor translation table formats.</td>
</tr>
<tr>
<td>0b1</td>
<td>Using the Long-descriptor translation table formats.</td>
</tr>
</tbody>
</table>

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [8:6]**

Reserved, RES0.
**STATUS, bits [5:0]**

Fault status bits. Possible values of this field are:

<table>
<thead>
<tr>
<th>STATUS</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>Address size fault in translation table base register.</td>

DISR, Deferred Interrupt Status Register

The DISR characteristics are:

**Purpose**

Records that an SError interrupt has been consumed by an ESB instruction.

**Configuration**

AArch32 System register DISR bits [31:0] are architecturally mapped to AArch64 System register DISR_EL1[31:0] when the highest implemented Exception level is using AArch64.

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to DISR are UNDEFINED.

**Attributes**

DISR is a 32-bit register.

**Field descriptions**

The DISR bit assignments are:

**When the ESB instruction is executed at EL2:**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| A  | RES0 | AET | EA | RES0 | DFSC |

**A, bit [31]**

Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [30:12]**

Reserved, RES0.

**AET, bits [11:10]**

Asynchronous Error Type. See the description of HSR.AET for an SError interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EA, bit [9]**

External abort Type. See the description of HSR.EA for an SError interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [8:6]**

Reserved, RES0.
DFSC, bits [5:0]

Fault Status Code. See the description of HSR.DFSC for an SError interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

When the ESB instruction is executed at EL0 or EL1 and where TTBCR.EAE == 0:

<table>
<thead>
<tr>

</tbody>
</table>

A, bit [31]

Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

Asynchronous Error Type. See the description of DFSR.AET for an SError interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

External abort Type. See the description of DFSR.ExT for an SError interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS, bits [10, 3:0]

Fault Status Code. See the description of DFSR.FS for an SError interrupt.

The FS field is split as follows:

- FS[4] is DISR[10].
- FS[3:0] is DISR[3:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

Format.

<table>
<thead>
<tr>
<th>LPAE</th>
<th>Meaning</th>

### A, bit [31]

Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [30:16]

Reserved, RES0.

### AET, bits [15:14]

Asynchronous Error Type. See the description of DFSR.AET for an SError interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bit [13]

Reserved, RES0.

### ExT, bit [12]

External abort Type. See the description of DFSR.ExT for an SError interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [11:10]

Reserved, RES0.

### LPAE, bit [9]

Format.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>Using the Long-descriptor translation table format.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [8:6]

Reserved, RES0.

### STATUS, bits [5:0]

Fault Status Code. See the description of DFSR.FS for an SError interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing the DISR

An indirect write to DISR made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of DISR occurring in program order after the ESB instruction.

DISR is RAZ/WI if EL3 is implemented, the PE is in Non-debug state, and any of the following apply:

- EL3 is using AArch64, SCR_EL3.EA == 1, and any of the following apply:
  - The PE is executing at EL2.
  - The PE is executing at EL1 and ((SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0) || HCR_EL2.AMO == 0).
- EL3 is using AArch32, SCR.EA == 1, and any of the following apply:
  - The PE is executing at EL2.
  - The PE is executing at EL1 and (SCR.NS == 0 || HCR.AMO == 0).

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>

DLR, Debug Link Register

The DLR characteristics are:

**Purpose**

In Debug state, holds the address to restart from.

**Configuration**

AArch32 System register DLR bits [31:0] are architecturally mapped to AArch64 System register DLR_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DLR are UNDEFINED.

**Attributes**

DLR is a 32-bit register.

**Field descriptions**

The DLR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Restart address</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Restart address.

**Accessing the DLR**

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}\{<q>\} <\text{coproc}>, \{#<\text{opc1}>\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#<\text{opc2}>\}
\]

if !Halted() then
  UNDEFINED;
else
  DLR = R[t];
DSPSR, Debug Saved Program Status Register

The DSPSR characteristics are:

**Purpose**

Holds the saved process state for Debug state. On entering Debug state, PSTATE information is written to this register. On exiting Debug state, values are copied from this register to PSTATE.

**Configuration**

AArch32 System register DSPSR bits [31:0] are architecturally mapped to AArch64 System register `DSPSR_EL0[31:0]`.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DSPSR are UNDEFINED.

**Attributes**

DSPSR is a 32-bit register.

**Field descriptions**

The DSPSR bit assignments are:

<table>
<thead>
<tr>

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on entering Debug state, and copied to PSTATE.N on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on entering Debug state, and copied to PSTATE.Z on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on entering Debug state, and copied to PSTATE.C on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on entering Debug state, and copied to PSTATE.V on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on entering Debug state, and copied to PSTATE.Q on exiting Debug state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on entering Debug state, and copied to PSTATE.IT[1:0] on exiting Debug state.

On exiting Debug state DSPSR.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**DIT, bit [24]**

*When FEAT_DIT is implemented:*

Data Independent Timing. Set to the value of PSTATE.DIT on entering Debug state, and copied to PSTATE.DIT on exiting Debug state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**SSBS, bit [23]**

*When FEAT_SSBS is implemented:*

Speculative Store Bypass. Set to the value of PSTATE.SSBS on entering Debug state, and copied to PSTATE.SSBS on exiting Debug state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**PAN, bit [22]**

*When FEAT_PAN is implemented:*

Privileged Access Never. Set to the value of PSTATE.PAN on entering Debug state, and copied to PSTATE.PAN on exiting Debug state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE.SS on entering Debug state, and conditionally copied to PSTATE.SS on exiting Debug state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on entering Debug state, and copied to PSTATE.IL on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on entering Debug state, and copied to PSTATE.GE on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on entering Debug state, and copied to PSTATE.IT[7:2] on exiting Debug state.

DSPSR.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on entering Debug state, and copied to PSTATE.E on exiting Debug state.

If the implementation does not support big-endian operation, DSPSR.E is RES0. If the implementation does not support little-endian operation, DSPSR.E is RES1. On exiting Debug state, if the implementation does not support big-endian operation at the Exception level being returned to, DSPSR.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, DSPSR.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on entering Debug state, and copied to PSTATE.A on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on entering Debug state, and copied to PSTATE.I on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on entering Debug state, and copied to PSTATE.F on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on entering Debug state, and copied to PSTATE.T on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**M[4:0], bits [4:0]**

Mode. Set to the value of PSTATE.M[4:0] on entering Debug state, and copied to PSTATE.M[4:0] on exiting Debug state.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10000</td>
<td>User.</td>
</tr>
<tr>
<td>0b10001</td>

<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If DSPSR.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, exiting Debug state is an illegal return event, as described in 'Illegal return events from AArch32 state'.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the DSPSR**

DTLBIALL, Data TLB Invalidate All

The DTLBIALL characteristics are:

**Purpose**

Invalidate all cached copies of translation table entries from data TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
  - Would be required for the EL1&0 translation regime.
  - Match the current VMID, if EL2 is implemented and enabled in the current Security state.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at EL2, and if EL2 is enabled in the current Security state, the stage 1 or stage 2 translation table entries that would be required for the Non-secure PL1&0 translation regime and matches the current VMID.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DTLBIALL are **UNDEFINED**.

**Attributes**

DTLBIALL is a 32-bit System instruction.

**Field descriptions**

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

**Executing the DTLBIALL instruction**

Accesses to this instruction use the following encodings:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>

  end
elsif PSTATE.EL == EL2 then
  DTLBIALL();
elsif PSTATE.EL == EL3 then
  DTLBIALL();
end
DTLBIASID, Data TLB Invalidate by ASID match

The DTLBIASID characteristics are:

**Purpose**

Invalidate all cached copies of translation table entries from data TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DTLBIASID are **UNDEFINED**.

**Attributes**

DTLBIASID is a 32-bit System instruction.

**Field descriptions**

The DTLBIASID input value bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |

DTLBIMVA, Data TLB Invalidate by VA

The DTLBIMVA characteristics are:

**Purpose**

Invalidate all cached copies of translation table entries from data TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DTLBIMVA are **undefined**.

**Attributes**

DTLBIMVA is a 32-bit System instruction.

**Field descriptions**

The DTLBIMVA input value bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>

   endif;
elsif PSTATE.EL == EL2 then
   DTLBIMVA(R[t]);
elsif PSTATE.EL == EL3 then
   DTLBIMVA(R[t]);

**DVPRCTX, Data Value Prediction Restriction by Context**

The DVPRCTX characteristics are:

**Purpose**

Data Value Prediction Restriction by Context applies to all Data Value Prediction Resources that predict execution based on information gathered within the target execution context or contexts.

When this instruction is complete and synchronized, data value prediction does not permit later speculative execution within the target execution context to be observable through side channels.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

**Note**

This instruction does not require the invalidation of prediction structures so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level and FEAT_SPECRES is implemented. Otherwise, direct accesses to DVPRCTX are UNDEFINED.

**Attributes**

DVPRCTX is a 32-bit System instruction.

**Field descriptions**

The DVPRCTX input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-28</td>
</tr>
<tr>
<td>27</td>
</tr>
<tr>
<td>26-1</td>
</tr>
</tbody>
</table>

**Bits [31:28]**

Reserved, RES0.

**GVMID, bit [27]**

Execution of this instruction applies to all VMIDs or a specified VMID.

<table>
<thead>
<tr>
<th>GVMID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Applies to specified VMID for an EL0 or EL1 target execution context.</td>
</tr>
<tr>
<td>0b1</td>
<td>Applies to all VMIDs for an EL0 or EL1 target execution context.</td>
</tr>
</tbody>
</table>
For target execution contexts other than EL0 or EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

**NS, bit [26]**

Security State.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Secure state.</td>
</tr>
<tr>
<td>1</td>
<td>Non-secure state.</td>
</tr>
</tbody>
</table>

If the instruction is executed in Non-secure state, this field has an Effective value of 1.

**EL, bits [25:24]**

Exception Level. Indicates the Exception level of the target execution context.

<table>
<thead>
<tr>
<th>EL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>EL0.</td>
</tr>
<tr>
<td>01</td>
<td>EL1.</td>
</tr>
<tr>
<td>10</td>
<td>EL2.</td>
</tr>
<tr>
<td>11</td>
<td>EL3.</td>
</tr>
</tbody>
</table>

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

**VMID, bits [23:16]**

Only applies when bit[27] is 0 and the target execution context is either:

- EL1.
- EL0 when (HCR_EL2.E2H==0 or HCR_EL2.TGE==0) or EL2 is using AArch32 state.

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and (HCR_EL2.E2H==0 or HCR_EL2.TGE==0 or ELUsingAArch32(EL2)), this field is treated as the current VMID.

When the instruction is executed at EL0 and (HCR_EL2.E2H==1 and HCR_EL2.TGE==1 and !ELUsingAArch32(EL2)), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

**Bits [15:9]**

Reserved, RES0.

**GASID, bit [8]**

Execution of this instruction applies to all ASIDs or a specified ASID.

<table>
<thead>
<tr>
<th>GASID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Applies to specified ASID for an EL0 target execution context.</td>
</tr>
<tr>
<td>1</td>
<td>Applies to all ASID for an EL0 target execution context.</td>
</tr>
</tbody>
</table>

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.
**ASID, bits [7:0]**

Only applies for an EL0 target execution context and when bit[8] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

**Executing theDVPRCTX instruction**

Accesses to this instruction use the following encodings:

\[
\text{MCR}\{<c>\}\{<q>\} <\text{coproc}>, \{#\}<\text{opcl}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>\{, \{#\}<\text{opc2}\rangle
\]

<table>
<thead>
<tr>
<th>coproc</th>

ELR_hyp, Exception Link Register (Hyp mode)

The ELR_hyp characteristics are:

**Purpose**

When taking an exception to Hyp mode, holds the address to return to.

**Configuration**

AArch32 System register ELR_hyp bits [31:0] are architecturally mapped to AArch64 System register ELR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ELR_hyp are UNDEFINED.

**Attributes**

ELR_hyp is a 32-bit register.

**Field descriptions**

The ELR_hyp bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [31:0]**

Return address.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ELR_hyp**

ELR_hyp is accessible only at Hyp mode and Monitor mode.

Accesses to this register use the following encodings:

- **MRS{<c>}{<q>} <Rd>, ELR_hyp**

<table>
<thead>
<tr>
<th>R</th>
<th>M</th>
<th>M1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>0b1</td>
<td>0b1110</td>
</tr>
</tbody>
</table>

- **MSR{<c>}{<q>} ELR_hyp, <Rn>**

<table>
<thead>
<tr>
<th>R</th>
<th>M</th>
<th>M1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>0b1</td>
<td>0b1110</td>
</tr>
</tbody>
</table>
ERRIDR, Error Record ID Register

The ERRIDR characteristics are:

**Purpose**

Defines the highest numbered index of the error records that can be accessed through the Error Record System registers.

**Configuration**

AArch32 System register ERRIDR bits [31:0] are architecturally mapped to AArch64 System register \texttt{ERRIDR_EL1[31:0]}.

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERRIDR are \texttt{UNDEFINED}.

**Attributes**

ERRIDR is a 32-bit register.

**Field descriptions**

The ERRIDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>\texttt{RES0}</td>
</tr>
<tr>
<td>15-0</td>
<td>\texttt{NUM}</td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, \texttt{RES0}.

**NUM, bits [15:0]**

Highest numbered index of the records that can be accessed through the Error Record System registers plus one. Zero indicates that no records can be accessed through the Error Record System registers.

Each implemented record is owned by a node. A node might own multiple records.

**Accessing the ERRIDR**

Accesses to this register use the following encodings:

\[ \text{MRC}\{<c>\}\{<q>\} \text{<coproc}, \{#}\text{<opc1>, <Rt>, <CRn>, <CRm>{, \{#}\text{<opc2>}}} \]

<table>
<thead>
<tr>

ERRSELR, Error Record Select Register

The ERRSELR characteristics are:

**Purpose**

Selects an error record to be accessed through the Error Record System registers.

**Configuration**

AArch32 System register `ERRSELR` bits [31:0] are architecturally mapped to AArch64 System register `ERRSELR_EL1[31:0]`.

This register is present only when `FEAT_RAS` is implemented. Otherwise, direct accesses to ERRSELR are **UNDEFINED**.

If `ERRIDR` indicates that zero error records are implemented, then it is **IMPLEMENTATION DEFINED** whether ERRSELR is **UNDEFINED** or **RES0**.

**Attributes**

ERRSELR is a 32-bit register.

**Field descriptions**

The ERRSELR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | SEL |

**Bits [31:16]**

Reserved, RES0.

**SEL, bits [15:0]**

Selects the error record accessed through the ERX registers.

For example, if `ERRSELR.SEL` is set to `0x0004`, then direct reads and writes of `ERXSTATUS` access `ERR4STATUS`.

If `ERRSELR.SEL` is set to a value greater than or equal to `ERRIDR.NUM`, then all of the following apply:

- The value read back from `ERRSELR.SEL` is **UNKNOWN**.
- One of the following occurs:
  - An **UNKNOWN** error record is selected.
  - The ERX* registers are RAZ/WI.
  - ERX* register reads and writes are NOPs.
  - ERX* register reads and writes are **UNDEFINED**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the ERRSELR**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

ERXADDR, Selected Error Record Address Register

The ERXADDR characteristics are:

**Purpose**

Accesses bits [31:0] of \(\text{ERR}_n\text{ADDR}\) for the error record \(n\) selected by \(\text{ERRSELR}.\text{SEL}\).

**Configuration**

AArch32 System register ERXADDR bits [31:0] are architecturally mapped to AArch64 System register \(\text{ERXADDR}_{\text{EL1}}[31:0]\).

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXADDR are UNDEFINED.

**Attributes**

ERXADDR is a 32-bit register.

**Field descriptions**

The ERXADDR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [31:0]**

ERXADDR accesses bits [31:0] of \(\text{ERR}_n\text{ADDR}\), where \(n\) is the value in \(\text{ERRSELR}.\text{SEL}\).

**Accessing the ERXADDR**

If \(\text{ERRIDR}.\text{NUM} == 0x0000\) or \(\text{ERRSELR}.\text{SEL}\) is set to a value greater than or equal to \(\text{ERRIDR}.\text{NUM}\), then one of the following occurs:

- An **UNKNOWN** error record is selected.
- ERXADDR is RAZ/WI.
- Direct reads and writes of ERXADDR are NOPs.
- Direct reads and writes of ERXADDR are UNDEFINED.

\(\text{ERR}_n\text{ADDR}\) describes additional constraints that also apply when \(\text{ERR}_n\text{ADDR}\) is accessed through ERXADDR.

Accesses to this register use the following encodings:

\[\text{MRC\{<c>\}{<q>}} <\text{coproc}>, \{#<\text{opc1}>\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}\} \{,#\}<\text{opc2}>\]

ERXADDR2, Selected Error Record Address Register 2

The ERXADDR2 characteristics are:

**Purpose**

Accesses bits [63:32] of ERXADDR for the error record <n> selected by ERRSELR.SEL.

**Configuration**

AArch32 System register ERXADDR2 bits [31:0] are architecturally mapped to AArch64 System register ERXADDR_EL1[63:32].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXADDR2 are UNDEFINED.

**Attributes**

ERXADDR2 is a 32-bit register.

**Field descriptions**

The ERXADDR2 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [63:32]**

ERXADDR2 accesses bits [63:32] of ERR<n>ADDR, where <n> is the value in ERRSELR.SEL.

**Accessing the ERXADDR2**

If ERRDR.NUM == 0x0000 or ERRSELR.SEL is set to a value greater than or equal to ERRDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXADDR2 is RAZ/WI.
- Direct reads and writes of ERXADDR2 are NOPs.
- Direct reads and writes of ERXADDR2 are UNDEFINED.

**ERR<n>ADDR** describes additional constraints that also apply when ERR<n>ADDR is accessed through ERXADDR2.

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

ERXFR, Selected Error Record Feature Register

The ERXFR characteristics are:

**Purpose**

Accesses bits \([31:0]\) of ERR\(<n>\)FR for the error record \(<n>\) selected by ERRSELR.SEL.

**Configuration**

AArch32 System register ERXFR bits \([31:0]\) are architecturally mapped to AArch64 System register ERXFR_EL1[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXFR are UNDEFINED.

**Attributes**

ERXFR is a 32-bit register.

**Field descriptions**

The ERXFR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bits [31:0] of ERR\(<n>\)FR |

**Bits [31:0]**

ERXFR accesses bits [31:0] of ERR\(<n>\)FR, where \(<n>\) is the value in ERRSELR.SEL.

**Accessing the ERXFR**

If ERRIDR.NUM == 0x0000 or ERRSELR.SEL is set to a value greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXFR is RAZ.
- Direct reads of ERXFR are NOPs.
- Direct reads of ERXFR are UNDEFINED.

Accesses to this register use the following encodings:

ERXMISC1, Selected Error Record Miscellaneous Register 1

The ERXMISC1 characteristics are:

**Purpose**

Accesses bits [63:32] of ERR\(n\)MISC0 for the error record \(n\) selected by ERXSELR.SEL.

**Configuration**

AArch32 System register ERXMISC1 bits [31:0] are architecturally mapped to AArch64 System register ERXMISC0_EL1[63:32].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXMISC1 are UNDEFINED.

**Attributes**

ERXMISC1 is a 32-bit register.

**Field descriptions**

The ERXMISC1 bit assignments are:

<table>
<thead>

*Bits [63:32] of ERR\(n\)MISC0*

**Bits [31:0]**

ERXMISC1 accesses bits [63:32] of ERR\(n\)MISC0, where \(n\) is the value in ERXSELR.SEL.

**Accessing the ERXMISC1**

If ERRIDR.NUM == 0x0000 or ERXSELR.SEL is set to a value greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC1 is RAZ/WI.
- Direct reads and writes of ERXMISC1 are NOPs.
- Direct reads and writes of ERXMISC1 are UNDEFINED.

ERR\(n\)MISC0 describes additional constraints that also apply when ERR\(n\)MISC0 is accessed through ERXMISC1.

Accesses to this register use the following encodings:

\[ \text{MRC\{<c>\}{<q>}} \text{ <coproc>, \{#<opc1>, <Rt>, <CRn>, <CRm>{, \{#<opc2>}} \}

The ERXMISC3 characteristics are:

**Purpose**

Accesses bits [63:32] of ERR<n>MISC1 for the error record <n> selected by ERRSEL.R SEL.

**Configuration**

AArch32 System register ERXMISC3 bits [31:0] are architecturally mapped to AArch64 System register ERXMISC1_EL1[63:32].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXMISC3 are UNDEFINED.

**Attributes**

ERXMISC3 is a 32-bit register.

**Field descriptions**

The ERXMISC3 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [31:0]**

ERXMISC3 accesses bits [63:32] of ERR<n>MISC1, where <n> is the value in ERRSEL.R SEL.

**Accessing the ERXMISC3**

If ERRIDR.NUM == 0x0000 or ERRSEL.R SEL is set to a value greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC3 is RAZ/WI.
- Direct reads and writes of ERXMISC3 are NOPs.
- Direct reads and writes of ERXMISC3 are UNDEFINED.

ERR<n>MISC1 describes additional constraints that also apply when ERR<n>MISC1 is accessed through ERXMISC3.

Accesses to this register use the following encodings:

ERXMISC4, Selected Error Record Miscellaneous Register 4

The ERXMISC4 characteristics are:

**Purpose**

Accesses bits [31:0] of ERR<n>MISC2 for the error record <n> selected by ERRELR.SEL.

**Configuration**

AArch32 System register ERXMISC4 bits [31:0] are architecturally mapped to AArch64 System register ERXMISC2_EL1[31:0].

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXMISC4 are UNDEFINED.

**Attributes**

ERXMISC4 is a 32-bit register.

**Field descriptions**

The ERXMISC4 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>ERR&lt;n&gt;MISC2[31]</td>
<td>Access bit</td>
</tr>
<tr>
<td>30</td>
<td>ERR&lt;n&gt;MISC2[29]</td>
<td>Access bit</td>
</tr>
<tr>
<td>...</td>
<td>...</td>
<td>...</td>
</tr>
<tr>
<td>0</td>
<td>ERR&lt;n&gt;MISC2[0]</td>
<td>Access bit</td>
</tr>
</tbody>
</table>

**Accessing the ERXMISC4**

If ERRIDR.NUM == 0x0000 or ERRELR.SEL is set to a value greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC4 is RAZ/WI.
- Direct reads and writes of ERXMISC4 are NOPs.
- Direct reads and writes of ERXMISC4 are UNDEFINED.

ERR<n>MISC2 describes additional constraints that also apply when ERR<n>MISC2 is accessed through ERXMISC4.

Accesses to this register use the following encodings:

\[

ERXMISC5, Selected Error Record Miscellaneous Register 5

The ERXMISC5 characteristics are:

**Purpose**

Accesses bits [63:32] of \(\text{ERR}<n>MISC2\) for the error record \(<n>\) selected by \(\text{ERRSELR}.\SEL\).

**Configuration**

AArch32 System register ERXMISC5 bits [31:0] are architecturally mapped to AArch64 System register \(\text{ERXMISC2_EL1}[63:32]\).

This register is present only when \(\text{FEAT_RASv1p1}\) is implemented. Otherwise, direct accesses to ERXMISC5 are UNDEFINED.

**Attributes**

ERXMISC5 is a 32-bit register.

**Field descriptions**

The ERXMISC5 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|                |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

**Bits [31:0]**

ERXMISC5 accesses bits [63:32] of \(\text{ERR}<n>MISC2\), where \(<n>\) is the value in \(\text{ERRSELR}.\SEL\).

**Accessing the ERXMISC5**

If \(\text{ERRIDR}.\NUM == 0x0000\) or \(\text{ERRSELR}.\SEL\) is set to a value greater than or equal to \(\text{ERRIDR}.\NUM\), then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC5 is RAZ/WI.
- Direct reads and writes of ERXMISC5 are NOPs.
- Direct reads and writes of ERXMISC5 are UNDEFINED.

\(\text{ERR}<n>MISC2\) describes additional constraints that also apply when \(\text{ERR}<n>MISC2\) is accessed through ERXMISC5.

Accesses to this register use the following encodings:

\[ \text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}\{, \{#\}<\text{opc2}\}} \]

The ERXMISC6 characteristics are:

**Purpose**

Accesses bits [31:0] of \( \text{ERR}<n>MISC3 \) for the error record \(<n>\) selected by ERRELR.SEL.

**Configuration**

AArch32 System register ERXMISC6 bits [31:0] are architecturally mapped to AArch64 System register \( \text{ERXMISC3\_EL1}[31:0] \).

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXMISC6 are UNDEFINED.

**Attributes**

ERXMISC6 is a 32-bit register.

**Field descriptions**

The ERXMISC6 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Bits [31:0] of ( \text{ERR}&lt;n&gt;MISC3 )</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

ERXMISC6 accesses bits [31:0] of \( \text{ERR}<n>MISC3 \), where \(<n>\) is the value in ERRELR.SEL.

**Accessing the ERXMISC6**

If ERRIDR.NUM == 0x0000 or ERRELR.SEL is set to a value greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC6 is RAZ/WI.
- Direct reads and writes of ERXMISC6 are NOPs.
- Direct reads and writes of ERXMISC6 are UNDEFINED.

\( \text{ERR}<n>MISC3 \) describes additional constraints that also apply when \( \text{ERR}<n>MISC3 \) is accessed through ERXMISC6.

Accesses to this register use the following encodings:

\[
\text{MRC} \{<c>\} \{<q>\} \text{ <coproc>, \{#<opc1>, <Rt>, <CRn>, <CRm>{, \{#<opc2>\}}}
\]

**ERXMISC7, Selected Error Record Miscellaneous Register 7**

The ERXMISC7 characteristics are:

### Purpose

Accesses bits [63:32] of ERR<n>MISC3 for the error record <n> selected by ERRSELR.SEL.

### Configuration

AArch32 System register ERXMISC7 bits [31:0] are architecturally mapped to AArch64 System register ERXMISC3_EL1[63:32].

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXMISC7 are **UNDEFINED**.

### Attributes

ERXMISC7 is a 32-bit register.

### Field descriptions

The ERXMISC7 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [63:32] of ERR<n>MISC3**

**Bits [31:0]**

ERXMISC7 accesses bits [63:32] of ERR<n>MISC3, where <n> is the value in ERRSELR.SEL.

### Accessing the ERXMISC7

If ERRIDR.NUM == 0x0000 or ERRSELR.SEL is set to a value greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An **UNKNOWN** error record is selected.
- ERXMISC7 is RAZ/WI.
- Direct reads and writes of ERXMISC7 are NOPs.
- Direct reads and writes of ERXMISC7 are **UNDEFINED**.

ERR<n>MISC3 describes additional constraints that also apply when ERR<n>MISC3 is accessed through ERXMISC7.

Accesses to this register use the following encodings:

else
  ERXMISC7 = R[t];
The ERXSTATUS characteristics are:

**Purpose**

Accesses bits [31:0] of \texttt{ERR<n>STATUS} for the error record selected by \texttt{ERRSELR.SEL}.

**Configuration**

AArch32 System register ERXSTATUS bits [31:0] are architecturally mapped to AArch64 System register \texttt{ERXSTATUS_EL1[31:0]}.

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXSTATUS are UNDEFINED.

**Attributes**

ERXSTATUS is a 32-bit register.

**Field descriptions**

The ERXSTATUS bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

**Bits [31:0]**

ERXSTATUS accesses bits [31:0] of \texttt{ERR<n>STATUS}, where \(n\) is the value in \texttt{ERRSELR.SEL}.

**Accessing the ERXSTATUS**

If \texttt{ERRIDR.NUM} == 0 or \texttt{ERRSELR.SEL} is set to a value greater than or equal to \texttt{ERRIDR.NUM}, then one of the following occurs:

- An \texttt{UNKNOWN} record is selected.
- ERXSTATUS is RAZ/WI.
- Direct reads and writes of ERXSTATUS are NOPs.
- Direct reads and writes of ERXSTATUS are UNDEFINED.

Accesses to this register use the following encodings:

\[
\text{MRC} \{<c>\} \{<q>\} <\text{coproc}>, \{#<opc1>\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#<opc2>\}
\]

FCSEIDR, FCSE Process ID register

The FCSEIDR characteristics are:

**Purpose**

Identifies whether the Fast Context Switch Extension (FCSE) is implemented.

From Armv8, the FCSE is not implemented, so this register is RAZ/WI. Software can access this register to determine that the implementation does not include the FCSE.

**Configuration**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to FCSEIDR are UNDEFINED.

**Attributes**

FCSEIDR is a 32-bit register.

**Field descriptions**

The FCSEIDR bit assignments are:

| Bit 31 | Bit 30 | Bit 29 | Bit 28 | Bit 27 | Bit 26 | Bit 25 | Bit 24 | Bit 23 | Bit 22 | Bit 21 | Bit 20 | Bit 19 | Bit 18 | Bit 17 | Bit 16 | Bit 15 | Bit 14 | Bit 13 | Bit 12 | Bit 11 | Bit 10 | Bit 9  | Bit 8  | Bit 7  | Bit 6  | Bit 5  | Bit 4  | Bit 3  | Bit 2  | Bit 1  | Bit 0  |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
|        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |

FPEXC, Floating-Point Exception Control register

The FPEXC characteristics are:

**Purpose**

Provides a global enable for the implemented Advanced SIMD and floating-point functionality, and reports floating-point status information.

**Configuration**

AArch32 System register FPEXC bits [31:0] are architecturally mapped to AArch64 System register FPEXC32_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to FPEXC are UNDEFINED.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

**Attributes**

FPEXC is a 32-bit register.

**Field descriptions**

The FPEXC bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| EX | EN | DEX | FP2V | VV | TFV | RES0 | VECITR | DF | RES0 | XF | UFF | OFF | DZF | IOF |

**EX, bit [31]**

Exception bit. From Armv8, this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EN, bit [30]**

Enables access to the Advanced SIMD and floating-point functionality from all Exception levels, except that setting this field to 0 does not disable the following:

- VMSR accesses to the FPEXC or FPSID.
- VMRS accesses from the FPEXC, FPSID, MVFR0, MVFR1, or MVFR2.

<table>
<thead>
<tr>
<th>EN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to the FPSR, and any of the SIMD and floating-point registers Q0-Q15, including their views as D0-D31 registers or S0-S31 registers, are UNDEFINED at all Exception levels.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control permits access to the Advanced SIMD and floating-point functionality at all Exception levels.</td>
</tr>
</tbody>
</table>

Execution of floating-point and Advanced SIMD instructions in AArch32 state can be disabled or trapped by the following controls:

- CPACR.cp10, or, if executing at EL0, CPACR_EL1.FPEN.
- FPEXC.EN.
- If executing in Non-secure state:
  - HCPR.TCP10, or if EL2 is using AArch64, CPTR_EL2.TFP.
  - NSACR.cp10, or if EL3 is using AArch64, CPTR_EL3.TFP.
- For Advanced SIMD instructions only:
See the descriptions of the controls for more information.

Note

When executing at EL0 using AArch32:

- If EL1 is using AArch64 then behavior is as if the value of FPEXC.EN is 1.
- If EL2 is using AArch64 and enabled in the current Security state, and the value of HCR_EL2.{RW, TGE} is \{1, 1\}, then the behavior is as if the value of FPEXC.EN is 1.
- If EL2 is using AArch64 and enabled in the current Security state, and the value of HCR_EL2.{RW, TGE} is \{0, 1\}, then it is IMPLEMENTATION DEFINED whether the behavior is:
  - As if the value of FPEXC.EN is 1.
  - Determined by the value of FPEXC.EN, as described in this field description. However, Arm deprecates using the value of FPEXC.EN to determine behavior.

On a Warm reset, this field resets to 0.

**DEX, bit [29]**

Defined synchronous exception on floating-point execution.

This field identifies whether a synchronous exception generated by the attempted execution of an instruction was generated by an unallocated encoding. The instruction must be in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr() returning TRUE. This field also indicates whether the FPEXC.TFV field is valid.

The meaning of this bit is:

<table>
<thead>
<tr>
<th>DEX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The exception was generated by the attempted execution of an unallocated instruction in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr(). If FPEXC.TFV is RW then it is invalid and UNKNOWN. If FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} are RW then they are invalid and UNKNOWN.</td>
</tr>
<tr>
<td>0b1</td>
<td>The exception was generated during the execution of an unallocated encoding. FPEXC.TFV is valid and indicates the cause of the exception.</td>
</tr>
</tbody>
</table>

On an exception that sets this bit to 1 the exception-handling routine must clear this bit to 0.

On an implementation that both does not support trapping of floating-point exceptions and implements the FPSCR.{Stride, Len} fields as RAZ, this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**FP2V, bit [28]**

FPINST2 instruction valid bit. From Armv8, this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**VV, bit [27]**

VECITR valid bit. From Armv8, this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**TFV, bit [26]**

Trapped Fault Valid bit. Valid only when the value of FPEXC.DEX is 1. When valid, it indicates the cause of the exception and therefore whether the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are valid.

<table>
<thead>
<tr>
<th>TFV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The exception was caused by the execution of a floating-point VABS, VADD, VDIV, VFMA, VFMS, VFNMA, VFNMS, VMLA, VMLS, VMOV, VMUL, VNEG, VNMLA, VNMLS, VNMUL, VSQRT, or VSUB instruction when one or both of FPSCR.{Stride, Len} was non-zero. If the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are RW then they are invalid and UNKNOWN.</td>
</tr>
<tr>
<td>0b1</td>
<td>FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} indicate the presence of trapped floating-point exceptions that had occurred at the time of the exception. Bits are set for all trapped exceptions that had occurred at the time of the exception.</td>
</tr>
</tbody>
</table>

This bit returns a status value and ignores writes.

When the value of FPEXC.DEX is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On an implementation that supports the trapping of floating-point exceptions and implements FPSCR.{Stride, Len} as RAZ, this bit is RAO/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [25:11]**

Reserved, RES0.

**VECITR, bits [10:8]**

Vector iteration count. From Armv8, this field is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IDF, bit [7]**

Input Denormal trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Input Denormal exception occurred while FPSCR.IDE was 1:

<table>
<thead>
<tr>
<th>IDF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Input Denormal exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Input Denormal exception has occurred.</td>
</tr>
</tbody>
</table>

Input Denormal exceptions can occur only when FPSCR.FZ is 1.

**Note**

A half-precision floating-point value that is flushed to zero because the value of FPSCR.FZ16 is 1 does not generate an Input Denormal exception.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [6:5]**

Reserved, RES0.
**IXF, bit [4]**

Inexact trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Inexact exception occurred while FPSCR.IXE was 1:

<table>
<thead>
<tr>
<th>IXF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Inexact exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Inexact exception has occurred.</td>
</tr>
</tbody>
</table>

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and **UNKNOWN**.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**UFF, bit [3]**

Underflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Underflow exception occurred while FPSCR.UFE was 1:

<table>
<thead>
<tr>
<th>UFF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Underflow exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Underflow exception has occurred.</td>
</tr>
</tbody>
</table>

Underflow trapped exceptions can occur:

- On half-precision data-processing instructions only when FPSCR.FZ16 is 0.
- Otherwise only when FPSCR.FZ is 0.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and **UNKNOWN**.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**OFF, bit [2]**

Overflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Overflow exception occurred while FPSCR.OFE was 1:

<table>
<thead>
<tr>
<th>OFF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Overflow exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Overflow exception has occurred.</td>
</tr>
</tbody>
</table>

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and **UNKNOWN**.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**DZF, bit [1]**

Divide by Zero trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether a Divide by Zero exception occurred while FPSCR.DZE was 1:

<table>
<thead>
<tr>
<th>DZF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Divide by Zero exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Divide by Zero exception has occurred.</td>
</tr>
</tbody>
</table>

This bit must be cleared to 0 by the exception-handling routine.
When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and **UNKNOWN**.

On an implementation that does not support the trapping of floating-point exceptions this bit is **RAZ/WI**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IOF, bit [0]**

Invalid Operation trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Invalid Operation exception occurred while **FPSCR.IOE** was 1:

<table>
<thead>
<tr>
<th>IOF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Invalid Operation exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Invalid Operation exception has occurred.</td>
</tr>
</tbody>
</table>

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and **UNKNOWN**.

On an implementation that does not support the trapping of floating-point exceptions this bit is **RAZ/WI**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the FPEXC**

Accesses to this register use the following encodings:

```
VMRS{<c>}{<q>} <Rt>, <spec_reg>
```

<table>
<thead>
<tr>
<th>reg</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1000</td>
</tr>
</tbody>
</table>

            end
        end
FPSCR, Floating-Point Status and Control Register

The FPSCR characteristics are:

**Purpose**

Provides floating-point system status information and control.

**Configuration**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to FPSCR are UNDEFINED.

The named fields in this register map to the equivalent fields in the AArch64 FPCR and FPSR.

It is IMPLEMENTATION DEFINED whether the Len and Stride fields can be programmed to non-zero values, which will cause some AArch32 floating-point instruction encodings to be UNDEFINED, or whether these fields are RAZ.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

**Attributes**

FPSCR is a 32-bit register.

**Field descriptions**

The FPSCR bit assignments are:

```
0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31
N Z C V QC AH D N FZRMode Stride FZ16 Len DERES0 I XE UF E0 F DZE10E IDCR E0 X C U F C O F CD ZC IO C
```

**N, bit [31]**

Negative condition flag. This is updated by floating-point comparison operations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero condition flag. This is updated by floating-point comparison operations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry condition flag. This is updated by floating-point comparison operations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow condition flag. This is updated by floating-point comparison operations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**QC, bit [27]**

Cumulative saturation bit, Advanced SIMD only. This bit is set to 1 to indicate that an Advanced SIMD integer operation has saturated since 0 was last written to this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**AHP, bit [26]**

Alternative half-precision control bit:

<table>
<thead>
<tr>
<th>AHP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IEEE half-precision format selected.</td>
</tr>
<tr>
<td>0b1</td>
<td>Alternative half-precision format selected.</td>
</tr>
</tbody>
</table>

This bit is used only for conversions between half-precision floating-point and other floating-point formats.

The data-processing instructions added as part of the FEAT_FP16 extension always use the IEEE half-precision format, and ignore the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DN, bit [25]**

Default NaN mode control bit:

<table>
<thead>
<tr>
<th>DN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>NaN operands propagate through to the output of a floating-point operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any operation involving one or more NaNs returns the Default NaN.</td>
</tr>
</tbody>
</table>

The value of this bit controls only scalar floating-point arithmetic. Advanced SIMD arithmetic always uses the Default NaN setting, regardless of the value of the DN bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**FZ, bit [24]**

Flush-to-zero mode control bit:

<table>
<thead>
<tr>
<th>FZ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard.</td>
</tr>
<tr>
<td>0b1</td>
<td>Flush-to-zero mode enabled.</td>
</tr>
</tbody>
</table>

The value of this bit controls only scalar floating-point arithmetic. Advanced SIMD arithmetic always uses the Flush-to-zero setting, regardless of the value of the FZ bit.

This bit has no effect on half-precision calculations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**RMode, bits [23:22]**

Rounding Mode control field. The encoding of this field is:

<table>
<thead>
<tr>
<th>RMode</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Round to Nearest (RN) mode.</td>
</tr>
<tr>
<td>0b01</td>
<td>Round towards Plus Infinity (RP) mode.</td>
</tr>
<tr>
<td>0b10</td>
<td>Round towards Minus Infinity (RM) mode.</td>
</tr>
<tr>
<td>0b11</td>
<td>Round towards Zero (RZ) mode.</td>
</tr>
</tbody>
</table>

The specified rounding mode is used by almost all scalar floating-point instructions. Advanced SIMD arithmetic always uses the Round to Nearest setting, regardless of the value of the RMode bits.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Stride, bits [21:20]**

It is **IMPLEMENTATION DEFINED** whether this field is RW or RAZ.

If this field is RW and is set to a value other than zero, some floating-point instruction encodings are **UNDEFINED**. The instruction pseudocode identifies these instructions.

Arm strongly recommends that software never sets this field to a value other than zero.

The value of this field is ignored when processing Advanced SIMD instructions.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**FZ16, bit [19]**

*When FEAT_FP16 is implemented:*

Flush-to-zero mode control bit on half-precision data-processing instructions:

<table>
<thead>
<tr>
<th>FZ16</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard.</td>
</tr>
<tr>
<td>0b1</td>
<td>Flush-to-zero mode enabled.</td>
</tr>
</tbody>
</table>

The value of this bit applies to both scalar and Advanced SIMD floating-point half-precision calculations.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**Len, bits [18:16]**

It is **IMPLEMENTATION DEFINED** whether this field is RW or RAZ.

If this field is RW and is set to a value other than zero, some floating-point instruction encodings are **UNDEFINED**. The instruction pseudocode identifies these instructions.

Arm strongly recommends that software never sets this field to a value other than zero.

The value of this field is ignored when processing Advanced SIMD instructions.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IDE, bit [15]**

Input Denormal floating-point exception trap enable.

<table>
<thead>
<tr>
<th>IDE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Untrapped exception handling selected. If the floating-point exception occurs, the IDC bit is set to 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the IDC bit.</td>
</tr>
</tbody>
</table>

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [14:13]**

Reserved, RES0.

**IXE, bit [12]**

Inexact floating-point exception trap enable.

<table>
<thead>
<tr>
<th>IXE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Untrapped exception handling selected. If the floating-point exception occurs, the IXC bit is set to 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the IXC bit.</td>
</tr>
</tbody>
</table>

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**UFE, bit [11]**

Underflow floating-point exception trap enable.

<table>
<thead>
<tr>
<th>UFE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Untrapped exception handling selected. If the floating-point exception occurs, the UFC bit is set to 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trapped exception handling selected. If the floating-point exception occurs and Flush-to-zero is not enabled, the PE does not update the UFC bit.</td>
</tr>
</tbody>
</table>

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**OFE, bit [10]**

Overflow floating-point exception trap enable.

<table>
<thead>
<tr>
<th>OFE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Untrapped exception handling selected. If the floating-point exception occurs, the OFC bit is set to 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the OFC bit.</td>
</tr>
</tbody>
</table>

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DZE, bit [9]**

Divide by Zero floating-point exception trap enable.
### DZE, bit [9]

Input Denormal cumulative floating-point exception bit. This bit is set to 1 to indicate that the Input Denormal floating-point exception has occurred since 0 was last written to this bit.

- **0b0**: Untrapped exception handling selected. If the floating-point exception occurs, the DZE bit is set to 1.
- **0b1**: Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the DZE bit.

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### IOE, bit [8]

Invalid Operation floating-point exception trap enable.

- **0b0**: Untrapped exception handling selected. If the floating-point exception occurs, the IOC bit is set to 1.
- **0b1**: Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the IOC bit.

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### IDC, bit [7]

Input Denormal cumulative floating-point exception bit. This bit is set to 1 to indicate that the Input Denormal floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the IDE bit.

Advanced SIMD instructions set this bit if the Input Denormal floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the IDE bit.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Bits [6:5]

Reserved, **RES0**.

### IXC, bit [4]

Inexact cumulative floating-point exception bit. This bit is set to 1 to indicate that the Inexact floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the IXE bit.

Advanced SIMD instructions set this bit if the Inexact floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the IXE bit.

The criteria for the Inexact floating-point exception to occur are different in Flush-to-zero mode. For details, see 'Flush-to-zero'.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
**UFC, bit [3]**

Underflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Underflow floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the UFE bit.

Advanced SIMD instructions set this bit if the Underflow floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, if FPSCR.UFE is 0 or if Flush-to-zero is enabled.

The criteria for the Underflow floating-point exception to occur are different in Flush-to-zero mode. For details, see 'Flush-to-zero'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**OFC, bit [2]**

Overflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Overflow floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the OFE bit.

Advanced SIMD instructions set this bit if the Overflow floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the OFE bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DZC, bit [1]**

Divide by Zero cumulative floating-point exception bit. This bit is set to 1 to indicate that the Divide by Zero floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the DZE bit.

Advanced SIMD instructions set this bit if the Divide by Zero floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the DZE bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IOC, bit [0]**

Invalid Operation cumulative floating-point exception bit. This bit is set to 1 to indicate that the Invalid Operation floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the IOE bit.

Advanced SIMD instructions set this bit if the Invalid Operation floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the IOE bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the FPSCR**

Accesses to this register use the following encodings:

\[
\text{VMRS\{<c>\}{<q>\}} \ <Rt>, \ <\text{spec\_reg}> 
\]

        end if
    end if
end if

The FPSID characteristics are:

**Purpose**

Provides top-level information about the floating-point implementation.

This register largely duplicates information held in the MIDR. Arm deprecates use of it.

**Configuration**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to FPSID are UNDEFINED.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

**Attributes**

FPSID is a 32-bit register.

**Field descriptions**

The FPSID bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Implementer</td>
</tr>
<tr>
<td>30</td>
<td>SW</td>
</tr>
<tr>
<td>29</td>
<td>Subarchitecture</td>
</tr>
<tr>
<td>28</td>
<td>PartNum</td>
</tr>
<tr>
<td>27</td>
<td>Variant</td>
</tr>
<tr>
<td>26</td>
<td>Revision</td>
</tr>
</tbody>
</table>

**Implementer, bits [31:24]**

Implementer codes are the same as those used for the MIDR.

For an implementation by Arm this field is 0x41, the ASCII code for A.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SW, bit [23]**

Software bit. Defined values are:

<table>
<thead>
<tr>
<th>SW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The implementation provides a hardware implementation of the floating-point instructions.</td>
</tr>
<tr>
<td>0b1</td>
<td>The implementation supports only software emulation of the floating-point instructions.</td>
</tr>
</tbody>
</table>

In Armv8-A, the only permitted value is 0b0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Subarchitecture, bits [22:16]**

Subarchitecture version number. For an implementation by Arm, defined values are:
### Subarchitecture

<table>
<thead>
<tr>
<th>Subarchitecture</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00000000</td>
<td>VFPv1 architecture with an IMPLEMENTATION DEFINED subarchitecture.</td>
</tr>
<tr>
<td>0b00000001</td>
<td>VFPv2 architecture with Common VFP subarchitecture v1.</td>
</tr>
<tr>
<td>0b00000100</td>
<td>VFPv3 architecture, or later, with Common VFP subarchitecture v2. The VFP architecture version is indicated by the MVFR0 and MVFR1 registers.</td>
</tr>
<tr>
<td>0b00000111</td>
<td>VFPv3 architecture, or later, with Null subarchitecture. The entire floating-point implementation is in hardware, and no software support code is required. The VFP architecture version is indicated by the MVFR0 and MVFR1 registers. This value can be used only by an implementation that does not support the trap enable bits in the FPSCR.</td>
</tr>
<tr>
<td>0b00001000</td>
<td>VFPv3 architecture, or later, with Common VFP subarchitecture v3, and support for trap enable bits in FPSCR. The VFP architecture version is indicated by the MVFR0 and MVFR1 registers.</td>
</tr>
</tbody>
</table>

For a subarchitecture designed by Arm the most significant bit of this field, register bit[22], is 0. Values with a most significant bit of 0 that are not listed here are reserved.

When the subarchitecture designer is not Arm, the most significant bit of this field, register bit[22], must be 1. Each implementer must maintain its own list of subarchitectures it has designed, starting at subarchitecture version number 0x40.

In Armv8-A, the permitted values are 0b00000111 and 0b00001000.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### PartNum, bits [15:8]

An IMPLEMENTATION DEFINED part number for the floating-point implementation, assigned by the implementer.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Variant, bits [7:4]

An IMPLEMENTATION DEFINED variant number. Typically, this field distinguishes between different production variants of a single product.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the floating-point implementation.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

HACR, Hyp Auxiliary Configuration Register

The HACR characteristics are:

**Purpose**

Controls trapping to Hyp mode of IMPLEMENTATION DEFINED aspects of Non-secure EL1 or EL0 operation.

**Configuration**

AArch32 System register HACR bits [31:0] are architecturally mapped to AArch64 System register HACR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HACR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

HACR is a 32-bit register.

**Field descriptions**

The HACR bit assignments are:

HACTLR2, Hyp Auxiliary Control Register 2

The HACTLR2 characteristics are:

**Purpose**

Provides additional space to the HACTLR register to hold IMPLEMENTATION DEFINED trap functionality.

**Configuration**

AArch32 System register HACTLR2 bits [31:0] are architecturally mapped to AArch64 System register ACTLR_EL2[63:32].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HACTLR2 are UNDEFINED.

In Armv8.0 and Armv8.1, it is IMPLEMENTATION DEFINED whether this register is implemented, or whether it causes UNDEFINED exceptions when accessed. The implementation of this register can be detected by examining ID_MMFR4.AC2.

From Armv8.2 this register must be implemented.

**Attributes**

HACTLR2 is a 32-bit register.

**Field descriptions**

The HACTLR2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>

HADFSR, Hyp Auxiliary Data Fault Status Register

The HADFSR characteristics are:

**Purpose**

Provides additional IMPLEMENTATION DEFINED syndrome information for Data Abort exceptions taken to Hyp mode.

**Configuration**

AArch32 System register HADFSR bits [31:0] are architecturally mapped to AArch64 System register AFSR0_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HADFSR are UNDEFINED.

This is an optional register. An implementation that does not require this register can implement it as RES0.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

HADFSR is a 32-bit register.

**Field descriptions**

The HADFSR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

**HAIFSR, Hyp Auxiliary Instruction Fault Status Register**

The HAIFSR characteristics are:

**Purpose**

Provides additional IMPLEMENTATION DEFINED syndrome information for Prefetch Abort exceptions taken to Hyp mode.

**Configuration**

AArch32 System register HAIFSR bits [31:0] are architecturally mapped to AArch64 System register AFSR1_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HAIFSR are UNDEFINED.

This is an optional register. An implementation that does not require this register can implement it as RES0.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

HAIFSR is a 32-bit register.

**Field descriptions**

The HAIFSR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>

HCPtr, Hyp Architectural Feature Trap Register

The HCPtr characteristics are:

**Purpose**

Controls:

- Trapping to Hyp mode of Non-secure access, at EL1 or EL0, to trace, and to Advanced SIMD and floating-point functionality.
- Hyp mode access to trace, and to Advanced SIMD and floating-point functionality.

**Note**

Accesses to this functionality:

- From Non-secure modes other than Hyp mode are also affected by settings in the **CPACR** and **NSACR**.
- From Hyp mode are also affected by settings in the **NSACR**.

Exceptions generated by the **CPACR** and **NSACR** controls are higher priority than those generated by the HCPtr controls.

**Configuration**

AArch32 System register HCPtr bits [31:0] are architecturally mapped to AArch64 System register **CPTR_EL2[31:0]**.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HCPtr are **UNDEFINED**.

If EL2 is not implemented, this register is **RES0** from EL3.

**Attributes**

HCPtr is a 32-bit register.

**Field descriptions**

The HCPtr bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| TCPAC | TAM | RES0 | TTA | RES0 | TASE | RES0 | RES1 | TCP11 | TCP10 | RES1 |

**TCPAC, bit [31]**

Traps Non-secure EL1 accesses to the **CPACR** to Hyp mode.

<table>
<thead>
<tr>
<th>TCPAC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 accesses to the <strong>CPACR</strong> are trapped to Hyp mode.</td>
</tr>
</tbody>
</table>

**Note**

The **CPACR** is not accessible at EL0.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.
TAM, bit [30]

When FEAT_AMUv1 is implemented:

Trap Activity Monitor access. Traps Non-secure EL1 and EL0 accesses to all Activity Monitor registers to EL2.

<table>
<thead>
<tr>
<th>TAM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses from Non-secure EL1 and EL0 to Activity Monitor registers are not trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses from Non-secure EL1 and EL0 to Activity Monitor registers are trapped to Hyp mode.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [29:21]

Reserved, RES0.

TTA, bit [20]

Traps Non-secure System register accesses to all implemented trace registers to Hyp mode.

<table>
<thead>
<tr>
<th>TTA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>
| 0b1  | Any Non-secure System register access to an implemented trace register is trapped to Hyp mode, unless the access is trapped to EL1 by a CPACR or NSACR control, or the access is from Non-secure EL0 and the definition of the register in the appropriate trace architecture specification indicates that the register is not accessible from EL0. A trapped instruction generates:  
• A Hyp Trap exception, if the exception is taken from Non-secure EL0 or EL1.  
• An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode. |

If the implementation does not include a PE trace unit, or does not include a System register interface to the PE trace unit registers, it is IMPLEMENTATION DEFINED whether this bit:

• Is RES0.
• Is RES1.
• Can be written from Hyp mode, and from Secure Monitor mode when SCR.NS is 1.

If EL3 is implemented and is using AArch32, and the value of NSACR.NSTRCDIS is 1, in Non-secure state this field behaves as RAO/WI, regardless of its actual value.

Note

• The ETMv4 architecture does not permit EL0 to access the trace registers. If the PE trace unit implements FEAT_ETMv4, EL0 accesses to the trace registers are UNDEFINED, and a resulting Undefined Instruction exception is higher priority than a HCPT.TTA Hyp Trap exception.  
• The architecture does not provide traps on trace register accesses through the optional memory-mapped debug interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Bits [19:16]

Reserved, RES0.
TASE, bit [15]

Traps Non-secure execution of Advanced SIMD instructions to Hyp mode when the value of HCPTR.TCP10 is 0.

<table>
<thead>
<tr>
<th>TASE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>
| 0b1  | When the value of HCPTR.TCP10 is 0, any attempt to execute an Advanced SIMD instruction in Non-secure state is trapped to Hyp mode, unless it is trapped to EL1 by a CPACR or NSACR control. A trapped instruction generates:  
  • A Hyp Trap exception, if the exception is taken from Non-secure EL0 or EL1.  
  • An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode. |

When the value of HCPTR.TCP10 is 1, the value of this field is ignored.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is res1. Otherwise, it is IMPLEMENTATION DEFINED whether this field is implemented as a RW field. If it is not implemented as a RW field, then it is RAZ/WI.

If EL3 is implemented and is using AArch32, and the value of NSACR_NSASEDIS is 1, in Non-secure state this field behaves as RAO/WI, regardless of its actual value. This applies even if the field is implemented as RAZ/WI.

For the list of instructions affected by this field, see ‘Controls of Advanced SIMD operation that do not apply to floating-point operation’.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Bit [14]

Reserved, res0.

Bits [13:12]

Reserved, res1.

TCP11, bit [11]

The value of this field is ignored. If this field is programmed with a different value to the TCP10 bit then this field is UNKNOWN on a direct read of the HCPTR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is res1.

If EL3 is implemented and is using AArch32, and the value of NSACR_cp10 is 0, in Non-secure state this field behaves as RAO/WI, regardless of its actual value.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TCP10, bit [10]

Trap Non-secure accesses to Advanced SIMD and floating-point functionality to Hyp mode:

<table>
<thead>
<tr>
<th>TCP10</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>
| 0b1   | Any attempted access to Advanced SIMD and floating-point functionality from Non-secure state is trapped to Hyp mode, unless it is trapped to EL1 by a CPACR or NSACR control. A trapped instruction generates:  
  • A Hyp Trap exception, if the exception is taken from Non-secure EL0 or EL1.  
  • An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode. |

The Advanced SIMD and floating-point features controlled by these fields are:
• Execution of any floating-point or Advanced SIMD instruction.
• Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
• Any access to the FPSCR, FPSID, MVFR0, MVFR1, MVFR2, or FPEXC System registers.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES1.

If EL3 is implemented and is using AArch32, and the value of NSACR.cp10 is 0, in Non-secure state this field behaves as RAO/WI, regardless of its actual value.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Bits [9:0]**

Reserved, RES1.

HCR, Hyp Configuration Register

The HCR characteristics are:

**Purpose**

Provides configuration controls for virtualization, including defining whether various Non-secure operations are trapped to Hyp mode.

**Configuration**

AArch32 System register HCR bits [31:0] are architecturally mapped to AArch64 System register HCR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

HCR is a 32-bit register.

**Field descriptions**

The HCR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES | TRVM | HCD | RES | TGET | TVMTTLB | TMPUPCT | TSWT | TACT | IDCPT | TSC | TID3 | TID2 | TID1 | TID0 | TWE | TWI | DCBSU | FB | VA | VF | AMO | IMO | FMO | PTW | SWIO | VM |

**Bit [31]**

Reserved, RES0.

**TRVM, bit [30]**

Trap Reads of Virtual Memory controls. Traps Non-secure EL1 reads of the virtual memory control registers to EL2, when EL2 is enabled in the current Security state.

The registers for which read accesses are trapped are as follows:

SCTLB, TTBR0, TTBR1, TTBCR, TTBCR2, DACR, DFSR, JFSR, DFAR, IFAR, ADFSR, AIFSAR, PRRR, NMRR, MAIR0, MAIR1, AMAIR0, AMAIR1, CONTEXTIDR.

<table>
<thead>
<tr>
<th>TRVM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 read accesses to the specified Virtual Memory controls are trapped to EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**HCD, bit [29]**

When EL3 is not implemented:

HVC instruction disable. Disables Non-secure EL1 and EL2 execution of HVC instructions, when EL2 is enabled in the current Security state.
HVC instruction execution is enabled at EL2 and EL1.

Note

HVC instructions are always UNDEFINED at EL0.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [28]

Reserved, RES0.

TGE, bit [27]

Trap General Exceptions, from Non-secure EL0.

TGE | Meaning
---|---
0b0 | This control has no effect on execution at EL0.
0b1 | When EL2 is not enabled in the current Security state, this control has no effect on execution at EL0.
When EL2 is enabled in the current Security state, then:
• All exceptions that would be routed to EL1 are routed to EL2.
• The SCTLR.M bit is treated as being 0 for all purposes other than returning the result of a direct read of SCTLR.
• The HCR.{FMO, IMO, AMO} bits are treated as being 1 for all purposes other than returning the result of a direct read of HCR.
• All virtual interrupts are disabled.
• Any IMPLEMENTATION DEFINED mechanisms for signaling virtual interrupts are disabled.
• An exception return to EL1 is treated as an illegal exception return.
• Monitor mode execution of an MSR or CPS instruction that changes PSTATE.M to a Non-secure EL1 mode is an illegal change to PSTATE.M. For more information see ‘Illegal changes to PSTATE.M’.

Also, when HCR.TGE is 1:

• If EL3 is using AArch32, an attempt to change from a Secure PL1 mode to a Non-secure EL1 mode by changing SCR.NS from 0 to 1 results in SCR.NS remaining as 0.
• The HDCR.{TDRA, TDOSA, TDA, TDE} bits are ignored and treated as being 1 other than for the purpose of a direct read of HDCR.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TVM, bit [26]

Trap Virtual Memory controls. Traps Non-secure EL1 writes to the virtual memory control registers to EL2, when EL2 is enabled in the current Security state.

The registers for which write accesses are trapped are as follows:

SCTLR, TTBR0, TTBR1, TTBCR, TTBCR2, DACR, DFSR, IFSR, DFAR, IFAR, ADFSR, AIFSR, PRRR, NMRR, MAIR0, MAIR1, AMAIR0, AMAIR1, CONTEXTIDR.
On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**TTLB, bit [25]**

Trap TLB maintenance instructions. Traps Non-secure EL1 execution of a TLBI instruction to EL2, when EL2 is enabled in the current Security state.

This applies to the following instructions:

- TLBIALL, TLBIIMVA, TLBIASID, TLBIMVAA, TLBIMVAI, TLBIMVAI, TLBIALL, TLBIMVA, TLBIASID, DTLBIALL, DTLBIMVA, DTLBIMVAA, DTLBIMVAI, DTLBIMVA.

<table>
<thead>
<tr>
<th>TTLB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 accesses to the specified TLB maintenance instructions are trapped to EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**TPU, bit [24]**

Trap cache maintenance instructions that operate to the Point of Unification. Traps Non-secure EL1 execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state.

This applies to the following instructions:

- ICIMVAU, ICIALLU, ICIALLUS, DCCMVAA.

**Note**

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

<table>
<thead>
<tr>
<th>TPU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 execution of the specified cache maintenance instructions is trapped to EL2.</td>
</tr>
</tbody>
</table>

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**TPC, bit [23]**

Trap data or unified cache maintenance instructions that operate to the Point of Coherency. Traps Non-secure EL1 execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state.

This applies to the following instructions:

- DCIMVAC, DCCIMVAC, DCCMVAC.

**Note**

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.
### TPC

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0                      This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1                      Non-secure EL1 execution of the specified cache maintenance instructions is trapped to EL2.</td>
</tr>
</tbody>
</table>

If the Point of Coherency is before any level of data cache, it is **IMPLEMENTATION DEFINED** whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

### TSW, bit [22]

Trap data or unified cache maintenance instructions that operate by Set/Way. Traps non-secure EL1 execution of those cache maintenance instructions by set/way to EL2, when EL2 is enabled in the current Security state.

This applies to the following instructions:

- DCISW, DCCSW, DCCISW.

**Note**

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always **UNDEFINED** at EL0.

### TSW

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0                      This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1                      Non-secure EL1 execution of the specified cache maintenance instructions is trapped to EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

### TAC, bit [21]

Trap Auxiliary Control Registers. Traps non-secure EL1 accesses to the Auxiliary Control Registers to EL2, when EL2 is enabled in the current Security state, from both Execution states.

This applies to the following register accesses:

- ACTLR and, if implemented, ACTLR2.

### TAC

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0                      This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1                      Non-secure EL1 accesses to the specified registers are trapped to EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

### TIDCP, bit [20]

Trap **IMPLEMENTATION DEFINED** functionality. Traps non-secure EL1 accesses to the encodings for **IMPLEMENTATION DEFINED** System Registers to EL2, when EL2 is enabled in the current Security state.

MCR and MRC instructions accessing the following encodings:

- All coproc==p15, CRn==c9, Opcode1 = {0-7}, CRm == {c0-c2, c5-c8}, opcode2 == {0-7}.
- All coproc==p15, CRn==c10, Opcode1 == {0-7}, CRm == {c0, c1, c4, c8}, opcode2 == {0-7}.
- All coproc==p15, CRn==c11, Opcode1=={0-7}, CRm == {c0-c8, c15}, opcode2 == {0-7}.

When HCR.TIDCP is set to 1, it is **IMPLEMENTATION DEFINED** whether any of this functionality accessed from Non-secure EL0 is trapped to EL2. Otherwise, it is **UNDEFINED** and the PE takes an Undefined Instruction exception to Non-secure Undefined mode.
TIDCP

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**TSC, bit [19]**

Trap SMC instructions. Traps Non-secure EL1 execution of SMC instructions to Hyp mode.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

The Armv8-A architecture permits, but does not require, this trap to apply to conditional SMC instructions that fail their condition code check, in the same way as with traps on other conditional instructions.

**Note**
- This trap is only implemented if the implementation includes EL3.
- SMC instructions are always UNDEFINED at PL0.
- This bit traps execution of the SMC instruction. It is not a routing control for the SMC exception. Hyp Trap exceptions and SMC exceptions have different preferred return addresses.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**TID3, bit [18]**

Trap ID group 3. Traps Non-secure EL1 reads of the following registers to EL2, when EL2 is enabled in the current Security state as follows:

- VMRS access to MVFR0, MVFR1, and MVFR2, reported using EC syndrome value 0x08, unless access is also trapped by HCPTR which takes priority.
- MRC access to the following registers are reported using EC syndrome value 0x03:
  - If FEAT_FGT is implemented:
    - ID_MMFR4 and ID_MMFR5 are trapped to EL2.
    - ID_ISAR6 is trapped to EL2.
    - ID_DFR1 is trapped to EL2.
    - This field traps all MRC accesses to registers in the following range that are not already mentioned in this field description: coproc == p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}.
  - If FEAT_FGT is not implemented:
    - ID_MMFR4 and ID_MMFR5 are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_MMFR4 or ID_MMFR5 are trapped.
    - ID_ISAR6 is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_ISAR6 are trapped to EL2.
    - ID_DFR1 is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_DFR1 are trapped to EL2.
    - Otherwise, it is IMPLEMENTATION DEFINED whether this bit traps MRC accesses to registers not already mentioned, with coproc == p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}. 

Page 2454
### TID3

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0  This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1  The specified Non-secure EL1 read accesses to ID group 3 registers are trapped to EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

### TID2, bit [17]

Trap ID group 2. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

- Non-secure EL1 and EL0 reads of the **CTR**, **CCSIDR**, **CCSIDR2**, **CLIDR**, and **CSSELr**.
- Non-secure EL1 and EL0 writes to the **CSSELr**.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0  This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1  The specified Non-secure EL1 and EL0 accesses to ID group 2 registers are trapped to EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

### TID1, bit [16]

Trap ID group 1. Traps Non-secure EL1 reads of the following registers to EL2, when EL2 is enabled in the current Security state:

**TCMTR**, **TLBTR**, **REVIDR**, **AIDR**.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0  This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1  The specified Non-secure EL1 read accesses to ID group 1 registers are trapped to EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

### TID0, bit [15]

Trap ID group 0. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

- Non-secure EL1 reads of the **JIDR** and **FPSID**.
- If the **JIDR** is RAZ from Non-secure EL0, Non-secure EL0 reads of the **JIDR**.

**Note**

- It is IMPLEMENTATION DEFINED whether the **JIDR** is RAZ or **UNDEFINED** at EL0. If it is **UNDEFINED** at EL0 then the Undefined Instruction exception takes precedence over this trap.
- The **FPSID** is not accessible at EL0.
- Writes to the **FPSID** are ignored, and not trapped by this control.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0  This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1  The specified Non-secure EL1 read accesses to ID group 0 registers are trapped to EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

### TWE, bit [14]

Traps Non-secure EL0 and EL1 execution of WFE instructions to EL2, when EL2 is enabled in the current Security state.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0  This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1  Any attempt to execute a WFE instruction at Non-secure EL0 or EL1 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by <strong>SCTLr</strong> nTWE.</td>
</tr>
</tbody>
</table>

---

Page 2455
The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE can complete at any time, even without a Wakeup event, the traps on WFE are not guaranteed to be taken, even if the WFE is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**TWI, bit [13]**

Traps Non-secure EL0 and EL1 execution of WFI instructions to EL2, when EL2 is enabled in the current Security state.

<table>
<thead>
<tr>
<th>TWI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any attempt to execute a WFI instruction at Non-secure EL0 or EL1 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWI.</td>
</tr>
</tbody>
</table>

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFI can complete at any time, even without a Wakeup event, the traps on WFI are not guaranteed to be taken, even if the WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**DC, bit [12]**

Default Cacheability.

<table>
<thead>
<tr>
<th>DC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on the Non-secure EL1&amp;0 translation regime.</td>
</tr>
</tbody>
</table>
| 0b1 | In Non-secure state:  
  • The SCTLR M field behaves as 0 for all purposes other than a direct read of the value of the field.  
  • The HCR.VM field behaves as 1 for all purposes other than a direct read of the value of the field.  
  • The memory type produced by the first stage of the EL1&0 translation regime is Normal Non-Shareable, Inner Write-Back Read-Allocate Write-Allocate, Outer Write-Back Read-Allocate Write-Allocate. |

This field has no effect on the EL2 and EL3 translation regimes.

This field is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**BSU, bits [11:10]**

Barrier Shareability upgrade. This field determines the minimum shareability domain that is applied to any barrier instruction executed from Non-secure EL1 or Non-secure EL0:
BSU | Meaning
--- | ---
0b00 | No effect.
0b01 | Inner Shareable.
0b10 | Outer Shareable.
0b11 | Full system.

This value is combined with the specified level of the barrier held in its instruction, using the same principles as combining the shareability attributes from two stages of address translation.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**FB, bit [9]**

Force broadcast. Causes the following instructions to be broadcast within the Inner Shareable domain when executed from Non-secure EL1:

- **BPIALL, TLBIALL, TLBIMVA, TLBISID, DTLBIALL, DTLIMVA, DTLBISID, ITLBIALL, ITLIMVA, ITLBISID, TLBIMVAA, ICIALLU, TLBIMAL, TLBIMVAAL.**

| FB | Meaning |
--- | --- |
0b0 | This field has no effect on the operation of the specified instructions. |
0b1 | When one of the specified instruction is executed at Non-secure EL1, the instruction is broadcast within the Inner Shareable shareability domain. |

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**VA, bit [8]**

Virtual SError interrupt exception.

| VA | Meaning |
--- | --- |
0b0 | This mechanism is not making a virtual SError interrupt pending. |
0b1 | A virtual SError interrupt is pending because of this mechanism. |

The virtual SError interrupt is enabled only when the value of HCR.{TGE, AMO} is {0, 1}.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**VI, bit [7]**

Virtual IRQ exception.

| VI | Meaning |
--- | --- |
0b0 | This mechanism is not making a virtual IRQ pending. |
0b1 | A virtual IRQ is pending because of this mechanism. |

The virtual IRQ is enabled only when the value of HCR.{TGE, IMO} is {0, 1}.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**VF, bit [6]**

Virtual FIQ exception.

| VF | Meaning |
--- | --- |
0b0 | This mechanism is not making a virtual FIQ pending. |
0b1 | A virtual FIQ is pending because of this mechanism. |

The virtual FIQ is enabled only when the value of HCR.{TGE, FMO} is {0, 1}.
The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**AMO, bit [5]**

SError interrupt Mask Override. When this bit is set to 1, it overrides the effect of PSTATE.A, and enables virtual exception signaling by the VA bit.

If the value of HCR.TGE is 0, then virtual SError interrupts are enabled in Non-secure state.

If the value of HCR.TGE is 1, then in Non-secure state the HCR.AMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**IMO, bit [4]**

IRQ Mask Override. When this bit is set to 1, it overrides the effect of PSTATE.I, and enables virtual exception signaling by the VI bit.

If the value of HCR.TGE is 0, then Virtual IRQ interrupts are enabled in the Non-secure state.

If the value of HCR.TGE is 1, then in Non-secure state the HCR.IMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**FMO, bit [3]**

FIQ Mask Override. When this bit is set to 1, it overrides the effect of PSTATE.F, and enables virtual exception signaling by the VF bit.

If the value of HCR.TGE is 0, then Virtual FIQ interrupts are enabled in the Non-secure state.

If the value of HCR.TGE is 1, then in Non-secure state the HCR.FMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**PTW, bit [2]**

Protected Table Walk. In the Non-secure PL1&0 translation regime, a translation table access made as part of a stage 1 translation table walk is subject to a stage 2 translation. The combining of the memory type attributes from the two stages of translation means the access might be made to a type of Device memory. If this occurs then the value of this bit determines the behavior:

<table>
<thead>
<tr>
<th>PTW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The translation table walk occurs as if it is to Normal Non-cachable memory. This means it can be made speculatively.</td>
</tr>
<tr>
<td>0b1</td>
<td>The memory access generates a stage 2 Permission fault.</td>
</tr>
</tbody>
</table>

This field is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**SWIO, bit [1]**

Set/Way Invalidation Override. Causes Non-secure EL1 execution of the data cache invalidate by set/way instructions to perform a data cache clean and invalidate by set/way.

<table>
<thead>
<tr>
<th>SWIO</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on the operation of data cache invalidate by set/way instructions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Data cache invalidate by set/way instructions perform a data cache clean and invalidate by set/way.</td>
</tr>
</tbody>
</table>
When this bit is set to 1, \texttt{DCISW} performs the same invalidation as a \texttt{DCCISW} instruction. As a result of changes to the behavior of \texttt{DCISW}, this bit is redundant in Armv8. This bit can be implemented as \texttt{RES1}.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

\textbf{VM, bit [0]}

Virtualization enable. Enables stage 2 address translation for the Non-secure EL1&0 translation regime.

<table>
<thead>
<tr>
<th>VM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL1&amp;0 stage 2 address translation disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1&amp;0 stage 2 address translation enabled.</td>
</tr>
</tbody>
</table>

If the HCR.DC bit is set to 1, then the behavior of the PE when executing in a Non-secure mode other than Hyp mode is consistent with HCR.VM being 1, regardless of the actual value of HCR.VM, other than the value returned by an explicit read of HCR.VM.

When the value of this bit is 1, data cache invalidate instructions executed at Non-secure EL1 perform a data cache clean and invalidate. For the invalidate by set/way instruction this behavior applies regardless of the value of the HCR.SWIO bit.

This bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

\textbf{Accessing the HCR}

Accesses to this register use the following encodings:

\begin{verbatim}
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
\end{verbatim}

\begin{verbatim}
<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b100</td>
<td>0b0001</td>
<td>0b0001</td>
<td>0b000</td>
</tr>
</tbody>
</table>
\end{verbatim}

\begin{verbatim}
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
  elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then

    else
        HCR = R[t];
HCR2, Hyp Configuration Register 2

The HCR2 characteristics are:

**Purpose**

Provides additional configuration controls for virtualization.

**Configuration**

AArch32 System register HCR2 bits [31:0] are architecturally mapped to AArch64 System register HCR_EL2[63:32].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HCR2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

HCR2 is a 32-bit register.

**Field descriptions**

The HCR2 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | TTLBIS | RES0 | TOCU | RES0 | TICAB | ID4 | RES0 | MIOCNC | TEA | TERR | RES0 | IDCD |

**Bits [31:23]**

Reserved, RES0.

**TTLBIS, bit [22]**

**When FEAT_EVT is implemented:**

Trap TLB maintenance instructions that operate on the Inner Shareable domain. Traps execution of the following TLB maintenance instructions at EL1 to EL2:

**TLBIALLIS, TLBIMVAIS, TLBIASIDIS, TLBIMVAAIS, TLBIMVALIS, TLBIMVAALIS**

<table>
<thead>
<tr>
<th>TTLBIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 execution of the specified TLB maintenance instructions is trapped to EL2.</td>
</tr>
</tbody>
</table>

When FEAT_VHE and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

**Otherwise:**

Reserved, RES0.

**Bit [21]**

Reserved, RES0.
**TOCU, bit [20]**

*When FEAT_EVT is implemented:*

Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of those cache maintenance instructions at EL1 or EL0 using AArch64, and at EL1 using AArch32, to EL2.

This applies to the following instructions:

- When Non-secure EL0 is using AArch64, **IC IVAU**, **DC CVAU**. However, if the value of **SCTLR_EL1.UCI** is 0 these instructions are *UNDEFINED* at EL0 and any resulting exception is higher priority than this trap to EL2.
- When EL1 is using AArch64, **IC IVAU**, **IC IALLU**, **DC CVAU**.
- When Non-secure EL1 is using AArch32, **ICIMVAU**, **ICIALLU**, **DCCMVAU**.

**Note**

An exception generated because an instruction is *UNDEFINED* at EL0 is higher priority than this trap to EL2. In addition:

- **IC IALLUIS** and **IC IALLU** are always *UNDEFINED* at EL0 using AArch64.
- **ICIMVAU**, **ICIALLU**, **ICIALLUIS**, and **DCCMVAU** are always *UNDEFINED* at EL0 using AArch32.

<table>
<thead>
<tr>
<th>TOCU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure execution of the specified cache maintenance instructions is trapped to EL2.</td>
</tr>
</tbody>
</table>

If the Point of Unification is before any level of data cache, it is *IMPLEMENTATION DEFINED* whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is *IMPLEMENTATION DEFINED* whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When **FEAT_VHE** is implemented, and the value of **HCR_EL2.E2H, TGE** is \{1, 1\}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

**Otherwise:**

Reserved, **RES0**.

**Bit [19]**

Reserved, **RES0**.

**TICAB, bit [18]**

*When FEAT_EVT is implemented:*

Trap **ICIALLUIS** cache maintenance instructions. Traps execution of those cache maintenance instructions at EL1 to EL2.

This applies to the following instruction:

**ICIALLUIS**.

<table>
<thead>
<tr>
<th>TICAB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 execution of the specified cache maintenance instructions is trapped to EL2.</td>
</tr>
</tbody>
</table>

If the Point of Unification is before any level of instruction cache, it is *IMPLEMENTATION DEFINED* whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.
When FEAT_VHE and the value of \texttt{HCR_EL2}.\{E2H, TGE\} is \{1, 1\}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

Otherwise:

Reserved, RES0.

TID4, bit [17]

When FEAT_EVT is implemented:

Trap ID group 4. Traps the following register accesses to EL2:

- EL1 reads of \texttt{CCSIDR}, \texttt{CCSIDR2}, \texttt{CLIDR}, and \texttt{CSSELR}.
- EL1 writes to \texttt{CSSELR}.

<table>
<thead>
<tr>
<th>TID4</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>The specified Non-secure EL1 and EL0 accesses to ID group 4 registers are trapped to EL2.</td>
</tr>
</tbody>
</table>

When FEAT_VHE is implemented and the value of \texttt{HCR_EL2}.\{E2H, TGE\} is \{1, 1\}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

Otherwise:

Reserved, RES0.

Bits [16:7]

Reserved, RES0.

MIOCNCE, bit [6]

Mismatched Inner/Outer Cacheable Non-Coherency Enable, for the Non-secure PL1&0 translation regime.

<table>
<thead>
<tr>
<th>MIOCNCE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For the Non-secure PL1&amp;0 translation regime, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there must be no loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.</td>
</tr>
<tr>
<td>0b1</td>
<td>For the Non-secure PL1&amp;0 translation regime, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there might be a loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.</td>
</tr>
</tbody>
</table>

For more information, see 'Mismatched memory attributes'.

This field can be implemented as RAZ/WI.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally \texttt{UNKNOWN} value.

TEA, bit [5]

When FEAT_RAS is implemented:

Route synchronous External abort exceptions from EL0 and EL1 to EL2.
### TEA

<table>
<thead>
<tr>
<th>TEA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not route synchronous External abort exceptions from Non-secure EL0 and EL1 to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Route synchronous External abort exceptions from Non-secure EL0 and EL1 to EL2, if not routed to EL3.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

### TERR, bit [4]

**When FEAT_RAS is implemented:**

Trap Error record accesses from EL1 to EL2. Trap accesses to the following registers from EL1 to EL2:

- ERRIDR
- ERRSELR
- ERXADDR
- ERXADDR2
- ERXCTLR
- ERXCTLR2
- ERXFR
- ERXFR2
- ERXMISC0
- ERXMISC1
- ERXMISC2
- ERXMISC3
- ERXSTATUS

When FEAT_RASv1p1 is implemented, ERXMISC4, ERXMISC5, ERXMISC6, and ERXMISC7.

<table>
<thead>
<tr>
<th>TERR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to the specified registers from EL1 generate a Trap exception to EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

### Bits [3:2]

Reserved, RES0.

### ID, bit [1]

Stage 2 Instruction access cacheability disable. For the Non-secure PL1&0 translation regime, when `HCR.VM==1`, this control forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

<table>
<thead>
<tr>
<th>ID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on stage 2 of the Non-secure PL1&amp;0 translation regime.</td>
</tr>
<tr>
<td>0b1</td>
<td>For the Non-secure PL1&amp;0 translation regime, forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.</td>
</tr>
</tbody>
</table>

This bit has no effect on the EL2 translation regime.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

### CD, bit [0]

Stage 2 Data access cacheability disable. When `HCR.VM==1`, this forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable for the Non-secure PL1&0 translation regime.
This control has no effect on stage 2 of the Non-secure PL1&0 translation regime for data accesses and translation table walks.

For the Non-secure PL1&0 translation regime, forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

This bit has no effect on the EL2 translation regime.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Accessing the HCR2**

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{<\text{opc}1>\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>\{, \{<\text{opc}2>\}\}

HDCR, Hyp Debug Control Register

The HDCR characteristics are:

**Purpose**

Controls the trapping to Hyp mode of Non-secure accesses, at EL1 or lower, to functions provided by the debug and trace architectures and the Performance Monitors Extension.

**Configuration**

AArch32 System register HDCR bits [31:0] are architecturally mapped to AArch64 System register MDCR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HDCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3, and other than for a direct read of the register, the PE behaves as if HDCR.HPMN == PMCR.N.

**Attributes**

HDCR is a 32-bit register.

**Field descriptions**

The HDCR bit assignments are:

<table>
<thead>
<tr>

</tr>
<tr>
<td>0</td>
<td>RES0</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:30]**

Reserved, RES0.

**HPMFZO, bit [29]**

When FEAT_PMu3p7 is implemented:

Hyp Performance Monitors Freeze-on-overflow. Stop event counters on overflow.

<table>
<thead>
<tr>
<th>HPMFZO</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not freeze on overflow.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counters do not count when PMOVSR[(PMCR.N-1):HDCR.HPMN] is nonzero.</td>
</tr>
</tbody>
</table>

If HDCR.HPMN is less than PMCR.N, this bit affects the operation of event counters in the range [HDCR.HPMN .. (PMCR.N-1)].

If HDCR.HPMN is equal to PMCR.N, this bit has no effect.

This bit does not affect the operation of event counters in the range [0 .. (HDCR.HPMN-1)] and PMCCNTR.

The operation of this bit ignores the values of PMOVSR[(HDCR.HPMN-1):0].

The operation of this bit applies even when EL2 is disabled in the current Security state.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**MTPME, bit [28]**

When FEAT_MTPMU is implemented and EL3 is not implemented:

Multi-threaded PMU Enable. Enables use of the PMEVTYPERx<MT> bits.

<table>
<thead>
<tr>
<th>MTPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FEAT_MTPMU is disabled. The Effective value of PMEVTYPERx&lt;MT&gt; is zero.</td>
</tr>
<tr>
<td>0b1</td>
<td>PMEVTYPERx&lt;MT&gt; bits not affected by this bit.</td>
</tr>
</tbody>
</table>

If FEAT_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this bit is 0b0.

On a Cold reset, in a system where the PE resets into EL2 or EL3, this field resets to 1.

Otherwise:

Reserved, RES0.

**TDCC, bit [27]**

When FEAT_FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel at EL1 and EL0 to EL2.

<table>
<thead>
<tr>
<th>TDCC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any register accesses to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state, accesses to the DCC registers at EL1 and EL0 generate a Hyp Trap exception, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.</td>
</tr>
</tbody>
</table>

The DCC registers trapped by this control are:

- DBGDTRRXext, DBGDTRTXext, DBGDSCRint, DBGDCCINT, and, when the PE is in Non-debug state, DBGDTRRXint and DBGDTRTXint.

The traps are reported with EC syndrome value:

- 0x05 for trapped MRC and MCR accesses with coproc == 0b1110.
- 0x06 for trapped LDC to DBGDTRTXint and STC from DBGDTRRXint.

When the PE is in Debug state, HDCR.TDCC does not trap any accesses to:

- DBGDTRRXint and DBGDTRTXint.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

**HLP, bit [26]**

When FEAT_PMUv3p5 is implemented:

Hypervisor Long event counter enable. Determines when unsigned overflow is recorded by a counter overflow bit.
### HLP

<table>
<thead>
<tr>
<th>HLP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counter overflow on increment that causes unsigned overflow of PMEVCNTR&lt;\text{n}&gt;[31:0].</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counter overflow on increment that causes unsigned overflow of PMEVCNTR&lt;\text{n}&gt;[63:0].</td>
</tr>
</tbody>
</table>

If the highest implemented Exception level is using AArch32, it is IMPLEMENTATION DEFINED whether this bit is read/write or RAZ/WI.

If HDCR.HPMN is less than PMCR.N, this bit affects the operation of event counters in the range \([\text{HDCR.HPMN..(PMCR.N-1)}]\). Otherwise this bit has no effect on the operation of the event counters.

**Note**

The effect of HDCR.HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state.

For more information see the description of the HDCR.HPMN field.

**Note**

PMEVCNTR<\text{n}>[63:32] cannot be accessed directly in AArch32 state.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [25:24]**

Reserved, RES0.

**HCCD, bit [23]**

**When FEAT_PMUv3p5 is implemented:**

Hypervisor Cycle Counter Disable. Prohibits PMCCNTR from counting at EL2.

<table>
<thead>
<tr>
<th>HCCD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counting by PMCCNTR is not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Cycle counting by PMCCNTR is prohibited at EL2.</td>
</tr>
</tbody>
</table>

This bit does not affect the CPU_CYCLES event or any other event that counts cycles.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bits [22:20]**

Reserved, RES0.
TTRF, bit [19]

When FEAT_TRF is implemented:

Traps use of the Trace Filter Control registers at EL1 to EL2.

<table>
<thead>
<tr>
<th>TTRF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to TRFCR at EL1 are not affected by this control bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to TRFCR at EL1 generate a Hyp Trap exception.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [18]

Reserved, RES0.

HPMD, bit [17]

When FEAT_PMUv3p1 is implemented:

Guest Performance Monitors Disable. This control prohibits event counting at EL2.

<table>
<thead>
<tr>
<th>HPMD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counting allowed in Hyp mode.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counting prohibited in Hyp mode.</td>
</tr>
</tbody>
</table>

If FEAT_Debugv8p2 is not implemented, event counting is prohibited unless enabled by the IMPLEMENTATION DEFINED authentication interface ExternalSecureNoninvasiveDebugEnabled().

This control applies only to:

- The event counters in the range [0..(HDCR.HPMN-1)].
- If PMCR.DP is set to 1, PMCCNTR.

The other event counters are unaffected. When PMCR.DP is set to 0, PMCCNTR is unaffected.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [16:12]

Reserved, RES0.

TDRA, bit [11]

Trap Debug ROM Address register access. Traps Non-secure EL0 and EL1 System register accesses to the Debug ROM registers to Hyp mode.

<table>
<thead>
<tr>
<th>TDRA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL0 and EL1 System register accesses to the DebugROM registers are trapped to Hyp mode, unless it is trapped by DBGDSCRx.UDCCdis.</td>
</tr>
</tbody>
</table>

If HCR.TGE or HDCR.TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.
On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TDOSA, bit [10]

When FEAT_DoubleLock is implemented:

Trap debug OS-related register access. Traps Non-secure EL1 System register accesses to the powerdown debug registers to Hyp mode.

<table>
<thead>
<tr>
<th>TDOSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 System register accesses to the powerdown debug registers are trapped to Hyp mode.</td>
</tr>
</tbody>
</table>

The registers for which accesses are trapped are as follows:

- DBGOSLSR, DBGOSLAR, DBGOSD, and DBGPRCR.
- Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

Note

These registers are not accessible at EL0.

If HCR.TGE or HDCR.TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

Otherwise:

Trap debug OS-related register access. Traps Non-secure EL1 System register accesses to the powerdown debug registers to Hyp mode.

<table>
<thead>
<tr>
<th>TDOSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 System register accesses to the powerdown debug registers are trapped to Hyp mode.</td>
</tr>
</tbody>
</table>

The registers for which accesses are trapped are as follows:

- DBGOSLSR, DBGOSLAR, and DBGPRCR.
- Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

It is IMPLEMENTATION DEFINED whether accesses to DBGOSDLR are trapped.

Note

These registers are not accessible at EL0.

If HCR.TGE or HDCR.TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TDA, bit [9]

Trap debug access. Traps Non-secure EL0 and EL1 System register accesses to those debug System registers in the (coproc==0b1110) encoding space that are not trapped by either of the following:

- HDCR.TDRA.
- HDCR.TDOSA.
TDA

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0  This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1  Non-secure EL0 or EL1 System register accesses to the debug</td>
</tr>
<tr>
<td>registers, other than the registers trapped by HDCR.TDRA and</td>
</tr>
<tr>
<td>HDCR.TDOSA, are trapped to Hyp mode, unless it is trapped by</td>
</tr>
<tr>
<td>DBGDSCRegext.UDCCdis.</td>
</tr>
</tbody>
</table>

Traps of AArch32 accesses to DBGDTRRXint and DBGDTRTXint are ignored in Debug state.

If HCR.TGE or HDCR.TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**TDE, bit [8]**

Trap Debug exceptions. Controls routing of Debug exceptions, and defines the debug target Exception level, EL_D.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0  The debug target Exception level is EL1.</td>
</tr>
<tr>
<td>0b1  If EL2 is enabled for the current Effective value of SCR.NS, the</td>
</tr>
<tr>
<td>debug target Exception level is EL2, otherwise the debug target</td>
</tr>
<tr>
<td>Exception level is EL1.</td>
</tr>
<tr>
<td>The HDCR. (TDRA, TDOSA, TDA) fields are treated as being 1 for</td>
</tr>
<tr>
<td>all purposes other than returning the result of a direct read of</td>
</tr>
<tr>
<td>the register.</td>
</tr>
</tbody>
</table>

For more information, see 'Routing debug exceptions'.

When HCR.TGE == 1, the PE behaves as if the value of this field is 1 for all purposes other than returning the value of a direct read of the register.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**HPME, bit [7]**

*When FEAT_PMUv3 is implemented:*

[HDCR.HPMN.(N-1)] event counters enable.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0  Event counters in the range [HDCR.HPMN..(PMCR.N-1)] are</td>
</tr>
<tr>
<td>disabled.</td>
</tr>
<tr>
<td>0b1  Event counters in the range [HDCR.HPMN..(PMCR.N-1)] are</td>
</tr>
<tr>
<td>enabled by PMCNTENSET.</td>
</tr>
</tbody>
</table>

If HDCR.HPMN is less than PMCR.N, the event counters in the range [HDCR.HPMN..(PMCR.N-1)], are enabled and disabled by this bit. Otherwise this bit has no effect on the operation of the event counters.

**Note**

The effect of HDCR.HPMN on the operation of this bit applies regardless of whether EL2 is enabled in the current Security state.

For more information see the description of the HPMN field.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally unknown value.

**Otherwise:**

Reserved, RES0.
TPM, bit [6]

When FEAT_PMUv3 is implemented:

Trap Performance Monitors accesses. Traps Non-secure EL0 and EL1 accesses to all Performance Monitors registers to Hyp mode.

<table>
<thead>
<tr>
<th>TPM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL0 and EL1 accesses to all Performance Monitors registers are trapped to Hyp mode.</td>
</tr>
</tbody>
</table>

Note

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

TPMCR, bit [5]

When FEAT_PMUv3 is implemented:

Trap PMCR accesses. Traps Non-secure EL0 and EL1 accesses to the PMCR to Hyp mode.

<table>
<thead>
<tr>
<th>TPM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL0 and EL1 accesses to the PMCR are trapped to Hyp mode, unless it is trapped by PMUSERENR.EN.</td>
</tr>
</tbody>
</table>

Note

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

HPMN, bits [4:0]

When FEAT_PMUv3 is implemented:

Defines the number of event counters that are accessible from Non-secure EL1 modes, and from Non-secure EL0 modes if unprivileged access is enabled.

If HPMN is less than PMCR.N, HPMN divides the event counters into two ranges, [0..(HPMN-1)] and [HPMN..(PMCR.N-1)].

For an event counter in the range [0..(HPMN-1)]:

- The counter is accessible from EL1 and EL2, and from EL0 if unprivileged access to the counters is enabled.
- If FEAT_PMUv3p5 is implemented, PMCR.LP determines whether the counter overflows at PMEVCNTR<n>[31:0] or PMEVCNTR<n>[63:0].
- PMCR.E enables the operation of counters in this range.

Note
If HPMN is equal to PMCR.N, this applies to all event counters.

If HPMN is less than PMCR.N, for an event counter in the range [HPMN..(PMCR.N-1)]:

- The counter is accessible only from EL2 and from Secure state.
- If FEAT_PMUv3p5 is implemented, HDCR.HLP determines whether the counter overflows at PMEVCNTR<n>[31:0] or PMEVCNTR<n>[63:0].
- HDCR.HPME enables the operation of counters in this range.

If this field is set to 0, or to a value larger than PMCR.N, then the following constrained unpredictable behaviors apply:

- The value returned by a direct read of HDCR.HPMN is unknown.
- Either:
  - An unknown number of counters are reserved for EL2 use. That is, the PE behaves as if HDCR.HPMN is set to an unknown non-zero value less than or equal to PMCR.N.
  - All counters are reserved for EL2 use, meaning no counters are accessible from Non-secure EL1 and Non-secure EL0.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in PMCR.N.

Otherwise:

Reserved, RES0.

## Accessing the HDCR

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}\} \{, \{#\}<\text{opc2}>\}
\]

The HDFAR characteristics are:

**Purpose**

Holds the virtual address of the faulting address that caused a synchronous Data Abort exception that is taken to Hyp mode.

**Configuration**

AArch32 System register HDFAR bits [31:0] are architecturally mapped to AArch64 System register `FAR_EL2[31:0]`.

AArch32 System register HDFAR bits [31:0] are architecturally mapped to AArch32 System register `DFAR[31:0] (S)` when EL2 is implemented, EL3 is implemented and the highest implemented Exception level is using AArch32 state.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HDFAR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

HDFAR is a 32-bit register.

**Field descriptions**

The HDFAR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>VA of faulting address of synchronous Data Abort exception taken to Hyp mode</td>

HIFAR, Hyp Instruction Fault Address Register

The HIFAR characteristics are:

**Purpose**

Holds the virtual address of the faulting address that caused a synchronous Prefetch Abort exception that is taken to Hyp mode.

**Configuration**

AArch32 System register HIFAR bits [31:0] are architecturally mapped to AArch64 System register `FAR_EL2[63:32]`.

AArch32 System register HIFAR bits [31:0] are architecturally mapped to AArch32 System register `IFAR[31:0]` when EL2 is implemented, EL3 is implemented and the highest implemented Exception level is using AArch32 state.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HIFAR are **UNDEFINED**.

If EL2 is not implemented, this register is **RES0** from EL3.

**Attributes**

HIFAR is a 32-bit register.

**Field descriptions**

The HIFAR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>

HMAIR0, Hyp Memory Attribute Indirection Register 0

The HMAIR0 characteristics are:

**Purpose**

Along with HMAIR1, provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations for memory accesses from Hyp mode.

AttrIndx[2] indicates the HMAIR register to be used:

- When AttrIndx[2] is 0, HMAIR0 is used.
- When AttrIndx[2] is 1, HMAIR1 is used.

**Configuration**

AArch32 System register HMAIR0 bits [31:0] are architecturally mapped to AArch64 System register MAIR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HMAIR0 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

HMAIR0 is a 32-bit register.

**Field descriptions**

The HMAIR0 bit assignments are:

**When TTBCR.EAE == 1:**

|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
| Attr3 | Attr2 | Attr1 | Attr0 |

Attr<n>, bits [8n+7:8n], for n = 3 to 0

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIndx[2:0] gives the value of <n> in Attr<n>.
- AttrIndx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

<table>
<thead>
<tr>
<th>Attr&lt;n&gt;[7:4]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Device memory. See encoding of Attr&lt;n&gt;[3:0] for the type of Device memory.</td>
</tr>
<tr>
<td>0b00RW, RW</td>
<td>Normal memory, Outer Write-Through Transient.</td>
</tr>
<tr>
<td>not0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01RW, RW</td>
<td>Normal memory, Outer Write-Back Transient.</td>
</tr>
<tr>

HMAIR1, Hyp Memory Attribute Indirection Register 1

The HMAIR1 characteristics are:

**Purpose**

Along with HMAIR0, provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations for memory accesses from Hyp mode.

AttrIndx[2] indicates the HMAIR register to be used:
- When AttrIndx[2] is 0, HMAIR0 is used.
- When AttrIndx[2] is 1, HMAIR1 is used.

**Configuration**

AArch32 System register HMAIR1 bits [31:0] are architecturally mapped to AArch64 System register MAIR_EL2[63:32].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HMAIR1 are **UNDEFINED**.

If EL2 is not implemented, this register is **RES0** from EL3.

**Attributes**

HMAIR1 is a 32-bit register.

**Field descriptions**

The HMAIR1 bit assignments are:

HPFAR, Hyp IPA Fault Address Register

The HPFAR characteristics are:

**Purpose**

Holds the faulting IPA for some aborts on a stage 2 translation taken to Hyp mode.

**Configuration**

AArch32 System register HPFAR bits [31:0] are architecturally mapped to AArch64 System register `HPFAR_EL2[31:0]`.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HPFAR are **UNDEFINED**.

If EL2 is not implemented, this register is **RES0** from EL3.

**Attributes**

HPFAR is a 32-bit register.

**Field descriptions**

The HPFAR bit assignments are:

```
   31  30  29  28  27  26  25  24  23  22  21  20  19  18  17  16  15  14  13  12  11  10  9  8  7  6  5  4  3  2  1  0
```

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [3:0]</td>
<td>RES0</td>
</tr>
</tbody>
</table>

Execution in any Non-secure mode other than Hyp mode makes this register **UNKNOWN**.

**FIPA[39:12], bits [31:4]**

Bits [39:12] of the faulting intermediate physical address.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [3:0]**

Reserved, RES0.

**Accessing the HPFAR**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>

        HPFAR = R[t];
HRMR, Hyp Reset Management Register

The HRMR characteristics are:

**Purpose**

If EL2 is the highest implemented Exception level and this register is implemented:

- A write to the register at EL2 can request a Warm reset.
- If EL2 can use AArch32 and AArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

**Configuration**

AArch32 System register HRMR bits [31:0] are architecturally mapped to AArch64 System register \texttt{RMR\_EL2[31:0]}.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HRMR are UNDEFINED.

Only implemented if EL2 is the highest implemented Exception level. In this case:

- If EL2 can use AArch32 and AArch64 then this register must be implemented.
- If EL2 cannot use AArch64 then it is IMPLEMENTATION DEFINED whether the register is implemented.

**Attributes**

HRMR is a 32-bit register.

**Field descriptions**

The HRMR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td><strong>RES0</strong></td>
</tr>
<tr>

<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

**Bits [31:2]**

Reserved, RES0.

**RR, bit [1]**

Reset Request. Setting this bit to 1 requests a Warm reset.

On a Warm reset, this field resets to 0.

**AA64, bit [0]**

When EL2 can use AArch64, determines which Execution state the PE boots into after a Warm reset:

<table>
<thead>
<tr>
<th>AA64</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>AArch32.</td>
</tr>
<tr>
<td>0b1</td>
<td>AArch64.</td>
</tr>
</tbody>
</table>

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If EL2 cannot use AArch64 this bit is RAZ/WI.

When implemented as a RW field, this field resets to 0 on a Cold reset.
Accessing the HRMR

Accesses to this register use the following encodings:

\[
\text{MRC\{c\}{\langle q\rangle} \coproc, \{\langle opc1\rangle, \langle Rt\rangle, \langle CRn\rangle, \langle CRm\rangle\}, \{\langle opc2\rangle\}}
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>

</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b100</td>
<td>0b1100</td>
<td>0b0000</td>
<td>0b010</td>
</tr>
</tbody>
</table>

```python
if PSTATE.EL == EL1 && EL2Enabled() && IsHighestEL(EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T12 == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
elsif PSTATE.EL == EL1 && EL2Enabled() && IsHighestEL(EL2) && ELUsingAArch32(EL2) && HSTR.T12 == '1' then
    AArch32.TakeHypTrapException(0x03);
elsif PSTATE.EL == EL2 && IsHighestEL(EL2) then
    return HRMR;
else
    UNDEFINED;
```

\[
\text{MCR\{c\}{\langle q\rangle} \coproc, \{\langle opc1\rangle, \langle Rt\rangle, \langle CRn\rangle, \langle CRm\rangle\}, \{\langle opc2\rangle\}}
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b100</td>
<td>0b1100</td>
<td>0b0000</td>
<td>0b010</td>
</tr>
</tbody>
</table>

```python
if PSTATE.EL == EL1 && EL2Enabled() && IsHighestEL(EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T12 == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
elsif PSTATE.EL == EL1 && EL2Enabled() && IsHighestEL(EL2) && ELUsingAArch32(EL2) && HSTR.T12 == '1' then
    AArch32.TakeHypTrapException(0x03);
elsif PSTATE.EL == EL2 && IsHighestEL(EL2) then
    HRMR = R[t];
else
    UNDEFINED;
```
HSCTRL, Hyp System Control Register

The HSCTRL characteristics are:

**Purpose**

Provides top level control of the system operation in Hyp mode.

**Configuration**

AArch32 System register HSCTRL bits [31:0] are architecturally mapped to AArch64 System register SCTLR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HSCTRL are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

HSCTRL is a 32-bit register.

**Field descriptions**

The HSCTRL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| DSSBS | TE | RES1 | RES0 | EEE | RES0 | RES0 | WXN | RES1 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | SED | TD | RES0 | RES0 | CP15B | LSMAOE | hTLS |

**DSSBS, bit [31]**

When FEAT_SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry. The defined values are:

<table>
<thead>
<tr>
<th>DSSBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PSTATE.SSBS is set to 0 on an exception to Hyp mode.</td>
</tr>
<tr>
<td>0b1</td>
<td>PSTATE.SSBS is set to 1 on an exception to Hyp mode.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an IMPLEMENTATION DEFINED value.

**Otherwise:**

Reserved, RES0.

**TE, bit [30]**

T32 Exception Enable. This bit controls whether exceptions to EL2 are taken to A32 or T32 state:

<table>
<thead>
<tr>
<th>TE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Exceptions, including reset, taken to A32 state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Exceptions, including reset, taken to T32 state.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.
Bits [29:28]
Reserved, RES1.

Bits [27:26]
Reserved, RES0.

EE, bit [25]

The value of the PSTATE.E bit on entry to Hyp mode, the endianness of stage 1 translation table walks in the EL2 translation regime, and the endianness of stage 2 translation table walks in the PL1&0 translation regime.

The possible values of this bit are:

<table>
<thead>
<tr>
<th>EE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Little-endian. PSTATE.E is cleared to 0 on entry to Hyp mode. Stage 1 translation table walks in the EL2 translation regime, and stage 2 translation table walks in the PL1&amp;0 translation regime are little-endian.</td>
</tr>
<tr>
<td>0b1</td>
<td>Big-endian. PSTATE.E is set to 1 on entry to Hyp mode. Stage 1 translation table walks in the EL2 translation regime, and stage 2 translation table walks in the PL1&amp;0 translation regime are big-endian.</td>
</tr>
</tbody>
</table>

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Bit [24]
Reserved, RES0.

Bits [23:22]
Reserved, RES1.

Bits [21:20]
Reserved, RES0.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL2 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

<table>
<thead>
<tr>
<th>WXN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on memory access permissions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any region that is writable in the EL2 translation regime is forced to XN for accesses from software executing at EL2.</td>
</tr>
</tbody>
</table>

This bit applies only when HSCTL.R.M bit is set.

The WXN bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Bit [18]
Reserved, RES1.
**Bit [17]**

Reserved, RES0.

**Bit [16]**

Reserved, RES1.

**Bits [15:13]**

Reserved, RES0.

**I, bit [12]**

Instruction access Cacheability control, for accesses at EL2:

<table>
<thead>
<tr>
<th>I</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All instruction access to Normal memory from EL2 are Non-cacheable for all levels of instruction and unified cache. If the value of HSCTLR.M is 0, instruction accesses from stage 1 of the EL2 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>All instruction access to Normal memory from EL2 can be cached at all levels of instruction and unified cache. If the value of HSCTLR.M is 0, instruction accesses from stage 1 of the EL2 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.</td>
</tr>
</tbody>
</table>

This bit has no effect on the PL1&0 translation regime.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Bit [11]**

Reserved, RES1.

**Bits [10:9]**

Reserved, RES0.

**SED, bit [8]**

SETEND instruction disable. Disables SETEND instructions at EL2.

<table>
<thead>
<tr>
<th>SED</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>SETEND instruction execution is enabled at EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>SETEND instructions are UNDEFINED at EL2.</td>
</tr>
</tbody>
</table>

If the implementation does not support mixed-endian operation at EL2, this bit is RES1.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**ITD, bit [7]**

IT Disable. Disables some uses of IT instructions at EL2.
### ITD

<table>
<thead>
<tr>
<th>ITD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All IT instruction functionality is enabled at EL2.</td>
</tr>
</tbody>
</table>
| 0b1 | Any attempt at EL2 to execute any of the following is UNDEFINED:  
  - All encodings of the IT instruction with hw1[3:0]! = 1000.  
  - All encodings of the subsequent instruction with the following values for hw1:  
    - 11xxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.  
    - 1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions'.  
    - 10100xxxxxxxxxxx: ADD Rd, PC, #imm  
    - 01001xxxxxxxxxxx: LDR Rd, [PC, #imm]  
    - 010011xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.  
    - 0100011xxxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn.  

These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.  
It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:  
  - A 16-bit instruction, that can only be followed by another 16-bit instruction.  
  - The first half of a 32-bit instruction.  

This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED. An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction. |

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information, see 'Changes to an ITD control by an instruction in an IT block'.

ITD is optional, but if it is implemented in the SCTLR then it must also be implemented in the HSCTLR. If it is not implemented then this bit is RAZ/WI.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

### Bit [6]

Reserved, RES0.

### CP15BEN, bit [5]

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL2:

<table>
<thead>
<tr>
<th>CP15BEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL2 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is UNDEFINED.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL2 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.</td>
</tr>
</tbody>
</table>

CP15BEN is optional, but if it is implemented in the SCTLR then it must also be implemented in the HSCTLR. If it is not implemented then this bit is RAO/WI.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

### LSMAOE, bit [4]

When FEAT_LSMAOC is implemented:

Load Multiple and Store Multiple Atomicity and Ordering Enable.
For all memory accesses at EL2, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.

The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL2 is as defined for Armv8.0.

This bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 1.

Otherwise:

Reserved, RES1.

When FEAT_LSMAOC is implemented:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL2 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.

This bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 1.

Otherwise:

Reserved, RES1.

Cacheability control, for data accesses at EL2:

All data access to Normal memory from EL2, and all accesses to the EL2 translation tables, are Non-cacheable for all levels of data and unified cache.

All data access to Normal memory from EL2, and all accesses to the EL2 translation tables, can be cached at all levels of data and unified cache.

This bit has no effect on the PL1&0 translation regime.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Alignment check enable. This is the enable bit for Alignment fault checking at EL2:
Meaning

0b0 Alignment fault checking disabled when executing at EL2. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element or data elements being accessed.

0b1 Alignment fault checking enabled when executing at EL2. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element or data elements being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL2 stage 1 address translation. Possible values of this bit are:

<table>
<thead>
<tr>
<th>M</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL2 stage 1 address translation disabled.</td>
</tr>
<tr>
<td></td>
<td>See the HSCTLR.I field for the behavior of instruction accesses to Normal memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL2 stage 1 address translation enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Accessing the HSCTLR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>

        UNDEFINED;
    else
        HSCTRL = R[t];

HSR, Hyp Syndrome Register

The HSR characteristics are:

**Purpose**

Holds syndrome information for an exception taken to Hyp mode.

**Configuration**

AArch32 System register HSR bits [31:0] are architecturally mapped to AArch64 System register ESR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HSR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

HSR is a 32-bit register.

**Field descriptions**

The HSR bit assignments are:

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| EC  | IL  | ISS |

Execution in any Non-secure PE mode other than Hyp mode makes this register UNKNOWN.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL2, the value of HSR is UNKNOWN. The value written to HSR must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

**EC, bits [31:26]**

Exception Class. Indicates the reason for the exception that this register holds information about. Possible values of this field are:
<table>
<thead>
<tr>
<th>EC</th>
<th>Meaning</th>
<th>ISS</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>Unknown reason.</td>
<td>ISS encoding for exceptions with an unknown reason</td>
</tr>
<tr>

<td>ISS encoding for Exception from a Prefetch Abort</td>
</tr>
<tr>
<td>0b100001</td>
<td>Prefetch Abort taken without a change in Exception level.</td>
<td>ISS encoding for Exception from a Prefetch Abort</td>
</tr>
<tr>
<td>0b100010</td>
<td>PC alignment fault exception.</td>
<td>ISS encoding for Exception from an Illegal state or PC alignment fault</td>
</tr>
</tbody>
</table>
Data Abort from a lower Exception level.

Data Abort taken without a change in Exception level.

All other EC values are reserved by Arm, and:

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IL, bit [25]**

Instruction length bit. Indicates the size of the instruction that has been trapped to Hyp mode. When this bit is valid, possible values of this bit are:

<table>
<thead>
<tr>
<th>IL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>16-bit instruction trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>32-bit instruction trapped.</td>
</tr>
</tbody>
</table>

This field is RES1 and not valid for the following cases:

- When the EC field is 0b000000, indicating an exception with an unknown reason.
- Prefetch Aborts.
- Data Aborts for which the HSR.ISS.ISV field is 0.
- When the EC value is 0b001110, indicating an Illegal state exception.

Note

This is a change from the behavior in Armv7, where the IL field is UNK/SBZP for the corresponding cases.

The IL field is not valid and is UNKNOWN on an exception from a PC alignment fault.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**ISS, bits [24:0]**

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

**ISS encoding for exceptions with an unknown reason**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 |

**Bits [24:0]**

Reserved, RES0.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or is not accessible in the current PE mode in the current Security state, including:
  - A read access using a System register encoding pattern that is not allocated for reads or that does not permit reads in the current PE mode and Security state.
A write access using a System register encoding pattern that is not allocated for writes or that does not permit writes in the current PE mode and Security state.

Instruction encodings that are unallocated.

Instruction encodings for instructions not implemented in the implementation.

- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- The attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the SCTLR.{ITD, SED, CP15BEN} control bits.
- Attempted execution of:
  - An HVC instruction when disabled by HCR.HCD, SCR.HCE, or SCR_EL3.HCE.
  - An SMC instruction when disabled by SCR.SCD or SCR_EL3.SMD.
  - An HLT instruction when disabled by EDSCR.HDE.
- An HVC instruction when disabled by HCR.HCD, SCR.HCE, or SCR_EL3.HCE.
- An SMC instruction when disabled by SCR.SCD or SCR_EL3.SMD.
- An HLT instruction when disabled by EDSCR.HDE.
- An exception generated because of the attempted execution of an MSR (Banked register) or MRS (Banked register) instruction that would access a Banked register that is not accessible from the Security state and PE mode at which the instruction was executed.

**Note**

An exception is generated only if the CONSTRAINED UNPREDICTABLE behavior of the instruction is that it is UNDEFINED, see 'MSR (banked register) and MRS (banked register)'.

- Attempted execution, in Debug state, of:
  - A DCPS1 instruction in Non-secure state from EL0 when EL2 is using AArch32 and the value of HCR.TGE is 1.
  - A DCPS2 instruction at EL1 or EL0 when EL2 is not implemented, or when EL3 is using AArch32 and the value of SCR.NS is 0, or when EL3 is using AArch64 and the value of SCR_EL3.NS is 0.
  - A DCPS3 instruction when EL3 is not implemented, or when the value of EDSCR.SDD is 1.
- In Debug state when the value of EDSCR.SDD is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.

'Undefined Instruction exception, when the value of HCR.TGE is 1' describes the configuration settings for a trap that returns an HSR.EC value of 0b000000.

**ISS encoding for Exception from a WFI or WFE instruction**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| CV | COND | RES0 | Ti |

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

The condition code for the trapped instruction.
When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [19:1]**

Reserved, RES0.

**TI, bit [0]**

Trapped instruction. Possible values of this bit are:

<table>
<thead>
<tr>
<th>TI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>WFI trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>WFE trapped.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

‘Traps to Hyp mode of Non-secure EL0 and EL1 execution of WFE and WFI instructions’ describes the configuration settings for this trap.

**ISS encoding for Exception from an MCR or MRC access**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| CV | COND | Opc2 | Opc1 | CRn | RES0 | Rt | CRm | Direction |

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:
If the instruction is conditional, COND is set to the condition code field value from the instruction.
If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:
• With COND set to 0b1110, the value for unconditional.
• With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
• CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
• CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Opc2, bits [19:17]**

The Opc2 value from the issued instruction.
For a trapped VMRS access, holds the value 0b000.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Opc1, bits [16:14]**

The Opc1 value from the issued instruction.
For a trapped VMRS access, holds the value 0b111.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CRn, bits [13:10]**

The CRn value from the issued instruction.
For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [9]**

Reserved, RES0.

**Rt, bits [8:5]**

The Rt value from the issued instruction, the general-purpose register used for the transfer.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CRm, bits [4:1]**

The CRm value from the issued instruction.
For a trapped VMRS access, holds the value 0b0000.
On a Warm reset, this field resets to an architecturally UNKNOWN value.
**Direction, bit [0]**

Indicates the direction of the trapped instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Write to System register space. MCR instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read from System register space. MRC or VMRS instruction.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

The following sections describe configuration settings for traps that are reported using EC value `0b000011`:

- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to the ID registers'.
- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to lockdown, DMA, and TCM operations'.
- 'Traps to Hyp mode of Non-secure EL1 execution of cache maintenance instructions'.
- 'Traps to Hyp mode of Non-secure EL1 execution of TLB maintenance instructions'.
- 'Traps to Hyp mode of Non-secure EL1 accesses to the Auxiliary Control Register'.
- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Performance Monitors registers'.
- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Activity Monitors registers'.
- 'Traps to Hyp mode of Non-secure EL1 accesses to the CPACR'.
- 'Traps to Hyp mode of Non-secure EL1 accesses to virtual memory control registers'.
- 'General trapping to Hyp mode of Non-secure EL0 and EL1 accesses to System registers in the (coproc == 1111) encoding space'.

The following sections describe configuration settings for traps that are reported using EC value `0b000101`:

- 'ID group 0, Primary device identification registers'.
- 'Traps to Hyp mode of Non-secure System register accesses to trace registers'.
- 'Trapping Non-secure System register accesses to Debug ROM registers'.
- 'Trapping Non-secure System register accesses to powerdown debug registers'.
- 'Trapping general Non-secure System register accesses to debug registers'.

The following sections describe configuration settings for traps that are reported using EC value `0b001000`:

- 'ID group 0, Primary device identification registers'.
- 'ID group 3, Detailed feature identification registers'.

**ISS encoding for Exception from an MCRR or MRRC access**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| CV | COND | Opc1 | RES0 | Rt2 | RES0 | Rt | CRm | Direction |

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**COND, bits [23:20]**

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to `0b1110`. 
A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to \(0b1110\), the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is **IMPLEMENTATION DEFINED** whether:

- CV is set to 0 and COND is set to an **UNKNOWN** value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is **IMPLEMENTATION DEFINED** whether the COND field is set to \(0b1110\), or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Opc1, bits [19:16]**

The Opc1 value from the issued instruction.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [15:14]**

Reserved, **RES0**.

**Rt2, bits [13:10]**

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [9]**

Reserved, **RES0**.

**Rt, bits [8:5]**

The Rt value from the issued instruction, the first general-purpose register used for the transfer.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**CRm, bits [4:1]**

The CRm value from the issued instruction.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Write to System register space. MCRR instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read from System register space. MRRC instruction.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

The following sections describe configuration settings for traps that are reported using EC value \(0b000100\):

- ‘Traps to Hyp mode of Non-secure EL1 accesses to virtual memory control registers’.
- ‘Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Performance Monitors registers’.
• ‘Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Activity Monitors registers’.
• ‘Traps to Hyp mode of Non-secure EL0 and EL1 accesses to the Generic Timer registers’.
• ‘General trapping to Hyp mode of Non-secure EL0 and EL1 accesses to System registers in the (coproc == 1111) encoding space’.

The following sections describe configuration settings for traps that are reported using EC value 0b001100:

• ‘Traps to Hyp mode of Non-secure System register accesses to trace registers’.
• ‘Trapping Non-secure System register accesses to Debug ROM registers’.

ISS encoding for Exception from an LDC or STC instruction

<table>
<thead>
<tr>
<th>CV</th>
<th>COND</th>
<th>imm8</th>
<th>RES0</th>
<th>Rn</th>
<th>Offset</th>
<th>AM</th>
<th>Direction</th>
</tr>
</thead>
</table>

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

• If the instruction is conditional, COND is set to the condition code field value from the instruction.
• If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

• With COND set to 0b1110, the value for unconditional.
• With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

• CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
• CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**imm8, bits [19:12]**

The immediate value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [11:9]**

Reserved, RES0.
Rn, bits [8:5]

The Rn value from the issued instruction. Valid only when AM[2] is 0, indicating an immediate form of the
LDC or STC instruction.

When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is \textit{UNKNOWN}.

On a Warm reset, this field resets to an architecturally unknown value.

Offset, bit [4]

Indicates whether the offset is added or subtracted:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Subtract offset.</td>
</tr>
<tr>
<td>0b1</td>
<td>Add offset.</td>
</tr>
</tbody>
</table>

This bit corresponds to the U bit in the instruction encoding.

On a Warm reset, this field resets to an architecturally unknown value.

AM, bits [3:1]

Addressing mode. The permitted values of this field are:

<table>
<thead>
<tr>
<th>AM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Immediate unindexed.</td>
</tr>
<tr>
<td>0b01</td>
<td>Immediate post-indexed.</td>
</tr>
<tr>
<td>0b10</td>
<td>Immediate offset.</td>
</tr>
<tr>
<td>0b11</td>
<td>Immediate pre-indexed.</td>
</tr>
<tr>
<td>0b100</td>
<td>Literal unindexed.</td>
</tr>
<tr>
<td></td>
<td>LDC instruction in A32 instruction set only.</td>
</tr>
<tr>
<td></td>
<td>For a trapped STC instruction or a trapped</td>
</tr>
<tr>
<td></td>
<td>T32 LDC instruction this encoding is reserved.</td>
</tr>
<tr>
<td>0b110</td>
<td>Literal offset.</td>
</tr>
<tr>
<td></td>
<td>LDC instruction only.</td>
</tr>
<tr>
<td></td>
<td>For a trapped STC instruction, this encoding is reserved.</td>
</tr>
</tbody>
</table>

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is \textit{CONSTRAINED UNPREDICTABLE}.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits \{P, W\} in the instruction encoding.

On a Warm reset, this field resets to an architecturally unknown value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Write to memory. STC instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read from memory. LDC instruction.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally unknown value.

'\textit{Trapping general Non-secure System register accesses to debug registers}' describes the configuration settings for the trap that is reported using EC value 0b000110.

\textbf{ISS encoding for Exception from an access to SIMD or floating-point functionality, resulting from HCPTR}

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| CV |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
Excludes exceptions that occur because Advanced SIMD and floating-point functionality is not implemented, or because the value of HCR.TGE or HCR_EL2.TGE is 1. These are reported with EC value 0b000000.

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is implementation defined whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

On a Warm reset, this field resets to an architecturally unknown value.

**COND, bits [23:20]**

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is implementation defined whether:

- CV is set to 0 and COND is set to an unknown value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is implementation defined whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally unknown value.

**Bits [19:6]**

Reserved, RES0.

**TA, bit [5]**

Indicates trapped use of Advanced SIMD functionality. The possible values of this bit are:

<table>
<thead>
<tr>
<th>TA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Exception was not caused by trapped use of Advanced SIMD functionality.</td>
</tr>
<tr>
<td>0b1</td>
<td>Exception was caused by trapped use of Advanced SIMD functionality.</td>
</tr>
</tbody>
</table>

Any use of an Advanced SIMD instruction that is not also a floating-point instruction that is trapped to Hyp mode because of a trap configured in the HCPTR sets this bit to 1.

For a list of these instructions, see 'Controls of Advanced SIMD operation that do not apply to floating-point operation'.

On a Warm reset, this field resets to an architecturally unknown value.
Bit [4]

Reserved, RES0.

coproc, bits [3:0]

When the HSR.TA field returns the value 1, this field returns the value 0b1010. Otherwise, this field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following sections describe the configuration settings for the traps that are reported using EC value 0b000111:

- 'General trapping to Hyp mode of Non-secure accesses to the SIMD and floating-point registers'.
- 'Traps to Hyp mode of Non-secure accesses to Advanced SIMD functionality'.

ISS encoding for Exception from HVC or SVC instruction execution

<table>
<thead>
<tr>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, this is the value of the imm16 field of the issued instruction.

For an SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- For the T32 instruction, this field is zero-extended from the imm8 field of the instruction. For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

'Supervisor Call exception, when the value of HCR.TGE is 1' describes the configuration settings for the trap reported with EC value 0b010001.

ISS encoding for Exception from SMC instruction execution

<table>
<thead>
<tr>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

CV, bit [24]

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

When an A32 instruction is trapped, CV is set to 1.
When a T32 instruction is trapped, it is \texttt{IMPLEMENTATION DEFINED} whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

This field is valid only if CCKNOWPASS is 1, otherwise it is \texttt{RES0}.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{COND, bits [23:20]}

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

\begin{itemize}
  \item If the instruction is conditional, COND is set to the condition code field value from the instruction.
  \item If the instruction is unconditional, COND is set to \texttt{0b1110}.
\end{itemize}

A conditional A32 instruction that is known to pass its condition code check can be presented either:

\begin{itemize}
  \item With COND set to \texttt{0b1110}, the value for unconditional.
  \item With the COND value held in the instruction.
\end{itemize}

When a T32 instruction is trapped, it is \texttt{IMPLEMENTATION DEFINED} whether:

\begin{itemize}
  \item CV is set to 0 and COND is set to an \texttt{UNKNOWN} value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  \item CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
\end{itemize}

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is \texttt{IMPLEMENTATION DEFINED} whether the COND field is set to \texttt{0b1110}, or to the value of any condition that applied to the instruction.

This field is valid only if CCKNOWPASS is 1, otherwise it is \texttt{RES0}.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{CCKNOWPASS, bit [19]}

Indicates whether the instruction might have failed its condition code check.

\begin{table}[h]
\centering
\begin{tabular}{ll}
  \hline
  \textbf{CCKNOWPASS} & \textbf{Meaning}                                \\
  \hline
  \texttt{0b0}     & The instruction was unconditional, or was    \\
                   & conditional and passed its condition code  \\
                   & check.                                      \\
  \texttt{0b1}     & The instruction was conditional, and might   \\
                   & have failed its condition code check.       \\
  \hline
\end{tabular}
\end{table}

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{Bits [18:0]}

Reserved, \texttt{RES0}.

'Traps to Hyp mode of Non-secure EL1 execution of SMC instructions' describes the configuration settings for this trap, for instructions executed in Non-secure EL1.

\textbf{ISS encoding for Exception from a Prefetch Abort}

\begin{table}[h]
\centering
\begin{tabular}{cccccccccccccccc}
  \hline
  \texttt{24} & \texttt{23} & \texttt{22} & \texttt{21} & \texttt{20} & \texttt{19} & \texttt{18} & \texttt{17} & \texttt{16} & \texttt{15} & \texttt{14} & \texttt{13} & \texttt{12} & \texttt{11} & \texttt{10} & \texttt{9} & \texttt{8} & \texttt{7} & \texttt{6} & \texttt{5} & \texttt{4} & \texttt{3} & \texttt{2} & \texttt{1} & \texttt{0} \\
  \hline
  \texttt{RES0} & \texttt{FnVEA} & \texttt{RES0} & \texttt{S1PTW} & \texttt{RES0} & \texttt{IFSC}  \\
  \hline
\end{tabular}
\end{table}

\textbf{Bits [24:11]}

Reserved, \texttt{RES0}.
FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<table>
<thead>
<tr>
<th>FnV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>HIFAR is valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>HIFAR is not valid, and holds an UNKNOWN value.</td>
</tr>
</tbody>
</table>

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

<table>
<thead>
<tr>
<th>S1PTW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault not on a stage 2 translation for a stage 1 translation table walk.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault on the stage 2 translation of an access for a stage 1 translation table walk.</td>
</tr>
</tbody>
</table>

For any abort other than a stage 2 fault this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code. Possible values of this field are:
For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Long-descriptor translation table lookup'.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following sections describe cases where Prefetch Abort exceptions can be routed to Hyp mode, generating exceptions that are reported in the HSR with EC value 0b100000:

- 'Abort exceptions, when the value of HCR.TGE is 1'.
- 'Routing debug exceptions to EL2 using AArch32'.

**ISS encoding for Exception from an Illegal state or PC alignment fault**

<table>
<thead>
<tr>
<th>Bits [24:0]</th>
</tr>

<td>24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
</tr>
<tr>
<td>RES0</td>
</tr>
</tbody>
</table>

Reserved, RES0.

For more information about the Illegal state exception, see:
• 'Illegal changes to PSTATE.M'.
• 'Illegal return events from AArch32 state'.
• 'Legal returns that set PSTATE.IL to 1'.
• 'The Illegal Execution state exception'.

For more information about the PC alignment fault exception, see 'Branching to an unaligned PC'.

### ISS encoding for Exception from a Data Abort

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>24</td>
<td>Instruction Syndrome Valid (ISV)</td>
</tr>
<tr>
<td>23-22</td>
<td>Syndrome Access Size (SAS)</td>
</tr>
<tr>
<td>19-18</td>
<td>Access Size (SSE)</td>
</tr>
<tr>
<td>15-14</td>
<td>Reservation (RES0)</td>
</tr>
<tr>
<td>13</td>
<td>Return Size (SRT)</td>
</tr>
<tr>
<td>12</td>
<td>Return Address (RES0AR)</td>
</tr>
<tr>
<td>11</td>
<td></td>
</tr>
</tbody>
</table>

#### ISV, bit [24]

Instruction syndrome valid. Indicates whether the syndrome information in ISS[23:14] is valid.

<table>
<thead>
<tr>
<th>ISV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No valid instruction syndrome. ISS[23:14] are RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>ISS[23:14] hold a valid instruction syndrome.</td>
</tr>
</tbody>
</table>

This bit is 0 for all faults except Data Aborts generated by stage 2 address translations for which all the following apply to the instruction that generated the Data Abort exception:

- The instruction is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDB, LDBRT, STR, STL, STRT, STRH, STLB, STRH, STR, or STRBT instruction.
- The instruction is not performing register writeback.
- The instruction is not using the PC as a source or destination register.

For these cases, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, as described in 'Data Aborts in Memory access mode', and otherwise indicates whether ISS[23:14] hold a valid syndrome.

#### Note

In the A32 instruction set, LDR*T and STR*T instructions always perform register writeback and therefore never return a valid instruction syndrome.

When FEAT_RAS is implemented, ISV is 0 for any synchronous External abort.

ISV is set to 0 on a stage 2 abort on a stage 1 translation table walk.

When FEAT_RAS is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### SAS, bits [23:22]

Syndrome Access Size. When ISV is 1, indicates the size of the access attempted by the faulting operation.

<table>
<thead>
<tr>
<th>SAS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Byte</td>
</tr>
<tr>
<td>0b01</td>
<td>Halfword</td>
</tr>
<tr>
<td>0b10</td>
<td>Word</td>
</tr>
<tr>
<td>0b11</td>
<td>Doubleword</td>
</tr>
</tbody>
</table>

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**SSE, bit [21]**

Syndrome Sign Extend. When ISV is 1, for a byte, halfword, or word load operation, indicates whether the data item must be sign extended. For these cases, the possible values of this bit are:

<table>
<thead>
<tr>
<th>SSE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sign-extension not required.</td>
</tr>
<tr>
<td>0b1</td>
<td>Data item must be sign-extended.</td>
</tr>
</tbody>
</table>

For all other operations this bit is 0.

This field is **UNKNOWN** when the value of ISV is **UNKNOWN**.

This field is **RES0** when the value of ISV is 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [20]**

Reserved, **RES0**.

**SRT, bits [19:16]**

Syndrome Register transfer. When ISV is 1, the register number of the Rt operand of the faulting instruction.

This field is **UNKNOWN** when the value of ISV is **UNKNOWN**.

This field is **RES0** when the value of ISV is 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [15]**

Reserved, **RES0**.

**AR, bit [14]**

Acquire/Release. When ISV is 1, the possible values of this bit are:

<table>
<thead>
<tr>
<th>AR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Instruction did not have acquire/release semantics.</td>
</tr>
<tr>
<td>0b1</td>
<td>Instruction did have acquire/release semantics.</td>
</tr>
</tbody>
</table>

This field is **UNKNOWN** when the value of ISV is **UNKNOWN**.

This field is **RES0** when the value of ISV is 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [13:12]**

Reserved, **RES0**.

**AET, bits [11:10]**

*When FEAT_RAS is implemented:*

Asynchronous Error Type. When DFSC is 0b010001, describes the PE error state after taking the SError interrupt exception. The possible values of this field are:
### AET

<table>
<thead>
<tr>
<th>Meaning</th>
<th>0b00</th>
<th>0b01</th>
<th>0b10</th>
<th>0b11</th>
</tr>

<tbody>
<tr>
<td>Uncontainable (UC).</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Unrecoverable state (UEU)</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Restartable state (UEO)</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Recoverable state (UER)</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

On a synchronous Data Abort, this field is `RES0`.

In the event of multiple errors taken as a single SError interrupt exception, the overall PE error state is reported.

**Note**

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

When `FEAT_RAS` is not implemented, or when `DFSC` is not `0b010001`:

- Bit[11] is `RES0`.
- Bit[10] forms the FnV field.

**Note**

Armv8.2 requires the implementation of `FEAT_RAS`.

On a Warm reset, this field resets to an architecturally `UNKNOWN` value.

### FnV

<table>
<thead>
<tr>
<th>Meaning</th>
<th>0b0</th>
<th>0b1</th>
</tr>
</thead>
<tbody>
<tr>
<td>HDFAR is valid.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>HDFAR is not valid, and holds an <code>UNKNOWN</code> value.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

When `FEAT_RAS` is not implemented, this field is valid only if `DFSC` is `0b010000`. It is `RES0` for all other aborts.

When `FEAT_RAS` is implemented:

- If `DFSC` is `0b010000`, this field is valid.
- If `DFSC` is `0b010001`, this bit forms part of the AET field, becoming AET[0].
- This field is `RES0` for all other aborts.

**Note**

Armv8.2 requires the implementation of `FEAT_RAS`.

On a Warm reset, this field resets to an architecturally `UNKNOWN` value.

### EA, bit [9]

External abort type. This bit can provide an `IMPLEMENTATION DEFINED` classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

On a Warm reset, this field resets to an architecturally `UNKNOWN` value.

### CM, bit [8]

Cache maintenance. For a synchronous fault, identifies fault that comes from a cache maintenance or address translation instruction. For synchronous faults, the possible values of this bit are:
<table>
<thead>
<tr>
<th>CM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault not generated by a cache maintenance or address translation instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault generated by a cache maintenance or address translation instruction.</td>
</tr>
</tbody>
</table>

For an asynchronous Data Abort exception, this bit is 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**S1PTW, bit [7]**

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

<table>
<thead>
<tr>
<th>S1PTW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault not on a stage 2 translation for a stage 1 translation table walk.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault on the stage 2 translation of an access for a stage 1 translation table walk.</td>
</tr>
</tbody>
</table>

For any abort other than a stage 2 fault this bit is **RES0**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**WnR, bit [6]**

Write not Read. Indicates whether a synchronous abort was caused by a write instruction or a read instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>WnR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Abort caused by a read instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Abort caused by a write instruction.</td>
</tr>
</tbody>
</table>

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

On an asynchronous Data Abort:

- When **FEAT_RAS** is not implemented, this bit is **UNKNOWN**.
- When **FEAT_RAS** is implemented, this bit is **RES0**.

**Note**

Armv8.2 requires the implementation of **FEAT_RAS**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**DFSC, bits [5:0]**

Data Fault Status Code. Possible values of this field are:
<table>
<thead>
<tr>
<th>DFSC</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>Address size fault in translation table base register.</td>

<td>Asynchronous SError interrupt, from a parity or ECC error on memory access.</td>
<td>When FEAT_RAS is not implemented</td>
</tr>
<tr>
<td>0b011101</td>
<td>Synchronous parity or ECC error on memory access on translation table walk, level 1.</td>
<td>When FEAT_RAS is not implemented</td>
</tr>
<tr>
<td>0b011110</td>
<td>Synchronous parity or ECC error on memory access on translation table walk, level 2.</td>
<td>When FEAT_RAS is not implemented</td>
</tr>
<tr>
<td>0b011111</td>
<td>Synchronous parity or ECC error on memory access on translation table walk, level 3.</td>
<td>When FEAT_RAS is not implemented</td>
</tr>
<tr>
<td>0b100001</td>
<td>Alignment fault.</td>
<td></td>
</tr>
<tr>
<td>0b100010</td>
<td>Debug exception.</td>
<td></td>
</tr>
<tr>
<td>0b110000</td>
<td>TLB conflict abort.</td>
<td></td>
</tr>
<tr>
<td>0b110100</td>
<td>IMPLEMENTATION DEFINED fault (Lockdown).</td>
<td></td>
</tr>
<tr>
<td>0b110101</td>
<td>IMPLEMENTATION DEFINED fault (Unsupported Exclusive access).</td>
<td></td>
</tr>
</tbody>
</table>

All other values are reserved.

For more information about the lookup level associated with a fault, see ‘The level associated with MMU faults on a Long-descriptor translation table lookup’.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following describe cases where Data Abort exceptions can be routed to Hyp mode, generating exceptions that are reported in the HSR with EC value 0b100000:

- ‘Abort exceptions, when the value of HCR.TGE is 1’.
- ‘Routing debug exceptions to EL2 using AArch32’.

The following describe cases that can cause a Data Abort exception that is taken to Hyp mode, and reported in the HSR with EC value of 0b100000 or 0b100100:
Accessing the HSR

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, \{#\}<\text{CRm}>, \{#\}<\text{opc2}> \\
\text{MCR}\{<c>\}{<q>} <\text{coproc}>, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, \{#\}<\text{CRm}>, \{#\}<\text{opc2}>
\]

elsif PSTATE.EL == EL3 then
  if SCR.NS == '0' then
    UNDEFINED;
  else
    HSR = R[t];
HSTR, Hyp System Trap Register

The HSTR characteristics are:

**Purpose**

Controls trapping to Hyp mode of Non-secure accesses, at EL1 or lower, to System registers in the coproc == 0b1111 encoding space:

- By the CRn value used to access the register using MCR or MRC instruction.
- By the CRm value used to access the register using MCRR or MRRC instruction.

**Configuration**

AArch32 System register HSTR bits [31:0] are architecturally mapped to AArch64 System register HSTR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HSTR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

HSTR is a 32-bit register.

**Field descriptions**

The HSTR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>T15</td>
<td>RES0</td>
<td>T13</td>
<td>T12</td>
<td>T11</td>
<td>T10</td>
<td>T9</td>
<td>T8</td>
<td>T7</td>
<td>T6</td>
<td>T5</td>
<td>RES0</td>
<td>T3</td>
<td>T2</td>
<td>T1</td>
<td>T0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:16, 14, 4]**

Reserved, RES0.

**T<n>, bit [n], for n = 15, 13 to 5, 3 to 0**

The remaining fields control whether Non-secure EL0 and EL1 accesses, using MCR, MRC, MCRR, and MRRC instructions, to the System registers in the coproc == 0b1111 encoding space are trapped to Hyp mode:

<table>
<thead>
<tr>
<th>T&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on Non-secure EL0 or EL1 accesses to System registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any Non-secure EL1 MCR or MRC access with coproc == 0b1111 and CRn == &lt;n&gt; is trapped to Hyp mode. A Non-secure EL0 MCR or MRC access with these values is trapped to Hyp mode only if the access is not UNDEFINED when the value of this field is 0. Any Non-secure EL1 MCRR or MRRC access with coproc == 0b1111 and CRm == &lt;n&gt; is trapped to Hyp mode. A Non-secure EL0 MCRR or MRRC access with these values is trapped to Hyp mode only if the access is not UNDEFINED when the value of this field is 0.</td>
</tr>
</tbody>
</table>

For example, when HSTR.T7 is 1, for instructions executed at Non-secure EL1:

- An MCR or MRC instruction with coproc set to 0b1111 and <CRn> set to c7 is trapped to Hyp mode.
- An MCRR or MRRC instruction with coproc set to 0b1111 and <CRm> set to c7 is trapped to Hyp mode.
On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Accessing the HSTR**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>

    HSTR = R[t];
```

---

HSTR, Hyp System Trap Register
HTCR, Hyp Translation Control Register

The HTCR characteristics are:

Purpose

The control register for stage 1 of the EL2 translation regime.

Note

This stage of translation always uses the Long-descriptor translation table format.

Configuration

AArch32 System register HTCR bits [31:0] are architecturally mapped to AArch64 System register TCR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HTCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HTCR is a 32-bit register.

Field descriptions

The HTCR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES1 | IMPLEMENTATION DEFINED | RES0 | HWU62 | HWU61 | HWU60 | HWU59 | HPD | RES1 | RES0 | RES0 | SH0 | ORGN0 | IRGN0 | RES0 | T0SZ |

Bit [31]

Reserved, RES1.

IMPLEMENTATION DEFINED, bit [30]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [29]

Reserved, RES0.

HWU62, bit [28]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.
Meaning

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of HTCR.HPD is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HWU61, bit [27]**

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of HTCR.HPD is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HWU60, bit [26]**

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of HTCR.HPD is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HWU59, bit [25]**
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU59</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of HTCR.HPD is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD, bit [24]

When FEAT_AA32HPD is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the PL2 translation regime.

<table>
<thead>
<tr>
<th>HPD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hierarchical permissions are enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hierarchical permissions are disabled.</td>
</tr>
</tbody>
</table>

When disabled, the permissions are treated as if the bits are zero.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES1.

Bits [22:14]

Reserved, RES0.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using HTTBR.

<table>
<thead>
<tr>
<th>SH0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**ORGN0, bits [11:10]**

Outer cacheability attribute for memory associated with translation table walks using HTTBR.

<table>
<thead>
<tr>
<th>ORGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IRGN0, bits [9:8]**

Inner cacheability attribute for memory associated with translation table walks using HTTBR.

<table>
<thead>
<tr>
<th>IRGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [7:3]**

Reserved, RES0.

**T0SZ, bits [2:0]**

The size offset of the memory region addressed by HTTBR. The region size is \(2^{32-\text{T0SZ}}\) bytes.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the HTCR**

Accesses to this register use the following encodings:

\[
\text{MRC}\{\text{<c>}\}\{\text{<q>}\} \text{ <coproc>, \{#<opc1>, <Rt>, <CRn>, <CRm>{, \{#<opc2>\}}}
\]

<table>

The HTPIDR characteristics are:

**Purpose**

Provides a location where software running in Hyp mode can store thread identifying information that is not visible to Non-secure software executing at EL0 or EL1, for hypervisor management purposes.

The PE makes no use of this register.

**Configuration**

AArch32 System register HTPIDR bits [31:0] are architecturally mapped to AArch64 System register `TPIDR_EL2[31:0]`.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HTPIDR are UNDEFINED.

If EL2 is not implemented, this register is `RES0` from EL3.

**Note**

The PE never updates this register.

**Attributes**

HTPIDR is a 32-bit register.

**Field descriptions**

The HTPIDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Thread ID</td>
<td>0b1111</td>

HTRFCR, Hyp Trace Filter Control Register

The HTRFCR characteristics are:

Purpose

Provides EL2 controls for Trace.

Configuration

AArch32 System register HTRFCR bits [31:0] are architecturally mapped to AArch64 System register TRFCR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_TRF is implemented. Otherwise, direct accesses to HTRFCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from Monitor mode when SCR_NS == 1.

Attributes

HTRFCR is a 32-bit register.

Field descriptions

The HTRFCR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>TS</td>
</tr>
<tr>

<tr>
<td>26</td>
<td>E2TRE</td>
</tr>
<tr>
<td>25</td>
<td>RES0</td>
</tr>
<tr>
<td>24</td>
<td>E0HTRE</td>
</tr>
</tbody>
</table>

Reserved, RES0.

TS, bits [6:5]

Timestamp Control. Controls which timebase is used for trace timestamps.

<table>
<thead>
<tr>
<th>TS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>The timestamp is controlled by TRFCR.TS.</td>
</tr>
<tr>
<td>01</td>
<td>Virtual timestamp. The traced timestamp is the physical counter value minus the value of CNTVOFF.</td>
</tr>
<tr>
<td>11</td>
<td>Physical timestamp. The traced timestamp is the physical counter value.</td>
</tr>
</tbody>
</table>

When SelfHostedTraceEnabled() == FALSE, this field is ignored.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Bit [4]

Reserved, RES0.

CX, bit [3]

VMID Trace Enable.
Meaning

<table>
<thead>
<tr>
<th>CX</th>
<th>0b0</th>
<th>VMID tracing is not allowed.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0b1</td>
<td>VMID tracing is allowed.</td>
</tr>
</tbody>
</table>

When `SelfHostedTraceEnabled()` == FALSE, this field is ignored.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Bit [2]**

Reserved, RES0.

**E2TRE, bit [1]**

EL2 Trace Enable.

<table>
<thead>
<tr>
<th>E2TRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Tracing is prohibited at EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Tracing is allowed at EL2.</td>
</tr>
</tbody>
</table>

When `SelfHostedTraceEnabled()` == FALSE, this field is ignored.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**E0HTRE, bit [0]**

EL0 Trace Enable.

<table>
<thead>
<tr>
<th>E0HTRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Tracing is prohibited at EL0 when <code>HCR.TGE == 1</code>.</td>
</tr>
<tr>
<td>0b1</td>
<td>Tracing is allowed at EL0 when <code>HCR.TGE == 1</code>.</td>
</tr>
</tbody>
</table>

This field is ignored if any of the following are true:

- The PE is in Secure state.
- `SelfHostedTraceEnabled()` == FALSE.
- `HCR.TGE == 0`.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Accessing the HTRFCR**

The HTTBR characteristics are:

**Purpose**

Holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL2 translation regime, and other information for this translation regime.

**Configuration**

AArch32 System register HTTBR bits [47:1] are architecturally mapped to AArch64 System register TTBR0_EL2[47:1].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HTTBR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

HTTBR is a 64-bit register.

**Field descriptions**

The HTTBR bit assignments are:

</tbody>
</table>

**Bits [63:48]**

Reserved, RES0.

**BADDR, bits [47:1]**

Translation table base address, bits[47:x]. Bits [x:1] are RES0, with the additional requirement that if bits[x:1] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x:1] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of HTCR.T0SZ as follows:

- If HTCR.T0SZ is 0 or 1, x = 5 - HTCR.T0SZ.
- If HTCR.T0SZ is greater than 1, x = 14 - HTCR.T0SZ.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**CnP, bit [0]**

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by HTTBR is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of HTTBR.CnP is 1.

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The translation table entries pointed to by HTTBR are permitted to differ from corresponding entries for HTTBR for other PEs in the Inner Shareable domain. This is not affected by the value of HTTBR.CnP on those other PEs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The translation table entries pointed to by HTTBR are the same as the translation table entries pointed to by HTTBR on every other PE in the Inner Shareable domain for which the value of HTTBR.CnP is 1.</td>
</tr>
</tbody>
</table>

**Note**

If the value of the HTTBR.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those HTTBRs do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are **CONSTRAINED UNPREDICTABLE**, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Accessing the HTTBR**

Accesses to this register use the following encodings:

**MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>**

```plaintext

HVBAR, Hyp Vector Base Address Register

The HVBAR characteristics are:

**Purpose**

Holds the vector base address for any exception that is taken to Hyp mode.

**Configuration**

AArch32 System register HVBAR bits [31:0] are architecturally mapped to AArch64 System register `VBAR_EL2[31:0]`. This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HVBAR are **UNDEFINED**.

If EL2 is not implemented, this register is `RES0` from EL3.

**Attributes**

HVBAR is a 32-bit register.

**Field descriptions**

The HVBAR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-5</td>
<td>Vector Base Address</td>
</tr>
<tr>
<td>4-0</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

**Bits [31:5]**

Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [4:0]**

Reserved, RES0.

**Accessing the HVBAR**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

The ICC_AP0R<n> characteristics are:

Purpose

Provides information about Group 0 active priorities.

Configuration

AArch32 System register ICC_AP0R<n> bits [31:0] are architecturally mapped to AArch64 System register ICC_AP0R<n>_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_AP0R<n> are(undefined).

Attributes

ICC_AP0R<n> is a 32-bit register.

Field descriptions

The ICC_AP0R<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to 0.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

Accessing the ICC_AP0R<n>

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 0 active priorities) might result in UNPREDICTABLE behavior of the interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICC_AP0R1 is only implemented in implementations that support 6 or more bits of preemption. ICC_AP0R2 and ICC_AP0R3 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

Note

The number of bits of preemption is indicated by ICH_VTR.PREbits.

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- ICC_AP0R<n>.
- Secure ICC_AP1R<n>.
- Non-secure ICC_AP1R<n>.

Accesses to this register use the following encodings:

\[ \text{MRC\{<c>\}{<q>} <coproc>, \{#\}<opc1>, <Rt>, <CRn>, <CRm>, \{#\}<opc2}> \]

The ICC_ASGI1R characteristics are:

**Purpose**

Generates Group 1 SGIs for the Security state that is not the current Security state.

**Configuration**

AArch32 System register ICC_ASGI1R performs the same function as AArch64 System register ICC_ASGI1R_EL1.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_ASGI1R are UNDEFINED.

Under certain conditions a write to ICC_ASGI1R can generate Group 0 interrupts, see 'Forwarding an SGI to a target PE' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Attributes**

ICC_ASGI1R is a 64-bit register.

**Field descriptions**

The ICC_ASGI1R bit assignments are:

| Bit 63 | Bit 62 | Bit 61 | Bit 60 | Bit 59 | Bit 58 | Bit 57 | Bit 56 | Bit 55 | Bit 54 | Bit 53 | Bit 52 | Bit 51 | Bit 50 | Bit 49 | Bit 48 | Bit 47 | Bit 46 | Bit 45 | Bit 44 | Bit 43 | Bit 42 | Bit 41 | Bit 40 | Bit 39 | Bit 38 | Bit 37 | Bit 36 | Bit 35 | Bit 34 | Bit 33 | Bit 32 |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| RES0   | Aff3   | RS     | RES0   | IRM    | Aff2   | TargetList |

**Bits [63:56]**

Reserved, RES0.

**Aff3, bits [55:48]**

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

**RS, bits [47:44]**

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value ((RS * 16) + n).

When ICC_CTLR_EL1.RSS==0, RS is RES0.

When ICC_CTLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a CONSTRAINED UNPREDICTABLE choice of:

- The write is ignored.
- The RS field is treated as 0.
Bits [43:41]
Reserved, RES0.

IRM, bit [40]
Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

<table>
<thead>
<tr>
<th>IRM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.&lt;target list&gt;.</td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupts routed to all PEs in the system, excluding &quot;self&quot;.</td>
</tr>
</tbody>
</table>

Aff2, bits [39:32]
The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.
If the IRM bit is 1, this field is RES0.

Bits [31:28]
Reserved, RES0.

INTID, bits [27:24]
The INTID of the SGI.

Aff1, bits [23:16]
The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.
If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]
Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.
If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

Note
This restricts a system to sending targeted SGIs to PEs with an affinity 0 number that is less than 16. If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs.
Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.
If the IRM bit is 1, this field is RES0.

Accessing the ICC_ASGI1R
This register allows software executing in a Secure state to generate Non-secure Group 1 SGIs. It will also allow software executing in a Non-secure state to generate Secure Group 1 SGIs, if permitted by the settings of GICR_NSACR in the Redistributor corresponding to the target PE.

When GICD_CTLR.DS==0, Non-secure writes do not generate an interrupt for a target PE if not permitted by the GICR_NSACR register associated with the target PE. For more information, see 'Use of control registers for SGI.
forwarding’ in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Note**

Accesses from Secure Monitor mode are treated as Secure regardless of the value of SCR.NS.

Accesses to this register use the following encodings:

\[
\text{MCRR}\{\langle c \rangle\}\{\langle q \rangle\} \langle \text{coproc} \rangle, \{\#\}\langle \text{opc1} \rangle, \langle \text{Rt} \rangle, \langle \text{Rt2} \rangle, \langle \text{CRm} \rangle
\]

<table>

else
  ICC_ASGI1R = R[t2]:R[t];
endif
The ICC_BPR0 characteristics are:

**Purpose**

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption.

**Configuration**

AArch32 System register ICC_BPR0 bits [31:0] are architecturally mapped to AArch64 System register ICC_BPR0_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_BPR0 are UNDEFINED.

**Attributes**

ICC_BPR0 is a 32-bit register.

**Field descriptions**

The ICC_BPR0 bit assignments are:

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     | RES0 | BinaryPoint |

**Bits [31:3]**

Reserved, RES0.

**BinaryPoint, bits [2:0]**

The value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

<table>
<thead>
<tr>
<th>Binary point value</th>
<th>Group priority field</th>
<th>Subpriority field</th>
<th>Field with binary point</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>[7:1]</td>
<td>[0]</td>
<td>gggggg.s</td>
</tr>
<tr>
<td>1</td>
<td>[7:2]</td>
<td>[1:0]</td>
<td>gggggg.ss</td>
</tr>
<tr>
<td>2</td>
<td>[7:3]</td>
<td>[2:0]</td>
<td>gggggg.sss</td>
</tr>
<tr>
<td>3</td>
<td>[7:4]</td>
<td>[3:0]</td>
<td>ggggg.ssss</td>
</tr>
<tr>
<td>4</td>
<td>[7:5]</td>
<td>[4:0]</td>
<td>ggg.sssss</td>
</tr>
<tr>
<td>5</td>
<td>[7:6]</td>
<td>[5:0]</td>
<td>gg.ssssss</td>
</tr>
<tr>
<td>6</td>
<td>[7]</td>
<td>[6:0]</td>
<td>g.sssssss</td>
</tr>
<tr>
<td>7</td>
<td>No preemption</td>
<td>[7:0]</td>
<td>.ssssssss</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ICC_BPR0**

The minimum binary point value is derived from the number of implemented priority bits. The number of priority bits is IMPLEMENTATION DEFINED, and reported by ICC_CTLR.PRIbits and ICC_MCTLR.PRIbits.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is set to the minimum supported value.
Accesses to this register use the following encodings:

\[ \text{MRC}\{c\}\{q\} \ <\text{coproc}>, \ \{\#\}<\text{opc1}>, \ <\text{Rt}>, \ <\text{CRn}>, \ <\text{CRm}>, \ \{\#\}<\text{opc2}> \]

ICC_BPR1, Interrupt Controller Binary Point Register 1

The ICC_BPR1 characteristics are:

**Purpose**

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption.

**Configuration**

AArch32 System register ICC_BPR1 bits [31:0] (S) are architecturally mapped to AArch64 System register ICC_BPR1_EL1[31:0] (S).

AArch32 System register ICC_BPR1 bits [31:0] (NS) are architecturally mapped to AArch64 System register ICC_BPR1_EL1[31:0] (NS).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_BPR1 are UNDEFINED.

In GIC implementations supporting two Security states, this register is Banked.

**Attributes**

ICC_BPR1 is a 32-bit register.

**Field descriptions**

The ICC_BPR1 bit assignments are:

<table>

<td></td>
<td></td>
<td></td>
<td></td>
<td>BinaryPoint</td>
</tr>
</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**BinaryPoint, bits [2:0]**

If the GIC is configured to use separate binary point fields for Group 0 and Group 1 interrupts, the value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. For more information about priorities, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Writing 0 to this field will set this field to its reset value.

If EL3 is implemented and ICC_MCTLR_CBPRI_EL1S is 1:

- Accesses to this register at EL3 not in Monitor mode access the state of ICC_BPR0.
- When SCR_EL3.EEL2 is 1 and HCR_EL2.IMO is 1, Secure accesses to this register at EL1 access the state of ICC_BPR0.
- Otherwise, Secure accesses to this register at EL1 access the state of ICC_BPR0.

If EL3 is implemented and ICC_MCTLR_CBPRI_EL1NS is 1, Non-secure accesses to this register at EL1 or EL2 behave as follows, depending on the values of HCR.IMO and SCR.IRQ:
If EL3 is not implemented and ICC_CTLR.CBPR is 1, Non-secure accesses to this register at EL1 or EL2 behave as follows, depending on the values of HCR.IMO:

<table>
<thead>
<tr>
<th>HCR.IMO</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL1 and EL2 reads return ICC_BPR0 + 1 saturated to 0b111. Non-secure EL1 and EL2 writes are ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 reads return ICC_BPR0 + 1 saturated to 0b111. Non-secure EL2 writes ignored.</td>
</tr>
</tbody>
</table>

This field resets to an IMPLEMENTATION DEFINED non-zero value.

### Accessing the ICC_BPR1

When the PE resets into an Exception level that is using AArch32, the reset value is equal to:

- For the Secure copy of the register, the minimum value of ICC_BPR0 plus one.
- For the Non-secure copy of the register, the minimum value of ICC_BPR0.

Where the minimum value of ICC_BPR0 is IMPLEMENTATION DEFINED.

If EL3 is not implemented:

- If the PE is Secure this reset value is (minimum value of ICC_BPR0 plus one).
- If the PE is Non-secure this reset value is (minimum value of ICC_BPR0).

An attempt to program the binary point field to a value less than the reset value sets the field to the reset value.

Accesses to this register use the following encodings:

\[
\text{MRC\{}\langle c\rangle\text{\{}\langle q\rangle\text{\{}coproc\rangle, \{#\}\langle opc1\rangle, <Rt>, <CRn>, <CRm}\{, \{#\}\langle opc2\rangle\}}
\]

The ICC_CTLR characteristics are:

**Purpose**

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

**Configuration**

AArch32 System register ICC_CTLR bits [31:0] (S) are architecturally mapped to AArch64 System register ICC_CTLR_EL1[31:0] (S).

AArch32 System register ICC_CTLR bits [31:0] (NS) are architecturally mapped to AArch64 System register ICC_CTLR_EL1[31:0] (NS).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_CTLR are UNDEFINED.

**Attributes**

ICC_CTLR is a 32-bit register.

**Field descriptions**

The ICC_CTLR bit assignments are:

</tbody>
</table>

**Bits [31:20]**

Reserved, RES0.

**ExtRange, bit [19]**

Extended INTID range (read-only).

- **0b0**: CPU interface does not support INTIDs in the range 1024..8191. Behaviour is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface.

  **Note**
  Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.

- **0b1**: CPU interface supports INTIDs in the range 1024..8191. All INTIDs in the range 1024..8191 are treated as requiring deactivation.

If EL3 is implemented, ICC_CTLR_EL1.ExtRange is an alias of ICC_CTLR_EL3.ExtRange.

**RSS, bit [18]**

Range Selector Support. Possible values are:
### RSS

<table>
<thead>
<tr>
<th>RSS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Targeted SGIs with affinity level 0 values of 0 - 15 are supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>Targeted SGIs with affinity level 0 values of 0 - 255 are supported.</td>
</tr>
</tbody>
</table>

This bit is read-only.

### Bits [17:16]

Reserved, RES0.

### A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

<table>
<thead>
<tr>
<th>A3V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>The CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.</td>
</tr>
</tbody>
</table>

If EL3 is implemented and using AArch32, this bit is an alias of ICC_MCTLR.A3V.

If EL3 is implemented and using AArch64, this bit is an alias of ICC_CTLR_EL3.A3V.

### SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports local generation of SEIs:

<table>
<thead>
<tr>
<th>SEIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CPU interface logic does not support local generation of SEIs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The CPU interface logic supports local generation of SEIs.</td>
</tr>
</tbody>
</table>

If EL3 is implemented and using AArch32, this bit is an alias of ICC_MCTLR.SEIS.

If EL3 is implemented and using AArch64, this bit is an alias of ICC_CTLR_EL3.SEIS.

### IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. The number of physical interrupt identifier bits supported:

<table>
<thead>
<tr>
<th>IDbits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>16 bits.</td>
</tr>
<tr>
<td>0b01</td>
<td>24 bits.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If EL3 is implemented and using AArch32, this field is an alias of ICC_MCTLR.IDbits.

If EL3 is implemented and using AArch64, this field is an alias of ICC_CTLR_EL3.IDbits.

### PRIbits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).

---

**Note**
This field always returns the number of priority bits implemented, regardless of the Security state of the access or the value of GICD_CTLR.DS.

The division between group priority and subpriority is defined in the binary point registers ICC_BPR0 and ICC_BPR1.

If EL3 is implemented and using AArch32, physical accesses return the value from ICC_MCTLR.PRIbits.

If EL3 is implemented and using AArch64, physical accesses return the value from ICC_CTLR_EL3.PRIbits.

If EL3 is not implemented, physical accesses return the value from this field.

**Bit [7]**

Reserved, RES0.

**PMHE, bit [6]**

Priority Mask Hint Enable. Controls whether the priority mask register is used as a hint for interrupt distribution:

<table>
<thead>
<tr>
<th>PMHE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disables use of ICC_PMR as a hint for interrupt distribution.</td>
</tr>
<tr>
<td>0b1</td>
<td>Enables use of ICC_PMR as a hint for interrupt distribution.</td>
</tr>
</tbody>
</table>

If EL3 is implemented:

- If EL3 is using AArch32, this bit is an alias of ICC_MCTLR.PMHE.
- If EL3 is using AArch64, this bit is an alias of ICC_CTLR_EL3.PMHE.
- If GICD_CTLR.DS == 0, this bit is read-only.
- If GICD_CTLR.DS == 1, this bit is read/write.

If EL3 is not implemented, it is **IMPLEMENTATION DEFINED** whether this bit is read-only or read-write:

- If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
- If this bit is read/write, it resets to zero.

**Bits [5:2]**

Reserved, RES0.

**EOImode, bit [1]**

EOI mode for the current Security state. Controls whether a write to an End of Interrupt register also deactivates the interrupt:

<table>
<thead>
<tr>
<th>EOImode</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICC_EOIR0 and ICC_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR are UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICC_EOIR0 and ICC_EOIR1 provide priority drop functionality only. ICC_DIR provides interrupt deactivation functionality.</td>
</tr>
</tbody>
</table>

If EL3 is implemented:

- If EL3 is using AArch32, this bit is an alias of ICC_MCTLR.EOImode_EL1{S, NS} where S or NS corresponds to the current Security state.
- If EL3 is using AArch64, this bit is an alias of ICC_CTLR_EL3.EOImode_EL1{S, NS} where S or NS corresponds to the current Security state.

If EL3 is not implemented, it is **IMPLEMENTATION DEFINED** whether this bit is read-only or read-write:

- If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
- If this bit is read/write, it resets to zero.
**CBPR, bit [0]**

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 interrupts:

<table>
<thead>
<tr>
<th>CBPR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICC_BPR0 determines the preemption group for Group 0 interrupts only. ICC_BPR1 determines the preemption group for Group 1 interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICC_BPR0 determines the preemption group for both Group 0 and Group 1 interrupts.</td>
</tr>
</tbody>
</table>

If EL3 is implemented:

- If EL3 is using AArch32, this bit is an alias of ICC_MCTLR.CBPR_EL1{S,NS} where S or NS corresponds to the current Security state.
- If EL3 is using AArch64, this bit is an alias of ICC_CTLR_EL3.CBPR_EL1{S,NS} where S or NS corresponds to the current Security state.
- If GICD_CTLR.DS == 0, this bit is read-only.
- If GICD_CTLR.DS == 1, this bit is read/write.

If EL3 is not implemented, it is IMPLEMENTATION DEFINED whether this bit is read-only or read-write:

- If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
- If this bit is read/write, it resets to zero.

**Accessing the ICC_CTLR**

**ICC_DIR, Interrupt Controller Deactivate Interrupt Register**

The ICC_DIR characteristics are:

**Purpose**

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified interrupt.

**Configuration**

AArch32 System register ICC_DIR performs the same function as AArch64 System register ICC_DIR_EL1.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_DIR are UNDEFINED.

**Attributes**

ICC_DIR is a 32-bit register.

**Field descriptions**

The ICC_DIR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-24</td>
<td>RES0</td>
</tr>
<tr>
<td>23-0</td>
<td>INTID</td>
</tr>
</tbody>
</table>

**Bits [31:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID of the interrupt to be deactivated.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR.IDbits and ICC_MCTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

**Accessing the ICC_DIR**

There are two cases when writing to ICC_DIR_EL1 that were UNPREDICTABLE for a corresponding GICv2 write to GICC_DIR:

- When EOImode == 0. GICv3 implementations must ignore such writes. In systems supporting system error generation, an implementation might generate an SEI.
- When EOImode == 1 but no EOI has been issued. The interrupt will be de-activated by the Distributor; however the active priority in the CPU interface for the interrupt will remain set (because no EOI was issued).

Accesses to this register use the following encodings:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>

</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap priority when SDD == '1'" && !ELUsingAArch32(EL3) && SCR_EL3.<IRQ,FIQ> == '11' then
        UNDEFINED;
    elsif Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap priority when SDD == '1'" && ELUsingAArch32(EL3) && PSTATE.M != M32_Monitor && SCR.<IRQ,FIQ> == '11' then
        UNDEFINED;
    else
        ICC_DIR = R[t];
    endif
else
    ICC_DIR = R[t];
endif

if PSTATE.EL == EL2 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap priority when SDD == '1'" && !ELUsingAArch32(EL3) && SCR_EL3.<IRQ,FIQ> == '11' then
        UNDEFINED;
    elsif Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap priority when SDD == '1'" && ELUsingAArch32(EL3) && SCR.<IRQ,FIQ> == '11' then
        UNDEFINED;
    elsif ICC_HSRE.SRE == '0' then
        UNDEFINED;
    else
        ICC_DIR = R[t];
    endif
else
    ICC_DIR = R[t];
endif

if PSTATE.EL == EL3 then
    if ICC_MSR.E = '0' then
        UNDEFINED;
    else
        ICC_DIR = R[t];
    endif
else
    ICC_DIR = R[t];
endif
ICC_EOIR0, Interrupt Controller End Of Interrupt Register 0

The ICC_EOIR0 characteristics are:

**Purpose**

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified Group 0 interrupt.

**Configuration**

AArch32 System register ICC_EOIR0 performs the same function as AArch64 System register ICC_EOIR0_EL1.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_EOIR0 are UNDEFINED.

**Attributes**

ICC_EOIR0 is a 32-bit register.

**Field descriptions**

The ICC_EOIR0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
|  RES0  |             | INTID |

**Bits [31:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID from the corresponding ICC_IAR0 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR.IDbits and ICC_MCTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the EOImode bit for the current Exception level and Security state is 0, a write to this register drops the priority for the interrupt, and also deactivates the interrupt.

If the EOImode bit for the current Exception level and Security state is 1, a write to this register only drops the priority for the interrupt. Software must write to ICC_DIR to deactivate the interrupt.

The appropriate EOImode bit varies as follows:

- If EL3 is not implemented, the appropriate bit is ICC_CTLR.EOImode.
- If EL3 is implemented and the software is executing in Monitor mode, the appropriate bit is ICC_MCTLR.EOImode_EL3.
- If EL3 is implemented and the software is not executing in Monitor mode, the bit depends on the current Security state:
  - If the software is executing in Secure state, the bit is ICC_CTLR.EOImode in the Secure instance of ICC_CTLR. This is an alias of ICC_MCTLR.EOImode_EL1S.
  - If the software is executing in Non-secure state, the bit is ICC_CTLR.EOImode in the Non-secure instance of ICC_CTLR. This is an alias of ICC_MCTLR.EOImode_EL1NS.
**Accessing the ICC_EOIR0**

A write to this register must correspond to the most recent valid read by this PE from an Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICC_IAR0, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

A write of a Special INTID is ignored. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Accesses to this register use the following encodings:

The ICC_EOIR1 characteristics are:

**Purpose**
A PE writes to this register to inform the CPU interface that it has completed the processing of the specified Group 1 interrupt.

**Configuration**
AArch32 System register ICC_EOIR1 performs the same function as AArch64 System register ICC_EOIR1_EL1.
This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_EOIR1 are **UNDEFINED**.

**Attributes**
ICC_EOIR1 is a 32-bit register.

**Field descriptions**
The ICC_EOIR1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-24</td>
<td>RES0</td>
</tr>
<tr>
<td>23-0</td>
<td>INTID</td>
</tr>
</tbody>
</table>

**Bits [31:24]**
Reserved, RES0.

**INTID, bits [23:0]**
The INTID from the corresponding ICC_IAR1 access.
This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR.IDbits and ICC_MCTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.
If the EOI mode bit for the current Exception level and Security state is 0, a write to this register drops the priority for the interrupt, and also deactivates the interrupt.
If the EOI mode bit for the current Exception level and Security state is 1, a write to this register only drops the priority for the interrupt. Software must write to ICC_DIR to deactivate the interrupt.

The appropriate EOI mode bit varies as follows:

- If EL3 is not implemented, the appropriate bit is ICC_CTLR.EOI mode.
- If EL3 is implemented and the software is executing in Monitor mode, the appropriate bit is ICC_MCTLR.EOI mode_EL3.
- If EL3 is implemented and the software is not executing in Monitor mode, the bit depends on the current Security state:
  - If the software is executing in Secure state, the bit is ICC_CTLR.EOI mode in the Secure instance of ICC_CTLR. This is an alias of ICC_MCTLR.EOI mode_EL1 S.
  - If the software is executing in Non-secure state, the bit is ICC_CTLR.EOI mode in the Non-secure instance of ICC_CTLR. This is an alias of ICC_MCTLR.EOI mode_EL1 NS.
Accessing the ICC_EOIR1

A write to this register must correspond to the most recent valid read by this PE from an Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICC_IAR1, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

A write of a Special INTID is ignored. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Accesses to this register use the following encodings:

\[
\text{MCR}\{<c>\}\{<q>\} <\text{coproc}, \{#<\text{opc1}>\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>\{, \{#<\text{opc2}>\}\}

ICC_HPPIR0, Interrupt Controller Highest Priority Pending Interrupt Register 0

The ICC_HPPIR0 characteristics are:

**Purpose**

Indicates the highest priority pending Group 0 interrupt on the CPU interface.

**Configuration**

AArch32 System register ICC_HPPIR0 performs the same function as AArch64 System register ICC_HPPIR0_EL1.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_HPPIR0 are **UNDEFINED**.

**Attributes**

ICC_HPPIR0 is a 32-bit register.

**Field descriptions**

The ICC_HPPIR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-24</td>
<td><strong>RES0</strong></td>
</tr>
<tr>
<td>23-0</td>
<td><strong>INTID</strong></td>
</tr>
</tbody>
</table>

**Bits [31:24]**

Reserved, **RES0**.

**INTID, bits [23:0]**

The INTID of the highest priority pending interrupt, if that interrupt is observable at the current Security state and Exception level.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. These special INTIDs can be one of: 1020, 1021, or 1023. For more information, see ‘Special INTIDs’ in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR.IDbits and ICC_MCTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are **RES0**.

        if ICC_MSRE.SRE == '0' then
            UNDEFINED;
        else
            return ICC.HPPR1;
        endif
else
    return ICC.HPPR1;
endif
The ICC_HSRE characteristics are:

**Purpose**

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL2.

**Configuration**

AArch32 System register ICC_HSRE bits [31:0] are architecturally mapped to AArch64 System register ICC_SRE_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_HSRE are **UNDEFINED**.

**Attributes**

ICC_HSRE is a 32-bit register.

**Field descriptions**

The ICC_HSRE bit assignments are:

- **RES0**
  - Bits [31:4]: Reserved, RES0.
- **Enable**
  - **Meaning**
    - 0b0: Non-secure EL1 accesses to ICC_SRE trap to EL2.
    - 0b1: Non-secure EL1 accesses to ICC_SRE do not trap to EL2.
  
  If ICC_HSRE.SRE is RAO/WI, an implementation is permitted to make the Enable bit RAO/WI.
  
  If ICC_HSRE.SRE is 0, the Enable bit behaves as 1 for all purposes other than reading the value of the bit.
  
  On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
- **DIB**
  - **Meaning**
    - 0b0: IRQ bypass enabled.
    - 0b1: IRQ bypass disabled.
  
  If EL3 is implemented and GICD_CTLR.DS is 0, this field is a read-only alias of ICC_MSRE.DIB.
If EL3 is implemented and `GICD_CTLR.DS` is 1, this field is a read-write alias of `ICC_MSRE.DIB`. In systems that do not support IRQ bypass, this bit is RAO/WI.

On a Warm reset, this field resets to 0.

### DFB, bit [1]
Disabling FIQ bypass.

<table>
<thead>
<tr>
<th>DFB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FIQ bypass enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>FIQ bypass disabled.</td>
</tr>
</tbody>
</table>

If EL3 is implemented and `GICD_CTLR.DS` is 0, this field is a read-only alias of `ICC_MSRE.DFB`. If EL3 is implemented and `GICD_CTLR.DS` is 1, this field is a read-write alias of `ICC_MSRE.DFB`. In systems that do not support FIQ bypass, this bit is RAO/WI.

On a Warm reset, this field resets to 0.

### SRE, bit [0]
System Register Enable.

<table>
<thead>
<tr>
<th>SRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The memory-mapped interface must be used. Accesses at EL2 or below to any ICH_* System register, or any EL1 or EL2 ICC_* register other than <code>ICC_SRE</code> or ICC_HSRE, are UNDEFINED.</td>
</tr>
<tr>
<td>0b1</td>
<td>The System register interface to the ICH_* registers and the EL1 and EL2 ICC_* registers is enabled for EL2.</td>
</tr>
</tbody>
</table>

If software changes this bit from 1 to 0, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

If EL3 is implemented and using AArch64:

- When `ICC_SRE_EL3.SRE==0` this bit is RAZ/WI.

If EL3 is implemented using AArch32:

- When `ICC_MSRE.SRE==0` this bit is RAZ/WI.

On a Warm reset, this field resets to 0.

### Accessing the ICC_HSRE
The GIC architecture permits, but does not require, that registers can be shared between memory-mapped registers and the equivalent System registers. This means that if the memory-mapped registers have been accessed while `ICC_HSRE.SRE==0`, then the System registers might be modified. Therefore, software must only rely on the reset values of the System registers if there has been no use of the GIC functionality while the memory-mapped registers are in use. Otherwise, the System register values must be treated as UNKNOWN.

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b100</td>
<td>0b1100</td>
<td>0b1001</td>
<td>0b101</td>
</tr>
</tbody>
</table>

The ICC_IAR0 characteristics are:

**Purpose**

The PE reads this register to obtain the INTID of the signaled Group 0 interrupt. This read acts as an acknowledge for the interrupt.

**Configuration**

AArch32 System register ICC_IAR0 performs the same function as AArch64 System register ICC_IAR0_EL1.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_IAR0 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when PSTATE.{I,F} == {0,0}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Attributes**

ICC_IAR0 is a 32-bit register.

**Field descriptions**

**Bits [31:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID of the signaled interrupt.

This is the INTID of the highest priority pending interrupt, if that interrupt is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged at the current Security state and Exception level.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. These special INTIDs can be one of: 1020, 1021, or 1023. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR.IDbits and ICC_MCTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

**Accessing the ICC_IAR0**

        UNDEFINED;
    else
        return ICC_IAR0;
    end if;
end if;
The ICC_IAR1 characteristics are:

**Purpose**

The PE reads this register to obtain the INTID of the signaled Group 1 interrupt. This read acts as an acknowledge for the interrupt.

**Configuration**

AArch32 System register ICC_IAR1 performs the same function as AArch64 System register ICC_IAR1_EL1.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_IAR1 are **UNDEFINED**.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when PSTATE.{I,F} == {0,0}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see ‘Observability of the effects of accesses to the GIC registers’ in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Attributes**

ICC_IAR1 is a 32-bit register.

**Field descriptions**

The ICC_IAR1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | INTID |

**Bits [31:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID of the signaled interrupt.

This is the INTID of the highest priority pending interrupt, if that interrupt is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged at the current Security state and Exception level.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. This special INTID can take the value 1023 only. For more information, see ‘Special INTIDs’ in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR.IDbits and ICC_MCTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

**Accessing the ICC_IAR1**

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
   UNDEFINED;
elsif PSTATE.EL == EL1 then
   if Halted() & HaveEL(EL3) & EDSCR.SDD == '1' & boolean IMPLEMENTATION_DEFINED "EL3 trap
   priority when SDD == '1'" & ELUsingAArch32(EL3) & SCR_EL3.IRQ == '1' then
      UNDEFINED;

   UNDEFINED;
elsif ICC_MSRE.SRE == '0' then
   UNDEFINED;
else
   return ICC_IAR1;
endif
else
   return ICC_IAR1;
else
   if ICC_MSRE.SRE == '0' then
      UNDEFINED;
   else
      return ICC_IAR1;
elese
      return ICC_IAR1;
endif
The ICC_IGRPEN0 characteristics are:

**Purpose**

Controls whether Group 0 interrupts are enabled or not.

**Configuration**

AArch32 System register ICC_IGRPEN0 bits [31:0] are architecturally mapped to AArch64 System register ICC_IGRPEN0_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_IGRPEN0 are **UNDEFINED**.

**Attributes**

ICC_IGRPEN0 is a 32-bit register.

**Field descriptions**

The ICC_IGRPEN0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td>0b0</td>
<td>Group 0 interrupts are disabled.</td>
</tr>
<tr>
<td>30</td>
<td></td>
<td>0b1</td>
<td>Group 0 interrupts are enabled.</td>
</tr>
</tbody>
</table>

Virtual accesses to this register update ICH_VMCR.VENG0.

On a Warm reset, this field resets to 0.

**Accessing the ICC_IGRPEN0**

The lowest Exception level at which this register can be accessed is governed by the Exception level to which FIQ is routed. This routing depends on SCR.FIQ, SCR.NS and HCR.FMO.

If an interrupt is pending within the CPU interface when Enable becomes 0, the interrupt must be released to allow the Distributor to forward the interrupt to a different PE.

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if Halted() && HaveEL(EL3) && EDSR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap priority when SDD == '1'" && !ELUsingAArch32(EL3) && SCR_EL3.FIQ == '1' then

ICC_IGRPEN1, Interrupt Controller Interrupt Group 1 Enable register

The ICC_IGRPEN1 characteristics are:

**Purpose**

Controls whether Group 1 interrupts are enabled for the current Security state.

**Configuration**

AArch32 System register ICC_IGRPEN1 bits [31:0] (S) are architecturally mapped to AArch64 System register ICC_IGRPEN1_EL1[31:0] (S).

AArch32 System register ICC_IGRPEN1 bits [31:0] (NS) are architecturally mapped to AArch64 System register ICC_IGRPEN1_EL1[31:0] (NS).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_IGRPEN1 are **UNDEFINED**.

**Attributes**

ICC_IGRPEN1 is a 32-bit register.

**Field descriptions**

The ICC_IGRPEN1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit No.</th>
<th>Field Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-30</td>
<td>RES0</td>
<td></td>
</tr>
<tr>
<td>29-21</td>
<td>Enable</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:1]**

Reserved, RES0.

**Enable, bit [0]**

Enables Group 1 interrupts for the current Security state.

<table>
<thead>
<tr>
<th>Enable</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 1 interrupts are disabled</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 1 interrupts are enabled</td>
</tr>
</tbody>
</table>

Virtual accesses to this register update ICH_VMCR.VENG1.

If EL3 is present:

- This bit is a read/write alias of ICC_MGRPEN1.EnableGrp1 {S, NS} as appropriate if EL3 is using AArch32, or ICC_IGRPEN1_EL3.EnableGrp1 {S, NS} as appropriate if EL3 is using AArch64.
- When this register is accessed at EL3, the copy of this register appropriate to the current setting of SCR.NS is accessed.

On a Warm reset, this field resets to 0.
**Accessing the ICC_IGRPEN1**

The lowest Exception level at which this register can be accessed is governed by the Exception level to which IRQ is routed. This routing depends on SCR.IRC, SCR.NS and HCR.IMO.

If an interrupt is pending within the CPU interface when Enable becomes 0, the interrupt must be released to allow the Distributor to forward the interrupt to a different PE.

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>

The ICC_MCTLR characteristics are:

**Purpose**

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

**Configuration**

AArch32 System register ICC_MCTLR bits [31:0] can be mapped to AArch64 System register ICC_CTLR_EL3[31:0], but this is not architecturally mandated.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_MCTLR are UNDEFINED.

**Attributes**

ICC_MCTLR is a 32-bit register.

**Field descriptions**

The ICC_MCTLR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td>Reserved, UNDEFINED</td>

<td></td>
</tr>
<tr>
<td>7</td>
<td>CBPR_EL1S</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:20]**

Reserved, RES0.

**ExtRange, bit [19]**

Extended INTID range (read-only).

<table>
<thead>
<tr>
<th>ExtRange</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>CPU interface does not support INTIDs in the range 1024..8191. Behavior is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface.</td>
</tr>
<tr>
<td>0b1</td>
<td>CPU interface supports INTIDs in the range 1024..8191. All INTIDs in the range 1024..8191 are treated as requiring deactivation.</td>
</tr>
</tbody>
</table>

**Note**

Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.

**RSS, bit [18]**

Range Selector Support. Possible values are:
Meaning

0b0 Targeted SGIs with affinity level 0 values of 0 - 15 are supported.
0b1 Targeted SGIs with affinity level 0 values of 0 - 255 are supported.

This bit is read-only.

**nDS, bit [17]**

Disable Security not supported. Read-only and writes are ignored.

<table>
<thead>
<tr>
<th>nDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CPU interface logic supports disabling of security.</td>
</tr>
<tr>
<td>0b1</td>
<td>The CPU interface logic does not support disabling of security, and requires that security is not disabled.</td>
</tr>
</tbody>
</table>

**Bit [16]**

Reserved, RES0.

**A3V, bit [15]**

Affinity 3 Valid. Read-only and writes are ignored.

<table>
<thead>
<tr>
<th>A3V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CPU interface logic does not support non-zero values of the Aff3 field in SGI generation System registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>The CPU interface logic supports non-zero values of the Aff3 field in SGI generation System registers.</td>
</tr>
</tbody>
</table>

If EL3 is present, ICC_CTLR.A3V is an alias of ICC_MCTLR.A3V.

**SEIS, bit [14]**

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports generation of SEIs.

<table>
<thead>
<tr>
<th>SEIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CPU interface logic does not support generation of SEIs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The CPU interface logic supports generation of SEIs.</td>
</tr>
</tbody>
</table>

If EL3 is present, ICC_CTLR.SEIS is an alias of ICC_MCTLR.SEIS.

**IDbits, bits [13:11]**

Identifier bits. Read-only and writes are ignored. Indicates the number of physical interrupt identifier bits supported.

<table>
<thead>
<tr>
<th>IDbits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>16 bits.</td>
</tr>
<tr>
<td>0b001</td>
<td>24 bits.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If EL3 is present, ICC_CTLR.IDbits is an alias of ICC_MCTLR.IDbits.

**PRIbits, bits [10:8]**

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).
Note

This field always returns the number of priority bits implemented, regardless of the value of SCR.NS or the value of GICD_CTRLR.DS.

The division between group priority and subpriority is defined in the binary point registers ICC_BPR0 and ICC_BPR1. This field determines the minimum value of ICC_BPR0.

**Bit [7]**

Reserved, RES0.

**PMHE, bit [6]**

Priority Mask Hint Enable.

<table>
<thead>
<tr>
<th>PMHE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disables use of the priority mask register as a hint for interrupt distribution.</td>
</tr>
<tr>
<td>0b1</td>
<td>Enables use of the priority mask register as a hint for interrupt distribution.</td>
</tr>
</tbody>
</table>

Software must write ICC_PMR to 0xFF before clearing this field to 0.

An implementation might choose to make this field RAO/WI.

If EL3 is present, ICC_CTRLR.PMHE is an alias of ICC_MCTLR.PMHE.

On a Warm reset, this field resets to 0.

**RM, bit [5]**

SBZ.

The equivalent bit in AArch64 is the Routing Modifier bit. This feature is not supported when EL3 is using AArch32.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EOImode_EL1NS, bit [4]**

EOI mode for interrupts handled at Non-secure EL1 and EL2. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

<table>
<thead>
<tr>
<th>EOImode_EL1NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICC_EOIR0 and ICC_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR are UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICC_EOIR0 and ICC_EOIR1 provide priority drop functionality only. ICC_DIR provides interrupt deactivation functionality.</td>
</tr>
</tbody>
</table>

If EL3 is present, ICC_CTRLR(NS).EOImode is an alias of ICC_MCTLR.EOImode_EL1NS.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EOImode_EL1S, bit [3]**

EOI mode for interrupts handled at Secure EL1. Controls whether a write to an End of Interrupt register also deactivates the interrupt.
EOImode_EL1S | Meaning
---|---
0b0 | ICC_EOIR0 and ICC_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR are UNPREDICTABLE.
0b1 | ICC_EOIR0 and ICC_EOIR1 provide priority drop functionality only. ICC_DIR provides interrupt deactivation functionality.

If EL3 is present, ICC_CTLR(S).EOImode is an alias of ICC_MCTLR.EOImode_EL1S.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### EOImode_EL3, bit [2]

EOI mode for interrupts handled at EL3. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

<table>
<thead>
<tr>
<th>EOImode_EL3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICC_EOIR0 and ICC_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR are UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICC_EOIR0 and ICC_EOIR1 provide priority drop functionality only. ICC_DIR provides interrupt deactivation functionality.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### CBPR_EL1NS, bit [1]

Common Binary Point Register, EL1 Non-secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Non-secure interrupts at EL1 and EL2.

<table>
<thead>
<tr>
<th>CBPR_EL1NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICC_BPR0 determines the preemption group for Group 0 interrupts only. ICC_BPR1 determines the preemption group for Non-secure Group 1 interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICC_BPR0 determines the preemption group for Group 0 and Non-secure Group 1 interrupts. Non-secure accesses to GICC_BPR and ICC_BPR1 access the state of ICC_BPR0.</td>
</tr>
</tbody>
</table>

If EL3 is present, ICC_CTLR(NS).CBPR is an alias of ICC_MCTLR.CBPR_EL1NS.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### CBPR_EL1S, bit [0]

Common Binary Point Register, EL1 Secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Secure interrupts in Secure non-Monitor modes.

<table>
<thead>
<tr>
<th>CBPR_EL1S</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICC_BPR0 determines the preemption group for Group 0 interrupts only. ICC_BPR1 determines the preemption group for Secure Group 1 interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICC_BPR0 determines the preemption group for Group 0 interrupts and Secure Group 1 interrupts. Secure EL1 accesses, or EL3 accesses when not in Monitor mode, to ICC_BPR1 access the state of ICC_BPR0.</td>
</tr>
</tbody>
</table>

If EL3 is present, ICC_CTLR(S).CBPR is an alias of ICC_MCTLR.CBPR_EL1S.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing the ICC_MCTLR

This register is only accessible when executing in Monitor mode.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}\{<q>\} \text{ <coproc>, \{#<opc1>, <Rt>, <CRn>, <CRm}\{, \{#<opc2>\}}
\]

<table>

</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure Group 1 interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure Group 1 interrupts are enabled.</td>
</tr>
</tbody>
</table>

The Secure ICC_IGRPEN1.Enable bit is a read/write alias of the ICC_MGRPEN1.EnableGrp1S bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

On a Warm reset, this field resets to 0.

**EnableGrp1NS, bit [0]**

Enables Group 1 interrupts for the Non-secure state.

<table>
<thead>
<tr>
<th>EnableGrp1NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure Group 1 interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure Group 1 interrupts are enabled.</td>
</tr>
</tbody>
</table>

The Non-secure ICC_IGRPEN1.Enable bit is a read/write alias of the ICC_MGRPEN1.EnableGrp1NS bit.
If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

On a Warm reset, this field resets to 0.

## Accessing the ICC_MGRPEN1

If an interrupt is pending within the CPU interface when an Enable bit becomes 0, the interrupt must be released to allow the Distributor to forward the interrupt to a different PE.

This register is only accessible when executing in Monitor mode.

Accesses to this register use the following encodings:

```
MRC<<q>> <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>

ICC_MSRE, Interrupt Controller Monitor System Register Enable register

The ICC_MSRE characteristics are:

**Purpose**

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL3.

**Configuration**

AArch32 System register ICC_MSRE bits [31:0] can be mapped to AArch64 System register ICC_SRE_EL3[31:0], but this is not architecturally mandated.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_MSRE are UNDEFINED.

**Attributes**

ICC_MSRE is a 32-bit register.

**Field descriptions**

The ICC_MSRE bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    | RES0 |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [31:4]**

Reserved, RES0.

**Enable, bit [3]**

Enable. Enables lower Exception level access to ICC_SRE and ICC_HSRE.

<table>
<thead>
<tr>
<th>Enable</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure EL1 accesses to Secure ICC_SRE trap to EL3. EL2 accesses to Non-secure ICC_SRE and ICC_HSRE trap to EL3. Non-secure EL1 accesses to ICC_SRE trap to EL3, unless these accesses are trapped to EL2 as a result of ICC_HSRE.Enable == 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure EL1 accesses to Secure ICC_SRE do not trap to EL3. EL2 accesses to Non-secure ICC_SRE and ICC_HSRE do not trap to EL3. Non-secure EL1 accesses to ICC_SRE do not trap to EL3.</td>
</tr>
</tbody>
</table>

If ICC_MSRE.SRE is RAO/WI, an implementation is permitted to make the Enable bit RAO/WI.

If ICC_MSRE.SRE is 0, the Enable bit behaves as 1 for all purposes other than reading the value of the bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**DIB, bit [2]**

Disable IRQ bypass.

<table>
<thead>
<tr>
<th>DIB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IRQ bypass enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>IRQ bypass disabled.</td>
</tr>
</tbody>
</table>

In systems that do not support IRQ bypass, this bit is RAO/WI.

On a Warm reset, this field resets to 0.

**DFB, bit [1]**

Disable FIQ bypass.

<table>
<thead>
<tr>
<th>DFB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FIQ bypass enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>FIQ bypass disabled.</td>
</tr>
</tbody>
</table>

In systems that do not support FIQ bypass, this bit is RAO/WI.

On a Warm reset, this field resets to 0.

**SRE, bit [0]**

System Register Enable.

<table>
<thead>
<tr>
<th>SRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The memory-mapped interface must be used.</td>
</tr>
<tr>
<td></td>
<td>Accesses at EL3 or below to any ICH_* System</td>
</tr>
<tr>
<td></td>
<td>register, or any EL1, EL2, or EL3 ICC_*</td>
</tr>
<tr>
<td></td>
<td>register other than ICC_SRE, ICC_HSRE, or ICC_MSRE, are UNDEFINED.</td>
</tr>
<tr>
<td>0b1</td>
<td>The System register interface to the ICH_*</td>
</tr>
<tr>
<td></td>
<td>registers and the EL1, EL2, and EL3 ICC_*</td>
</tr>
<tr>
<td></td>
<td>registers is enabled for EL3.</td>
</tr>
</tbody>
</table>

If software changes this bit from 1 to 0, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

On a Warm reset, this field resets to 0.

**Accessing the ICC_MSRE**

This register is always System register accessible.

The GIC architecture permits, but does not require, that registers can be shared between memory-mapped registers and the equivalent System registers. This means that if the memory-mapped registers have been accessed while ICC_MSRE.SRE==0, then the System registers might be modified. Therefore, software must only rely on the reset values of the System registers if there has been no use of the GIC functionality while the memory-mapped registers are in use. Otherwise, the System register values must be treated as UNKNOWN.

This register is only accessible when executing in Monitor mode.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#<\text{opc1}>\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#<\text{opc2}>\}
\]

**ICC_PMR, Interrupt Controller Interrupt Priority Mask Register**

The ICC_PMR characteristics are:

**Purpose**

Provides an interrupt priority filter. Only interrupts with a higher priority than the value in this register are signaled to the PE.

**Configuration**

AArch32 System register ICC_PMR bits [31:0] are architecturally mapped to AArch64 System register ICC_PMR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_PMR are undefined.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that writes to this register are self-synchronising. This ensures that no interrupts below the written PMR value will be taken after a write to this register is architecturally executed. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Attributes**

ICC_PMR is a 32-bit register.

**Field descriptions**

The ICC_PMR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Implemented priority bits</th>
<th>Possible priority field values</th>
<th>Number of priority levels</th>
</tr>
</thead>
<tbody>
<tr>
<td>[0]</td>
<td>RES0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>[31:1]</td>
<td>Priority</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**Priority, bits [7:0]**

The priority mask level for the CPU interface. If the priority of an interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

The possible priority field values are as follows:
Unimplemented priority bits are RAZ/WI.

On a Warm reset, this field resets to 0.

**Accessing the ICC_PMR**

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} \ <\text{coproc}>, \ {#}<\text{opc}1>, \ <\text{Rt}>, \ <\text{CRn}>, \ <\text{CRm}>\{, \ {#}<\text{opc}2>\}

The ICC_RPR characteristics are:

**Purpose**

Indicates the Running priority of the CPU interface.

**Configuration**

AArch32 System register ICC_RPR performs the same function as AArch64 System register ICC_RPR_EL1.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_RPR are **UNDEFINED**.

**Attributes**

ICC_RPR is a 32-bit register.

**Field descriptions**

The ICC_RPR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | Priority |

**Bits [31:8]**

Reserved, RES0.

**Priority, bits [7:0]**

The current running priority on the CPU interface. This is the group priority of the current active interrupt.

The priority returned is the group priority as if the BPR for the current Exception level and Security state was set to the minimum value of BPR for the number of implemented priority bits.

**Note**

If 8 bits of priority are implemented the group priority is bits[7:1] of the priority.

**Accessing the ICC_RPR**

If there are no active interrupts on the CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

Software cannot determine the number of implemented priority bits from a read of this register.

Accesses to this register use the following encodings:
MRC{{c}{q}} {coproc}, {#}<{opc1}, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

ICC_RPR, Interrupt Controller Running Priority Register
The ICC_SGI0R characteristics are:

**Purpose**
Generates Secure Group 0 SGIs.

**Configuration**
AArch32 System register ICC_SGI0R performs the same function as AArch64 System register ICC_SGI0R_EL1.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_SGI0R are UNDEFINED.

**Attributes**
ICC_SGI0R is a 64-bit register.

**Field descriptions**
The ICC_SGI0R bit assignments are:

**Bits [63:56]**
Reserved, RES0.

**Aff3, bits [55:48]**
The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.
If the IRM bit is 1, this field is RES0.

**RS, bits [47:44]**
RangeSelector
Controls which group of 16 values is represented by the TargetList field.
TargetList[n] represents aff0 value ((RS * 16) + n).
When ICC_CTLR_EL1.RSS==0, RS is RES0.
When ICC_CTLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a CONSTRAINED UNPREDICTABLE choice of:

- The write is ignored.
- The RS field is treated as 0.
Bits [43:41]
Reserved, RES0.

IRM, bit [40]
Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

<table>
<thead>
<tr>
<th>IRM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.&lt;target list&gt;</td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupts routed to all PEs in the system, excluding &quot;self&quot;</td>
</tr>
</tbody>
</table>

Aff2, bits [39:32]
The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.
If the IRM bit is 1, this field is RES0.

Bits [31:28]
Reserved, RES0.

INTID, bits [27:24]
The INTID of the SGI.

Aff1, bits [23:16]
The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.
If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]
Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.
If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

Note
This restricts a system to sending targeted SGIs to PEs with an affinity 0 number that is less than 16. If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.
If the IRM bit is 1, this field is RES0.

Accessing the ICC_SGI0R
This register allows software executing in a Secure state to generate Group 0 SGIs. It will also allow software executing in a Non-secure state to generate Group 0 SGIs, if permitted by the settings of GICR_NSACR in the Redistributor corresponding to the target PE.

When GICD_CTLR.DS==0, Non-secure writes do not generate an interrupt for a target PE if not permitted by the GICR_NSACR register associated with the target PE. For more information, see 'Use of control registers for SGI
forwarding' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Note**

Accesses from Secure Monitor mode are treated as Secure regardless of the value of SCR.NS.

Accesses to this register use the following encodings:

\[ \text{MCRR}\{<c>\}{<q>} \{<coproc>, \{#<opc1>, <Rt>, <Rt2>, <CRm> \}
\]

<table>
<thead>
<tr>

</table>

Reserved, RES0.

**DIB, bit [2]**

Disable IRQ bypass.

If EL3 is implemented and GICD_CTLR.DS == 0, this field is a read-only alias of ICC_MSRE.DIB.

If EL3 is implemented and GICD_CTLR.DS == 1, and EL2 is not implemented, this field is a read-write alias of ICC_MSRE.DIB.

If EL3 is not implemented and EL2 is implemented, this field is a read-only alias of ICC_HSRE.DIB.

If GICD_CTLR.DS == 1 and EL2 is implemented, this field is a read-only alias of ICC_HSRE.DIB.

In systems that do not support IRQ bypass, this field is RAO/WI.

On a Warm reset, this field resets to 0.
DFB, bit [1]

Disable FIQ bypass.

<table>
<thead>
<tr>
<th>DFB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FIQ bypass enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>FIQ bypass disabled.</td>
</tr>
</tbody>
</table>

If EL3 is implemented and `GICD_CTLR.DS == 0`, this field is a read-only alias of `ICC_MSRE.DFB`.

If EL3 is implemented and `GICD_CTLR.DS == 1`, and EL2 is not implemented, this field is a read-write alias of `ICC_MSRE.DFB`.

If EL3 is not implemented and EL2 is implemented, this field is a read-only alias of `ICC_HSRE.DFB`.

If EL3 is not implemented and EL2 is implemented, this field is a read-only alias of `ICC_HSRE.DFB`.

In systems that do not support FIQ bypass, this field is RAO/WI.

On a Warm reset, this field resets to 0.

SRE, bit [0]

System Register Enable.

<table>
<thead>
<tr>
<th>SRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The memory-mapped interface must be used. Accesses at EL1 to any ICC_* System register other than ICC_SRE are UNDEFINED.</td>
</tr>
<tr>
<td>0b1</td>
<td>The System register interface for the current Security state is enabled.</td>
</tr>
</tbody>
</table>

If software changes this bit from 1 to 0 in the Secure instance of this register, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

If EL3 is implemented and using AArch64:

- When `ICC_SRE_EL3.SRE==0` the Secure copy of this bit is RAZ/WI.
- When `ICC_SRE_EL3.SRE==0` the Non-secure copy of this bit is RAZ/WI.

If EL3 is implemented and using AArch32:

- When `ICC_MSRE.SRE==0` the Secure copy of this bit is RAZ/WI.
- When `ICC_MSRE.SRE==0` the Non-secure copy of this bit is RAZ/WI.

If EL2 is implemented and using AArch64:

- When `ICC_SRE_EL2.SRE==0` the Non-secure copy of this bit is RAZ/WI.

If EL2 is implemented and using AArch32:

- When `ICC_HSRE.SRE==0` the Non-secure copy of this bit is RAZ/WI.

On a Warm reset, this field resets to 0.

Accessing the ICC_SRE

The GIC architecture permits, but does not require, that registers can be shared between memory-mapped registers and the equivalent System registers. This means that if the memory-mapped registers have been accessed while ICC_SRE.SRE==0, then the System registers might be modified. Therefore, software must only rely on the reset values of the System registers if there has been no use of the GIC functionality while the memory-mapped registers are in use. Otherwise, the System register values must be treated as UNKNOWN.

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T12 == '1' then

else
    ICC_SRE_NS = R[t];
end if;
The ICH_AP0R<n> characteristics are:

**Purpose**

Provides information about Group 0 active priorities for EL2.

**Configuration**

AArch32 System register ICH_AP0R<n> bits [31:0] are architecturally mapped to AArch64 System register ICH_AP0R<n>_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICH_AP0R<n> are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

ICH_AP0R<n> is a 32-bit register.

**Field descriptions**

The ICH_AP0R<n> bit assignments are:

\[
\begin{array}{cccccccccccccccccccccc}
\end{array}
\]

**P<x>, bit \([x]\), for \(x = 31 \text{ to } 0\)**

Provides the access to the virtual active priorities for Group 0 interrupts. Possible values of each bit are:

<table>
<thead>
<tr>
<th>P&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>There is no Group 0 interrupt active at the priority corresponding to that bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>There is a Group 0 interrupt active at the priority corresponding to that bit.</td>
</tr>
</tbody>
</table>

The correspondence between priority levels and bits depends on the number of bits of priority that are implemented.

If 5 bits of preemption are implemented (bits [7:3] of priority), then there are 32 preemption levels, and the active state of these preemption levels are held in ICH_AP0R0 in the bits corresponding to Priority[7:3].

If 6 bits of preemption are implemented (bits [7:2] of priority), then there are 64 preemption levels, and:

- The active state of preemption levels 0 - 124 are held in ICH_AP0R0 in the bits corresponding to 0:Priority[6:2].
- The active state of preemption levels 128 - 252 are held in ICH_AP0R1 in the bits corresponding to 1:Priority[6:2].

If 7 bits of preemption are implemented (bits [7:1] of priority), then there are 128 preemption levels, and:

- The active state of preemption levels 0 - 62 are held in ICH_AP0R0 in the bits corresponding to 00:Priority[5:1].
- The active state of preemption levels 64 - 126 are held in ICH_AP0R1 in the bits corresponding to 01:Priority[5:1].
- The active state of preemption levels 128 - 190 are held in ICH_AP0R2 in the bits corresponding to 10:Priority[5:1].
• The active state of preemption levels 192 - 254 are held in ICH_AP0R3 in the bits corresponding to 11:Priority[5:1].

Note

Having the bit corresponding to a priority set to 1 in both ICH_AP0R<n> and ICH_AP1R<n> might result in UNPREDICTABLE behavior of the interrupt prioritization system for virtual interrupts.

On a Warm reset, this field resets to 0.

Accessing the ICH_AP0R<n>

ICH_AP0R1 is only implemented in implementations that support 6 or more bits of preemption. ICH_AP0R2 and ICH_AP0R3 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

Note

The number of bits of preemption is indicated by ICH_VTR.PREbits.

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- ICH_AP0R<n>
- ICH_AP1R<n>

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#<\text{opc1}>\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#<\text{opc2}>\}
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b100</td>
<td>0b1100</td>
<td>0b1000</td>
<td>0b0:n[1:0]</td>
</tr>
</tbody>
</table>

</tbody>
</table>

P<x>, bit [x], for x = 31 to 0

Group 1 interrupt active priorities. Possible values of each bit are:

<table>
<thead>
<tr>
<th>P&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>There is no Group 1 interrupt active at the priority corresponding to that bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>There is a Group 1 interrupt active at the priority corresponding to that bit.</td>
</tr>
</tbody>
</table>

The correspondence between priority levels and bits depends on the number of bits of priority that are implemented.

If 5 bits of preemption are implemented (bits [7:3] of priority), then there are 32 preemption levels, and the active state of these preemption levels are held in ICH_AP1R0 in the bits corresponding to Priority[7:3].

If 6 bits of preemption are implemented (bits [7:2] of priority), then there are 64 preemption levels, and:

- The active state of preemption levels 0 - 124 are held in ICH_AP1R0 in the bits corresponding to 0:Priority[6:2].
- The active state of preemption levels 128 - 252 are held in ICH_AP1R1 in the bits corresponding to 1:Priority[6:2].

If 7 bits of preemption are implemented (bits [7:1] of priority), then there are 128 preemption levels, and:

- The active state of preemption levels 0 - 62 are held in ICH_AP1R0 in the bits corresponding to 00:Priority[5:1].
- The active state of preemption levels 64 - 126 are held in ICH_AP1R1 in the bits corresponding to 01:Priority[5:1].
- The active state of preemption levels 128 - 190 are held in ICH_AP1R2 in the bits corresponding to 10:Priority[5:1].
• The active state of preemption levels 192 - 254 are held in ICH_AP1R3 in the bits corresponding to 11:Priority[5:1].

**Note**

Having the bit corresponding to a priority set to 1 in both ICH_AP0R<n> and ICH_AP1R<n> might result in **UNPREDICTABLE** behavior of the interrupt prioritization system for virtual interrupts.

On a Warm reset, this field resets to 0.

### Accessing the ICH_AP1R<n>

ICH_AP1R1 is only implemented in implementations that support 6 or more bits of preemption. ICH_AP1R2 and ICH_AP1R3 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are **UNDEFINED**.

**Note**

The number of bits of preemption is indicated by ICH_VTR.PREbits

Writing to the active priority registers in any order other than the following order will result in **UNPREDICTABLE** behavior:

- ICH_AP0R<n>
- ICH_AP1R<n>

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>}<\text{coproc}>,\{#<opc1>,<Rt>,<CRn>,<CRm}\{,#<opc2}\}
\]

ICH_EISR, Interrupt Controller End of Interrupt Status Register

The ICH_EISR characteristics are:

**Purpose**

Indicates which List registers have outstanding EOI maintenance interrupts.

**Configuration**

AArch32 System register ICH_EISR bits [31:0] are architecturally mapped to AArch64 System register ICH_EISR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICH_EISR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

ICH_EISR is a 32-bit register.

**Field descriptions**

The ICH_EISR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Positions</th>
<th>RES0</th>
<th>Status15</th>
<th>Status14</th>
<th>Status13</th>
<th>Status12</th>
<th>Status11</th>
<th>Status10</th>
<th>Status9</th>
<th>Status8</th>
<th>Status7</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:16</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**Status<n>, bit [n], for n = 15 to 0**

EOI maintenance interrupt status bit for List register <n>:

<table>
<thead>
<tr>
<th>Status&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>List register &lt;n&gt;, ICH_LR&lt;n&gt;, does not have an EOI maintenance interrupt.</td>
</tr>
<tr>
<td>0b1</td>
<td>List register &lt;n&gt;, ICH_LR&lt;n&gt;, has an EOI maintenance interrupt that has not been handled.</td>
</tr>
</tbody>
</table>

For any ICH_LR<n>, the corresponding status bit is set to 1 if all of the following are true:

- ICH_LRC<n>.State is 0b00.
- ICH_LRC<n>.HW is 0.
- ICH_LRC<n>.EOI (bit [9]) is 1, indicating that when the interrupt corresponding to that List register is deactivated, a maintenance interrupt is asserted.

On a Warm reset, this field resets to 0.

**Accessing the ICH_EISR**

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then

</tbody>
</table>
ICH_ELRSR, Interrupt Controller Empty List Register Status Register

The ICH_ELRSR characteristics are:

Purpose

Indicates which List registers contain valid interrupts.

Configuration

AArch32 System register ICH_ELRSR bits [31:0] are architecturally mapped to AArch64 System register ICH_ELRSR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICH_ELRSR are UNDEFINED.

If EL2 is not implemented, this register is res0 from EL3.

Attributes

ICH_ELRSR is a 32-bit register.

Field descriptions

The ICH_ELRSR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | Status15 | Status14 | Status13 | Status12 | Status11 | Status10 | Status9 | Status8 | Status7 |

Bits [31:16]

Reserved, RES0.

Status<n>, bit [n], for n = 15 to 0

Status bit for List register <n>, ICH_LR<n>:

<table>
<thead>
<tr>
<th>Status&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>List register ICH_LR&lt;n&gt;, if implemented, contains a valid interrupt. Using this List register can result in overwriting a valid interrupt.</td>
</tr>
<tr>
<td>0b1</td>
<td>List register ICH_LR&lt;n&gt; does not contain a valid interrupt. The List register is empty and can be used without overwriting a valid interrupt or losing an EOI maintenance interrupt.</td>
</tr>
</tbody>
</table>

For any List register <n>, the corresponding status bit is set to 1 if ICH_LRC<n>.State is 0b00 and either ICH_LRC<n>.HW is 1 or ICH_LRC<n>.EOI (bit [9]) is 0.

Accessing the ICH_ELRSR

Accesses to this register use the following encodings:
MRC{c}<q> coproc>, {#}opc1>, <Rt>, <CRn>, <CRm>{, {#}opc2>

ICH_HCR, Interrupt Controller Hyp Control Register

The ICH_HCR characteristics are:

**Purpose**

Controls the environment for VMs.

**Configuration**

AArch32 System register ICH_HCR bits [31:0] are architecturally mapped to AArch64 System register ICH_HCR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICH_HCR are **UNDEFINED**.

If EL2 is not implemented, this register is **RES0** from EL3.

**Attributes**

ICH_HCR is a 32-bit register.

**Field descriptions**

The ICH_HCR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| EOIcount | RES0 | TDIR | TSE | TALL1 | TALL0 | TCRES0 | vSGIEOICount | vGrp1DIE | vGrp1EIE | vGrp0DIE | vGrp0EIE | NPIE | LRENPIE | UIE | En |

**EOIcount, bits [31:27]**

This field is incremented whenever a successful write to a virtual EOIR or DIR register would have resulted in a virtual interrupt deactivation. That is either:

- A virtual write to EOIR with a valid interrupt identifier that is not in the LPI range (that is < 8192) when EOI mode is zero and no List Register was found.
- A virtual write to DIR with a valid interrupt identifier that is not in the LPI range (that is < 8192) when EOI mode is one and no List Register was found.

This allows software to manage more active interrupts than there are implemented List Registers.

It **is constrained unpredictable** whether a virtual write to EOIR that does not clear a bit in the Active Priorities registers (ICH_AP0R<n>/ICH_AP1R<n>) increments EOIcount. Permitted behaviors are:

- Increment EOIcount.
- Leave EOIcount unchanged.

On a Warm reset, this field resets to 0.

**Bits [26:15]**

Reserved, RES0.

**TDIR, bit [14]**

Trap Non-secure EL1 writes to ICC_DIR and ICV_DIR.
ICH_HCR, Interrupt Controller Hyp Control Register

<table>
<thead>
<tr>
<th>TDIR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL1 writes of ICC_DIR and ICV_DIR are not trapped to EL2, unless trapped by other mechanisms.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 writes of ICV_DIR are trapped to EL2. It is IMPLEMENTATION DEFINED whether Non-secure writes of ICC_DIR are trapped. Not trapping ICC_DIR writes is DEPRECATED.</td>
</tr>
</tbody>
</table>

Support for this bit is OPTIONAL, with support indicated by ICH_VTR.

If the implementation does not support this trap, this bit is RES0.

Arm deprecates not including this trap bit.

On a Warm reset, this field resets to 0.

**TSEI, bit [13]**

Trap all locally generated SEIs. This bit allows the hypervisor to intercept locally generated SEIs that would otherwise be taken at Non-secure EL1.

<table>
<thead>
<tr>
<th>TSEI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Locally generated SEIs do not cause a trap to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Locally generated SEIs trap to EL2.</td>
</tr>
</tbody>
</table>

If ICH_VTR.SEIS is 0, this bit is RES0.

On a Warm reset, this field resets to 0.

**TALL1, bit [12]**

Trap all Non-secure EL1 accesses to ICC_* and ICV_* System registers for Group 1 interrupts to EL2.

<table>
<thead>
<tr>
<th>TALL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL1 accesses to ICC_* and ICV_* registers for Group 1 interrupts proceed as normal.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 accesses to ICC_* and ICV_* registers for Group 1 interrupts trap to EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**TALL0, bit [11]**

Trap all Non-secure EL1 accesses to ICC_* and ICV_* System registers for Group 0 interrupts to EL2.

<table>
<thead>
<tr>
<th>TALL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL1 accesses to ICC_* and ICV_* registers for Group 0 interrupts proceed as normal.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 accesses to ICC_* and ICV_* registers for Group 0 interrupts trap to EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**TC, bit [10]**

Trap all Non-secure EL1 accesses to System registers that are common to Group 0 and Group 1 to EL2.

<table>
<thead>
<tr>
<th>TC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL1 accesses to common registers proceed as normal.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 accesses to common registers trap to EL2.</td>
</tr>
</tbody>
</table>

This affects accesses to ICC_SGI0R, ICC_SGI1R, ICC_ASGI1R, ICC_CTLR, ICC_DIR, ICC_PMR, ICC_RPR, ICV_CTLR, ICV_DIR, ICV_PMR, and ICV_RPR.

On a Warm reset, this field resets to 0.
Bit [9]

Reserved, RES0.

vSGIEOICount, bit [8]

When FEAT_GICv4p1 is implemented:

Controls whether deactivation of virtual SGIs can increment ICH_HCR_EL2.EOIcount

<table>
<thead>
<tr>
<th>vSGIEOICount</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Deactivation of virtual SGIs can increment ICH_HCR_EOIcount.</td>
</tr>
<tr>
<td>0b1</td>
<td>Deactivation of virtual SGIs does not increment ICH_HCR_EOIcount.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

VGrp1DIE, bit [7]

VM Group 1 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected vPE is disabled:

<table>
<thead>
<tr>
<th>VGrp1DIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled when ICH_VMCR.VENG1 is 0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

VGrp1EIE, bit [6]

VM Group 1 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected vPE is enabled:

<table>
<thead>
<tr>
<th>VGrp1EIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled when ICH_VMCR.VENG1 is 1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

VGrp0DIE, bit [5]

VM Group 0 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected vPE is disabled:

<table>
<thead>
<tr>
<th>VGrp0DIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled when ICH_VMCR.VENG0 is 0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

VGrp0EIE, bit [4]

VM Group 0 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected vPE is enabled:
<table>
<thead>
<tr>
<th>VGrp0EIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled when ICH_VMCR.VENG0 is 1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**NPIE, bit [3]**

No Pending Interrupt Enable. Enables the signaling of a maintenance interrupt when there are no List registers with the State field set to 0b01 (pending):

<table>
<thead>
<tr>
<th>NPIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled while the List registers contain no interrupts in the pending state.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**LRENPIE, bit [2]**

List Register Entry Not Present Interrupt Enable. Enables the signaling of a maintenance interrupt while the virtual CPU interface does not have a corresponding valid List register entry for an EOI request:

<table>
<thead>
<tr>
<th>LRENPIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt is asserted while the EOIcount field is not 0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**UIE, bit [1]**

Underflow Interrupt Enable. Enables the signaling of a maintenance interrupt when the List registers are empty, or hold only one valid entry:

<table>
<thead>
<tr>
<th>UIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt is asserted if none, or only one, of the List register entries is marked as a valid interrupt.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**En, bit [0]**

Enable. Global enable bit for the virtual CPU interface:

<table>
<thead>
<tr>
<th>En</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Virtual CPU interface operation disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Virtual CPU interface operation enabled.</td>
</tr>
</tbody>
</table>

When this field is set to 0:

- The virtual CPU interface does not signal any maintenance interrupts.
- The virtual CPU interface does not signal any virtual interrupts.
- A read of ICV_IAR0, ICV_IAR1, GICV_IAR or GICV_AIAR returns a spurious interrupt ID.

On a Warm reset, this field resets to 0.

**Accessing the ICH_HCR**

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T12 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T12 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
else
    return ICH_HCR;
elsif PSTATE.EL == EL2 then
    if ICC_HSRE.SRE == '0' then
        UNDEFINED;

</tbody>
</table>
ICH_LRC<n>, Interrupt Controller List Registers, n = 0 - 15

The ICH_LRC<n> characteristics are:

**Purpose**

Provides interrupt context information for the virtual CPU interface.

**Configuration**

AArch32 System register ICH_LRC<n> bits [31:0] are architecturally mapped to AArch64 System register ICH_LR<n>_EL2[63:32].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICH_LRC<n> are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

If list register n is not implemented, then accesses to this register are UNDEFINED.

**Attributes**

ICH_LRC<n> is a 32-bit register.

**Field descriptions**

The ICH_LRC<n> bit assignments are:

<table>
<thead>
<tr>
<th>State</th>
<th>HW</th>
<th>Group</th>
<th>Priority</th>
<th>pINTID</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>30</td>
<td>29</td>

<td>6</td>
<td>5</td>
<td>4</td>
<td>6</td>
</tr>
<tr>
<td></td>
<td></td>
<td>RES0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>2</td>
<td>1</td>
<td>0</td>
<td>7</td>
</tr>
<tr>
<td></td>
<td></td>
<td>RES0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**State, bits [31:30]**

The state of the interrupt:

<table>
<thead>
<tr>
<th>State</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Invalid (Inactive).</td>
</tr>
<tr>
<td>0b01</td>
<td>Pending.</td>
</tr>
<tr>
<td>0b10</td>
<td>Active.</td>
</tr>
<tr>
<td>0b11</td>
<td>Pending and active</td>
</tr>
</tbody>
</table>

The GIC updates these state bits as virtual interrupts proceed through the interrupt life cycle. Entries in the invalid state are ignored, except for the purpose of generating virtual maintenance interrupts.

For hardware interrupts, the pending and active state is held in the physical Distributor rather than the virtual CPU interface. A hypervisor must only use the pending and active state for software originated interrupts, which are typically associated with virtual devices, or SGIs.

On a Warm reset, this field resets to 0.

**HW, bit [29]**

Indicates whether this virtual interrupt maps directly to a hardware interrupt, meaning that it corresponds to a physical interrupt. Deactivation of the virtual interrupt also causes the deactivation of the physical interrupt with the INTID that the pINTID field indicates.
The interrupt is triggered entirely by software. No notification is sent to the Distributor when the virtual interrupt is deactivated.

The interrupt maps directly to a hardware interrupt. A deactivate interrupt request is sent to the Distributor when the virtual interrupt is deactivated, using the pINTID field from this register to indicate the physical INTID. If ICH_VMCR VEOIM is 0, this request corresponds to a write to ICC_EOIR0 or ICC_EOIR1. Otherwise, it corresponds to a write to ICC_DIR.

On a Warm reset, this field resets to 0.

### Group, bit [28]

Indicates the group for this virtual interrupt.

<table>
<thead>
<tr>
<th>Group</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This is a Group 0 virtual interrupt. ICH_VMCR VFIQEn determines whether it is signaled as a virtual IRQ or as a virtual FIQ, and ICH_VMCR VENG0 enables signaling of this interrupt to the virtual machine.</td>
</tr>
<tr>
<td>0b1</td>
<td>This is a Group 1 virtual interrupt, signaled as a virtual IRQ. ICH_VMCR VENG1 enables the signaling of this interrupt to the virtual machine. If ICH_VMCR VCBPR is 0, then ICC_BPR1 determines if a pending Group 1 interrupt has sufficient priority to preempt current execution. Otherwise, ICH_LR&lt;n&gt; determines preemption.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

### Bits [27:24]

Reserved, RES0.

### Priority, bits [23:16]

The priority of this interrupt.

It is IMPLEMENTATION DEFINED how many bits of priority are implemented, though at least five bits must be implemented. Unimplemented bits are RES0 and start from bit[16] up to bit[18]. The number of implemented bits can be discovered from ICH_VTR PRIBits.

On a Warm reset, this field resets to 0.

### Bits [15:13]

Reserved, RES0.

### pINTID, bits [12:0]

Physical INTID, for hardware interrupts.

When ICH_LRC<n>.HW is 0 (there is no corresponding physical interrupt), this field has the following meaning:

- Bits[12:10] : RES0.
- Bit[9] : EOI. If this bit is 1, then when the interrupt identified by vINTID is deactivated, an EOI maintenance interrupt is asserted.
- Bits[8:0] : Reserved, RES0.

When ICH_LRC<n>.HW is 1 (there is a corresponding physical interrupt):

- This field indicates the physical INTID. This field is only required to implement enough bits to hold a valid value for the implemented INTID size. Any unused higher order bits are RES0.
• When ICC_CTLR_EL1.ExtRange is 0, then bits[44:42] of this field are RES0.
• If the value of pINTID is not a valid INTID, behavior is UNPREDICTABLE. If the value of pINTID indicates a PPI, this field applies to the PPI associated with this same physical PE ID as the virtual CPU interface requesting the deactivation.

A hardware physical identifier is only required in List Registers for interrupts that require deactivation. This means only 13 bits of Physical INTID are required, regardless of the number specified by ICC_CTLR.IDbits.

On a Warm reset, this field resets to 0.

**Accessing the ICH_LRC<n>**

ICH_LR<n> and ICH_LRC<n> can be updated independently.

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>

  else
    ICH_LRC[UInt(CRm<0>:opc2<2:0>)] = R[t];
  endif

ICH_LR<n>, Interrupt Controller List Registers, n = 0 - 15

The ICH_LR<n> characteristics are:

**Purpose**

Provides interrupt context information for the virtual CPU interface.

**Configuration**

AArch32 System register ICH_LR<n> bits [31:0] are architecturally mapped to AArch64 System register ICH_LR<n>_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICH_LR<n> are **UNDEFINED**.

If EL2 is not implemented, this register is **RES0** from EL3.

If list register n is not implemented, then accesses to this register are **UNDEFINED**.

**Attributes**

ICH_LR<n> is a 32-bit register.

**Field descriptions**

The ICH_LR<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**vINTID**, bits [31:0]

Virtual INTID of the interrupt.

If the value of vINTID is 1020-1023 and ICH_LRC<n>.State!=0b00 (Inactive), behavior is **UNPREDICTABLE**.

Behavior is **UNPREDICTABLE** if two or more List Registers specify the same vINTID when:

- ICH_LRC<n>.State == 01.
- ICH_LRC<n>.State == 10.
- ICH_LRC<n>.State == 11.

It is **IMPLEMENTATION DEFINED** how many bits are implemented, though at least 16 bits must be implemented. Unimplemented bits are **RES0**. The number of implemented bits can be discovered from ICH_VTR.IDbits.

**Note**

When a VM is using memory-mapped access to the GIC, software must ensure that the correct source PE ID is provided in bits[12:10].

On a Warm reset, this field resets to 0.

**Accessing the ICH_LR<n>**

ICH_LR<n> and ICH_LRC<n> can be updated independently.
Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#<opc1>, <Rt>, <CRn>, <CRm>{, {#<opc2>}}}

ICH_MISR, Interrupt Controller Maintenance Interrupt State Register

The ICH_MISR characteristics are:

**Purpose**

Indicates which maintenance interrupts are asserted.

**Configuration**

AArch32 System register ICH_MISR bits [31:0] are architecturally mapped to AArch64 System register ICH_MISR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICH_MISR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

ICH_MISR is a 32-bit register.

**Field descriptions**

The ICH_MISR bit assignments are:

|            | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|            | RES0 | VGrp1D | VGrp1E | VGrp0D | VGrp0E | NP | LRENP | U | EOI |

**Bits [31:8]**

Reserved, RES0.

**VGrp1D, bit [7]**

vPE Group 1 Disabled.

<table>
<thead>
<tr>
<th>VGrp1D</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>vPE Group 1 Disabled maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>vPE Group 1 Disabled maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when ICH_HCR.VGrp1DIE is 1 and ICH_VMCR.VENG0 is 0.

On a Warm reset, this field resets to 0.

**VGrp1E, bit [6]**

vPE Group 1 Enabled.

<table>
<thead>
<tr>
<th>VGrp1E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>vPE Group 1 Enabled maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>vPE Group 1 Enabled maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when ICH_HCR.VGrp1EIE is 1 and ICH_VMCR.VENG1 is 1.

On a Warm reset, this field resets to 0.
ICH_MISR, Interrupt Controller Maintenance Interrupt State Register

**VGrp0D, bit [5]**

vPE Group 0 Disabled.

<table>
<thead>
<tr>
<th>VGrp0D</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>vPE Group 0 Disabled maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>vPE Group 0 Disabled maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when **ICH_HCR.VGrp0DIE** is 1 and **ICH_VMCR.VENG0** is 0.

On a Warm reset, this field resets to 0.

**VGrp0E, bit [4]**

vPE Group 0 Enabled.

<table>
<thead>
<tr>
<th>VGrp0E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>vPE Group 0 Enabled maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>vPE Group 0 Enabled maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when **ICH_HCR.VGrp0EIE** is 1 and **ICH_VMCR.VENG0** is 1.

On a Warm reset, this field resets to 0.

**NP, bit [3]**

No Pending.

<table>
<thead>
<tr>
<th>NP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No Pending maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>No Pending maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when **ICH_HCR.NPIE** is 1 and no List register is in pending state.

On a Warm reset, this field resets to 0.

**LRENP, bit [2]**

List Register Entry Not Present.

<table>
<thead>
<tr>
<th>LRENP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>List Register Entry Not Present maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>List Register Entry Not Present maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when **ICH_HCR.LRENPIE** is 1 and **ICH_HCR.EOIcount** is non-zero.

On a Warm reset, this field resets to 0.

**U, bit [1]**

Underflow.

<table>
<thead>
<tr>
<th>U</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Underflow maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Underflow maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when **ICH_HCR.UIE** is 1 and zero or one of the List register entries are marked as a valid interrupt, that is, if the corresponding **ICH_LRC<n>.State** bits do not equal 0x0.

On a Warm reset, this field resets to 0.
**EOI, bit [0]**

End Of Interrupt.

<table>
<thead>
<tr>
<th>EOI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>End Of Interrupt maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>End Of Interrupt maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when at least one bit in **ICH_EISR** is 1.

On a Warm reset, this field resets to 0.

**Accessing the ICH_MISR**

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#<\text{opc1}>\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#<\text{opc2}>\}
\]

<table>

ICH_VMCR, Interrupt Controller Virtual Machine Control Register

The ICH_VMCR characteristics are:

**Purpose**

Enables the hypervisor to save and restore the virtual machine view of the GIC state.

**Configuration**

AArch32 System register ICH_VMCR bits [31:0] are architecturally mapped to AArch64 System register ICH_VMCR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICH_VMCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

ICH_VMCR is a 32-bit register.

**Field descriptions**

The ICH_VMCR bit assignments are:

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |
|----------------------------------------|--------|--------|--------|--------|--------|
| VPMR        | VBPR0 | VBPR1  | RES0   | VEOIM  | RES0   | VCBPR  | VFIQEn | VAckCtl | VENG1 | VENG0 |

**VPMR, bits [31:24]**

Virtual Priority Mask. The priority mask level for the virtual CPU interface. If the priority of a pending virtual interrupt is higher than the value indicated by this field, the interface signals the virtual interrupt to the PE.

This field is an alias of ICV_PMR.Priority.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**VBPR0, bits [23:21]**

Virtual Binary Point Register, Group 0. Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption, and also determines Group 1 interrupt preemption if ICH_VMCR.VCBPR == 1.

This field is an alias of ICV_BPR0.BinaryPoint.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**VBPR1, bits [20:18]**

Virtual Binary Point Register, Group 1. Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption if ICH_VMCR.VCBPR == 0.

This field is an alias of ICV_BPR1.BinaryPoint.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**Bits [17:10]**

Reserved, RES0.

**VEOIM, bit [9]**

Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt:

<table>
<thead>
<tr>
<th>VEOIM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICV_EOIR0 and ICV_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICV_DIR are UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICV_EOIR0 and ICV_EOIR1 provide priority drop functionality only. ICV_DIR provides interrupt deactivation functionality.</td>
</tr>
</tbody>
</table>

This bit is an alias of ICV_CTLR.EOImode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [8:5]**

Reserved, RES0.

**VCBPR, bit [4]**

Virtual Common Binary Point Register. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VCBPR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICV_BPR0 determines the preemption group for virtual Group 0 interrupts only. ICV_BPR1 determines the preemption group for virtual Group 1 interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICV_BPR0 determines the preemption group for both virtual Group 0 and virtual Group 1 interrupts. Reads of ICV_BPR1 return ICV_BPR0 plus one, saturated to 0b111. Writes to ICV_BPR1 are ignored.</td>
</tr>
</tbody>
</table>

This field is an alias of ICV_CTLR.CBPR.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**VFIQEn, bit [3]**

Virtual FIQ enable. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VFIQEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 0 virtual interrupts are presented as virtualIRQs.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 0 virtual interrupts are presented as virtual FIQs.</td>
</tr>
</tbody>
</table>

This bit is an alias of GICV_CTLR.FIQEn.

In implementations where the Non-secure copy of ICC_SRE.SRE is always 1, this bit is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**VAckCtl, bit [2]**

Virtual AckCtl. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VAckCtl</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns an INTID of 1022.</td>
</tr>
<tr>
<td>0b1</td>
<td>If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns the INTID of the corresponding interrupt.</td>
</tr>
</tbody>
</table>
This bit is an alias of GICV_CTLR.AckCtl.

This field is supported for backwards compatibility with GICv2. Arm deprecates the use of this field.

In implementations where the Non-secure copy of ICC_SRE.SRE is always 1, this bit is res0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**VENG1, bit [1]**

Virtual Group 1 interrupt enable. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VENG1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Virtual Group 1 interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Virtual Group 1 interrupts are enabled.</td>
</tr>
</tbody>
</table>

This bit is an alias of ICV_IGRPEN1.Enable.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**VENG0, bit [0]**

Virtual Group 0 interrupt enable. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VENG0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Virtual Group 0 interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Virtual Group 0 interrupts are enabled.</td>
</tr>
</tbody>
</table>

This bit is an alias of ICV_IGRPEN0.Enable.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ICH_VMCR**

When EL2 is using System register access, EL1 using either System register or memory-mapped access must be supported.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>}, <\text{coproc}>, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#\}<\text{opc2}>\
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b111</td>
<td>0b100</td>
<td>0b1100</td>
<td>0b1011</td>
<td>0b111</td>
</tr>
</tbody>
</table>

  end if;
end if;
```
ICH_VTR, Interrupt Controller VGIC Type Register

The ICH_VTR characteristics are:

**Purpose**

Reports supported GIC virtualization features.

**Configuration**

AArch32 System register ICH_VTR bits [31:0] are architecturally mapped to AArch64 System register
ICH_VTR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to
ICH_VTR are **UNDEFINED**.

If EL2 is not implemented, all bits in this register are RES0 from EL3, except for nV4, which is RES1 from EL3.

**Attributes**

ICH_VTR is a 32-bit register.

**Field descriptions**

The ICH_VTR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| PRIbits | PREbits | IDbits | SEISA3VnV4TDS | RES0 | ListRegs |

**PRIbits, bits [31:29]**

Priority bits. The number of virtual priority bits implemented, minus one.

An implementation must implement at least 32 levels of virtual priority (5 priority bits).

This field is an alias of ICV_CTLR.PRIbits.

**PREbits, bits [28:26]**

The number of virtual preemption bits implemented, minus one.

An implementation must implement at least 32 levels of virtual preemption priority (5 preemption bits).

The value of this field must be less than or equal to the value of ICH_VTR.PRIbits.

**IDbits, bits [25:23]**

The number of virtual interrupt identifier bits supported:

<table>
<thead>
<tr>
<th>IDbits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>16 bits.</td>
</tr>
<tr>
<td>0b0010</td>
<td>24 bits.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field is an alias of ICV_CTLR.IDbits.
SEIS, bit [22]

SEI Support. Indicates whether the virtual CPU interface supports generation of SEIs:

<table>
<thead>
<tr>
<th>SEIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The virtual CPU interface logic does not support generation of SEIs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The virtual CPU interface logic supports generation of SEIs.</td>
</tr>
</tbody>
</table>

This bit is an alias of `ICV_CTLR:SEIS`.

A3V, bit [21]

Affinity 3 Valid. Possible values are:

<table>
<thead>
<tr>
<th>A3V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>The virtual CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.</td>
</tr>
</tbody>
</table>

This bit is an alias of `ICV_CTLR:A3V`.

nV4, bit [20]

Direct injection of virtual interrupts not supported. Possible values are:

<table>
<thead>
<tr>
<th>nV4</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CPU interface logic supports direct injection of virtual interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>The CPU interface logic does not support direct injection of virtual interrupts.</td>
</tr>
</tbody>
</table>

If FEAT_GICv4 is not implemented, this bit is RES1.

TDS, bit [19]

Separate trapping of Non-secure EL1 writes to `ICV_DIR` supported.

<table>
<thead>
<tr>
<th>TDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Implementation does not support <code>ICH_HCR:TDIR</code>.</td>
</tr>
<tr>
<td>0b1</td>
<td>Implementation supports <code>ICH_HCR:TDIR</code>.</td>
</tr>
</tbody>
</table>

Bits [18:5]

Reserved, RES0.

ListRegs, bits [4:0]

The number of implemented List registers, minus one. For example, a value of 0b01111 indicates that the maximum of 16 List registers are implemented.

**Accessing the ICH_VTR**

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}\{<q>\} <\text{coproc}>, \{#<\text{opc1}>\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#<\text{opc2}>\}
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b100</td>
<td>0b1100</td>
<td>0b1011</td>
<td>0b001</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then

    UNDEFINED;
  else
    return ICH_VTR;
ICIALLU, Instruction Cache Invalidate All to PoU

The ICIALLU characteristics are:

**Purpose**

Invalidate all instruction caches to PoU. If branch predictors are architecturally visible, also flush branch predictors.

**Configuration**

AArch32 System instruction ICIALLU performs the same function as AArch64 System instruction IC IALLU.

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICIALLU are UNDEFINED.

**Attributes**

ICIALLU is a 32-bit System instruction.

**Field descriptions**

This instruction has no applicable fields.

The value in the register specified by \(<Rt>\) is ignored.

**Executing the ICIALLU instruction**

The PE ignores the value of \(<Rt>\). Software does not have to write a value to this register before issuing this instruction.

When \(HCR.FB\) is 1, at Non-secure EL1 this instruction executes as a ICIALLUIS.

Accesses to this instruction use the following encodings:

\[
\text{MCR}\{<c>}\{<q>\} \ <\text{coproc}, \ {#}<\text{opc1}>, \ <Rt>, \ <CRn>, \ <CRm}\{, \ {#}<\text{opc2}>\}
\]

<table>

ICIALLUIS, Instruction Cache Invalidate All to PoU, Inner Shareable

The ICIALLUIS characteristics are:

Purpose

Invalidate all instruction caches Inner Shareable to PoU. If branch predictors are architecturally visible, also flush branch predictors.

Configuration

AArch32 System instruction ICIALLUIS performs the same function as AArch64 System instruction IC IALLUIS.

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICIALLUIS are UNDEFINED.

Attributes

ICIALLUIS is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing the ICIALLUIS instruction

The PE ignores the value of <Rt>. Software does not have to write a value to this register before issuing this instruction.

Accesses to this instruction use the following encodings:

\[
\text{MCR}\{<c>\}\{<q>\} \ <\text{coproc}>, \{#\}<\text{opc1}>, \ <\text{Rt}>, \ <\text{CRn}>, \ <\text{CRm}\}{, \{#\}<\text{opc2}>}
\]

ICIMVAU, Instruction Cache line Invalidate by VA to PoU

The ICIMVAU characteristics are:

**Purpose**

Invalidate instruction cache line by virtual address to PoU.

**Configuration**

AArch32 System instruction ICIMVAU performs the same function as AArch64 System instruction IC IVAU.

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICIMVAU are UNDEFINED.

**Attributes**

ICIMVAU is a 32-bit System instruction.

**Field descriptions**

The ICIMVAU input value bit assignments are:

ICV_AP0R<n>, Interrupt Controller Virtual Active Priorities Group 0 Registers, n = 0 - 3

The ICV_AP0R<n> characteristics are:

**Purpose**

Provides information about virtual Group 0 active priorities.

**Configuration**

AArch32 System register ICV_AP0R<n> bits [31:0] are architecturally mapped to AArch64 System register ICV_AP0R<n>_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICV_AP0R<n> are undefined.

**Attributes**

ICV_AP0R<n> is a 32-bit register.

**Field descriptions**

The ICV_AP0R<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to 0.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

**Accessing the ICV_AP0R<n>**

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 0 active priorities) might result in UNPREDICTABLE behavior of the virtual interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICV_AP0R1 is only implemented in implementations that support 6 or more bits of priority. ICV_AP0R2 and ICV_AP0R3 are only implemented in implementations that support 7 bits of priority. Unimplemented registers are UNDEFINED.

Writing to the active priority registers in any order other than the following order might result in UNPREDICTABLE behavior of the interrupt prioritization system:

- ICV_AP0R<n>.
- ICV_AP1R<n>.

Accesses to this register use the following encodings:

ICV_API1R<n>, Interrupt Controller Virtual Active Priorities Group 1 Registers, n = 0 - 3
ICV_BPR0, Interrupt Controller Virtual Binary Point Register 0

The ICV_BPR0 characteristics are:

**Purpose**

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines virtual Group 0 interrupt preemption.

**Configuration**

AArch32 System register ICV_BPR0 bits [31:0] are architecturally mapped to AArch64 System register ICV_BPR0_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICV_BPR0 are UNDEFINED.

**Attributes**

ICV_BPR0 is a 32-bit register.

**Field descriptions**

The ICV_BPR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:3]</th>
<th>RES0</th>
<th>BinaryPoint</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
<td>RES0</td>
<td>BinaryPoint</td>
</tr>
</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**BinaryPoint, bits [2:0]**

The value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

<table>
<thead>
<tr>
<th>Binary point value</th>
<th>Group priority field</th>
<th>Subpriority field</th>
<th>Field with binary point</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>[7:1]</td>
<td>[0]</td>
<td>ggggggg.s</td>
</tr>
<tr>
<td>1</td>
<td>[7:2]</td>
<td>[1:0]</td>
<td>gggggg.ss</td>
</tr>
<tr>
<td>2</td>
<td>[7:3]</td>
<td>[2:0]</td>
<td>gggggg.sss</td>
</tr>
<tr>
<td>3</td>
<td>[7:4]</td>
<td>[3:0]</td>
<td>ggggg.sssss</td>
</tr>
<tr>
<td>4</td>
<td>[7:5]</td>
<td>[4:0]</td>
<td>ggg.sssssss</td>
</tr>
<tr>
<td>5</td>
<td>[7:6]</td>
<td>[5:0]</td>
<td>g.sssssssss</td>
</tr>
<tr>
<td>6</td>
<td>[7]</td>
<td>[6:0]</td>
<td>.ssssssssss</td>
</tr>
<tr>
<td>7</td>
<td>No preemption</td>
<td>[7:0]</td>
<td>.ssssssssss</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ICV_BPR0**

The minimum binary point value is derived from the number of implemented priority bits. The number of priority bits is IMPLEMENTATION DEFINED, and reported by ICV_CTLR.PRIbits.
An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is set to the minimum supported value.

Accesses to this register use the following encodings:

\[
\text{MRC\{}<c>{<q}>\{} <coproc>, \{#\}<opc1>, <Rt>, <CRn>, <CRm\}{, \{#\}<opc2>}
\]

Bits [31:3]

Reserved, RES0.

**BinaryPoint, bits [2:0]**

If the GIC is configured to use separate binary point fields for virtual Group 0 and virtual Group 1 interrupts, the value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

<table>
<thead>
<tr>
<th>Binary point value</th>
<th>Group priority field</th>
<th>Subpriority field</th>
<th>Field with binary point</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>.</td>
<td>.</td>
<td>.</td>
</tr>
<tr>
<td>1</td>
<td>[7:1]</td>

<td>[7:4]</td>
<td>[3:0]</td>
<td>gggg.sssss</td>
</tr>
<tr>
<td>5</td>
<td>[7:5]</td>
<td>[4:0]</td>
<td>ggg.sssssss</td>
</tr>
<tr>
<td>6</td>
<td>[7:6]</td>
<td>[5:0]</td>
<td>gg.sssssss</td>
</tr>
<tr>
<td>7</td>
<td>[7]</td>
<td>[6:0]</td>
<td>g.sssssssss</td>
</tr>
</tbody>
</table>

Writing 0 to this field will set this field to its reset value.

If ICV_CTLR.CBPR is set to 1, Non-secure EL1 reads return ICV_BPR0 + 1 saturated to 0b111. Non-secure EL1 writes are ignored.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing the ICV_BPR1

The minimum value of this register is equal to the minimum value of ICV_BPR0 plus one.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is UNKNOWN.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>}\ <\text{coproc},\ \{#\}<\text{opc1},\ <\text{Rt},\ <\text{CRn},\ <\text{CRm}\{,\ \{#\}<\text{opc2}\}}
\]

ICV_CTLR, Interrupt Controller Virtual Control Register

The ICV_CTLR characteristics are:

**Purpose**

Controls aspects of the behavior of the GIC virtual CPU interface and provides information about the features implemented.

**Configuration**

AArch32 System register ICV_CTLR bits [31:0] are architecturally mapped to AArch64 System register ICV_CTLR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICV_CTLR are **UNDEFINED**.

**Attributes**

ICV_CTLR is a 32-bit register.

**Field descriptions**

The ICV_CTLR bit assignments are:

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |
|---------------------------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| RES0                           | ExtRange        | RSS             | A3V             | SEIS            | IDbits          | PRIbits         | RES0            | EOImode         | CBPR            |

**Bits [31:20]**

Reserved, RES0.

**ExtRange, bit [19]**

Extended INTID range (read-only).

<table>
<thead>
<tr>
<th>ExtRange</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>CPU interface does not support INTIDs in the range 1024..8191. Behaviour is <strong>UNPREDICTABLE</strong> if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.</td>
</tr>
<tr>
<td>0b1</td>
<td>CPU interface supports INTIDs in the range 1024..8191. All INTIDs in the range 1024..8191 are treated as requiring deactivation.</td>
</tr>
</tbody>
</table>

ICV_CTLR.ExtRange is an alias of ICC_CTLR.ExtRange.

**RSS, bit [18]**

Range Selector Support. Possible values are:
<table>
<thead>
<tr>
<th>RSS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Targeted SGIs with affinity level 0 values of 0 - 15 are supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>Targeted SGIs with affinity level 0 values of 0 - 255 are supported.</td>
</tr>
</tbody>
</table>

This bit is read-only.

**Bits [17:16]**

Reserved, RES0.

**A3V, bit [15]**

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

<table>
<thead>
<tr>
<th>A3V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>The virtual CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.</td>
</tr>
</tbody>
</table>

**SEIS, bit [14]**

SEI Support. Read-only and writes are ignored. Indicates whether the virtual CPU interface supports local generation of SEIs:

<table>
<thead>
<tr>
<th>SEIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The virtual CPU interface logic does not support local generation of SEIs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The virtual CPU interface logic supports local generation of SEIs.</td>
</tr>
</tbody>
</table>

**IDbits, bits [13:11]**

Identifier bits. Read-only and writes are ignored. The number of virtual interrupt identifier bits supported:

<table>
<thead>
<tr>
<th>IDbits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>16 bits.</td>
</tr>
<tr>
<td>0b001</td>
<td>24 bits.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**PRIbits, bits [10:8]**

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation must implement at least 32 levels of physical priority (5 priority bits).

**Note**

This field always returns the number of priority bits implemented.

The division between group priority and subpriority is defined in the binary point registers ICV_BPR0 and ICV_BPR1.

**Bits [7:2]**

Reserved, RES0.

**EOImode, bit [1]**

Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt:
<table>
<thead>
<tr>
<th>EOImode</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICV_EOIR0 and ICV_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICV_DIR are UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICV_EOIR0 and ICV_EOIR1 provide priority drop functionality only. ICV_DIR provides interrupt deactivation functionality.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CBPR, bit [0]**

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both virtual Group 0 and virtual Group 1 interrupts:

<table>
<thead>
<tr>
<th>CBPR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICV_BPR0 determines the preemption group for virtual Group 0 interrupts only. ICV_BPR1 determines the preemption group for virtual Group 1 interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICV_BPR0 determines the preemption group for both virtual Group 0 and virtual Group 1 interrupts. Reads of ICV_BPR1 return ICV_BPR0 plus one, saturated to 0b111. Writes to ICV_BPR1 are ignored.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ICV_CTLR**

Accesses to this register use the following encodings:

ICV_DIR, Interrupt Controller Deactivate Virtual Interrupt Register

The ICV_DIR characteristics are:

**Purpose**

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified virtual interrupt.

**Configuration**

AArch32 System register ICV_DIR bits [31:0] performs the same function as AArch64 System register ICV_DIR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICV_DIR are UNDEFINED.

**Attributes**

ICV_DIR is a 32-bit register.

**Field descriptions**

The ICV_DIR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-24</td>
<td>RESERVED, RES0</td>
</tr>
<tr>
<td>23-0</td>
<td>INTID</td>
</tr>
</tbody>
</table>

**Bits [31:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID of the virtual interrupt to be deactivated.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

**Accessing the ICV_DIR**

When EOImode == 0, writes are ignored. In systems supporting system error generation, an implementation might generate an SEI.

Accesses to this register use the following encodings:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>

ICV_EOIR0, Interrupt Controller Virtual End Of Interrupt Register 0

The ICV_EOIR0 characteristics are:

**Purpose**

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified virtual Group 0 interrupt.

**Configuration**

AArch32 System register ICV_EOIR0 performs the same function as AArch64 System register ICV_EOIR0_EL1.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICV_EOIR0 are UNDEFINED.

**Attributes**

ICV_EOIR0 is a 32-bit register.

**Field descriptions**

The ICV_EOIR0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | INTID|

**Bits [31:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID from the corresponding ICV_IAR0 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the ICV_CTLR.EOImode bit is 0, a write to this register drops the priority for the virtual interrupt, and also deactivates the virtual interrupt.

If the ICV_CTLR.EOImode bit is 1, a write to this register only drops the priority for the virtual interrupt. Software must write to ICV_DIR to deactivate the virtual interrupt.

**Accessing the ICV_EOIR0**

A write to this register must correspond to the most recent valid read by this vPE from a Virtual Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICV_IAR0, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

Accesses to this register use the following encodings:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

| coproc | opc1 | CRn | CRm | opc2 |

ICV_IAR0, Interrupt Controller Virtual Interrupt Acknowledge Register 0

The ICV_IAR0 characteristics are:

**Purpose**

The PE reads this register to obtain the INTID of the signaled virtual Group 0 interrupt. This read acts as an acknowledge for the interrupt.

**Configuration**

AArch32 System register ICV_IAR0 performs the same function as AArch64 System register ICV_IAR0_EL1.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICV_IAR0 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when PSTATE.{I,F} == {0,0}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Attributes**

ICV_IAR0 is a 32-bit register.

**Field descriptions**

The ICV_IAR0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| INTID | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

**Bits [31:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID of the signaled virtual interrupt.

This is the INTID of the highest priority pending virtual interrupt, if that interrupt is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. This special INTID can take the value 1023 only. For more information, see ‘Special INTIDs’ in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

**Accessing the ICV_IAR0**

ICV_IAR1, Interrupt Controller Virtual Interrupt Acknowledge Register 1

The ICV_IAR1 characteristics are:

**Purpose**

The PE reads this register to obtain the INTID of the signaled virtual Group 1 interrupt. This read acts as an acknowledge for the interrupt.

**Configuration**

AArch32 System register ICV_IAR1 performs the same function as AArch64 System register ICV_IAR1_EL1.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICV_IAR1 are **UNDEFINED**.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when PSTATE.{I,F} == {0,0}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see ‘Observability of the effects of accesses to the GIC registers’ in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Attributes**

ICV_IAR1 is a 32-bit register.

**Field descriptions**

ICV_IGRPEN0, Interrupt Controller Virtual Interrupt Group 0 Enable register

The ICV_IGRPEN0 characteristics are:

Purpose

Controls whether virtual Group 0 interrupts are enabled or not.

Configuration

AArch32 System register ICV_IGRPEN0 bits [31:0] are architecturally mapped to AArch64 System register ICV_IGRPEN0_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICV_IGRPEN0 are UNDEFINED.

Attributes

ICV_IGRPEN0 is a 32-bit register.

Field descriptions

The ICV_IGRPEN0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>RES0</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

Enable, bit [0]

Enables virtual Group 0 interrupts.

<table>
<thead>
<tr>
<th>Enable</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Virtual Group 0 interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>

ICV_IGRPEN1, Interrupt Controller Virtual Interrupt Group 1 Enable register

The ICV_IGRPEN1 characteristics are:

**Purpose**

Controls whether virtual Group 1 interrupts are enabled for the current Security state.

**Configuration**

AArch32 System register ICV_IGRPEN1 bits [31:0] are architecturally mapped to AArch64 System register ICV_IGRPEN1_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICV_IGRPEN1 are UNDEFINED.

**Attributes**

ICV_IGRPEN1 is a 32-bit register.

**Field descriptions**

The ICV_IGRPEN1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>Enable</td>
</tr>
<tr>
<td>29</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

**Enable, bit [0]**

Enables virtual Group 1 interrupts.

<table>
<thead>
<tr>
<th>Enable</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Virtual Group 1 interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Virtual Group 1 interrupts are enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**Accessing the ICV_IGRPEN1**

Accesses to this register use the following encodings:

ICV_IGRPEN1, Interrupt Controller Virtual Interrupt Group 1 Enable register
ICV_PMR, Interrupt Controller Virtual Interrupt Priority Mask Register

The ICV_PMR characteristics are:

**Purpose**

Provides a virtual interrupt priority filter. Only virtual interrupts with a higher priority than the value in this register are signaled to the PE.

**Configuration**

AArch32 System register ICV_PMR bits [31:0] are architecturally mapped to AArch64 System register ICV_PMR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICV_PMR are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that writes to this register are self-synchronising. This ensures that no interrupts below the written PMR value will be taken after a write to this register is architecturally executed. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Attributes**

ICV_PMR is a 32-bit register.

**Field descriptions**

The ICV_PMR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| RES0 | Priority |

**Bits [31:8]**

Reserved, RES0.

**Priority, bits [7:0]**

The priority mask level for the virtual CPU interface. If the priority of a virtual interrupt is higher than the value indicated by this field, the interface signals the virtual interrupt to the PE.

The possible priority field values are as follows:

<table>
<thead>
<tr>
<th>Implemented priority bits</th>
<th>Possible priority field values</th>
<th>Number of priority levels</th>
</tr>
</thead>
<tbody>
<tr>
<td>[7:0]</td>
<td>0x00-0xFFFF (0-255), all values</td>
<td>256</td>
</tr>
<tr>
<td>[7:1]</td>
<td>0x00-0xFE (0-254), even values only</td>
<td>128</td>
</tr>
<tr>
<td>[7:2]</td>
<td>0x00-0xFC (0-252), in steps of 4</td>
<td>64</td>
</tr>
<tr>
<td>[7:3]</td>
<td>0x00-0xF8 (0-248), in steps of 8</td>
<td>32</td>
</tr>
<tr>
<td>[7:4]</td>
<td>0x00-0xF0 (0-240), in steps of 16</td>
<td>16</td>
</tr>
</tbody>
</table>
Unimplemented priority bits are RAZ/WI.

On a Warm reset, this field resets to 0.

The ICV_RPR characteristics are:

**Purpose**

Indicates the Running priority of the virtual CPU interface.

**Configuration**

AArch32 System register ICV_RPR performs the same function as AArch64 System register ICV_RPR_EL1.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICV_RPR are UNDEFINED.

**Attributes**

ICV_RPR is a 32-bit register.

**Field descriptions**

The ICV_RPR bit assignments are:

|   | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|---|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|
|   | RES0 | Priority |

**Bits [31:8]**

Reserved, RES0.

**Priority, bits [7:0]**

The current running priority on the virtual CPU interface. This is the group priority of the current active virtual interrupt.

The priority returned is the group priority as if the BPR for the current Exception level and Security state was set to the minimum value of BPR for the number of implemented priority bits.

**Note**

If 8 bits of priority are implemented the group priority is bits[7:1] of the priority.

**Accessing the ICV_RPR**

If there are no active interrupts on the virtual CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

Software cannot determine the number of implemented priority bits from a read of this register.

Accesses to this register use the following encodings:
ICV_RPR, Interrupt Controller Virtual Running Priority Register

**ID_DFR0, Debug Feature Register 0**

The ID_DFR0 characteristics are:

**Purpose**

Provides top level information about the debug system in AArch32 state.

Must be interpreted with the Main ID Register, **MIDR**.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch32 System register ID_DFR0 bits [31:0] are architecturally mapped to AArch64 System register **ID_DFR0_EL1[31:0]**.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID_DFR0 are **UNDEFINED**.

**Attributes**

ID_DFR0 is a 32-bit register.

**Field descriptions**

The ID_DFR0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| TraceFilt | PerfMon | MProfDbg | MMapTrc | CopTrc | MMapDbg | CopSDbg | CopDbg |

**TraceFilt, bits [31:28]**

Armv8.4 Self-hosted Trace Extension version. Defined values are:

<table>
<thead>
<tr>
<th>TraceFilt</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Armv8.4 Self-hosted Trace Extension not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Armv8.4 Self-hosted Trace Extension implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_TRF implements the functionality added by the value 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

**PerfMon, bits [27:24]**

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'.

Defined values are:
<table>
<thead>
<tr>
<th>PerfMon</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Performance Monitors Extension not implemented.</td>
</tr>
<tr>
<td>0b0001</td>

</tr>
<tr>
<td></td>
<td>• 64-bit event counters.</td>
</tr>
<tr>
<td></td>
<td>• If EL2 is implemented, the HDCR, HCCD control bit.</td>
</tr>
<tr>
<td></td>
<td>• If EL3 is implemented, the SDCR, SCCD control bit.</td>
</tr>
<tr>
<td>0b0111</td>
<td>PMUv3 for Armv8.7. As 0b0110, and also includes support for:</td>
</tr>
<tr>
<td></td>
<td>• The PMCR, FZO and, if EL2 is implemented, HDCR, HPMFZO control bits.</td>
</tr>
<tr>
<td></td>
<td>• If EL3 is implemented and using AArch64, the MDCR_EL3, {MPMX, MCCD} control bits.</td>
</tr>
<tr>
<td>0b1111</td>
<td>IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value 0b0011.

FEAT_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT_PMUv3p7 implements the functionality identified by the value 0b0111.

In any Armv8 implementation, the values 0b0001 and 0b0010 are not permitted.

From Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0011 is not permitted.

From Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.

From Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT_PMUv3 is implemented, the value 0b0110 is not permitted.

**Note**

In Armv7, the value 0b0000 can mean that PMUv1 is implemented. PMUv1 is not permitted in an Armv8 implementation.

**MProfDbg, bits [23:20]**

M Profile Debug. Support for memory-mapped debug model for M profile processors. Defined values are:

<table>
<thead>
<tr>
<th>MProfDbg</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for M profile Debug architecture, with memory-mapped access.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.
**MMAPTrc, bits [19:16]**

Memory Mapped Trace. Support for memory-mapped trace model. Defined values are:

<table>
<thead>
<tr>
<th>MMapTrc</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for Arm trace architecture, with memory-mapped access.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

See the ETM Architecture Specification for more information.

**CopTrc, bits [15:12]**

Support for System registers-based trace model, using registers in the coproc == 0b1110 encoding space. Defined values are:

<table>
<thead>
<tr>
<th>CopTrc</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for Arm trace architecture, with System registers access.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

See the ETM Architecture Specification for more information.

**MMapDbg, bits [11:8]**

Memory Mapped Debug. Support for v7 memory-mapped debug model, for A and R profile processors.

In Armv8-A, this field is RES0.

The optional memory map defined by Armv8 is not compatible with Armv7.

**CopSDbg, bits [7:4]**

Support for a System registers-based Secure debug model, using registers in the coproc = 0b1110 encoding space, for an A profile processor that includes EL3.

If EL3 is not implemented and the implemented Security state is Non-secure state, this field is RES0. Otherwise, this field reads the same as bits [3:0].

**CopDbg, bits [3:0]**

Support for System registers-based debug model, using registers in the coproc == 0b1110 encoding space, for A and R profile processors. Defined values are:
All other values are reserved.

FEAT_Debugv8p2 adds the functionality identified by the value 0b1000.

FEAT_Debugv8p4 adds the functionality identified by the value 0b1001.

In Armv8.0, the only permitted value is 0b0110.

In Armv8.1, the only permitted value is 0b0111.

In Armv8.2, the only permitted value is 0b1000.

From Armv8.4, the only permitted value is 0b1001.

### Accessing the ID_DFR0

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b0000</td>
<td>0b0001</td>
<td>0b010</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then

  else
    return ID_DFR0;
  end if;
elsif PSTATE.EL == EL2 then
  return ID_DFR0;
elsif PSTATE.EL == EL3 then
  return ID_DFR0;
```
The ID_DFR1 characteristics are:

**Purpose**

Provides top level information about the debug system in AArch32.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch32 System register ID_DFR1 bits [31:0] are architecturally mapped to AArch64 System register ID_DFR1_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID_DFR1 are UNDEFINED.

**Note**

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

**Attributes**

ID_DFR1 is a 32-bit register.

**Field descriptions**

The ID_DFR1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 |
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | MTPMU |

**Bits [31:4]**

Reserved, RES0.

**MTPMU, bits [3:0]**

Multi-threaded PMU extension. Defined values are:

<table>
<thead>
<tr>
<th>MTPMU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, it is IMPLEMENTATION DEFINED whether PMEVTYPER&lt;n&gt;.MT are read/write or RES0.</td>
</tr>
<tr>
<td>0b0001</td>
<td>FEAT_MTPMU and FEAT_PMUv3 implemented. PMEVTYPER&lt;n&gt;.MT are read/write. When FEAT_MTPMU is disabled, the Effective values of PMEVTYPER&lt;n&gt;.MT are 0.</td>
</tr>
<tr>
<td>0b1111</td>
<td>FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, PMEVTYPER&lt;n&gt;.MT are RES0.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_MTPMU implements the functionality identified by the value 0b0001.

From Armv8.6, in an implementation that includes FEAT_PMUv3, the value 0b0000 is not permitted.
In an implementation that does not include FEAT_PMUv3, the value 0b0001 is not permitted.

**Accessing the ID_DFR1**

Accesses to this register use the following encodings:

\[
\text{MRC}\{c\}\{q\} \langle\text{coproc}\rangle, \{\#\langle\text{opc1}\rangle, \langle\text{Rt}\rangle, \langle\text{CRn}\rangle, \langle\text{CRm}\rangle, \{\#\langle\text{opc2}\rangle}\}
\]

<table>

<td>0b0001</td>
<td>Adds BKPT.</td>
</tr>
</tbody>
</table>
All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**Coproc, bits [19:16]**

Indicates the implemented System register access instructions. Defined values are:

<table>
<thead>
<tr>
<th>Coproc</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented, except for instructions separately attributed by the architecture to provide access to AArch32 System registers and System instructions.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds generic CDP, LDC, MCR, MRC, and STC.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds generic CDP2, LDC2, MCR2, MRC2, and STC2.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0010, and adds generic MCRR and MRRC.</td>
</tr>
<tr>
<td>0b0100</td>
<td>As for 0b0011, and adds generic MCRR2 and MRRC2.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**CmpBranch, bits [15:12]**

Indicates the implemented combined Compare and Branch instructions in the T32 instruction set. Defined values are:

<table>
<thead>
<tr>
<th>CmpBranch</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds CBNZ and CBZ.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**BitField, bits [11:8]**

Indicates the implemented BitField instructions. Defined values are:

<table>
<thead>
<tr>
<th>BitField</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds BFC, BFI, SBFX, and UBFX.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**BitCount, bits [7:4]**

Indicates the implemented Bit Counting instructions. Defined values are:

<table>
<thead>
<tr>
<th>BitCount</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds CLZ.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**Swap, bits [3:0]**

Indicates the implemented Swap instructions in the A32 instruction set. Defined values are:

<table>
<thead>
<tr>
<th>Swap</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds SWP and SWPB.</td>
</tr>
</tbody>
</table>
All other values are reserved.

In Armv8-A, the only permitted value is \texttt{0b0000}.

**Accessing the ID_ISAR0**

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>}, \{#\}<opc1>, <Rt>, <CRn>, <CRm>{, \{#\}<opc2>}\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b0000</td>
<td>0b0010</td>
<td>0b000</td>
</tr>
</tbody>
</table>

ID_ISAR1, Instruction Set Attribute Register 1

The ID_ISAR1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR2, ID_ISAR3, ID_ISAR4, and ID_ISAR5.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch32 System register ID_ISAR1 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR1_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID_ISAR1 are UNDEFINED.

**Attributes**

ID_ISAR1 is a 32-bit register.

**Field descriptions**

The ID_ISAR1 bit assignments are:

```
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Jazelle | Interwork | Immediate | IfThen | Extend | Except_AR | Except | Endian |
```

**Jazelle, bits [31:28]**

Indicates the implemented Jazelle extension instructions. Defined values are:

<table>
<thead>
<tr>
<th>Jazelle</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No support for Jazelle.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the BXJ instruction, and the J bit in the PSR. This setting might indicate a trivial implementation of the Jazelle extension.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**Interwork, bits [27:24]**

Indicates the implemented Interworking instructions. Defined values are:

<table>
<thead>
<tr>
<th>Interwork</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the BX instruction, and the T bit in the PSR.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the BLX instruction. PC loads have BX-like behavior.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0010, and guarantees that data-processing instructions in the A32 instruction set with the PC as the destination and the S bit clear have BX-like behavior.</td>
</tr>
</tbody>
</table>

All other values are reserved.
In Armv8-A, the only permitted value is 0b0011.

**Immediate, bits [23:20]**

Indicates the implemented data-processing instructions with long immediates. Defined values are:

<table>
<thead>
<tr>
<th>Immediate</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds:</td>
</tr>
<tr>
<td></td>
<td>• The MOVT instruction</td>
</tr>
<tr>
<td></td>
<td>• The MOV instruction encodings with zero-extended 16-bit immediates.</td>
</tr>
<tr>
<td></td>
<td>• The T32 ADD and SUB instruction encodings with zero-extended 12-bit immediates, and the other ADD, ADR, and SUB encodings cross-referenced by the pseudocode for those encodings.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**IfThen, bits [19:16]**

Indicates the implemented If-Then instructions in the T32 instruction set. Defined values are:

<table>
<thead>
<tr>
<th>IfThen</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the IT instructions, and the IT bits in the PSRs.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**Extend, bits [15:12]**

Indicates the implemented Extend instructions. Defined values are:

<table>
<thead>
<tr>
<th>Extend</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No scalar sign-extend or zero-extend instructions are implemented, where scalar instructions means non-Advanced SIMD instructions.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SXTB, SXTH, UXTB, and UXTH instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the SXTB16, SXTAB, SXTAB16, SXTAH, UXTB16, UXTAB, UXTAB16, and UXTAH instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

**Except_AR, bits [11:8]**

Indicates the implemented A and R profile exception-handling instructions. Defined values are:

<table>
<thead>
<tr>
<th>Except_AR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SRS and RFE instructions, and the A and R profile forms of the CPS instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**Except, bits [7:4]**

Indicates the implemented exception-handling instructions in the A32 instruction set. Defined values are:
All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

**Endian, bits [3:0]**

Indicates the implemented Endian instructions. Defined values are:

<table>
<thead>
<tr>
<th>Endian</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>0b0000</code></td>
<td>None implemented.</td>
</tr>
<tr>
<td><code>0b0001</code></td>
<td>Adds the SETEND instruction, and the E bit in the PSRs.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0001`.

**Accessing the ID_ISAR1**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

```
<table>
<thead>

**ID_ISAR2, Instruction Set Attribute Register 2**

The ID_ISAR2 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR3, ID_ISAR4, and ID_ISAR5.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch32 System register ID_ISAR2 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR2_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID_ISAR2 are UNDEFINED.

**Attributes**

ID_ISAR2 is a 32-bit register.

**Field descriptions**

The ID_ISAR2 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>

<td></td>
</tr>
</tbody>
</table>

**Reversal, bits [31:28]**

Indicates the implemented Reversal instructions. Defined values are:

<table>
<thead>
<tr>
<th>Reversal</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the REV, REV16, and REVSH instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the RBIT instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

**PSR_AR, bits [27:24]**

Indicates the implemented A and R profile instructions to manipulate the PSR. Defined values are:

<table>
<thead>
<tr>
<th>PSR_AR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the MRS and MSR instructions, and the exception return forms of data-processing instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

The exception return forms of the data-processing instructions are:
In the A32 instruction set, data-processing instructions with the PC as the destination and the S bit set. These instructions might be affected by the WithShifts attribute.
In the T32 instruction set, the SUBS PC,LR,#N instruction.

**MultU, bits [23:20]**

Indicates the implemented advanced unsigned Multiply instructions. Defined values are:

<table>
<thead>
<tr>
<th>MultU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the UMULL and UMLAL instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the UMAAL instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.
In Armv8-A, the only permitted value is 0b0010.

**MultS, bits [19:16]**

Indicates the implemented advanced signed Multiply instructions. Defined values are:

<table>
<thead>
<tr>
<th>MultS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SMULL and SMLAL instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the SMLABB, SMLABT, SMLALBB, SMLALBT, SMLALTB, SMLALTT, SMLATB, SMLATT, SMLAWB, SMLAWT, SMLUBB, SMUBLT, SMULBT, SMULTB, SMULTT, SMULWB, and SMULWT instructions. Also adds the Q bit in the PSRs.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0010, and adds the SMLAD, SMLADX, SMLALD, SMLALDX, SMLSD, SMLSDX, SMLSLD, SMLSLDX, SMMLA, SMMLAR, SMMLS, SMMLSR, SMMUL, SMMULR, SMUAD, SMUADX, SMUSD, and SMUSDX instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.
In Armv8-A, the only permitted value is 0b0011.

**Mult, bits [15:12]**

Indicates the implemented additional Multiply instructions. Defined values are:

<table>
<thead>
<tr>
<th>Mult</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No additional instructions implemented. This means only MUL is implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the MLA instruction.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the MLS instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.
In Armv8-A, the only permitted value is 0b0010.

**MultiAccessInt, bits [11:8]**

Indicates the support for interruptible multi-access instructions. Defined values are:

<table>
<thead>
<tr>
<th>MultiAccessInt</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No support. This means the LDM and STM instructions are not interruptible.</td>
</tr>
<tr>
<td>0b0001</td>
<td>LDM and STM instructions are restartable.</td>
</tr>
<tr>
<td>0b0010</td>
<td>LDM and STM instructions are continuable.</td>
</tr>
</tbody>
</table>

All other values are reserved.
In Armv8-A, the only permitted value is 0b0000.
MemHint, bits [7:4]

Indicates the implemented Memory Hint instructions. Defined values are:

<table>
<thead>
<tr>
<th>MemHint</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the PLD instruction.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Adds the PLD instruction. (0b0001 and 0b0010 have identical effects.)</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0001 (or 0b0010), and adds the PLI instruction.</td>
</tr>
<tr>
<td>0b0100</td>
<td>As for 0b0011, and adds the PLDW instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0100.

LoadStore, bits [3:0]

Indicates the implemented additional load/store instructions. Defined values are:

<table>
<thead>
<tr>
<th>LoadStore</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No additional load/store instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the LDRD and STRD instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the Load Acquire (LDAB, LDAH, LDA, LDAEXB, LDAEXH, LDAEX, LDAEXD) and Store Release (STLB, STLH, STL, STLEXB, STLEXH, STLEX, STLEXD) instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Accessing the ID_ISAR2

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} \text{ coproc}, \{#\}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
\]

<table>

ID_ISAR3, Instruction Set Attribute Register 3

The ID_ISAR3 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR4, and ID_ISAR5.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch32 System register ID_ISAR3 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR3_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID_ISAR3 are UNDEFINED.

**Attributes**

ID_ISAR3 is a 32-bit register.

**Field descriptions**

The ID_ISAR3 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| T32EE | TrueNOP | T32Copy | TabBranch | SynchPrim | SVC | SIMD | Saturate |

**T32EE, bits [31:28]**

Indicates the implemented T32EE instructions. Defined values are:

<table>
<thead>
<tr>
<th>T32EE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the ENTERX and LEAVEX instructions, and modifies the load behavior to include null checking.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**TrueNOP, bits [27:24]**

Indicates the implemented true NOP instructions. Defined values are:

<table>
<thead>
<tr>
<th>TrueNOP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented. This means there are no NOP instructions that do not have any register dependencies.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds true NOP instructions in both the T32 and A32 instruction sets. This also permits additional NOP-compatible hints.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.
T32Copy, bits [23:20]

Indicates the support for T32 non flag-setting MOV instructions. Defined values are:

<table>
<thead>
<tr>
<th>T32Copy</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported. This means that in the T32 instruction set, encoding T1 of the MOV (register) instruction does not support a copy from a low register to a low register.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds support for T32 instruction set encoding T1 of the MOV (register) instruction, copying from a low register to a low register.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

TabBranch, bits [19:16]

Indicates the implemented Table Branch instructions in the T32 instruction set. Defined values are:

<table>
<thead>
<tr>
<th>TabBranch</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the TBB and TBH instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

SynchPrim, bits [15:12]

Used in conjunction with ID_ISAR4.SynchPrim_frac to indicate the implemented Synchronization Primitive instructions. Defined values are:

<table>
<thead>
<tr>
<th>SynchPrim</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>If SynchPrim_frac == 0b000, no Synchronization Primitives implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>If SynchPrim_frac == 0b000, adds the LDREX and STREX instructions. If SynchPrim_frac == 0b011, also adds the CLREX, LDREXB, STREXB, and STREXH instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>If SynchPrim_frac == 0b000, as for [0b001, 0b011] and also adds the LDREXD and STREXD instructions.</td>
</tr>
</tbody>
</table>

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is 0b0010.

SVC, bits [11:8]

Indicates the implemented SVC instructions. Defined values are:

<table>
<thead>
<tr>
<th>SVC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SVC instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

SIMD, bits [7:4]

Indicates the implemented SIMD instructions. Defined values are:
### SIMD

<table>
<thead>
<tr>
<th>SIMD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SSAT and USAT instructions, and the Q bit in the PSRs.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0001, and adds the PKHTB, PKHTB, QADD16, QADD8, QASX, QSUB16, QSUB8, QSAX, SADD16, SADD8, SASX, SEL, SHADD16, SHADD8, SHASX, SHSUB16, SHSUB8, SHSAX, SSAT16, SSUB16, SSUB8, SSAX, SXTAB16, SXTB16, UADD16, UADD8, UAXS, UHADD16, UHADD8, UHASX, UHSUB16, UHSUB8, UHSAX, UQADD16, UQADD8, UQASX, UQSUB16, UQSUB8, UQSAX, USAD8, USADA8, USAT16, USUB16, USUB8, USAX, UXTAB16, and UXTB16 instructions. Also adds support for the GE[3:0] bits in the PSRs.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

The SIMD field relates only to implemented instructions that perform SIMD operations on the general-purpose registers. In an implementation that supports floating-point and Advanced SIMD instructions, MVFR0, MVFR1, and MVFR2 give information about the implemented Advanced SIMD instructions.

### Saturate, bits [3:0]

Indicates the implemented Saturate instructions. Defined values are:

<table>
<thead>
<tr>
<th>Saturate</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented. This means no non-Advanced SIMD saturate instructions are implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the QADD, QDADD, QDSUB, and QSUB instructions, and the Q bit in the PSRs.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

## Accessing the ID_ISAR3

Accesses to this register use the following encodings:

```c
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b0000</td>
<td>0b0010</td>
<td>0b011</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TID3 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return ID_ISAR3;

        return ID_ISAR3;
ID_ISAR4, Instruction Set Attribute Register 4

The ID_ISAR4 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, and ID_ISAR5.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch32 System register ID_ISAR4 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR4_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID_ISAR4 are UNDEFINED.

**Attributes**

ID_ISAR4 is a 32-bit register.

**Field descriptions**

The ID_ISAR4 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>SWP_frac</td>
<td>PSR_M</td>
<td>SynchPrim_frac</td>
<td>Barrier</td>
<td>SMC</td>
<td>Writeback</td>
<td>WithShifts</td>
<td>Unpriv</td>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**SWP_frac, bits [31:28]**

Indicates support for the memory system locking the bus for SWP or SWPB instructions. Defined values are:

<table>
<thead>
<tr>
<th>SWP_frac</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SWP or SWPB instructions not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SWP or SWPB implemented but only in a uniprocessor context. SWP and SWPB do not guarantee whether memory accesses from other Requesters can come between the load memory access and the store memory access of the SWP or SWPB.</td>
</tr>
</tbody>
</table>

All other values are reserved. This field is valid only if ID_ISAR0.Swap is 0b0000.

In Armv8-A, the only permitted value is 0b0000.

**PSR_M, bits [27:24]**

Indicates the implemented M profile instructions to modify the PSRs. Defined values are:

<table>
<thead>
<tr>
<th>PSR_M</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the M profile forms of the CPS, MRS, and MSR instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.
In Armv8-A, the only permitted value is 0b0000.

**SynchPrim_frac, bits [23:20]**

Used in conjunction with ID_ISAR3.SynchPrim to indicate the implemented Synchronization Primitive instructions. Possible values are:

<table>
<thead>
<tr>
<th>SynchPrim_frac</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>If SynchPrim == 0b0000, no Synchronization Primitives implemented. If SynchPrim == 0b0001, adds the LDREX and STREX instructions. If SynchPrim == 0b0010, also adds the CLREX, LDREXB, LDREXH, STREXB, STREXH, LDREXD, and STREXD instructions.</td>
</tr>
<tr>
<td>0b0011</td>
<td>If SynchPrim == 0b0001, adds the LDREX, STREX, CLREX, LDREXB, LDREXH, STREXB, and STREXH instructions.</td>
</tr>
</tbody>
</table>

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is 0b0000.

**Barrier, bits [19:16]**

Indicates the implemented Barrier instructions in the A32 and T32 instruction sets. Defined values are:

<table>
<thead>
<tr>
<th>Barrier</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented. Barrier operations are provided only as System instructions in the (coproc==0b1111) encoding space.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the DMB, DSB, and ISB barrier instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**SMC, bits [15:12]**

Indicates the implemented SMC instructions. Defined values are:

<table>
<thead>
<tr>
<th>SMC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SMC instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**Writeback, bits [11:8]**

Indicates the support for Writeback addressing modes. Defined values are:

<table>
<thead>
<tr>
<th>Writeback</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Basic support. Only the LDM, STM, PUSH, POP, SRS, and RFE instructions support writeback addressing modes. These instructions support all of their writeback addressing modes.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds support for all of the writeback addressing modes.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**WithShifts, bits [7:4]**

Indicates the support for instructions with shifts. Defined values are:
<table>
<thead>
<tr>
<th>WithShifts</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Nonzero shifts supported only in MOV and shift instructions.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds support for shifts of loads and stores over the range LSL 0-3.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0001, and adds support for other constant shift options, both on load/store and other instructions.</td>
</tr>
<tr>
<td>0b0100</td>
<td>As for 0b0011, and adds support for register-controlled shift options.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0100.

**Unpriv, bits [3:0]**

Indicates the implemented unprivileged instructions. Defined values are:

<table>
<thead>
<tr>
<th>Unpriv</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented. No T variant instructions are implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the LDRBT, LDRT, STRBT, and STRT instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the LDRHT, LDRSBT, LDRSHT, and STRHT instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

**Accessing the ID_ISAR4**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>

elsif PSTATE.EL == EL3 then
  return ID_ISAR4;
```
**ID_ISAR5, Instruction Set Attribute Register 5**

The ID_ISAR5 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, and ID_ISAR4.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch32 System register ID_ISAR5 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR5_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID_ISAR5 are UNDEFINED.

**Attributes**

ID_ISAR5 is a 32-bit register.

**Field descriptions**

The ID_ISAR5 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| VCMA | RDM | RES0 | CRC32 | SHA2 | SHA1 | AES | SEVL |

**VCMA, bits [31:28]**

Indicates AArch32 support for complex number addition and multiplication where numbers are stored in vectors. Defined values are:

<table>
<thead>
<tr>
<th>VCMA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The VCMLA and VCADD instructions are not implemented in AArch32.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The VCMLA and VCADD instructions are implemented in AArch32.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_FCMA implements the functionality identified by the value 0b0001.

From Armv8.3, the only permitted value is 0b0001.

**RDM, bits [27:24]**

Indicates support for the VQRDMLAH and VQRDMLSH instructions in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>RDM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No VQRDMLAH and VQRDMLSH instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>VQRDMLAH and VQRDMLSH instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_RDM implements the functionality identified by the value 0b0001.
From Armv8.1, the only permitted value is 0b0001.

**Bits [23:20]**

Reserved, RES0.

**CRC32, bits [19:16]**

Indicates support for the CRC32 instructions in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>CRC32</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No CRC32 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CH, and CRC32CW instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.1, the only permitted value is 0b0001.

**SHA2, bits [15:12]**

Indicates support for the SHA2 instructions in AArch32 state.

<table>
<thead>
<tr>
<th>SHA2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No SHA2 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

**SHA1, bits [11:8]**

Indicates support for the SHA1 instructions are implemented in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>SHA1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No SHA1 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

**AES, bits [7:4]**

Indicates support for the AES instructions in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>AES</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No AES instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>AESE, AESD, AESMC, and AESIMC implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, plus VMULL (polynomial) instructions operating on 64-bit data quantities.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0010.

**SEVL, bits [3:0]**

Indicates support for the SEVL instruction in AArch32 state. Defined values are:
SEVL

<table>
<thead>
<tr>
<th>SEVL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SEVL is implemented as a NOP.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SEVL is implemented as Send Event Local.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**Accessing the ID_ISAR5**

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#<\text{opc1}>\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}\}{, \{#<\text{opc2}>\}}
\]

<table>
<thead>

elsif \(PSTATE.EL == EL2\) then
    return ID ISAR5;
elsif \(PSTATE.EL == EL3\) then
    return ID_ISAR5;
The ID_ISAR6 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, ID_ISAR4, and ID_ISAR5.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch32 System register ID_ISAR6 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR6_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID_ISAR6 are UNDEFINED.

**Note**

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

**Attributes**

ID_ISAR6 is a 32-bit register.

**Field descriptions**

The ID_ISAR6 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | I8MM | BF16 | SPECRES | SB | FHM | DP | JSCVT |

**Bits [31:28]**

Reserved, RES0.

**I8MM, bits [27:24]**

Indicates support for Advanced SIMD and floating-point Int8 matrix multiplication instructions in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>I8MM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Int8 matrix multiplication instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>VSMMLA, VSUDOT, VUMMLA, VUSMMLA, and VUSDOT instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_AA32I8MM implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.
BF16, bits [23:20]

Indicates support for Advanced SIMD and floating-point BFloat16 instructions in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>BF16</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>BFloat16 instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>VCVT, VCVTB, VCVTT, VDOT, VFMAB, VFMAT, and VMMLA</td>
</tr>
<tr>
<td></td>
<td>instructions with BF16 operand or result types are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_AA32BF16 implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

SPECRES, bits [19:16]

Indicates support for Speculation invalidation instructions in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>SPECRES</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>CFPRCTX, DVPRCTX, and CPPRCTX instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>CFPRCTX, DVPRCTX, and CPPRCTX instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8.5, the only permitted value is 0b0001.

SB, bits [15:12]

Indicates support for SB instruction in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>SB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SB instruction is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SB instruction is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8.5, the only permitted value is 0b0001.

FHM, bits [11:8]

Indicates support for Advanced SIMD and floating-point VFMAL and VFMSL instructions in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>FHM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>VFMAL and VMFSL instructions not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>VFMAL and VMFSL instructions implemented.</td>
</tr>
</tbody>
</table>

FEAT_FHM implements the functionality identified by the value 0b0001.

DP, bits [7:4]

Indicates support for dot product instructions in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>DP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No dot product instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>VUDOT and VSDOT instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_DotProd implements the functionality identified by the value 0b0001.
**JSCVT, bits [3:0]**

Indicates support for the Javascript conversion instruction in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>JSCVT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The VJCVT instruction is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The VJCVT instruction is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8.0, the only permitted value is 0b0000.

FEAT_JSCVT implements the functionality identified by 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

**Accessing the ID_ISAR6**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b0000</td>
<td>0b0010</td>
<td>0b111</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
  elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
    AArch32.TakeHypTrapException(0x03);
  elsif EL2Enabled() && !ELUsingAArch32(EL2) && (!IsZero(ID_ISAR6) || boolean IMPLEMENTATION_DEFINED "ID_ISAR6 trapped by HCR_EL2.TID3") && HCR_EL2.TID3 == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
  elsif EL2Enabled() && ELUsingAArch32(EL2) && (!IsZero(ID_ISAR6) || boolean IMPLEMENTATION_DEFINED "ID_ISAR6 trapped by HCR.TID3") && HCR.TID3 == '1' then
    AArch32.TakeHypTrapException(0x03);
else
  return ID_ISAR6;
elsif PSTATE.EL == EL2 then
  return ID_ISAR6;
elsif PSTATE.EL == EL3 then
  return ID_ISAR6;
```
The ID_MMFR0 characteristics are:

### Purpose

Provides information about the implemented memory model and memory management support in AArch32 state. Must be interpreted with ID_MMFR1, ID_MMFR2, ID_MMFR3, and ID_MMFR4.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

### Configuration

AArch32 System register ID_MMFR0 bits [31:0] are architecturally mapped to AArch64 System register ID_MMFR0_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID_MMFR0 are UNDEFINED.

### Attributes

ID_MMFR0 is a 32-bit register.

### Field descriptions

The ID_MMFR0 bit assignments are:

<table>
<thead>
<tr>
<th>InnerShr</th>
<th>FCSE</th>
<th>AuxReg</th>
<th>TCM</th>
<th>ShareLvl</th>
<th>OuterShr</th>
<th>PMSA</th>
<th>VMSA</th>
</tr>
</thead>
</table>

**InnerShr, bits [31:28]**

Innermost Shareability. Indicates the innermost shareability domain implemented. Defined values are:

<table>
<thead>
<tr>
<th>InnerShr</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Implemented as Non-cacheable.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Implemented with hardware coherency support.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Shareability ignored.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000, 0b0001, and 0b1111.

This field is valid only if the implementation supports two levels of shareability, as indicated by ID_MMFR0.ShareLvl having the value 0b0001.

When ID_MMFR0.ShareLvl is zero, this field is UNKNOWN.

**FCSE, bits [27:24]**

Indicates whether the implementation includes the FCSE. Defined values are:

<table>
<thead>
<tr>
<th>FCSE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for FCSE.</td>
</tr>
</tbody>
</table>

All other values are reserved.
In Armv8-A, the only permitted value is \(0b0000\).

**AuxReg, bits [23:20]**

Auxiliary Registers. Indicates support for Auxiliary registers. Defined values are:

<table>
<thead>
<tr>
<th>AuxReg</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for Auxiliary Control Register only.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Support for Auxiliary Fault Status Registers (AIFSR and ADFSR) and Auxiliary Control Register.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is \(0b0010\).

**Note**

Accesses to unimplemented Auxiliary registers are **UNDEFINED**.

**TCM, bits [19:16]**

Indicates support for TCMs and associated DMAs. Defined values are:

<table>
<thead>
<tr>
<th>TCM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support is IMPLEMENTATION DEFINED. Armv7 requires this setting.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Support for TCM only, Armv6 implementation.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Support for TCM and DMA, Armv6 implementation.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is \(0b0000\).

**ShareLvl, bits [15:12]**

Shareability Levels. Indicates the number of shareability levels implemented. Defined values are:

<table>
<thead>
<tr>
<th>ShareLvl</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>One level of shareability implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Two levels of shareability implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is \(0b0001\).

**OuterShr, bits [11:8]**

Outermost Shareability. Indicates the outermost shareability domain implemented. Defined values are:

<table>
<thead>
<tr>
<th>OuterShr</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Implemented as Non-cacheable.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Implemented with hardware coherency support.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Shareability ignored.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are \(0b0000\), \(0b0001\), and \(0b1111\).

**PMSA, bits [7:4]**

Indicates support for a PMSA. Defined values are:
### PMSA

<table>
<thead>
<tr>
<th>PMSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for IMPLEMENTATION DEFINED PMSA.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Support for PMSAv6, with a Cache Type Register implemented.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Support for PMSAv7, with support for memory subsections. Armv7-R profile.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

### VMSA, bits [3:0]

Indicates support for a VMSA. Defined values are:

<table>
<thead>
<tr>
<th>VMSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for IMPLEMENTATION DEFINED VMSA.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Support for VMSAv6, with Cache and TLB Type Registers implemented.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Support for VMSAv7, with support for remapping and the Access flag. Armv7-A profile.</td>
</tr>
<tr>
<td>0b0100</td>
<td>As for 0b0011, and adds support for the PXN bit in the Short-descriptor translation table format descriptors</td>
</tr>
<tr>
<td>0b0101</td>
<td>As for 0b0100, and adds support for the Long-descriptor translation table format.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0101.

### Accessing the ID_MMFR0

Accesses to this register use the following encodings:

\[
\text{MRC} \{<c>\}<q> <\text{coproc}>, \{#\}<\text{opc1}>\), <\text{Rt}>\), <\text{CRn}>\), <\text{CRm}>\}, \{#\}<\text{opc2}>\)}
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b0000</td>
<td>0b0001</td>
<td>0b100</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
  elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
    AArch32.TakeHypTrapException(0x03);
  else
    return ID_MMFR0;
  endif
elsif PSTATE.EL == EL2 then
  return ID_MMFR0;
elsif PSTATE.EL == EL3 then
  return ID_MMFR0;
ID_MMFR1, Memory Model Feature Register 1

The ID_MMFR1 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with [ID_MMFR0](#), [ID_MMFR2](#), [ID_MMFR3](#), and [ID_MMFR4](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch32 System register ID_MMFR1 bits [31:0] are architecturally mapped to AArch64 System register [ID_MMFR1_EL1][31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID_MMFR1 are **UNDEFINED**.

**Attributes**

ID_MMFR1 is a 32-bit register.

**Field descriptions**

The ID_MMFR1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| BPred | L1TstCln | L1Uni | L1Hvd | L1UniSW | L1HvdSW | L1UniVA | L1HvdVA |

**BPred, bits [31:28]**

Branch Predictor. Indicates branch predictor management requirements. Defined values are:

<table>
<thead>
<tr>
<th>BPred</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No branch predictor, or no MMU present. Implies a fixed MPU configuration.</td>
</tr>
</tbody>
</table>
| 0b0001 | Branch predictor requires flushing on:  
  • Enabling or disabling a stage of address translation.  
  • Writing new data to instruction locations.  
  • Writing new mappings to the translation tables.  
  • Changes to the TTBR0, TTBR1, or TTBCR registers.  
  • Changes to the ContextID or ASID, or to the FCSE ProcessID if this is supported. |
| 0b0010 | Branch predictor requires flushing on:  
  • Enabling or disabling a stage of address translation.  
  • Writing new data to instruction locations.  
  • Writing new mappings to the translation tables.  
  • Any change to the TTBR0, TTBR1, or TTBCR registers without a change to the corresponding ContextID or ASID, or FCSE ProcessID if this is supported. |
| 0b0011 | Branch predictor requires flushing only on writing new data to instruction locations. |
| 0b0100 | For execution correctness, branch predictor requires no flushing at any time. |

All other values are reserved.
In Armv8-A, the permitted values are 0b0010, 0b0011, or 0b0100. For values other than 0b0000 and 0b0100, the Arm Architecture Reference Manual, or the product documentation, might give more information about the required maintenance.

**L1TstCln, bits [27:24]**

Level 1 cache Test and Clean. Indicates the supported Level 1 data cache test and clean operations, for Harvard or unified cache implementations. Defined values are:

<table>
<thead>
<tr>
<th>L1TstCln</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported Level 1 data cache test and clean operations are:</td>
</tr>
<tr>
<td></td>
<td>• Test and clean data cache.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Test, clean, and invalidate data cache.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**L1Uni, bits [23:20]**

Level 1 Unified cache. Indicates the supported entire Level 1 cache maintenance operations for a unified cache implementation. Defined values are:

<table>
<thead>
<tr>
<th>L1Uni</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported entire Level 1 cache operations are:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate cache, including branch predictor if appropriate.</td>
</tr>
<tr>
<td></td>
<td>• Invalidate branch predictor, if appropriate.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Clean cache, using a recursive model that uses the cache dirty status bit.</td>
</tr>
<tr>
<td></td>
<td>• Clean and invalidate cache, using a recursive model that uses the cache dirty status bit.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**L1Hvd, bits [19:16]**

Level 1 Harvard cache. Indicates the supported entire Level 1 cache maintenance operations for a Harvard cache implementation. Defined values are:

<table>
<thead>
<tr>
<th>L1Hvd</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported entire Level 1 cache operations are:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate instruction cache, including branch predictor if appropriate.</td>
</tr>
<tr>
<td></td>
<td>• Invalidate branch predictor, if appropriate.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate data cache.</td>
</tr>
<tr>
<td></td>
<td>• Invalidate data cache and instruction cache, including branch predictor if appropriate.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0010, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Clean data cache, using a recursive model that uses the cache dirty status bit.</td>
</tr>
<tr>
<td></td>
<td>• Clean and invalidate data cache, using a recursive model that uses the cache dirty status bit.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.
**L1UniSW, bits [15:12]**

Level 1 Unified cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a unified cache implementation. Defined values are:

<table>
<thead>
<tr>
<th>L1UniSW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported Level 1 unified cache line maintenance operations by set/way are:</td>
</tr>
<tr>
<td></td>
<td>• Clean cache line by set/way.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Clean and invalidate cache line by set/way.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0010, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate cache line by set/way.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**L1HvdSW, bits [11:8]**

Level 1 Harvard cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a Harvard cache implementation. Defined values are:

<table>
<thead>
<tr>
<th>L1HvdSW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported Level 1 Harvard cache line maintenance operations by set/way are:</td>
</tr>
<tr>
<td></td>
<td>• Clean data cache line by set/way.</td>
</tr>
<tr>
<td></td>
<td>• Clean and invalidate data cache line by set/way.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate data cache line by set/way.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0010, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate instruction cache line by set/way.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**L1UniVA, bits [7:4]**

Level 1 Unified cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a unified cache implementation. Defined values are:

<table>
<thead>
<tr>
<th>L1UniVA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported Level 1 unified cache line maintenance operations by VA are:</td>
</tr>
<tr>
<td></td>
<td>• Clean cache line by VA.</td>
</tr>
<tr>
<td></td>
<td>• Invalidate cache line by VA.</td>
</tr>
<tr>
<td></td>
<td>• Clean and invalidate cache line by VA.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate branch predictor by VA, if branch predictor is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**L1HvdVA, bits [3:0]**

Level 1 Harvard cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a Harvard cache implementation. Defined values are:
None supported.

Supported Level 1 Harvard cache line maintenance operations by VA are:
- Clean data cache line by VA.
- Invalidate data cache line by VA.
- Clean and invalidate data cache line by VA.
- Clean instruction cache line by VA.

As for 0b0001, and adds:
- Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**Accessing the ID_MMFR1**

Accesses to this register use the following encodings:

\[ \text{MRC}\{<c>\}{<q}> \text{ <coproc}, \{#<opc1>, <Rt>, <CRn>, <CRm>{, \{#<opc2}\}} \]

<table>

    return ID_MMFR1;

ID_MMFR2, Memory Model Feature Register 2

The ID_MMFR2 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32 state. Must be interpreted with ID_MMFR0, ID_MMFR1, ID_MMFR3, and ID_MMFR4.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch32 System register ID_MMFR2 bits [31:0] are architecturally mapped to AArch64 System register ID_MMFR2_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID_MMFR2 are UNDEFINED.

**Attributes**

ID_MMFR2 is a 32-bit register.

**Field descriptions**

The ID_MMFR2 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| HWAccFlg | WFIStall | MemBarr | UniTLB | HvdTLB | L1HvdRng | L1HvdBG | L1HvdFG |

**HWAccFlg, bits [31:28]**

Hardware Access Flag. In earlier versions of the Arm Architecture, this field indicates support for a Hardware Access flag, as part of the VMSAv7 implementation. Defined values are:

<table>
<thead>
<tr>
<th>HWAccFlg</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for VMSAv7 Access flag, updated in hardware.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**WFIStall, bits [27:24]**

Wait For Interrupt Stall. Indicates the support for Wait For Interrupt (WFI) stalling. Defined values are:

<table>
<thead>
<tr>
<th>WFIStall</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for WFI stalling.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.
MemBarr, bits [23:20]

Memory Barrier. Indicates the supported memory barrier System instructions in the (coproc == 1111) encoding space. Defined values are:

<table>
<thead>
<tr>
<th>MemBarr</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported memory barrier System instructions are:</td>
</tr>
<tr>
<td></td>
<td>• Data Synchronization Barrier (DSB).</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Instruction Synchronization Barrier (ISB).</td>
</tr>
<tr>
<td></td>
<td>• Data Memory Barrier (DMB).</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Arm deprecates the use of these operations. ID_ISAR4.BARRIER_INSTRS indicates the level of support for the preferred barrier instructions.

UniTLB, bits [19:16]

Unified TLB. Indicates the supported TLB maintenance operations, for a unified TLB implementation. Defined values are:

<table>
<thead>
<tr>
<th>UniTLB</th>
<th>Meaning</th>
</tr>

</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0110.

HvdTLB, bits [15:12]

If the value of ID_MMFR2.UniTLB is not 0b0000, then the meaning of this field is IMPLEMENTATION DEFINED. Arm deprecates the use of this field by software.

L1HvdRng, bits [11:8]

Level 1 Harvard cache Range. Indicates the supported Level 1 cache maintenance range operations, for a Harvard cache implementation. Defined values are:

<table>
<thead>
<tr>
<th>L1HvdRng</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>

</tr>
<tr>
<td></td>
<td>• Clean data cache range by VA.</td>
</tr>
<tr>
<td></td>
<td>• Clean and invalidate data cache range by VA.</td>
</tr>
</tbody>
</table>
All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

### L1HvdBG, bits [7:4]

Level 1 Harvard cache Background fetch. Indicates the supported Level 1 cache background fetch operations, for a Harvard cache implementation. When supported, background fetch operations are non-blocking operations. Defined values are:

<table>
<thead>
<tr>
<th>L1HvdBG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
</tbody>
</table>
| 0b0001  | Supported Level 1 Harvard cache background fetch operations are:  
|         | • Fetch instruction cache range by VA.  
|         | • Fetch data cache range by VA. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

### L1HvdFG, bits [3:0]

Level 1 Harvard cache Foreground fetch. Indicates the supported Level 1 cache foreground fetch operations, for a Harvard cache implementation. When supported, foreground fetch operations are blocking operations. Defined values are:

<table>
<thead>
<tr>
<th>L1HvdFG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
</tbody>
</table>
| 0b0001  | Supported Level 1 Harvard cache foreground fetch operations are:  
|         | • Fetch instruction cache range by VA.  
|         | • Fetch data cache range by VA. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

### Accessing the ID_MMFR2

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>}\{<q}\} <\text{coproc}>, \{#}\text{opc1}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>\{, \{#}\text{opc2}\}
\]

ID_MMFR3, Memory Model Feature Register 3

The ID_MMFR3 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with ID_MMFR0, ID_MMFR1, ID_MMFR2, and ID_MMFR4.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch32 System register ID_MMFR3 bits [31:0] are architecturally mapped to AArch64 System register ID_MMFR3_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID_MMFR3 are UNDEFINED.

**Attributes**

ID_MMFR3 is a 32-bit register.

**Field descriptions**

The ID_MMFR3 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Supersec | CMemSz | CohWalk | PAN | MaintBcst | BPMaint | CMaintSW | CMaintVA |

**Supersec, bits [31:28]**

Supersections. On a VMSA implementation, indicates whether Supersections are supported. Defined values are:

<table>
<thead>
<tr>
<th>Supersec</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Supersections supported.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Supersections not supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b1111.

**CMemSz, bits [27:24]**

Cached Memory Size. Indicates the physical memory size supported by the caches. Defined values are:

<table>
<thead>
<tr>
<th>CMemSz</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>4GB, corresponding to a 32-bit physical address range.</td>
</tr>
<tr>
<td>0b0001</td>
<td>64GB, corresponding to a 36-bit physical address range.</td>
</tr>
<tr>
<td>0b0010</td>
<td>1TB or more, corresponding to a 40-bit or larger physical address range.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000, 0b0001, and 0b0010.
CohWalk, bits [23:20]

Coherent Walk. Indicates whether Translation table updates require a clean to the Point of Unification. Defined values are:

<table>
<thead>
<tr>
<th>CohWalk</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Updates to the translation tables require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Updates to the translation tables do not require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

PAN, bits [19:16]

Privileged Access Never. Indicates support for the PAN bit in CPSR, SPSR, and DSPSR in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>PAN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>PAN not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>PAN supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>PAN supported and ATS1CPRP and ATS1CPWP instructions supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_PAN implements the functionality identified by the value 0b0001.

FEAT_PAN2 implements the functionality added by the value 0b0010.

In Armv8.1, the value 0b0000 is not permitted.

From Armv8.2, the only permitted value is 0b0010.

MaintBcst, bits [15:12]

Maintenance Broadcast. Indicates whether Cache, TLB, and branch predictor operations are broadcast. Defined values are:

<table>
<thead>
<tr>
<th>MaintBcst</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Cache, TLB, and branch predictor operations only affect local structures.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Cache and branch predictor operations affect structures according to shareability and defined behavior of instructions. TLB operations only affect local structures.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Cache, TLB, and branch predictor operations affect structures according to shareability and defined behavior of instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

BPMaint, bits [11:8]

Branch Predictor Maintenance. Indicates the supported branch predictor maintenance operations in an implementation with hierarchical cache maintenance operations. Defined values are:
BPMaint

<table>
<thead>
<tr>
<th>BPMaint</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
</tbody>
</table>
| 0b0001  | Supported branch predictor maintenance operations are:  
|         | • Invalidate all branch predictors. |
| 0b0010  | As for 0b0001, and adds:  
|         | • Invalidate branch predictors by VA. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

CMaintSW, bits [7:4]

Cache Maintenance by Set/Way. Indicates the supported cache maintenance operations by set/way, in an implementation with hierarchical caches. Defined values are:

<table>
<thead>
<tr>
<th>CMaintSW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
</tbody>
</table>
| 0b0001   | Supported hierarchical cache maintenance instructions by set/way are:  
|         | • Invalidate data cache by set/way.  
|         | • Clean data cache by set/way.  
|         | • Clean and invalidate data cache by set/way. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

In a unified cache implementation, the data cache maintenance operations apply to the unified caches.

CMaintVA, bits [3:0]

Cache Maintenance by Virtual Address. Indicates the supported cache maintenance operations by VA, in an implementation with hierarchical caches. Defined values are:

<table>
<thead>
<tr>
<th>CMaintVA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
</tbody>
</table>
| 0b0001   | Supported hierarchical cache maintenance operations by VA are:  
|         | • Invalidate data cache by VA.  
|         | • Clean data cache by VA.  
|         | • Clean and invalidate data cache by VA.  
|         | • Invalidate instruction cache by VA.  
|         | • Invalidate all instruction cache entries. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

In a unified cache implementation, data cache maintenance operations apply to the unified caches, and the instruction cache maintenance instructions are not implemented.

Accessing the ID_MMFR3

Accesses to this register use the following encodings:

\[
\text{MRC\{\langle c\rangle\{\langle q\rangle\} \langle coproc\rangle, \{\langle opc1\rangle, <Rt>, <CRn>, <CRm\rangle, \{\langle opc2\rangle\}}
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b0000</td>
<td>0b0001</td>
<td>0b111</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TID3 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return ID_MMFR3;
    endif
elsif PSTATE.EL == EL2 then
    return ID_MMFR3;
elsif PSTATE.EL == EL3 then
    return ID_MMFR3;

The ID_MMFR4 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with ID_MMFR0, ID_MMFR1, ID_MMFR2, and ID_MMFR3.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch32 System register ID_MMFR4 bits [31:0] are architecturally mapped to AArch64 System register ID_MMFR4_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID_MMFR4 are UNDEFINED.

**Attributes**

ID_MMFR4 is a 32-bit register.

**Field descriptions**

The ID_MMFR4 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| EVT | CCIDX | LSM | HPDS | CnP | XNX | AC2 | SpecSEI |

**EVT, bits [31:28]**

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the HCR2.\{TTLBIS, TOCU, TICAB, TID4\} traps. Defined values are:

<table>
<thead>
<tr>
<th>EVT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>HCR2.{TTLBIS, TOCU, TICAB, TID4} traps are not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>HCR2.{TOCU, TICAB, TID4} traps are supported.</td>
</tr>
<tr>
<td></td>
<td>HCR2.TTLBIS trap is not supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>HCR2.{TTLBIS, TOCU, TICAB, TID4} traps are supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_EVT implements the functionality identified by the values 0b0001 and 0b0010.

If EL2 is not implemented supporting AArch32, the only permitted value is 0b0000.

In Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

From Armv8.5, the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0010 when EL2 is implemented.

**CCIDX, bits [27:24]**

Support for use of the revised CCSIDR format and the presence of the CCSIDR2 is indicated. Defined values are:
CCIDX

<table>
<thead>
<tr>
<th>CCIDX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>32-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>64-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_CCIDX implements the functionality identified by 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

LSM, bits [23:20]

Indicates support for LSMAOE and nTLSMD bits in HSCTRL and SCTLR. Defined values are:

<table>
<thead>
<tr>
<th>LSM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>LSMAOE and nTLSMD bits not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>LSMAOE and nTLSMD bits supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_LSMAOC implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

HPDS, bits [19:16]

Hierarchical permission disables bits in translation tables. Defined values are:

<table>
<thead>
<tr>
<th>HPDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Disabling of hierarchical controls not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supports disabling of hierarchical controls using the TTBCR2, HPD0, TTBCR2, HPD1, and HTCR HPD bits.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for value 0b0001, and adds possible hardware allocation of bits[62:59] of the translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED USE.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_AA32HPD implements the functionality identified by the value 0b0001.

FEAT_HPDS2 implements the functionality added by the value 0b010.

Note

The value 0b0000 implies that the encoding for TTBCR2 is UNDEFINED.

CnP, bits [15:12]

Common not Private translations. Defined values are:

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Common not Private translations not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Common not Private translations supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_TTCNP implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

XNX, bits [11:8]

Support for execute-never control distinction by Exception level at stage 2. Defined values are:
<table>
<thead>
<tr>
<th>XNX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Distinction between EL0 and EL1 execute-never control at stage 2 not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Distinction between EL0 and EL1 execute-never control at stage 2 supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_XNX implements the functionality identified by the value 0b0001.

When FEAT_XNX is implemented:

- If all of the following conditions are true, it is IMPLEMENTATION DEFINED whether the value of ID_MMFR4.XNX is 0b0000 or 0b0001:
  - ID_AA64MMFR1_EL1.XNX ==1.
  - EL2 cannot use AArch32.
  - EL1 can use AArch32.
- If EL2 can use AArch32 then the only permitted value is 0b0001.

**AC2, bits [7:4]**

Indicates the extension of the ACTLR and HACTLR registers using ACTLR2 and HACTLR2. Defined values are:

<table>
<thead>
<tr>
<th>AC2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>ACTLR2 and HACTLR2 are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>ACTLR2 and HACTLR2 are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.2, the only permitted value is 0b0001.

**SpecSEI, bits [3:0]**

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:

<table>
<thead>
<tr>
<th>SpecSEI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The PE never generates an SError interrupt due to an External abort on a speculative read.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The PE might generate an SError interrupt due to an External abort on a speculative read.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Accessing the ID_MMFR4**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}  
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>

**Bits [31:4]**

Reserved, RES0.

**ETS, bits [3:0]**

Support for Enhanced Translation Synchronization. Defined values are:

<table>
<thead>
<tr>
<th>ETS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Enhanced Translation Synchronization is not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Enhanced Translation Synchronization is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_ETS implements the functionality identified by the value 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.7, the only permitted value is 0b0001.

**Accessing the ID_MMFR5**

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>
<th>proc</th>
<th>opc1</th>
<th>CRn</th>

elsif PSTATE.EL == EL3 then
    return ID_MMFR5;
The ID_PFR0 characteristics are:

**Purpose**

Gives top-level information about the instruction sets and other features supported by the PE in AArch32 state.

Must be interpreted with ID_PFR1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'

**Configuration**

AArch32 System register ID_PFR0 bits [31:0] are architecturally mapped to AArch64 System register ID_PFR0_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID_PFR0 are UNDEFINED.

**Attributes**

ID_PFR0 is a 32-bit register.

**Field descriptions**

The ID_PFR0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RAS | DIT | AMU | CSV2 | State3 | State2 | State1 | State0 |

**RAS, bits [31:28]**

RAS Extension version. Defined values are:

<table>
<thead>
<tr>
<th>RAS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No RAS Extension.</td>
</tr>
<tr>
<td>0b0001</td>
<td>RAS Extension present.</td>
</tr>
<tr>
<td>0b0010</td>
<td>FEAT_RASv1p1 present. As 0b0001, and adds support for additional ERXMISC&lt;m&gt; System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR&lt;n&gt;STATUS and support for the optional RAS Timestamp Extension.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_RAS implements the functionality identified by the value 0b0001.

FEAT_RASv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0 and Armv8.1, the permitted values are 0b0000 and 0b0001.

In Armv8.2, the only permitted value is 0b0001.

From Armv8.4, if FEAT_DoubleFault is implemented, the only permitted value is 0b0010.

From Armv8.4, when FEAT_DoubleFault is not implemented, and ERRIDR.NUM is 0, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b010.
**Note**

When the value of this field is 0b0001, **ID_PFR2.RAS_frac** indicates whether **FEAT_RASv1p1** is implemented.

---

**DIT, bits [27:24]**

Data Independent Timing. Defined values are:

<table>
<thead>
<tr>
<th>DIT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>AArch32 does not guarantee constant execution time of any instructions.</td>

<td>FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**FEAT_AMUv1** implements the functionality identified by the value 0b0001.

**FEAT_AMUv1p1** implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

---

**CSV2, bits [19:16]**

Speculative use of out of context branch targets. Defined values are:

<table>
<thead>
<tr>
<th>CSV2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>This Device does not disclose whether branch targets trained in one hardware described context can affect speculative execution in a different hardware described context.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Branch targets trained in one hardware described context can only affect speculative execution in a different hardware described context in a hard-to-determine way.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**FEAT_CSV2** implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

---

**State3, bits [15:12]**

T32EE instruction set support. Defined values are:
### State3, Meaning

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented.</td>
</tr>
<tr>

</tr>
<tr>
<td>0b0011</td>
<td>T32 encodings after the introduction of Thumb-2 technology implemented, for all 16-bit and 32-bit T32 basic instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

### State0, bits [3:0]

A32 instruction set support. Defined values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>A32 instruction set not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>A32 instruction set implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

## Accessing the ID_PFR0

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} \ <\text{coproc}>{,\ <#<opc1>}, \ <\text{Rt}>}, \ <\text{CRn}>, \ <\text{CRm}>{,\ <#<opc2>}
\]

        AArch32.TakeHypTrapException(0x03);
    else
        return ID_PFR0;
    endif
elsif PSTATE.EL == EL2 then
    return ID_PFR0;
elsif PSTATE.EL == EL3 then
    return ID_PFR0;
ID_PFR1, Processor Feature Register 1

The ID_PFR1 characteristics are:

**Purpose**

Gives information about the AArch32 programmers' model.

Must be interpreted with ID_PFR0.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch32 System register ID_PFR1 bits [31:0] are architecturally mapped to AArch64 System register ID_PFR1_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID_PFR1 are UNDEFINED.

**Attributes**

ID_PFR1 is a 32-bit register.

**Field descriptions**

The ID_PFR1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| GIC | Virt_frac | Sec_frac | GenTimer | Virtualization | MProgMod | Security | ProgMod |

**GIC, bits [31:28]**

System register GIC CPU interface. Defined values are:

<table>
<thead>
<tr>
<th>GIC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00000</td>
<td>GIC CPU interface system registers not implemented.</td>
</tr>
<tr>
<td>0b00001</td>
<td>System register interface to versions 3.0 and 4.0 of the GIC</td>
</tr>
<tr>
<td></td>
<td>CPU interface is supported.</td>
</tr>
<tr>
<td>0b0011</td>
<td>System register interface to version 4.1 of the GIC CPU</td>
</tr>
<tr>
<td></td>
<td>interface is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Virt_frac, bits [27:24]**

Virtualization fractional field. When the Virtualization field is 0b0000, determines the support for features from the ARMv7 Virtualization Extensions. Defined values are:
### Virt_frac, bits [0:0]

<table>
<thead>
<tr>
<th>Virt_frac</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No features from the ARMv7 Virtualization Extensions are implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The following features of the ARMv7 Virtualization Extensions are implemented:</td>
</tr>
<tr>
<td></td>
<td>• The <code>SCR</code>.SIF bit, if EL3 is implemented.</td>
</tr>
<tr>
<td></td>
<td>• The modifications to the <code>SCR</code>.AW and <code>SCR</code>.FW bits described in the Virtualization Extensions, if EL3 is implemented.</td>
</tr>
<tr>
<td></td>
<td>• The MSR (banked register) and MRS (banked register) instructions.</td>
</tr>
<tr>
<td></td>
<td>• The ERET instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL2 is implemented.
- 0b0001 when EL2 is not implemented.

This field is only valid when the value of ID_PFR1.Virtualization is 0, otherwise it holds the value 0b0000.

**Note**

The ID_ISAR registers do not identify whether the instructions added by the ARMv7 Virtualization Extensions are implemented.

### Sec_frac, bits [23:20]

Security fractional field. When the Security field is 0b0000, determines the support for features from the ARMv7 Security Extensions. Defined values are:

<table>
<thead>
<tr>
<th>Sec_frac</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No features from the ARMv7 Security Extensions are implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The following features from the ARMv7 Security Extensions are implemented:</td>
</tr>
<tr>
<td></td>
<td>• The VBAR register.</td>
</tr>
<tr>
<td></td>
<td>• The <code>TTBCR</code>.PD0 and <code>TTBCR</code>.PD1 bits.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, plus the ability to access Secure or Non-secure physical memory is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL3 is implemented.
- 0b0001 or 0b0010 when EL3 is not implemented.

This field is only valid when the value of ID_PFR1.Security is 0, otherwise it holds the value 0b0000.

### GenTimer, bits [19:16]

Generic Timer support. Defined values are:

<table>
<thead>
<tr>
<th>GenTimer</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Generic Timer is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Generic Timer is implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Generic Timer is implemented, and also includes support for <code>CNTHCTL</code>.EVNTIS and <code>CNTKCTL</code>.EVNTIS fields, and <code>CNTPCTSS</code> and <code>CNTVCTSS</code> counter views.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_ECV implements the functionality identified by the value 0b0010.

In Armv8.0 to Armv8.4, the only permitted value is 0b0001.
From Armv8.6, the only permitted value is \texttt{0b0010}.

**Virtualization, bits [15:12]**

Virtualization support. Defined values are:

<table>
<thead>
<tr>
<th>Virtualization</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0000}</td>
<td>EL2, Hyp mode, and the HVC instruction not implemented.</td>
</tr>
<tr>
<td>\texttt{0b0001}</td>
<td>EL2, Hyp mode, the HVC instruction, and all the features described by Virt_frac == \texttt{0b0001} implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are:

- \texttt{0b0000} when EL2 is not implemented.
- \texttt{0b0001} when EL2 is implemented.

In an implementation that includes EL2, if EL2 cannot use AArch32 but EL1 can use AArch32 then this field has the value \texttt{0b0001}.

**Note**

The ID\_ISARs do not identify whether the HVC instruction is implemented.

**MProgMod, bits [11:8]**

M profile programmers' model support. Defined values are:

<table>
<thead>
<tr>
<th>MProgMod</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0000}</td>
<td>Not supported.</td>
</tr>
<tr>
<td>\texttt{0b0010}</td>
<td>Support for two-stack programmers' model.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is \texttt{0b0000}.

**Security, bits [7:4]**

Security support. Defined values are:

<table>
<thead>
<tr>
<th>Security</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0000}</td>
<td>EL3, Monitor mode, and the SMC instruction not implemented.</td>
</tr>
<tr>
<td>\texttt{0b0001}</td>
<td>EL3, Monitor mode, the SMC instruction, and all the features described by Sec_frac == \texttt{0b0001} implemented.</td>
</tr>
<tr>
<td>\texttt{0b0010}</td>
<td>As for \texttt{0b0001}, and adds the ability to set the NSACR_RFR bit. Not permitted in Armv8 as the NSACR_RFR bit is RES0.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are:

- \texttt{0b0000} when EL3 is not implemented.
- \texttt{0b0001} when EL3 is implemented.

In an implementation that includes EL3, if EL3 cannot use AArch32 but EL1 can use AArch32 then this field has the value \texttt{0b0001}.

**ProgMod, bits [3:0]**

Support for the standard programmers' model for ARMv4 and later. Model must support User, FIQ, IRQ, Supervisor, Abort, Undefined, and System modes. Defined values are:
### ID_PFR1, Processor Feature Register 1

<table>
<thead>
<tr>
<th>ProgMod</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**Accessing the ID_PFR1**

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>}\ <\text{coproc}>, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#\}<\text{opc2}>\

  else
    return ID_PFR1;
  endif
elsif PSTATE.EL == EL2 then
  return ID_PFR1;
elsif PSTATE.EL == EL3 then
  return ID_PFR1;
ID_PFR2, Processor Feature Register 2

The ID_PFR2 characteristics are:

**Purpose**

Gives information about the AArch32 programmers' model.

Must be interpreted with ID_PFR0 and ID_PFR1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch32 System register ID_PFR2 bits [31:0] are architecturally mapped to AArch64 System register ID_PFR2_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID_PFR2 are UNDEFINED.

**Attributes**

ID_PFR2 is a 32-bit register.

**Field descriptions**

The ID_PFR2 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [31:12]**

Reserved, RES0.

**RAS_frac, bits [11:8]**

RAS Extension fractional field.

<table>
<thead>
<tr>
<th>RAS_frac</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>If ID_PFR0.RAS == 0b0001, RAS Extension implemented. If ID_PFR0.RAS == 0b0001, as 0b0000 and adds support for additional ERXMISC&lt;m&gt; System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR&lt;n&gt;STATUS and support for the optional RAS Timestamp Extension.</td>
</tr>
<tr>
<td>0b0001</td>
<td>All other values are reserved.</td>
</tr>
</tbody>
</table>

This field is valid only if ID_PFR0.RAS == 0b0001.

**SSBS, bits [7:4]**

Speculative Store Bypassing controls in AArch64 state. Defined values are:
SSBS | Meaning
---|---
0b0000 | AArch32 provides no mechanism to control the use of Speculative Store Bypassing.
0b0001 | AArch32 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

All other values are reserved.

CSV3, bits [3:0]

Speculative use of faulting data. Defined values are:

<table>
<thead>
<tr>
<th>CSV3</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0000 | This Device does not disclose whether data loaded under speculation with a permission or domain fault can be used to form an address or generate condition codes or SVE predicate values to be used by instructions newer than the load in the speculative sequence.
| 0b0001 | Data loaded under speculation with a permission or domain fault cannot be used to form an address or generate condition codes or SVE predicate values to be used by instructions newer than the load in the speculative sequence.

All other values are reserved.

FEAT_CSV3 implements the functionality identified by the value 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If FEAT_E0PD is implemented, FEAT_CSV3 must be implemented.

Accessing the ID_PFR2

IFAR, Instruction Fault Address Register

The IFAR characteristics are:

**Purpose**

Holds the virtual address of the faulting address that caused a synchronous Prefetch Abort exception.

**Configuration**

AArch32 System register IFAR bits [31:0] are architecturally mapped to AArch64 System register `FAR_EL1[63:32]`.

AArch32 System register IFAR bits [31:0] (S) are architecturally mapped to AArch32 System register `HIFAR[31:0]` when EL2 is implemented, EL3 is implemented and the highest implemented Exception level is using AArch32 state.

AArch32 System register IFAR bits [31:0] (S) are architecturally mapped to AArch64 System register `FAR_EL2[63:32]` when EL2 is implemented.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to IFAR are UNDEFINED.

**Attributes**

IFAR is a 32-bit register.

**Field descriptions**

The IFAR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>VA of faulting address of synchronous Prefetch Abort exception</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

VA of faulting address of synchronous Prefetch Abort exception.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the IFAR**

Accesses to this register use the following encodings:

IFSР, Instruction Fault Status Register

The IFSР characteristics are:

**Purpose**

Holds status information about the last instruction fault.

**Configuration**

AArch32 System register IFSР [31:0] are architecturally mapped to AArch64 System register IFSР_32_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to IFSР are UNDEFINED.

The current translation table format determines which format of the register is used.

**Attributes**

IFSР is a 32-bit register.

**Field descriptions**

The IFSР bit assignments are:

**When TTBCR.EAE == 0:**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | Res0 | FnV | RES0 | ExT | RES0 | FS[4] | LPAE | RES0 | FS[3:0] |

**Bits [31:17]**

Reserved, RES0.

**FnV, bit [16]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<table>
<thead>
<tr>
<th>FnV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IFAR is valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>IFAR is not valid, and holds an UNKNOWN value.</td>
</tr>
</tbody>
</table>

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [15:13]**

Reserved, RES0.

**ExT, bit [12]**

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.
For aborts other than External aborts this bit always returns 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [11]**

Reserved, RES0.

**FS, bits [10, 3:0]**

<table>
<thead>
<tr>

<td>When FEAT_RAS is not implemented</td>
</tr>
</tbody>
</table>

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Short-descriptor translation table lookup'.

The FS field is split as follows:

- FS[4] is IFSR[10].
- FS[3:0] is IFSR[3:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**LPAE, bit [9]**

On taking a Data Abort exception, this bit is set as follows:

<table>
<thead>
<tr>
<th>LPAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Using the Short-descriptor translation table formats.</td>
</tr>
<tr>
<td>0b1</td>
<td>Using the Long-descriptor translation table formats.</td>
</tr>
</tbody>
</table>

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Bits [8:4]

Reserved, RES0.

When TTBCR.EAE == 1:

ISR, Interrupt Status Register

The ISR characteristics are:

**Purpose**

Shows the pending status of the IRQ, FIQ, or SError.

When executing at EL2, EL3, or Secure EL1, when \( \text{SCR}_\text{EL3}.\text{EEL2} == 0b0 \), this shows the pending status of the physical interrupts.

When executing at Non-secure EL1, or at Secure EL1, when \( \text{SCR}_\text{EL3}.\text{EEL2} == 0b01 \):

- If the \( \text{HCR}.\{\text{IMO,FMO,AMO}\} \) bit has a value of 1, the corresponding ISR.\{I,F,A\} bit shows the pending status of the virtual IRQ, FIQ, or SError.
- If the \( \text{HCR}.\{\text{IMO,FMO,AMO}\} \) bit has a value of 0, the corresponding ISR.\{I,F,A\} bit shows the pending status of the physical IRQ, FIQ, or SError.

**Configuration**

AArch32 System register ISR bits [31:0] are architecturally mapped to AArch64 System register ISR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ISR are UNDEFINED.

**Attributes**

ISR is a 32-bit register.

**Field descriptions**

The ISR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>

  if EL2Enabled() & ELUsingAArch32(EL2) & HSTR_EL2.T12 == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
  elsif EL2Enabled() & ELUsingAArch32(EL2) & HSTR.T12 == '1' then
    AArch32.TakeHypTrapException(0x03);
  else
    return ISR;
elsif PSTATE.EL == EL2 then
  return ISR;
elsif PSTATE.EL == EL3 then
  return ISR;
The ITLBIALL characteristics are:

**Purpose**

Invalidate all cached copies of translation table entries from instruction TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
  - Would be required for the EL1&0 translation regime.
  - Match the current VMID, if EL2 is implemented and enabled in the current Security state.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at EL2, and if EL2 is enabled in the current Security state, the stage 1 or stage 2 translation table entries that would be required for the Non-secure PL1&0 translation regime and matches the current VMID.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ITLBIALL are **UNDEFINED**.

**Attributes**

ITLBIALL is a 32-bit System instruction.

**Field descriptions**

This instruction has no applicable fields.

The value in the register specified by `<Rt>` is ignored.

**Executing the ITLBIALL instruction**

Accesses to this instruction use the following encodings:

\[
\text{MCR}\{<c>\}{<q>} \text{ <coproc>, \{#}<opc1>, <Rt>, <CRn>, <CRm>{, \{#}<opc2>}}
\]

ITLBIASID, Instruction TLB Invalidate by ASID match

The ITLBIASID characteristics are:

**Purpose**

Invalidate all cached copies of translation table entries from instruction TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ITLBIASID are UNDEFINED.

**Attributes**

ITLBIASID is a 32-bit System instruction.

**Field descriptions**

The ITLBIASID input value bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

    end if;
elsif PSTATE.EL == EL2 then
    ITLBIASID(R[t]);
elsif PSTATE.EL == EL3 then
    ITLBIASID(R[t]);
ITLBIMVA, Instruction TLB Invalidate by VA

The ITLBIMVA characteristics are:

**Purpose**

Invalidate all cached copies of translation table entries from instruction TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ITLBIMVA are **UNDEFINED**.

**Attributes**

ITLBIMVA is a 32-bit System instruction.

**Field descriptions**

The ITLBIMVA input value bit assignments are:

<table>

elsif PSTATE.EL == EL2 then
  // no operation
elsif PSTATE.EL == EL3 then
  // no operation
MAIR0, Memory Attribute Indirection Register 0

The MAIR0 characteristics are:

Purpose

Along with MAIR1, provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations.

AttrIndx[2] indicates the MAIR register to be used:

- When AttrIndx[2] is 0, MAIR0 is used.
- When AttrIndx[2] is 1, MAIR1 is used.

Configuration

AArch32 System register MAIR0 bits [31:0] are architecturally mapped to AArch64 System register MAIR_EL1[31:0] when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register MAIR0 bits [31:0] are architecturally mapped to AArch32 System register PRRR[31:0] when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register MAIR0 bits [31:0] (MAIR0_NS) are architecturally mapped to AArch32 System register PRRR[31:0] (PRRR_NS) when EL3 is using AArch32.

AArch32 System register MAIR0 bits [31:0] (MAIR0_S) are architecturally mapped to AArch32 System register PRRR[31:0] (PRRR_S) when EL3 is using AArch32.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to MAIR0 are UNDEFINED.

MAIR0 and PRRR are the same register, with a different view depending on the value of TTBCR.EAE:

- When it is set to 0, the register is as described in PRRR.
- When it is set to 1, the register is as described in MAIR0.

When EL3 is using AArch32, write access to MAIR0(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

Attributes

MAIR0 is a 32-bit register.

Field descriptions

The MAIR0 bit assignments are:

When TTBCR.EAE == 1:

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |
|------------------------------------------|------------------------------------------|------------------------------------------|
| Attr3 | Attr2 | Attr1 | Attr0 |

Attr<n>, bits [8n+7:8n], for n = 3 to 0

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIndx[2:0] gives the value of <n> in Attr<n>.
- AttrIndx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:
### Attr<n>[7:4] Meaning

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Device memory. See encoding of Attr&lt;n&gt;[3:0] for the type of Device memory.</td>
</tr>
<tr>
<td>0b00RW, RW</td>
<td>Normal memory, Outer Write-Through Transient.</td>
</tr>
<tr>
<td>not0b00</td>
<td></td>
</tr>
<tr>
<td>0b0100</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01RW, RW</td>
<td>Normal memory, Outer Write-Back Transient.</td>
</tr>
<tr>
<td>not0b00</td>
<td></td>
</tr>
<tr>
<td>0b10RW</td>
<td>Normal memory, Outer Write-Through Non-transient.</td>
</tr>
<tr>
<td>0b11RW</td>
<td>Normal memory, Outer Write-Back Non-transient.</td>
</tr>
</tbody>
</table>

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

<table>
<thead>
<tr>
<th>Attr&lt;n&gt;[3:0]</th>
<th>Meaning when Attr&lt;n&gt;[7:4] is 0b0000</th>
<th>Meaning when Attr&lt;n&gt;[7:4] is not0b0000</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Device-nGnRnE memory</td>
<td>UNPREDICTABLE</td>
</tr>
<tr>
<td>0b00RW, RW</td>
<td>UNPREDICTABLE</td>
<td>Normal memory, Inner Write-Through Transient</td>
</tr>
<tr>
<td>not0b00</td>
<td>Device-nGnRE memory</td>
<td>Normal memory, Inner Non-cacheable</td>
</tr>
<tr>
<td>0b01RW, RW</td>
<td>UNPREDICTABLE</td>
<td>Normal memory, Inner Write-Back Transient</td>
</tr>
<tr>
<td>not0b00</td>
<td>Device-GRE memory</td>
<td>Normal memory, Inner Write-Through Non-transient (RW=0b00)</td>
</tr>
<tr>
<td>0b10RW, RW</td>
<td>UNPREDICTABLE</td>
<td>Normal memory, Inner Write-Back Non-transient (RW=0b00)</td>
</tr>
<tr>
<td>not0b00</td>
<td>Device-GRnRnE memory</td>
<td>Normal memory, Inner Write-Through Non-transient (RW=0b00)</td>
</tr>
<tr>
<td>0b11RW, RW</td>
<td>UNPREDICTABLE</td>
<td>Normal memory, Inner Write-Back Non-transient</td>
</tr>
<tr>
<td>not0b00</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

<table>
<thead>
<tr>
<th>R or W</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No Allocate</td>
</tr>
<tr>
<td>0b1</td>
<td>Allocate</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Accessing the MAIR0

Accesses to this register use the following encodings:

\[
\text{MRC}\{\langle c\rangle\{\langle q\rangle\ \langle\text{coproc}\rangle, \{\#\langle\text{opc1}\rangle, \langle\text{Rt}\rangle, \langle\text{CRn}\rangle, \langle\text{CRm}\rangle, \{\#\langle\text{opc2}\rangle\}}
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>

MAIR1, Memory Attribute Indirection Register 1

The MAIR1 characteristics are:

**Purpose**

Along with MAIR0, provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations.

AttrIndx[2] indicates the MAIR register to be used:

- When AttrIndx[2] is 0, MAIR0 is used.
- When AttrIndx[2] is 1, MAIR1 is used.

**Configuration**

AArch32 System register MAIR1 bits [31:0] are architecturally mapped to AArch64 System register MAIR_EL1[63:32] when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register MAIR1 bits [31:0] are architecturally mapped to AArch32 System register NMRR[31:0] when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register MAIR1 bits [31:0] (MAIR1_NS) are architecturally mapped to AArch32 System register NMRR[31:0] (NMRR_NS) when EL3 is using AArch32.

AARc32 System register MAIR1 bits [31:0] (MAIR1_S) are architecturally mapped to AArch32 System register NMRR[31:0] (NMRR_S) when EL3 is using AArch32.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to MAIR1 are UNDEFINED.

MAIR1 and NMRR are the same register, with a different view depending on the value of TTBCR.EAE:

- When it is set to 0, the register is as described in NMRR.
- When it is set to 1, the register is as described in MAIR1.

When EL3 is using AArch32, write access to MAIR1(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

**Attributes**

MAIR1 is a 32-bit register.

**Field descriptions**

The MAIR1 bit assignments are:

When TTBCR.EAE == 1:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Attr7</th>
<th>Attr6</th>
<th>Attr5</th>
<th>Attr4</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>30</td>
<td>29</td>
<td>28</td>
<td>27</td>
</tr>
<tr>
<td>26</td>
<td>25</td>
<td>24</td>
<td>23</td>
<td>22</td>
</tr>
<tr>
<td>21</td>
<td>20</td>
<td>19</td>
<td>18</td>
<td>17</td>
</tr>
<tr>
<td>16</td>
<td>15</td>
<td>14</td>
<td>13</td>
<td>12</td>
</tr>
<tr>
<td>11</td>
<td>10</td>
<td>9</td>
<td>8</td>
<td>7</td>
</tr>
<tr>
<td>6</td>
<td>5</td>
<td>4</td>
<td>3</td>
<td>2</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Attr<n>, bits [8(n-4)+7:8(n-4)], for n = 7 to 4

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIndx[2:0] gives the value of <n> in Attr<n>.
- AttrIndx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:
<table>
<thead>
<tr>
<th>Attr&lt;\text{n}&gt;[7:4]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Device memory. See encoding of Attr&lt;\text{n}&gt;[3:0] for the type of Device memory.</td>
</tr>
<tr>
<td>0b00RW, RW</td>
<td>Normal memory, Outer Write-Through Transient.</td>
</tr>
<tr>
<td>not0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01RW, RW</td>
<td>Normal memory, Outer Write-Back Transient.</td>
</tr>
<tr>
<td>not0b00</td>
<td>Normal memory, Outer Write-Through Non-transient.</td>
</tr>
<tr>
<td>0b10RW</td>
<td>Normal memory, Outer Write-Back Non-transient.</td>
</tr>
</tbody>
</table>

\textbf{R} = Outer Read-Allocate policy, \textbf{W} = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

<table>
<thead>
<tr>
<th>Attr&lt;\text{n}&gt;[3:0]</th>
<th>Meaning when Attr&lt;\text{n}&gt;[7:4] is 0b0000</th>
<th>Meaning when Attr&lt;\text{n}&gt;[7:4] is not0b0000</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Device-nGnRnE memory</td>
<td>UNPREDICTABLE</td>
</tr>
<tr>
<td>0b00RW, RW</td>
<td>UNPREDICTABLE</td>
<td>Normal memory, Inner Write-Through Transient</td>
</tr>
<tr>
<td>not0b00</td>
<td>Normal memory, Inner Non-cacheable</td>
<td></td>
</tr>
<tr>
<td>0b01RW, RW</td>
<td>UNPREDICTABLE</td>
<td>Normal memory, Inner Write-Back Transient (RW=0b00)</td>
</tr>
<tr>
<td>not0b00</td>
<td>Normal memory, Inner Write-Through Non-transient (RW=0b00)</td>
<td></td>
</tr>
<tr>
<td>0b10RW</td>
<td>Device-GRE memory</td>
<td>Normal memory, Inner Write-Back Non-transient</td>
</tr>
<tr>
<td>not0b00</td>
<td>Normal memory, Inner Write-Back Non-transient</td>
<td></td>
</tr>
</tbody>
</table>

\textbf{R} = Inner Read-Allocate policy, \textbf{W} = Inner Write-Allocate policy.

The \textbf{R} and \textbf{W} bits in some Attr<\text{n}> fields have the following meanings:

<table>
<thead>
<tr>
<th>\textbf{R or W}</th>
<th>\textbf{Meaning}</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No Allocate</td>
</tr>
<tr>
<td>0b1</td>
<td>Allocate</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally \textbf{UNKNOWN} value.

**Accessing the MAIR1**

Accesses to this register use the following encodings:

\[ \text{MRC}\{<c>\}{<q>} \ <\text{coproc}> , \{#\}<\text{opc1}>, \ <\text{Rt}> , \ <\text{CRn}> , \ <\text{CRm}>, \{#\}<\text{opc2}> \]

<table>
<thead>
<tr>
<th>\textbf{coproc}</th>
<th>\textbf{opc1}</th>
<th>\textbf{CRn}</th>
<th>\textbf{CRm}</th>
<th>\textbf{opc2}</th>
</tr>
</thead>

### MIDR, Main ID Register

The MIDR characteristics are:

#### Purpose

Provides identification information for the PE, including an implementer code for the device and a device ID number.

#### Configuration

AArch32 System register MIDR bits [31:0] are architecturally mapped to AArch64 System register `MIDR_EL1[31:0]`.

AArch32 System register MIDR bits [31:0] are architecturally mapped to External register `MIDR_EL1[31:0]`.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to MIDR are UNDEFINED.

Some fields of the MIDR are IMPLEMENTATION DEFINED. For details of the values of these fields for a particular Armv8 implementation, and any implementation-specific significance of these values, see the product documentation.

#### Attributes

MIDR is a 32-bit register.

#### Field descriptions

The MIDR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Implementer | Variant | Architecture | PartNum | Revision |

**Implementer, bits [31:24]**

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

<table>
<thead>
<tr>
<th>Hex representation</th>
<th>Implementer</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x00</td>
<td>Reserved for software use</td>
</tr>
<tr>
<td>0x01</td>
<td>Ampere Computing</td>
</tr>
<tr>
<td>0x41</td>
<td>Arm Limited</td>
</tr>
<tr>
<td>0x42</td>
<td>Broadcom Corporation</td>
</tr>
<tr>
<td>0x43</td>
<td>Cavium Inc.</td>
</tr>
<tr>
<td>0x44</td>
<td>Digital Equipment Corporation</td>
</tr>
<tr>
<td>0x46</td>
<td>Fujitsu Ltd.</td>
</tr>
<tr>
<td>0x49</td>
<td>Infineon Technologies AG</td>
</tr>
<tr>
<td>0x4A</td>
<td>Motorola or Freescale Semiconductor Inc.</td>
</tr>
<tr>
<td>0x4E</td>
<td>NVIDIA Corporation</td>
</tr>
<tr>
<td>0x50</td>
<td>Applied Micro Circuits Corporation</td>
</tr>
<tr>
<td>0x51</td>
<td>Qualcomm Inc.</td>
</tr>
<tr>
<td>0x56</td>
<td>Marvell International Ltd.</td>
</tr>
<tr>
<td>0x69</td>
<td>Intel Corporation</td>
</tr>
</tbody>
</table>

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

**Variant, bits [23:20]**

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.
Architecture, bits [19:16]

Architecture version. Defined values are:

<table>
<thead>
<tr>
<th>Architecture</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>Armv4.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Armv4T.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Armv5 (obsolete).</td>
</tr>
<tr>
<td>0b0100</td>
<td>Armv5I.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Armv5TE.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Armv5TEJ.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Armv6.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Architectural features are individually identified in the ID * registers, see 'ID registers'.</td>
</tr>
</tbody>
</table>

All other values are reserved.

PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.

Accessing the MIDR

Accesses to this register use the following encodings:

\[
\text{MRC\{<c>\}{<q>} <coproc>, \{#<opc1>, <Rt>, <CRn>, <CRm>{, \{#<opc2>}}
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b0000</td>
<td>0b0000</td>
<td>0b000</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() &amp; !ELUsingAArch32(EL2) &amp; HSTR_EL2.T0 == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
  elsif EL2Enabled() &amp; ELUsingAArch32(EL2) &amp; HSTR.T0 == '1' then
    AArch32.TakeHypTrapException(0x03);
  elsif EL2Enabled() &amp; !ELUsingAArch32(EL2) then
    return VPIDR_EL2<31:0>;
  elsif EL2Enabled() &amp; ELUsingAArch32(EL2) then
    return VPIDR;
  else
    return MIDR;
elsif PSTATE.EL == EL2 then
  return MIDR;
elsif PSTATE.EL == EL3 then
  return MIDR;
The MPIDR characteristics are:

**Purpose**

In a multiprocessor system, provides an additional PE identification mechanism for scheduling purposes.

**Configuration**

AArch32 System register MPIDR bits [31:0] are architecturally mapped to AArch64 System register MPIDR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to MPIDR are UNDEFINED.

In a uniprocessor system Arm recommends that each Aff<n> field of this register returns a value of 0.

**Attributes**

MPIDR is a 32-bit register.

**Field descriptions**

The MPIDR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**M, bit [31]**

Indicates whether this implementation includes the functionality introduced by the ARMv7 Multiprocessing Extensions. The possible values of this bit are:

<table>
<thead>
<tr>
<th>M</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This implementation does not include the ARMv7 Multiprocessing</td>
</tr>
<tr>
<td></td>
<td>Extensions functionality.</td>
</tr>
<tr>
<td>0b1</td>
<td>This implementation includes the ARMv7 Multiprocessing</td>
</tr>
<tr>
<td></td>
<td>Extensions functionality.</td>
</tr>
</tbody>
</table>

From Armv8, this bit is RAO.

**U, bit [30]**

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. The possible values of this bit are:

<table>
<thead>
<tr>
<th>U</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Processor is part of a multiprocessor system.</td>
</tr>
<tr>
<td>0b1</td>
<td>Processor is part of a uniprocessor system.</td>
</tr>
</tbody>
</table>

**Bits [29:25]**

Reserved, RES0.
MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of Aff0 for more information about affinity levels. The possible values of this bit are:

<table>
<thead>
<tr>
<th>MT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Performance of PEs at the lowest affinity level, or PEs with MPIDR.MT set to 1, different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent.</td>
</tr>
<tr>
<td>0b1</td>
<td>Performance of PEs at the lowest affinity level, or PEs with MPIDR.MT set to 1, different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.</td>
</tr>
</tbody>
</table>

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

Aff0, bits [7:0]

Affinity level 0. This is the affinity level that is most significant for determining PE behavior. Higher affinity levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

Accessing the MPIDR

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}\{<q>\} \text{ <coproc>, } \{#<opc1>, <Rt>, <CRn>, <CRm}\{, \{#<opc2>\}\}
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b000</td>
<td>0b000</td>
<td>0b101</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then

elsif PSTATE.EL == EL3 then
  return MPIDR;
The MVBAR characteristics are:

**Purpose**

When EL3 is implemented and can use AArch32, holds the vector base address for any exception that is taken to Monitor mode.

Secure software must program the MVBAR with the required initial value as part of the PE boot sequence.

**Configuration**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to MVBAR are UNDEFINED.

It is IMPLEMENTATION DEFINED whether MVBAR[0] has a fixed value and ignored writes, or takes the last value written to it.

On a reset into EL3 using AArch32, the reset value of MVBAR is an IMPLEMENTATION DEFINED choice between the following:

- MVBAR[31:5] = an IMPLEMENTATION DEFINED value, which might be UNKNOWN, MVBAR[4:1] = RES0, and MVBAR[0] = 0.
- MVBAR[31:1] = an IMPLEMENTATION DEFINED value that is bits[31:1] of the AArch32 reset address, and MVBAR[0] = 1.

**Attributes**

MVBAR is a 32-bit register.

**Field descriptions**

The MVBAR bit assignments are:

**When programmed with a vector base address:**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-5</td>
<td>Vector Base Address</td>
</tr>
<tr>
<td>4-0</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

**Bits [31:5]**

Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset.

**Reserved, bits [4:0]**

Reserved, see Configurations.

**Accessing the MVBAR**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>

The MVFR0 characteristics are:

**Purpose**

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with MVFR1 and MVFR2.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch32 System register MVFR0 bits [31:0] are architecturally mapped to AArch64 System register MVFR0_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to MVFR0 are UNDEFINED.

Implemented only if the implementation includes Advanced SIMD and floating-point instructions.

**Attributes**

MVFR0 is a 32-bit register.

**Field descriptions**

The MVFR0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| FPRound | FPShVec | FPSqrt | FPDivide | FPTrap | FPDP | FPSP | SIMDReg |

**FPRound, bits [31:28]**

Floating-Point Rounding modes. Indicates whether the floating-point implementation provides support for rounding modes. Defined values are:

<table>
<thead>
<tr>
<th>FPRound</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented, or only Round to Nearest mode supported, except that Round towards Zero mode is supported for VCVT instructions that always use that rounding mode regardless of the FPSCR setting.</td>
</tr>
<tr>
<td>0b0001</td>
<td>All rounding modes supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

**FPShVec, bits [27:24]**

Short Vectors. Indicates whether the floating-point implementation provides support for the use of short vectors. Defined values are:

<table>
<thead>
<tr>
<th>FPShVec</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Short vectors not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Short vector operation supported.</td>
</tr>
</tbody>
</table>
All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**FPSqrt, bits [23:20]**

Square Root. Indicates whether the floating-point implementation provides support for the ARMv6 VFP square root operations. Defined values are:

<table>
<thead>
<tr>
<th>FPSqrt</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported in hardware.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

The VSQRT.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VSQRT.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

**FPDivide, bits [19:16]**

Indicates whether the floating-point implementation provides support for VFP divide operations. Defined values are:

<table>
<thead>
<tr>
<th>FPDivide</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported in hardware.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

The VDIV.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VDIV.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

**FPTrap, bits [15:12]**

Floating Point Exception Trapping. Indicates whether the floating-point implementation provides support for exception trapping. Defined values are:

<table>
<thead>
<tr>
<th>FPTrap</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

A value of 0b0001 indicates that, when the corresponding trap is enabled, a floating-point exception generates an exception.

**FPDP, bits [11:8]**

Double Precision. Indicates whether the floating-point implementation provides support for double-precision operations. Defined values are:

<table>
<thead>
<tr>
<th>FPDP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported in hardware.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported, VFPv2.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Supported, VFPv3, VFPv4, or Armv8. VFPv3 and Armv8 add an instruction to load a double-precision floating-point constant, and conversions between double-precision and fixed-point values.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0010.
A value of \texttt{0b0001} or \texttt{0b0010} indicates support for all VFP double-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- \texttt{VSQR.F64} is only available if the Square root field is \texttt{0b0001}.
- \texttt{VDIV.F64} is only available if the Divide field is \texttt{0b0001}.
- Conversion between double-precision and single-precision is only available if the single-precision field is nonzero.

### FPSP, bits [7:4]

Single Precision. Indicates whether the floating-point implementation provides support for single-precision operations. Defined values are:

<table>
<thead>
<tr>
<th>FPSP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0000}</td>
<td>Not supported in hardware.</td>
</tr>
<tr>
<td>\texttt{0b0001}</td>
<td>Supported, VFPv2.</td>
</tr>
<tr>
<td>\texttt{0b0010}</td>
<td>Supported, VFPv3 or VFPv4. VFPv3 adds an instruction to load a single-precision floating-point constant, and conversions between single-precision and fixed-point values.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are \texttt{0b0000} and \texttt{0b0010}.

A value of \texttt{0b0001} or \texttt{0b0010} indicates support for all VFP single-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- \texttt{VSQR.F32} is only available if the Square root field is \texttt{0b0001}.
- \texttt{VDIV.F32} is only available if the Divide field is \texttt{0b0001}.
- Conversion between double-precision and single-precision is only available if the double-precision field is nonzero.

### SIMDReg, bits [3:0]

Advanced SIMD registers. Indicates whether the Advanced SIMD and floating-point implementation provides support for the Advanced SIMD and floating-point register bank. Defined values are:

<table>
<thead>
<tr>
<th>SIMDReg</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0000}</td>
<td>The implementation has no Advanced SIMD and floating-point support.</td>
</tr>
<tr>
<td>\texttt{0b0001}</td>
<td>The implementation includes floating-point support with 16 x 64-bit registers.</td>
</tr>
<tr>
<td>\texttt{0b0010}</td>
<td>The implementation includes Advanced SIMD and floating-point support with 32 x 64-bit registers.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are \texttt{0b0000} and \texttt{0b0010}.

### Accessing the MVFR0

Accesses to this register use the following encodings:

\[ \text{VMRS}\{<c>\}{<q>} \{Rt\}, \{spec\_reg\} \]

<table>
<thead>
<tr>
<th>reg</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0111}</td>
</tr>
</tbody>
</table>

Copyright © 2010-2020 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.
The MVFR1 characteristics are:

**Purpose**

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with MVFR0 and MVFR2.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch32 System register MVFR1 bits [31:0] are architecturally mapped to AArch64 System register MVFR1_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to MVFR1 are UNDEFINED.

Implemented only if the implementation includes Advanced SIMD and floating-point instructions.

**Attributes**

MVFR1 is a 32-bit register.

**Field descriptions**

The MVFR1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| SIMDFMAC | FPHP | SIMDHP | SIMDSP | SIMDInt | SIMDLS | FPDNaN | FPfTZ |

**SIMDFMAC, bits [31:28]**

Advanced SIMD Fused Multiply-Accumulate. Indicates whether the Advanced SIMD implementation provides fused multiply accumulate instructions. Defined values are:

<table>
<thead>
<tr>
<th>SIMDFMAC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

The Advanced SIMD and floating-point implementations must provide the same level of support for these instructions.

**FPHP, bits [27:24]**

Floating Point Half Precision. Indicates the level of half-precision floating-point support. Defined values are:
### FPHP

<table>
<thead>
<tr>
<th>FPHP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Floating-point half-precision conversion instructions are supported for conversion between single-precision and half-precision.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds instructions for conversion between double-precision and half-precision.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0010, and adds support for half-precision floating-point arithmetic.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 in an implementation without floating-point support.
- 0b0010 in an implementation with floating-point support that does not include the FEAT_FP16 extension.
- 0b0011 in an implementation with floating-point support that includes the FEAT_FP16 extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the SIMDHP field, meaning the permitted values are:

<table>
<thead>
<tr>
<th>Half Precision instructions supported</th>
<th>FPHP</th>
<th>SIMDHP</th>
</tr>
</thead>
<tbody>
<tr>
<td>No support</td>
<td>0b0000</td>
<td>0b0000</td>
</tr>
<tr>
<td>Conversions only</td>
<td>0b0010</td>
<td>0b0001</td>
</tr>
<tr>
<td>Conversions and arithmetic</td>
<td>0b0011</td>
<td>0b0010</td>
</tr>
</tbody>
</table>

### SIMDHP, bits [23:20]

Advanced SIMD Half Precision. Indicates the level of half-precision floating-point support. Defined values are:

<table>
<thead>
<tr>
<th>SIMDHP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SIMD half-precision conversion instructions are supported for conversion between single-precision and half-precision.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds support for half-precision floating-point arithmetic.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 in an implementation without SIMD floating-point support.
- 0b0010 in an implementation with SIMD floating-point support that does not include the FEAT_FP16 extension.
- 0b0011 in an implementation with SIMD floating-point support that includes the FEAT_FP16 extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the FPHP field, meaning the permitted values are:

<table>
<thead>
<tr>
<th>Half Precision instructions supported</th>
<th>FPHP</th>
<th>SIMDHP</th>
</tr>
</thead>
<tbody>
<tr>
<td>No support</td>
<td>0b0000</td>
<td>0b0000</td>
</tr>
<tr>
<td>Conversions only</td>
<td>0b0010</td>
<td>0b0001</td>
</tr>
<tr>
<td>Conversions and arithmetic</td>
<td>0b0011</td>
<td>0b0010</td>
</tr>
</tbody>
</table>

### SIMDSP, bits [19:16]

Advanced SIMD Single Precision. Indicates whether the Advanced SIMD and floating-point implementation provides single-precision floating-point instructions. Defined values are:

<table>
<thead>
<tr>
<th>SIMDSP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Implemented. This value is permitted only if the SIMDInt field is 0b0001.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.
**SIMDInt, bits [15:12]**

Advanced SIMD Integer. Indicates whether the Advanced SIMD and floating-point implementation provides integer instructions. Defined values are:

<table>
<thead>
<tr>
<th>SIMDInt</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

**SIMDLS, bits [11:8]**

Advanced SIMD Load/Store. Indicates whether the Advanced SIMD and floating-point implementation provides load/store instructions. Defined values are:

<table>
<thead>
<tr>
<th>SIMDLS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

**FPDNaN, bits [7:4]**

Default NaN mode. Indicates whether the floating-point implementation provides support only for the Default NaN mode. Defined values are:

<table>
<thead>
<tr>
<th>FPDNaN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented, or hardware supports only the Default NaN mode.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Hardware supports propagation of NaN values.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

**FPFtZ, bits [3:0]**

Flush to Zero mode. Indicates whether the floating-point implementation provides support only for the Flush-to-Zero mode of operation. Defined values are:

<table>
<thead>
<tr>
<th>FPFtZ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented, or hardware supports only the Flush-to-Zero mode of operation.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Hardware supports full denormalized number arithmetic.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

**Accessing the MVFR1**

Accesses to this register use the following encodings:

```
VMRS{<c>}{<q>} <Rt>, <spec_reg>
```

<table>
<thead>
<tr>
<th>reg</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0110</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    UNDEFINED;

end

**MVFR2, Media and VFP Feature Register 2**

The MVFR2 characteristics are:

**Purpose**

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with MVFR0 and MVFR1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch32 System register MVFR2 bits [31:0] are architecturally mapped to AArch64 System register MVFR2_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to MVFR2 are UNDEFINED.

Implemented only if the implementation includes Advanced SIMD and floating-point instructions.

**Attributes**

MVFR2 is a 32-bit register.

**Field descriptions**

The MVFR2 bit assignments are:

|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |

**Bits [31:8]**

Reserved, RES0.

**FPMisc, bits [7:4]**

Indicates whether the floating-point implementation provides support for miscellaneous VFP features.

<table>
<thead>

```
NMRR, Normal Memory Remap Register

The NMRR characteristics are:

**Purpose**

Provides additional mapping controls for memory regions that are mapped as Normal memory by their entry in the PRRR.

Used in conjunction with the PRRR.

**Configuration**

AArch32 System register NMRR bits [31:0] are architecturally mapped to AArch64 System register MAIR_EL1[63:32] when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register NMRR bits [31:0] are architecturally mapped to AArch32 System register MAIR1[31:0] when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register NMRR bits [31:0] (NMRR_S) are architecturally mapped to AArch32 System register MAIR1[31:0] (MAIR1_S) when EL3 is using AArch32.

AArch32 System register NMRR bits [31:0] (NMRR_NS) are architecturally mapped to AArch32 System register MAIR1[31:0] (MAIR1_NS) when EL3 is using AArch32.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to NMRR are UNDEFINED.

MAIR1 and NMRR are the same register, with a different view depending on the value of TTBCR.EAE:

- When it is set to 0, the register is as described in NMRR.
- When it is set to 1, the register is as described in MAIR1.

**Attributes**

NMRR is a 32-bit register.

**Field descriptions**

The NMRR bit assignments are:

**When TTBCR.EAE == 0:**

<table>
<thead>
<tr>
<th>OR7</th>
<th>OR6</th>
<th>OR5</th>
<th>OR4</th>
<th>OR3</th>
<th>OR2</th>
<th>OR1</th>
<th>OR0</th>
<th>IR7</th>
<th>IR6</th>
<th>IR5</th>
<th>IR4</th>
<th>IR3</th>
<th>IR2</th>
<th>IR1</th>
<th>IR0</th>
</tr>
</thead>
</table>

**OR<n>**, bits [2n+17:2n+16], for n = 7 to 0

Outer Cacheable property mapping for memory attributes n, if the region is mapped as Normal memory by the PRRR.TR<n> entry. n is the value of the TEX[0], C, and B bits concatenated. The possible values of this field are:

<table>
<thead>
<tr>
<th>OR&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Region is Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Region is Write-Back, Write-Allocate.</td>
</tr>
<tr>
<td>0b10</td>
<td>Region is Write-Through, no Write-Allocate.</td>
</tr>
<tr>
<td>0b11</td>
<td>Region is Write-Back, no Write-Allocate.</td>
</tr>
</tbody>
</table>

The meaning of the field with n = 6 is IMPLEMENTATION DEFINED and might differ from the meaning given here. This is because the meaning of the attribute combination {TEX[0] = 1, C = 1, B = 0} is IMPLEMENTATION DEFINED.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IR\(<n>\>, \text{bits } [2n+1:2n], \text{for } n = 7 \text{ to } 0**

Inner Cacheable property mapping for memory attributes \(n\), if the region is mapped as Normal memory by the PRRR.TR\(<n>\) entry. \(n\) is the value of the TEX[0], C, and B bits concatenated. The possible values of this field are:

<table>
<thead>
<tr>
<th>IR(&lt;n&gt;)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Region is Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Region is Write-Back, Write-Allocate.</td>
</tr>
<tr>
<td>0b10</td>
<td>Region is Write-Through, no Write-Allocate.</td>
</tr>
<tr>
<td>0b11</td>
<td>Region is Write-Back, no Write-Allocate.</td>
</tr>
</tbody>
</table>

The meaning of the field with \(n = 6\) is IMPLEMENTATION DEFINED and might differ from the meaning given here. This is because the meaning of the attribute combination \{TEX[0] = 1, C = 1, B = 0\} is IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the NMRR**

Accesses to this register use the following encodings:

    end
NSACR, Non-Secure Access Control Register

The NSACR characteristics are:

**Purpose**

When EL3 is implemented and can use AArch32, defines the Non-secure access permissions to Trace, Advanced SIMD and floating-point functionality. Also includes IMPLEMENTATION DEFINED bits that can define Non-secure access permissions for IMPLEMENTATION DEFINED functionality.

**Configuration**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to NSACR are UNDEFINED.

**Note**

In AArch64 state, the NSACR controls are replaced by controls in CPTR_EL3.

**Attributes**

NSACR is a 32-bit register.

**Field descriptions**

The NSACR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | NSTRCDIS | RES0 | IMPLEMENTATION DEFINED | NSASEDIS | RES0 | cp11 | cp10 | RES0 |

If EL3 is implemented and is using AArch64 then:

- Any read of the NSACR from Non-secure EL2 or Non-secure EL1 returns a value of 0x00000C00.
- Any read or write to NSACR from Secure EL1 is trapped as an exception to EL3.

If EL3 is not implemented, then any read of the NSACR from EL2 or EL1 returns a value of 0x00000C00.

**Bits [31:21]**

Reserved, RES0.

**NSTRCDIS, bit [20]**

Disables Non-secure System register accesses to all implemented trace registers.

<table>
<thead>
<tr>
<th>NSTRCDIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on:</td>
</tr>
<tr>
<td></td>
<td>• System register access to implemented trace registers.</td>
</tr>
<tr>
<td></td>
<td>• The behavior of CPACR TRCDIS and HCPTR TTA.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure System register accesses to all implemented trace registers are disabled, meaning:</td>
</tr>
<tr>
<td></td>
<td>• CPACR TRCDIS behaves as RAO/WI in Non-secure state, regardless of its actual value.</td>
</tr>
<tr>
<td></td>
<td>• HCPTR TTA behaves as RAO/WI, regardless of its actual value.</td>
</tr>
</tbody>
</table>
The implementation of this field must correspond to the implementation of the CPACR.TRCDIS field:

- If CPACR.TRCDIS is RAZ/WI, this field is RAZ/WI.
- If CPACR.TRCDIS is RW, this field is RW.

**Note**
- The ETMv4 architecture does not permit EL0 to access the trace registers. If the PE trace unit implements FEAT_ETMv4, EL0 accesses to the trace registers are **UNDEFINED**.
- The architecture does not provide Non-secure access controls on trace register accesses through the optional memory-mapped external debug interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**Bit [19]**

Reserved, RES0.

**IMPLEMENTATION DEFINED, bits [18:16]**

IMPLEMENTATION DEFINED.

**NSASEDIS, bit [15]**

Disables Non-secure access to the Advanced SIMD functionality.

<table>
<thead>
<tr>
<th>NSASEDIS</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0      | This control has no effect on:  
|          | • Non-secure access to Advanced SIMD functionality.  
|          | • The behavior of CPACR.ASEDIS and HCPTR.TASE. |
| 0b1      | Non-secure access to the Advanced SIMD functionality is disabled, meaning:  
|          | • CPACR.ASEDIS behaves as RAO/WI in Non-secure state, regardless of its actual value.  
|          | • HCPTR.TASE behaves as RAO/WI, regardless of its actual value. |

The implementation of this field must correspond to the implementation of the CPACR.ASEDIS field:

- If CPACR.ASEDIS is RES0, this field is RES0. If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.
- If CPACR.ASEDIS is RAZ/WI, this field is RAZ/WI.
- If CPACR.ASEDIS is RW, this field is RW.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**Bits [14:12]**

Reserved, RES0.

**cp11, bit [11]**

The value of this field is ignored. If this field is programmed with a different value to the cp10 field then this field is **UNKNOWN** on a direct read of the NSACR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally **UNKNOWN** value.

Page 2848
 cp10, bit [10]

Enable Non-secure access to the Advanced SIMD and floating-point features. Possible values of the fields are:

<table>
<thead>
<tr>
<th>cp10</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0  | Advanced SIMD and floating-point features can be accessed only from Secure state. Any attempt to access this functionality from Non-secure state is UNDEFINED. When the PE is in Non-secure state:  
  - The CPACR (cp11, cp10) fields ignore writes and read as 0b00, access denied.  
  - The HCPTR (TCP11, TCP10) fields behave as RAO/WI, regardless of their actual values. |
| 0b1  | Advanced SIMD and floating-point features can be accessed from both Security states. |

If Non-secure access to the Advanced SIMD and floating-point functionality is enabled, the CPACR must be checked to determine the level of access that is permitted.

The Advanced SIMD and floating-point features controlled by these fields are:

- Execution of any floating-point or Advanced SIMD instruction.
- Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
- Any access to the FPSCR, FPSID, MVFR0, MVFR1, MVFR2, or FPEXC System registers.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Bits [9:0]

Reserved, RES0.

**Accessing the NSACR**

PAR, Physical Address Register

The PAR characteristics are:

**Purpose**

Returns the output address (OA) from an Address translation instruction that executed successfully, or fault information if the instruction did not execute successfully.

**Configuration**

AArch32 System register PAR bits [63:0] are architecturally mapped to AArch64 System register PAR_EL1[63:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to PAR are undefined.

PAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits[31:0] and do not modify bits[63:32].

The Configurations section specifies the cases where each PAR format is used.

PAR is accessed as a 32-bit value:

- When the PE is not in Hyp mode and is using the Short-descriptor translation table format.
- When the PE is in Hyp mode and executes an ATS12NSOPR, ATS12NSOPW, ATS12NSOUR, or ATS12NSOUW instruction and the value of HCR.VM is 0 and the value of TTBCR.EAE is 0.

In these cases, PAR[63:32] is RES0.

Otherwise, the PAR is accessed as a 64-bit value, if any of the following is true:

- When using the Long-descriptor translation table format.
- If the stage 1 address translation is disabled and TTBCR.EAE is set to 1.
- In an implementation that includes EL2, for the result of an ATS1Cxx instruction performed from Hyp mode.

For PL1&0 stage 1 translations, TTBCR.EAE selects the translation table format.

**Attributes**

PAR is a 64-bit register.

**Field descriptions**

The PAR bit assignments are:

**When the instruction returned a 32-bit value to the PAR, PAR.F==0:**

<table>
<thead>
<tr>
<th>PA</th>
<th>LPAE</th>
<th>NOS</th>
<th>NS</th>
<th>IMPLEMENTATION</th>
<th>DEFINED</th>
<th>SHInner[2:0]</th>
<th>Outer[1:0]</th>
<th>SS</th>
<th>F</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44</td>
<td>43 42 41 40</td>
<td>39 38 37 36</td>
<td>35 34 33 32</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12</td>

<td>7 6 5 4</td>
<td>3 2 1 0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR can return a value that indicates the resulting attributes, rather than the values that appear in the translation table descriptors. More precisely:
Memory attribute fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the translation table descriptors. This applies to the NOS, SH, Inner, and Outer fields.

- See the NS bit description for constraints on the value it returns.

**Bits [63:32]**

Reserved, RES0.

**PA, bits [31:12]**

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[31:12].

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**LPAE, bit [11]**

When updating the PAR with the result of the translation operation, this bit is set as follows:

<table>
<thead>
<tr>
<th>LPAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Short-descriptor translation table format used. This means the PAR returned a 32-bit value.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**NOS, bit [10]**

Not Outer Shareable. When the returned value of PAR.SH is 1, indicates the Shareability attribute for the physical memory region:

<table>
<thead>
<tr>
<th>NOS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Memory region is Outer Shareable.</td>
</tr>
<tr>
<td>0b1</td>
<td>Memory region is Inner Shareable.</td>
</tr>
</tbody>
</table>

When the returned value of PAR.SH is 0 the value returned to this field is **UNKNOWN**.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**NS, bit [9]**

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is **UNKNOWN**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IMPLEMENTATION DEFINED, bit [8]**

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**SH, bit [7]**

Shareability. Indicates whether the physical memory region is Non-shareable:
SH | Meaning
--- | ---
0b0 | Memory is Non-shareable.
0b1 | Memory is shareable, and PAR.NOS indicates whether the region is Outer Shareable or Inner Shareable.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Inner[2:0], bits [6:4]**

Inner cacheability attribute for the region. Permitted values are:

<table>
<thead>
<tr>
<th>Inner[2:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Non-cacheable.</td>
</tr>
<tr>
<td>0b001</td>
<td>Device-nGnRnE.</td>
</tr>
<tr>
<td>0b011</td>
<td>Device-nGnRE.</td>
</tr>
<tr>
<td>0b101</td>
<td>Write-Back, Write-Allocate.</td>
</tr>
<tr>
<td>0b110</td>
<td>Write-Through.</td>
</tr>
<tr>
<td>0b111</td>
<td>Write-Back, no Write-Allocate.</td>
</tr>
</tbody>
</table>

The values 0b010 and 0b100 are reserved.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Outer[1:0], bits [3:2]**

Outer cacheability attribute for the region. Permitted values are:

<table>
<thead>
<tr>
<th>Outer[1:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Write-Back, Write-Allocate.</td>
</tr>
<tr>
<td>0b10</td>
<td>Write-Through, no Write-Allocate.</td>
</tr>
<tr>
<td>0b11</td>
<td>Write-Back, no Write-Allocate.</td>
</tr>
</tbody>
</table>

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SS, bit [1]**

Supersection. Used to indicate if the result is a Supersection:

<table>
<thead>
<tr>
<th>SS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Result is not a Supersection. PAR[31:12] contains OA[31:12].</td>
</tr>
</tbody>
</table>
| 0b1 | Result is a Supersection, and:
  • PAR[31:24] contains OA[31:24].
  • PAR[15:12] contains 0b0000.
  If an implementation supports less than 40 bits of physical address, the bits in the PAR field that correspond to physical address bits that are not implemented are UNKNOWN. |

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**F, bit [0]**

Indicates whether the instruction performed a successful address translation.

<table>
<thead>
<tr>
<th>F</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Address translation completed successfully.</td>
</tr>
</tbody>
</table>
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

## When the instruction returned a 32-bit value to the PAR, PAR.F==1:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-32</td>
<td>Reserved</td>
<td>RES0</td>
<td>IMPLEMENTATION DEFINED, bits [31:16]</td>
</tr>
<tr>

<td>RES0</td>
<td>IMPLEMENTATION DEFINED.</td>
</tr>
<tr>
<td>23-22</td>
<td>LPAE</td>
<td>RES0</td>
<td>When updating the PAR with the result of the translation operation, this bit is set as follows:</td>
</tr>
<tr>
<td>21-12</td>
<td>Reserved</td>
<td>RES0</td>
<td></td>
</tr>
<tr>
<td>11</td>
<td>FS[5]</td>
<td>RES0</td>
<td>Fault status bits, external abort type. Provides an IMPLEMENTATION DEFINED classification of an External abort. Values are as in the DFSR.EXT field when using the Short-descriptor translation table format.</td>
</tr>
<tr>
<td>10-7</td>
<td>FS[4:0]</td>
<td>RES0</td>
<td>For aborts other than External aborts this bit always returns 0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

---

This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

### Bits [63:32]

- Reserved, RES0.

### IMPLEMENTATION DEFINED, bits [31:16]

- IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Bits [15:12]

- Reserved, RES0.

### LPAE, bit [11]

- When updating the PAR with the result of the translation operation, this bit is set as follows:

<table>
<thead>
<tr>
<th>LPAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Short-descriptor translation table format used. This means the PAR returned a 32-bit value.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Bits [10:7]

- Reserved, RES0.

### FS[5], bit [6]

- Fault status bits, external abort type. Provides an IMPLEMENTATION DEFINED classification of an External abort. Values are as in the DFSR.EXT field when using the Short-descriptor translation table format.

  In an implementation that does not provide any classification of External aborts, this bit is RES0.

  For aborts other than External aborts this bit always returns 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### FS[4:0], bits [5:1]

- Fault status bits. Values are as in the DFSR.FS field when using the Short-descriptor translation table format.
On a Warm reset, this field resets to an **UNKNOWN** value.

**F, bit [0]**

Indicates whether the instruction performed a successful address translation.

<table>
<thead>
<tr>
<th>F</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Address translation aborted.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**When the instruction returned a 64-bit value to the PAR, PAR.F==0:**

<table>

<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR can return a value that indicates the resulting attributes, rather than the values that appear in the translation table descriptors. More precisely:

- Memory attribute fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the translation table descriptors. This applies to the ATTR and SH fields.
- See the NS bit description for constraints on the value it returns.

**ATTR, bits [63:56]**

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in **MAIR0** and **MAIR1**.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Bits [55:40]

Reserved, RES0.

PA, bits [39:12]

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits [39:12].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [11]

When updating the PAR with the result of the translation operation, this bit is set as follows:

<table>
<thead>
<tr>
<th>LPAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>Long-descriptor translation table format used. This means the PAR returned a 64-bit value.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bit [10]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS, bit [9]

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH, bits [8:7]

Shareability attribute, for the returned output address. Permitted values are:

<table>
<thead>
<tr>
<th>SH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

The value 0b01 is reserved.

Note

This field returns the value 0b10 for:

- Any type of Device memory.
- Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Bits [6:1]
Reserved, RES0.

F, bit [0]
Indicates whether the instruction performed a successful address translation.

F

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

When the instruction returned a 64-bit value to the PAR, PAR.F==1:

<table>
<thead>
<tr>
<th>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMPLEMENTATION DEFINED</td>
</tr>
<tr>
<td>IMPLEMENTATION DEFINED</td>
</tr>
<tr>
<td>IMPLEMENTATION DEFINED</td>
</tr>
<tr>
<td>RES0</td>
</tr>
</tbody>
</table>

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

IMPLEMENTATION DEFINED, bits [63:56]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [55:52]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [51:48]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [47:12]
Reserved, RES0.

LPAE, bit [11]
When updating the PAR with the result of the translation operation, this bit is set as follows:

<table>
<thead>
<tr>
<th>LPAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>Long-descriptor translation table format used. This means the PAR returned a 64-bit value.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [10]
Reserved, RES0.
FSTAGE, bit [9]

Indicates the translation stage at which the translation aborted:

<table>
<thead>
<tr>
<th>FSTAGE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Translation aborted because of a fault in the stage 1 translation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Translation aborted because of a fault in the stage 2 translation.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

S2WLK, bit [8]

If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

FST, bits [6:1]

Fault status field. Values are as in the DFSR.STATUS and IFSR.STATUS fields when using the Long-descriptor translation table format.

<table>
<thead>
<tr>
<th>FST</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>

PMCCFILTR, Performance Monitors Cycle Count Filter Register

The PMCCFILTR characteristics are:

**Purpose**

Determines the modes in which the Cycle Counter, PMCCNTR, increments.

**Configuration**

AArch32 System register PMCCFILTR bits [31:0] are architecturally mapped to AArch64 System register PMCCFILTR_EL0[31:0].

AArch32 System register PMCCFILTR bits [31:0] are architecturally mapped to External register PMCCFILTR_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCCFILTR are UNDEFINED.

**Attributes**

PMCCFILTR is a 32-bit register.

**Field descriptions**

The PMCCFILTR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| P  | U  | NSK | NSU | NSH | RES0 |

**P, bit [31]**

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR.NSK bit.

<table>
<thead>
<tr>
<th>P</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count cycles in EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count cycles in EL1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**U, bit [30]**

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR.NSU bit.

<table>
<thead>
<tr>
<th>U</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count cycles in EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count cycles in EL0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.
**NSK, bit [29]**

*When EL3 is implemented:*

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of PMCCFILTR.P, cycles in Non-secure EL1 are counted.
Otherwise, cycles in Non-secure EL1 are not counted.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

**NSU, bit [28]**

*When EL3 is implemented:*

Non-secure EL0 (Unprivileged) filtering. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of PMCCFILTR.U, cycles in Non-secure EL0 are counted.
Otherwise, cycles in Non-secure EL0 are not counted.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

**NSH, bit [27]**

*When EL2 is implemented:*

EL2 (Hyp mode) filtering bit. Controls counting in EL2.

<table>
<thead>
<tr>
<th>NSH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not count cycles in EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Count cycles in EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

**Bits [26:0]**

Reserved, RES0.

**Accessing the PMCCFILTR**

PMCCFILTR can also be accessed by using PMXEVTYPER with PMSELR SEL set to 0b11111.

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
  if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap priority when SDD == '1'" && !ELUsingAArch32(EL3) && MDCR_EL3.TPM == '1' then UNDEFINED;

PMCCNTR, Performance Monitors Cycle Count Register

The PMCCNTR characteristics are:

**Purpose**

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See 'Time as measured by the Performance Monitors cycle counter' for more information.

**Configuration**

AArch32 System register PMCCNTR bits [63:0] are architecturally mapped to AArch64 System register PMCCNTR_EL0[63:0].

AArch32 System register PMCCNTR bits [63:0] are architecturally mapped to External register PMCCNTR_EL0[63:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCCNTR are UNDEFINED.

PMCCNTR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

All counters are subject to any changes in clock frequency, including clock stopping caused by the WFI and WFE instructions. This means that it is CONSTRAINED UNPREDICTABLE whether or not PMCCNTR continues to increment when clocks are stopped by WFI and WFE instructions.

**Attributes**

PMCCNTR is a 64-bit register.

**Field descriptions**

The PMCCNTR bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| CCNT | CCNT |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

**CCNT, bits [63:0]**

Cycle count. Depending on the values of PMCR_{LC,D}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to PMCR.C sets this field to 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMCCNTR**

Accesses to this register use the following encodings:
MRC{<c>}{<q>}  coproc, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

PMCEID0, Performance Monitors Common Event Identification register 0

The PMCEID0 characteristics are:

**Purpose**

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x0000 to 0x001F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

**Note**

Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEIDn registers see 'The PMU event number space and common events'.

**Configuration**

AArch32 System register PMCEID0 bits [31:0] are architecturally mapped to AArch64 System register PMCEID0_EL0[31:0].

AArch32 System register PMCEID0 bits [31:0] are architecturally mapped to External register PMCEID0[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCEID0 are **UNDEFINED**.

**Attributes**

PMCEID0 is a 32-bit register.

**Field descriptions**

The PMCEID0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 |

**ID<n>**, bit [n], for n = 31 to 0

ID[n] corresponds to common event n.

For each bit:

<table>
<thead>
<tr>
<th>ID&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The common event is not implemented, or not counted.</td>
</tr>
<tr>
<td>0b1</td>
<td>The common event is implemented.</td>
</tr>
</tbody>
</table>

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

**Note**

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCID<n> registers of that earlier version of the PMU architecture.

### Accessing the PMCID0

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c}\}{<q}> \text{<coproc>, } \{#\text{<opc1>}, \text{<Rt>, <CRn>, <CRm>{, }{#}\text{<opc2>}}
\]

For more information about the common events and the use of the PMCEIDn registers see 'The PMU event number space and common events'.

**Configuration**

AArch32 System register PMCEID1 bits [31:0] are architecturally mapped to AArch64 System register PMCEID1_EL0[31:0].

AArch32 System register PMCEID1 bits [31:0] are architecturally mapped to External register PMCEID1[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCEID1 are **UNDEFINED**.

**Attributes**

PMCEID1 is a 32-bit register.

**Field descriptions**

The PMCEID1 bit assignments are:

| 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

**ID<n>, bit [n], for n = 31 to 0**

ID[n] corresponds to common event (0x0020 + n).

For each bit:

<table>
<thead>
<tr>
<th>ID&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The common event is not implemented, or not counted.</td>
</tr>
<tr>
<td>0b1</td>
<td>The common event is implemented.</td>
</tr>
</tbody>
</table>

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

---

**Note**
Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<\text{n}> registers of that earlier version of the PMU architecture.

## Accessing the PMCEID1

Accesses to this register use the following encodings:

\[
\text{MRC}\{c\}\{q\}\ <\text{coproc}, \{#\}\text{opc1}, <\text{Rt}, <\text{CRn}, <\text{CRm}\{, \{#\}\text{opc2}\}
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b1001</td>
<td>0b1100</td>
<td>0b111</td>
</tr>
</tbody>
</table>

The PMCEID2 characteristics are:

**Purpose**

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x4000 to 0x401F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

---

**Note**

Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEIDn registers see 'The PMU event number space and common events'.

**Configuration**

AArch32 System register PMCEID2 bits [31:0] are architecturally mapped to AArch64 System register PMCEID0_EL0[63:32].

AArch32 System register PMCEID2 bits [31:0] are architecturally mapped to External register PMCEID2[63:32].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3p1 is implemented. Otherwise, direct accesses to PMCEID2 are **UNDEFINED**.

**Attributes**

PMCEID2 is a 32-bit register.

**Field descriptions**

The PMCEID2 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dhi31</td>
<td>Dhi30</td>
<td>Dhi29</td>
<td>Dhi28</td>

<td>Dhi22</td>
<td>Dhi21</td>
<td>Dhi20</td>
<td>Dhi19</td>
<td>Dhi18</td>
<td>Dhi17</td>
<td>Dhi16</td>
<td>Dhi15</td>
</tr>
</tbody>
</table>

**IDhi<n>**, bit [n], for n = 31 to 0

IDhi[n] corresponds to common event (0x4000 + n).

For each bit:

<table>
<thead>
<tr>
<th>IDhi&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The common event is not implemented, or not counted.</td>
</tr>
<tr>
<td>0b1</td>
<td>The common event is implemented.</td>
</tr>
</tbody>
</table>

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

---

**Note**
Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID\textless n\textgreater registers of that earlier version of the PMU architecture.

PMCEID3, Performance Monitors Common Event Identification register 3

The PMCEID3 characteristics are:

**Purpose**

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x4020 to 0x403F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

---

**Note**

Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

---

For more information about the common events and the use of the PMCEIDn registers see 'The PMU event number space and common events'.

**Configuration**

AArch32 System register PMCEID3 bits [31:0] are architecturally mapped to AArch64 System register PMCEID1_EL0[63:32].

AArch32 System register PMCEID3 bits [31:0] are architecturally mapped to External register PMCEID3[63:32].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3p1 is implemented. Otherwise, direct accesses to PMCEID3 are **UNDEFINED**.

**Attributes**

PMCEID3 is a 32-bit register.

**Field descriptions**

The PMCEID3 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>

PMCNTENCLR, Performance Monitors Count Enable Clear register

The PMCNTENCLR characteristics are:

**Purpose**

Disables the Cycle Count Register, **PMCCNTR**, and any implemented event counters **PMEVCNTR<n>**. Reading this register shows which counters are enabled.

PMCNTENCLR is used in conjunction with the **PMCNTENSET** register.

**Configuration**

AArch32 System register PMCNTENCLR bits [31:0] are architecturally mapped to AArch64 System register **PMCNTENCLR_EL0[31:0]**.

AArch32 System register PMCNTENCLR bits [31:0] are architecturally mapped to External register **PMCNTENCLR_EL0[31:0]**.

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCNTENCLR are **UNDEFINED**.

**Attributes**

PMCNTENCLR is a 32-bit register.

**Field descriptions**

The PMCNTENCLR bit assignments are:

|---|---|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

**C, bit [31]**

**PMCCNTR** disable bit. Disables the cycle counter register.

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter is enabled. When written, disables the cycle counter.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**P<n>, bit [n], for n = 30 to 0**

Event counter disable bit for **PMEVCNTR<n>**.

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in **MDCR_EL2.HPMN** if EL2 is using AArch64, or in **HDCR.HPMN** if EL2 is using AArch32. Otherwise, N is the value in **PMCR.N**.
### PMCNTENCLR, Performance Monitors Count Enable Clear register

PMCNTENSET, Performance Monitors Count Enable Set register

The PMCNTENSET characteristics are:

**Purpose**

Enables the Cycle Count Register, PMCCNTR, and any implemented event counters PMEVCNTR<n>. Reading this register shows which counters are enabled.

PMCNTENSET is used in conjunction with the PMCNTENCLR register.

**Configuration**

AArch32 System register PMCNTENSET bits [31:0] are architecturally mapped to AArch64 System register PMCNTENSET_EL0[31:0].

AArch32 System register PMCNTENSET bits [31:0] are architecturally mapped to External register PMCNTENSET_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCNTENSET are **UNDEFINED**.

**Attributes**

PMCNTENSET is a 32-bit register.

**Field descriptions**

The PMCNTENSET bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

**C, bit [31]**

**PMCCNTR** enable bit. Enables the cycle counter register.

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter is enabled. When written, enables the cycle counter.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**P<n>, bit [n], for n = 30 to 0**

Event counter enable bit for PMEVCNTR<n>.

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in MDCR_EL2.HPMN if EL2 is using AArch64, or in HDCR.HPMN if EL2 is using AArch32. Otherwise, N is the value in PMCR.N.
<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that PMEVCNTR&lt;n&gt; is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that PMEVCNTR&lt;n&gt; event counter is enabled. When written, enables PMEVCNTR&lt;n&gt;.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMCNTENSET**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>

PMCR, Performance Monitors Control Register

The PMCR characteristics are:

**Purpose**

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

**Configuration**

AArch32 System register PMCR bits [31:0] are architecturally mapped to AArch64 System register PMCR_EL0[31:0].

AArch32 System register PMCR bits [7:0] are architecturally mapped to External register PMCR_EL0[7:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCR are UNDEFINED.

**Attributes**

PMCR is a 32-bit register.

**Field descriptions**

**IMP, bits [31:24]**

When FEAT_PMUv3p7 is not implemented:

Implementer code.

If this field is zero, then PMCR.IDCODE is RES0 and software must use MIDR to identify the PE.

Otherwise, this field and PMCR.IDCODE identify the PMU implementation to software. The implementer codes are allocated by Arm. A non-zero value has the same interpretation as MIDR. Implementer.

Use of this field is deprecated.

This field reads as an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

Reserved, RAZ.

**IDCODE, bits [23:16]**

When PMCR.IMP != 0x00:

Identification code. Use of this field is deprecated. This field has an IMPLEMENTATION DEFINED value.

Each implementer must maintain a list of identification codes that are specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.
Access to this field is **RO**.

**Otherwise:**

Reserved, **RES0**.

### N, bits [15:11]

Indicates the number of event counters implemented. This value is in the range of 0b00000-0b111111. If the value is 0b00000 then only **PMCCNTR** is implemented. If the value is 0b111111 **PMCCNTR** and 31 event counters are implemented.

In an implementation that includes EL2:

- If EL2 is using AArch32, reads of this field from Non-secure EL1 and Non-secure EL0 return the value of **HDCR.HPMN**.
- If EL2 is using AArch64 and enabled in the current Security state, reads of this field from EL1 and EL0 return the value of **MDCR_EL2.HPMN**.

Access to this field is **RO**.

**Bit [10]**

Reserved, **RES0**.

**FZO, bit [9]**

**When FEAT_PMUv3p7 is implemented:**

Freeze-on-overflow. Stop event counters on overflow.

<table>
<thead>
<tr>
<th>FZO</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not freeze on overflow.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counters do not count when <strong>PMOVSR[(N-1):0]</strong> is nonzero, where N is the value of <strong>HDCR.HPMN</strong> if EL2 is implemented, and <strong>PMCR.N</strong> otherwise.</td>
</tr>
</tbody>
</table>

If EL2 is implemented, then:

- This bit affects the operation of event counters in the range [0 .. **(HDCR.HPMN-1)**].
- If **HDCR.HPMN** is less than **PMCR.N**:
  - This bit does not affect the operation of event counters in the range [**HDCR.HPMN** .. **(PMCR.N-1)**].
  - The operation of this bit ignores the values of **PMOVSR[(PMCR.N-1):HDCR.HPMN]**.
- This applies even when EL2 is disabled in the current Security state.

This bit does not affect the operation of **PMCCNTR**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**Bit [8]**

Reserved, **RES0**.

**LP, bit [7]**

**When FEAT_PMUv3p5 is implemented:**

Long event counter enable. Determines when unsigned overflow is recorded by a counter overflow bit.
LP, bit [0]

Meaning

0b0  Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>[31:0].

0b1  Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>[63:0].

If the highest implemented Exception level is using AArch32, it is IMPLEMENTATION DEFINED whether this bit is RW or RAZ/WI.

If EL2 is implemented and HDCR.HPMN or MDCR_EL2.HPMN is less than PMCR.N, this bit does not affect the operation of event counters in the range [HDCR.HPMN..(PMCR.N-1)] or [MDCR_EL2.HPMN..(PMCR.N-1)].

PMEVCNTR<n>[63:32] cannot be accessed directly in AArch32 state.

Note

The effect of HDCR.HPMN or MDCR_EL2.HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state. For more information, see the description of HDCR.HPMN or MDCR_EL2.HPMN.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

LC, bit [6]

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

<table>
<thead>
<tr>
<th>LC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR[31:0].</td>
</tr>
<tr>
<td>0b1</td>
<td>Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR[63:0].</td>
</tr>
</tbody>
</table>

Arm deprecates use of PMCR.LC = 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

DP, bit [5]

When EL3 is implemented or (FEAT_PMUv3p1 is implemented and EL2 is implemented):

Disable cycle counter when event counting is prohibited.

<table>
<thead>
<tr>
<th>DP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counting by PMCCNTR is not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>When event counting for counters in the range [0..(HDCR.HPMN-1)] or [0..(MDCR_EL2.HPMN-1)] is prohibited, cycle counting by PMCCNTR is disabled.</td>
</tr>
</tbody>
</table>

For more information see 'Prohibiting event counting'

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

X, bit [4]
When the implementation includes a PMU event export bus:

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

<table>
<thead>
<tr>
<th>X</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not export events.</td>
</tr>
<tr>
<td>0b1</td>
<td>Export events where not prohibited.</td>
</tr>
</tbody>
</table>

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL PE trace unit.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RAZ/WI.

D, bit [3]

Clock divider. The possible values of this bit are:

<table>
<thead>
<tr>
<th>D</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When enabled, PMCCNTR counts every clock cycle.</td>
</tr>
<tr>
<td>0b1</td>
<td>When enabled, PMCCNTR counts once every 64 clock cycles.</td>
</tr>
</tbody>
</table>

If PMCR.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR.D = 1.

On a Warm reset, this field resets to 0.

C, bit [2]

Cycle counter reset. The effects of writing to this bit are:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reset PMCCNTR to zero.</td>
</tr>
</tbody>
</table>

Note

Resetting PMCCNTR does not change the cycle counter overflow bit.

The value of PMCR_EL0.LC is ignored, and bits [63:0] of all affected event counters are reset.

Access to this field is WO/RAZ.

P, bit [1]

Event counter reset. The effects of writing to this bit are:

<table>
<thead>
<tr>
<th>P</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reset all event counters accessible in the current Exception level, not including PMCCNTR, to zero.</td>
</tr>
</tbody>
</table>

In EL0 and EL1:
If EL2 is implemented and enabled in the current Security state, and HDCR.HPMN or MDCR_EL2.HPMN is less than PMCR_EL0.N, a write of 1 to this bit does not reset event counters in the range [HDCR.HPMN..(PMN-1)] or [MDCR_EL2.HPMN..(PMN-1)].

If EL2 is not implemented, EL2 is disabled in the current Security state, or HDCR.HPMN or MDCR_EL2.HPMN is equal to PMCR_EL0.N, a write of 1 to this bit resets all the event counters.

In EL2 and EL3, a write of 1 to this bit resets all the event counters.

**Note**

Resetting the event counters does not change the event counter overflow bits.

If FEAT_PMUv3p5 is implemented, the values of HDCR.HLP and PMCR.LP are ignored and bits [63:0] of all affected event counters are reset.

Access to this field is **WO/RAZ**.

**E, bit [0]**

Enable.

<table>
<thead>
<tr>
<th>E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All event counters in the range [0..(PMN-1)] and PMCCNTR. are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>All event counters in the range [0..(PMN-1)] and PMCCNTR. are enabled by PMCNTENSET.</td>
</tr>
</tbody>
</table>

If EL2 is implemented then:

- If EL2 is using AArch32, PMN is HDCR.HPMN.
- If EL2 is using AArch64, PMN is MDCR_EL2.HPMN.
- If PMN is less than PMCR.N, this bit does not affect the operation of event counters in the range [PMN..(PMN-1)].

If EL2 is not implemented, PMN is PMCR.N.

**Note**

The effect of MDCR_EL2.HPMN or HDCR.HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, regardless of whether EL2 is enabled in the current Security state. For more information, see the description of MDCR_EL2.HPMN or HDCR.HPMN.

On a Warm reset, this field resets to 0.

**Accessing the PMCR**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>}{<coproc>}, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b1001</td>
<td>0b1100</td>
<td>0b000</td>
</tr>
</tbody>

PMEVCNTR\(<n>\), Performance Monitors Event Count Registers, \(n = 0 - 30\)

The PMEVCNTR\(<n>\) characteristics are:

**Purpose**

Holds event counter \(n\), which counts events, where \(n\) is 0 to 30.

**Configuration**

AArch32 System register PMEVCNTR\(<n>\) bits [31:0] are architecturally mapped to AArch64 System register PMEVCNTR\(<n>_EL0[31:0]\).

AArch32 System register PMEVCNTR\(<n>\) bits [31:0] are architecturally mapped to External register PMEVCNTR\(<n>_EL0[31:0]\).

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMEVCNTR\(<n>\) are **UNDEFINED**.

**Attributes**

PMEVCNTR\(<n>\) is a 32-bit register.

**Field descriptions**

The PMEVCNTR\(<n>\) bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Event counter \(n\). Value of event counter \(n\), where \(n\) is the number of this register and is a number from 0 to 30.

If FEAT_PMUv3p5 is implemented, the event counter is 64 bits and only the least-significant part of the event counter is accessible in AArch32 state:

- Reads from PMEVCNTR\(<n>\) return bits [31:0] of the counter.
- Writes to PMEVCNTR\(<n>\) update bits [31:0] and leave bits [63:32] unchanged.
- There is no means to access bits [63:32] directly from AArch32 state.
- If the implementation does not support AArch64 at any Exception level, bits [63:32] are not required to be implemented.

If FEAT_PMUv3p5 is not implemented, the event counter is 32 bits.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the PMEVCNTR\(<n>\)**

PMEVCNTR\(<n>\) can also be accessed by using PMXEV CNTR with PMSEL.R.SEL set to the value of \(<n>\).

If FEAT_FGT is implemented and \(<n>\) is greater than or equal to the number of accessible counters, then the behavior of permitted reads and writes of PMEVCNTR\(<n>\) is as follows:

- If \(<n>\) is an unimplemented event counter, the access is **UNDEFINED**.
• Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and \(<n>\) is greater than or equal to the number of accessible counters, then reads and writes of \(\text{PMEVCNTR}<n>\) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

If \(<n>\) is greater than or equal to the number of accessible event counters, then reads and writes of \(\text{PMEVCNTR}<n>\) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

• Accesses to the register are UNDEFINED.
• Accesses to the register behave as RAZ/WI.
• Accesses to the register execute as a NOP
• If EL2 is implemented and enabled in the current Security state, and \(<n>\) is less than the number of implemented counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

---

**Note**

In EL0, an access is permitted if it is enabled by \(\text{PMUSERENR}, \{\text{ER,EN}\}\) or \(\text{PMUSERENR_EL0}, \{\text{ER,EN}\}\).

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

• If EL2 is using AArch32, \(\text{HDCR}, \text{HPMN}\) identifies the number of accessible event counters.
• If EL2 is using AArch64, \(\text{MDCR_EL2}, \text{HPMN}\) identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented counters. See \(\text{HDCR}, \text{HPMN}\) and \(\text{MDCR_EL2}, \text{HPMN}\) for more details.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#<\text{opc2}>\}}
\]

The PMEVTPYPER<n> characteristics are:

**Purpose**

Configures event counter n, where n is 0 to 30.

**Configuration**

AArch32 System register PMEVTPYPER<n> bits [31:0] are architecturally mapped to AArch64 System register PMEVTPYPER<n>_EL0[31:0].

AArch32 System register PMEVTPYPER<n> bits [31:0] are architecturally mapped to External register PMEVTPYPER<n>_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMEVTPYPER<n> are UNDEFINED.

**Attributes**

PMEVTYPER<n> is a 32-bit register.

**Field descriptions**

The PMEVTPYPER<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| P  | U  | NSK | NSU | NSH | RES0 | RES0 | evtCount[15:10] | evtCount[9:0] |

**P, bit [31]**

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTPYPER<n>.NSK bit.

<table>
<thead>
<tr>
<th>P</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count events in EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count events in EL1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**U, bit [30]**

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTPYPER<n>.NSU bit.

<table>
<thead>
<tr>
<th>U</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count events in EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count events in EL0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**NSK, bit [29]**

*When EL3 is implemented:*

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of PMEVTYPER<n>.P, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**NSU, bit [28]**

*When EL3 is implemented:*

Non-secure EL0 (Unprivileged) filtering. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of PMEVTYPER<n>.U, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**NSH, bit [27]**

*When EL2 is implemented:*

EL2 (Hyp mode) filtering bit. Controls counting in EL2.

<table>
<thead>
<tr>
<th>NSH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not count events in EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Count events in EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Bit [26]**

Reserved, RES0.

**MT, bit [25]**

*When FEAT_MTPMU is implemented or an IMPLEMENTATION DEFINED multi-threaded PMU extension is implemented:*

Multithreading.

<table>
<thead>
<tr>
<th>MT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count events only on controlling PE.</td>
</tr>
<tr>
<td>0b1</td>
<td>Count events from any PE with the same affinity at level 1 and above as this PE.</td>
</tr>
</tbody>
</table>
From Armv8.6, the *IMPLEMENTATION DEFINED* multi-threaded PMU extension is not permitted, meaning if FEAT_MTPMU is not implemented, this bit is RES0. See ID_DFR1_MTPMU.

This bit is ignored by the PE and treated as zero when FEAT_MTPMU is implemented and Disabled.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Bits [24:16]**

Reserved, RES0.

**evtCount[15:10], bits [15:10]**

When FEAT_PMUv3p1 is implemented:

Extension to(evtCount[9:0]. See evtCount[9:0] for more details.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**evtCount[9:0], bits [9:0]**

Event to count. The event number of the event that is counted by event counter PMEVCNTR<n>. Software must program this field with an event that is supported by the PE being programmed.

The ranges of event numbers allocated to each type of event are shown in 'Allocation of the PMU event number space'.

If evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range 0x0000 to 0x003F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- If 16-bit evtCount is implemented, for the range 0x4000 to 0x403F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED events, it is **UNPREDICTABLE** what event, if any, is counted, and the value returned by a direct or external read of the evtCount field is **UNKNOWN**.

**Note**

**UNPREDICTABLE** means the event must not expose privileged information.

Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include an event from a set of common IMPLEMENTATION DEFINED events, then no event is counted and the value read back on evtCount is the value written.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the PMEVTYPER<n>**

PMEVTYPER<n> can also be accessed by using PMXEVTPYPER with PMSELR SEL set to n.

If FEAT_FGT is implemented and <n> is greater than or equal to the number of accessible counters, then the behavior of permitted reads and writes of PMEVTYPER<n> is as follows:

- If <n> is an unimplemented event counter, the access is **UNDEFINED**.
• Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and \(<n>\) is greater than or equal to the number of accessible counters, then reads and writes of \(\text{PMEVTYPER}<n>\) are constrained unpredictable, and the following behaviors are permitted:

If \(<n>\) is greater or equal to the number of accessible event counters, then reads and writes of \(\text{PMEVTYPER}<n>\) are constrained unpredictable, and the following behaviors are permitted:

- Accesses to the register are undefined.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- If EL2 is implemented and enabled in the current Security state, and \(<n>\) is less than the number of implemented counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by \(\text{PMUSERENR}.\text{EN}\) or \(\text{PMUSERENR_EL0}.\text{EN}\).

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, \(\text{HDCR}.\text{HPMN}\) identifies the number of accessible event counters.
- If EL2 is using AArch64, \(\text{MDCR_EL2}.\text{HPMN}\) identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented counters. See \(\text{HDCR}.\text{HPMN}\) and \(\text{MDCR_EL2}.\text{HPMN}\) for more details.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} \text{ coproc}, \{\#\text{opc1}\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{\#\text{opc2}\}
\]

PMINTENCLR, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR characteristics are:

**Purpose**

Disables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR, and the event counters PMEVCNTR<n>. Reading the register shows which overflow interrupt requests are enabled.

PMINTENCLR is used in conjunction with the PMINTENSET register.

**Configuration**

AArch32 System register PMINTENCLR bits [31:0] are architecturally mapped to AArch64 System register PMINTENCLR_EL1[31:0].

AArch32 System register PMINTENCLR bits [31:0] are architecturally mapped to External register PMINTENCLR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMINTENCLR are UNDEFINED.

**Attributes**

PMINTENCLR is a 32-bit register.

**Field descriptions**

The PMINTENCLR bit assignments are:

On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow interrupt request disable bit for PMEVCNTR<n>.

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1, N is the value in MDCR_EL2.HPMN if EL2 is using AArch64, or in HDCR.HPMN if EL2 is using AArch32. Otherwise, N is the value in PMCR.N.

PMMIR, Performance Monitors Machine Identification Register

The PMMIR characteristics are:

**Purpose**

Describes Performance Monitors parameters specific to the implementation to software.

**Configuration**

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3p4 is implemented. Otherwise, direct accesses to PMMIR are UNDEFINED.

**Attributes**

PMMIR is a 32-bit register.

**Field descriptions**

The PMMIR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>BUS_WIDTH</th>
<th>BUS_SLOTS</th>
<th>SLOTS</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>30</td>
<td>29</td>
<td>28</td>
</tr>
<tr>
<td>27</td>
<td>26</td>
<td>25</td>
<td>24</td>
</tr>
<tr>
<td>23</td>
<td>22</td>
<td>21</td>
<td>20</td>
</tr>
<tr>
<td>19</td>
<td>18</td>
<td>17</td>
<td>16</td>
</tr>
<tr>
<td>14</td>
<td>13</td>
<td>12</td>
<td>11</td>
</tr>
<tr>
<td>8</td>
<td>7</td>
<td>6</td>
<td>5</td>
</tr>
<tr>
<td>3</td>
<td>2</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

**Bits [31:20]**

Reserved, RES0.

**BUS_WIDTH, bits [19:16]**

*From Armv8.7:*

Bus width. Indicates the number of bytes each BUS_ACCESS event relates to. Encoded as Log2(number of bytes), plus one. Defined values are:

<table>
<thead>
<tr>
<th>BUS_WIDTH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The information is not available.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Four bytes.</td>
</tr>
<tr>
<td>0b0100</td>
<td>8 bytes.</td>
</tr>
<tr>
<td>0b0101</td>
<td>16 bytes.</td>
</tr>
<tr>
<td>0b0110</td>
<td>32 bytes.</td>
</tr>
<tr>
<td>0b0111</td>
<td>64 bytes.</td>
</tr>
<tr>
<td>0b1000</td>
<td>128 bytes.</td>
</tr>
<tr>
<td>0b1001</td>
<td>256 bytes.</td>
</tr>
<tr>
<td>0b1010</td>
<td>512 bytes.</td>
</tr>
<tr>
<td>0b1011</td>
<td>1024 bytes.</td>
</tr>
<tr>
<td>0b1100</td>
<td>2048 bytes.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Each transfer is up to this number of bytes. An access might be smaller than the bus width.

When this field is nonzero, each access counted by BUS_ACCESS is at most BUS_WIDTH bytes. An implementation might treat a wide bus as multiple narrower buses, such that a wide access on the bus increments the BUS_ACCESS counter by more than one.
Otherwise:
Reserved, RAZ.

**BUS_SLOTS, bits [15:8]**

*From Armv8.7:*

Bus count. The largest value by which the BUS_ACCESS event might increment by in a single BUS_CYCLES cycle. If the information is not available, this field will read as zero.

Otherwise:
Reserved, RAZ.

**SLOTS, bits [7:0]**

Operation width. The largest value by which the STALL_SLOT event might increment by in a single cycle. If the STALL_SLOT event is not implemented, this field might read as zero.

**Accessing the PMMIR**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

        end
    else
        return PMMIR;
    end
elsif PSTATE.EL == EL3 then
    return PMMIR;

The PMOVSR characteristics are:

**Purpose**

Contains the state of the overflow bit for the Cycle Count Register, PMCCNTR, and each of the implemented event counters PMEVCNTR<n>. Writing to this register clears these bits.

**Configuration**

AArch32 System register PMOVSR bits [31:0] are architecturally mapped to AArch64 System register PMOVSCLR_EL0[31:0].

AArch32 System register PMOVSR bits [31:0] are architecturally mapped to External register PMOVSCLR_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMVv3 is implemented. Otherwise, direct accesses to PMOVSR are UNDEFINED.

**Attributes**

PMOVSR is a 32-bit register.

**Field descriptions**

The PMOVSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>C</td>
</tr>
<tr>
<td>00</td>
<td>When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.</td>
</tr>
<tr>
<td>01</td>
<td>When read, means the cycle counter has overflowed since this bit was last cleared. When written, clears the cycle counter overflow bit to 0.</td>
</tr>
</tbody>
</table>

PMCR.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR[31:0] or unsigned overflow of PMCCNTR[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P<n>, bit [n], for n = 30 to 0**

Event counter overflow clear bit for PMEVCNTR<n>.

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in MDCR_EL2.HPMN if EL2 is using AArch64, or in HDCR.HPMN if EL2 is using AArch32. Otherwise, N is the value in PMCR.N.
<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that PMEVCNTR&lt;n&gt; has not overflowed since this bit was last cleared. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that PMEVCNTR&lt;n&gt; has overflowed since this bit was last cleared. When written, clears the PMEVCNTR&lt;n&gt; overflow bit to 0.</td>
</tr>
</tbody>
</table>

If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP, HDCR.HLP, and PMCR.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<n>[31:0] or unsigned overflow of PMEVCNTR<n>[63:0]. PMEVCNTR<n>[63:32] cannot be accessed directly in AArch32 state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMOVSR**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

PMOVSR, Performance Monitors Overflow Flag Status Register

Page 2936
PMOVSSET, Performance Monitors Overflow Flag Status Set register

The PMOVSSET characteristics are:

**Purpose**

Sets the state of the overflow bit for the Cycle Count Register, **PMCCNTR**, and each of the implemented event counters **PMEVCNTR<n>**.

**Configuration**

AArch32 System register PMOVSSET bits [31:0] are architecturally mapped to AArch64 System register **PMOVSSET_EL0[31:0]**.

AArch32 System register PMOVSSET bits [31:0] are architecturally mapped to External register **PMOVSSET_EL0[31:0]**.

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMOVSSET are **UNDEFINED**.

**Attributes**

PMOVSSET is a 32-bit register.

**Field descriptions**

The PMOVSSET bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

**C, bit [31]**

Cycle counter overflow set bit.

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter has overflowed since this bit was last cleared. When written, sets the cycle counter overflow bit to 1.</td>
</tr>
</tbody>
</table>

**PMCR.LC** controls whether an overflow is detected from unsigned overflow of **PMCCNTR[31:0]** or unsigned overflow of **PMCCNTR[63:0]**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**P<n>, bit [n], for n = 30 to 0**

Event counter overflow set bit for **PMEVCNTR<n>**.

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in **MDCR_EL2.HPMN** if EL2 is using AArch64, or in **HDCR.HPMN** if EL2 is using AArch32. Otherwise, N is the value in **PMCR.N**.
<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that PMEVCNTR&lt;n&gt; has not overflowed since this bit was last cleared. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that PMEVCNTR&lt;n&gt; has overflowed since this bit was last cleared. When written, sets the PMEVCNTR&lt;n&gt; overflow bit to 1.</td>
</tr>
</tbody>
</table>

If FEAT_PMUv3p5 is implemented, MDCR_EL2_HLP, HDCR_HLP, and PMCR_LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<n>[31:0] or unsigned overflow of PMEVCNTR<n>[63:0]. PMEVCNTR<n>[63:32] cannot be accessed directly in AArch32 state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMOVSSET**

PMSELR, Performance Monitors Event Counter Selection Register

The PMSELR characteristics are:

**Purpose**

Selects the current event counter PMEVCNTR<n> or the cycle counter, CCNT.

PMSELR is used in conjunction with PMXEVTYPER to determine the event that increments a selected event counter, and the modes and states in which the selected counter increments.

It is also used in conjunction with PMXEVCNTR, to determine the value of a selected event counter.

**Configuration**

AArch32 System register PMSELR bits [31:0] are architecturally mapped to AArch64 System register PMSELR_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMSELR are UNDEFINED.

**Attributes**

PMSELR is a 32-bit register.

**Field descriptions**

The PMSELR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:5]**

Reserved, RES0.

**SEL, bits [4:0]**

Selects event counter PMEVCNTR<n>, where n is the value held in this field. This value identifies which event counter is accessed when a subsequent access to PMXEVTYPER or PMXEVCNTR occurs.

This field can take any value from 0 (0b00000) to (PMCR.N)-1, or 31 (0b11111).

When PMSELR.SEL is 0b11111, it selects the cycle counter and:

- A read of the PMXEVTYPER returns the value of PMCCFILTR.
- A write of the PMXEVTYPER writes to PMCCFILTR.
- A read or write of PMXEVCNTR has CONSTRAINED UNPREDICTABLE effects. See PMXEVCNTR for more details.

For details of the results of accesses to event counters, see PMXEVTYPER and PMXEVCNTR.

For information about the number of counters accessible at each Exception level, see HDCR.HPMN and MDCR_EL2.HPMN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing the PMSELR

Accesses to this register use the following encodings:

\[
\text{MRC}\{\langle c\rangle}\{\langle q\rangle\} \langle \text{coproc} \rangle, \{\#\langle \text{opc1} \rangle\}, \langle \text{Rt} \rangle, \langle \text{CRn} \rangle, \langle \text{CRm} \rangle, \{\#\langle \text{opc2} \rangle\}
\]

PMSWINC, Performance Monitors Software Increment register

The PMSWINC characteristics are:

**Purpose**

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see SW_INCR.

**Configuration**

AArch32 System register PMSWINC bits [31:0] are architecturally mapped to AArch64 System register PMSWINC_EL0[31:0].

AArch32 System register PMSWINC bits [31:0] are architecturally mapped to External register PMSWINC_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMSWINC are UNDEFINED.

**Attributes**

PMSWINC is a 32-bit register.

**Field descriptions**

The PMSWINC bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>

PMUSERENR, Performance Monitors User Enable Register

The PMUSERENR characteristics are:

**Purpose**

Enables or disables User mode access to the Performance Monitors.

**Configuration**

AArch32 System register PMUSERENR bits [31:0] are architecturally mapped to AArch64 System register PMUSERENR_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMUSERENR are UNDEFINED.

**Attributes**

PMUSERENR is a 32-bit register.

**Field descriptions**

The PMUSERENR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
<td>RES0 ER CR SW EN</td>
</tr>
</tbody>
</table>

**Bits [31:4]**

Reserved, RES0.

**ER, bit [3]**

Event counter read trap control:

<table>
<thead>
<tr>
<th>ER</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 reads of the PMXEVCNTR and PMEVCNTR&lt;n&gt;, and EL0 RW access to the PMSELR, are trapped to Undefined mode if PMUSERENR.EN is also 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Overrides PMUSERENR.EN and enables RO access to PMXEVCNTR and PMEVCNTR&lt;n&gt;, and RW access to PMSELR.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**CR, bit [2]**

Cycle counter read trap control:

<table>
<thead>
<tr>
<th>CR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 reads of the PMCCNTR are trapped to Undefined mode if PMUSERENR.EN is also 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Overrides PMUSERENR.EN and enables access to PMCCNTR.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.
**SW, bit [1]**

Software increment write trap control:

<table>
<thead>
<tr>
<th>SW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>(0b0)</td>
<td>EL0 writes to the PMSWINC are trapped to Undefined mode if PMUSERENR.EN is also 0.</td>
</tr>
<tr>
<td>(0b1)</td>
<td>Overrides PMUSERENR.EN and enables access to PMSWINC.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**EN, bit [0]**

Traps EL0 accesses to the Performance Monitors registers to Undefined mode, as follows:

- PMCR, PMOVSR, PMSLR, PMCEID0, PMCEID1, PMCCNTR, PMXEVTYPER, PMXEVCTR, PMCENSET, PMCCNTRCLR, PMOVSSET, PMEVCTR<n>, PMEVTYPE<n>, PMCCFILT, PMSWINC.
- If FEAT_PMUv3p1 is implemented, PMCEID2, and PMCEID3.
- If FEAT_PMUv3p4 is implemented, PMMIR.

<table>
<thead>
<tr>
<th>EN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>(0b0)</td>
<td>While at EL0, accesses to the specified registers at EL0 are trapped to Undefined mode, unless overridden by one of PMUSERENR.{ER, CR, SW}.</td>
</tr>
<tr>
<td>(0b1)</td>
<td>While at EL0, software can access all of the specified registers.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**Accessing the PMUSERENR**

Accesses to this register use the following encodings:

\(\text{MRC\{<c>\}{<q>}} \text{<coproc>, \{#<opc1>, <Rt>, <CRn>, <CRm>{, \{#<opc2>\}}}}\)

<table>

PMXEVCNTR, Performance Monitors Selected Event Count Register

The PMXEVCNTR characteristics are:

**Purpose**

Reads or writes the value of the selected event counter, PMEVCNTR<n>. PMSELR.SEL determines which event counter is selected.

**Configuration**

AArch32 System register PMXEVCNTR bits [31:0] are architecturally mapped to AArch64 System register PMXEVCNTR_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMXEVCNTR are UNDEFINED.

**Attributes**

PMXEVCNTR is a 32-bit register.

**Field descriptions**

The PMXEVCNTR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

PMEVCNTR<n>, bits [31:0]

Value of the selected event counter, PMEVCNTR<n>, where n is the value stored in PMSELR.SEL.

If FEAT_PMUv3p5 is implemented, the event counter is 64 bits and only the least-significant part of the event counter is accessible in AArch32 state:

- Reads from PMXEVCNTR return bits [31:0] of the counter.
- There is no means to access bits [63:32] directly from AArch32 state.
- If the implementation does not support AArch64 at any Exception level, bits [63:32] are not required to be implemented.

If FEAT_PMUv3p5 is not implemented, the event counter is 32 bits.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMXEVCNTR**

If FEAT_FGT is implemented and PMSELR SEL is greater than or equal to the number of accessible counters, then the behavior of permitted reads and writes of PMXEVCNTR is as follows:

- If PMSELR.SEL selects an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and PMSELR.SEL is greater than or equal to the number of accessible counters, then reads and writes of PMXEVCNTR are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:
Accesses to the register are UNDEFINED.
Accesses to the register behave as RAZ/WI.
Accesses to the register execute as a NOP.
Accesses to the register behave as if PMSELR_SEL has an UNKNOWN value less than the number of event counters accessible at the current Exception level and Security state.
If EL2 is implemented and enabled in the current Security state, and PMSELR_SEL is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

**Note**

In EL0, an access is permitted if it is enabled by PMUSERENR:{ER,EN} or PMUSERENR_EL0:{ER,EN}.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, HDCR.HPMN identifies the number of accessible event counters.
- If EL2 is using AArch64, MDCR_EL2.HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented counters. See HDCR.HPMN and MDCR_EL2.HPMN for more details.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#\}<\text{opc2}>

PMXEVTPYPER, Performance Monitors Selected Event Type Register

The PMXEVTPYPER characteristics are:

**Purpose**

When PMSELR SEL selects an event counter, this accesses a PMEVTYPER<n> register. When PMSELR_SEL selects the cycle counter, this accesses PMCCFILTR.

**Configuration**

AArch32 System register PMXEVTPYPER bits [31:0] are architecturally mapped to AArch64 System register PMXEVTPYPER_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMXEVTPYPER are UNDEFINED.

**Attributes**

PMXEVTPYPER is a 32-bit register.

**Field descriptions**

The PMXEVTPYPER bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Event type register or PMCCFILTR |

**Bits [31:0]**

Event type register or PMCCFILTR.

When PMSELR_SEL == 31, this register accesses PMCCFILTR.

Otherwise, this register accesses PMEVTYPER<n> where n is the value in PMSELR_SEL.

**Accessing the PMXEVTPYPER**

If FEAT_FGT is implemented, and PMSELR_SEL is not 31 and is greater than or equal to the number of accessible counters, then the behavior of permitted reads and writes of PMXEVTPYPER is as follows:

- If PMSELR_SEL selects an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented, and PMSELR_SEL is not 31 and is greater than or equal to the number of accessible counters, then reads and writes of PMXEVTPYPER are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP
- Accesses to the register behave as if PMSELR_SEL has an UNKNOWN value less than the number of event counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if PMSELR_SEL is 31.
- If EL2 is implemented and enabled in the current Security state, and PMSELR_SEL is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.
Note

In EL0, an access is permitted if it is enabled by `PMUSERENR.EN` or `PMUSERENR_EL0.EN`.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, `HDCR.HPMN` identifies the number of accessible event counters.
- If EL2 is using AArch64, `MDCR_EL2.HPMN` identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented counters. See `HDCR.HPMN` and `MDCR_EL2.HPMN` for more details.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}\{<q>\} <\text{coproc}>, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>\{, \{#\}<\text{opc2}>\}

PRRR, Primary Region Remap Register

The PRRR characteristics are:

**Purpose**

Controls the top level mapping of the TEX[0], C, and B memory region attributes.

**Configuration**

AArch32 System register PRRR bits [31:0] are architecturally mapped to AArch64 System register `MAIR_EL1[31:0]` when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register PRRR bits [31:0] are architecturally mapped to AArch32 System register `MAIR0[31:0]` when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register PRRR bits [31:0] (PRRR_S) are architecturally mapped to AArch32 System register `MAIR0[31:0]` (MAIR0_S) when EL3 is using AArch32.

AArch32 System register PRRR bits [31:0] (PRRR_NS) are architecturally mapped to AArch32 System register `MAIR0[31:0]` (MAIR0_NS) when EL3 is using AArch32.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to PRRR are UNDEFINED.

`MAIR0` and PRRR are the same register, with a different view depending on the value of `TTBCR.EAE`:

- When it is set to 0, the register is as described in PRRR.
- When it is set to 1, the register is as described in `MAIR0`.

**Attributes**

PRRR is a 32-bit register.

**Field descriptions**

The PRRR bit assignments are:

**When TTBCR.EAE == 0:**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23222120 | 19 | 18 | 17 | 16 | 151413121110 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|-----------|----|----|----|----|----------------|---|---|---|---|---|---|---|---|---|---|---|
| NOS7 | NOS6 | NOS5 | NOS4 | NOS3 | NOS2 | NOS1 | NOS0 | RES0 | NS1 | NS0 | DS1 | DS0 | TR7 | TR6 | TR5 | TR4 | TR3 | TR2 | TR1 | TR0 |

**NOS<n>, bit [n+24], for n = 7 to 0**

Not Outer Shareable. NOS<n> is the Outer Shareable property for memory attributes n, if the region is mapped as Normal memory that is not Inner Non-cacheable, Outer Non-cacheable, and the appropriate PRRR.{NS0, NS1} field identifies the region as shareable. n is the value of the concatenation of the {TEX[0], C, B} bits from the translation table descriptor. The possible values of each NOS<n> field other than NOS6 are:

<table>
<thead>
<tr>
<th>NOS&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Memory region is Outer Shareable.</td>
</tr>
<tr>
<td>0b1</td>
<td>Memory region is Inner Shareable.</td>
</tr>
</tbody>
</table>

The value of this bit is ignored if the region is:

- Device memory
- Normal memory that is at least one of:
  - Inner Non-cacheable, Outer Non-cacheable.
  - Identified by the appropriate PRRR.{NS0, NS1} field as Non-shareable.
The meaning of the NOS6 field is **IMPLEMENTATION DEFINED**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [23:20]**

Reserved, RES0.

**NS1, bit [19]**

Mapping of S = 1 attribute for Normal memory regions. This field is used in determining the Shareability of a memory region that is mapped to Normal memory and both:

- Is not Inner Non-cacheable, Outer Non-cacheable.
- Has the S bit in the translation table descriptor set to 1.

The possible values of this bit are:

<table>
<thead>
<tr>
<th>NS1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Region is Non-shareable.</td>
</tr>
<tr>
<td>0b1</td>
<td>Region is shareable. The value of the appropriate PRRR.NOS&lt;n&gt;</td>
</tr>
<tr>
<td></td>
<td>field determines whether the region is Inner Shareable or Outer</td>
</tr>
<tr>
<td></td>
<td>Shareable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**NS0, bit [18]**

Mapping of S = 0 attribute for Normal memory regions. This field is used in determining the Shareability of a memory region that is mapped to Normal memory and both:

- Is not Inner Non-cacheable, Outer Non-cacheable.
- Has the S bit in the translation table descriptor set to 0.

The possible values of this bit are:

<table>
<thead>
<tr>
<th>NS0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Region is Non-shareable.</td>
</tr>
<tr>
<td>0b1</td>
<td>Region is shareable. The value of the appropriate PRRR.NOS&lt;n&gt;</td>
</tr>
<tr>
<td></td>
<td>field determines whether the region is Inner Shareable or Outer</td>
</tr>
<tr>
<td></td>
<td>Shareable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**DS1, bit [17]**

Mapping of S = 1 attribute for Device memory. From Armv8, all types of Device memory are Outer Shareable, and therefore this bit is RES1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**DS0, bit [16]**

Mapping of S = 0 attribute for Device memory. From Armv8, all types of Device memory are Outer Shareable, and therefore this bit is RES1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**TR<n>, bits [2n+1:2n], for n = 7 to 0**

TR<n> is the primary TEX mapping for memory attributes n, and defines the mapped memory type for a region with attributes n. n is the value of the concatenation of the {TEX[0], C, B} bits from the translation table descriptor. The possible values for each field other than TR6 are:
The meaning of the TR6 field is IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

REVIDR, Revision ID Register

The REVIDR characteristics are:

**Purpose**

Provides implementation-specific minor revision information.

**Configuration**

AArch32 System register REVIDR bits [31:0] are architecturally mapped to AArch64 System register `REVIDR_EL1[31:0]`.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to REVIDR are **UNDEFINED**.

If REVIDR has the same value as `MIDR`, then its contents have no significance.

**Attributes**

REVIDR is a 32-bit register.

**Field descriptions**

The REVIDR bit assignments are:

<table>
<thead>
<tr>

        AArch32.TakeHypTrapException(0x03);
    else
        return REVIDR;
    endif
elsif PSTATE.EL == EL2 then
    return REVIDR;
elsif PSTATE.EL == EL3 then
    return REVIDR;
end
The RMR characteristics are:

**Purpose**

If EL1 or EL3 is the highest implemented Exception level and this register is implemented:

- A write to the register at the highest implemented Exception level can request a Warm reset.
- If the highest implemented Exception level can use AArch32 and AArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

**Configuration**

AArch32 System register RMR bits [31:0] are architecturally mapped to AArch64 System register RMR_EL1[31:0] when the highest implemented Exception level is EL1.

AArch32 System register RMR bits [31:0] are architecturally mapped to AArch64 System register RMR_EL3[31:0] when EL3 is implemented.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to RMR are UNDEFINED.

Only implemented if EL1 or EL3 is the highest implemented Exception level. In this case:

- If the highest implemented Exception level can use AArch32 and AArch64 then this register must be implemented.
- If the highest implemented Exception level cannot use AArch64 then it is IMPLEMENTATION DEFINED whether the register is implemented.

**Attributes**

RMR is a 32-bit register.

**Field descriptions**

The RMR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>0</td>
<td>Reset Request. Setting this bit to 1 requests a Warm reset.</td>
<td>1</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**AA64, bit [0]**

When the highest implemented Exception level can use AArch64, determines which Execution state the PE boots into after a Warm reset:

<table>
<thead>
<tr>
<th>AA64</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>AArch32.</td>
</tr>
<tr>
<td>0b1</td>
<td>AArch64.</td>
</tr>
</tbody>
</table>
On coming out of the Warm reset, execution starts at the implementation defined reset vector address of the specified execution state.

If the highest implemented Exception level cannot use AArch64 this bit is RAZ/WI.

When implemented as a RW field, this field resets to 0 on a Cold reset.

### Accessing the RMR

When EL3 is implemented, Arm deprecates accessing this register from any PE mode other than Monitor mode.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}\{<q>\} <\text{coproc}>, \{#\}<\text{opc}_1>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#\}<\text{opc}_2> \]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b1100</td>
<td>0b0000</td>
<td>0b010</td>
</tr>
</tbody>
</table>

if PSTATE.EL IN {EL1, EL3} && IsHighestEL(PSTATE.EL) then
  return RMR;
else
  UNDEFINED;

\[
\text{MCR}\{<c>\}\{<q>\} <\text{coproc}>, \{#\}<\text{opc}_1>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#\}<\text{opc}_2> \]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b1100</td>
<td>0b0000</td>
<td>0b010</td>
</tr>
</tbody>
</table>

if PSTATE.EL IN {EL1, EL3} && IsHighestEL(PSTATE.EL) then
  RMR = R[t];
else
  UNDEFINED;
RVBAR, Reset Vector Base Address Register

The RVBAR characteristics are:

**Purpose**

If EL3 is not implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch32 state.

**Configuration**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to RVBAR are UNDEFINED.

This register is only implemented if the highest Exception level implemented is capable of using AArch32, and is not EL3.

**Attributes**

RVBAR is a 32-bit register.

**Field descriptions**

The RVBAR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-1</td>
<td>Reset Address[31:1]</td>
</tr>
<tr>
<td>0</td>
<td>Reserved, RES1</td>
</tr>
</tbody>
</table>

**Bits [31:1]**

Reset Address[31:1]. Bits [31:1] of the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 32-bit state.

**Bit [0]**

Reserved, RES1.

**Accessing the RVBAR**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b1100</td>
<td>0b0000</td>
<td>0b001</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if IsHighestEL(EL1) then
        return RVBAR;
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T12 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T12 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif !ELUsingAArch32(EL2) && SCR_EL3.<NS,EEL2> == '01' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif !ELUsingAArch32(EL3) && SCR_EL3.NS == '0' then
        AArch64.AArch32SystemAccessTrap(EL3, 0x03);
    else
        UNDEFINED;
    endif
elsif PSTATE.EL == EL2 then
    if IsHighestEL(EL2) then
        return RVBAR;
    else
        UNDEFINED;
    endif
elsif PSTATE.EL == EL3 then
    return MVBAR;
SCR, Secure Configuration Register

The SCR characteristics are:

**Purpose**

When EL3 is implemented and can use AArch32, defines the configuration of the current Security state. It specifies:

- The Security state, either Secure or Non-secure.
- What mode the PE branches to if an IRQ, FIQ, or External abort occurs.
- Whether the PSTATE.F or PSTATE.A bits can be modified when SCR.NS==1.

**Configuration**

AArch32 System register SCR bits [31:0] can be mapped to AArch64 System register SCR_EL3[31:0], but this is not architecturally mandated.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SCR are UNDEFINED.

**Attributes**

SCR is a 32-bit register.

**Field descriptions**

The SCR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**TERR, bit [15]**

When FEAT_RAS is implemented:

Trap Error record accesses. Generate a Monitor Trap exception on accesses to the following registers from modes other than Monitor mode:

ERRIDR, ERRSELR, ERXADDR, ERXADDR2, ERXCTLR, ERXCTRLR2, ERXF, ERXFR2, ERXMISC0, ERXMISC1, ERXMISC2, ERXMISC3, and ERXSTATUS. When FEAT_RASv1p1 is implemented, ERXMISC4, ERXMISC5, ERXMISC6, ERXMISC7.

<table>
<thead>
<tr>
<th>TERR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to the specified registers from modes other than Monitor mode generate a Monitor Trap exception.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.
**Bit [14]**

Reserved, RES0.

**TWE, bit [13]**

Traps WFE instructions to Monitor mode.

<table>
<thead>
<tr>
<th>TWE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped. Any attempt to execute a WFE instruction in any mode other than Monitor mode is trapped to Monitor mode, if the instruction would otherwise have caused the PE to enter a low-power state and the attempted execution does not generate an exception that is taken to EL1 or EL2 by $\text{SCTLR.nTWE}$ or $\text{HCR.TWE}$. Any exception that is taken to EL1 or to EL2 has priority over this trap.</td>
</tr>
<tr>
<td>0b1</td>
<td></td>
</tr>
</tbody>
</table>

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**TWI, bit [12]**

Traps WFI instructions to Monitor mode.

<table>
<thead>
<tr>
<th>TWI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped. Any attempt to execute a WFI instruction in any mode other than Monitor mode is trapped to Monitor mode, if the instruction would otherwise have caused the PE to enter a low-power state and the attempted execution does not generate an exception that is taken to EL1 or EL2 by $\text{SCTLR.nTWI}$ or $\text{HCR.TWI}$. Any exception that is taken to EL1 or to EL2 has priority over this trap.</td>
</tr>
<tr>
<td>0b1</td>
<td></td>
</tr>
</tbody>
</table>

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**Bits [11:10]**

Reserved, RES0.
**SIF, bit [9]**

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from Non-secure memory. The possible values for this bit are:

<table>
<thead>
<tr>
<th>SIF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure state instruction fetches from Non-secure memory are permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure state instruction fetches from Non-secure memory are not permitted.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**HCE, bit [8]**

Hypervisor Call instruction enable. If EL2 is implemented, enables execution of HVC instructions at Non-secure EL1 and EL2.

<table>
<thead>
<tr>
<th>HCE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>HVC instructions are:</td>
</tr>
<tr>
<td></td>
<td>• UNDEFINED at Non-secure EL1. The Undefined Instruction exception is taken from PL1 to PL1.</td>
</tr>
<tr>
<td></td>
<td>• UNPREDICTABLE at EL2. Behavior is one of the following:</td>
</tr>
<tr>
<td></td>
<td>◦ The instruction is UNDEFINED.</td>
</tr>
<tr>
<td></td>
<td>◦ The instruction executes as a NOP.</td>
</tr>
<tr>
<td>0b1</td>
<td>HVC instructions are enabled at Non-secure EL1 and EL2.</td>
</tr>
</tbody>
</table>

**Note**

HVC instructions are always UNDEFINED at EL0 and in Secure state.

If EL2 is not implemented, this bit is RES0 and HVC is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**SCD, bit [7]**

Secure Monitor Call disable. Disables SMC instructions.

<table>
<thead>
<tr>
<th>SCD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>SMC instructions are enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>In Non-secure state, SMC instructions are UNDEFINED. The Undefined Instruction exception is taken from the current Exception level to the current Exception level. In Secure state, behavior is one of the following:</td>
</tr>
<tr>
<td></td>
<td>◦ The instruction is UNDEFINED.</td>
</tr>
<tr>
<td></td>
<td>◦ The instruction executes as a NOP.</td>
</tr>
</tbody>
</table>

**Note**

SMC instructions are always UNDEFINED at PL0.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**nET, bit [6]**

Not Early Termination. This bit disables early termination.

<table>
<thead>
<tr>
<th>nET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Early termination permitted. Execution time of data operations can depend on the data values.</td>
</tr>
<tr>
<td>0b1</td>
<td>Disable early termination. The number of cycles required for data operations is forced to be independent of the data values.</td>
</tr>
</tbody>
</table>
This implementation defined mechanism can disable data dependent timing optimizations from multiplies and data operations. It can provide system support against information leakage that might be exploited by timing correlation types of attack.

On implementations that do not support early termination or do not support disabling early termination, this bit is RES0.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**AW, bit [5]**

When the value of SCR.EA is 1 and the value of HCR.AMO is 0, this bit controls whether PSTATE.A masks an External abort taken from Non-secure state.

<table>
<thead>
<tr>
<th>AW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>External aborts taken from Non-secure state are not masked by PSTATE.A, and are taken to EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>External aborts taken from Secure state are masked by PSTATE.A. When PSTATE.A is 0, the abort is taken to EL3.</td>
</tr>
</tbody>
</table>

When SCR.EA is 0 or HCR.AMO is 1, this bit has no effect.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**FW, bit [4]**

When the value of SCR.FIQ is 1 and the value of HCR.FMO is 0, this bit controls whether PSTATE.F masks an FIQ interrupt taken from Non-secure state.

<table>
<thead>
<tr>
<th>FW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An FIQ taken from Non-secure state is not masked by PSTATE.F, and is taken to EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>An FIQ taken from Secure state is masked by PSTATE.F.</td>
</tr>
</tbody>
</table>

When SCR.FIQ is 0 or HCR.FMO is 1, this bit has no effect.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**EA, bit [3]**

External Abort handler. This bit controls which mode takes External aborts and SError interrupt exceptions.

<table>
<thead>
<tr>
<th>EA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>External aborts taken to Abort mode.</td>
</tr>
<tr>
<td>0b1</td>
<td>External aborts taken to Monitor mode.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**FIQ, bit [2]**

FIQ handler. This bit controls which mode takes FIQ exceptions.

<table>
<thead>
<tr>
<th>FIQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FIQs taken to FIQ mode.</td>
</tr>
<tr>
<td>0b1</td>
<td>FIQs taken to Monitor mode.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**IRQ, bit [1]**

IRQ handler. This bit controls which mode takes IRQ exceptions.
**IRQ**

<table>
<thead>
<tr>
<th>IRQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IRQs taken to IRQ mode.</td>
</tr>
<tr>
<td>0b1</td>
<td>IRQs taken to Monitor mode.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**NS, bit [0]**

Non-secure bit. Except when the PE is in Monitor mode, this bit determines the Security state of the PE:

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PE is in Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>PE is in Non-secure state.</td>
</tr>
</tbody>
</table>

If the HCR.TGE bit is set, an attempt to change from a Secure PL1 mode to a Non-secure EL1 mode by changing the SCR.NS bit from 0 to 1 results in the SCR.NS bit remaining as 0.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**Accessing the SCR**

Accesses to this register use the following encodings:

\[
\text{MRC\{<c>\}{<q>} <coproc>, \{#\}<opc1>, <Rt>, <CRn>, <CRm>\{, \{#\}<opc2>\}}
\]

<table>
<thead>

SCTLR, System Control Register

The SCTLR characteristics are:

**Purpose**

Provides the top level control of the system, including its memory system.

**Configuration**

AArch32 System register SCTLR bits [31:0] are architecturally mapped to AArch64 System register SCTLR_EL1[31:0]. This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SCTLR are UNDEFINED.

Some bits in the register are read-only. These bits relate to non-configurable features of an implementation, and are provided for compatibility with previous versions of the architecture.

**Attributes**

SCTLR is a 32-bit register.

**Field descriptions**

The SCTLR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| DSSBS | TE | AF | ET | RES0 | EE | RES0 | SPAN | RES1 | RES0 | UWXN | WXN | nTWE | RES0 | nTWI | RES0 | V | RES1 | EnRCTX | RES0 | SED | ITD | UNK | CP15BEN | LSMAOE | nTLSMD | C | A | M |

**DSSBS, bit [31]**

When FEAT_SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry. The defined values are:

<table>
<thead>
<tr>
<th>DSSBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PSTATE.SSBS is set to 0 on an exception to any mode in this security state except Hyp mode</td>
</tr>
<tr>
<td>0b1</td>
<td>PSTATE.SSBS is set to 1 on an exception to any mode in this security state except Hyp mode</td>
</tr>
</tbody>
</table>

**Note**

When EL3 is implemented and is using AArch32, this bit is banked between the two Security states.

On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

**Otherwise:**

Reserved, RES0.

**TE, bit [30]**

T32 Exception Enable. This bit controls whether exceptions to an Exception Level that is executing at PL1 are taken to A32 or T32 state:
Meaning

| TE | Exceptions, including reset, taken to A32 state. |
|    | Exceptions, including reset, taken to T32 state. |

On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

**AFE, bit [29]**

Access Flag Enable. When using the Short-descriptor translation table format for the PL1&0 translation regime, this bit enables use of the AP[0] bit in the translation descriptors as the Access flag, and restricts access permissions in the translation descriptors to the simplified model. The possible values of this bit are:

<table>
<thead>
<tr>
<th>AFE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>In the translation table descriptors, AP[0] is an access permissions bit. The full range of access permissions is supported. No Access flag is implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>In the translation table descriptors, AP[0] is the Access flag. Only the simplified model for access permissions is supported.</td>
</tr>
</tbody>
</table>

When using the Long-descriptor translation table format, the VMSA behaves as if this bit is set to 1, regardless of the value of this bit.

The AFE bit is permitted to be cached in a TLB.

On a Warm reset, this field resets to 0.

**TRE, bit [28]**

TEX remap enable. This bit enables remapping of the TEX[2:1] bits in the PL1&0 translation regime for use as two translation table bits that can be managed by the operating system. Enabling this remapping also changes the scheme used to describe the memory region attributes in the VMSA. The possible values of this bit are:

<table>
<thead>
<tr>
<th>TRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TEX remap disabled. TEX[2:0] are used, with the C and B bits, to describe the memory region attributes.</td>
</tr>
<tr>
<td>0b1</td>
<td>TEX remap enabled. TEX[2:1] are reassigned for use as bits managed by the operating system. The TEX[0], C, and B bits are used to describe the memory region attributes, with the MMU remap registers.</td>
</tr>
</tbody>
</table>

When the value of TTBCR.EAE is 1, this bit is RES1.

The TRE bit is permitted to be cached in a TLB.

On a Warm reset, this field resets to 0.

**Bits [27:26]**

Reserved, RES0.

**EE, bit [25]**

The value of the PSTATE.E bit on branch to an exception vector or coming out of reset, and the endianness of stage 1 translation table walks in the PL1&0 translation regime.

The possible values of this bit are:

<table>
<thead>
<tr>
<th>EE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Little-endian. PSTATE.E is cleared to 0 on taking an exception or coming out of reset. Stage 1 translation table walks in the PL1&amp;0 translation regime are little-endian.</td>
</tr>
<tr>
<td>0b1</td>
<td>Big-endian. PSTATE.E is set to 1 on taking an exception or coming out of reset. Stage 1 translation table walks in the PL1&amp;0 translation regime are big-endian.</td>
</tr>
</tbody>
</table>
If an implementation does not provide Big-endian support for data accesses at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support for data accesses at Exception Levels higher than EL0, this bit is RES1.

On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

**Bit [24]**

Reserved, RES0.

**SPAN, bit [23]**

*When FEAT_PAN is implemented:*

Set Privileged Access Never, on taking an exception to EL1 from either Secure or Non-secure state, or to EL3 from Secure state when EL3 is using AArch32.

<table>
<thead>
<tr>
<th>SPAN</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0  | PSTATE.PAN is set to 1 in the following situations:  
  - In Non-secure state, on taking an exception to EL1.  
  - In Secure state, when EL3 is using AArch64, on taking an exception to EL1.  
  - In Secure state, when EL3 is using AArch32, on taking an exception to EL3. |
| 0b1  | The value of PSTATE.PAN is left unchanged on taking an exception to EL1. |

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.

**Bit [22]**

Reserved, RES1.

**Bit [21]**

Reserved, RES0.

**UWXN, bit [20]**

Unprivileged write permission implies PL1 XN (Execute-never). This bit can force all memory regions that are writable at PL0 to be treated as XN for accesses from software executing at PL1. The possible values of this bit are:

<table>
<thead>
<tr>
<th>UWXN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on memory access permissions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any region that is writable at PL0 forced to XN for accesses from software executing at PL1.</td>
</tr>
</tbody>
</table>

The UWXN bit is permitted to be cached in a TLB.

On a Warm reset, this field resets to 0.

**WXN, bit [19]**

Write permission implies XN (Execute-never). For the PL1&0 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:
This bit applies only when SCTLR.M bit is set.

The WXN bit is permitted to be cached in a TLB.

On a Warm reset, this field resets to 0.

### nTWE, bit [18]

Traps EL0 execution of WFE instructions to Undefined mode.

<table>
<thead>
<tr>
<th>nTWE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any attempt to execute a WFE instruction at EL0 is trapped to Undefined mode, if the instruction would otherwise have caused the PE to enter a low-power state.</td>
</tr>
</tbody>
</table>

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

On a Warm reset, this field resets to 1.

### Bit [17]

Reserved, RES0.

### nTWI, bit [16]

Traps EL0 execution of WFI instructions to Undefined mode.

<table>
<thead>
<tr>
<th>nTWI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any attempt to execute a WFI instruction at EL0 is trapped to Undefined mode, if the instruction would otherwise have caused the PE to enter a low-power state.</td>
</tr>
</tbody>
</table>

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

On a Warm reset, this field resets to 1.
Bits [15:14]

Reserved, RES0.

V, bit [13]

Vectors bit. This bit selects the base address of the exception vectors for exceptions taken to a PE mode other than Monitor mode or Hyp mode:

<table>
<thead>
<tr>
<th>V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal exception vectors. Base address is held in <strong>VBAR</strong>.</td>
</tr>
<tr>
<td>0b1</td>
<td>High exception vectors (Hivecs), base address 0xFFFF0000. This base address cannot be remapped.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

I, bit [12]

Instruction access Cacheability control, for accesses at EL1 and EL0:

<table>
<thead>
<tr>
<th>I</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All instruction access to Normal memory from PL1 and PL0 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR.M is 0, instruction accesses from stage 1 of the PL1&amp;0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>All instruction access to Normal memory from PL1 and PL0 can be cached at all levels of instruction and unified cache. If the value of SCTLR.M is 0, instruction accesses from stage 1 of the PL1&amp;0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.</td>
</tr>
</tbody>
</table>

Instruction accesses to Normal memory from EL1 and EL0 are Cacheable regardless of the value of the SCTLR.I bit if either:

- EL2 is using AArch32 and the value of **HCR.DC** is 1.
- EL2 is using AArch64 and the value of **HCR_EL2.DC** is 1.

On a Warm reset, this field resets to 0.

Bit [11]

Reserved, RES1.

EnRCTX, bit [10]

When FEAT_CSV2 is implemented:

Enable EL0 Access to the AArch32 CFPRCTX, DVPRCTX and CPPRCTX instructions. The defined values are:

<table>
<thead>
<tr>
<th>EnRCTX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 access to these instructions is disabled, and these instructions are trapped to EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 access to these instructions is enabled.</td>
</tr>
</tbody>
</table>

Note

When EL3 is implemented and is using AArch32, this bit is banked between the two Security states.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

Bit [9]

Reserved, RES0.

SED, bit [8]

SETEND instruction disable. Disables SETEND instructions at PL0 and PL1.

<table>
<thead>
<tr>
<th>SED</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>SETEND instruction execution is enabled at PL0 and PL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>SETEND instructions are UNDEFINED at PL0 and PL1.</td>
</tr>
</tbody>
</table>

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

On a Warm reset, this field resets to 0.

ITD, bit [7]

IT Disable. Disables some uses of IT instructions at PL1 and PL0.

<table>
<thead>
<tr>
<th>ITD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All IT instruction functionality is enabled at PL1 and PL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any attempt at PL1 or PL0 to execute any of the following is UNDEFINED:</td>
</tr>
</tbody>
</table>

- All encodings of the IT instruction with hw1[3:0]!=1000.
- All encodings of the subsequent instruction with the following values for hw1:
  - 11xxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.
  - 1011xxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions'.
  - 10100xxxxxxxxxxx: ADD Rd, PC, #imm
  - 01001xxxxxxxxxxx: LDR Rd, [PC, #imm]
  - 01001xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rdr, PC; BX PC; BLX PC.
  - 010001x1xxxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rm.

These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.

It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:

- A 16-bit instruction, that can only be followed by another 16-bit instruction.
- The first half of a 32-bit instruction.

This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.

An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see 'Changes to an ITD control by an instruction in an IT block'.

ITD is optional, but if it is implemented in the SCTLR then it must also be implemented in the SCTLR_EL1. If it is not implemented then this bit is RAZ/WI.

On a Warm reset, this field resets to 0.
UNK, bit [6]

Writes to this bit are IGNORED. Reads of this bit return an UNKNOWN value.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

CP15BEN, bit [5]

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from PL1 and PL0:

<table>
<thead>
<tr>
<th>CP15BEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PL0 and PL1 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is UNDEFINED.</td>
</tr>
<tr>
<td>0b1</td>
<td>PL0 and PL1 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.</td>
</tr>
</tbody>
</table>

CP15BEN is optional, but if it is implemented in the SCTLR then it must also be implemented in the SCTLR_EL1. If it is not implemented then this bit is RAO/WI.

On a Warm reset, this field resets to 1.

LSMAOE, bit [4]

When FEAT_LSMAOC is implemented:

Load Multiple and Store Multiple Atomicity and Ordering Enable.

<table>
<thead>
<tr>
<th>LSMAOE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For all memory accesses at EL1 or EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.</td>
</tr>
<tr>
<td>0b1</td>
<td>The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL1 or EL0 is as defined for Armv8.0.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

On a Warm reset, this field resets to 1.

Otherwise:

Reserved, RES1.

nTLSMD, bit [3]

When FEAT_LSMAOC is implemented:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

<table>
<thead>
<tr>
<th>nTLSMD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL1 or EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.</td>
</tr>
<tr>
<td>0b1</td>
<td>All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL1 or EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

On a Warm reset, this field resets to 1.
Otherwise:

Reserved, RES1.

**C, bit [2]**

Cacheability control, for data accesses at EL1 and EL0:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All data access to Normal memory from PL1 and PL0, and all accesses to the PL1&amp;0 stage 1 translation tables, are Non-cacheable for all levels of data and unified cache.</td>
</tr>
<tr>
<td>0b1</td>
<td>All data access to Normal memory from PL1 and PL0, and all accesses to the PL1&amp;0 stage 1 translation tables, can be cached at all levels of data and unified cache.</td>
</tr>
</tbody>
</table>

The PE ignores SCTLR.C for Non-secure state and data accesses to Normal memory from EL1 and EL0 are Cacheable if either:

- EL2 is using AArch32 and the value of $HCR_{DC}$ is 1.
- EL2 is using AArch64 and the value of $HCR_{EL2}_{DC}$ is 1.

On a Warm reset, this field resets to 0.

**A, bit [1]**

Alignment check enable. This is the enable bit for Alignment fault checking at PL1 and PL0:

<table>
<thead>
<tr>
<th>A</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Alignment fault checking disabled when executing at PL1 or PL0. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.</td>
</tr>
<tr>
<td>0b1</td>
<td>Alignment fault checking enabled when executing at PL1 or PL0. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.</td>
</tr>
</tbody>
</table>

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

On a Warm reset, this field resets to 0.

**M, bit [0]**

MMU enable for EL1 and EL0 stage 1 address translation. Possible values of this bit are:

<table>
<thead>
<tr>
<th>M</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL1 and EL0 stage 1 address translation disabled. See the SCTLR.I field for the behavior of instruction accesses to Normal memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 and EL0 stage 1 address translation enabled.</td>
</tr>
</tbody>
</table>

In the Non-secure state the PE behaves as if the value of the SCTLR.M field is 0 for all purposes other than returning the value of a direct read of the field if either:

- EL2 is using AArch32 and the value of $HCR_{\{DC, TGE\}}$ is not {0, 0}.
- EL2 is using AArch64 and the value of $HCR_{EL2}\_{\{DC, TGE\}}$ is not {0, 0}.

On a Warm reset, this field resets to 0.
Accessing the SCTLR

Accesses to this register use the following encodings:

\[ \text{MRC\{}<c>{q}\}\ <\text{coproc}, \#<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}\{, \#<\text{opc2}\}\} \]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b0001</td>
<td>0b0000</td>
<td>0b000</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
    UNDEFINED;

    else
        if SCR_NS == '0' then
            SCTLR_S = R[t];
        else
            SCTLR_NS = R[t];

SDCR, Secure Debug Control Register

The SDCR characteristics are:

**Purpose**

Provides EL3 configuration options for self-hosted debug, trace, and the Performance Monitors Extension.

**Configuration**

AArch32 System register SDCR bits [31:0] can be mapped to AArch64 System register MDCR_EL3[31:0], but this is not architecturally mandated.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SDCR are UNDEFINED.

**Attributes**

SDCR is a 32-bit register.

**Field descriptions**

The SDCR bit assignments are:

```
31  30  29  28  27  26  25  24  23  22  21  20  19  18  17  16  15  14  13  12  11  10  9  8  7  6  5  4  3  2  1  0
RES0 MTPME|TDCC RES0 SCCD|RES0|EPMAD|EDAD|TT|TR|STE|SP|RES0|RES0|RES0|RES0|RES0|RES0|RES0|RES0
```

**Bits [31:29]**

Reserved, RES0.

**MTPME, bit [28]**

When FEAT_MTPMU is implemented:

Multi-threaded PMU Enable. Enables use of the PMEVTYPER<n>.MT bits.

<table>
<thead>
<tr>
<th>MTPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FEAT_MTPMU is disabled. The Effective value of PMEVTYPER&lt;n&gt;.MT is zero.</td>
</tr>
<tr>
<td>0b1</td>
<td>PMEVTYPER&lt;n&gt;.MT bits not affected by this bit.</td>
</tr>
</tbody>
</table>

If FEAT_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this bit is 0b0.

On a Cold reset, in a system where the PE resets into EL3, this field resets to 1.

**Otherwise:**

Reserved, RES0.

**TDCC, bit [27]**

When FEAT_FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel in modes other than Monitor mode to Monitor mode.
The DCC registers trapped by this control are:

- **DBGDTRRXext**, **DBGDTRTXext**, **DBGDSCRInt**, **DBGDCCINT**, and, when the PE is in Non-debug state, **DBGDTRRXint** and **DBGDTRTXint**.

When the PE is in Debug state, SDCR.TDCC does not trap any accesses to:

- **DBGDTRRXint** and **DBGDTRTXint**.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

- Reserved, RES0.

**Bits [26:24]**

- Reserved, RES0.

**SCCD, bit [23]**

When **FEAT_PMUv3p5** is implemented:

Secure Cycle Counter Disable. Prohibits **PMCCNTR** from counting in Secure state.

<table>
<thead>
<tr>
<th>SCCD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counting by <strong>PMCCNTR</strong> is not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Cycle counting by <strong>PMCCNTR</strong> is prohibited in Secure state.</td>
</tr>
</tbody>
</table>

This bit does not affect the CPU_CYCLES event or any other event that counts cycles.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**Otherwise:**

- Reserved, RES0.

**Bit [22]**

- Reserved, RES0.

**EPMAD, bit [21]**

When **FEAT_Debugv8p4** is implemented and **FEAT_PMUv3** is implemented:

External Performance Monitors Non-secure access disable. Controls Non-secure access to Performance Monitors registers by an external debugger.

<table>
<thead>
<tr>
<th>EPMAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure access to the Performance Monitors registers from an external debugger is permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure access to the Performance Monitors registers from an external debugger is not permitted.</td>
</tr>
</tbody>
</table>

If the Performance Monitors Extension does not support external debug interface accesses this bit is **RES0**.
Otherwise, if EL3 is not implemented and the Effective value of `SCR.NS` is 0b0, then the Effective value of this field is 0b1.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**When FEAT_PMUv3 is implemented:**

External Performance Monitors access disable. Controls access to Performance Monitors registers by an external debugger.

<table>
<thead>
<tr>
<th>EPMAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to Performance Monitors registers from an external debugger is permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access to Performance Monitors registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.</td>
</tr>
</tbody>
</table>

If the Performance Monitors Extension does not support external debug interface accesses this bit is RES0.

Otherwise, if EL3 is not implemented and the Effective value of `SCR.NS` is 0b0, then the Effective value of this field is 0b1.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**EDAD, bit [20]**

**When FEAT_Debugv8p4 is implemented:**

External debug Non-secure access disable. Controls Non-secure access to breakpoint, watchpoint, and `OSLAR_EL1` registers by an external debugger.

<table>
<thead>
<tr>
<th>EDAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure access to debug registers from an external debugger is permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure access to breakpoint registers, watchpoint registers, and <code>OSLAR_EL1</code> from an external debugger is not permitted.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the Effective value of `SCR.NS` is 0b0, then the Effective value of this field is 0b1.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**When FEAT_Debugv8p2 is implemented:**

External debug access disable. Controls access to breakpoint, watchpoint, and `OSLAR_EL1` registers by an external debugger.

<table>
<thead>
<tr>
<th>EDAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to debug registers from an external debugger is permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access to breakpoint registers, watchpoint registers and <code>OSLAR_EL1</code> from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the Effective value of `SCR.NS` is 0b0, then the Effective value of this field is 0b1.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.
External debug access disable. Controls access to breakpoint, watchpoint, and optionally OSLAR_EL1 registers by an external debugger:

<table>
<thead>
<tr>
<th>EDAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to debug registers from an external debugger is permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access to breakpoint registers and watchpoint registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface. It is IMPLEMENTATION DEFINED whether access to the OSLAR_EL1 register from an external debugger is permitted or not permitted.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the Effective value of SCR NS is 0b0, then the Effective value of this field is 0b1.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**TTRF, bit [19]**

When FEAT_TRF is implemented:

Trap Trace Filter controls. Controls whether accesses at EL2 and EL1 to the trace filter control registers are trapped to EL3.

<table>
<thead>
<tr>
<th>TTRF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to HTRFCR and TRFCR registers are not affected by this control bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>When not in Monitor mode, accesses to HTRFCR and TRFCR registers generate a Monitor Trap exception, unless the access generates a higher priority exception.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

**STE, bit [18]**

When FEAT_TRF is implemented:

Secure Trace Enable. This bit enables tracing in Secure state and controls the level of authentication required by an external debugger to enable external tracing.

<table>
<thead>
<tr>
<th>STE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Trace is prohibited in Secure state unless overridden by the IMPLEMENTATION DEFINED authentication interface.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trace in Secure state is not affected by this bit.</td>
</tr>
</tbody>
</table>

This bit also controls the level of authentication required by an external debugger to enable external tracing. See 'Register controls to enable self-hosted trace'.

If EL3 is not implemented and the Effective value of SCR NS is 0b0, the PE behaves as if this bit is set to 0b1.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

**SPME, bit [17]**
When **FEAT_Debugv8p2** is implemented and **FEAT_PMUv3** is implemented:

Secure Performance Monitors enable. This allows event counting in Secure state.

<table>
<thead>
<tr>
<th>SPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counting prohibited in Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counting allowed in Secure state.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the Effective value of **SCR.NS** is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

When **FEAT_PMUv3** is implemented:

Secure Performance Monitors enable. This allows event counting in Secure state.

<table>
<thead>
<tr>
<th>SPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counting prohibited in Secure state, unless ExternalSecureNoninvasiveDebugEnabled() is TRUE.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counting allowed in Secure state.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the Effective value of **SCR.NS** is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

**Bit [16]**

Reserved, RES0.

**SPD, bits [15:14]**

AArch32 Secure self-hosted Privileged Debug. Enables or disables debug exceptions from EL3, other than Breakpoint Instruction exceptions

<table>
<thead>
<tr>
<th>SPD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Legacy mode. Debug exceptions from EL3 are enabled by the authentication interface.</td>
</tr>
<tr>
<td>0b10</td>
<td>Secure privileged debug disabled. Debug exceptions from EL3 are disabled.</td>
</tr>
<tr>
<td>0b11</td>
<td>Secure privileged debug enabled. Debug exceptions from EL3 are enabled.</td>
</tr>
</tbody>
</table>

Other values are reserved, and have the **CONSTRAINED UNPREDICTABLE** behavior that they must have the same behavior as 0b00. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field has no effect on Breakpoint Instruction exceptions. These are always enabled.

This field is ignored in Non-secure state.

If debug exceptions from EL3 are enabled, then debug exceptions from Secure EL0 are also enabled.

Otherwise, debug exceptions from Secure EL0 are enabled only if the value of **SDER.SUIDEN** is 0b1.

If EL3 is not implemented and the Effective value of **SCR.NS** is 0b0, then the Effective value of this field is 0b11.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.
Bits [13:0]

Reserved, RES0.

SDER, Secure Debug Enable Register

The SDER characteristics are:

**Purpose**

Controls invasive and non-invasive debug in the Secure EL0 mode.

**Configuration**

AArch32 System register SDER bits [31:0] are architecturally mapped to AArch64 System register SDER32_EL3[31:0].

This register is present only when AArch32 is supported at any Exception level, or EL3 is implemented or the implemented Security state is Secure state. Otherwise, direct accesses to SDER are UNDEFINED.

This register is ignored by the PE when one or more of the following are true:

- The PE is in Non-secure state.
- EL1 is using AArch64.

**Attributes**

SDER is a 32-bit register.

**Field descriptions**

The SDER bit assignments are:

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0          |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0 | SUNIDEN | SUIDEN |

**Bits [31:2]**

Reserved, RES0.

**SUNIDEN, bit [1]**

Secure User Non-Invasive Debug Enable.

<table>
<thead>
<tr>
<th>SUNIDEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This bit does not affect Performance Monitors event counting at Secure EL0</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL3 or EL1 is using AArch32, Performance Monitors event counting is allowed in Secure EL0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**SUIDEN, bit [0]**

Secure User Invasive Debug Enable.

<table>
<thead>
<tr>
<th>SUIDEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This bit does not affect the generation of debug exceptions at Secure EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL3 or EL1 is using AArch32, debug exceptions from Secure EL0 are enabled.</td>
</tr>
</tbody>
</table>
On a Warm reset, this field resets to 0.

## Accessing the SDER

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>}\ <\text{coproc}, \{#\}<\text{opc1}, <\text{Rt}, <\text{CRn}, <\text{CRm}\{, \{#\}<\text{opc2}\}}
\]

<table>

    SDER = R[t];
SPSR, Saved Program Status Register

The SPSR characteristics are:

**Purpose**

Holds the saved process state for the current mode.

**Configuration**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SPSR are UNDEFINED.

**Attributes**

SPSR is a 32-bit register.

**Field descriptions**

The SPSR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to the current mode, and copied to PSTATE.N on executing an exception return operation in the current mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to the current mode, and copied to PSTATE.Z on executing an exception return operation in the current mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to the current mode, and copied to PSTATE.C on executing an exception return operation in the current mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to the current mode, and copied to PSTATE.V on executing an exception return operation in the current mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to the current mode, and copied to PSTATE.Q on executing an exception return operation in the current mode.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to the current mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in the current mode.

On executing an exception return operation in the current mode SPSR.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**J, bit [24]**

RES0.

In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**SSBS, bit [23]**

*When FEAT_SSBS is implemented:*

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to the current mode, and copied to PSTATE.SSBS on executing an exception return operation in the current mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**PAN, bit [22]**

*When FEAT_PAN is implemented:*

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to the current mode, and copied to PSTATE.PAN on executing an exception return operation in the current mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**DIT, bit [21]**

*When FEAT_DIT is implemented:*

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to the current mode, and copied to PSTATE.DIT on executing an exception return operation in the current mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.
IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to the current mode, and copied to PSTATE.IL on executing an exception return operation in the current mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to the current mode, and copied to PSTATE.GE on executing an exception return operation in the current mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to the current mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in the current mode.

SPSR.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to the current mode, and copied to PSTATE.E on executing an exception return operation in the current mode.

If the implementation does not support big-endian operation, SPSR.E is RES0. If the implementation does not support little-endian operation, SPSR.E is RES1. On executing an exception return operation in the current mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to the current mode, and copied to PSTATE.A on executing an exception return operation in the current mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to the current mode, and copied to PSTATE.I on executing an exception return operation in the current mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to the current mode, and copied to PSTATE.F on executing an exception return operation in the current mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to the current mode, and copied to PSTATE.T on executing an exception return operation in the current mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**M[4:0], bits [4:0]**

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to the current mode, and copied to PSTATE.M[4:0] on executing an exception return operation in the current mode.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10000</td>
<td>User.</td>
</tr>
<tr>
<td>0b10001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b10010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b10011</td>
<td>Supervisor.</td>
</tr>
<tr>
<td>0b10110</td>
<td>Monitor.</td>
</tr>
<tr>
<td>0b10111</td>
<td>Abort.</td>
</tr>
<tr>
<td>0b11010</td>
<td>Hyp.</td>
</tr>
<tr>
<td>0b11011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b11111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in the current mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the SPSR**

SPSR can be read using the MRS instruction and written using the MSR (register) or MSR (immediate) instructions.
**SPSR_abt, Saved Program Status Register (Abort mode)**

The SPSR_abt characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Abort mode.

**Configuration**

AArch32 System register SPSR_abt bits [31:0] are architecturally mapped to AArch64 System register SPSR_abt[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SPSR_abt are UNDEFINED.

**Attributes**

SPSR_abt is a 32-bit register.

**Field descriptions**

The SPSR_abt bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Abort mode, and copied to PSTATE.N on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Abort mode, and copied to PSTATE.Z on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Abort mode, and copied to PSTATE.C on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Abort mode, and copied to PSTATE.V on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Q, bit [27]
Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Abort mode, and copied to PSTATE.Q on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT[1:0], bits [26:25]
If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Abort mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Abort mode.

On executing an exception return operation in Abort mode SPSR_abt.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]
RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]
When FEAT_SSBS is implemented:
Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Abort mode, and copied to PSTATE.SSBS on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:
Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Abort mode, and copied to PSTATE.PAN on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

DIT, bit [21]
When FEAT_DIT is implemented:
Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Abort mode, and copied to PSTATE.DIT on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Abort mode, and copied to PSTATE.IL on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Abort mode, and copied to PSTATE.GE on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Abort mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in Abort mode.

SPSR_abt.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to Abort mode, and copied to PSTATE.E on executing an exception return operation in Abort mode.

If the implementation does not support big-endian operation, SPSR_abt.E is RES0. If the implementation does not support little-endian operation, SPSR_abt.E is RES1. On executing an exception return operation in Abort mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_abt.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_abt.E is RES1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Abort mode, and copied to PSTATE.A on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Abort mode, and copied to PSTATE.I on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Abort mode, and copied to PSTATE.F on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Abort mode, and copied to PSTATE.T on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Abort mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Abort mode.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10000</td>
<td>User.</td>
</tr>
<tr>
<td>0b10001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b10010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b10011</td>
<td>Supervisor.</td>
</tr>
<tr>
<td>0b10111</td>
<td>Abort.</td>
</tr>
<tr>
<td>0b11011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b11111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_abt.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Abort mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the SPSR_abt**

SPSR_abt is accessible in all modes other than User mode and Abort mode.

Accesses to this register use the following encodings:

**MRS{<c>}{<q>} <Rd>, SPSR_abt**

<table>
<thead>
<tr>
<th>R</th>
<th>M</th>
<th>M1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>0b0100</td>
</tr>
</tbody>
</table>

**MSR{<c>}{<q>} SPSR_abt, <Rn>**

<table>
<thead>
<tr>
<th>R</th>
<th>M</th>
<th>M1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>0b0100</td>
</tr>
</tbody>
</table>
SPSR_fiq, Saved Program Status Register (FIQ mode)

The SPSR_fiq characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to FIQ mode.

**Configuration**

AArch32 System register SPSR_fiq bits [31:0] are architecturally mapped to AArch64 System register SPSR_fiq[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SPSR_fiq are UNDEFINED.

**Attributes**

SPSR_fiq is a 32-bit register.

**Field descriptions**

The SPSR_fiq bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to FIQ mode, and copied to PSTATE.N on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to FIQ mode, and copied to PSTATE.Z on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to FIQ mode, and copied to PSTATE.C on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to FIQ mode, and copied to PSTATE.V on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to FIQ mode, and copied to PSTATE.Q on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT[1:0], bits [26:25]

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to FIQ mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in FIQ mode.

On executing an exception return operation in FIQ mode SPSR_fiq.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to FIQ mode, and copied to PSTATE.SSBS on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to FIQ mode, and copied to PSTATE.PAN on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to FIQ mode, and copied to PSTATE.DIT on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to FIQ mode, and copied to PSTATE.IL on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to FIQ mode, and copied to PSTATE.GE on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to FIQ mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in FIQ mode.

SPSR_fiq.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to FIQ mode, and copied to PSTATE.E on executing an exception return operation in FIQ mode.

If the implementation does not support big-endian operation, SPSR_fiq.E is RES0. If the implementation does not support little-endian operation, SPSR_fiq.E is RES1. On executing an exception return operation in FIQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_fiq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_fiq.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to FIQ mode, and copied to PSTATE.A on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to FIQ mode, and copied to PSTATE.I on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to FIQ mode, and copied to PSTATE.F on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**T, bit [5]**

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to FIQ mode, and copied to PSTATE.T on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**M[4:0], bits [4:0]**

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to FIQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in FIQ mode.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10000</td>
<td>User.</td>
</tr>
<tr>
<td>0b10001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b10010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b10011</td>
<td>Supervisor.</td>
</tr>
<tr>
<td>0b10111</td>
<td>Abort.</td>
</tr>
<tr>
<td>0b11011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b11111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_fiq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in FIQ mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the SPSR_fiq**

SPSR_fiq is accessible in all modes other than User mode and FIQ mode.

Accesses to this register use the following encodings:

\[
\text{MRS\{<c>\}{<q>} <Rd>, SPSR_fiq}
\]

<table>
<thead>
<tr>
<th>R</th>
<th>M</th>
<th>M1</th>
</tr>
</thead>
<tbody>

<td>0b1110</td>
</tr>
</tbody>
</table>

\[
\text{MSR\{<c>\}{<q>} SPSR_fiq, <Rn>}
\]

<table>
<thead>
<tr>
<th>R</th>
<th>M</th>
<th>M1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>0b0</td>
<td>0b1110</td>
</tr>
</tbody>
</table>
SPSR_hyp, Saved Program Status Register (Hyp mode)

The SPSR_hyp characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Hyp mode.

**Configuration**

AArch32 System register SPSR_hyp bits [31:0] are architecturally mapped to AArch64 System register SPSR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SPSR_hyp are UNDEFINED.

**Attributes**

SPSR_hyp is a 32-bit register.

**Field descriptions**

The SPSR_hyp bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Hyp mode, and copied to PSTATE.N on executing an exception return operation in Hyp mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Hyp mode, and copied to PSTATE.Z on executing an exception return operation in Hyp mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Hyp mode, and copied to PSTATE.C on executing an exception return operation in Hyp mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Hyp mode, and copied to PSTATE.V on executing an exception return operation in Hyp mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Hyp mode, and copied to PSTATE.Q on executing an exception return operation in Hyp mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT[1:0], bits [26:25]

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Hyp mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Hyp mode.

On executing an exception return operation in Hyp mode SPSR_hyp.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Hyp mode, and copied to PSTATE.SSBS on executing an exception return operation in Hyp mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Hyp mode, and copied to PSTATE.PAN on executing an exception return operation in Hyp mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Hyp mode, and copied to PSTATE.DIT on executing an exception return operation in Hyp mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Hyp mode, and copied to PSTATE.IL on executing an exception return operation in Hyp mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Hyp mode, and copied to PSTATE.GE on executing an exception return operation in Hyp mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Hyp mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in Hyp mode.

SPSR_hyp.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Hyp mode, and copied to PSTATE.E on executing an exception return operation in Hyp mode.

If the implementation does not support big-endian operation, SPSR_hyp.E is RES0. If the implementation does not support little-endian operation, SPSR_hyp.E is RES1. On executing an exception return operation in Hyp mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_hyp.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_hyp.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Hyp mode, and copied to PSTATE.A on executing an exception return operation in Hyp mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Hyp mode, and copied to PSTATE.I on executing an exception return operation in Hyp mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Hyp mode, and copied to PSTATE.F on executing an exception return operation in Hyp mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Hyp mode, and copied to PSTATE.T on executing an exception return operation in Hyp mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Hyp mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Hyp mode.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10000</td>
<td>User.</td>
</tr>
<tr>
<td>0b10001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b10010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b10011</td>
<td>Supervisor.</td>
</tr>
<tr>
<td>0b10111</td>
<td>Abort.</td>
</tr>
<tr>

<td>Hyp.</td>
</tr>
<tr>
<td>0b11011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b11111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_hyp.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Hyp mode is an illegal return event, as described in ‘Illegal return events from AArch32 state’.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the SPSR_hyp

SPSR_hyp is accessible only in Monitor mode.

Accesses to this register use the following encodings:

\[
\text{MRS\{<c>\}{<q>}} <\text{Rd}>, \text{SPSR\_hyp}
\]

<table>
<thead>
<tr>
<th>R</th>

SPSR_irq, Saved Program Status Register (IRQ mode)

The SPSR_irq characteristics are:

### Purpose

Holds the saved process state when an exception is taken to IRQ mode.

### Configuration

AArch32 System register SPSR_irq bits [31:0] are architecturally mapped to AArch64 System register SPSR_irq[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SPSR_irq are UNDEFINED.

### Attributes

SPSR_irq is a 32-bit register.

### Field descriptions

The SPSR_irq bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Negative Condition flag. Set to the value of PSTATE.N on taking an exception to IRQ mode, and copied to PSTATE.N on executing an exception return operation in IRQ mode. On a Warm reset, this field resets to an architecturally UNKNOWN value.</td>
</tr>
<tr>
<td>30</td>
<td>Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to IRQ mode, and copied to PSTATE.Z on executing an exception return operation in IRQ mode. On a Warm reset, this field resets to an architecturally UNKNOWN value.</td>
</tr>
<tr>
<td>29</td>
<td>Carry Condition flag. Set to the value of PSTATE.C on taking an exception to IRQ mode, and copied to PSTATE.C on executing an exception return operation in IRQ mode. On a Warm reset, this field resets to an architecturally UNKNOWN value.</td>
</tr>
<tr>
<td>28</td>
<td>Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to IRQ mode, and copied to PSTATE.V on executing an exception return operation in IRQ mode. On a Warm reset, this field resets to an architecturally UNKNOWN value.</td>
</tr>
</tbody>
</table>
**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to IRQ mode, and copied to PSTATE.Q on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to IRQ mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in IRQ mode.

On executing an exception return operation in IRQ mode SPSR_irq.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**J, bit [24]**

RES0.

In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state. Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**SSBS, bit [23]**

When \texttt{FEAT\_SSBS} is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to IRQ mode, and copied to PSTATE.SSBS on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**PAN, bit [22]**

When \texttt{FEAT\_PAN} is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to IRQ mode, and copied to PSTATE.PAN on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**DIT, bit [21]**

When \texttt{FEAT\_DIT} is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to IRQ mode, and copied to PSTATE.DIT on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to IRQ mode, and copied to PSTATE.IL on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to IRQ mode, and copied to PSTATE.GE on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to IRQ mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in IRQ mode.

SPSR_irq.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to IRQ mode, and copied to PSTATE.E on executing an exception return operation in IRQ mode.

If the implementation does not support big-endian operation, SPSR_irq.E is RES0. If the implementation does not support little-endian operation, SPSR_irq.E is RES1. On executing an exception return operation in IRQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_irq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_irq.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to IRQ mode, and copied to PSTATE.A on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to IRQ mode, and copied to PSTATE.I on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to IRQ mode, and copied to PSTATE.F on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to IRQ mode, and copied to PSTATE.T on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to IRQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in IRQ mode.

<table>
<thead>
<tr>
<th>M[4:0]</th>

</tr>
</tbody>
</table>

Other values are reserved. If SPSR_irq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in IRQ mode is an illegal return event, as described in ‘Illegal return events from AArch32 state’.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the SPSR_irq

SPSR_irq is accessible in all modes other than User mode and IRQ mode.

Accesses to this register use the following encodings:

MRS{<c>}{<q>} <Rd>, SPSR_irq

<table>
<thead>
<tr>
<th>R</th>
<th>M</th>
<th>M1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>0b0000</td>
</tr>
</tbody>
</table>

MSR{<c>}{<q>} SPSR_irq, <Rn>

<table>
<thead>
<tr>
<th>R</th>
<th>M</th>
<th>M1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>0b0000</td>
</tr>
</tbody>
</table>
The SPSR_mon characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Monitor mode.

**Configuration**

AArch32 System register SPSR_mon bits [31:0] can be mapped to AArch64 System register `SPSR_EL3[31:0]`, but this is not architecturally mandated.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SPSR_mon are UNDEFINED.

**Attributes**

SPSR_mon is a 32-bit register.

**Field descriptions**

The SPSR_mon bit assignments are:

\[
\begin{array}{cccccccccccccccccccccccccccccccccc}
\end{array}
\]

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Monitor mode, and copied to PSTATE.N on executing an exception return operation in Monitor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Monitor mode, and copied to PSTATE.Z on executing an exception return operation in Monitor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Monitor mode, and copied to PSTATE.C on executing an exception return operation in Monitor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Monitor mode, and copied to PSTATE.V on executing an exception return operation in Monitor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Q, bit [27]
Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Monitor mode, and copied to PSTATE.Q on executing an exception return operation in Monitor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT[1:0], bits [26:25]
If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Monitor mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Monitor mode.

On executing an exception return operation in Monitor mode SPSR_mon.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]
RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.
Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:
Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Monitor mode, and copied to PSTATE.SSBS on executing an exception return operation in Monitor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:
Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Monitor mode, and copied to PSTATE.PAN on executing an exception return operation in Monitor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:
Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Monitor mode, and copied to PSTATE.DIT on executing an exception return operation in Monitor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Monitor mode, and copied to PSTATE.IL on executing an exception return operation in Monitor mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Monitor mode, and copied to PSTATE.GE on executing an exception return operation in Monitor mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Monitor mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in Monitor mode.

SPSR_mon.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to Monitor mode, and copied to PSTATE.E on executing an exception return operation in Monitor mode.

If the implementation does not support big-endian operation, SPSR_mon.E is RES0. If the implementation does not support little-endian operation, SPSR_mon.E is RES1. On executing an exception return operation in Monitor mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_mon.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_mon.E is RES1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Monitor mode, and copied to PSTATE.A on executing an exception return operation in Monitor mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Monitor mode, and copied to PSTATE.I on executing an exception return operation in Monitor mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Monitor mode, and copied to PSTATE.F on executing an exception return operation in Monitor mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Monitor mode, and copied to PSTATE.T on executing an exception return operation in Monitor mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Monitor mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Monitor mode.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10000</td>
<td>User.</td>
</tr>
<tr>
<td>0b10001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b10010</td>
<td>IRQ.</td>
</tr>
<tr>

<td>Hyp.</td>
</tr>
<tr>
<td>0b11011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b11111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_mon.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Monitor mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the SPSR_mon**

SPSR_mon is only accessible in EL3 modes other than Monitor mode.

Accesses to this register use the following encodings:

**MRS{<c>}{<q>} <Rd>, SPSR_mon**

<table>
<thead>
<tr>
<th>R</th>
<th>M</th>
<th>M1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>0b1100</td>
</tr>
</tbody>
</table>

**MSR{<c>}{<q>} SPSR_mon, <Rn>**

<table>
<thead>
<tr>
<th>R</th>
<th>M</th>
<th>M1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>0b1100</td>
</tr>
</tbody>
</table>
The SPSR_svc characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Supervisor mode.

**Configuration**

AArch32 System register SPSR_svc bits [31:0] are architecturally mapped to AArch64 System register SPSR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SPSR_svc are UNDEFINED.

**Attributes**

SPSR_svc is a 32-bit register.

**Field descriptions**

The SPSR_svc bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Supervisor mode, and copied to PSTATE.N on executing an exception return operation in Supervisor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Supervisor mode, and copied to PSTATE.Z on executing an exception return operation in Supervisor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Supervisor mode, and copied to PSTATE.C on executing an exception return operation in Supervisor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Supervisor mode, and copied to PSTATE.V on executing an exception return operation in Supervisor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Supervisor mode, and copied to PSTATE.Q on executing an exception return operation in Supervisor mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Supervisor mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Supervisor mode.

On executing an exception return operation in Supervisor mode SPSR_svc.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**J, bit [24]**

RES0.

In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**SSBS, bit [23]**

*When FEAT_SSBS is implemented:*

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Supervisor mode, and copied to PSTATE.SSBS on executing an exception return operation in Supervisor mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**PAN, bit [22]**

*When FEAT_PAN is implemented:*

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Supervisor mode, and copied to PSTATE.PAN on executing an exception return operation in Supervisor mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**DIT, bit [21]**

*When FEAT_DIT is implemented:*

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Supervisor mode, and copied to PSTATE.DIT on executing an exception return operation in Supervisor mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
SPSR_svc, Saved Program Status Register (Supervisor mode)

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Supervisor mode, and copied to PSTATE.IL on executing an exception return operation in Supervisor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Supervisor mode, and copied to PSTATE.GE on executing an exception return operation in Supervisor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Supervisor mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in Supervisor mode.

SPSR_svc.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Supervisor mode, and copied to PSTATE.E on executing an exception return operation in Supervisor mode.

If the implementation does not support big-endian operation, SPSR_svc.E is RES0. If the implementation does not support little-endian operation, SPSR_svc.E is RES1. On executing an exception return operation in Supervisor mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_svc.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_svc.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Supervisor mode, and copied to PSTATE.A on executing an exception return operation in Supervisor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Supervisor mode, and copied to PSTATE.I on executing an exception return operation in Supervisor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Supervisor mode, and copied to PSTATE.F on executing an exception return operation in Supervisor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**T, bit [5]**

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Supervisor mode, and copied to PSTATE.T on executing an exception return operation in Supervisor mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**M[4:0], bits [4:0]**

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Supervisor mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Supervisor mode.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>

SPSR_und, Saved Program Status Register (Undefined mode)

The SPSR_und characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Undefined mode.

**Configuration**

AArch32 System register SPSR_und bits [31:0] are architecturally mapped to AArch64 System register SPSR_und[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SPSR_und are UNDEFINED.

**Attributes**

SPSR_und is a 32-bit register.

**Field descriptions**

The SPSR_und bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Undefined mode, and copied to PSTATE.N on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Undefined mode, and copied to PSTATE.Z on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Undefined mode, and copied to PSTATE.C on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Undefined mode, and copied to PSTATE.V on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Undefined mode, and copied to PSTATE.Q on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{IT}[1:0], bits [26:25]

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Undefined mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Undefined mode.

On executing an exception return operation in Undefined mode SPSR\textsubscript{und}.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

J, bit [24]

\texttt{RES0}.

In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

\textbf{SSBS, bit [23]}

\textbf{When FEAT\textsubscript{SSBS} is implemented:}

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Undefined mode, and copied to PSTATE.SSBS on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{Otherwise:}

Reserved, \texttt{RES0}.

\textbf{PAN, bit [22]}

\textbf{When FEAT\textsubscript{PAN} is implemented:}

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Undefined mode, and copied to PSTATE.PAN on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{Otherwise:}

Reserved, \texttt{RES0}.

\textbf{DIT, bit [21]}

\textbf{When FEAT\textsubscript{DIT} is implemented:}

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Undefined mode, and copied to PSTATE.DIT on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.
Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Undefined mode, and copied to
PSTATE.IL on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Undefined mode, and copied to
PSTATE.GE on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Undefined mode, and copied to PSTATE.IT[7:2]
on executing an exception return operation in Undefined mode.

SPSR_und.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Undefined mode, and copied to PSTATE.E on
executing an exception return operation in Undefined mode.

If the implementation does not support big-endian operation, SPSR_und.E is RES0. If the implementation does not
support little-endian operation, SPSR_und.E is RES1. On executing an exception return operation in Undefined mode, if
the implementation does not support big-endian operation at the Exception level being returned to, SPSR_und.E is
RES0, and if the implementation does not support little-endian operation at the Exception level being returned to,
SPSR_und.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Undefined mode, and copied to PSTATE.A on
executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Undefined mode, and copied to PSTATE.I
on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Undefined mode, and copied to PSTATE.F
on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Undefined mode, and copied to PSTATE.T on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Undefined mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Undefined mode.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10000</td>
<td>User.</td>
</tr>
<tr>
<td>0b10001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b10010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b10011</td>

<tr>
<td>0b10111</td>
<td>Abort.</td>
</tr>
<tr>
<td>0b11011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b11111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_und.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Undefined mode is an illegal return event, as described in ‘Illegal return events from AArch32 state’.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the SPSR_und

SPSR_und is accessible in all modes other than User mode and Undefined mode.

Accesses to this register use the following encodings:

MRS{<c>}{<q>} <Rd>, SPSR_und

<table>

**TCMTR, TCM Type Register**

The TCMTR characteristics are:

**Purpose**

Provides information about the implementation of the TCM.

**Configuration**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TCMTR are UNDEFINED.

If EL1 or above can use AArch32 then this register must be implemented.

**Attributes**

TCMTR is a 32-bit register.

**Field descriptions**

The TCMTR bit assignments are:

TLBIALL, TLB Invalidate All

The TLBIALL characteristics are:

**Purpose**

Invalidates all cached copies of translation table entries from TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
  - Would be required for the EL1&0 translation regime.
  - Match the current VMID, if EL2 is implemented and enabled in the current Security state.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at EL2, and if EL2 is enabled in the current Security state, the stage 1 or stage 2 translation table entries that would be required for the PL1&0 translation regime and matches the current VMID.

The invalidation only applies to the PE that executes this System instruction.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TLBIALL are **UNDEFINED**.

**Attributes**

TLBIALL is a 32-bit System instruction.

**Field descriptions**

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

**Executing the TLBIALL instruction**

Accesses to this instruction use the following encodings:

\[ \text{MCR}\{<c>\}{<q>} \ <\text{coproc}>, \{#<opc1>\}, \ <\text{Rt}>, \ <\text{CRn}>, \ <\text{CRm}\{, \{#<opc2>\}\} \]

<table>
<thead>

    end if;
TLBIASID, TLB Invalidate by ASID match

The TLBIASID characteristics are:

**Purpose**

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TLBIASID are UNDEFINED.

**Attributes**

TLBIASID is a 32-bit System instruction.

**Field descriptions**

The TLBIASID input value bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | ASID |

**Bits [31:8]**

Reserved, RES0.

**ASID, bits [7:0]**

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this System instruction.

**Executing the TLBIASID instruction**

Accesses to this instruction use the following encodings:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>

        TLBIASIDIS(R[t]);
    elsif PSTATE.EL == EL3 then
        TLBIASIDIS(R[t]);
The TLBIPAS2 characteristics are:

**Purpose**

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- SCR.NS is 1.
- The entry would be used for the specified IPA.
- The entry would be used with the current VMID.
- The entry would be required for the PL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation only applies to the PE that executes this System instruction.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TLBIPAS2 are UNDEFINED.

---

**Note**

This System instruction is not implemented in architecture versions before Armv8.

---

**Attributes**

TLBIPAS2 is a 32-bit System instruction.

**Field descriptions**

The TLBIPAS2 input value bit assignments are:

**Bits [31:28]**

Reserved, RES0.

**IPA[39:12], bits [27:0]**

Bits[39:12] of the intermediate physical address to match.

**Executing the TLBIPAS2 instruction**

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is **CONSTRAINED UNPREDICTABLE**, and one of the following behaviors must occur:

- The instruction is **UNDEFINED**.
The instruction is treated as a NOP.
The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings:

\[
\text{MCR}\{<c>\}<q>\{<\text{coproc}>\}, \{#\}<\text{opc1}>\{, \{#\}<\text{opc2}>\{, <Rt>, <CRn>, <CRm>\}
\]

TLBIIPAS2IS, TLB Invalidate by Intermediate Physical Address, Stage 2, Inner Shareable

The TLBIIPAS2IS characteristics are:

**Purpose**

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- **SCR**.NS is 1.
- The entry would be used for the specified IPA.
- The entry would be used with the current VMID.
- The entry would be required for the PL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TLBIIPAS2IS are **UNDEFINED**.

---

**Note**

This System instruction is not implemented in architecture versions before Armv8.

---

**Attributes**

TLBIIPAS2IS is a 32-bit System instruction.

The TLBIMVA characteristics are:

**Purpose**

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TLBIMVA are UNDEFINED.

        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR2.TTLBIS == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        TLBIMVAIS(R[t]);
    end if;
elsif PSTATE.EL == EL2 then
    TLBIMVAIS(R[t]);
elsif PSTATE.EL == EL3 then
    TLBIMVAIS(R[t]);
The TLBIMVAAL characteristics are:

**Purpose**

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified address.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TLBIMVAAL are **UNDEFINED**.

**Note**

This System instruction is not implemented in architecture versions before Armv8.

**Attributes**

TLBIMVAAL is a 32-bit System instruction.

**Field descriptions**

The TLBIMVAAL input value bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**VA**, bits [31:12]

Virtual address to match. Any unlocked TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

**Bits [11:0]**

Reserved, RES0.

**Executing the TLBIMVAAL instruction**

Accesses to this instruction use the following encodings:
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T8 == '1' then

  TLBIMVAAL(R[t]);
TLBIMVAALIS, TLB Invalidate by VA, All ASID, Last level, Inner Shareable

The TLBIMVAALIS characteristics are:

**Purpose**

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified address.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TLBIMVAALIS are **UNDEFINED**.

---

**Note**

This System instruction is not implemented in architecture versions before Armv8.

---

**Attributes**

TLBIMVAALIS is a 32-bit System instruction.

**Field descriptions**

The TLBIMVAALIS input value bit assignments are:

```
| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |

TLBIMVAIS, TLB Invalidate by VA, Inner Shareable

The TLBIMVAIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TLBIMVAIS are undefined.

Attributes

TLBIMVAIS is a 32-bit System instruction.

**VA, bits [31:12]**

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

**Bits [11:0]**

Reserved, RES0.

**Executing the TLBIMVALH instruction**

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is **CONSTRAINED UNPREDICTABLE**, and one of the following behaviors must occur:

- The instruction is **UNDEFINED**.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>

            UNDEFINED;
        else
            TLBIMVALH(R[t]);
The TLBIMVALHIS characteristics are:

**Purpose**

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from the final level of the translation table walk that would be required for the Non-secure EL2 translation regime and used to translate the specified address.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TLBIMVALHIS are **UNDEFINED**.

This System instruction is not implemented in architecture versions before Armv8.

**Attributes**

TLBIMVALHIS is a 32-bit System instruction.

**Field descriptions**

The TLBIMVALHIS input value bit assignments are:

**VA, bits [31:12]**

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

**Bits [11:0]**

Reserved, RES0.

**Executing the TLBIMVALHIS instruction**

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is **CONSTRAINED UNPREDICTABLE**, and one of the following behaviors must occur:

- The instruction is **UNDEFINED**.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings:

\[
\text{MCR}\{<c>\}\{<q>\} \text{<coproc>}, \{#\}<\text{opc1}>\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#\}<\text{opc2}>\}
\]
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T8 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T8 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    TLBIMVALHIS(R[t]);
elsif PSTATE.EL == EL3 then
    if !HaveEL(EL2) then
        UNDEFINED;
    else
        TLBIMVALHIS(R[t]);

The TLBIMVALIS characteristics are:

**Purpose**

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TLBIMVALIS are **UNDEFINED**.

This System instruction is not implemented in architecture versions before Armv8.

**Attributes**

TLBIMVALIS is a 32-bit System instruction.

**Field descriptions**

The TLBIMVALIS input value bit assignments are:

<table>

<td>VA</td>
</tr>
<tr>
<td>30</td>
<td>29</td>
</tr>
<tr>
<td></td>
<td>ASID</td>
</tr>
</tbody>
</table>

**VA, bits [31:12]**

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

**Bits [11:8]**

Reserved, RES0.

**ASID, bits [7:0]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.
Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

### Executing the TLBIMVALID instruction

TLBTR, TLB Type Register

The TLBTR characteristics are:

### Purpose

Provides information about the TLB implementation. The register must define whether the implementation provides separate instruction and data TLBs, or a unified TLB. Normally, the IMPLEMENTATION DEFINED information in this register includes the number of lockable entries in the TLB.

### Configuration

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TLBTR are UNDEFINED.

### Attributes

TLBTR is a 32-bit register.

### Field descriptions

The TLBTR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Index</th>
<th>Bit Assignment</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-1</td>
<td>IMPLEMENTATION DEFINED</td>

TPIDRPRW, PL1 Software Thread ID Register

The TPIDRPRW characteristics are:

**Purpose**

Provides a location where software executing at EL1 or higher can store thread identifying information that is not visible to software executing at EL0, for OS management purposes.

The PE makes no use of this register.

**Configuration**

AArch32 System register TPIDRPRW bits [31:0] are architecturally mapped to AArch64 System register TPIDR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TPIDRPRW are UNDEFINED.

**Note**

The PE never updates this register.

**Attributes**

TPIDRPRW is a 32-bit register.

**Field descriptions**

The TPIDRPRW bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

The TRFCR characteristics are:

**Purpose**

Provides EL1 controls for Trace.

**Configuration**

AArch32 System register TRFCR bits [31:0] are architecturally mapped to AArch64 System register TRFCR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_TRF is implemented. Otherwise, direct accesses to TRFCR are UNDEFINED.

**Attributes**

TRFCR is a 32-bit register.

**Field descriptions**

The TRFCR bit assignments are:

<table>
<thead>
<tr>
<th>Bit position</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-7</td>
<td>Reserved, RES0</td>
<td></td>
</tr>
<tr>
<td>6-5</td>
<td>TS</td>
<td></td>
</tr>
<tr>
<td>4-3</td>
<td>E0TRE</td>
<td></td>
</tr>
<tr>
<td>2-0</td>
<td>E1TREOTRE</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:7]**

Reserved, RES0.

**TS, bits [6:5]**

Timestamp Control. Controls which timebase is used for trace timestamps.

<table>
<thead>
<tr>
<th>TS</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>Virtual timestamp. The traced timestamp is the physical counter value minus the value of CNTVOFF.</td>
<td>When FEAT_ECV is implemented</td>
</tr>
</tbody>
</table>
| 0b10| Guest physical timestamp. The traced timestamp is the physical counter value minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2.  
  - EL3 is implemented and using AArch32.  
  - EL3 is implemented, using AArch64, and SCR_EL3.ECVEn == 0b0.  
  - EL2 is using AArch32.  
  - EL2 is using AArch64 and CNTCTL_EL2.ECV == 0b0. | |
| 0b11| Physical timestamp. The traced timestamp is the physical counter value. |             |

All other values are reserved.

This field is ignored by the PE when any of the following are true:

- EL2 is implemented and HTRFCR.TS != 0b0.
• SelfHostedTraceEnabled() == FALSE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [4:2]**

Reserved, RES0.

**E1TRE, bit [1]**

EL1 Trace Enable.

<table>
<thead>
<tr>
<th>E1TRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Tracing is prohibited in PL1 modes.</td>
</tr>
<tr>
<td>0b1</td>
<td>Tracing is allowed in PL1 modes.</td>
</tr>
</tbody>
</table>

This field is ignored if SelfHostedTraceEnabled() == FALSE.

On a Warm reset, this field resets to 0.

**E0TRE, bit [0]**

EL0 Trace Enable.

<table>
<thead>
<tr>
<th>E0TRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Tracing is prohibited at EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Tracing is allowed at EL0.</td>
</tr>
</tbody>
</table>

This field is ignored if any of the following are true:

• SelfHostedTraceEnabled() == FALSE.
• EL2 is implemented and enabled in the current security state and HCR.TGE == 1.

On a Warm reset, this field resets to 0.

**Accessing the TRFCR**

Accesses to this register use the following encodings:

TTBCR, Translation Table Base Control Register

The TTBCR characteristics are:

**Purpose**

The control register for stage 1 of the PL1&0 translation regime. Its controls include:

- Where the VA range is split between addresses translated using TTBR0 and addresses translated using TTBR1.
- The translation table format used by this stage of translation.

From Armv8.2, when the value of TTBCR.{EAE, T2E} is {1, 1}, TTBCR is used with TTBCR2.

**Configuration**

AArch32 System register TTBCR bits [31:0] are architecturally mapped to AArch64 System register TCR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TTBCR are UNDEFINED.

The current translation table format determines which format of the register is used.

Some RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 then:

- The EAE bit resets to 0 in both the Secure and the Non-secure instances of the register.
- Other reset values apply only to the Secure instance of the register.

**Attributes**

TTBCR is a 32-bit register.

**Field descriptions**

The TTBCR bit assignments are:

**When TTBCR.EAE == 0:**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| EAE | RES0 | PD1 | PD0 | RES0 | N |

**EAE, bit [31]**

Extended Address Enable.

<table>
<thead>
<tr>
<th>EAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Use the VMSAv8-32 translation system with the Short-descriptor translation table format.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**Bits [30:6]**

Reserved, RES0.
**PD1, bit [5]**

Translation table walk disable for translations using TTBR1. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR1.

<table>
<thead>
<tr>
<th>PD1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Perform translation table walks using TTBR1.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on an address that is translated using TTBR1 generates a Translation fault. No translation table walk is performed.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**PD0, bit [4]**

Translation table walk disable for translations using TTBR0. This bit controls whether a translation table walk is performed on a TLB miss for an address that is translated using TTBR0.

<table>
<thead>
<tr>
<th>PD0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Perform translation table walks using TTBR0.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on an address that is translated using TTBR0 generates a Translation fault. No translation table walk is performed.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**Bit [3]**

Reserved, RES0.

**N, bits [2:0]**

Indicate the width of the base address held in TTBR0. In TTBR0, the base address field is bits[31:14-N]. The value of N also determines:

- Whether TTBR0 or TTBR1 is used as the base address for translation table walks.
- The size of the translation table pointed to by TTBR0.

N can take any value from 0 to 7, that is, from 0b000 to 0b111.

When N has its reset value of 0, the translation table base is compatible with Armv5 and Armv6.

On a Warm reset, this field resets to 0.

**When TTBCR.EAE == 1:**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| EAE | IMPLEMENTATION DEFINED | SH1 | ORGN1 | RGN1 | EPD1 | A1 | RES0 | T1S | RES0 | SH0 | ORGN0 | RGN0 | EPD0 | T2E | RES0 | T0SZ |

**EAE, bit [31]**

Extended Address Enable.

<table>
<thead>
<tr>
<th>EAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>Use the VMSAv8-32 translation system with the Long-descriptor translation table format.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**IMPLEMENTATION DEFINED, bit [30]**

IMPLEMENTATION DEFINED.
On a Warm reset, this field resets to 0.

**SH1, bits [29:28]**

Shareability attribute for memory associated with translation table walks using TTBR1.

<table>
<thead>
<tr>
<th>SH1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this field resets to 0.

**ORGN1, bits [27:26]**

Outer cacheability attribute for memory associated with translation table walks using TTBR1.

<table>
<thead>
<tr>
<th>ORGN1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**IRGN1, bits [25:24]**

Inner cacheability attribute for memory associated with translation table walks using TTBR1.

<table>
<thead>
<tr>
<th>IRGN1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>

<tr>
<td>0b10</td>
<td>Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**EPD1, bit [23]**

Translation table walk disable for translations using TTBR1. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR1.

<table>
<thead>
<tr>
<th>EPD1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Perform translation table walks using TTBR1.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on an address that is translated using TTBR1 generates a Translation fault. No translation table walk is performed.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**A1, bit [22]**

Selects whether TTBR0 or TTBR1 defines the ASID.
Meaning

| A1 | TTBR0.ASID defines the ASID. |
| A0 | TTBR1.ASID defines the ASID. |

On a Warm reset, this field resets to 0.

### Bits [21:19]

Reserved, RES0.

### T1SZ, bits [18:16]

See 'Selecting between TTBR0 and TTBR1, VMSAv8-32 Long-descriptor translation table format' for how TTBCR.{T1SZ, T0SZ} determine the input address ranges and memory region sizes translated using TTBR0 and TTBR1.

On a Warm reset, this field resets to 0.

### Bits [15:14]

Reserved, RES0.

### SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using TTBR0.

<table>
<thead>
<tr>
<th>SH0</th>
<th>Meaning</th>

<tr>
<td>11</td>
<td>Inner Shareable</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this field resets to 0.

### ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using TTBR0.

<table>
<thead>
<tr>
<th>ORGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

### IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using TTBR0.

<table>
<thead>
<tr>
<th>IRGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>01</td>
<td>Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>10</td>
<td>Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>
On a Warm reset, this field resets to 0.

**EPD0, bit [7]**

Translation table walk disable for translations using TTBR0. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR0.

<table>
<thead>
<tr>
<th>EPD0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Perform translation table walks using TTBR0.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on an address that is translated using TTBR0 generates a Translation fault. No translation table walk is performed.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**T2E, bit [6]**

When FEAT_AA32HPD is implemented:

TTBCR2 Enable.

<table>
<thead>
<tr>
<th>T2E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TTBCR2 is disabled. The contents of TTBCR2 are treated as 0 for all purposes other than reading or writing the register.</td>
</tr>
<tr>
<td>0b1</td>
<td>TTBCR2 is enabled.</td>
</tr>
</tbody>
</table>

If TTBCR.EAE==0, then the behavior is as if the bit is 0.

Otherwise:

Reserved, RES0.

**Bits [5:3]**

Reserved, RES0.

**T0SZ, bits [2:0]**

See 'Selecting between TTBR0 and TTBR1, VMSAv8-32 Long-descriptor translation table format' for how TTBCR.{T1SZ, T0SZ} determine the input address ranges and memory region sizes translated using TTBR0 and TTBR1.

On a Warm reset, this field resets to 0.

**Accessing the TTBCR**

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>

end
TTBCR2, Translation Table Base Control Register 2

The TTBCR2 characteristics are:

**Purpose**

The second control register for stage 1 of the PL1&0 translation regime.

If FEAT_AA32HPD is not implemented then this register is not implemented and its encoding is **UNDEFINED**. Otherwise:

- When the value of TTBCR.EAE, T2E is not \{1, 1\} the contents of TTBCR2 are treated as zero for all purposes other than reading or writing the register.
- When the value of TTBCR.EAE, T2E is \{1, 1\} TTBCR2 is used with TTBCR.

**Configuration**

AArch32 System register TTBCR2 bits \[31:0\] are architecturally mapped to AArch64 System register TCR_EL1[63:32].

This register is present only when AArch32 is supported at any Exception level and FEAT_AA32HPD is implemented. Otherwise, direct accesses to TTBCR2 are **UNDEFINED**.

**Attributes**

TTBCR2 is a 32-bit register.

**Field descriptions**

The TTBCR2 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

<td>For translations using TTBR1, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of TTBCR.T2E is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HWU159, bit [15]**

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR1.
The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of TTBCR.T2E is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU062, bit [14]

When FEAT_HPD52 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR0.

<table>
<thead>
<tr>
<th>HWU062</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For translations using TTBR1, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>For translations using TTBR1, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of TTBCR.T2E is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU061, bit [13]

When FEAT_HPD52 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using TTBR0.

<table>
<thead>
<tr>
<th>HWU061</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For translations using TTBR0, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>For translations using TTBR0, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of TTBCR.T2E is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
HWU060, bit [12]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR0.

<table>
<thead>
<tr>
<th>HWU060</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For translations using TTBR0, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>For translations using TTBR0, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of TTBCR.T2E is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU059, bit [11]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR0.

<table>
<thead>
<tr>
<th>HWU059</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For translations using TTBR0, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>For translations using TTBR0, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of TTBCR.T2E is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD1, bit [10]

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the translation tables pointed to by TTBR1.

<table>
<thead>
<tr>
<th>HPD1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hierarchical permissions are enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hierarchical permissions are disabled if TTBCR.T2E == 1.</td>
</tr>
</tbody>
</table>

When disabled, the permissions are treated as if the bits are 0.

The Effective value of this field is 0 if the value of TTBCR.T2E is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**HPD0, bit [9]**

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the translation tables pointed to by TTBR0.

<table>
<thead>
<tr>
<th>HPD0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hierarchical permissions are enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hierarchical permissions are disabled if TTBCR.T2E == 1.</td>
</tr>
</tbody>
</table>

When disabled, the permissions are treated as if the bits are 0.

The Effective value of this field is 0 if the value of TTBCR.T2E is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [8:0]**

Reserved, RES0.

**Accessing the TTBCR2**

Accesses to this register use the following encodings:

TTBR0, Translation Table Base Register 0

The TTBR0 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the PL1&0 translation regime, and other information for this translation regime.

Configuration

AArch32 System register TTBR0 bits [63:0] are architecturally mapped to AArch64 System register TTBR0_EL1[63:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TTBR0 are UNDEFINED.

TTBR0 is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

TTBCR.EAE determines which TTBR0 format is used:

- TTBCR.EAE == 0b0: 32-bit format is used. TTBR0[63:32] are ignored.
- TTBCR.EAE == 0b1: 64-bit format is used.

When EL3 is using AArch32, write access to TTBR0(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

Used in conjunction with the TTBCR. When the 64-bit TTBR0 format is used, cacheability and shareability information is held in the TTBCR, not in TTBR0.

Attributes

TTBR0 is a 64-bit register.

Field descriptions

The TTBR0 bit assignments are:

When TTBCR.EAE == 0:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | TTB0 | [RGN[0]] | NOS | [RGN] | IMP | S | [RGN[1]] |

Bits [63:32]

Reserved, RES0.

TTB0, bits [31:7]

Translation table base address, bits[31:x], where x is 14-(TTBCR.N). Register bits [x-1:7] are RES0, with the additional requirement that if these bits are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:7] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IRGN, bits [0, 6]**

Inner region bits. Bits [0,6] of this register together indicate the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

<table>
<thead>
<tr>
<th>IRGN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Inner Write-Back Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Inner Write-Through Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back no Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

**Note**

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for ARMv7 without the Multiprocessing Extensions can run unmodified on an implementation that includes the functionality introduced by the ARMv7 Multiprocessing Extensions.

The IRGN field is split as follows:

- IRGN[0] is TTBR0[6].
- IRGN[1] is TTBR0[0].

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**NOS, bit [5]**

Not Outer Shareable. When the value of TTBR0.S is 1, indicates whether the memory associated with a translation table walk is Inner Shareable or Outer Shareable:

<table>
<thead>
<tr>
<th>NOS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Memory is Outer Shareable.</td>
</tr>
<tr>
<td>0b1</td>
<td>Memory is Inner Shareable.</td>
</tr>
</tbody>
</table>

This bit is ignored when the value of TTBR0.S is 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**RGN, bits [4:3]**

Region bits. Indicates the Outer cacheability attributes for the memory associated with the translation table walks:

<table>
<thead>
<tr>
<th>RGN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back no Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IMP, bit [2]**

The effect of this bit is **IMPLEMENTATION DEFINED**. If the translation table implementation does not include any **IMPLEMENTATION DEFINED** features this bit is **RES0**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**S, bit [1]**

Shareable. Indicates whether the memory associated with the translation table walks is Non-shareable:
Meaning
---
0b0  Memory is Non-shareable.
0b1  Memory is shareable. The TTBR0.NOS field indicates whether the memory is Inner Shareable or Outer Shareable.

On a Warm reset, this field resets to an architecturally `UNKNOWN` value.

**When TTBCR.EAE == 1:**

<table>
<thead>
<tr>
<th>Bits [63:56]</th>
<th>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reserved, RES0.</td>
<td></td>
</tr>
</tbody>
</table>

**ASID, bits [55:48]**

An ASID for the translation table base address. The TTBCR.A1 field selects either TTBR0.ASID or TTBR1.ASID.

On a Warm reset, this field resets to an architecturally `UNKNOWN` value.

**BADDR, bits [47:1]**

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are `CONSTRAINED UNPREDICTABLE`, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of TTBCR.T0SZ as follows:

- If TTBCR.T0SZ is 0 or 1, x = 5 - TTBCR.T0SZ.
- If TTBCR.T0SZ is greater than 1, x = 14 - TTBCR.T0SZ.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

On a Warm reset, this field resets to an architecturally `UNKNOWN` value.

**CnP, bit [0]**

**When FEAT_TTCNP is implemented:**

Common not Private. When TTBCR.EAE == 1, this bit indicates whether each entry that is pointed to by TTBR0 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0.CnP is 1.
The translation table entries pointed to by this instance of TTBR0, for the current ASID, are permitted to differ from corresponding entries for this instance of TTBR0 for other PEs in the Inner Shareable domain. This is not affected by:

- The value of TTBR0.CnP on those other PEs.
- The value of TTBCR.EAE on those other PEs.
- The value of the current ASID or, for the Non-secure instance of TTBR0, the value of the current VMID.

The translation table entries pointed to by this instance of TTBR0 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0.CnP is 1 for this instance of TTBR0 and all of the following apply:

- The translation table entries are pointed to by this instance of TTBR0.
- The value of the applicable TTBCR.EAE field is 1.
- The ASID is the same as the current ASID.
- For the Non-secure instance of TTBR0, the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR0.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are **CONstrained UNPREDICTable**, see 'CONstrained UNPREDICTable behaviors due to caching of control or data values'.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

### Accessing the TTBR0

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#<\text{opc1}>\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#<\text{opc2}>\}
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b0010</td>
<td>0b0000</td>
<td>0b000</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
