(LES-PRE-20349 version 21.0)

Confidentiality Status

This document is Non-Confidential. The right to use, copy and disclose this document may be subject to license restrictions in accordance with the terms of the agreement entered into by Arm and the party that Arm delivered this document to.

Product Status

The information in this document covers multiple versions of the architecture. The content relating to different versions is given different quality ratings.

The information in this document relating to v8.7 of the architecture and the features introduced in this release is at Alpha quality. Alpha quality means that most major features of the specification are included, features and details might be missing.

The information in this document relating to versions of the architecture before v8.7 and features introduced in previous releases is at Beta quality. Beta quality means that all major features of the specification are included, some details might be missing.

CNTHVS_TVAL_EL2: Counter-timer Secure Virtual Timer TimerValue register (EL2)
CNTHV_CTL_EL2: Counter-timer Virtual Timer Control register (EL2)
CNTHV_CVAL_EL2: Counter-timer Virtual Timer CompareValue register (EL2)
CNTHV_TVAL_EL2: Counter-timer Virtual Timer TimerValue Register (EL2)
CNTKCTL_EL1: Counter-timer Kernel Control register
CNTPCTSS_EL0: Counter-timer Self-Synchronized Physical Count register
CNTPCT_EL0: Counter-timer Physical Count register
CNTPOFF_EL2: Counter-timer Physical Offset register
CNTPS_CTL_EL1: Counter-timer Physical Secure Timer Control register
CNTPS_CVAL_EL1: Counter-timer Physical Secure Timer CompareValue register
CNTPS_TVAL_EL1: Counter-timer Physical Secure Timer TimerValue register
CNTP_CTL_EL0: Counter-timer Physical Timer Control register
CNTP_CVAL_EL0: Counter-timer Physical Timer CompareValue register
CNTP_TVAL_EL0: Counter-timer Physical Timer TimerValue register
CNTVCTSS_EL0: Counter-timer Self-Synchronized Virtual Count register
CNTVCT_EL0: Counter-timer Virtual Count register
CNTVOFF_EL2: Counter-timer Virtual Offset register
CNTV_CTL_EL0: Counter-timer Virtual Timer Control register
CNTV_CV р: Counter-timer Virtual Timer CompareValue register
CNTV_TV р: Counter-timer Virtual Timer TimerValue register
CONTEXTIDR_EL1: Context ID Register (EL1)
CONTEXTIDR_EL2: Context ID Register (EL2)
CPACR_EL1: Architectural Feature Access Control Register
CPTR_EL2: Architectural Feature Trap Register (EL2)
CPTR_EL3: Architectural Feature Trap Register (EL3)
CSSELR_EL1: Cache Size Selection Register
CTR_EL0: Cache Type Register
CurrentEL: Current Exception Level
DACR32_EL2: Domain Access Control Register
DAIF: Interrupt Mask Bits
DBGAUTHSTATUS_EL1: Debug Authentication Status register
DBGBCР<n>_EL1: Debug Breakpoint Control Registers
DBGВVR<n>_EL1: Debug Breakpoint Value Registers
DBGCLAIMCLR_EL1: Debug CLAIM Tag Clear register
DBGCLAIMSET_EL1: Debug CLAIM Tag Set register
DBGDTRRX_EL0: Debug Data Transfer Register, Receive
DBGDTRTX_EL0: Debug Data Transfer Register, Transmit
DBGDT_EL0: Debug Data Transfer Register, half-duplex
DBGPRCР_EL1: Debug Power Control Register
DBGVCР32_EL2: Debug Vector Catch Register
DBGWCR<n>_EL1: Debug Watchpoint Control Registers
DBGWVR<n>_EL1: Debug Watchpoint Value Registers
DCZID_EL0: Data Cache Zero ID register
DISR_EL1: Deferred Interrupt Status Register
DIT: Data Independent Timing
DLR_EL0: Debug Link Register
DSPSR_EL0: Debug Saved Program Status Register
ELR_EL1: Exception Link Register (EL1)
ELR_EL2: Exception Link Register (EL2)
ELR_EL3: Exception Link Register (EL3)
ERRIDR_EL1: Error Record ID Register
ERRSELР_EL1: Error Record Select Register
ERRADDR_EL1: Selected Error Record Address Register
ERXCTRL_EL1: Selected Error Record Control Register
ERXFR_EL1: Selected Error Record Feature Register
ERXMISC0_EL1: Selected Error Record Miscellaneous Register 0
ERXMISC1_EL1: Selected Error Record Miscellaneous Register 1
ERXMISC2_EL1: Selected Error Record Miscellaneous Register 2
ERXMISC3_EL1: Selected Error Record Miscellaneous Register 3
ERXPFGCDN_EL1: Selected Pseudo-fault Generation Countdown register
ERXPFGCTL_EL1: Selected Pseudo-fault Generation Control register
ERXPFGF_EL1: Selected Pseudo-fault Generation Feature register
ERXSTATUS_EL1: Selected Error Record Primary Status Register
ESR_EL1: Exception Syndrome Register (EL1)
ESR_EL2: Exception Syndrome Register (EL2)
ESR_EL3: Exception Syndrome Register (EL3)
FAR_EL1: Fault Address Register (EL1)
FAR_EL2: Fault Address Register (EL2)
FAR_EL3: Fault Address Register (EL3)
FPCR: Floating-point Control Register
FPEXC32_EL2: Floating-Point Exception Control register
FPSR: Floating-point Status Register
GCR_EL1: Tag Control Register.
GMID_EL1: Multiple tag transfer ID register
HACR_EL2: Hypervisor Auxiliary Control Register
HAFGRTR_EL2: Hypervisor Activity Monitors Fine-Grained Read Trap Register
HCRX_EL2: Extended Hypervisor Configuration Register
HCR_EL2: Hypervisor Configuration Register
HDFGRTR_EL2: Hypervisor Debug Fine-Grained Read Trap Register
HDFGWTR_EL2: Hypervisor Debug Fine-Grained Write Trap Register
HFGITR_EL2: Hypervisor Fine-Grained Instruction Trap Register
HFGRTR_EL2: Hypervisor Fine-Grained Read Trap Register
HFGWTR_EL2: Hypervisor Fine-Grained Write Trap Register
HPFAR_EL2: Hypervisor IPA Fault Address Register
HSTR_EL2: Hypervisor System Trap Register
ICC_AP0R<n>_EL1: Interrupt Controller Active Priorities Group 0 Registers
ICC_AP1R<n>_EL1: Interrupt Controller Active Priorities Group 1 Registers

ACCDATA_EL1, Accelerator Data

The ACCDATA_EL1 characteristics are:

**Purpose**

Holds the lower 32 bits of the data that is stored by an ST64BV0, Single-copy atomic 64-byte EL0 store instruction.

**Configuration**

This register is present only when FEAT_LS64_ACCDATA is implemented. Otherwise, direct accesses to ACCDATA_EL1 are UNDEFINED.

**Attributes**

ACCDATA_EL1 is a 64-bit register.

**Field descriptions**

The ACCDATA_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit (63:32)</th>
<th>Bit (31:0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reserved, RES0</td>
<td>ACCDATA</td>
</tr>
</tbody>
</table>

- **Bits [63:32]**
  - Reserved, RES0.

- **ACCDATA, bits [31:0]**
  - Accelerator Data field. Holds bits[31:0] of the data that is stored by an ST64BV0 instruction.

**Accessing the ACCDATA_EL1**

Accesses to this register use the following encodings:

\[
\text{MRS } <Xt>, \text{ ACCDATA_EL1}
\]

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>
<td>0b1101</td>
<td>0b0000</td>
<td>0b101</td>
</tr>
</tbody>
</table>

ACTLR_EL1, Auxiliary Control Register (EL1)

The ACTLR_EL1 characteristics are:

**Purpose**

Provides IMPLEMENTATION DEFINED configuration and control options for execution at EL1 and EL0.

**Note**

Arm recommends the contents of this register have no effect on the PE when \( \text{HCR\_EL2.\{E2H, TGE\}} \) is \{1, 1\}, and instead the configuration and control fields are provided by the ACTLR_EL2 register. This avoids the need for software to manage the contents of these register when switching between a Guest OS and a Host OS.

**Configuration**

AArch64 System register ACTLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register \( \text{ACTLR[31:0]} \).

AArch64 System register ACTLR_EL1 bits [63:32] are architecturally mapped to AArch32 System register \( \text{ACTLR2[31:0]} \).

**Attributes**

ACTLR_EL1 is a 64-bit register.

**Field descriptions**

The ACTLR_EL1 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     | IMPLEMENTATION DEFINED |

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   | IMPLEMENTATION DEFINED |

**IMPLEMENTATION DEFINED, bits [63:0]**

**IMPLEMENTATION DEFINED.**

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ACTLR_EL1**

Accesses to this register use the following encodings:

\[ \text{MRS \langle Xt\rangle, ACTLR\_EL1} \]

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>
<td>0b0001</td>
<td>0b0000</td>
<td>0b001</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && HCR_EL2.TACR == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  elsif EL2Enabled() && HCR_EL2.<NV2,NV1,NV> == '1x1' then
    return NVMem[0x118];
  else
    return ACTLR_EL1;
  endif
elsif PSTATE.EL == EL2 then
  return ACTLR_EL1;
elsif PSTATE.EL == EL3 then
  return ACTLR_EL1;
endif

MSR ACTLR_EL1, <Xt>

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>
<td>0b0001</td>
<td>0b0000</td>
<td>0b001</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
  UNDEFINED;

  endif
elsif PSTATE.EL == EL2 then
  ACTLR_EL1 = X[t];
elsif PSTATE.EL == EL3 then
  ACTLR_EL1 = X[t];
endif
The ACTLR_EL2 characteristics are:

**Purpose**

Provides IMPLEMENTATION DEFINED configuration and control options for EL2.

**Note**

Arm recommends the contents of this register are updated to apply to EL0 when HCR_EL2.{E2H, TGE} is {1, 1}, gaining configuration and control fields from the ACTLR_EL1. This avoids the need for software to manage the contents of these register when switching between a Guest OS and a Host OS.

**Configuration**

AArch64 System register ACTLR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HACTLR[31:0].

AArch64 System register ACTLR_EL2 bits [63:32] are architecturally mapped to AArch32 System register HACTLR2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

ACTLR_EL2 is a 64-bit register.

**Field descriptions**

The ACTLR_EL2 bit assignments are:

<table>

AMAIR_EL2, Auxiliary Memory Attribute Indirection Register (EL2)

The AMAIR_EL2 characteristics are:

**Purpose**

Provides IMPLEMENTATION DEFINED memory attributes for the memory regions specified by MAIR_EL2.

**Configuration**

AArch64 System register AMAIR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HAMAIR0[31:0].

AArch64 System register AMAIR_EL2 bits [63:32] are architecturally mapped to AArch32 System register HAMAIR1[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

AMAIR_EL2 is a 64-bit register.

**Field descriptions**

The AMAIR_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | IMPLEMENTATION DEFINED |
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | IMPLEMENTATION DEFINED |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |

AMAIR_EL2 is permitted to be cached in a TLB.

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the AMAIR_EL2**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic AMAIR_EL2 or AMAIR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

AMCFGR_EL0, Activity Monitors Configuration Register

The AMCFGR_EL0 characteristics are:

**Purpose**

Global configuration register for the activity monitors.

Provides information on supported features, the number of counter groups implemented, the total number of activity monitor event counters implemented, and the size of the counters. AMCFGR_EL0 is applicable to both the architectured and the auxiliary counter groups.

**Configuration**

AArch64 System register AMCFGR_EL0 bits [31:0] are architecturally mapped to AArch32 System register AMCFGR[31:0].

AArch64 System register AMCFGR_EL0 bits [31:0] are architecturally mapped to External register AMCFGR[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCFGR_EL0 are UNDEFINED.

**Attributes**

AMCFGR_EL0 is a 64-bit register.

**Field descriptions**

The AMCFGR_EL0 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| NCG | RES0| HDBG| RAZ | SIZE| N   |
| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |

**Bits [63:32]**

Reserved, RES0.

**NCG, bits [31:28]**

Defines the number of counter groups.

The number of implemented counter groups is defined as [AMCFGR_EL0.NCG + 1].

If the number of implemented auxiliary activity monitor event counters is zero, this field has a value of 0b0000. Otherwise, this field has a value of 0b0001.

**Bits [27:25]**

Reserved, RES0.

**HDBG, bit [24]**

Halt-on-debug supported.

From Armv8, this feature must be supported, and so this bit is 0b1.
### Bits [23:14]

Reserved, RAZ.

### SIZE, bits [13:8]

Defines the size of activity monitor event counters.

The size of the activity monitor event counters implemented by the activity monitors Extension is defined as $[\text{AMCFGR\_EL0.\text{SIZE}} + 1]$. From Armv8, the counters are 64-bit, and so this field is `0b111111`.

Note

Software also uses this field to determine the spacing of counters in the memory-map. From Armv8, the counters are at doubleword-aligned addresses.

### N, bits [7:0]

Defines the number of activity monitor event counters.

The total number of counters implemented in all groups by the Activity Monitors Extension is defined as $[\text{AMCFGR\_EL0.\text{N}} + 1]$. 

### Accessing the AMCFGR\_EL0

Accesses to this register use the following encodings:

<td>CG1NC</td>
<td>CG0NC</td>
</tr>
</tbody>
</table>

**Bits [63:16]**

Reserved, RES0.

**CG1NC, bits [15:8]**

Counter Group 1 Number of Counters. The number of counters in the auxiliary counter group.

In an implementation that includes FEAT_AMUv1, the permitted range of values is 0x0 to 0x10.

**CG0NC, bits [7:0]**

Counter Group 0 Number of Counters. The number of counters in the architected counter group.

In an implementation that includes FEAT_AMUv1, the value of this field is 0x4.

**Accessing the AMCGCR_EL0**

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then

AMCNTENSET1_EL0, Activity Monitors Count Enable Set Register 1

The AMCNTENSET1_EL0 characteristics are:

**Purpose**

Enable control bits for the auxiliary activity monitors event counters, AMEVCNTR1<n>_EL0.

**Configuration**

AArch64 System register AMCNTENSET1_EL0 bits [31:0] are architecturally mapped to AArch32 System register AMCNTENSET1[31:0].

AArch64 System register AMCNTENSET1_EL0 bits [31:0] are architecturally mapped to External register AMCNTENSET1[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET1_EL0 are UNDEFINED.

**Attributes**

AMCNTENSET1_EL0 is a 64-bit register.

**Field descriptions**

The AMCNTENSET1_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RES0 | P15 | P14 | P13 | P12 | P11 | P10 | P9  | P8  | P7  | P6  | P5  | P4  | P3  | P2  | P1  | P0  |

**Bits [63:16]**

Reserved, RES0.

**P<n>, bit [n], for n = 15 to 0**

Activity monitor event counter enable bit for AMEVCNTR1<n>_EL0.

Bits [31:16] are RES0. Bits [15:N] are RAZ/WI. N is the value in AMCGCR_EL0.CG1NC.

Possible values of each bit are:

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that AMEVCNTR1&lt;n&gt;_EL0 is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that AMEVCNTR1&lt;n&gt;_EL0 is enabled. When written, enables AMEVCNTR1&lt;n&gt;_EL0.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.

**Accessing the AMCNTENSET1_EL0**

If the number of auxiliary activity monitor event counters implemented is zero, reads and writes of AMCNTENSET1_EL0 are UNDEFINED.
The number of auxiliary activity monitor counters implemented is zero when 
**AMCFGR_EL0**.NCG == 0b0000.

Accesses to this register use the following encodings:

ACNT, bits [63:0]

Auxiliary activity monitor event counter n.

Value of auxiliary activity monitor event counter n, where n is the number of this register and is a number from 0 to 15.

If FEAT_AMUv1p1 is implemented, HCR_EL2.AMVOFFEN is 1, SCR_EL3.AMVOFFEN is 1, HCR_EL2.{E2H, TGE} is not {1,1}, EL2 is implemented in the current Security state, and AMCR_EL0.CG1RZ is 0, reads to these registers at EL0 or EL1 return (PCount<63:0> - AMEVCNTRVOFF1<n>._EL2<63:0>).

PCount is the physical count returned when AMEVCNTR1<n>._EL0 is read from EL2 or EL3.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

On a Cold reset, this field resets to 0.

Accessing the AMEVCNTR1<n>._EL0

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVCNTR1<n>._EL0 are UNDEFINED.

Note
AMCGCR_EL0 identifies the number of auxiliary activity monitor event counters.

Accesses to this register use the following encodings:

MRS <Xt>, AMEVCNTR1<n>_EL0

AMEVTYPER0<n>_EL0, Activity Monitors Event Type Registers 0, n = 0 - 15

The AMEVTYPER0<n>_EL0 characteristics are:

Purpose

Provides information on the events that an architected activity monitor event counter AMEVCNTR0<n>_EL0 counts.

Configuration

AArch64 System register AMEVTYPER0<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register AMEVTYPER0<n>[31:0].

AArch64 System register AMEVTYPER0<n>_EL0 bits [31:0] are architecturally mapped to External register AMEVTYPER0<n>[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER0<n>_EL0 are undefined.

Attributes

AMEVTYPER0<n>_EL0 is a 64-bit register.

Field descriptions

The AMEVTYPER0<n>_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | evtCount |

Bits [63:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the architected activity monitor event counter AMEVCNTR0<n>_EL0. The value of this field is architecturally mandated for each architected counter.

The following table shows the mapping between required event numbers and the corresponding counters:

<table>
<thead>
<tr>
<th>evtCount</th>

| RES0 | RES0 | evtCount |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

**Bits [63:16]**

Reserved, RES0.

**evtCount, bits [15:0]**

Event to count. The event number of the event that is counted by the auxiliary activity monitor event counter AMEVCNTR1<n>_EL0.

It is IMPLEMENTATION DEFINED what values are supported by each counter.

If software writes a value to this field which is not supported by the corresponding counter AMEVCNTR1<n>_EL0, then:

- It is UNPREDICTABLE which event will be counted.
- The value read back is UNKNOWN.

The event counted by AMEVCNTR1<n>_EL0 might be fixed at implementation. In this case, the field is read-only and writes are UNDEFINED.

If the corresponding counter AMEVCNTR1<n>_EL0 is enabled, writes to this register have UNPREDICTABLE results.
Accessing the AMEVTYPER1<n>_EL0

If \(<n>\) is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVTYPER1<n>_EL0 are UNDEFINED.

**Note**

AMEVTYPER1<n>_EL0 identifies the number of auxiliary activity monitor event counters.

Accesses to this register use the following encodings:

\[
\begin{array}{|c|c|c|c|c|}
\hline
\text{op0} & \text{op1} & \text{CRn} & \text{CRm} & \text{op2} \\
\hline
0b11 & 0b011 & 0b1101 & 0b111:n[3] & n[2:0] \\
\hline
\end{array}
\]

MSR AMEVTYPER1<n>_EL0, <Xt>
The AMUSERENR_EL0 characteristics are:

**Purpose**

Global user enable register for the activity monitors. Enables or disables EL0 access to the activity monitors. AMUSERENR_EL0 is applicable to both the architected and the auxiliary counter groups.

**Configuration**

AArch64 System register AMUSERENR_EL0 bits [31:0] are architecturally mapped to AArch32 System register AMUSERENR[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMUSERENR_EL0 are UNDEFINED.

**Attributes**

AMUSERENR_EL0 is a 64-bit register.

**Field descriptions**

**Bits [63:1]**

Reserved, RES0.

**EN, bit [0]**

Traps EL0 accesses to the activity monitors registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, as follows:

- In AArch64 state, accesses to the following registers are trapped, reported using EC syndrome value 0x18:
  - AMCFG_ELO, AMCGCR_ELO, AMCNTENCLR0_ELO, AMCNTENCLR1_ELO, AMCNTENSET0_ELO, AMCNTENSET1_ELO, AMCR_ELO, AMEVCTR0<_n>_EL0, AMEVCTR1<_n>_EL0, AMEVTPR0<_n>_EL0, and AMEVTPR1<_n>_EL0.

- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value 0x03, MRRC and MCRR accesses are trapped and reported using EC syndrome value 0x04:
  - AMCFG, AMCGCR, AMCNTENCLR0, AMCNTENCLR1, AMCNTENSET0, AMCNTENSET1, AMCR, AMEVCTR0<_n>, AMEVCTR1<_n>, AMEVTPR0<_n>, and AMEVTPR1<_n>.

<table>

APDAKeyHi_EL1, Pointer Authentication Key A for Data (bits[127:64])

The APDAKeyHi_EL1 characteristics are:

**Purpose**

Holds bits[127:64] of key A used for authentication of data pointer values.

**Note**

The term APDAKey_EL1 is used to describe the concatenation of APDAKeyHi_EL1 : APDAKeyLo_EL1.

**Configuration**

This register is present only when FEAT_PAuth is implemented. Otherwise, direct accesses to APDAKeyHi_EL1 are UNDEFINED.

**Attributes**

APDAKeyHi_EL1 is a 64-bit register.

**Field descriptions**

The APDAKeyHi_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-0</td>
<td>64 bit value, bits[127:64] of the 128 bit pointer authentication key value on a Warm reset, this field resets to an architecturally UNKNOWN value.</td>
</tr>
</tbody>
</table>

**Bits [63:0]**

64 bit value, bits[127:64] of the 128 bit pointer authentication key value.

APDKeyHi_EL1, Pointer Authentication Key A for Data (bits[127:64])
The APDAKeyLo_EL1 characteristics are:

**Purpose**

Holds bits[63:0] of key A used for authentication of data pointer values.

**Note**

The term APDAKey_EL1 is used to describe the concatenation of APDAKeyHi_EL1: APDAKeyLo_EL1.

**Configuration**

This register is present only when FEAT_PAuth is implemented. Otherwise, direct accesses to APDAKeyLo_EL1 are UNDEFINED.

**Attributes**

APDAKeyLo_EL1 is a 64-bit register.

**Field descriptions**

The APDAKeyLo_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>64 bit value, bits[63:0] of the 128 bit pointer authentication key value</td>
</tr>
<tr>
<td>31</td>
<td>64 bit value, bits[63:0] of the 128 bit pointer authentication key value</td>
</tr>
</tbody>
</table>

**Bits [63:0]**

64 bit value, bits[63:0] of the 128 bit pointer authentication key value.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the APDAKeyLo_EL1**

Accesses to this register use the following encodings:

APGAKeyLo_EL1, Pointer Authentication Key A for Code (bits[63:0])
The APIAKeyHi_EL1 characteristics are:

**Purpose**

Holds bits[127:64] of key A used for authentication of instruction pointer values.

**Note**

The term APIAKey_EL1 is used to describe the concatenation of
APIAKeyHi_EL1: APIAKeyLo_EL1.

**Configuration**

This register is present only when FEAT_PAuth is implemented. Otherwise, direct accesses to APIAKeyHi_EL1 are UNDEFINED.

**Attributes**

APIAKeyHi_EL1 is a 64-bit register.

**Field descriptions**

The APIAKeyHi_EL1 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |

APIBKeyHi_EL1, Pointer Authentication Key B for Instruction (bits[127:64])
APIBKeyLo_EL1, Pointer Authentication Key B for Instruction (bits[63:0])

The APIBKeyLo_EL1 characteristics are:

**Purpose**

Holds bits[63:0] of key B used for authentication of instruction pointer values.

**Note**

The term APIBKey_EL1 is used to describe the concatenation of APIBKeyHi_EL1: APIBKeyLo_EL1.

**Configuration**

This register is present only when FEAT_PAuth is implemented. Otherwise, direct accesses to APIBKeyLo_EL1 are UNDEFINED.

**Attributes**

APIBKeyLo_EL1 is a 64-bit register.

**Field descriptions**

The APIBKeyLo_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</td>

AT S12E0R, Address Translate Stages 1 and 2 EL0 Read

The AT S12E0R characteristics are:

**Purpose**

Performs stage 1 and 2 address translations from EL0, with permissions as if reading from the given virtual address from EL0, using the following translation regime:

- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the EL2&0 translation regime.
- Otherwise, the EL1&0 translation regime.

**Configuration**

There are no configuration notes.

**Attributes**

AT S12E0R is a 64-bit System instruction.

**Field descriptions**

The AT S12E0R input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:32]</th>
<th>Input address for translation</th>
<th>Input address for translation</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</td>

**Bits [63:0]**

Input address for translation. The resulting address can be read from the PAR_EL1.

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

**Executing the AT S1E0W instruction**

Accesses to this instruction use the following encodings:

AT S1E0W, <Xt>
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && HCR_EL2.AT == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGITR_EL2.ATS1E0W == '1' then
      AArch64.SystemAccessTrap(EL2, 0x18);
  else
    AT_S1E0W(X[t]);
  endif
elsif PSTATE.EL == EL2 then
  AT_S1E0W(X[t]);
elsif PSTATE.EL == EL3 then
  AT_S1E0W(X[t]);

AT S1E1R, Address Translate Stage 1 EL1 Read

The AT S1E1R characteristics are:

**Purpose**

Performs stage 1 address translation, with permissions as if reading from the given virtual address from EL1, or from EL2 if the Effective value of HCR_EL2.(E2H, TGE) is \( \{1, 1\} \), using the following translation regime:

- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.(E2H, TGE) is not \( \{1, 1\} \), the EL1&0 translation regime, accessed from EL1.
  - If HCR_EL2.(E2H, TGE) is \( \{1, 1\} \), the EL2&0 translation regime, accessed from EL2.
- Otherwise, the EL1&0 translation regime, accessed from EL1.

**Configuration**

There are no configuration notes.

**Attributes**

AT S1E1R is a 64-bit System instruction.

**Field descriptions**

The AT S1E1R input value bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |

AT S1E1RP, Address Translate Stage 1 EL1 Read PAN

The AT S1E1RP characteristics are:

**Purpose**

Performs a stage 1 address translation, where the value of PSTATE.PAN determines if a read from a location will generate a permission fault for a privileged access, using the following translation regime:

- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the EL1&0 translation regime, accessed from EL1.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the EL2&0 translation regime, accessed from EL2.
- Otherwise, the EL1&0 translation regime, accessed from EL1.

**Configuration**

This instruction is present only when FEAT_PAN2 is implemented. Otherwise, direct accesses to AT S1E1RP are UNDEFINED.

**Attributes**

AT S1E1RP is a 64-bit System instruction.

**Field descriptions**

The AT S1E1RP input value bit assignments are:

AT S1E3R, Address Translate Stage 1 EL3 Read

The AT S1E3R characteristics are:

**Purpose**

Performs stage 1 address translation as defined for EL3, with permissions as if reading from the given virtual address.

**Configuration**

There are no configuration notes.

**Attributes**

AT S1E3R is a 64-bit System instruction.

**Field descriptions**

The AT S1E3R input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

CCSIDR2_EL1, Current Cache Size ID Register 2

The CCSIDR2_EL1 characteristics are:

**Purpose**

When FEAT_CCIDX is implemented, provides the information about the architecture of the currently selected cache from bits[63:32] of CCSIDR_EL1.

When FEAT_CCIDX is not implemented, this register is not implemented.

**Configuration**

AArch64 System register CCSIDR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register CCSIDR2[31:0].

This register is present only when FEAT_CCIDX is implemented. Otherwise, direct accesses to CCSIDR2_EL1 are UNDEFINED.

In an AArch64 only implementation, it is IMPLEMENTATION DEFINED whether reading this register gives an UNKNOWN value or is UNDEFINED.

The implementation includes one CCSIDR2_EL1 for each cache that it can access. CSSELR_EL1 selects which Cache Size ID Register is accessible.

**Attributes**

CCSIDR2_EL1 is a 64-bit register.

**Field descriptions**

The CCSIDR2_EL1 bit assignments are:

<table>

elsif PSTATE.EL == EL2 then
  return CCSIDR2_EL1;
elsif PSTATE.EL == EL3 then
  return CCSIDR2_EL1;
The CCSIDR_EL1 characteristics are:

**Purpose**

Provides information about the architecture of the currently selected cache.

**Configuration**

AArch64 System register CCSIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register CCSIDR31:0.

AArch64 System register CCSIDR_EL1 bits [63:32] are architecturally mapped to AArch32 System register CCSIDR2[31:0].

The implementation includes one CCSIDR_EL1 for each cache that it can access. CSSELR_EL1 selects which Cache Size ID Register is accessible.

**Attributes**

CCSIDR_EL1 is a 64-bit register.

**Field descriptions**

The CCSIDR_EL1 bit assignments are:

**When FEAT_CCIDX is implemented:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | NumSets |
| RES0 | Associativity | LineSize |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Note**

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

**Bits [63:56]**

Reserved, RES0.

**NumSets, bits [55:32]**

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

**Bits [31:24]**

Reserved, RES0.
Associativity, bits [23:3]

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

LineSize, bits [2:0]

(Log₂(Number of bytes in cache line)) - 4. For example:

- For a line length of 16 bytes: Log₂(16) = 4, LineSize entry = 0. This is the minimum line length.
- For a line length of 32 bytes: Log₂(32) = 5, LineSize entry = 1.

When FEAT_MTE is implemented and enabled, where a cache only holds Allocation tags, this field is RES0.

Otherwise:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
</table>

NumSets, bits [27:13]

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

Associativity, bits [12:3]

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

LineSize, bits [2:0]

(Log₂(Number of bytes in cache line)) - 4. For example:

- For a line length of 16 bytes: Log₂(16) = 4, LineSize entry = 0. This is the minimum line length.
- For a line length of 32 bytes: Log₂(32) = 5, LineSize entry = 1.

Accessing the CCSIDR_EL1

If CSSEL_EL1.Level is programmed to a cache level that is not implemented, then on a read of the CCSIDR_EL1 the behavior is CONSTRAINED UNPREDICTABLE, and can be one of the following:

- The CCSIDR_EL1 read is treated as NOP.
- The CCSIDR_EL1 read is **UNDEFINED**.
- The CCSIDR_EL1 read returns an **UNKNOWN** value.

Accesses to this register use the following encodings:

### MRS <Xt>, CCSIDR_EL1

<table>

  end
elsif PSTATE.EL == EL2 then
  return CCSIDR_EL1;
elsif PSTATE.EL == EL3 then
  return CCSIDR_EL1;
CFP RCTX, Control Flow Prediction Restriction by Context

The CFP RCTX characteristics are:

**Purpose**

Control Flow Prediction Restriction by Context applies to all Control Flow Prediction Resources that predict execution based on information gathered within the target execution context or contexts.

When this instruction is complete and synchronized, control flow prediction does not permit later speculative execution within the target execution context to be observable through side channels.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

**Note**

This instruction does not require the invalidation of prediction structures so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

**Configuration**

This instruction is present only when FEAT_SPECRES is implemented. Otherwise, direct accesses to CFP RCTX are undefined.

**Attributes**

CFP RCTX is a 64-bit System instruction.

**Field descriptions**

The CFP RCTX input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
<td>Reserved</td>
</tr>
<tr>
<td>57</td>
<td>GVMID</td>
<td>Execution applies to all VMIDs or a specified VMID.</td>
</tr>
<tr>
<td>50</td>
<td>VMID</td>
<td></td>
</tr>
<tr>
<td>48</td>
<td>NS</td>
<td></td>
</tr>
<tr>
<td>31</td>
<td>ASID</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:49]**

Reserved, RES0.

**GVMID, bit [48]**

Execution of this instruction applies to all VMIDs or a specified VMID.
<table>
<thead>
<tr>
<th>GVMID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>000</td>
<td>Applies to specified VMID for an EL0 or EL1 target execution context.</td>
</tr>
<tr>
<td>001</td>
<td>Applies to all VMIDs for an EL0 or EL1 target execution context.</td>
</tr>
</tbody>
</table>

For target execution contexts other than EL0 or EL1, this field is \texttt{RES0}.

If the instruction is executed at EL0 or EL1, this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is \texttt{RES0}.

**VMID, bits [47:32]**

Only applies when bit[48] is 0 and the target execution context is either:

- EL1.
- EL0 when \( \text{HCR} \_\text{EL2.E2H}==0 \) or \( \text{HCR} \_\text{EL2.TGE}==0 \).

Otherwise this field is \texttt{RES0}.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and \( \text{HCR} \_\text{EL2.E2H}==0 \) or \( \text{HCR} \_\text{EL2.TGE}==0 \), this field is treated as the current VMID.

When the instruction is executed at EL0 and \( \text{HCR} \_\text{EL2.E2H}==1 \) and \( \text{HCR} \_\text{EL2.TGE}==1 \), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is \texttt{RES0}.

**Bits [31:27]**

Reserved, \texttt{RES0}.

**NS, bit [26]**

Security State. Defined values are:

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure state.</td>
</tr>
</tbody>
</table>

When executed in Non-secure state, the Effective value of NS is 1.

**EL, bits [25:24]**

Exception Level. Indicates the Exception level of the target execution context.

<table>
<thead>
<tr>
<th>EL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>EL0</td>
</tr>
<tr>
<td>0b01</td>
<td>EL1</td>
</tr>
<tr>
<td>0b10</td>
<td>EL2</td>
</tr>
<tr>
<td>0b11</td>
<td>EL3</td>
</tr>
</tbody>
</table>

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

**Bits [23:17]**

Reserved, \texttt{RES0}.

**GASID, bit [16]**

Execution of this instruction applies to all ASIDs or a specified ASID.
<table>
<thead>
<tr>
<th>GASID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Applies to specified ASID for an EL0 target execution context.</td>
</tr>
<tr>
<td>0b1</td>
<td>Applies to all ASID for an EL0 target execution context.</td>
</tr>
</tbody>
</table>

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

**ASID, bits [15:0]**

Only applies for an EL0 target execution context and when bit[16] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

**Executing the CFP RCTX instruction**

Accesses to this instruction use the following encodings:

**CFP RCTX, <Xt>**

<table>
<thead>

        endif
    endif
else
    CFP_RCTX(X[t]);
endif
```
The CLIDR_EL1 characteristics are:

**Purpose**

Identifies the type of cache, or caches, that are implemented at each level and can be managed using the architected cache maintenance instructions that operate by set/way, up to a maximum of seven levels. Also identifies the Level of Coherence (LoC) and Level of Unification (LoU) for the cache hierarchy.

**Configuration**

AArch64 System register CLIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register CLIDR[31:0].

**Attributes**

CLIDR_EL1 is a 64-bit register.

**Field descriptions**

The CLIDR_EL1 bit assignments are:

<table>

<td>L3 cache is the highest Inner Cacheable level.</td>
</tr>
<tr>
<td>0b100</td>
<td>L4 cache is the highest Inner Cacheable level.</td>
</tr>
<tr>
<td>0b101</td>
<td>L5 cache is the highest Inner Cacheable level.</td>
</tr>
<tr>
<td>0b110</td>
<td>L6 cache is the highest Inner Cacheable level.</td>
</tr>
<tr>
<td>0b111</td>
<td>L7 cache is the highest Inner Cacheable level.</td>
</tr>
</tbody>
</table>

**LoUU, bits [29:27]**

Level of Unification Uniprocessor for the cache hierarchy.

**Note**

When FEAT S2FWB is implemented, the architecture requires that this field is zero so that no levels of data cache need to be cleaned in order to manage coherency with instruction fetches.

**LoC, bits [26:24]**

Level of Coherence for the cache hierarchy.

**LoUIS, bits [23:21]**

Level of Unification Inner Shareable for the cache hierarchy.

**Note**

When FEAT S2FWB is implemented, the architecture requires that this field is zero so that no levels of data cache need to be cleaned in order to manage coherency with instruction fetches.

**Ctype<n>, bits [3(n-1)+2:3(n-1)], for n = 7 to 1**

Cache Type fields. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy. Possible values of each field are:

<table>
<thead>
<tr>
<th>Ctype&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>No cache.</td>
</tr>
<tr>
<td>0b001</td>
<td>Instruction cache only.</td>
</tr>
<tr>
<td>0b010</td>
<td>Data cache only.</td>
</tr>
<tr>
<td>0b011</td>
<td>Separate instruction and data caches.</td>
</tr>
<tr>
<td>0b100</td>
<td>Unified cache.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If software reads the Cache Type fields from Ctype1 upwards, once it has seen a value of 000, no caches that can be managed using the architected cache maintenance instructions that operate by set/way exist at further-out levels of the hierarchy. So, for example, if Ctype3 is the first Cache Type field with a value of 000, the values of Ctype4 to Ctype7 must be ignored.

**Accessing the CLIDR_EL1**

Accesses to this register use the following encodings:
MRS <Xt>, CLIDR_EL1

The CNTFRQ_EL0 characteristics are:

**Purpose**

This register is provided so that software can discover the frequency of the system counter. It must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

**Configuration**

AArch64 System register CNTFRQ_EL0 bits [31:0] are architecturally mapped to AArch32 System register CNTFRQ[31:0].

**Attributes**

CNTFRQ_EL0 is a 64-bit register.

**Field descriptions**

The CNTFRQ_EL0 bit assignments are:

<table>
<thead>
<tr>

The CNTHCTL_EL2 characteristics are:

**Purpose**

Controls the generation of an event stream from the physical counter, and access from EL1 to the physical counter and the EL1 physical timer.

**Configuration**

AArch64 System register CNTHCTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHCTL[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

CNTHCTL_EL2 is a 64-bit register.

**Field descriptions**

The CNTHCTL_EL2 bit assignments are:

**When FEAT_VHE is implemented and HCR_EL2.E2H == 1:**

| 0b1     | If HCR_EL2.(E2H, TGE) is {1, 1}, this control does not cause any instructions to be trapped.  
If HCR_EL2.E2H is 0 or HCR_EL2.TGE is 0, then:  
• In AArch64 state, traps EL0 and EL1 accesses to CNTV_CTL_EL0, CNTV_CVAL_EL0, and CNTV_TVAL_EL0 to EL2, unless they are trapped by CNTKCTL_EL1.EL0VTEN.  
• In AArch32 state, traps EL0 and EL1 accesses to CNTV_CTL, CNTV_CVAL, and CNTV_TVAL to EL2, unless they are trapped by CNTKCTL_EL1.EL0VTEN or CNTKCTL.PL0VTEN. |

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
**ECV, bit [12]**

When **FEAT_ECV** is implemented:

Enables the Enhanced Counter Virtualization functionality registers.

<table>
<thead>
<tr>
<th>ECV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Enhanced Counter Virtualization functionality is disabled.</td>
</tr>
</tbody>
</table>
| 0b1 | When \(HCR\_EL2.\{E2H, \text{TGE}\} = \{1, 1\}\) or \(SCR\_EL3.\{\text{NS, EEL2}\} = \{0, 0\}\), then Enhanced Counter Virtualization functionality is disabled.  
When \(SCR\_EL3.\text{NS}\) or \(SCR\_EL3.\text{EEL2}\) are 1, and \(HCR\_EL2.\text{E2H}\) or \(HCR\_EL2.\text{TGE}\) are 0, then Enhanced Counter Virtualization functionality is enabled when EL2 is enabled for the current Security state. This means that:
  - An MRS to \(\text{CNTPCT\_EL0}\) from either EL0 or EL1 that is not trapped will return the value \((\text{PCount}<63:0> - \text{CNTPOFF\_EL2}<63:0>)\).  
  - The EL1 physical timer interrupt is triggered when \((\text{PCount}<63:0> - \text{CNTPOFF\_EL2}<63:0>) - \text{PCVal}<63:0>\) is greater than or equal to 0. \(\text{PCount}<63:0>\) is the physical count returned when \(\text{CNTPCT\_EL0}\) is read from EL2 or EL3. \(\text{PCVal}<63:0>\) is the EL1 physical timer compare value for this timer. |

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

---

**EL1PTEN, bit [11]**

When \(HCR\_EL2.\text{TGE}\) is 0, traps EL0 and EL1 accesses to the E1 physical timer registers to EL2 when EL2 is enabled in the current Security state.

<table>
<thead>
<tr>
<th>EL1PTEN</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0     | From AArch64 state: EL0 and EL1 accesses to the \(\text{CNTP\_CTL\_EL0, CNTP\_CVAL\_EL0, and CNTP\_TVAL\_EL0}\) are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by \(\text{CNTKCTL\_EL1.EL0PTEN}\).  
From AArch32 state: EL0 and EL1 accesses to the \(\text{CNTP\_CTL, CNTP\_CVAL, and CNTP\_TVAL}\) are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by \(\text{CNTKCTL\_EL1.EL0PTEN}\) or \(\text{CNTKCTL\_PL0PTEN}\). |
| 0b1     | This control does not cause any instructions to be trapped. |

When \(HCR\_EL2.\text{TGE}\) is 1, this control does not cause any instructions to be trapped.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

---

**EL1PCTEN, bit [10]**

When \(HCR\_EL2.\text{TGE}\) is 0, traps EL0 and EL1 accesses to the EL1 physical counter register to EL2 when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to \(\text{CNTPCT\_EL0}\) are trapped to EL2, reported using EC syndrome value 0x18.  
- In AArch32 state, MRRC or MCRR accesses to \(\text{CNTPCT}\) are trapped to EL2, reported using EC syndrome value 0x04.
EL1PCTEN

| Meaning | 0b0 | From AArch64 state: EL0 and EL1 accesses to the CNTPCT_EL0 are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PCTEN.
| 0b1 | This control does not cause any instructions to be trapped. |

From AArch32 state: EL0 and EL1 accesses to the CNTPCT are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PCTEN or CNTKCTL.PL0PCTEN.

When HCR_EL2.TGE is 1, this control does not cause any instructions to be trapped.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL0PTEN, bit [9]

When HCR_EL2.TGE is 0, this control does not cause any instructions to be trapped.

When HCR_EL2.TGE is 1, traps EL0 accesses to the physical timer registers to EL2.

| Meaning | 0b0 | EL0 using AArch64: EL0 accesses to the CNTP_CTL_EL0, CNTP_CVAL_EL0, and CNTP_TVAL_EL0 registers are trapped to EL2.
| 0b1 | EL0 using AArch32: EL0 accesses to the CNTP_CTL, CNTP_CVAL, and CNTP_TVAL registers are trapped to EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL0VTEN, bit [8]

When HCR_EL2.TGE is 0, this control does not cause any instructions to be trapped.

When HCR_EL2.TGE is 1, traps EL0 accesses to the virtual timer registers to EL2.

| Meaning | 0b0 | EL0 using AArch64: EL0 accesses to the CNTV_CTL_EL0, CNTV_CVAL_EL0, and CNTV_TVAL_EL0 registers are trapped to EL2.
| 0b1 | EL0 using AArch32: EL0 accesses to the CNTV_CTL, CNTV_CVAL, and CNTV_TVAL registers are trapped to EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTI, bits [7:4]

Selects which bit of the counter register CNTPCT_EL0 is the trigger for the event stream generated from that counter, when that stream is enabled.

If FEAT_ECV is implemented, and CNTHCTL_EL2.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of the counter register CNTPCT_EL0.

Otherwise, this field selects a trigger bit in the range 0 to 15 of the counter register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the counter register CNTPCT_EL0 trigger bit, defined by EVNTI, generates an event when the event stream is enabled.
### EVNTDIR

<table>
<thead>
<tr>
<th>Meaning</th>
<th>0b0</th>
<th>0b1</th>
</tr>
</thead>
<tbody>
<tr>
<td>A 0 to 1 transition of the trigger bit triggers an event.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>A 1 to 0 transition of the trigger bit triggers an event.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### EVNTEN, bit [2]

Enables the generation of an event stream from the counter register `CNTPCT_EL0`.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>0b0</th>
<th>0b1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disables the event stream.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Enables the event stream.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### EL0VCTEN, bit [1]

When `HCR_EL2.TGE` is 0, this control does not cause any instructions to be trapped.

When `HCR_EL2.TGE` is 1, traps EL0 accesses to the frequency register and virtual counter register to EL2.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>0b0</th>
<th>0b1</th>
</tr>
</thead>
<tbody>
<tr>
<td>EL0 using AArch64: EL0 accesses to the <code>CNTVCT_EL0</code> register are trapped to EL2, if <code>CNTHCTL_EL2.EL0PCTEN</code> is also 0.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>EL0 using AArch32: EL0 accesses to the <code>CNTVCT</code> register are trapped to EL2.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>EL0 using AArch32: EL0 accesses to the <code>CNTFRQ</code> register are trapped to EL2, if <code>CNTHCTL_EL2.EL0PCTEN</code> is also 0.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>This control does not cause any instructions to be trapped.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### EL0PCTEN, bit [0]

When `HCR_EL2.TGE` is 0, this control does not cause any instructions to be trapped.

When `HCR_EL2.TGE` is 1, traps EL0 accesses to the frequency register and physical counter register to EL2.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>0b0</th>
<th>0b1</th>
</tr>
</thead>
<tbody>
<tr>
<td>EL0 using AArch64: EL0 accesses to the <code>CNTPCT_EL0</code> register are trapped to EL2.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>EL0 using AArch64: EL0 accesses to the <code>CNTFRQ_EL0</code> register are trapped to EL2, if <code>CNTHCTL_EL2.EL0VCTEN</code> is also 0.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>EL0 using AArch32: EL0 accesses to the <code>CNTVCT</code> register are trapped to EL2.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>EL0 using AArch32: EL0 accesses to the <code>CNTFRQ</code> register are trapped to EL2, if <code>CNTHCTL_EL2.EL0VCTEN</code> is also 0.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>This control does not cause any instructions to be trapped.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Otherwise:

This format applies in all Armv8.0 implementations, and it also contains a description of the behavior when EL3 is implemented and EL2 is not implemented.
Bits [63:18]

<thead>
<tr>
<th>E1TVD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>If HCR_EL2, (E2H, TGE) is {1, 1}, this control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

If HCR_EL2.E2H is 0 or HCR_EL2.TGE is 0, then:
- In AArch64 state, traps EL0 and EL1 accesses to CNTV_CTL_EL0, CNTV_CVAL_EL0, and CNTV_TVAL_EL0 to EL2, unless they are trapped by CNTKCTL_EL1.EL0VTEN.
- In AArch32 state, traps EL0 and EL1 accesses to CNTV_CTL, CNTV_CVAL, and CNTV_TVAL to EL2, unless they are trapped by CNTKCTL_EL1.EL0VTEN or CNTKCTL.PL0VTEN.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Otherwise:

Reserved, RES0.

### ECV, bit [12]

#### When FEAT_ECV is implemented:

Enables the Enhanced Counter Virtualization functionality registers.

<table>
<thead>
<tr>
<th>ECV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Enhanced Counter Virtualization functionality is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>When HCR_EL2, (E2H, TGE) == {1, 1} or SCR_EL3, {NS, EEL2} == {0, 0}, then Enhanced Counter Virtualization functionality is disabled.</td>
</tr>
</tbody>
</table>

When SCR_EL3.NS or SCR_EL3.EEL2 are 1, and HCR_EL2.E2H or HCR_EL2.TGE are 0, then Enhanced Counter Virtualization functionality is enabled when EL2 is enabled for the current Security state. This means that:
- An MRS to CNTPCT_EL0 from either EL0 or EL1 that is not trapped will return the value (PCount<63:0> - CNTPOFF_EL2<63:0>).
- The EL1 physical timer interrupt is triggered when ((PCount<63:0> - CNTPOFF_EL2<63:0>) - PCVal<63:0>) is greater than or equal to 0. PCount is the physical count returned when CNTPCT_EL0 is read from EL2 or EL3. PCVal<63:0> is the EL1 physical timer compare value for this timer.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Otherwise:

Reserved, RES0.

### Bits [11:8]

Reserved, RES0.

### EVNTI, bits [7:4]

Selects which bit of the counter register CNTPCT_EL0 is the trigger for the event stream generated from that counter, when that stream is enabled.
If FEAT_ECV is implemented, and CNTHCTL_EL2.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of the counter register CNTPCT_EL0.

Otherwise, this field selects a trigger bit in the range 0 to 15 of the counter register.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**EVNTDIR, bit [3]**

Controls which transition of the counter register CNTPCT_EL0 trigger bit, defined by EVNTI, generates an event when the event stream is enabled.

<table>
<thead>
<tr>
<th>EVNTDIR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A 0 to 1 transition of the trigger bit triggers an event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A 1 to 0 transition of the trigger bit triggers an event.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**EVNTEN, bit [2]**

Enables the generation of an event stream from the counter register CNTPCT_EL0.

<table>
<thead>
<tr>
<th>EVNTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disables the event stream.</td>
</tr>
<tr>
<td>0b1</td>
<td>Enables the event stream.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**EL1PCEN, bit [1]**

Traps EL0 and EL1 accesses to the EL1 physical timer registers to EL2 when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to CNTP_CTL_EL0, CNTP_CVAL_EL0, CNTP_TVAL_EL0 are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2 reported using EC syndrome value 0x3 and MRRC and MCRR accesses are trapped to EL2, reported using EC syndrome value 0x04:
  - CNTP_CTL, CNTP_CVAL, CNTP_TVAL.

<table>
<thead>
<tr>
<th>EL1PCEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>From AArch64 state: EL0 and EL1 accesses to the CNTP_CTL_EL0, CNTP_CVAL_EL0, and CNTP_TVAL_EL0 are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1_EL0PTEN. From AArch32 state: EL0 and EL1 accesses to the CNTP_CTL, CNTP_CVAL, and CNTP_TVAL are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1_EL0PTEN or CNTKCTL.PL0PTEN.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**EL1PCTEN, bit [0]**

Traps EL0 and EL1 accesses to the EL1 physical counter register to EL2 when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to CNTPCT_EL0 are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, MRRC or MCRR accesses to CNTPCT are trapped to EL2, reported using EC syndrome value 0x04.
ELPCTEN | Meaning
--- | ---
0b0 | From AArch64 state: EL0 and EL1 accesses to the CNTPCT_EL0 are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PCTEN.
From AArch32 state: EL0 and EL1 accesses to the CNTPCT are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PCTEN or CNTKCTL.PL0PCTEN.
0b1 | This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTHCTL_EL2**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHCTL_EL2 or CNTKCTL_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

elsif PSTATE.EL == EL3 then
    CNTKCTL_EL1 = X[t];
The CNTHP_CTL_EL2 characteristics are:

**Purpose**

Control register for the EL2 physical timer.

**Configuration**

AArch64 System register CNTHP_CTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHP_CTL[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

CNTHP_CTL_EL2 is a 64-bit register.

**Field descriptions**

The CNTHP_CTL_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RES0 | ISTATUS | IMASK | ENABLE |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is **UNKNOWN**.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>
For more information, see the description of the ISTATUS bit.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from **CNTHP_TVAL_EL2** continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the CNTHP_CTL_EL2**

When **HCR_EL2.E2H** is 1, without explicit synchronization, access from EL2 using the mnemonic **CNTHP_CTL_EL2** or **CNTP_CTL_EL0** are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

CNTHP_CVAL_EL2, Counter-timer Physical Timer CompareValue register (EL2)

The CNTHP_CVAL_EL2 characteristics are:

**Purpose**

Holds the compare value for the EL2 physical timer.

**Configuration**

AArch64 System register CNTHP_CVAL_EL2 bits [63:0] are architecturally mapped to AArch32 System register CNTHP_CVAL[63:0].

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

CNTHP_CVAL_EL2 is a 64-bit register.

**Field descriptions**

The CNTHP_CVAL_EL2 bit assignments are:

</tr>
</tbody>
</table>

**CompareValue, bits [63:0]**

Holds the EL2 physical timer CompareValue.

When CNTHP_CTL_EL2 ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHP_CTL_EL2.ISTATUS is set to 1.
- If CNTHP_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHP_CTL_EL2 ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTHP_CVAL_EL2**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHP_CVAL_EL2 or CNTP_CVAL_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

The CNTHP_TVAL_EL2 characteristics are:

**Purpose**

Holds the timer value for the EL2 physical timer.

**Configuration**

AArch64 System register CNTHP_TVAL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHP_TVAL[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

CNTHP_TVAL_EL2 is a 64-bit register.

**Field descriptions**

The CNTHP_TVAL_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | TimerValue |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:32]**

Reserved, RES0.

**TimerValue, bits [31:0]**

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If CNTHP_CTL_EL2.ENABLE is 0, the value returned is **UNKNOWN**.
- If CNTHP_CTL_EL2.ENABLE is 1, the value returned is (CNTHP_CVAL_EL2 - CNTPCT_EL0).

On a write of this register, CNTHP_CVAL_EL2 is set to (CNTPCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHP_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CNTHP_CVAL_EL2) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHP_CTL_EL2.ISTATUS is set to 1.
- If CNTHP_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHP_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Accessing the CNTHP_TVAL_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHP_TVAL_EL2 or CNTP_TVAL_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

end if
CNTHPS_CTL_EL2, Counter-timer Secure Physical Timer Control register (EL2)

The CNTHPS_CTL_EL2 characteristics are:

**Purpose**

Control register for the Secure EL2 physical timer.

**Configuration**

AArch64 System register CNTHPS_CTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHPS_CTL[31:0].

This register is present only when FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHPS_CTL_EL2 are **UNDEFINED**.

**Attributes**

CNTHPS_CTL_EL2 is a 64-bit register.

**Field descriptions**

The CNTHPS_CTL_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RES0 | RES0 | RES0 | ISTATUS | IMASK | ENABLE |

**Bits [63:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the CNTHPS_CTL_EL2.ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the CNTHPS_CTL_EL2.ENABLE bit is 0, the ISTATUS field is **UNKNOWN**.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>
For more information, see the description of the ISTATUS bit.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from \texttt{CNTHPS_TVAL_EL2} continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

CNTHPS_CVAL_EL2, Counter-timer Secure Physical Timer CompareValue register (EL2)

The CNTHPS_CVAL_EL2 characteristics are:

**Purpose**

Holds the compare value for the Secure EL2 physical timer.

**Configuration**

AArch64 System register CNTHPS_CVAL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHPS_CVAL[31:0].

This register is present only when EL2 is implemented and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHPS_CVAL_EL2 are UNDEFINED.

**Attributes**

CNTHPS_CVAL_EL2 is a 64-bit register.

**Field descriptions**

The CNTHPS_CVAL_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | CompareValue |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  | CompareValue |

**CompareValue, bits [63:0]**

Holds the EL2 physical timer CompareValue.

When CNTHPS_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHPS_CTL_EL2.ISTATUS is set to 1.
- If CNTHPS_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHPS_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTHPS_CVAL_EL2**

Accesses to this register use the following encodings:

**Bits [63:32]**

Reserved, RES0.

**TimerValue, bits [31:0]**

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If CNTHPS_CTL_EL2.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHPS_CTL_EL2.ENABLE is 1, the value returned is (CNTHPS_CVAL_EL2 - CNTPCT_EL0).

On a write of this register, CNTHPS_CVAL_EL2 is set to (CNTPCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHPS_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CNTHPS_CVAL_EL2) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHPS_CTL_EL2.ISTATUS is set to 1.
- If CNTHPS_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHPS_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

CNTHV_CTL_EL2, Counter-timer Virtual Timer Control register (EL2)

The CNTHV_CTL_EL2 characteristics are:

**Purpose**

Control register for the EL2 virtual timer.

**Configuration**

AArch64 System register CNTHV_CTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHV_CTL[31:0].

This register is present only when FEAT_VHE is implemented. Otherwise, direct accesses to CNTHV_CTL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

CNTHV_CTL_EL2 is a 64-bit register.

**Field descriptions**

The CNTHV_CTL_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| RES0 | RES0 | ISTATUS | IMASK | ENABLE |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:
**IMASK**

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>

For more information, see the description of the ISTATUS bit.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from **CNTHV_TVAL_EL2** continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the CNTHV_CTL_EL2**

When **HCR_EL2.E2H** is 1, without explicit synchronization, access from EL2 using the mnemonic **CNTHV_CTL_EL2** or **CNTV_CTL_EL0** are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

**CompareValue, bits [63:0]**

Holds the EL2 virtual timer CompareValue.

When CNTHV_CTL_EL2 ENABLE is 1, the timer condition is met when (CNTVCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHV_CTL_EL2.ISTATUS is set to 1.
- If CNTHV_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHV_CTL_EL2 ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTHV_CVAL_EL2**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHV_CVAL_EL2 or CNTV_CVAL_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

CNTHV_TVAL_EL2, Counter-timer Virtual Timer

TimerValue Register (EL2)

The CNTHV_TVAL_EL2 characteristics are:

Purpose

Holds the timer value for the EL2 virtual timer.

Configuration

AArch64 System register CNTHV_TVAL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHV_TVAL[31:0].

This register is present only when FEAT_VHE is implemented. Otherwise, direct accesses to CNTHV_TVAL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHV_TVAL_EL2 is a 64-bit register.

Field descriptions

The CNTHV_TVAL_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | TimerValue |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If CNTHV_CTL_EL2.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHV_CTL_EL2.ENABLE is 1, the value returned is (CNTHV_CVAL_EL2 - CNTVCT_EL0).

On a write of this register, CNTHV_CVAL_EL2 is set to (CNTVCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHV_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTVCT_EL0 - CNTHV_CVAL_EL2) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHV_CTL_EL2.ISTATUS is set to 1.
- If CNTHV_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHV_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing the CNTHV_TVAL_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHV_TVAL_EL2 or CNTV_TVAL_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

CNTHVS_CTL_EL2, Counter-timer Secure Virtual Timer Control register (EL2)

The CNTHVS_CTL_EL2 characteristics are:

**Purpose**

Control register for the Secure EL2 virtual timer.

**Configuration**

AArch64 System register CNTHVS_CTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHVS_CTL[31:0].

This register is present only when EL2 is implemented and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHVS_CTL_EL2 are UNDEFINED.

**Attributes**

CNTHVS_CTL_EL2 is a 64-bit register.

**Field descriptions**

The CNTHVS_CTL_EL2 bit assignments are:

<td></td>
<td></td>
</tr>
<tr>
<td>0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the CNTHVS_CTL_EL2.ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>
For more information, see the description of the CNTHVS_CTL_EL2.ISTATUS bit.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from **CNTHVS_TVAL_EL2** continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

CNTHVS_CVAL_EL2, Counter-timer Secure Virtual Timer CompareValue register (EL2)

The CNTHVS_CVAL_EL2 characteristics are:

**Purpose**

Holds the compare value for the Secure EL2 virtual timer.

**Configuration**

AArch64 System register CNTHVS_CVAL_EL2 bits [63:0] are architecturally mapped to AArch32 System register CNTHVS_CVAL[63:0].

This register is present only when EL2 is implemented and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHVS_CVAL_EL2 are UNDEFINED.

**Attributes**

CNTHVS_CVAL_EL2 is a 64-bit register.

**Field descriptions**

The CNTHVS_CVAL_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| CompareValue |
| CompareValue |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

**CompareValue, bits [63:0]**

Holds the Secure EL2 virtual timer CompareValue.

When CNTHVS_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTVCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHVS_CTL_EL2.ISTATUS is set to 1.
- If CNTHVS_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHVS_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTHVS_CVAL_EL2**

Accesses to this register use the following encodings:

MRS <Xt>, CNTHVS_CVAL_EL2

<table>
<thead>

The CNTHVS_TVAL_EL2 characteristics are:

Purpose

Holds the timer value for the Secure EL2 virtual timer.

Configuration

AArch64 System register CNTHVS_TVAL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHVS_TVAL[31:0].

This register is present only when EL2 is implemented and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHVS_TVAL_EL2 are UNDEFINED.

Attributes

CNTHVS_TVAL_EL2 is a 64-bit register.

Field descriptions

The CNTHVS_TVAL_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If CNTHVS_CTL_EL2.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHVS_CTL_EL2.ENABLE is 1, the value returned is (CNTHVS_CVAL_EL2 - CNTVCT_EL0).

On a write of this register, CNTHVS_CVAL_EL2 is set to (CNTVCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHVS_CTL_EL2.ENABLE is 1, the timer condition is met when ((CNTVCT_EL0 - CNTHVS_CVAL_EL2) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHVS_CTL_EL2.ISTATUS is set to 1.
- If CNTHVS_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHVS_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

CNTKCTL_EL1, Counter-timer Kernel Control register

The CNTKCTL_EL1 characteristics are:

**Purpose**

When FEAT_VHE is not implemented, or when HCR_EL2.E2H, TGE is not {1, 1}, this register controls the generation of an event stream from the virtual counter; and access from EL0 to the physical counter, virtual counter, EL1 physical timers, and the virtual timer.

When FEAT_VHE is implemented and HCR_EL2.E2H, TGE is {1, 1}, this register does not cause any event stream from the virtual counter to be generated, and does not control access to the counters and timers. The access to counters and timers at EL0 is controlled by CNTHCTL_EL2.

**Configuration**

AArch64 System register CNTKCTL_EL1 bits [31:0] are architecturally mapped to AArch32 System register CNTKCTL[31:0].

**Attributes**

CNTKCTL_EL1 is a 64-bit register.

**Field descriptions**

The CNTKCTL_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:18</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>17</td>
<td>EVNTIS, bit [17]</td>
</tr>
<tr>
<td></td>
<td>Controls the scale of the generation of the event stream.</td>
</tr>
<tr>
<td>EVNTIS</td>
<td>Meaning</td>
</tr>
<tr>
<td>0b0</td>
<td>The CNTKCTL_EL1.EVNTI field applies to CNTVCT_EL0[15:0].</td>
</tr>
<tr>
<td>0b1</td>
<td>The CNTKCTL_EL1.EVNTI field applies to CNTVCT_EL0[23:8].</td>
</tr>
</tbody>
</table>

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
Bits [16:10]
Reserved, RES0.

ELOPTEN, bit [9]
Traps EL0 accesses to the physical timer registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and \texttt{HCR\_EL2.TGE} is 1, as follows:

- In AArch64 state, the following registers are trapped, reported using EC syndrome value 0x18:
  - \texttt{CNTP\_CTL\_EL0}, \texttt{CNTP\_CVAL\_EL0}, and \texttt{CNTP\_TVAL\_EL0}.
- In AArch32 state, MRC and MCR accesses to the following registers are trapped, reported using EC syndrome value 0x03, MRRC and MCRR accesses are trapped, reported using EC syndrome value 0x04:
  - \texttt{CNTP\_CTL}, \texttt{CNTP\_CVAL}, \texttt{CNTP\_TVAL}.

<table>
<thead>
<tr>
<th>ELOPTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 accesses to the physical timer registers are trapped to EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

When \texttt{FEAT\_VHE} is implemented and \texttt{HCR\_EL2.(E2H, TGE) is \{1, 1\}}, this control does not cause any instructions to be trapped.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

ELOVTEN, bit [8]
Traps EL0 accesses to the virtual timer registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and \texttt{HCR\_EL2.TGE} is 1, as follows:

- In AArch64 state, accesses to the following registers are trapped, reported using EC syndrome value 0x18:
  - \texttt{CNTV\_CTL\_EL0}, \texttt{CNTV\_CVAL\_EL0}, and \texttt{CNTV\_TVAL\_EL0}.
- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value 0x03, MRRC and MCRR accesses are trapped using EC syndrome value 0x04:
  - \texttt{CNTV\_CTL}, \texttt{CNTV\_CVAL}, and \texttt{CNTV\_TVAL}.

<table>
<thead>
<tr>
<th>ELOVTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 accesses to the virtual timer registers are trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

When \texttt{FEAT\_VHE} is implemented and \texttt{HCR\_EL2.(E2H, TGE) is \{1, 1\}}, this control does not cause any instructions to be trapped.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTI, bits [7:4]
Selects which bit of the counter register \texttt{CNTVCT\_EL0} is the trigger for the event stream generated from that counter, when that stream is enabled.

If \texttt{FEAT\_ECV} is implemented, and \texttt{CNTKCTL\_EL1.EVTIS} is 1, this field selects a trigger bit in the range 8 to 23 of the counter register \texttt{CNTVCT\_EL0}.

Otherwise, this field selects a trigger bit in the range 0 to 15 of the counter register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]
Controls which transition of the counter register \texttt{CNTVCT\_EL0} trigger bit, defined by EVNTI, generates an event when the event stream is enabled.
## EVNTDIR

<table>
<thead>
<tr>
<th>Meanings</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A 0 to 1 transition of the trigger bit triggers an event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A 1 to 0 transition of the trigger bit triggers an event.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### EVNTEN, bit [2]

When FEAT_VHE is not implemented, or when HCR_EL2.E2H, TGE is not \{1, 1\}, enables the generation of an event stream from the counter register CNTVCT_EL0.

<table>
<thead>
<tr>
<th>Meanings</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disables the event stream.</td>
</tr>
<tr>
<td>0b1</td>
<td>Enables the event stream.</td>
</tr>
</tbody>
</table>

When FEAT_VHE is implemented and HCR_EL2.E2H, TGE is \{1, 1\}, this control does not enable the event stream.

On a Warm reset, this field resets to 0.

### EL0VCTEN, bit [1]

Traps EL0 accesses to the frequency register and virtual counter register to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, as follows:

- In AArch64 state, accesses to the following registers are trapped and reported using EC syndrome value 0x18:
  - CNTVCT_EL0 if CNTKCTL_EL1.EL0PCTEN is 0, CNTFRQ_EL0.
- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value 0x03, MRRC and MCRR accesses are trapped and reported using EC syndrome value 0x04:
  - CNTVCT and if CNTKCTL_EL1.EL0PCTEN is 0, CNTFRQ.

<table>
<thead>
<tr>
<th>Meanings</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 accesses to the frequency register and virtual counter registers are trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

When FEAT_VHE is implemented and HCR_EL2.E2H, TGE is \{1, 1\}, this control does not cause any instructions to be trapped.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### EL0PCTEN, bit [0]

Traps EL0 accesses to the frequency register and physical counter register to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, as follows:

- In AArch64 state, the following registers are trapped, reported using EC syndrome value 0x18:
  - CNTPCT_EL0 if CNTKCTL_EL1.EL0PCTEN is 0, CNTFRQ_EL0.
- In AArch32 state, MCR or MRC accesses the following registers are trapped, reported using EC syndrome value 0x03, MCRR or MRRC accesses are trapped and reported using EC syndrome value 0x04:
  - CNTPCT and if CNTKCTL_EL1.EL0PCTEN is 0, CNTFRQ.

<table>
<thead>
<tr>
<th>Meanings</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 accesses to the frequency register and physical counter register are trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

When FEAT_VHE is implemented and HCR_EL2.E2H, TGE is \{1, 1\}, this control does not cause any instructions to be trapped.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Accessing the CNTKCTL_EL1

When \texttt{HCR\_EL2.E2H} is 1, without explicit synchronization, access from EL3 using the mnemonic CNTKCTL\_EL1 or CNTKCTL\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

\texttt{MRS <Xt>, CNTKCTL\_EL1}

\begin{verbatim}
\begin{verbatim}
\begin{tabular}{|c|c|c|c|c|}
\hline
 op0 & op1 & CRn & CRm & op2 \\
\hline
 0b11 & 0b000 & 0b1110 & 0b0001 & 0b000 \\
\hline
\end{tabular}
\end{verbatim}
\end{verbatim}

\begin{verbatim}
if \texttt{PSTATE.EL == EL0} then
\texttt{UNDEFINED};
elsif \texttt{PSTATE.EL == EL1} then
return \texttt{CNTKCTL\_EL1};
elsif \texttt{PSTATE.EL == EL2} then
  if \texttt{HCR\_EL2.E2H == '1'} then
    return \texttt{CNTKCTL\_EL2};
  else
    return \texttt{CNTKCTL\_EL1};
elsif \texttt{PSTATE.EL == EL3} then
return \texttt{CNTKCTL\_EL1};
\end{verbatim}

\texttt{MSR CNTKCTL\_EL1, <Xt>}

\begin{verbatim}
\begin{verbatim}
\begin{tabular}{|c|c|c|c|c|}
\hline
 op0 & op1 & CRn & CRm & op2 \\
\hline
 0b11 & 0b000 & 0b1110 & 0b0001 & 0b000 \\
\hline
\end{tabular}
\end{verbatim}
\end{verbatim}

\begin{verbatim}
if \texttt{PSTATE.EL == EL0} then
\texttt{UNDEFINED};

    else
        UNDEFINED;
The CNTP_CTL_EL0 characteristics are:

**Purpose**

Control register for the EL1 physical timer.

**Configuration**

AArch64 System register CNTP_CTL_EL0 bits [31:0] are architecturally mapped to AArch32 System register CNTP_CTL[31:0].

**Attributes**

CNTP_CTL_EL0 is a 64-bit register.

**Field descriptions**

The CNTP_CTL_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>62</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>61</td>
<td>ISTATUS</td>
</tr>
<tr>
<td>60</td>
<td>IMASK</td>
</tr>
<tr>
<td>59</td>
<td>ENABLE</td>
</tr>
<tr>
<td>58</td>
<td>57</td>
</tr>
<tr>
<td></td>
<td>RES0</td>
</tr>
<tr>
<td>31</td>
<td>30</td>
</tr>
</tbody>
</table>

**Bits [63:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>

For more information, see the description of the ISTATUS bit.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from **CNTP_TVAL_EL0** continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the CNTP_CTL_EL0**

When **HCR_EL2.E2H** is 1, without explicit synchronization, access from EL3 using the mnemonic **CNTP_CTL_EL0** or **CNTP_CTL_EL02** are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

CNTP_CVAL_EL0, Counter-timer Physical Timer CompareValue register

The CNTP_CVAL_EL0 characteristics are:

**Purpose**

Holds the compare value for the EL1 physical timer.

**Configuration**

AArch64 System register CNTP_CVAL_EL0 bits [63:0] are architecturally mapped to AArch32 System register CNTP_CVAL[63:0].

**Attributes**

CNTP_CVAL_EL0 is a 64-bit register.

**Field descriptions**

The CNTP_CVAL_EL0 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

CompareValue, bits [63:0]

Holds the EL1 physical timer CompareValue.

When \texttt{CNTP_CTL_EL0.ENABLE} is 1, the timer condition is met when (\texttt{CNTPCT_EL0} - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- \texttt{CNTP_CTL_EL0.ISTATUS} is set to 1.
- If \texttt{CNTP_CTL_EL0.IMASK} is 0, an interrupt is generated.

When \texttt{CNTP_CTL_EL0.ENABLE} is 0, the timer condition is not met, but \texttt{CNTPCT_EL0} continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTP_CVAL_EL0**

When \texttt{HCR_EL2.E2H} is 1, without explicit synchronization, access from EL3 using the mnemonic CNTP_CVAL_EL0 or CNTP_CVAL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

- \texttt{MRS <Xt>, CNTP_CVAL_EL0}
if PSTATE.EL == EL0 then
    if !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && CNTKCTL_EL1.EL0PTEN == '0' then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    elseif EL2Enabled() && HCR_EL2.<E2H,TGE> == '10' && CNTKCTL_EL2.EL1PTEN == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elseif EL2Enabled() && HCR_EL2.<E2H,TGE> == '11' && SCR_EL3.NS == '0' &&
        IsFeatureImplemented(FEAT_SEL2) then
        return CNTHPS_CVAL_EL2;
    elseif EL2Enabled() && HCR_EL2.<E2H,TGE> == '11' && SCR_EL3.NS == '1' then
        return CNTHP_CVAL_EL2;
    else
        return CNTP_CVAL_EL0;
else
    elseif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.E2H == '0' && CNTKCTL_EL2.EL1PCEN == '0' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        elseif EL2Enabled() && HCR_EL2.E2H == '1' && CNTKCTL_EL2.EL1PTEN == '0' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        elseif EL2Enabled() && HCR_EL2.<NV2,NV1,NV> == '111' then
            return NVMem[0x178];
        else
            return CNTP_CVAL_EL0;

The CNTP_TVAL_EL0 characteristics are:

**Purpose**

Holds the timer value for the EL1 physical timer.

**Configuration**

AArch64 System register CNTP_TVAL_EL0 bits [31:0] are architecturally mapped to AArch32 System register \texttt{CNTP\_TVAL\[31:0].}

**Attributes**

CNTP_TVAL_EL0 is a 64-bit register.

**Field descriptions**

The CNTP_TVAL_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|    |
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 |    |    |    |    |    |    |    |    |    |

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|    |

**Bits [63:32]**

Reserved, RES0.

**TimerValue, bits [31:0]**

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If \texttt{CNTP\_CTL\_EL0.ENABLE} is 0, the value returned is unknown.
- If \texttt{CNTP\_CTL\_EL0.ENABLE} is 1, the value returned is \((\texttt{CNTP\_CVAL\_EL0} - \texttt{CNTPCT\_EL0}).

On a write of this register, \texttt{CNTP\_CVAL\_EL0} is set to \((\texttt{CNTPCT\_EL0} + \text{TimerValue}), where TimerValue is treated as a signed 32-bit integer:

When \texttt{CNTP\_CTL\_EL0.ENABLE} is 1, the timer condition is met when \((\texttt{CNTPCT\_EL0} - \texttt{CNTP\_CVAL\_EL0})\) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- \texttt{CNTP\_CTL\_EL0.ISTATUS} is set to 1.
- If \texttt{CNTP\_CTL\_EL0.IMASK} is 0, an interrupt is generated.

When \texttt{CNTP\_CTL\_EL0.ENABLE} is 0, the timer condition is not met, but \texttt{CNTPCT\_EL0} continues to count, so the TimerValue view appears to continue to count down.

On a Warm reset, this field resets to an architecturally unknown value.
**Accessing the CNTP_TVAL_EL0**

When `HCR_EL2.E2H` is 1, without explicit synchronization, access from EL3 using the mnemonic `CNTP_TVAL_EL0` or `CNTP_TVAL_EL02` are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

```

CNTPCT_EL0, Counter-timer Physical Count register

The CNTPCT_EL0 characteristics are:

Purpose

Holds the 64-bit physical count value.

Configuration

AArch64 System register CNTPCT_EL0 bits [63:0] are architecturally mapped to AArch32 System register CNTPCT[63:0].

All reads to the CNTPCT_EL0 occur in program order relative to reads to CNTPCTSS_EL0 or CNTPCT_EL0.

Attributes

CNTPCT_EL0 is a 64-bit register.

Field descriptions

The CNTPCT_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

|    |    |    |    |    |    |    |    |    |    | Physical count value |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |

Bits [63:0]

Physical count value.

Reads of CNTPCT_EL0 from EL0 or EL1 return (PCount<63:0> - CNTPOFF_EL2<63:0>) if the access is not trapped, and all of the following are true:

- CNTHCTL_EL2.ECV is 1.
- HCR_EL2.{E2H, TGE} is not {1, 1}.

Where PCount<63:0> is the physical count returned when CNTPCT_EL0 is read from EL2 or EL3.

Accessing the CNTPCT_EL0

Accesses to this register use the following encodings:

MRS <Xt>, CNTPCT_EL0

CNTPCTSS_EL0, Counter-timer Self-Synchronized Physical Count register

The CNTPCTSS_EL0 characteristics are:

**Purpose**

Holds the self-synchronized view of the 64-bit physical count value.

**Configuration**

AArch64 System register CNTPCTSS_EL0 bits [63:0] are architecturally mapped to AArch32 System register CNTPCTSS[63:0].

This register is present only when FEAT_ECV is implemented. Otherwise, direct accesses to CNTPCTSS_EL0 are UNDEFINED.

All reads to the CNTPCTSS_EL0 occur in program order relative to reads to CNTPCT_EL0 or CNTPCTSS_EL0.

This register is a self-synchronised view of the CNTPCT_EL0 counter, and cannot be read speculatively.

**Attributes**

CNTPCTSS_EL0 is a 64-bit register.

**Field descriptions**

    endif
elsif PSTATE.EL == EL2 then
    return CNTPCTSS_EL0;
elsif PSTATE.EL == EL3 then
    return CNTPCTSS_EL0;

The CNTPOFF_EL2 characteristics are:

### Purpose

Holds the 64-bit physical offset. This is the offset for the AArch64 physical timers and counters when Enhanced Counter Virtualization is enabled.

### Configuration

This register is present only when FEAT_ECV is implemented. Otherwise, direct accesses to CNTPOFF_EL2 are **UNDEFINED**.

The offsetting of the timers and counters based on EL2 using AArch64 apply at:

- EL1 when EL1 is using AArch64 or AArch32.
- EL0 when EL0 is using AArch64 or AArch32.

When EL2 is implemented and enabled in the current Security state, the physical counter uses a fixed physical offset of zero if either of the following are true:

- **CNTHCTL_EL2.ECV** is 0.
- **SCR_EL3.ECVEn** is 0.
- **HCR_EL2.{E2H, TGE}** is {1, 1}.

### Attributes

CNTPOFF_EL2 is a 64-bit register.

### Field descriptions

The CNTPOFF_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>62-0</td>
<td>Physical offset</td>
</tr>
</tbody>
</table>

| Bits [63:0] |

Physical offset.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Accessing the CNTPOFF_EL2

Accesses to this register use the following encodings:

```

end
CNTPS_CTL_EL1, Counter-timer Physical Secure Timer Control register

The CNTPS_CTL_EL1 characteristics are:

**Purpose**

Control register for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

**Configuration**

There are no configuration notes.

**Attributes**

CNTPS_CTL_EL1 is a 64-bit register.

**Field descriptions**

The CNTPS_CTL_EL1 bit assignments are:

|       | 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|       | RES0 |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |
|       | RES0 |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |
| 31    | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |

**Bits [63:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>

For more information, see the description of the ISTATUS bit.
**ENABLE, bit [0]**

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from **CNTPS_TVAL_EL1** continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

---

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Accessing the CNTPS_CTL_EL1

Accesses to this register use the following encodings:

**MRS <Xt>, CNTPS_CTL_EL1**

CNTPS_CVAL_EL1, Counter-timer Physical Secure Timer CompareValue register

The CNTPS_CVAL_EL1 characteristics are:

Purpose

Holds the compare value for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

Configuration

There are no configuration notes.

Attributes

CNTPS_CVAL_EL1 is a 64-bit register.

Field descriptions

The CNTPS_CVAL_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

CompareValue, bits [63:0]

Holds the secure physical timer CompareValue.

When CNTPS_CTL_EL1.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTPS_CTL_EL1.ISTATUS is set to 1.
- If CNTPS_CTL_EL1.IMASK is 0, an interrupt is generated.

When CNTPS_CTL_EL1.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the CNTPS_CVAL_EL1

Accesses to this register use the following encodings:

The CNTV_CTL_EL0 characteristics are:

**Purpose**

Control register for the virtual timer.

**Configuration**

AArch64 System register CNTV_CTL_EL0 bits [31:0] are architecturally mapped to AArch32 System register CNTV_CTL[31:0].

**Attributes**

CNTV_CTL_EL0 is a 64-bit register.

**Field descriptions**

The CNTV_CTL_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>62</td>
<td>ISTATUS, bit [2]</td>
<td>0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>61</td>
<td>ISTATUS, bit [2]</td>
<td>1</td>
<td>Timer condition is met.</td>
</tr>
<tr>
<td>60</td>
<td>IMASK, bit [1]</td>
<td>0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>59</td>
<td>IMASK, bit [1]</td>
<td>1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>

**Bits [63:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>

For more information, see the description of the ISTATUS bit.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE (bit 0)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from `CNTV_TVAL_EL0` continues to count down.

---

**Note**

Disabling the output signal might be a power-saving option.

---

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the CNTV_CTL_EL0**

When `HCR_EL2.E2H` is 1, without explicit synchronization, access from EL3 using the mnemonic `CNTV_CTL_EL0` or `CNTV_CTL_EL02` are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

```
MRS <Xt>, CNTV_CTL_EL0
```

<table>

    end if
The CNTV_CVAL_EL0 characteristics are:

**Purpose**

Holds the compare value for the virtual timer.

**Configuration**

AArch64 System register CNTV_CVAL_EL0 bits [63:0] are architecturally mapped to AArch32 System register CNTV_CVAL[63:0].

**Attributes**

CNTV_CVAL_EL0 is a 64-bit register.

**Field descriptions**

The CNTV_CVAL_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**CompareValue, bits [63:0]**

Holds the EL1 virtual timer CompareValue.

When CNTV_CTL_EL0.ENABLE is 1, the timer condition is met when (CNTVCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTV_CTL_EL0.ISTATUS is set to 1.
- If CNTV_CTL_EL0.IMASK is 0, an interrupt is generated.

When CNTV_CTL_EL0.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTV_CVAL_EL0**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTV_CVAL_EL0 or CNTV_CVAL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

The CNTV_TVAL_EL0 characteristics are:

**Purpose**

Holds the timer value for the EL1 virtual timer.

**Configuration**

AArch64 System register CNTV_TVAL_EL0 bits [31:0] are architecturally mapped to AArch32 System register CNTV_TVAL[31:0].

**Attributes**

CNTV_TVAL_EL0 is a 64-bit register.

**Field descriptions**

The CNTV_TVAL_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0                     | TimerValue               |

**Bits [33:32]**

Reserved, RES0.

**TimerValue, bits [31:0]**

The TimerValue view of the EL1 virtual timer.

On a read of this register:

- If CNTV_CTL_EL0.ENABLE is 0, the value returned is UNKNOWN.
- If CNTV_CTL_EL0.ENABLE is 1, the value returned is (CNTV_CVAL_EL0 - CNTVCT_EL0).

On a write of this register, CNTV_CVAL_EL0 is set to (CNTVCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer:

When CNTV_CTL_EL0 ENABLE is 1, the timer condition is met when (CNTVCT_EL0 - CNTV_CVAL_EL0) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTV_CTL_EL0.ISTATUS is set to 1.
- If CNTV_CTL_EL0.IMASK is 0, an interrupt is generated.

When CNTV_CTL_EL0.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing the CNTV_TVAL_EL0

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTV_TVAL_EL0 or CNTV_TVAL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

CNTVCT_EL0, Counter-timer Virtual Count register

The CNTVCT_EL0 characteristics are:

**Purpose**

Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value minus the virtual offset visible in CNTVOFF_EL2.

**Configuration**

AArch64 System register CNTVCT_EL0 bits [63:0] are architecturally mapped to AArch32 System register CNTVCT[63:0].

The value of this register is the same as the value of CNTPCT_EL0 in the following conditions:

- When EL2 is not implemented.
- When EL2 is implemented, HCR_EL2.E2H is 1, and this register is read from EL2.
- When EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} is {1, 1}, and this register is read from EL0 or EL2.

All reads to the CNTVCT_EL0 occur in program order relative to reads to CNTVCTSS_EL0 or CNTVCT_EL0.

**Attributes**

CNTVCT_EL0 is a 64-bit register.

**Field descriptions**

The CNTVCT_EL0 bit assignments are:

<table>

elsif PSTATE.EL == EL3 then
    return CNTVCT_EL0;
else
    return CNTVCT_EL0;
end
The CNTVCTSS_EL0 characteristics are:

**Purpose**

Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value visible in CNTPCT_EL0 minus the virtual offset visible in CNTVOFF_EL2.

**Configuration**

AArch64 System register CNTVCTSS_EL0 bits [63:0] are architecturally mapped to AArch32 System register CNTVCTSS[63:0].

This register is present only when FEAT_ECV is implemented. Otherwise, direct accesses to CNTVCTSS_EL0 are UNDEFINED.

All reads to the CNTVCTSS_EL0 occur in program order relative to reads to CNTPCT_EL0 or CNTVCTSS_EL0.

This register is a self-synchronised view of the CNTPCT_EL0 counter, and cannot be read speculatively.

**Attributes**

CNTVCTSS_EL0 is a 64-bit register.

**Field descriptions**

The CNTVCTSS_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Self-synchronized virtual count value</td>
</tr>
<tr>
<td>31</td>
<td>Self-synchronized virtual count value</td>
</tr>
</tbody>
</table>

**Bits [63:0]**

Self-synchronized virtual count value.

else if PSTATE.EL == EL3 then
    return CNTVCTSS_EL0;
CNTVOFF_EL2, Counter-timer Virtual Offset register

The CNTVOFF_EL2 characteristics are:

**Purpose**

Holds the 64-bit virtual offset. This is the offset between the physical count value visible in CNTPCT_EL0 and the virtual count value visible in CNTVCT_EL0.

**Configuration**

AArch64 System register CNTVOFF_EL2 bits [63:0] are architecturally mapped to AArch32 System register CNTVOFF[63:0].

If EL2 is not implemented, this register is RES0 from EL3 and the virtual counter uses a fixed virtual offset of zero.

**Note**

When EL2 is implemented and enabled in the current Security state, and is using AArch64, the virtual counter uses a fixed virtual offset of zero in the following situations:

- HCR_EL2.E2H is 1, and CNTVCT_EL0 is read from EL2.
- HCR_EL2.{E2H, TGE} is {1, 1}, and either:
  - CNTVCT_EL0 is read from EL0 or EL2.
  - CNTVCT is read from EL0.

**Attributes**

CNTVOFF_EL2 is a 64-bit register.

**Field descriptions**

**Bits [63:0]**

Virtual offset.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

CONTEXTIDR_EL1, Context ID Register (EL1)

The CONTEXTIDR_EL1 characteristics are:

**Purpose**

Identifies the current Process Identifier.

The value of the whole of this register is called the Context ID and is used by:

- The debug logic, for Linked and Unlinked Context ID matching.
- The trace logic, to identify the current process.

The significance of this register is for debug and trace use only.

**Configuration**

AArch64 System register CONTEXTIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register CONTEXTIDR[31:0].

**Attributes**

CONTEXTIDR_EL1 is a 64-bit register.

**Field descriptions**

The CONTEXTIDR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

| RES0 | PROCID |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:32]**

Reserved, RES0.

**PROCID, bits [31:0]**

Process Identifier. This field must be programmed with a unique value that identifies the current process.

**Note**

In AArch32 state, when TTBCR.EAE is set to 0, CONTEXTIDR. ASID holds the ASID.

In AArch64 state, CONTEXTIDR_EL1 is independent of the ASID, and for the EL1&0 translation regime either TTBR0_EL1 or TTBR1_EL1 holds the ASID.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the CONTEXTIDR_EL1**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CONTEXTIDR_EL1 or CONTEXTIDR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then

MSR CONTEXTIDR_EL12, <Xt>
The CONTEXTIDR_EL2 characteristics are:

**Purpose**

Identifies the current Process Identifier for EL2.

The value of the whole of this register is called the Context ID and is used by:

- The debug logic, for Linked and Unlinked Context ID matching.
- The trace logic, to identify the current process.

The significance of this register is for debug and trace use only.

**Configuration**

This register is present only when FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented. Otherwise, direct accesses to CONTEXTIDR_EL2 are *undefined*.

If EL2 is not implemented, this register is *res0* from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

CONTEXTIDR_EL2 is a 64-bit register.

**Field descriptions**

The CONTEXTIDR_EL2 bit assignments are:

The CPACR_EL1 characteristics are:

**Purpose**

Controls access to trace, SVE, Advanced SIMD and floating-point functionality.

**Configuration**

AArch64 System register CPACR_EL1 bits [31:0] are architecturally mapped to AArch32 System register CPACR[31:0].

When HCR_EL2.{E2H, TGE} == {1, 1}, the fields in this register have no effect on execution at EL0 and EL1. In this case, the controls provided by CPTR_EL2 are used.

**Attributes**

CPACR_EL1 is a 64-bit register.

**Field descriptions**

The CPACR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-29</td>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>28</td>
<td>TTA</td>
<td>Traps EL0 and EL1 System register accesses to all implemented trace registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.{E2H, TGE} is {0,1}, from both Execution states as follows:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• In AArch64 state, accesses to trace registers are trapped, reported using ESR_ELx.EC value 0x18.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• In AArch32 state, MRC and MCR accesses to trace registers are trapped, reported using ESR_ELx.EC value 0x85.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• In AArch32 state, MRRC and MCRR accesses to trace registers are trapped, reported using ESR_ELx.EC value 0x0C.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>TTA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control causes EL0 and EL1 System register accesses to all implemented trace registers to be trapped.</td>
</tr>
</tbody>
</table>

**Note**

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the PE trace unit implements FEAT_ETMv4, EL0 accesses to the trace registers are **UNDEFINED**, and any resulting exception is higher
priority than an exception that would be generated because the value of \texttt{CPACR\_EL1.\_TTA} is 1.

- The Armv8-A architecture does not provide traps on trace register accesses through the optional memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

If System register access to the trace functionality is not implemented, this bit is \texttt{RES0}.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

**Bits [27:22]**

Reserved, \texttt{RES0}.

**FPEN, bits [21:20]**

Traps EL0 and EL1 accesses to SVE, Advanced SIMD and floating-point registers to EL1, reported using ESR\_ELx.EC value 0x07, or to EL2 reported using ESR\_ELx.EC value 0x00, when EL2 is implemented and enabled for the current Security state and \texttt{HCR\_EL2.\{E2H, TGE\}} is \{0,1\}, from both Execution states as follows:

- In AArch64 state, accesses to \texttt{FPCR}, \texttt{FPSCR}, any of the SIMD and floating-point registers V0-V31, including their views as D0-D31 registers or S0-31 registers.
- In AArch32 state, \texttt{FPSCR}, and any of the SIMD and floating-point registers Q0-15, including their views as D0-D31 registers or S0-31 registers.

Trapping behavior is affected by precedence as follows: A trap taken as a result of CPACR\_EL1.ZEN has precedence over the value of CPACR\_EL1.FPEN.

<table>
<thead>
<tr>
<th>FPEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>This control causes any instructions at EL0 or EL1 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped.</td>
</tr>
<tr>
<td>0b01</td>
<td>This control causes any instructions at EL0 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, but does not cause any instruction at EL1 to be trapped.</td>
</tr>
<tr>
<td>0b10</td>
<td>This control causes any instructions at EL0 or EL1 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped.</td>
</tr>
<tr>
<td>0b11</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

Writes to \texttt{MVFR0, MVFR1} and \texttt{MVFR2} from EL1 or higher are \texttt{CONSTRAINED\_UNPREDICTABLE} and whether these accesses can be trapped by this control depends on implemented \texttt{CONSTRAINED\_UNPREDICTABLE} behavior.

**Note**

- Attempts to write to the FPSID count as use of the registers for accesses from EL1 or higher.
- Accesses from EL0 to \texttt{FPSID, MVFR0, MVFR1, MVFR2, and FPEXC} are \texttt{UNDEFINED}, and any resulting exception is higher priority than an exception that would be generated because the value of CPACR\_EL1.FPEN is not 0b11.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

**Bits [19:18]**

Reserved, \texttt{RES0}. 

---

\texttt{CPACR\_EL1, Architectural Feature Access Control Register}
**ZEN, bits [17:16]**

When `FEAT_SVE` is implemented:

Traps EL0 and EL1 execution of SVE instructions and instructions that directly access `ZCR_EL1` System register to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and `HCR_EL2` (E2H, TGE) is \{0,1\}.

The exception is reported using `ESR_ELx.EC` value 0x19.

Trapping behavior is affected by precedence as follows: A trap taken as a result of `CPACR_EL1.ZEN` has precedence over the value of `CPACR_EL1.FPEN`.

<table>
<thead>
<tr>
<th>ZEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>This control causes these instructions executed at EL0 or EL1 to be trapped.</td>
</tr>

The CPP RCTX characteristics are:

**Purpose**

Cache Prefetch Prediction Restriction by Context applies to all Cache Allocation Resources that predict cache allocations based on information gathered within the target execution context or contexts.

When this instruction is complete and synchronized, cache prefetch prediction does not permit later speculative execution within the target execution context to be observable through side channels.

This instruction applies to all:

- Instruction caches.
- Data caches.
- TLB prefetching hardware used by the executing PE that applies to the supplied context or contexts.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

**Note**

This instruction does not require the invalidation of Cache Allocation Resources so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

**Configuration**

This instruction is present only when FEAT_SPECRES is implemented. Otherwise, direct accesses to CPP RCTX are UNDEFINED.

**Attributes**

CPP RCTX is a 64-bit System instruction.

**Field descriptions**

The CPP RCTX input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:49]</td>
<td>RES0</td>
<td>GVMID</td>
</tr>
<tr>
<td>[31:0]</td>
<td>RES0</td>
<td>NS</td>
</tr>
</tbody>
</table>

**Bits [63:49]**

Reserved, RES0.
**GVMID, bit [48]**

Execution of this instruction applies to all VMIDs or a specified VMID.

<table>
<thead>
<tr>
<th>GVMID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Applies to specified VMID for an EL0 or EL1 target execution context.</td>
</tr>
<tr>
<td>0b1</td>
<td>Applies to all VMIDs for an EL0 or EL1 target execution context.</td>
</tr>
</tbody>
</table>

For target execution contexts other than EL0 and EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

**VMID, bits [47:32]**

Only applies when bit[48] is 0 and the target execution context is either:

- EL1.
- EL0 when \((HCR\_EL2.E2H==0 \text{ or } HCR\_EL2.TGE==0)\).

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and \((HCR\_EL2.E2H==0 \text{ or } HCR\_EL2.TGE==0)\), this field is treated as the current VMID.

When the instruction is executed at EL0 and \((HCR\_EL2.E2H==1 \text{ and } HCR\_EL2.TGE==1)\), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

**Bits [31:27]**

Reserved, RES0.

**NS, bit [26]**

Security State. Defined values are:

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure state.</td>
</tr>
</tbody>
</table>

When executed in Non-secure state, the Effective value of NS is 1.

**EL, bits [25:24]**

Exception Level. Indicates the Exception level of the target execution context.

<table>
<thead>
<tr>
<th>EL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>EL0.</td>
</tr>
<tr>
<td>0b01</td>
<td>EL1.</td>
</tr>
<tr>
<td>0b10</td>
<td>EL2.</td>
</tr>
<tr>
<td>0b11</td>
<td>EL3.</td>
</tr>
</tbody>
</table>

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

**Bits [23:17]**

Reserved, RES0.
GASID, bit [16]

Execution of this instruction applies to all ASIDs or a specified ASID.

<table>
<thead>
<tr>
<th>GASID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Applies to specified ASID for an EL0 target execution context.</td>
</tr>
<tr>
<td>0b1</td>
<td>Applies to all ASID for an EL0 target execution context.</td>
</tr>
</tbody>
</table>

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

ASID, bits [15:0]

Only applies for an EL0 target execution context and when bit[16] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

Executing the CPP RCTX instruction

Accesses to this instruction use the following encodings:

CPP RCTX, <Xt>

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>0b011</td>
<td>0b0111</td>
<td>0b0011</td>
<td>0b111</td>
</tr>
</tbody>
</table>

```
if PSTATE.EL == EL0 then
    if !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && SCTLR_EL1.EnRCTX == '0' then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else

CPTR_EL2, Architectural Feature Trap Register (EL2)

The CPTR_EL2 characteristics are:

**Purpose**

Controls trapping to EL2 of accesses to CPACR, CPACR_EL1, trace, Activity Monitor, SVE, Advanced SIMD and floating-point functionality.

**Configuration**

AArch64 System register CPTR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HCPTR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

CPTR_EL2 is a 64-bit register.

**Field descriptions**

The CPTR_EL2 bit assignments are:

**When FEAT_VHE is implemented and HCR_EL2.E2H == 1:**

</table>

Bits [63:32]

Reserved, RES0.

**TCPAC, bit [31]**

When HCR_EL2.TGE is 0, traps EL1 accesses to CPACR_EL1 reported using ESR_ELx.EC value 0x18, and accesses to CPACR reported using ESR_ELx.EC value 0x03, to EL2 when EL2 is enabled in the current Security state.

<table>
<thead>
<tr>
<th>TCPAC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 accesses to CPACR_EL1 and CPACR are trapped to EL2 when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

When HCR_EL2.TGE is 1, this control does not cause any instructions to be trapped.

**Note**

CPACR_EL1 and CPACR are not accessible at EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
TAM, bit [30]

When FEAT_AMUv1 is implemented:

Trap Activity Monitor access. Traps EL1 and EL0 accesses to all Activity Monitor registers to EL2, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using ESR_ELx.EC value 0x18:
  - $\text{AMUSERENR}_{EL0}$, $\text{AMCFGR}_{EL0}$, $\text{AMCGCR}_{EL0}$, $\text{AMCNTENCLR0}_{EL0}$, $\text{AMCNTENCLR1}_{EL0}$, $\text{AMCNTENSET0}_{EL0}$, $\text{AMCNTENSET1}_{EL0}$, $\text{AMCR}_{EL0}$, $\text{AMEVCNTR0}_{n}\_EL0$, $\text{AMEVTYPER0}_{n}\_EL0$, and $\text{AMEVTYPER1}_{n}\_EL0$.

- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2 and reported using ESR_ELx.EC value 0x03:
  - $\text{AMUSERENR}$, $\text{AMCFGR}$, $\text{AMCGCR}$, $\text{AMCNTENCLR0}$, $\text{AMCNTENCLR1}$, $\text{AMCNTENSET0}$, $\text{AMCNTENSET1}$, $\text{AMCR}$, $\text{AMEVTYPER0}_{n}$, and $\text{AMEVTYPER1}_{n}$.

- In AArch32 state, MRRC or MCRR accesses to $\text{AMEVCNTR0}_{n}$ and $\text{AMEVCNTR1}_{n}$, are trapped to EL2, reported using ESR_ELx.EC value 0x04.

<table>
<thead>
<tr>
<th>TAM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses from EL1 and EL0 to Activity Monitor registers are not trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses from EL1 and EL0 to Activity Monitor registers are trapped to EL2, when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [29]

Reserved, RES0.

TTA, bit [28]

Traps System register accesses to all implemented trace registers to EL2 when EL2 is enabled in the current Security state, from both Execution states as follows:

- In AArch64 state, accesses to trace registers with op0=2, op1=1, and CRn<0b1000 are trapped to EL2, reported using EC syndrome value 0x18.

- In AArch32 state, MRC or MCR accesses to trace registers with cpnum=14, opc1=1, and CRn<0b1000 are trapped to EL2, reported using EC syndrome value 0x05.

<table>
<thead>
<tr>
<th>TTA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any attempt at EL0, EL1 or EL2, to execute a System register access to an implemented trace register is trapped to EL2 when EL2 is enabled in the current Security state, unless $\text{HCR}<em>{EL2}.\text{TGE}$ is 0 and it is trapped by $\text{CPACR}.\text{NSTRCDIS}$ or $\text{CPACR}</em>{EL1}.\text{TTA}$. When $\text{HCR}_{EL2}.\text{TGE}$ is 1, any attempt at EL0 or EL2 to execute a System register access to an implemented trace register is trapped to EL2 when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

**Note**

The ETMv4 architecture does not permit EL0 to access the trace registers. If the PE trace unit implements FEAT_ETMv4, EL0 access to the trace registers are UNDEFINED, and any resulting exception is higher priority than this trap exception that would be generated because the value of CPTR_EL2.TTA is 1.
EL2 does not provide traps on trace register accesses through the optional Memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

If System register access to the trace functionality is not supported, this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [27:22]**

Reserved, RES0.

**FPEN, bits [21:20]**

Traps execution at EL2, EL1, and EL0 of instructions that directly access the SVE, Advanced SIMD and floating-point registers to EL2 when EL2 is enabled in the current Security state, from both Execution states.

The exception is reported using ESR_ELx.EC value 0x07.

Trapping behavior is affected by precedence as follows: A trap taken as a result of CPTR_EL2.ZEN has precedence over the value of CPTR_EL2.FPEN.

<table>
<thead>
<tr>
<th>FPEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>This control causes any instructions at EL0, EL1, or EL2 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, subject to the exception prioritization rules.</td>
</tr>
<tr>
<td>0b01</td>
<td>When HCR_EL2.TGE is 0, this control does not cause any instructions to be trapped. When HCR_EL2.TGE is 1, this control causes instructions at EL0 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, but does not cause any instruction at EL2 to be trapped.</td>
</tr>
<tr>
<td>0b10</td>
<td>This control causes any instructions at EL0, EL1, or EL2 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, subject to the exception prioritization rules.</td>
</tr>
<tr>
<td>0b11</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

Writes to MVFR0, MVFR1, and MVFR2 from EL1 or higher are CONSTRAINED UNPREDICTABLE and whether these accesses can be trapped by this control depends on implemented CONSTRAINED UNPREDICTABLE behavior.

**Note**

- Attempts to write to the FPSID count as use of the registers for accesses from EL1 or higher.
- Accesses from EL0 to FPSID, MVFR0, MVFR1, MVFR2, and FPEXC are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPTR_EL2.FPEN is not 0b11.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [19:18]**

Reserved, RES0.

**ZEN, bits [17:16]**

When FEAT_SVE is implemented:

Traps execution at EL2, EL1, and EL0 of SVE instructions, and instructions that directly access the ZCR_EL1 and ZCR_EL2 System registers to EL2 when EL2 is enabled in the current Security state.
The exception is reported using ESR_ELx.EC value 0x19.

Trapping behavior is affected by precedence as follows: A trap taken as a result of CPTR_EL2.ZEN has precedence over the value of CPTR_EL2.FPEN.

<table>
<thead>
<tr>
<th>ZEN</th>
<th>Meaning</th>

</table>

Note

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the PE trace unit implements FEAT_ETMv4, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPTR_EL2.TTA is 1.
- EL2 does not provide traps on trace register accesses through the optional memory-mapped interface.
System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

If System register access to the trace functionality is not supported, this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [19:14]**

Reserved, RES0.

**Bits [13:12]**

Reserved, RES1.

**Bit [11]**

Reserved, RES0.

**TFP, bit [10]**

Traps accesses to SVE, Advanced SIMD and floating-point functionality to EL2 when EL2 is enabled in the current Security state, from both Execution states, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using ESR_ELx.EC value 0x07:
  - FPCR, FPSR, FPEXC32_EL2, any of the SIMD and floating-point registers V0-V31, including their views as D0-D31 registers or S0-31 registers.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using ESR_ELx.EC value 0x07:
  - MVFR0, MVFR1, MVFR2, FPSCR, FPEXC, and any of the SIMD and floating-point registers Q0-15, including their views as D0-D31 registers or S0-31 registers. For the purposes of this trap, the architecture defines a VMSR access to FPSID from EL1 or higher as an access to a SIMD and floating-point register. Otherwise, permitted VMSR accesses to FPSID are ignored.

Trapping behavior is affected by precedence as follows: A trap taken as a result of CPTR_EL2.TZ has precedence over the value of CPTR_EL2.TFP.

<table>
<thead>
<tr>
<th>TFP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any attempt at EL0, EL1 or EL2, to execute an instruction that uses the registers associated with SVE, Advanced SIMD and floating-point execution is trapped to EL2 when EL2 is enabled in the current Security state, subject to the exception prioritization rules.</td>
</tr>
</tbody>
</table>

**Note**

FPEXC32_EL2 is not accessible from EL0 using AArch64.

FPSID, MVFR0, MVFR1, and FPEXC are not accessible from EL0 using AArch32.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [9]**

Reserved, RES1.
TZ, bit [8]

When FEAT_SVE is implemented:

Traps execution at EL2, EL1, or EL0 of SVE instructions and instructions that directly access the ZCR_EL2 and ZCR_EL1 System registers to EL2 when EL2 is enabled in the current Security state.

The exception is reported using ESR_ELx.EC value 0x19.

Trapping behavior is affected by precedence as follows: A trap taken as a result of CPTR_EL2.TZ has precedence over the value of CPTR_EL2.TFP.

<table>
<thead>
<tr>
<th>TZ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instruction to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control causes these instructions to be trapped, subject to the exception prioritization rules.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CPTR_EL3, Architectural Feature Trap Register (EL3)**

The CPTR_EL3 characteristics are:

**Purpose**

Controls trapping to EL3 of accesses to CPACR, CPACR_EL1, HCPTR, CPTR_EL2, trace, Activity Monitor, SVE, Advanced SIMD and floating-point functionality.

**Configuration**

This register is present only when EL3 is implemented. Otherwise, direct accesses to CPTR_EL3 are UNDEFINED.

**Attributes**

CPTR_EL3 is a 64-bit register.

**Field descriptions**

The CPTR_EL3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>

<td>2</td>
<td>1</td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**TCPAC, bit [31]**

Traps all of the following to EL3, from both Security states and both Execution states.

- EL2 accesses to CPTR_EL2, reported using ESR_ELx.EC value 0x18, or HCPTR, reported using ESR_ELx.EC value 0x03.
- EL2 and EL1 accesses to CPACR_EL1 reported using ESR_ELx.EC value 0x18, or CPACR reported using ESR_ELx.EC value 0x03.

When CPTR_EL3.TCPAC is:

<table>
<thead>
<tr>
<th>TCPAC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL2 accesses to the CPTR_EL2 or HCPR, and EL2 and EL1 accesses to the CPACR_EL1 or CPACR, are trapped to EL3, unless they are trapped by CPTR_EL2.TCPAC.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TAM, bit [30]**

When FEAT_AMUv1 is implemented:

Trap Activity Monitor access. Traps EL2, EL1 and EL0 accesses to all Activity Monitor registers to EL3.

Accesses to the Activity Monitors registers are trapped as follows:

- In AArch64 state, the following registers are trapped to EL3 and reported with ESR_ELx.EC value 0x18:
AMUSERENR_EL0, AMCFGR_EL0, AMCGCR_EL0, AMCNTENCLR0_EL0, AMCNTENCLR1_EL0, AMCNTENSET0_EL0, AMCNTENSET1_EL0, AMCR_EL0, AMEVCNTR<n>_EL0, AMEVTCYPER<n>_EL0, and AMEVTPERM<n>_EL0.

- In AArch32 state, accesses with MRC or MCR to the following registers reported with ESR_ELx.EC value 0x03:
  - AMUSERENR, AMCFGR, AMCGCR, AMCNTENCLR0, AMCNTENCLR1, AMCNTENSET0, AMCNTENSET1, AMCR, AMEVTCYPER<n>, and AMEVTPERM<n>.

- In AArch32 state, accesses with MRRC or MCRR to the following registers, reported with ESR_ELx.EC value 0x04:
  - AMEVCNTR<n>, AMEVTCYPER1<n>.

### TAM

<table>
<thead>
<tr>
<th>TAM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses from EL2, EL1, and EL0 to Activity Monitor registers are not trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses from EL2, EL1, and EL0 to Activity Monitor registers are trapped to EL3.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [29:21]**

Reserved, RES0.

**TTA, bit [20]**

Traps System register accesses. Accesses to the trace registers, from all Exception levels, both Security states, and both Execution states are trapped to EL3 as follows:

- In AArch64 state, Trace registers with op0=2, op1=1, and CRn<0b1000 are trapped to EL3 and reported using EC syndrome value 0x18.

- In AArch32 state, accesses using MCR or MRC to the Trace registers with cpnum=14, opc1=1, and CRn<0b1000 are reported using EC syndrome value 0x05.

<table>
<thead>
<tr>
<th>TTA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any System register access to the trace registers is trapped to EL3, subject to the exception prioritization rules, unless it is trapped by CPACR.TRCDIS, CPACR_EL1.TTA or CPTER_EL2.TTA.</td>
</tr>
</tbody>
</table>

If System register access to trace functionality is not supported, this bit is RES0.

**Note**

The ETMv4 architecture does not permit EL0 to access the trace registers. If the PE trace unit implements FEAT_ETMv4, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than this trap exception.

EL3 does not provide traps on trace register accesses through the Memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, no side-effects occur before the exception is taken, see 'Traps on instructions'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Bits [19:11]

Reserved, RES0.

TFP, bit [10]

Traps all accesses to SVE, Advanced SIMD and floating-point functionality, from all Exception levels, both Security states, and both Execution states, to EL3.

This includes the following registers, all reported using ESR_ELx.EC value 0x07:

- **FPCR, FPSR, FPEXC32_EL2**, any of the SIMD and floating-point registers V0-V31, including their views as D0-D31 registers or S0-31 registers.
- **MVFR0, MVFR1, MVFR2, FPSCR, FPEXC**, and any of the SIMD and floating-point registers Q0-15, including their views as D0-D31 registers or S0-31 registers.

Permitted VMSR accesses to **FPSID** are ignored, but for the purposes of this trap the architecture define a VMSR access to the **FPSID** from EL1 or higher as an access to a SIMD and floating-point register.

Trapping behavior is affected by precedence as follows: A trap taken as a result of CPT_EL3.EZ has precedence over the value of CPT_EL3.TFP.

Defined values are:

<table>
<thead>
<tr>
<th>TFP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any attempt at any Exception level to execute an instruction that uses the registers associated with SVE, Advanced SIMD and floating-point is trapped to EL3, subject to the exception prioritization rules.</td>
</tr>
</tbody>
</table>

Note

- **FPEXC32_EL2** is not accessible from EL0 using AArch64.
- **FPSID, MVFR0, MVFR1, and FPEXC** are not accessible from EL0 using AArch32.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES0.

EZ, bit [8]

When FEAT_SVE is implemented:

Traps execution of SVE instructions and instructions that directly access the **ZCR_EL3, ZCR_EL2, and ZCR_EL1** System registers, from all Exception levels and both Security states, to EL3.

The exception is reported using ESR_ELx.EC value 0x19.

Trapping behavior is affected by precedence as follows: A trap taken as a result of CPT_EL3.EZ has precedence over the value of CPT_EL3.TFP.

<table>
<thead>
<tr>
<th>EZ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control causes these instructions executed at any Exception level to be trapped, subject to the exception prioritization rules.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instruction to be trapped.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

Bits [7:0]

Reserved, RES0.

elsif PSTATE.EL == EL3 then
  CPTR_EL3 = X[t];
CSSELR_EL1, Cache Size Selection Register

The CSSELR_EL1 characteristics are:

**Purpose**

Selects the current Cache Size ID Register, CSIDR_EL1, by specifying the required cache level and the cache type (either instruction or data cache).

**Configuration**

AArch64 System register CSSELR_EL1 bits [31:0] are architecturally mapped to AArch32 System register CSSEL[31:0].

**Attributes**

CSSELR_EL1 is a 64-bit register.

**Field descriptions**

The CSSELR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>62</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>61</td>
<td>TnD, bit [4]</td>
</tr>
<tr>
<td>60</td>
<td>Level, bits [3:1]</td>
</tr>
<tr>
<td>59</td>
<td>InD</td>
</tr>
</tbody>
</table>

**Bits [63:5]**

Reserved, RES0.

**TnD, bit [4]**

*When FEAT_MTE is implemented:*

Allocation Tag not Data bit.

<table>
<thead>
<tr>
<th>TnD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>000</td>
<td>Data, Instruction or Unified cache.</td>
</tr>
<tr>
<td>001</td>
<td>Separate Allocation Tag cache.</td>
</tr>
</tbody>
</table>

When CSSELR_EL1.InD == 1, this bit is RES0.

If CSSELR_EL1.Level is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR_EL1 is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Level, bits [3:1]**

Cache level of required cache.
<table>
<thead>
<tr>
<th>Level</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Level 1 cache.</td>
</tr>
<tr>
<td>0b001</td>
<td>Level 2 cache.</td>
</tr>
<tr>
<td>0b010</td>
<td>Level 3 cache.</td>
</tr>
<tr>
<td>0b011</td>
<td>Level 4 cache.</td>
</tr>
<tr>
<td>0b100</td>
<td>Level 5 cache.</td>
</tr>
<tr>
<td>0b101</td>
<td>Level 6 cache.</td>
</tr>
<tr>
<td>0b110</td>
<td>Level 7 cache.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If CSSEL_EL1.Level is programmed to a cache level that is not implemented, then the value for this field on a read of CSSEL_EL1 is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**InD, bit [0]**

Instruction not Data bit.

<table>
<thead>
<tr>
<th>InD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Data or unified cache.</td>
</tr>
<tr>
<td>0b1</td>
<td>Instruction cache.</td>
</tr>
</tbody>
</table>

If CSSEL_EL1.Level is programmed to a cache level that is not implemented, then a read of CSSEL_EL1 is CONSTRAINED UNPREDICTABLE, and returns UNKNOWN values for CSSEL_EL1.{Level, InD}.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CSSEL_EL1**

Accesses to this register use the following encodings:

**MRS <Xt>, CSSEL_EL1**

```
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && HCR_EL2.TID2 == '1' then

| RES0 | RES0 | DIC | IDC | CWG | ERG | DminLine | L1Ip | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 |

**Bits [63:38]**

Reserved, RES0.

**TminLine, bits [37:32]**

When FEAT_MTE is implemented:

Tag minimum Line. $\log_2$ of the number of words covered by Allocation Tags in the smallest cache line of all caches which can contain Allocation tags that are controlled by the PE.

---

**Note**

- For an implementation with cache lines containing 64 bytes of data and 4 Allocation Tags, this will be $\log_2(64/4) = 4$.
- For an implementation with Allocations Tags in separate cache lines of 128 Allocation Tags per line, this will be $\log_2(128*16/4) = 9$.

---

**Otherwise:**

Reserved, RES0.

**Bit [31]**

Reserved, RES1.

**Bit [30]**

Reserved, RES0.
DIC, bit [29]

Instruction cache invalidation requirements for data to instruction coherence.

<table>
<thead>
<tr>
<th>DIC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Instruction cache invalidation to the Point of Unification is required for data to instruction coherence.</td>
</tr>
<tr>
<td>0b1</td>
<td>Instruction cache invalidation to the Point of Unification is not required for data to instruction coherence.</td>
</tr>
</tbody>
</table>

IDC, bit [28]

Data cache clean requirements for instruction to data coherence. The meaning of this bit is:

<table>
<thead>
<tr>
<th>IDC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Data cache clean to the Point of Unification is required for instruction to data coherence, unless CLIDR_EL1.LoC == 0b000 or (CLIDR_EL1.LoUIS == 0b000 &amp;&amp; CLIDR_EL1.LoUU == 0b000).</td>
</tr>
<tr>
<td>0b1</td>
<td>Data cache clean to the Point of Unification is not required for instruction to data coherence.</td>
</tr>
</tbody>
</table>

CWG, bits [27:24]

Cache writeback granule. Log_2 of the number of words of the maximum size of memory that can be overwritten as a result of the eviction of a cache entry that has had a memory location in it modified.

A value of 0b0000 indicates that this register does not provide Cache writeback granule information and either:

- The architectural maximum of 512 words (2KB) must be assumed.
- The Cache writeback granule can be determined from maximum cache line size encoded in the Cache Size ID Registers.

Values greater than 0b1001 are reserved.

Arm recommends that an implementation that does not support cache write-back implements this field as 0b0001. This applies, for example, to an implementation that supports only write-through caches.

ERG, bits [23:20]

Exclusives reservation granule. Log_2 of the number of words of the maximum size of the reservation granule that has been implemented for the Load-Exclusive and Store-Exclusive instructions.

The use of the value 0b0000 is deprecated.

The value 0b0001 and values greater than 0b1001 are reserved.

DminLine, bits [19:16]

Log_2 of the number of words in the smallest cache line of all the data caches and unified caches that are controlled by the PE.

L1Ip, bits [15:14]

Level 1 instruction cache policy. Indicates the indexing and tagging policy for the L1 instruction cache. Possible values of this field are:

<table>
<thead>
<tr>
<th>L1Ip</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>VMID aware Physical Index, Physical tag (VPIPT)</td>
</tr>
<tr>
<td>0b01</td>
<td>ASID-tagged Virtual Index, Virtual Tag (AIVIVT)</td>
</tr>
<tr>
<td>0b10</td>
<td>Virtual Index, Physical Tag (VIPT)</td>
</tr>
<tr>
<td>0b11</td>
<td>Physical Index, Physical Tag (PIPT)</td>
</tr>
</tbody>
</table>

The value 0b01 is reserved in Armv8.
The value 0b00 is permitted only in an implementation that includes FEAT_VPIPT, otherwise the value is reserved.

**Bits [13:4]**

Reserved, RES0.

**ImiLine, bits [3:0]**

Log2 of the number of words in the smallest cache line of all the instruction caches that are controlled by the PE.

### Accessing the CTR_EL0

Accesses to this register use the following encodings:

```
MRS <Xt>, CTR_EL0
```

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b11</td>
<td>0b0000</td>
<td>0b0000</td>
<td>0b001</td>
</tr>
</tbody>
</table>

```c

DACR32_EL2, Domain Access Control Register

The DACR32_EL2 characteristics are:

**Purpose**

Allows access to the AArch32 DACR register from AArch64 state only. Its value has no effect on execution in AArch64 state.

**Configuration**

AArch64 System register DACR32_EL2 bits [31:0] are architecturally mapped to AArch32 System register DACR[31:0].

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to DACR32_EL2 are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

**Attributes**

DACR32_EL2 is a 64-bit register.

**Field descriptions**

The DACR32_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>62</th>
<th>61</th>
<th>60</th>
<th>59</th>
<th>58</th>

<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**D<n>, bits [2n+1:2n], for n = 15 to 0**

Domain n access permission, where n = 0 to 15. Permitted values are:

<table>
<thead>
<tr>
<th>D&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>No access. Any access to the domain generates a Domain fault.</td>
</tr>
<tr>
<td>0b01</td>
<td>Client. Accesses are checked against the permission bits in the translation tables.</td>
</tr>
<tr>
<td>0b11</td>
<td>Manager: Accesses are not checked against the permission bits in the translation tables.</td>
</tr>
</tbody>
</table>

The value 0b10 is reserved.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the DACR32_EL2**

Accesses to this register use the following encodings:

DAIF, Interrupt Mask Bits

The DAIF characteristics are:

Purpose

Allows access to the interrupt mask bits.

Configuration

There are no configuration notes.

Attributes

DAIF is a 64-bit register.

Field descriptions

The DAIF bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | D | A | I | F | RES0 |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:10]

Reserved, RES0.

D, bit [9]

Process state D mask. The possible values of this bit are:

<table>
<thead>
<tr>
<th>D</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Watchpoint, Breakpoint, and Software Step exceptions targeted at the current Exception level are not masked.</td>
</tr>
<tr>
<td>0b1</td>
<td>Watchpoint, Breakpoint, and Software Step exceptions targeted at the current Exception level are masked.</td>
</tr>
</tbody>
</table>

When the target Exception level of the debug exception is higher than the current Exception level, the exception is not masked by this bit.

On a Warm reset, this field resets to 1.

A, bit [8]

SError interrupt mask bit. The possible values of this bit are:

<table>
<thead>
<tr>
<th>A</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Exception not masked.</td>
</tr>
<tr>
<td>0b1</td>

DBGBCR<n>_EL1, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n>_EL1 characteristics are:

**Purpose**

Holds control information for a breakpoint. Forms breakpoint n together with value register DBGVR<n>_EL1.

**Configuration**

AArch64 System register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGBCR<n>[31:0].

AArch64 System register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to External register DBGBCR<n>_EL1[31:0].

If breakpoint n is not implemented, accesses to this register are UNDEFINED.

**Attributes**

DBGBCR<n>_EL1 is a 64-bit register.

**Field descriptions**

The DBGBCR<n>_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-24</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>23-20</td>
<td>Breakpoint Type, BT</td>
</tr>
</tbody>
</table>

**Bits [63:24]**

Reserved, RES0.

**BT, bits [23:20]**

Breakpoint Type. Possible values are:
<table>
<thead>
<tr>
<th>BT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Unlinked instruction address match. DBGBVR&lt;n&gt;_EL1 is the address of an instruction.</td>
</tr>
<tr>
<td>0b0001</td>
<td>As 0b0000, but linked to a Context matching breakpoint.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Unlinked Context ID match. When FEAT_VHE is implemented, EL2 is using AArch64, and the Effective value of HCR_EL2.E2H is 1, if either the PE is executing at EL0 with HCR_EL2.TGE set to 1 or the PE is executing at EL2, then DBGBVR&lt;n&gt;_EL1.ContextID must match the CONTEXTIDR_EL2 value. Otherwise, DBGBVR&lt;n&gt;_EL1.ContextID must match the CONTEXTIDR_EL1 value</td>
</tr>
<tr>

</tr>
<tr>
<td>0b1111</td>
<td>As 0b1110, with linking enabled.</td>
</tr>
</tbody>
</table>

All other values are reserved. Constraints on breakpoint programming mean other values are reserved under some conditions.

The fields that indicate when the breakpoint can be generated are: HMC, SSC, and PMC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

For more information on the effect of programming the fields to a reserved value, see 'Reserved DBGBCR<n>_EL1.BT values'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**LBN, bits [19:16]**

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of DBGBCR<n>_EL1.E is 0.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**SSC, bits [15:14]**

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated.

The fields that indicate when the breakpoint can be generated are: HMC, SSC, and PMC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.
For more information on the operation of these fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

For more information on the effect of programming the fields to a reserved set of values, see 'Reserved DBGBCR<n>_EL1.{SSC, HMC, PMC} values'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**HMC, bit [13]**

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated.

The fields that indicate when the breakpoint can be generated are: HMC, SSC, and PMC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

For more information, see DBGBCR<n>_EL1.SSC.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [12:9]**

Reserved, RES0.

**BAS, bits [8:5]**

_When AArch32 is supported at any Exception level:_

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints, the permitted values are:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Match instruction at</th>
<th>Constraint for debuggers</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0011</td>
<td>DBGBVR&lt;n&gt;_EL1</td>
<td>Use for T32 instructions</td>
</tr>
<tr>
<td>0b1100</td>
<td>DBGBVR&lt;n&gt;_EL1 + 2</td>
<td>Use for T32 instructions</td>
</tr>
<tr>
<td>0b1111</td>
<td>DBGBVR&lt;n&gt;_EL1</td>
<td>Use for A64 and A32 instructions</td>
</tr>
</tbody>
</table>

All other values are reserved. For more information, see 'Reserved DBGBCR<n>_EL1.BAS values'.

For more information on using the BAS field in address match breakpoints, see 'Using the BAS field in Address Match breakpoints'.

For Context matching breakpoints, this field is RES1 and ignored.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.

**Bits [4:3]**

Reserved, RES0.

**PMC, bits [2:1]**

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated.
The fields that indicate when the breakpoint can be generated are: HMC, SSC, and PMC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

For more information, see DBGBCR<n>_EL1.SSC.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**E, bit [0]**

Enable breakpoint DBGVR<n>_EL1.

<table>
<thead>
<tr>
<th>E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Breakpoint disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Breakpoint enabled.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally UNKNOWN value.

The DBGBVR<n> EL1 characteristics are:

**Purpose**

Holds a virtual address, or a VMID and/or a context ID, for use in breakpoint matching. Forms breakpoint n together with control register DBGBCR<n> EL1.

**Configuration**

AArch64 System register DBGBVR<n> EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGBVR<n>[31:0].

AArch64 System register DBGBVR<n> EL1 bits [63:32] are architecturally mapped to AArch32 System register DBGBXVR<n>[31:0].

AArch64 System register DBGBVR<n> EL1 bits [63:0] are architecturally mapped to External register DBGBVR<n> EL1[63:0].

How this register is interpreted depends on the value of DBGBCR<n> EL1.BT.

- When DBGBCR<n> EL1.BT is 0b000x, this register holds a virtual address.
- When DBGBCR<n> EL1.BT is 0b001x, 0b011x, or 0b110x, this register holds a Context ID.
- When DBGBCR<n> EL1.BT is 0b100x, this register holds a VMID.
- When DBGBCR<n> EL1.BT is 0b101x, this register holds a VMID and a Context ID.
- When DBGBCR<n> EL1.BT is 0b111x, this register holds two Context ID values.

For other values of DBGBCR<n> EL1.BT, this register is RES0.

If breakpoint n is not implemented then accesses to this register are UNDEFINED.

**Attributes**

DBGBVR<n> EL1 is a 64-bit register.

**Field descriptions**

The DBGBVR<n> EL1 bit assignments are:

**When DBGBCR<n> EL1.BT == 0b000x:**

|------------|----------|------|

**RESS[14:4], bits [63:53]**

Reserved, Sign extended. Software must set all bits in this field to the same value as the most significant bit of the VA field. If all bits in this field are not the same value as the most significant bit of the VA field, then all of the following apply:

- It is CONSTRAINED UNPREDICTABLE whether the PE ignores this field when comparing an address.
- If the breakpoint is not context-aware, it is IMPLEMENTATION DEFINED whether the value read back in each bit of this field is a copy of the most significant bit of the VA field or the value written.
VA[52:49], bits [52:49]

When FEAT_LVA is implemented:

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When FEAT_LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, bits [52:49] are part of the RESS field.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT == 0b001x:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | ContextID |

Bits [63:32]

Reserved, RES0.

ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against CONTEXTIDR_EL2 when (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented), HCR_EL2.E2H is 1, and either:

- The PE is executing at EL2.
- HCR_EL2.TGE is 1, the PE is executing at EL0, and EL2 is enabled in the current Security state.

Otherwise, the value is compared against CONTEXTIDR_EL1.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>_EL1.BT == 0b011x:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | ContextID |

Bits [63:32]

Reserved, RES0.
ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>_EL1.BT == 0b100x and EL2 is implemented:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

When FEAT_VMID16 is implemented, VTCR_EL2.VS == 1 and EL2 is using AArch64:

Extension to VMID[7:0]. See DBGBVR<n>_EL1.VMID[7:0] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- VTCR_EL2.VS is 0.
- FEAT_VMID16 is not implemented.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT == 0b101x and EL2 is implemented:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

When FEAT_VMID16 is implemented, VTCR_EL2.VS == 1 and EL2 is using AArch64:

Extension to VMID[7:0]. See DBGBVR<n>_EL1.VMID[7:0] for more details.
On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**VMID[7:0], bits [39:32]**

VMID value for comparison.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- VTCR_EL2.VS is 0.
- FEAT_VMID16 is not implemented.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**ContextID, bits [31:0]**

Context ID value for comparison against CONTEXTIDR_EL1.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**When DBGBCR<n> _EL1.BT == 0b110x, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented):**

end
The DBGCLAIMCLR_EL1 characteristics are:

**Purpose**

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0.

The architecture does not define any functionality for the CLAIM tag bits.

**Note**

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the DBGCLAIMSET_EL1 register.

**Configuration**

AArch64 System register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGCLAIMCLR[31:0].

AArch64 System register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to External register DBGCLAIMCLR_EL1[31:0].

An implementation must include eight CLAIM tag bits.

**Attributes**

DBGCLAIMCLR_EL1 is a 64-bit register.

**Field descriptions**

The DBGCLAIMCLR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-32</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>31-24</td>
<td>Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.</td>
</tr>
<tr>
<td>7-0</td>
<td>CLAIM, bits [7:0]</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**Bits [31:8]**

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

**CLAIM, bits [7:0]**

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.

Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.
On a Cold reset, this field resets to 0.

**Accessing the DBGCLAIMCLR_EL1**

Accesses to this register use the following encodings:

DBGCLAIMSET_EL1, Debug CLAIM Tag Set register

The DBGCLAIMSET_EL1 characteristics are:

**Purpose**

Used by software to set the CLAIM tag bits to 1.

The architecture does not define any functionality for the CLAIM tag bits.

---

**Note**

CLAIM tags are typically used for communication between the debugger and target software.

---

Used in conjunction with the DBGCLAIMCLR_EL1 register.

**Configuration**

AArch64 System register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGCLAIMSET[31:0].

AArch64 System register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to External register DBGCLAIMSET_EL1[31:0].

An implementation must include eight CLAIM tag bits.

**Attributes**

DBGCLAIMSET_EL1 is a 64-bit register.

**Field descriptions**

DBGDTR_EL0, Debug Data Transfer Register, half-duplex

The DBGDTR_EL0 characteristics are:

**Purpose**

Transfers 64 bits of data between the PE and an external debugger. Can transfer both ways using only a single register.

**Configuration**

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to AArch32 System register DBGDTRRXint[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to External register DBGDTRRX_EL0[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to AArch64 System register DBGDTRRX_EL0[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRTXint[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to External register DBGDTRTX_EL0[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to AArch64 System register DBGDTRTX_EL0[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to AArch32 System register DBGDTRTXint[31:0] when read.

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to External register DBGDTRTX_EL0[31:0] when read.

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to AArch64 System register DBGDTRTXint[31:0] when read.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to External register DBGDTRTX_EL0[31:0] when read.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to AArch64 System register DBGDTRTX_EL0[31:0] when read.

**Attributes**

DBGDTR_EL0 is a 64-bit register.

HighWord, bits [63:32]

Writes to this register set DTRRX to the value in this field and do not change RXfull.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRTX.
- If RXfull is set to 0, return an **UNKNOWN** value.

After the read, RXfull is cleared to 0.

LowWord, bits [31:0]

Writes to this register set DTRTX to the value in this field and set TXfull to 1.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRRX.
- If RXfull is set to 0, return an **UNKNOWN** value.

After the read, RXfull is cleared to 0.

**Bits [63:32]**

Reserved, RES0.

**Bits [31:0]**

Update DTRRX.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRRX.
- If RXfull is set to 0, return an **UNKNOWN** value.

After the read, RXfull is cleared to 0.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the DBGDTRRX_EL0**

Accesses to this register use the following encodings:
if Halted() then
    return DBGDTRRX_EL0;

DBGDTRTX_EL0, Debug Data Transfer Register, Transmit

The DBGDTRTX_EL0 characteristics are:

**Purpose**

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communication Channel.

**Configuration**

AArch64 System register DBGDTRTX_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRTXint[31:0].

AArch64 System register DBGDTRTX_EL0 bits [31:0] are architecturally mapped to External register DBGDTRTX_EL0[31:0].

**Attributes**

DBGDTRTX_EL0 is a 64-bit register.

**Field descriptions**

The DBGDTRTX_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>31</td>
<td>Return DTRTX</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**Bits [31:0]**

Return DTRTX.

Writes to this register:

- If TXfull is set to 1, set DTRRX and DTRTX to UNKNOWN.
- If TXfull is set to 0, update the value in DTRTX.

After the write, TXfull is set to 1.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the DBGDTRTX_EL0**

Accesses to this register use the following encodings:
if Halted() then
    DBGDTRTX_EL0 = X[t];
elsif PSTATE.EL == EL0 then

endfunction
DBGPRCR_EL1, Debug Power Control Register

The DBGPRCR_EL1 characteristics are:

**Purpose**

Controls behavior of the PE on powerdown request.

**Configuration**

AArch64 System register DBGPRCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGPRCR[31:0].

Bit [0] of this register is mapped to EDPRCR.CORENPDRQ, bit [0] of the external view of this register.

The other bits in these registers are not mapped to each other.

**Attributes**

DBGPRCR_EL1 is a 64-bit register.

**Field descriptions**

The DBGPRCR_EL1 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |

| RES0| RES0| CORENPDRQ |
| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |

**Bits [63:1]**

Reserved, RES0.

**CORENPDRQ, bit [0]**

*When FEAT_DoPD is implemented:*

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

<table>
<thead>
<tr>
<th>CORENPDRQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If the system responds to a powerdown request, it powers down Core power domain.</td>
</tr>
<tr>
<td>0b1</td>
<td>If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.</td>
</tr>
</tbody>
</table>

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to its Cold reset value on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see 'Core power domain power states'.

**Note**
Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a Cold reset, if the powerup request is implemented and the powerup request has been asserted, this field is set to an IMPLEMENTATION DEFINED choice of 0 or 1. If the powerup request is not asserted, this field is set to 0.

Otherwise:

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

<table>
<thead>
<tr>
<th>CORENPDRQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If the system responds to a powerdown request, it powers down Core power domain.</td>
</tr>
<tr>
<td>0b1</td>
<td>If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.</td>
</tr>
</tbody>
</table>

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of EDPRCR, COREPURQ on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see 'Core power domain power states'.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a Cold reset, this field resets to the value in EDPRCR, COREPURQ.

Accessing the DBGPRCR_EL1

**DBGVCR32_EL2, Debug Vector Catch Register**

The DBGVCR32_EL2 characteristics are:

**Purpose**

Allows access to the AArch32 register DBGVCR from AArch64 state only. Its value has no effect on execution in AArch64 state.

**Configuration**

AArch64 System register DBGVCR32_EL2 bits [31:0] are architecturally mapped to AArch32 System register DBGVCR[31:0].

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to DBGVCR32_EL2 are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not present.

**Attributes**

DBGVCR32_EL2 is a 64-bit register.

**Field descriptions**

The DBGVCR32_EL2 bit assignments are:

**When EL3 is implemented:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |

**Bits [63:32]**

Reserved, RES0.

**NSF, bit [31]**

FIQ vector catch enable in Non-secure state.

The exception vector offset is 0x1C.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**NSI, bit [30]**

IRQ vector catch enable in Non-secure state.

The exception vector offset is 0x18.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [29]**

Reserved, RES0.
NSD, bit [28]
Data Abort vector catch enable in Non-secure state.
The exception vector offset is 0x10.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSP, bit [27]
Prefetch Abort vector catch enable in Non-secure state.
The exception vector offset is 0x0C.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSS, bit [26]
Supervisor Call (SVC) vector catch enable in Non-secure state.
The exception vector offset is 0x08.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSU, bit [25]
Undefined Instruction vector catch enable in Non-secure state.
The exception vector offset is 0x04.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [24:8]
Reserved, RES0.

SF, bit [7]
FIQ vector catch enable in Secure state.
The exception vector offset is 0x1C.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

SI, bit [6]
IRQ vector catch enable in Secure state.
The exception vector offset is 0x18.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]
Reserved, RES0.

SD, bit [4]
Data Abort vector catch enable in Secure state.
The exception vector offset is 0x10.
On a Warm reset, this field resets to an architecturally UNKNOWN value.
SP, bit [3]

Prefetch Abort vector catch enable in Secure state.
The exception vector offset is 0x0C.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

SS, bit [2]

Supervisor Call (SVC) vector catch enable in Secure state.
The exception vector offset is 0x08.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

SU, bit [1]

Undefined Instruction vector catch enable in Secure state.
The exception vector offset is 0x04.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

When EL3 is not implemented:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 |

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | F | I | RES0 | D | P | S | U | RES0 |

Bits [63:8]

Reserved, RES0.

F, bit [7]

FIQ vector catch enable.
The exception vector offset is 0x1C.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [6]

IRQ vector catch enable.
The exception vector offset is 0x18.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.
D, bit [4]

Data Abort vector catch enable.
The exception vector offset is 0x10.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

P, bit [3]

Prefetch Abort vector catch enable.
The exception vector offset 0x0C.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [2]

Supervisor Call (SVC) vector catch enable.
The exception vector offset is 0x08.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [1]

Undefined Instruction vector catch enable.
The exception vector offset is 0x04.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

    DBGVCR32_EL2 = X[t];
DBGWCR<n>_EL1, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n>_EL1 characteristics are:

**Purpose**

Holds control information for a watchpoint. Forms watchpoint n together with value register DBGWVR<n>_EL1.

**Configuration**

AArch64 System register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGWCR<n>[31:0].

AArch64 System register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to External register DBGWCR<n>_EL1[31:0].

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

**Attributes**

DBGWCR<n>_EL1 is a 64-bit register.

**Field descriptions**

The DBGWCR<n>_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:29]</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>[28:24]</td>
<td>MASK, bits</td>
</tr>
</tbody>
</table>

**Bits [63:29]**

Reserved, RES0.

**MASK, bits [28:24]**

Address mask. Only objects up to 2GB can be watched using a single mask.

<table>
<thead>
<tr>
<th>MASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00000</td>
<td>No mask.</td>
</tr>
<tr>
<td>0b00001</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b00010</td>
<td>Reserved.</td>
</tr>
</tbody>
</table>

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

On a Cold reset, this field resets to an architecturally UNKNOWN value.
**Bits [23:21]**

Reserved, RES0.

**WT, bit [20]**

Watchpoint type. Possible values are:

<table>
<thead>
<tr>
<th>WT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Unlinked data address match.</td>
</tr>
<tr>
<td>0b1</td>
<td>Linked data address match.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**LBN, bits [19:16]**

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**SSC, bits [15:14]**

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated.

The fields that indicate when the watchpoint can be generated are: HMC, SSC, and PAC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

For more information on the effect of programming the fields to a reserved value, see 'Reserved DBGBCR<n>_EL1.{SSC, HMC, PMC} values'.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**HMC, bit [13]**

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated.

The fields that indicate when the watchpoint can be generated are: HMC, SSC, and PAC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**BAS, bits [12:5]**

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by DBGWVR<n>_EL1 is being watched.

<table>
<thead>
<tr>
<th>BAS</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xxxx111</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1</td>
</tr>
<tr>
<td>xxxx1xxx</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1 + 1</td>
</tr>
<tr>
<td>xxxx1xx</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1 + 2</td>
</tr>
<tr>
<td>xxxx1xx</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1 + 3</td>
</tr>
</tbody>
</table>

In cases where DBGWVR<n>_EL1 addresses a double-word:

The valid values for BAS are non-zero binary numbers all of whose set bits are contiguous. All other values are reserved and must not be used by software. See ‘Reserved DBGWCR<n>_EL1.BAS values’.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**LSC, bits [4:3]**

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

<table>
<thead>
<tr>
<th>LSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>Match instructions that load from a watchpointed address.</td>
</tr>
<tr>
<td>0b10</td>
<td>Match instructions that store to a watchpointed address.</td>
</tr>
<tr>
<td>0b11</td>
<td>Match instructions that load from or store to a watchpointed address.</td>
</tr>
</tbody>
</table>

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**PAC, bits [2:1]**

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint n is generated.

The fields that indicate when the watchpoint can be generated are: HMC, SSC, and PAC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see ‘Execution conditions for which a watchpoint generates Watchpoint exceptions’.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**E, bit [0]**

Enable watchpoint n. Possible values are:

<table>
<thead>
<tr>
<th>E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Watchpoint disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Watchpoint enabled.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally UNKNOWN value.

    Halt(DebugHalt_SoftwareAccess);
  else
    DBGWCR_EL1[UInt(CRm<3:0>)] = X[t];
  endif
The DBGWVR<n>_EL1 characteristics are:

**Purpose**

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register DBGWCR<n>_EL1.

**Configuration**

AArch64 System register DBGWVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGWVR<n>[31:0].

AArch64 System register DBGWVR<n>_EL1 bits [63:0] are architecturally mapped to External register DBGWVR<n>_EL1[63:0].

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

**Attributes**

DBGWVR<n>_EL1 is a 64-bit register.

**Field descriptions**

The DBGWVR<n>_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**RESS[14:4], bits [63:53]**

Reserved, Sign extended. Software must set all bits in this field to the same value as the most significant bit of the VA field. If all bits in this field are not the same value as the most significant bit of the VA field, then all of the following apply:

- It is CONstrained UNpredictable whether the PE ignores this field when comparing an address.
- It is IMPLEMENTation DEFINED whether the value read back in each bit of this field is a copy of the most significant bit of the VA field or the value written.

**VA[52:49], bits [52:49]**

When FEAT_LVA is implemented:

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

**VA[48:2], bits [48:2]**

Bits [48:2] of the address value for comparison.

When FEAT_LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, bits [52:49] are part of the RESS field.

Arm deprecates setting \texttt{DBGWVR<n>\_EL1[2]} == 1.

On a Cold reset, this field resets to an architecturally \texttt{UNKNOWN} value.

**Bits [1:0]**

Reserved, RES0.

**Accessing the DBGWVR<n>_EL1**

</table>

**Bits [63:32]**

Reserved, RES0.

**SetWay, bits [31:4]**

Contains two fields:
- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

A = Log2(ASSOCIATIVITY), L = Log2(LINELEN), B = (L + S), S = Log2(NSETS).

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

**Level, bits [3:1]**

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

**Bit [0]**

Reserved, RES0.
Executing the DC CGDSW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings:

DC CGDSW, \(<X_t>\)

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>0b000</td>
<td>0b0111</td>
<td>0b1010</td>
<td>0b110</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TSW == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGITR_EL2.DCCSW == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        DC_CGDSW(X[t]);
    endif
elsif PSTATE.EL == EL2 then
    DC_CGDSW(X[t]);
elsif PSTATE.EL == EL3 then
    DC_CGDSW(X[t]);
The DC CGDVAC characteristics are:

**Purpose**

Clean data and Allocation Tags in data cache by address to Point of Coherency.

**Configuration**

This instruction is present only when FEAT_MTE is implemented. Otherwise, direct accesses to DC CGDVAC are UNDEFINED.

**Attributes**

DC CGDVAC is a 64-bit System instruction.

**Field descriptions**

The DC CGDVAC input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Virtual address to use</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</td>

DC CGSW, Clean of Allocation Tags by Set/Way

The DC CGSW characteristics are:

**Purpose**

Clean Allocation Tags in data cache by set/way.

**Configuration**

This instruction is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to DC CGSW are UNDEFINED.

**Attributes**

DC CGSW is a 64-bit System instruction.

**Field descriptions**

The DC CGSW input value bit assignments are:

<table>

</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**SetWay, bits [31:4]**

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

A = \(\log_2(\text{ASSOCIATIVITY})\), \(L = \log_2(\text{LINELEN})\), \(B = (L + S)\), \(S = \log_2(\text{NSETS})\).

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

**Level, bits [3:1]**

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

**Bit [0]**

Reserved, RES0.
Executing the DC CGSW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is **CONSTRAINED UNPREDICTABLE** and one of the following occurs:

- The instruction is **UNDEFINED**.
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings:

**Virtual address to use**

Virtual address to use. No alignment restrictions apply to this VA.

**Executing the DC CGVAC instruction**

If EL0 access is enabled, when executed at EL0, this instruction requires read access permission to the VA, otherwise it generates a Permission Fault, subject to the constraints described in ‘Permission fault’.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

Accesses to this instruction use the following encodings:

DC CIGDSW, Clean and Invalidate of Data and Allocation Tags by Set/Way

The DC CIGDSW characteristics are:

**Purpose**

Clean and Invalidate data and Allocation Tags in data cache by set/way.

**Configuration**

This instruction is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to DC CIGDSW are UNDEFINED.

**Attributes**

DC CIGDSW is a 64-bit System instruction.

**Field descriptions**

The DC CIGDSW input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:32]</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>SetWay, bits [31:4]</strong></td>
<td>Contains two fields:</td>
</tr>
<tr>
<td>• Way, bits[31:32-A], the number of the way to operate on.</td>
<td></td>
</tr>
<tr>
<td>• Set, bits[B-1:L], the number of the set to operate on.</td>
<td></td>
</tr>
<tr>
<td>Bits[L-1:4] are RES0.</td>
<td></td>
</tr>
</tbody>
</table>

A = \(\log_2(\text{ASSOCIATIVITY})\), \(L = \log_2(\text{LINELEN})\), \(B = (L + S)\), \(S = \log_2(\text{NSETS})\).

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

**Level, bits [3:1]**

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

**Bit [0]**

Reserved, RES0.
Executing the DC CIGDSW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings:

</tr>
<tr>
<td>0</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**SetWay, bits [31:4]**

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

A = Log2(ASSOCIATIVITY), L = Log2(LINELEN), B = (L + S), S = Log2(NSETS).

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

**Level, bits [3:1]**

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

**Bit [0]**

Reserved, RES0.
Executing the DC CIGSW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings:

\[
\text{DC CIGSW, } \langle X_t \rangle
\]

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>

DC CIGVAC, Clean and Invalidate of Allocation Tags by VA to PoC

The DC CIGVAC characteristics are:

**Purpose**

Clean and Invalidate Allocation Tags in data cache by address to Point of Coherency.

**Configuration**

This instruction is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to DC CIGVAC are UNDEFINED.

**Attributes**

DC CIGVAC is a 64-bit System instruction.

**Field descriptions**

The DC CIGVAC input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---- |
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

Virtual address to use

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---- |

Virtual address to use

Bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

**Executing the DC CIGVAC instruction**

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

If EL0 access is enabled, when executed at EL0, this instruction requires read access permission to the VA, otherwise it generates a Permission Fault, subject to the constraints described in 'Permission fault'.

Accesses to this instruction use the following encodings:

**Bits [63:0]**

Virtual address to use. No alignment restrictions apply to this VA.

**Executing the DC CVADP instruction**

If EL0 access is enabled, when executed at EL0, this instruction requires read access permission to the VA, otherwise it generates a Permission Fault, see 'Permission fault'.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

Accesses to this instruction use the following encodings:

**DC CVADP, <Xt>**

The DC CVAP characteristics are:

**Purpose**

Clean data cache by address to Point of Persistence.

If the memory system does not identify a Point of Persistence, then this instruction behaves as a DC CVAC.

When FEAT_MTE is implemented, this instruction might clean Allocation Tags from caches.

**Configuration**

This instruction is present only when FEAT_DPB is implemented. Otherwise, direct accesses to DC CVAP are UNDEFINED.

**Attributes**

DC CVAP is a 64-bit System instruction.

**Field descriptions**

The DC CVAP input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>

**DC CVAU, Data or unified Cache line Clean by VA to PoU**

The DC CVAU characteristics are:

**Purpose**

Clean data cache by address to Point of Unification.

**Configuration**

AArch64 System instruction DC CVAU performs the same function as AArch32 System instruction DCCMVAU.

**Attributes**

DC CVAU is a 64-bit System instruction.

**Field descriptions**

The DC CVAU input value bit assignments are:

            elsif PSTATE.EL == EL3 then
                DC_CVAU(X[t]);
The DC GVA characteristics are:

**Purpose**

Write a value to the Allocation Tags of a naturally aligned block of N bytes, where the size of N is identified in DCZID_EL0. The Allocation Tag used is determined by the input address.

**Configuration**

This instruction is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to DC GVA are UNDEFINED.

**Attributes**

DC GVA is a 64-bit System instruction.

**Field descriptions**

The DC GVA input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [63:0]**

Virtual address to use. There is no alignment restriction on the address within the block of N bytes that is used.

**Executing the DC GVA instruction**

When this instruction is executed, it can generate memory faults or watchpoints which are prioritized in the same way as other memory-related faults or watchpoints. If a synchronous data abort fault or a watchpoint is generated, the CM bit in the ESR_ELx.ISS field is not set.

If the memory region being modified is any type of Device memory, this instruction can give an alignment fault that is prioritized in the same way as other alignment faults that are determined by the memory type.

This instruction applies to Normal memory regardless of cacheability attributes.

This instruction behaves as a set of stores to each Allocation Tag within the block being accessed, and so it:

- Generates a Permission Fault if the translation system does not permit writes to the locations.
- Requires the same considerations for ordering and the management of coherency as any other store instructions.

Accesses to this instruction use the following encodings:

**DC GVA, <Xt>**

<table>

The DC IGDSW characteristics are:

**Purpose**

Invalidate data and Allocation Tags in data cache by set/way.

**Configuration**

This instruction is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to DC IGDSW are UNDEFINED.

**Attributes**

DC IGDSW is a 64-bit System instruction.

**Field descriptions**

The DC IGDSW input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | SetWay | Level | RES0 |

**Bits [63:32]**

Reserved, RES0.

**SetWay, bits [31:4]**

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

A = Log2(ASSOCIATIVITY), L = Log2(LINELEN), B = (L + S), S = Log2(NSETS).

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

**Level, bits [3:1]**

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

**Bit [0]**

Reserved, RES0.
Executing the DC IGDSW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings:

DC IGSW, Invalidate of Allocation Tags by Set/Way

The DC IGSW characteristics are:

**Purpose**

Invalidate Allocation Tags in data cache by set/way.

**Configuration**

This instruction is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to DC IGSW are UNDEFINED.

**Attributes**

DC IGSW is a 64-bit System instruction.

**Field descriptions**

The DC IGSW input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Field 1</th>
<th>Field 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>62–4</td>
<td>SetWay</td>
<td></td>
<td></td>
</tr>
<tr>

<tr>
<td>30–1</td>
<td>Level</td>
<td></td>
<td></td>
</tr>
<tr>
<td>0</td>
<td>Reserved, RES0.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**SetWay, bits [31:4]**

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

\[
A = \log_2(\text{ASSOCIATIVITY}), \quad L = \log_2(\text{LINELEN}), \quad B = (L + S), \quad S = \log_2(\text{NSETS}).
\]

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

**Level, bits [3:1]**

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

**Bit [0]**

Reserved, RES0.
Executing the DC IGSW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is **CONSTRAINED UNPREDICTABLE** and one of the following occurs:

- The instruction is **UNDEFINED**.
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings:

DC IGSW, <Xt>

DC IVAC, Data or unified Cache line Invalidate by VA to PoC

The DC IVAC characteristics are:

**Purpose**

Invalidate data cache by address to Point of Coherency.

When FEAT_MTE is implemented, this instruction might invalidate Allocation Tags from caches. When it invalidates Allocation Tags from caches, it also cleans them.

**Configuration**

AArch64 System instruction DC IVAC performs the same function as AArch32 System instruction DCIMVAC.

**Attributes**

DC IVAC is a 64-bit System instruction.

**Field descriptions**

The DC IVAC input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Virtual address to use</td>
</tr>
<tr>
<td>31</td>
<td>Virtual address to use</td>
</tr>
</tbody>
</table>

**Bits [63:0]**

Virtual address to use. No alignment restrictions apply to this VA.

**Executing the DC IVAC instruction**

When the instruction is executed, it can generate a watchpoint, which is prioritized in the same way as other watchpoints. If a watchpoint is generated, the CM bit in the ESR_ELx.ISS field is set to 1.

This instruction requires write access permission to the VA, otherwise it generates a Permission Fault, subject to the constraints described in 'Permission fault'.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

Accesses to this instruction use the following encodings:

**DC IVAC, <Xt>**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>

elsif PSTATE.EL == EL3 then
  DC_IVAC(X[t]);
DC ZVA, Data Cache Zero by VA

The DC ZVA characteristics are:

**Purpose**

Zero data cache by address. Zeroes a naturally aligned block of N bytes, where the size of N is identified in DCZID_EL0.

**Configuration**

There are no configuration notes.

**Attributes**

DC ZVA is a 64-bit System instruction.

**Field descriptions**

The DC ZVA input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Virtual address to use**

Virtual address to use. There is no alignment restriction on the address within the block of N bytes that is used.

**Executing the DC ZVA instruction**

When this instruction is executed, it can generate memory faults or watchpoints which are prioritized in the same way as other memory-related faults or watchpoints. If a synchronous data abort fault or a watchpoint is generated, the CM bit in the ESR_ELx.ISS field is set to 0.

If the memory region being zeroed is any type of Device memory, this instruction can give an Alignment fault which is prioritized in the same way as other Alignment faults that are determined by the memory type.

This instruction applies to Normal memory regardless of cacheability attributes.

This instruction behaves as a set of Stores to each byte within the block being accessed, and so it:

- Generates a Permission Fault if the translation system does not permit writes to the locations.
- Requires the same considerations for ordering and the management of coherency as any other store instructions.

Accesses to this instruction use the following encodings:

**DC ZVA, <Xt>**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>

DISR_EL1, Deferred Interrupt Status Register

The DISR_EL1 characteristics are:

**Purpose**

Records that an SError interrupt has been consumed by an ESB instruction.

**Configuration**

AArch64 System register DISR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DISR[31:0]. This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to DISR_EL1 are UNDEFINED.

**Attributes**

DISR_EL1 is a 64-bit register.

**Field descriptions**

The DISR_EL1 bit assignments are:

*When DISR_EL1.IDS == 0:*

<table>
<thead>
<tr>
<th>Bits</th>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:32]</td>
<td>RES0</td>
<td>Reserved, RES0</td>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**ISS, bits [23:0]**

IMPLEMENTATION DEFINED syndrome. See the description of ESR_ELx[23:0] for an SError interrupt.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Accessing the DISR_EL1

An indirect write to DISR_EL1 made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of DISR_EL1 occurring in program order after the ESB instruction.

DISR_EL1 is RAZ/WI if EL3 is implemented, the PE is in Non-debug state, `SCR_EL3.EA == 1`, and any of the following apply:

- At EL2.
- At EL1 and \((\text{SCR_EL3.NS} == 0 \&\& \text{SCR_EL3.EEL2} == 0) \lor \text{HCR_EL2.AMO} == 0\).

Accesses to this register use the following encodings:

**MRS <Xt>, DISR_EL1**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>
<td>0b1100</td>
<td>0b0001</td>
<td>0b001</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
   UNDEFINED;
elsif PSTATE.EL == EL1 then
   if EL2Enabled() \&\& HCR_EL2.AMO == '1' then
      return VDISR_EL2;
   else
      return DISR_EL1;
else if PSTATE.EL == EL2 then
   return DISR_EL1;
elsif PSTATE.EL == EL3 then
   return DISR_EL1;

<td></td>
<td>◦ The values of the data supplied in any of its registers.</td>
</tr>
<tr>
<td></td>
<td>◦ The values of the NZCV flags.</td>
</tr>
<tr>
<td></td>
<td>• For certain data processing instructions, the response of the instruction to asynchronous exceptions does not vary based on:</td>
</tr>
<tr>
<td></td>
<td>◦ The values of the data supplied in any of its registers.</td>
</tr>
<tr>
<td></td>
<td>◦ The values of the NZCV flags.</td>
</tr>
</tbody>
</table>

The data processing instructions affected by this bit are:

- All cryptographic instructions. These instructions are:
  - AESD, AESE, AESIMC, AESMC, SHA1C, SHA1H, SHA1M, SHA1P, SHA1SU0, SHA1SU1, SHA256H, SHA256H2, SHA256SU0, SHA256SU1, SHA512H, SHA512H2, SHA512SU0, SHA512SU1, EOR3, RAX1, XAR, BCAx, SM3S1, SM3TT1A, SM3TT1B, SM3TT2A, SM3TT2B, SM3PARTW1, SM3PARTW2, SM4E, and SM4EKEY.
A subset of those instructions which use the general-purpose register file. These instructions are:

- ADC, ADCS, ADD, ADDS, AND, ANDS, ASR, ASRV, BFC, BFI, BFMI, BFXL, BIC, BICS, CCMN, CCMP, CFINV, CINC, CINV, CLS, CLZ, CMN, CMP, CNEG, CSEL, CSBT, CSETM, CSINC, CSINV, CSENE, EON, EOR, EXTR, LSL, LSLV, LSR, LSRR, MAD, MNEG, MOV, MOVK, MOVN, MOVZ, MSUB, MUL, MVN, NEG, NEQ, NG, NGC, NGE, NSC, NOP, OR, ORR, RBIT, RET, REV, REV16, REV32, REV64, RMIF, ROR, RORV, SBC, SBCS, SBFZ, SBFI, SBFX, SETF8, SETF16, SOMADDL, SMNEG, SMSUBL, SMULH, SMULL, SUB, SUBS, SXTB, SXTX, TST, UBZ, UBFM, UBFX, UMADDL, UMNGL, UMSUBL, UMULH, UMULL, UXTH.

A subset of those instructions which use the SIMD&FP register file. These instructions are:

- ABS, ADD, ADDHN, ADDHN2, ADDP, ADDV, AND, BIC, BIF, BIT, BSL, CLS, CLZ, CMEQ, CMGE, CMGT, CMHI, CMNS, CMLE, CLMT, CMTST, CNT, CRC32B, CRC32H, CRC32W, CRC32X, CRC32CB, CRC32CH, CRC32CW, CRC32CX, DUP, EOR, EXT, FCEL, INS, MLA, MLS, MOV, MOVI, MUL, MVN, MVI, NEG, NOT, ORN, ORR, PMUL, PMULL, PMULL2, RADDHN, RADDHN2, RBIT, REV16, REV32, RSHRN, RSHRN2, RSUBHN, RSUBHNN, SABA, SABD, SABAL, SABAL2, SABDL, SADLP, SADDLP, ADDDL2, SADDL2, SADDLP, SADML2, SADML2, SADML2, SADML2, SHRN, SHRN2, SHSUB, SLI, SMAX, SMAXP, SMAXX, SMIN, SMINP, SMOV, SMLA, SMLA2, SMLAL2, SMLSL, SMLSL2, SMV, SMULL, SMULL2, SRI, SSSH, SHLL, SHLL2, SHRN, SHRN2, SMV, SMLA, SMLA2, SMLSL, SMLSL2, SMV, SMULL, SMLA, SMLA2, SMLSL, SMLSL2, SMV, SMULL, SMULL2, SRI, SSSH, SHLL, SHLL2, SHRN, SHRN2, SSSH, SSSH, SSSH, SSSH.

### Note

The architecture makes no statement about the timing properties when the PSTATE.DIT bit is not set. However, it is likely that many of these instructions have timing that is invariant of the data in many situations.

In particular, Arm strongly recommends that the Armv8.3 pointer authentication instructions do not have their timing dependent on the key value used in the pointer authentication in all cases, regardless of the PSTATE.DIT bit.

On a Warm reset, this field resets to 0.

**Bits [23:0]**

DSPSR_EL0, Debug Saved Program Status Register

The DSPSR_EL0 characteristics are:

**Purpose**

Holds the saved process state for Debug state. On entering Debug state, PSTATE information is written to this register. On exiting Debug state, values are copied from this register to PSTATE.

**Configuration**

AArch64 System register DSPSR_EL0 bits [31:0] are architecturally mapped to AArch32 System register DSPSR[31:0].

**Attributes**

DSPSR_EL0 is a 64-bit register.

**Field descriptions**

The DSPSR_EL0 bit assignments are:

When AArch32 is supported at any Exception level and exiting Debug state to AArch32 state:

</tbody>
</table>
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Q, bit [27]**

Overflow or saturation flag. Copied to PSTATE.Q on exiting Debug state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IT[1:0], bits [26:25]**

If-Then. Copied to PSTATE.IT[1:0] on exiting Debug state.

On exiting Debug state DSPSR_EL0.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**DIT, bit [24]**

*When FEAT_DIT is implemented:*

Data Independent Timing. Copied to PSTATE.DIT on exiting Debug state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**SSBS, bit [23]**

*When FEAT_SSBS is implemented:*

Speculative Store Bypass. Copied to PSTATE.SSBS on exiting Debug state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**PAN, bit [22]**

*When FEAT_PAN is implemented:*

Privileged Access Never. Copied to PSTATE.PAN on exiting Debug state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**SS, bit [21]**

Software Step. Copied to PSTATE.SS on exiting Debug state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
IL, bit [20]

Illegal Execution state. Copied to PSTATE.IL on exiting Debug state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

GE, bits [19:16]

Greater than or Equal flags. Copied to PSTATE.GE on exiting Debug state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

IT[7:2], bits [15:10]

If-Then. Copied to PSTATE.IT[7:2] on exiting Debug state.

DSPSR_EL0.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

E, bit [9]

Endianness. Copied to PSTATE.E on exiting Debug state.

If the implementation does not support big-endian operation, DSPSR_EL0.E is **RES0**. If the implementation does not support little-endian operation, DSPSR_EL0.E is **RES1**. On exiting Debug state, if the implementation does not support big-endian operation at the Exception level being returned to, DSPSR_EL0.E is **RES0**, and if the implementation does not support little-endian operation at the Exception level being returned to, DSPSR_EL0.E is **RES1**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

A, bit [8]

SError interrupt mask. Copied to PSTATE.A on exiting Debug state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

I, bit [7]

IRQ interrupt mask. Copied to PSTATE.I on exiting Debug state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

F, bit [6]

FIQ interrupt mask. Copied to PSTATE.F on exiting Debug state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

T, bit [5]

T32 Instruction set state. Copied to PSTATE.T on exiting Debug state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

M[4], bit [4]

Execution state. Copied to PSTATE.nRW on exiting Debug state.

<table>

</tbody>
</table>

**Bits [63:32]**

Reserved, **RES0**.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on entering Debug state, and copied to PSTATE.N on exiting Debug state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on entering Debug state, and copied to PSTATE.Z on exiting Debug state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on entering Debug state, and copied to PSTATE.C on exiting Debug state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on entering Debug state, and copied to PSTATE.V on exiting Debug state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Bits [27:26]

Reserved, RES0.

TCO, bit [25]

When FEAT_MTE is implemented:

Tag Check Override. Set to the value of PSTATE.TCO on entering Debug state, and copied to PSTATE.TCO on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [24]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on entering Debug state, and copied to PSTATE.DIT on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UAO, bit [23]

When FEAT_UAO is implemented:

User Access Override. Set to the value of PSTATE.UAO on entering Debug state, and copied to PSTATE.UAO on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on entering Debug state, and copied to PSTATE.PAN on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on entering Debug state, and conditionally copied to PSTATE.SS on exiting Debug state.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on entering Debug state, and copied to PSTATE.IL on exiting Debug state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [19:13]**

Reserved, RES0.

**SSBS, bit [12]**

*When FEAT_SSBS is implemented:*

Speculative Store Bypass. Set to the value of PSTATE.SSBS on entering Debug state, and copied to PSTATE.SSBS on exiting Debug state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**BTYPE, bits [11:10]**

*When FEAT_BTI is implemented:*

Branch Type Indicator. Set to the value of PSTATE.BTYPE on entering Debug state, and copied to PSTATE.BTYPE on exiting Debug state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**D, bit [9]**

Debug exception mask. Set to the value of PSTATE.D on entering Debug state, and copied to PSTATE.D on exiting Debug state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on entering Debug state, and copied to PSTATE.A on exiting Debug state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on entering Debug state, and copied to PSTATE.I on exiting Debug state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on entering Debug state, and copied to PSTATE.F on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

Execution state. Set to 0b0, the value of PSTATE.nRW, on entering Debug state from AArch64 state, and copied to PSTATE.nRW on exiting Debug state.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>AArch64 execution state.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL0t.</td>

<tr>
<td>0b0101</td>
<td>EL1h.</td>
</tr>
<tr>
<td>0b1000</td>
<td>EL2t.</td>
</tr>
<tr>
<td>0b1001</td>
<td>EL2h.</td>
</tr>
<tr>
<td>0b1100</td>
<td>EL3t.</td>
</tr>
<tr>
<td>0b1101</td>
<td>EL3h.</td>
</tr>
</tbody>
</table>

Other values are reserved. If DSPSR_EL0.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, exiting Debug state is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on entering Debug state and copied to PSTATE.EL on exiting Debug state.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on entering Debug state and copied to PSTATE.SP on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the DSPSR_EL0

Accesses to this register use the following encodings:

\[
\text{MRS} \ <\text{Xt}, \ DSPSR\_EL0 > \\
\]

<table>

</tr>
</tbody>
</table>

if !Halted() then
    UNDEFINED;
else
    DSPSR_EL0 = X[t];
The DVP RCTX characteristics are:

**Purpose**

Data Value Prediction Restriction by Context applies to all Data Value Prediction Resources that predict execution based on information gathered within the target execution context or contexts.

When this instruction is complete and synchronized, data value prediction does not permit later speculative execution within the target execution context to be observable through side channels.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

**Note**

This instruction does not require the invalidation of prediction structures so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

**Configuration**

This instruction is present only when FEAT_SPECRES is implemented. Otherwise, direct accesses to DVP RCTX are UNDEFINED.

**Attributes**

DVP RCTX is a 64-bit System instruction.

**Field descriptions**

The DVP RCTX input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | GVMID | VMID |

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | NS | EL | RES0 | GASID | ASID |

**Bits [63:49]**

Reserved, RES0.

**GVMID, bit [48]**

Execution of this instruction applies to all VMIDs or a specified VMID.
GVMID | Meaning
---|---
0b0 | Applies to specified VMID for an EL0 or EL1 target execution context.
0b1 | Applies to all VMIDs for an EL0 or EL1 target execution context.

For target execution contexts other than EL0 or EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, then this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

**VMID, bits [47:32]**

Only applies when bit[48] is 0 and the target execution context is either:

- EL1.
- EL0 when (HCR_EL2.E2H==0 or HCR_EL2.TGE==0).

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and (HCR_EL2.E2H==0 or HCR_EL2.TGE==0), this field is treated as the current VMID.

When the instruction is executed at EL0 and (HCR_EL2.E2H==1 and HCR_EL2.TGE==1), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

**Bits [31:27]**

Reserved, RES0.

**NS, bit [26]**

Security State. Defined values are:

| NS | Meaning
|---|---
| 0b0 | Secure state.
| 0b1 | Non-secure state.

When executed in Non-secure state, the Effective value of NS is 1.

**EL, bits [25:24]**

Exception Level. Indicates the Exception level of the target execution context.

| EL | Meaning
|---|---
| 0b00 | EL0.
| 0b01 | EL1.
| 0b10 | EL2.
| 0b11 | EL3.

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

**Bits [23:17]**

Reserved, RES0.

**GASID, bit [16]**

Execution of this instruction applies to all ASIDs or a specified ASID.
<table>
<thead>
<tr>
<th>GASID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Applies to specified ASID for an EL0 target execution context.</td>
</tr>
<tr>
<td>0b1</td>
<td>Applies to all ASID for an EL0 target execution context.</td>
</tr>
</tbody>
</table>

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

**ASID, bits [15:0]**

Only applies for an EL0 target execution context and when bit[16] is 0.

Otherwise this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

**Executing the DVP RCTX instruction**

Accesses to this instruction use the following encodings:

DVP RCTX, <Xt>

```
<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>

ELR_EL2, Exception Link Register (EL2)

The ELR_EL2 characteristics are:

**Purpose**

When taking an exception to EL2, holds the address to return to.

**Configuration**

AArch64 System register ELR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ELR_hyp[31:0]. This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

ELR_EL2 is a 64-bit register.

**Field descriptions**

The ELR_EL2 bit assignments are:

<table>
<thead>

</tr>
</tbody>
</table>

**Bits [63:0]**

Return address.

An exception return from EL2 using AArch64 makes ELR_EL2 become **UNKNOWN**.

When EL2 is in AArch32 Execution state and an exception is taken from EL0, EL1, or EL2 to EL3 and AArch64 execution, the upper 32-bits of ELR_EL2 are either set to 0 or hold the same value that they did before AArch32 execution. Which option is adopted is determined by an implementation, and might vary dynamically within an implementation. Correspondingly software must regard the value as being an **UNKNOWN** choice between the two values.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the ELR_EL2**

When **HCR_EL2.E2H** is 1, without explicit synchronization, access from EL2 using the mnemonic ELR_EL2 or ELR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

\[
\text{MRS } \langle Xt \rangle, \text{ ELR_EL2}
\]

The ERRIDR_EL1 characteristics are:

**Purpose**

Defines the highest numbered index of the error records that can be accessed through the Error Record System registers.

**Configuration**

AArch64 System register ERRIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ERRIDR[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERRIDR_EL1 are UNDEFINED.

**Attributes**

ERRIDR_EL1 is a 64-bit register.

**Field descriptions**

The ERRIDR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>15</td>
<td>Num, bits [15:0] Highest numbered index of the records that can be accessed through the Error Record System registers plus one. Zero indicates no records can be accessed through the Error Record System registers. Each implemented record is owned by a node. A node might own multiple records.</td>
</tr>
</tbody>
</table>

**Accessing the ERRIDR_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, ERRIDR_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>

ERRSELR_EL1, Error Record Select Register

The ERRSELR_EL1 characteristics are:

**Purpose**

Selects an error record to be accessed through the Error Record System registers.

**Configuration**

AArch64 System register ERRSELR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ERRSELR[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERRSELR_EL1 are UNDEFINED.

If ERRIDR_EL1 indicates that zero error records are implemented, then it is IMPLEMENTATION DEFINED whether ERRSELR_EL1 is UNDEFINED or RES0.

**Attributes**

ERRSELR_EL1 is a 64-bit register.

**Field descriptions**

The ERRSELR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>71-32</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>31</td>
<td>SEL, bits [15:0]</td>
</tr>
</tbody>
</table>

**SEL, bits [15:0]**

Selects the error record accessed through the ERX registers.

For example, if ERRSELR_EL1.SEL is set to 0x0004, then direct reads and writes of ERXSTATUS_EL1 access ERR4STATUS.

If ERRSELR_EL1.SEL is set to a value greater than or equal to ERRIDR_EL1.NUM, then all of the following apply:

- The value read back from ERRSELR_EL1.SEL is UNKNOWN.
- One of the following occurs:
  - An UNKNOWN error record is selected.
  - The ERX* EL1 registers are RAZ/WI.
  - ERX* EL1 register reads and writes are NOPs.
  - ERX* EL1 register reads and writes are UNDEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ERRSELR_EL1**

Accesses to this register use the following encodings:
MRS \(<Xt>\), ERRSELR_EL1

\[
\begin{array}{|c|c|c|c|c|}

</tbody>
</table>

Bits [63:0]

ERXADDR_EL1 accesses \( \text{ERR}<n>\text{ADDR} \), where \(<n>\) is the value in \( \text{ERRSELR_EL1}.\text{SEL} \).

**Accessing the ERXADDR_EL1**

If \( \text{ERRIDR_EL1}.\text{NUM} == 0x0000 \) or \( \text{ERRSELR_EL1}.\text{SEL} \) is set to a value greater than or equal to \( \text{ERRIDR_EL1}.\text{NUM} \), then one of the following occurs:

- An **UNKNOWN** error record is selected.
- ERXADDR_EL1 is RAZ/WI.
- Direct reads and writes of ERXADDR_EL1 are NOPs.
- Direct reads and writes of ERXADDR_EL1 are UNDEFINED.

\( \text{ERR}<n>\text{ADDR} \) describes additional constraints that also apply when \( \text{ERR}<n>\text{ADDR} \) is accessed through ERXADDR_EL1.

Accesses to this register use the following encodings:

**MRS \(<Xt>, \text{ERXADDR_EL1}>**

ERXCTRL_EL1, Selected Error Record Control Register

The ERXCTRL_EL1 characteristics are:

**Purpose**

Accesses \( \text{ERR}<n>\text{CTRL} \) for the error record \(<n>\) selected by \( \text{ERRSELR_EL1}.\text{SEL} \).

**Configuration**

AArch64 System register ERXCTRL_EL1 bits [31:0] are architecturally mapped to AArch32 System register \( \text{ERXCTRL}[31:0] \).

AArch64 System register ERXCTRL_EL1 bits [63:32] are architecturally mapped to AArch32 System register \( \text{ERXCTRL2}[31:0] \).

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXCTRL_EL1 are UNDEFINED.

**Attributes**

ERXCTRL_EL1 is a 64-bit register.

**Field descriptions**

The ERXCTRL_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Bit Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-0</td>
<td>ERR(&lt;n&gt;\text{CTRL})</td>
<td>ERR(&lt;n&gt;\text{CTRL})</td>
</tr>
</tbody>
</table>

**Bits [63:0]**

ERXCTRL_EL1 accesses \( \text{ERR}<n>\text{CTRL} \), where \(<n>\) is the value in \( \text{ERRSELR_EL1}.\text{SEL} \).

**Accessing the ERXCTRL_EL1**

If \( \text{ERRIDR_EL1}.\text{NUM} == 0x0000 \) or \( \text{ERRSELR_EL1}.\text{SEL} \) is set to a value greater than or equal to \( \text{ERRIDR_EL1}.\text{NUM} \), then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXCTRL_EL1 is RAZ/WI.
- Direct reads and writes of ERXCTRL_EL1 are NOPs.
- Direct reads and writes of ERXCTRL_EL1 are UNDEFINED.

If \( \text{ERRSELR_EL1}.\text{SEL} \) is not the index of the first error record owned by a node, then \( \text{ERR}<n>\text{CTRL} \) is not present, meaning reads and writes of ERXCTRL_EL1 are RES0.

Accesses to this register use the following encodings:

\[
\begin{array}{c|c|c|c|c}
\text{op0} & \text{op1} & \text{CRn} & \text{CRm} & \text{op2} \\
\hline
0b11 & 0b000 & 0b0101 & 0b0100 & 0b001 \\
\end{array}
\]

ERXMISC2_EL1, Selected Error Record Miscellaneous Register 2

The ERXMISC2_EL1 characteristics are:

**Purpose**

Accesses \( \text{ERR}<n>\text{MISC2} \) for the error record \(<n>\) selected by \( \text{ERRSELR_EL1}.\text{SEL} \).

**Configuration**

AArch64 System register ERXMISC2_EL1 bits [31:0] are architecturally mapped to AArch32 System register \( \text{ERXMISC4}\{31:0\} \).

AArch64 System register ERXMISC2_EL1 bits [63:32] are architecturally mapped to AArch32 System register \( \text{ERXMISC5}\{31:0\} \).

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXMISC2_EL1 are UNDEFINED.

**Attributes**

ERXMISC2_EL1 is a 64-bit register.

**Field descriptions**

The ERXMISC2_EL1 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     | Errn|MISC2|
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |
| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  |  9  |  8  |  7  |  6  |  5  |  4  |  3  |  2  |  1  |  0  |

**Bits [63:0]**

ERXMISC2_EL1 accesses \( \text{ERR}<n>\text{MISC2} \), where \(<n>\) is the value in \( \text{ERRSELR_EL1}.\text{SEL} \).

**Accessing the ERXMISC2_EL1**

If \( \text{ERRIDR_EL1}.\text{NUM} == 0x0000 \) or \( \text{ERRSELR_EL1}.\text{SEL} \) is set to a value greater than or equal to \( \text{ERRIDR_EL1}.\text{NUM} \), then one of the following occurs:

- An unknown error record is selected.
- ERXMISC2_EL1 is RAZ/WI.
- Direct reads and writes of ERXMISC2_EL1 are NOPs.
- Direct reads and writes of ERXMISC2_EL1 are UNDEFINED.

\( \text{ERR}<n>\text{MISC2} \) describes additional constraints that also apply when \( \text{ERR}<n>\text{MISC2} \) is accessed through ERXMISC2_EL1.

Accesses to this register use the following encodings:

ERXPFGCDN_EL1, Selected Pseudo-fault Generation Countdown register

The ERXPFGCDN_EL1 characteristics are:

**Purpose**

Accesses `ERR<n>PFGCDN` for the error record `<n>` selected by `ERRSELR_EL1.SEL`.

**Configuration**

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXPFGCDN_EL1 are UNDEFINED.

**Attributes**

ERXPFGCDN_EL1 is a 64-bit register.

**Field descriptions**

The ERXPFGCDN_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td><code>ERR&lt;n&gt;PFGCDN</code></td>
</tr>
<tr>
<td>62</td>
<td><code>ERR&lt;n&gt;PFGCDN</code></td>
</tr>
<tr>
<td></td>
<td><code>ERR&lt;n&gt;PFGCDN</code></td>
</tr>
</tbody>
</table>

**Bits [63:0]**

ERXPFGCDN_EL1 accesses `ERR<n>PFGCDN`, where `<n>` is the value in `ERRSELR_EL1.SEL`.

**Accessing the ERXPFGCDN_EL1**

If `ERRIDR_EL1.NUM == 0x0000` or `ERRSELR_EL1.SEL` is set to a value greater than or equal to `ERRIDR_EL1.NUM`, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXPFGCDN_EL1 is RAZ/WI.
- Direct reads and writes of ERXPFGCDN_EL1 are NOPs.
- Direct reads and writes of ERXPFGCDN_EL1 are UNDEFINED.

If `ERRSELR_EL1.SEL` selects an error record owned by a node that does not implement the RAS Common Fault Injection Model Extension, then one of the following occurs:

- ERXPFGCDN_EL1 is RAZ/WI.
- Direct reads and writes of ERXPFGCDN_EL1 are NOPs.
- Direct reads and writes of ERXPFGCDN_EL1 are UNDEFINED.

**Note**

A node does not implement the RAS Common Fault Injection Model Extension when `ERR<q>FR.INJ == 0b00`. `<q>` is the index of the first error record owned by the same node as error record `<n>`, where `<n>` is the value in `ERRSELR_EL1.SEL`. If the node owns a single record, then `q = n`.

If `ERRSELR_EL1.SEL` is not the index of the first error record owned by a node, then `ERR<n>PFGCDN` is not present, meaning reads and writes of ERXPFGCDN_EL1 are RES0.
ERR\textsf{PFGCDN} describes additional constraints that also apply when ERR\textsf{PFGCDN} is accessed through ERXPFGCDN\_EL1.

Accesses to this register use the following encodings:

ERXPFGF_EL1, Selected Pseudo-fault Generation Feature register

The ERXPFGF_EL1 characteristics are:

**Purpose**

Accesses ER<n>PFGF for the error record <n> selected by ERRSELR_EL1.SEL.

**Configuration**

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXPFGF_EL1 are UNDEFINED.

**Attributes**

ERXPFGF_EL1 is a 64-bit register.

**Field descriptions**

The ERXPFGF_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>ERR&lt;n&gt;PFGF</td>
</tr>
<tr>
<td>31</td>
<td>ERR&lt;n&gt;PFGF</td>
</tr>
</tbody>
</table>

**Bits [63:0]**

ERXPFGF_EL1 accesses ER<n>PFGF, where <n> is the value in ERRSELR_EL1.SEL.

**Accessing the ERXPFGF_EL1**

If ERRIDR_EL1.NUM == 0x0000 or ERRSELR_EL1.SEL is set to a value greater than or equal to ERRIDR_EL1.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXPFGF_EL1 is RAZ.
- Direct reads of ERXPFGF_EL1 are NOPs.
- Direct reads of ERXPFGF_EL1 are UNDEFINED.

If ERRSELR_EL1.SEL selects an error record owned by a node that does not implement the RAS Common Fault Injection Model Extension, then one of the following occurs:

- ERXPFGF_EL1 is RAZ.
- Direct reads of ERXPFGF_EL1 are NOPs.
- Direct reads of ERXPFGF_EL1 are UNDEFINED.

**Note**

A node does not implement the RAS Common Fault Injection Model Extension when ER<n>FR.INJ == 0b00. <q> is the index of the first error record owned by the same node as error record <n>, where <n> is the value in ERRSELR_EL1.SEL. If the node owns a single record, then q = n.

If ERRSELR_EL1.SEL is not the index of the first error record owned by a node, then ER<n>PFGF is not present, meaning reads of ERXPFGF_EL1 are RES0.
ERR\textsubscript{PFGF} describes additional constraints that also apply when ERR\textsubscript{PFGF} is accessed through ERXPFGF\_EL1.

Accesses to this register use the following encodings:

$$\text{MRS } \langle Xt \rangle, \text{ ERXPFGF\_EL1}$$

ERXSTATUS_EL1, Selected Error Record Primary Status Register

The ERXSTATUS_EL1 characteristics are:

**Purpose**

Accesses `ERR<n>STATUS` for the error record `<n>` selected by `ERRSEL_EL1.SEL`.

**Configuration**

AArch64 System register ERXSTATUS_EL1 bits [31:0] are architecturally mapped to AArch32 System register `ERXSTATUS[31:0]`.

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXSTATUS_EL1 are **UNDEFINED**.

**Attributes**

ERXSTATUS_EL1 is a 64-bit register.

**Field descriptions**

The ERXSTATUS_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>ERXSTATUS_EL1 Access</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-0</td>
<td><code>ERR&lt;n&gt;STATUS</code></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:0]**

ERXSTATUS_EL1 accesses `ERR<n>STATUS`, where `<n>` is the value in `ERRSEL_EL1.SEL`.

**Accessing the ERXSTATUS_EL1**

If `ERRIDR_EL1.NUM` == 0x0000 or `ERRSEL_EL1.SEL` is set to a value greater than or equal to `ERRIDR_EL1.NUM`, then one of the following occurs:

- An **UNKNOWN** error record is selected.
- ERXSTATUS_EL1 is RAZ/WI.
- Direct reads and writes of ERXSTATUS_EL1 are NOPs.
- Direct reads and writes of ERXSTATUS_EL1 are **UNDEFINED**.

`ERR<n>STATUS` describes additional constraints that also apply when `ERR<n>STATUS` is accessed through ERXSTATUS_EL1.

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>

ESR_EL1, Exception Syndrome Register (EL1)

The ESR_EL1 characteristics are:

**Purpose**

Holds syndrome information for an exception taken to EL1.

**Configuration**

AArch64 System register ESR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DFSR[31:0].

**Attributes**

ESR_EL1 is a 64-bit register.

**Field descriptions**

</table>

ESR_EL1 is made UNKNOWN as a result of an exception return from EL1.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL1, the value of ESR_EL1 is UNKNOWN. The value written to ESR_EL1 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

**Bits [63:37]**

Reserved, RES0.

**ISS2, bits [36:32]**

When FEAT_LS64 is implemented:

If a memory access generated by an ST64BV or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

For any other Data Abort, this field is RES0.

Otherwise:

Reserved, RES0.

**EC, bits [31:26]**

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.
Possible values of the EC field are:
<table>
<thead>
<tr>

</table>
ST64BV, or ST64BV0 instruction.

0b001100  Trapped MRRC access with (coproc==0b1110). 
ISS encoding for an exception from an MCRR or MRRC access is implemented.

0b001101  Branch Target Exception.
ISS encoding for an exception from Branch Target Identification instruction.

0b001110  Illegal Execution state.
ISS encoding for an exception from an illegal Execution state, or a PC or SP alignment fault.

0b010001  SVC instruction execution in AArch32 state.
This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TGE is 1.
ISS encoding for an exception from HVC or SVC instruction execution.

0b010101  SVC instruction execution in AArch64 state.
ISS encoding for an exception from HVC or SVC instruction execution.

0b011000  Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC 0b000000, 0b000001, or 0b000111.
This includes all instructions that cause exceptions that are part of the encoding space defined in 'System instruction class encoding overview', except for those exceptions reported using EC values 0b000000, 0b000001, or 0b000111.
ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state.

0b011001  Access to SVE functionality trapped as a result of CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ, that is not reported using EC 0b000000.
ISS encoding for an exception from an access to SVE functionality resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ.

0b011100  Exception from a Pointer Authentication instruction authentication failure
ISS encoding for an exception from a Pointer Authentication.

When AArch32 is supported at any Exception level.

When AArch32 is supported at any Exception level.

When AArch32 is supported at any Exception level.

When AArch64 is supported at any Exception level.

When AArch64 is supported at any Exception level.

When FEAT_SVE is implemented.

When FEAT_FPAC is implemented.
<table>
<thead>
<tr>

</tr>
<tr>
<td><strong>0b100110</strong></td>
<td>SP alignment fault exception.</td>
</tr>
</tbody>
</table>
Trapped floating-point exception taken from AArch32 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.

Trapped floating-point exception taken from AArch64 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.

SErrror interrupt.

Breakpoint exception from a lower Exception level.

Breakpoint exception taken without a change in Exception level.

Software Step exception from a lower Exception level.

Software Step exception taken without a change in Exception level.

Watchpoint exception from a lower Exception level.

Watchpoint exception taken without a change in Exception level.

BKPT instruction execution in AArch32 state.

When AArch32 is supported at any Exception level.

When AArch64 is supported at any Exception level.
Exception level 0b111100 BRK instruction execution in AArch64 state. This is reported in ESR_EL3 only if a BRK instruction is executed.

ISS encoding for an exception from execution of a Breakpoint instruction

When AArch64 is supported at any Exception level

All other EC values are reserved by Arm, and:

* Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
* Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [25]

Instruction Length for synchronous exceptions. Possible values of this bit are:

<table>
<thead>
<tr>
<th>IL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>16-bit instruction trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>32-bit instruction trapped. This value is also used when the exception is one of the following:</td>
</tr>
<tr>
<td></td>
<td>• An SError interrupt.</td>
</tr>
<tr>
<td></td>
<td>• An Instruction Abort exception.</td>
</tr>
<tr>
<td></td>
<td>• A PC alignment fault exception.</td>
</tr>
<tr>
<td></td>
<td>• An SP alignment fault exception.</td>
</tr>
<tr>
<td></td>
<td>• A Data Abort exception for which the value of the ISV bit is 0.</td>
</tr>
<tr>
<td></td>
<td>• An Illegal Execution state exception.</td>
</tr>
<tr>
<td></td>
<td>• Any debug exception except for Breakpoint instruction exceptions.</td>
</tr>
<tr>
<td></td>
<td>For Breakpoint instruction exceptions, this bit has its standard meaning:</td>
</tr>
<tr>
<td></td>
<td>◦ 0b0: 16-bit T32 BKPT instruction.</td>
</tr>
<tr>
<td></td>
<td>◦ 0b1: 32-bit A32 BKPT instruction or A64 BRK instruction.</td>
</tr>
<tr>
<td></td>
<td>• An exception reported using EC value 0b000000.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number.

For an exception taken from AArch32 state, see 'Mapping of the general-purpose registers between the Execution states'.

If the AArch32 register descriptor is 0b1111, then:

* If the instruction that generated the exception was not UNPREDICTABLE, the field takes the value 0b11111.
* If the instruction that generated the exception was UNPREDICTABLE, the field takes an UNKNOWN value that must be either:
  ◦ The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
  ◦ The value 0b11111.

When the EC field is 0b000000, indicating an exception with an unknown reason, the ISS field is not valid, RES0.
ISS encoding for exceptions with an unknown reason

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 |

Bits [24:0]

Reserved, RES0.

When an exception is reported using this EC code the IL field is set to 1.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or that is not accessible at the current Exception level and Security state, including:
  - A read access using a System register pattern that is not allocated for reads or that does not permit reads at the current Exception level and Security state.
  - A write access using a System register pattern that is not allocated for writes or that does not permit writes at the current Exception level and Security state.
  - Instruction encodings that are unallocated.
  - Instruction encodings for instructions or System registers that are not implemented in the implementation.
- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- In AArch32 state, attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the SCTLR_EL1. {ITD, SED, CP15BEN} control bits.
- Attempted execution of:
  - An HVC instruction when disabled by HCR_EL2.HCD or SCR_EL3.HCE.
  - An SMC instruction when disabled by SCR_EL3.SMD.
  - An HLT instruction when disabled by EDSCR.HDE.
- Attempted execution of an MSR or MRS instruction to access SP_EL0 when the value of SPSel.SP is 0.
- Attempted execution of an MSR or MRS instruction using a _EL12 register name when HCR_EL2.E2H == 0.
- Attempted execution, in Debug state, of:
  - A DCPS1 instruction when the value of HCR_EL2.TGE is 1 and EL2 is disabled or not implemented in the current Security state.
  - A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.
  - A DCPS3 instruction when the value of EDSCR.SDD is 1, or when EL3 is not implemented.
- When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using R13 mon. See ‘Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32’.
- In Debug state when the value of EDSCR.SDD is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.
- In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to SPSR_mon, SP_mon, or LR_mon.
- An exception that is taken to EL2 because the value of HCR_EL2.TGE is 1 that, if the value of HCR_EL2.TGE was 0 would have been reported with an ESR_ELx.EC value of 0b000111.

ISS encoding for an exception from a WF* instruction

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| CV | COND |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 |

CV, bit [24]

Condition code valid.
The COND field is not valid.
The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [19:2]**

Reserved, RES0.

**TI, bits [1:0]**

Trapped instruction. Possible values of this bit are:

<table>
<thead>
<tr>
<th>TI</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>WFI trapped.</td>
<td></td>
</tr>
<tr>
<td>0b01</td>
<td>WFE trapped.</td>
<td></td>
</tr>
<tr>
<td>0b10</td>
<td>WFIT trapped.</td>
<td>When FEAT_WFxT is implemented</td>
</tr>
<tr>
<td>0b11</td>
<td>WFET trapped.</td>
<td>When FEAT_WFxT is implemented</td>
</tr>
</tbody>
</table>

When FEAT_WFxT is implemented, this is a two bit field as shown. Otherwise, bit[1] is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating this exception:

- **SCTLR_EL1**, {nTWE, nTWI}.
- **HCR_EL2**, {TWE, TWI}.
- **SCR_EL3**, {TWE, TWI}.
ISS encoding for an exception from an MCR or MRC access

<table>

</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc2, bits [19:17]

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value 0b000.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [16:14]

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value 0b111.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
CRn, bits [13:10]

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value 0b0000.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Write to System register space. MCR instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read from System register space. MRC or VMRS instruction.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b008811:

- **CNTKCTL_EL1. {EL0PTEN, EL0VTEN, EL0PTCTEN, EL0VCTEN},** for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **PMUSERENR_EL0. {ER, CR, SW, EN},** for accesses to Performance Monitor registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **AMUSERENR_EL0. EN,** for accesses to Activity Monitors registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **HCR_EL2. {TRVM, TVM},** for accesses to virtual memory control registers from EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **HCR_EL2. TTLB,** for execution of TLB maintenance instructions at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **HCR_EL2. TSW, TPC, TPU} for execution of cache maintenance instructions at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **HCR_EL2. TACR,** for accesses to the Auxiliary Control Register at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **HCR_EL2. TIDCP,** for accesses to lockdown, DMA, and TCM operations at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **HCR_EL2. {TID1, TID2, TID3},** for accesses to ID registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **CPTR_EL2. TCPAC,** for accesses to **CPACR_EL1** or **CPACR** using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **HSTR_EL2 T<n>,** for accesses to System registers using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **CNTHTCTL_EL2. EL1PCEN,** for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **MDCR_EL2. {TPM, TPMCR},** for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **CPTR_EL2. TAM,** for accesses to Activity Monitors registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
• **CPTR_EL3.TCPAC**, for accesses to **CPACR** from EL1 and EL2, and accesses to **HCPTR** from EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.

• **MDCR_EL3.TPM**, for accesses to Performance Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.

• **CPTR_EL3.TAM**, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.

• For information on other traps using EC value 0b000011, see ‘Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32’.

• If FEAT_FGT is implemented, MCR or MRC access to some registers at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000101:

• **CPACR_EL1.TTA** for accesses to trace registers, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.

• **MDSCR_EL1.TDCC**, for accesses to the Debug Communications Channel (DCC) registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.

• If FEAT_FGT is implemented, **MDCR_EL2.TDCC** for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and **MDCR_EL3.TDCC** for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.

• **HCR_EL2.TID0**, for accesses to the **JIDR** register in the ID group 0 at EL0 and EL1 using AArch32, MRC access (coproc == 0b1110) trapped to EL2.

• **CPTR_EL2.TTA**, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.

• **MDCR_EL2.TDRA**, for accesses to Debug ROM registers **DBGDRAR** and AArch-DBGDSAR using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.

• **MDCR_EL2.TDOSA**, for accesses to powerdown debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.

• **MDCR_EL2.TDA**, for accesses to other debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.

• **CPTR_EL3.TTA**, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.

• **MDCR_EL3.TDOSA**, for accesses to powerdown debug registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.

• **MDCR_EL3.TDA**, for accesses to other debug registers, using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b001000:

• **HCR_EL2.TID0**, for accesses to the **FPSID** register in ID group 0 at EL1 using AArch32 state, VMRS access trapped to EL2.

• **HCR_EL2.TID3**, for accesses to registers in ID group 3 including **MVFR0**, **MVFR1**, and **MVFR2**, VMRS access trapped to EL2.

CV, bit [24]

Condition code valid.

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [19:16]

The Opc1 value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

Rt2, bits [14:10]

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Rt, bits [9:5]

The Rt value from the issued instruction, the first general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See ‘Mapping of the general-purpose registers between the Execution states’.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Write to System register space. MCRR instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read from System register space. MRRC instruction.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000100:

- **CNTKCTL_EL1**, {EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **PMUSERENR_EL0**, (CR, EN), for accesses to Performance Monitor registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **AMUSERENR_EL0**, (EN), for accesses to Activity Monitors registers AMEVNTR0<n> and AMEVNTR1<n> from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **HCR_EL2**, {TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **HSTR_EL2.T<n>**, for accesses to System registers using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **CNTHCCTL_EL2**, {EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **MDCR_EL2**, (TPM, TPMCR), for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **CPTR_EL2.TAM**, for accesses to Activity Monitors registers registers AMEVNTR0<n> and AMEVNTR1<n> from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **MDCR_EL3**, TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- **MDCR_EL3.TDA**, for accesses to Activity Monitors registers registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- **CPACR_EL1.TTA** for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **CPTR_EL2.TTA**, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **CPTR_EL3.TTA**, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.

The following sections describe configuration settings for generating exceptions that are reported using EC value 0b001100:

- **MDSCR_EL1.TDCC**, for accesses to the Debug ROM registers DBGDSAR and DBGDRAR at EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- **MDCR_EL2.TDRA**, for accesses to Debug ROM registers DBGDRAR and AArch-DBGDSAR using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- **MDCR_EL3.TDA**, for accesses to debug registers, using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.
- **CPACR_EL1.TTA**, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- **CPTR_EL2.TTA**, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- **CPTR_EL3.TTA**, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.
If the Armv8-A architecture is implemented with an ETMv4 implementation, MCRR and MRRC accesses to trace registers are UNDEFINED and the resulting exception is higher priority than an exception due to these traps.

**ISS encoding for an exception from an LDC or STC instruction**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| CV | COND | imm8 | RES0 | Rn | Offset | AM | Direction |

**CV, bit [24]**

Condition code valid.

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**imm8, bits [19:12]**

The immediate value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Bits [11:10]

Reserved, RES0.

Rn, bits [9:5]

The Rn value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See ‘Mapping of the general-purpose registers between the Execution states’.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is unknown.

On a Warm reset, this field resets to an architecturally unknown value.

Offset, bit [4]

Indicates whether the offset is added or subtracted:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Subtract offset.</td>
</tr>
<tr>
<td>0b1</td>
<td>Add offset.</td>
</tr>
</tbody>
</table>

This bit corresponds to the U bit in the instruction encoding.

On a Warm reset, this field resets to an architecturally unknown value.

AM, bits [3:1]

Addressing mode. The permitted values of this field are:

<table>
<thead>
<tr>
<th>AM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Immediate unindexed.</td>
</tr>
<tr>
<td>0b001</td>
<td>Immediate post-indexed.</td>
</tr>
<tr>
<td>0b010</td>
<td>Immediate offset.</td>
</tr>
<tr>
<td>0b011</td>
<td>Immediate pre-indexed.</td>
</tr>
<tr>
<td>0b100</td>
<td>For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.</td>
</tr>
<tr>
<td>0b110</td>
<td>For a trapped STC instruction, this encoding is reserved.</td>
</tr>
</tbody>
</table>

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is constrained unpredictable, as described in ‘Reserved values in System and memory-mapped registers and translation table entries’.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

On a Warm reset, this field resets to an architecturally unknown value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Write to memory. STC instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read from memory. LDC instruction.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally unknown value.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000110:

- **MDSCR_EL1.TDCC**, for accesses using AArch32 state, LDC access to **DBGDTRTXint** or STC access to **DBGDTRRXint** trapped to EL1 or EL2.
• **MDCR_EL2.TDA**, for accesses using AArch32 state, LDC access to **DBGDTRTXint** or STC access to **DBGDTRRXint** MCR or MRC access trapped to EL2.

• **MDCR_EL3.TDA**, for accesses using AArch32 state, LDC access to **DBGDTRTXint** or STC access to **DBGDTRRXint** MCR or MRC access trapped to EL3.

• If FEAT_FGT is implemented, **MDCR_EL2.TDCC** for LDC and STC accesses to the DCC registers at EL0 and EL1 trapped to EL2, and **MDCR_EL3.TDCC** for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.

**ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEN and TFP traps**

<table>
<thead>
<tr>
<th>CV</th>
<th>COND</th>
<th>RES0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SIMD and floating-point System registers.

For an implementation that does not include either SVE or support for floating-point and Advanced SIMD, the exception is reported using the EC value 0b01000000.

**CV, bit [24]**

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Bits [19:0]

Reserved, RES0.

The following sections describe the configuration settings for the traps that are reported using EC value 0b00000:

- **CPACR_EL1.FPEN**, for accesses to SIMD and floating-point registers trapped to EL1.
- **CPACR_EL2.TFP**, for accesses to SIMD and floating-point registers trapped to EL2.
- **CPACR_EL3.TFP**, for accesses to SIMD and floating-point registers trapped to EL3.

**ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ**

<table>
<thead>
<tr>
<th>24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
</tr>
</tbody>
</table>

The accesses covered by this trap include:

- Execution of SVE instructions.
- Accesses to the SVE System register, ZCR_ELx.

For an implementation that does not include SVE, the exception is reported using the EC value 0b000000.

Bits [24:0]

Reserved, RES0.

The following sections describe the configuration settings for the traps that are reported using EC value 0b011001:

- **CPACR_EL1.ZEN**, for execution of SVE instructions and accesses to SVE registers at EL0 or EL1, trapped to EL2.
- **CPTR_EL2.ZEN**, for execution of SVE instructions and accesses to SVE registers at EL0, EL1, or EL2, trapped to EL2.
- **CPTR_EL2.TZ**, for execution of SVE instructions and accesses to SVE registers at EL0, EL1, or EL2, trapped to EL2.
- **CPTR_EL3.EZ**, for execution of SVE instructions and accesses to SVE registers from all Exception levels, trapped to EL3.

**ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault**

<table>
<thead>
<tr>
<th>24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
</tr>
</tbody>
</table>

**Bits [24:0]**

Reserved, RES0.

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about these exceptions, see 'The Illegal Execution state exception' and 'PC alignment checking'.

'SP alignment checking' describes the configuration settings for generating SP alignment fault exceptions.

**ISS encoding for an exception from HVC or SVC instruction execution**

<table>
<thead>
<tr>
<th>24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
</tr>
</tbody>
</table>

Page 501
Bits [24:16]

Reserved, res0.

imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is unknown.

On a Warm reset, this field resets to an architecturally unknown value.

In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see 'SVC' and 'HVC'.

For A64 instructions, see 'SVC' and 'HVC'.

If FEAT_FGT is implemented, HFGITR_EL2.{SVC_EL1, SVC_EL0} control fine-grained traps on SVC execution.

ISS encoding for an exception from SMC instruction execution in AArch32 state

```
<table>
<thead>
<tr>
<th>CV</th>
<th>COND</th>
<th>CCKOWNPASS</th>
<th>RES0</th>
</tr>
</thead>
<tbody>
<tr>
<td>24</td>
<td>23</td>
<td>22</td>
<td>21</td>
</tr>
<tr>
<td>20</td>
<td>19</td>
<td>18</td>
<td>17</td>
</tr>
<tr>
<td>16</td>
<td>15</td>
<td>14</td>
<td>13</td>
</tr>
<tr>
<td>12</td>
<td>11</td>
<td>10</td>
<td>9</td>
</tr>
<tr>
<td>8</td>
<td>7</td>
<td>6</td>
<td>5</td>
</tr>
<tr>
<td>4</td>
<td>3</td>
<td>2</td>
<td>1</td>
</tr>
<tr>
<td>0</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is res0.

For an SMC instruction that is trapped to EL2 from EL1 because HCR_EL2.TSC is 1, the ISS encoding is as shown in the diagram.

CV, bit [24]

Condition code valid.

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is implementation defined whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is valid only if CCKOWNPASS is 1, otherwise it is res0.

On a Warm reset, this field resets to an architecturally unknown value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.
The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CCKNOWNPASS, bit [19]**

Indicates whether the instruction might have failed its condition code check.

<table>
<thead>
<tr>
<th>CCKNOWNPASS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The instruction was unconditional, or was conditional and passed its condition code check.</td>
</tr>
<tr>
<td>0b1</td>
<td>The instruction was conditional, and might have failed its condition code check.</td>
</tr>
</tbody>
</table>

**Note**

In an implementation in which an SMC instruction that fails it code check is not trapped, this field can always return the value 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [18:0]**

Reserved, RES0.

HCR_EL2.TSC describes the configuration settings for trapping SMC instructions to EL2.

'System calls' describes the case where these exceptions are trapped to EL3.

**ISS encoding for an exception from SMC instruction execution in AArch64 state**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For exceptions caused by System instructions, see 'System instructions' subsection of 'Branches, exception generating and System instructions' for the encoding values returned by an instruction.

The following fields describe configuration settings for generating the exception that is reported using EC value 0b011000:

- `SCTLR_EL1.UCI`, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- `SCTLR_EL1.UCT`, for accesses to `CTR_EL0` using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- `SCTLR_EL1.DZE`, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- `SCTLR_EL1.UMA`, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- `CPACR_EL1.TTA`, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- `MDSCR_EL1.TDCC`, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- If `FEAT_FGT` is implemented, `MDCR_EL2.TDCC` for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and `MDCR_EL3.TDCC` for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- `CNTKCTL_EL1`, `{EL0PTEN, EL0VTEN, EL0PCTEN, ELOVCTEN}` accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- `PMUSERENR_EL0.ER, CR, SW, EN`, for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- `AMUSERENR_EL0.EN`, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- `HCR_EL2.TRVM, TVM`, for accesses to virtual memory control registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- `HCR_EL2.TDA`, for accesses to DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- `HCR_EL2.TTLB`, for execution of TLB maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- `HCR_EL2.TSW, TPC, TPU`, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- `HCR_EL2.TACR`, for accesses to the Auxiliary Control Register, `ACTLR_EL1`, using AArch64 state, MSR or MRS access trapped to EL2.
- `HCR_EL2.TIDCP`, for accesses to lockdown, DMA, and TCM operations using AArch64 state, MSR or MRS access trapped to EL2.
- `HCR_EL2.TID1, TID2, TID3`, for accesses to ID group 1, ID group 2 or ID group 3 registers, using AArch64 state, MSR or MRS access trapped to EL2.
- `CPTR_EL2.TCPAC`, for accesses to `CPACR_EL1`, using AArch64 state, MSR or MRS access trapped to EL2.
- `CPTR_EL2.TAM`, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.
- `MDCR_EL2.TTRF`, for accesses to the trace filter control register, `TRFCR_EL1`, using AArch64 state, MSR or MRS access trapped to EL2.
- `MDCR_EL2.TDRA`, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.
- `MDCR_EL2.TDOSA`, for accesses to powerdown debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- `CNTKCTL_EL2`, `{EL1PCEN, EL1PCTEN}` for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.
- `MDCR_EL2.TDA`, for accesses to debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- `MDCR_EL2.TPM, TPMCR`, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL2.
HCR_EL2.APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL2.

HCR_EL2.{NV, NV1}, for Nested virtualization register access, using AArch64 state, MSR or MRS access, trapped to EL2.

HCR_EL2.AT, for execution of AT S1E* instructions, using AArch64 state, MSR or MRS access, trapped to EL2.

HCR_EL2.{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access, trapped to EL2.

SCR_EL2.APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL3.

SCR_EL2.ST, for accesses to the Counter-timer Physical Secure timer registers, using AArch64 state, MSR or MRS access trapped to EL3.

SCR_EL2.{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL3.

CPTR_EL3.TCPAC, for accesses to CPTR_EL2 and CPACR_EL1 using AArch64 state, MSR or MRS access trapped to EL3.

CPTR_EL3.TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL3.

MDCR_EL3.TTRF, for accesses to the trace filter control registers, TRFCR_EL1 and TRFCR_EL2, using AArch64 state, MSR or MRS access trapped to EL3.

MDCR_EL3.TDA, for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.

MDCR_EL3.TDOSA, for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.

MDCR_EL3.TPM, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.

CPTR_EL3.TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access, trapped to EL3.

If FEAT_EVT is implemented, the following registers control traps for EL1 and EL0 Cache controls that use this EC value:

- HCR_EL2.{TTLBOS, TTLBIS, TICAB, TOCU, TID4}.
- HCR2.{TTLBIS, TICAB, TOCU, TID4}.

If FEAT_FGT is implemented:

- SCR_EL3.FGTEn, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
  - HFGTR_EL2 for reads and HFGWTR_EL2 for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
  - HDFGRTR_EL2 for reads and HDFGWTR_EL2 for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
  - HAFGRTR_EL2 for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.

| RES0 | SET | Fn | VE | EA | RES0 | S1PTW | RES0 | IFSC |

Bits [24:13]

Reserved, RES0.

SET, bits [12:11]

Reserved.
When FEAT_RAS is implemented:

Synchronous Error Type. When IFSC is 0b010000, describes the PE error state after taking the Instruction Abort exception.

<table>
<thead>
<tr>
<th>SET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Recoverable state (UER).</td>
</tr>
<tr>
<td>0b10</td>
<td>Uncontainable (UC).</td>
</tr>
<tr>
<td>0b11</td>
<td>Restartable state (UEO).</td>
</tr>
</tbody>
</table>

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the IFSC code is 0b010000. It is res0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, res0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<table>
<thead>
<tr>
<th>FnV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FAR is valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>FAR is not valid, and holds an UNKNOWN value.</td>
</tr>
</tbody>
</table>

This field is valid only if the IFSC code is 0b010000. It is res0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, res0.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

<table>
<thead>
<tr>
<th>S1PTW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault not on a stage 2 translation for a stage 1 translation table walk.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault on the stage 2 translation of an access for a stage 1 translation table walk.</td>
</tr>
</tbody>
</table>
For any abort other than a stage 2 fault this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [6]**

Reserved, RES0.

**IFSC, bits [5:0]**

Instruction Fault Status Code.
<table>
<thead>
<tr>
<th>IFSC</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>

</tr>
</tbody>
</table>

ESR_EL1, Exception Syndrome Register (EL1)
When FEAT_LPA2 is implemented

**TLB conflict abort.**

When FEAT_HAFDBS is implemented

**Unsupported atomic hardware update fault.**

All other values are reserved.

For more information about the lookup level associated with a fault, see ‘The level associated with MMU faults’.

**Note**

Because Access flag faults and Permission faults can result only from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### ISS encoding for an exception from a Data Abort

| Bit 24 | Bit 23 | Bit 22 | Bit 21 | Bit 20 | Bit 19 | Bit 18 | Bit 17 | Bit 16 | Bit 15 | Bit 14 | Bit 13 | Bit 12 | Bit 11 | Bit 10 | Bit 9  | Bit 8  | Bit 7  | Bit 6  | Bit 5  | Bit 4  | Bit 3  | Bit 2  | Bit 1  | Bit 0  |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| **ISV** | **SAS** | **SSR** | **SRT** | **SF** | **A** | **V** | **N** | **CR** | **Bits[12:11]** | **Fr** | **V** | **E** | **A** | **CM** | **S1PTW** | **WnR** | **DFSC** |

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this ISS encoding includes ISS2, **bits[36:32]**.

**ISV, bit [24]**

Instruction Syndrome Valid. Indicates whether the syndrome information in ISS[23:14] is valid.

<table>
<thead>
<tr>
<th><strong>ISV</strong></th>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No valid instruction syndrome. ISS[23:14] are <strong>RES0</strong>.</td>
</tr>
<tr>
<td>0b1</td>
<td>ISS[23:14] hold a valid instruction syndrome.</td>
</tr>
</tbody>
</table>

In ESR_EL2, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For other faults reported in ESR_EL2, ISV is 0 except for the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b11111, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback).
- AArch32 instructions where the instruction:
  - Is an LDR, LDA, LDRH, LDRB, LDRRT, LDRSH, LDRRT, LDRRT, , LDRRT, LDRB, LDRB, LDRRT, STR, STR, STR, STR, STR, STLH, STRHT, STRB, or STRBT instruction.
  - Is not performing register writeback.
  - Is not using R15 as a source or destination register.

For these stage 2 aborts, ISV is **UNKNOWN** if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault. ISV is 0 for all other faults reported in ESR_EL1 or ESR_EL3.

When FEAT_RAS is implemented, ISV is 0 for any synchronous External abort.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.
When FEAT_RAS is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

When FEAT_MTE is implemented, for a synchronous Tag Check Fault abort taken to ELx, ESR_ELx.FNV is 0 and FAR_ELx is valid.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SAS, bits [23:22]**

When ISV == ‘1’:

Syndrome Access Size. Indicates the size of the access attempted by the faulting operation.

<table>
<thead>
<tr>
<th>SAS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Byte</td>
</tr>
<tr>
<td>0b01</td>
<td>Halfword</td>
</tr>
<tr>
<td>0b10</td>
<td>Word</td>
</tr>
<tr>
<td>0b11</td>
<td>Doubleword</td>
</tr>
</tbody>
</table>

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

This field is UNKNOWN when the value of ISV is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**SSE, bit [21]**

When ISV == ‘1’:

Syndrome Sign Extend. For a byte, halfword, or word load operation, indicates whether the data item must be sign extended.

<table>
<thead>
<tr>
<th>SSE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sign-extension not required.</td>
</tr>
<tr>
<td>0b1</td>
<td>Data item must be sign-extended.</td>
</tr>
</tbody>
</table>

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

For all other operations, this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**SRT, bits [20:16]**

When ISV == ‘1’:

Syndrome Register Transfer. When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xt.
If the exception was taken from an Exception level that is using AArch32, then this is the AArch64 view of the register. See ‘Mapping of the general-purpose registers between the Execution states’.

This field is **UNKNOWN** when the value of ISV is **UNKNOWN**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**SF, bit [15]**

**When ISV == ‘1’:**

Width of the register accessed by the instruction is Sixty-Four.

<table>
<thead>
<tr>
<th>SF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Instruction loads/stores a 32-bit wide register.</td>
</tr>
<tr>
<td>0b1</td>
<td>Instruction loads/stores a 64-bit wide register.</td>
</tr>
</tbody>
</table>

**Note**

This field specifies the register width identified by the instruction, not the Execution state.

When FEAT LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

This field is **UNKNOWN** when the value of ISV is **UNKNOWN**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**AR, bit [14]**

**When ISV == ‘1’:**

Acquire/Release.

<table>
<thead>
<tr>
<th>AR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Instruction did not have acquire/release semantics.</td>
</tr>
<tr>
<td>0b1</td>
<td>Instruction did have acquire/release semantics.</td>
</tr>
</tbody>
</table>

When FEAT LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

This field is **UNKNOWN** when the value of ISV is **UNKNOWN**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.
**VNCR, bit [13]**

When FEAT_NV2 is implemented:

Indicates that the fault came from use of VNCR_EL2 register by EL1 code.

<table>
<thead>
<tr>
<th>VNCR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The fault was not generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The fault was generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.</td>
</tr>
</tbody>
</table>

This field is 0 in ESR_EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**SET, bits [12:11]**

When FEAT_RAS is implemented and FEAT_LS64 is not implemented:

Synchronous Error Type. When DFSC is 0b010000, describes the PE error state after taking the Data Abort exception.

<table>
<thead>
<tr>
<th>SET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Recoverable state (UER).</td>
</tr>
<tr>
<td>0b10</td>
<td>Uncontainable (UC).</td>
</tr>
<tr>
<td>0b11</td>
<td>Restartable state (UEO).</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Note**

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_LS64 is implemented:

Load/Store Type. Used when an LD64B, ST64B, ST64BV, or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

<table>
<thead>
<tr>
<th>LST</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>An ST64BV instruction generated the Data Abort.</td>
</tr>
<tr>
<td>0b10</td>
<td>An LD64B or ST64B instruction generated the Data Abort.</td>
</tr>
<tr>
<td>0b11</td>
<td>An ST64BV0 instruction generated the Data Abort.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field is valid only if the DFSC code is 0b110101. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<table>
<thead>
<tr>
<th>FnV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FAR is valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>FAR is not valid, and holds an unknown value.</td>
</tr>
</tbody>
</table>

This field is valid only if the DFSC code is 0b010000. It is res0 for all other aborts.

On a Warm reset, this field resets to an architecturally unknown value.

EA, bit [9]

External abort type. This bit can provide an implementation defined classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

On a Warm reset, this field resets to an architecturally unknown value.

CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

<table>
<thead>
<tr>
<th>CM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA, DC GVA, and DC GZVA instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally unknown value.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

<table>
<thead>
<tr>
<th>S1PTW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault not on a stage 2 translation for a stage 1 translation table walk.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault on the stage 2 translation of an access for a stage 1 translation table walk.</td>
</tr>
</tbody>
</table>

For any abort other than a stage 2 fault this bit is res0.

On a Warm reset, this field resets to an architecturally unknown value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

<table>
<thead>
<tr>
<th>WnR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Abort caused by an instruction reading from a memory location.</td>
</tr>
<tr>
<td>0b1</td>
<td>Abort caused by an instruction writing to a memory location.</td>
</tr>
</tbody>
</table>

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.
For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is **UNKNOWN** for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of **0b110101** or **0b110001**, indicating an unsupported Exclusive or atomic access.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**DFSC, bits [5:0]**

Data Fault Status Code.
<table>
<thead>
<tr>
<th>DFSC</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>

</tr>
</tbody>
</table>
Alignment fault.
Address size fault, level -1.
Translation fault, level -1.
TLB conflict abort.
Unsupported atomic hardware update fault.
IMPLEMENTATION DEFINED fault (Lockdown).
IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

Note

Because Access flag faults and Permission faults can result only from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

### ISS encoding for an exception from a trapped floating-point exception

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{RES0}\texttt{TFV}</td>
<td>\texttt{RES0}</td>
</tr>
</tbody>
</table>

#### Bit [24]

Reserved, \texttt{RES0}.

#### TFV, bit [23]

Trapped Fault Valid bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions.

<table>
<thead>
<tr>
<th>TFV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0}</td>
<td>The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are \texttt{UNKNOWN}.</td>
</tr>
<tr>
<td>\texttt{0b1}</td>
<td>One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information, see 'Floating-point exceptions and exception traps'.</td>
</tr>
</tbody>
</table>

It is \texttt{IMPLEMENTATION DEFINED} whether this field is set to 0 on an exception generated by a trapped floating point exception from a vector instruction.

Note

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from a vector instruction and return valid information in the \{IDF, IXF, UFF, OFF, DZF, IOF\} fields.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [22:11]**

Reserved, **RES0**.

**VECITR, bits [10:8]**

For a trapped floating-point exception from an instruction executed in AArch32 state this field is **RES1**.

For a trapped floating-point exception from an instruction executed in AArch64 state this field is **UNKNOWN**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IDF, bit [7]**

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is **UNKNOWN**. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>IDF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Input denormal floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Input denormal floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [6:5]**

Reserved, **RES0**.

**IXF, bit [4]**

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is **UNKNOWN**. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>IXF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Inexact floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Inexact floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**UFF, bit [3]**

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is **UNKNOWN**. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>UFF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Underflow floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Underflow floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**OFF, bit [2]**

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is **UNKNOWN**. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>OFF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Overflow floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Overflow floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**DZF, bit [1]**

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is **UNKNOWN**. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>DZF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Divide by Zero floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Divide by Zero floating-point exception occurred during</td>
</tr>
<tr>
<td></td>
<td>execution of the reported instruction.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IOF, bit [0]**

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is **UNKNOWN**. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>IOF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Invalid Operation floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Invalid Operation floating-point exception occurred during</td>
</tr>
<tr>
<td></td>
<td>execution of the reported instruction.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the **FPCR**.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the **FPSCR**.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.

**ISS encoding for an SError interrupt**

| 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| IDS | RES0| IESB| AET | EA  | RES0| DFSC|

**IDS, bit [24]**

**IMPLEMENTATION DEFINED** syndrome.

<table>
<thead>
<tr>
<th>IDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bits [23:0] of the ISS field holds the fields described in this encoding.</td>
</tr>
</tbody>
</table>

**Note**

If FEAT_RAS is not implemented, bits [23:0] of the ISS field are **RES0**.

| 0b1 | Bits [23:0] of the ISS field holds **IMPLEMENTATION DEFINED** syndrome information that can be used to provide additional information about the SError interrupt. |

**Note**

This field was previously called ISV.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [23:14]**

Reserved, **RES0**.
IESB, bit [13]

When FEAT_IESB is implemented:

Implicit error synchronization event.

<table>
<thead>
<tr>
<th>IESB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The SError interrupt was either not synchronized by the implicit error synchronization event or not taken immediately.</td>
</tr>
<tr>
<td>0b1</td>
<td>The SError interrupt was synchronized by the implicit error synchronization event and taken immediately.</td>
</tr>
</tbody>
</table>

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AET, bits [12:10]

When FEAT_RAS is implemented:

Asynchronous Error Type.

When DFSC is 0b010001, describes the PE error state after taking the SError interrupt exception.

<table>
<thead>
<tr>
<th>AET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Uncontainable (UC).</td>
</tr>
<tr>
<td>0b001</td>
<td>Unrecoverable state (UEU).</td>
</tr>
<tr>
<td>0b010</td>
<td>Restartable state (UEO).</td>
</tr>
<tr>
<td>0b011</td>
<td>Recoverable state (UER).</td>
</tr>
<tr>
<td>0b110</td>
<td>Corrected (CE).</td>
</tr>
</tbody>
</table>

All other values are reserved.

If multiple errors are taken as a single SError interrupt exception, the overall PE error state is reported.

Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EA, bit [9]

When FEAT_RAS is implemented:

External abort type. When DFSC is 0b010001, provides an IMPLEMENTATION DEFINED classification of External aborts.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

Bits [8:6]

Reserved, RES0.

DFSC, bits [5:0]

When FEAT_RAS is implemented:

Data Fault Status Code.

<table>
<thead>
<tr>
<th>DFSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>Uncategorized error.</td>
</tr>
<tr>
<td>0b010001</td>
<td>Asynchronous SError interrupt.</td>
</tr>
</tbody>
</table>

All other values are reserved.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ISS encoding for an exception from a Breakpoint or Vector Catch debug exception

<table>
<thead>
<tr>
<th>24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>
<th>RES0</th>
<th>IFSC</th>
</tr>
</thead>
</table>

Bits [24:6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code.

<table>
<thead>
<tr>
<th>IFSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b100010</td>
<td>Debug exception.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions:

- For exceptions from AArch64, see ‘Breakpoint exceptions’.
- For exceptions from AArch32, see ‘Breakpoint exceptions’ and ‘Vector Catch exceptions’.

ISS encoding for an exception from a Software Step exception

<table>
<thead>
<tr>
<th>24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>
<th>ISV</th>
<th>RES0</th>
<th>EX</th>
<th>IFSC</th>
</tr>
</thead>
</table>

ISV, bit [24]

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:
ISV | Meaning
--- | ---
0b0 | EX bit is RES0.
0b1 | EX bit is valid.

See the EX bit description for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [23:7]**

Reserved, RES0.

**EX, bit [6]**

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

<table>
<thead>
<tr>
<th>EX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An instruction other than a Load-Exclusive instruction was stepped.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Load-Exclusive instruction was stepped.</td>
</tr>
</tbody>
</table>

If the ISV bit is set to 0, this bit is RES0, indicating no syndrome data is available.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IFSC, bits [5:0]**

Instruction Fault Status Code.

<table>
<thead>
<tr>
<th>IFSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b100010</td>
<td>Debug exception.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see ‘Software Step exceptions’.

**ISS encoding for an exception from a Watchpoint exception**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RES0VNCR | RES0 | CMRES0WnR | DFSC |

**Bits [24:15]**

Reserved, RES0.

**Bit [14]**

Reserved, RES0.

**VNCR, bit [13]**

When FEAT_NV2 is implemented:

Indicates that the watchpoint came from use of VNCR_EL2 register by EL1 code.

<table>
<thead>
<tr>
<th>VNCR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The watchpoint was not generated by the use of VNCR_EL2 by EL1 code.</td>
</tr>
<tr>
<td>0b1</td>
<td>The watchpoint was generated by the use of VNCR_EL2 by EL1 code.</td>
</tr>
</tbody>
</table>

This field is 0 in ESR_EL1.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:9]

Reserved, RES0.

CM, bit [8]

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance or address translation instruction:

<table>
<thead>
<tr>
<th>CM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Watchpoint exception was not generated by the execution of one of the System instructions identified in the description of value 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Watchpoint exception was generated by either the execution of a cache maintenance instruction or by a synchronous Watchpoint exception on the execution of an address translation instruction. The DC ZVA, DC GVA, and DC GZVA instructions are not classified as a cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

WnR, bit [6]

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

<table>
<thead>
<tr>
<th>WnR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Watchpoint exception caused by an instruction reading from a memory location.</td>
</tr>
<tr>
<td>0b1</td>
<td>Watchpoint exception caused by an instruction writing to a memory location.</td>
</tr>
</tbody>
</table>

For Watchpoint exceptions on cache maintenance and address translation instructions, this bit always returns a value of 1.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is UNPREDICTABLE which watchpoint generates the Watchpoint exception.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code.

<table>
<thead>
<tr>
<th>DFSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b100010</td>
<td>Debug exception.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.
For more information about generating these exceptions, see 'Watchpoint exceptions'.

**ISS encoding for an exception from execution of a Breakpoint instruction**

<table>
<thead>
<tr>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>

<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Comment</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [24:16]**

Reserved, RES0.

**Comment, bits [15:0]**

Set to the instruction comment field value, zero extended as necessary.

For the AArch32 BKPT instructions, the comment field is described as the immediate field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Breakpoint instruction exceptions'.

**ISS encoding for an exception from an ERET, ERETA, or ERETAB instruction**

| 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0 |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     | ERETERETA |

This EC value applies when FEAT_FGT is implemented, or when HCR_EL2.NV is 1.

**Bits [24:2]**

Reserved, RES0.

**ERET, bit [1]**

Indicates whether an ERET or ERETA* instruction was trapped to EL2.

<table>
<thead>
<tr>
<th>ERET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERET instruction trapped to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>ERETA or ERETAB instruction trapped to EL2.</td>
</tr>
</tbody>
</table>

If this bit is 0, the ERETA field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EREOTA, bit [0]**

Indicates whether an ERETA or ERETAB instruction was trapped to EL2.

<table>
<thead>
<tr>
<th>ERETA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERETA instruction trapped to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>ERETAB instruction trapped to EL2.</td>
</tr>
</tbody>
</table>

When the ERET field is 0, this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see HCR_EL2.NV.

If FEAT_FGT is implemented, HFGITR_EL2.ERET controls fine-grained trap exceptions from ERET, ERETA and ERETAB execution.
ISS encoding for an exception from Branch Target Identification instruction

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0|    |    |    |    |    |    |    | BTYPE |

**Bits [24:2]**

Reserved, RES0.

**BTYPE, bits [1:0]**

This field is set to the PSTATE.BTYPE value that generated the Branch Target Exception.

For more information about generating these exceptions, see ’The AArch64 application level programmers model’.

ISS encoding for an exception from a Pointer Authentication instruction when HCR_EL2.API == 0 || SCR_EL3.API == 0

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0|    |    |    |    |    |    |    |    |

**Bits [24:0]**

Reserved, RES0.

For more information about generating these exceptions, see:

- HCR_EL2.API, for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL2.
- SCR_EL3.API, for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL3.

ISS encoding for an exception from a Pointer Authentication instruction authentication failure

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0|    |    |    |    |    |    |    |    |

**Bits [24:2]**

Reserved, RES0.

**Bit [1]**

This field indicates whether the exception is as a result of an Instruction key or a Data key.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Bit [0]

This field indicates whether the exception is as a result of an A key or a B key.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally unknown value.

The following instructions generate an exception when the Pointer Authentication Code (PAC) is incorrect:

- AUTIASP, AUTIAZ, AUTIA1716.
- AUTIBSP, AUTIBZ, AUTIB1716.
- AUTIA, AUTDA, AUTIB, AUTDB.
- AUTIZA, AUTIZB, AUTDZA, AUTDZB.

It is implementation defined whether the following instructions generate an exception directly from the authorization failure, rather than changing the address in a way that will generate a translation fault when the address is accessed:

- RETAA, RETAB.
- BRAA, BRAB, BLRAA, BLRAB.
- BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETA, ERETAB.
- LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

**Accessing the ESR_EL1**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic ESR_EL1 or ESR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

**MRS <Xt>, ESR_EL1**

<table>
<thead>

ESR_EL2, Exception Syndrome Register (EL2)

The ESR_EL2 characteristics are:

**Purpose**

Holds syndrome information for an exception taken to EL2.

**Configuration**

AArch64 System register ESR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HSR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

ESR_EL2 is a 64-bit register.

**Field descriptions**

The ESR_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| EC | IL | RES0 | ISS2 |

ESR_EL2 is made UNKNOWN as a result of an exception return from EL2.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL2, the value of ESR_EL2 is UNKNOWN. The value written to ESR_EL2 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

**Bits [63:37]**

Reserved, RES0.

**ISS2, bits [36:32]**

When FEAT_LS64 is implemented:

If a memory access generated by an ST64BV or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

For any other Data Abort, this field is RES0.

Otherwise:

Reserved, RES0.

**EC, bits [31:26]**

Exception Class. Indicates the reason for the exception that this register holds information about.
For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.

Possible values of the EC field are:
<table>

</tbody>
</table>
| 0b000110 | Trapped LDC or STC access. The only architected uses of these instruction are:  
  • An STC to write data to memory from DBGDTRRXint.  
  • An LDC to read data from memory to DBGDTRRXint. | ISS encoding for an exception from an LDC or STC instruction | When AArch32 is supported at any Exception level |
| 0b000111 | Access to SVE, Advanced SIMD or floating-point functionality trapped by CPACR_EL1.FPEN, CPTR_EL2.FPEN, CPTR_EL2.TFP, or CPTR_EL3.TFP control. Excludes exceptions resulting from CPACR_EL1 when the value of HCR_EL2.TGE is 1, or because SVE or Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000 as described in 'The EC used to report an exception routed to EL2 because HCR_EL2.TGE is 1'. | ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality resulting from the FPEN and TFP traps |                                                  |
| 0b001000 | Trapped VMRS access, from ID group trap.                                | ISS encoding for an exception                       | When AArch32 is supported at any Exception level |
that is not reported using EC 0b000111.

**0b001001**
Trapped use of a Pointer authentication instruction because HCR_EL2.API == 0 || SCR_EL3.API == 0.

**ISS encoding for an exception from a Pointer Authentication instruction when HCR_EL2.API == 0 || SCR_EL3.API == 0.**

When FEAT_PAuth is implemented.

**0b001010**
Trapped execution of an LD64B, ST64B, ST64BV, or ST64BV0 instruction.

**ISS encoding for an exception from an LD64B or ST64B* instruction.**

When FEAT_LS64 is implemented.

**0b001100**
Trapped MRRC access with (coproc==0b1110).

**ISS encoding for an exception from an MCRR or MRRC access.**

When AArch32 is supported at any Exception level.

**0b001101**
Branch Target Exception.

**ISS encoding for an exception from Branch Target Identification instruction.**

When FEAT_BTI is implemented.

**0b001110**
Illegal Execution state.

**ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault.**

When AArch32 is supported at any Exception level.

**0b010001**
SVC instruction execution in AArch32 state.

This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TGE is 1.

**ISS encoding for an exception from HVC or SVC instruction execution.**

When AArch32 is supported at any Exception level.

**0b010010**
HVC instruction execution in AArch32 state, when HVC is not disabled.

**ISS encoding for an exception from HVC or SVC instruction execution.**

When AArch32 is supported at any Exception level.

**0b010011**
SMC instruction execution in AArch32 state, when SMC is not disabled.

This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TSC is 1.

**ISS encoding for an exception from SMC instruction execution in AArch32 state.**

When AArch32 is supported at any Exception level.

**0b010101**
SVC instruction execution in AArch64 state.

**ISS encoding for an exception from HVC or SVC instruction execution.**

When AArch64 is supported at any Exception level.

**0b010110**
HVC instruction execution in AArch64 state.

**ISS encoding for an exception from HVC or SVC instruction execution.**

When AArch64 is supported at any Exception level.

or a PC or SP alignment fault
ISS encoding for an exception from a trapped floating-point exception
When AArch32 is supported at any Exception level

Trapped floating-point exception taken from AArch32 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.

ISS encoding for an exception from a trapped floating-point exception
When AArch64 is supported at any Exception level

Trapped floating-point exception taken from AArch64 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.

ISS encoding for an exception from a trapped floating-point exception
When AArch64 is supported at any Exception level

SErrror interrupt.
ISS encoding for an SError interrupt

Breakpoint exception from a lower Exception level.
ISS encoding for an exception from a Breakpoint or Vector Catch debug exception

Breakpoint exception taken without a change in Exception level.
ISS encoding for an exception from a Breakpoint or Vector Catch debug exception

Software Step exception from a lower Exception level.
ISS encoding for an exception from a Software Step exception

Software Step exception taken without a change in Exception level.
ISS encoding for an exception from a Software Step exception

Watchpoint from a lower Exception level, excluding Watchpoint Exceptions taken to EL2 as a result of accesses generated associated with VNCR_EL2 as part of nested virtualization support. These Watchpoint Exceptions might be generated from
ISS encoding for an exception from a Watchpoint exception
Exception levels using any Execution state.

0b110101 Watchpoint exceptions without a change in Exception level, or Watchpoint exceptions taken to EL2 as a result of accesses generated associated with VNCR_EL2 as part of nested virtualization support. 

**ISS encoding for an exception from a Watchpoint exception**

0b111000 BKPT instruction execution in AArch32 state.

**ISS encoding for an exception from execution of a Breakpoint instruction**

When AArch32 is supported at any Exception level

0b111010 Vector Catch exception from AArch32 state.

The only case where a Vector Catch exception is taken to an Exception level that is using AArch64 is when the exception is routed to EL2 and EL2 is using AArch64.

**ISS encoding for an exception from a Breakpoint or Vector Catch debug exception**

When AArch32 is supported at any Exception level

0b111100 BRK instruction execution in AArch64 state.

This is reported in ESR_EL3 only if a BRK instruction is executed.

**ISS encoding for an exception from execution of a Breakpoint instruction**

When AArch64 is supported at any Exception level

All other EC values are reserved by Arm, and:

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is **CONSTRAINED UNPREDICTABLE**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IL, bit [25]**

Instruction Length for synchronous exceptions. Possible values of this bit are:
<table>
<thead>
<tr>
<th>IL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>16-bit instruction trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>32-bit instruction trapped. This value is also used when the exception is one of the following:</td>
</tr>
<tr>
<td></td>
<td>• An SError interrupt.</td>
</tr>
<tr>
<td></td>
<td>• An Instruction Abort exception.</td>
</tr>
<tr>
<td></td>
<td>• A PC alignment fault exception.</td>
</tr>
<tr>
<td></td>
<td>• An SP alignment fault exception.</td>
</tr>
<tr>
<td></td>
<td>• A Data Abort exception for which the value of the ISV bit is 0.</td>
</tr>
<tr>
<td></td>
<td>• An Illegal Execution state exception.</td>
</tr>
<tr>
<td></td>
<td>• Any debug exception except for Breakpoint instruction exceptions. For Breakpoint instruction exceptions, this bit has its standard meaning:</td>
</tr>
<tr>
<td></td>
<td>◦ 0b0: 16-bit T32 BKPT instruction.</td>
</tr>
<tr>
<td></td>
<td>◦ 0b1: 32-bit A32 BKPT instruction or A64 BRK instruction.</td>
</tr>
<tr>
<td></td>
<td>• An exception reported using EC value 0b000000.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**ISS, bits [24:0]**

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number.

For an exception taken from AArch32 state, see 'Mapping of the general-purpose registers between the Execution states'.

If the AArch32 register descriptor is 0b1111, then:

- If the instruction that generated the exception was not UNPREDICTABLE, the field takes the value 0b11111.
- If the instruction that generated the exception was UNPREDICTABLE, the field takes an UNKNOWN value that must be either:
  ◦ The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
  ◦ The value 0b11111.

When the EC field is 0b000000, indicating an exception with an unknown reason, the ISS field is not valid, RES0.

**ISS encoding for exceptions with an unknown reason**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [24:0]**

Reserved, RES0.

When an exception is reported using this EC code the IL field is set to 1.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or that is not accessible at the current Exception level and Security state, including:
  ◦ A read access using a System register pattern that is not allocated for reads or that does not permit reads at the current Exception level and Security state.
  ◦ A write access using a System register pattern that is not allocated for writes or that does not permit writes at the current Exception level and Security state.
  ◦ Instruction encodings that are unallocated.
  ◦ Instruction encodings for instructions or System registers that are not implemented in the implementation.
In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.

In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.

In AArch32 state, attempted execution of a short vector floating-point instruction.

In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.

An exception generated because of the value of one of the SCTLR_EL1. {ITD, SED, CP15BEN} control bits.

Attempted execution of:
- An HVC instruction when disabled by HCR_EL2.HCD or SCR_EL3.HCE.
- An SMC instruction when disabled by SCR_EL3.SMD.
- An HLT instruction when disabled by EDSCR.HDE.

Attempted execution of an MSR or MRS instruction to access SP_EL0 when the value of SPSel.SP is 0.

Attempted execution of an MSR or MRS instruction using an _EL12 register name when HCR_EL2.E2H == 0.

Attempted execution, in Debug state, of:
- A DCPS1 instruction when the value of HCR_EL2.TGE is 1 and EL2 is disabled or not implemented in the current Security state.
- A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.
- A DCPS3 instruction when the value of EDSCR.SDD is 1, or when EL3 is not implemented.

When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using R13 mon. See ‘Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32’.

In Debug state when the value of EDSCR.SDD is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.

In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to SPSR_mon, SP_mon, or LR_mon.

An exception that is taken to EL2 because the value of HCR_EL2.TGE is 1 that, if the value of HCR_EL2.TGE was 0 would have been reported with an ESR_ELx.EC value of 0b000111.

### ISS encoding for an exception from a WF* instruction

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| CV | COND | RES0 | TI |

**CV, bit [24]**

Condition code valid.

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
If the instruction is conditional, COND is set to the condition code field value from the instruction.

- If the instruction is unconditional, COND is set to \(0b1110\).

- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to \(0b1110\), the value for unconditional.
  - With the COND value held in the instruction.

- When a T32 instruction is trapped, it is implementation defined whether:
  - CV is set to 0 and COND is set to an unknown value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is implementation defined whether the COND field is set to \(0b1110\), or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally unknown value.

**Bits [19:2]**

Reserved, \(\text{RES0}\).

**TI, bits [1:0]**

Trapped instruction. Possible values of this bit are:

<table>
<thead>
<tr>
<th>TI</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>WFI trapped.</td>
<td></td>
</tr>
<tr>
<td>0b01</td>
<td>WFE trapped.</td>
<td></td>
</tr>
<tr>
<td>0b10</td>
<td>WFIT trapped.</td>
<td>When FEAT_WFxT is implemented</td>
</tr>
<tr>
<td>0b11</td>
<td>WFET trapped.</td>
<td>When FEAT_WFxT is implemented</td>
</tr>
</tbody>
</table>

When FEAT_WFxT is implemented, this is a two bit field as shown. Otherwise, bit[1] is \(\text{RES0}\).

On a Warm reset, this field resets to an architecturally unknown value.

The following fields describe configuration settings for generating this exception:

- SCTLR_EL1.{nTWE, nTWI}.
- HCR_EL2.{TWE, TWI}.
- SCR_EL3.{TWE, TWI}.

**ISS encoding for an exception from an MCR or MRC access**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

**CV, bit [24]**

Condition code valid.

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is implementation defined whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally unknown value.
COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc2, bits [19:17]

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value 0b000.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [16:14]

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value 0b111.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value 0b000.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction.

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Write to System register space. MCR instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read from System register space. MRC or VMRS instruction.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000011:

- **CNTKCTL_EL1**, \{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN\}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **PMUSERENR_EL0** (ER, CR, SW, EN), for accesses to Performance Monitor registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **AMUSERENR_EL0**.EN, for accesses to Activity Monitors registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **HCR_EL2**.\{TRVM, TVM\}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **HCR_EL2**.TTLB, for execution of TLB maintenance instructions at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **HCR_EL2**.\{TSW, TPC, TPU\} for execution of cache maintenance instructions at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **HCR_EL2**.TACR, for accesses to the Auxiliary Control Register at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **HCR_EL2**.TIDCP, for accesses to lockdown, DMA, and TCM operations at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **HCR_EL2**.TID1, TID2, TID3, for accesses to ID registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **CPTR_EL2**.TCPAC, for accesses to **CPACR_EL1** or **CPACR** using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **HSTR_EL2**.T<n>, for accesses to System registers using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **CNTKCTL_EL2**.EL1PCEN, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **MDCR_EL2**.\{TPM, TPMCR\}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **CPTR_EL2**.TAM, for accesses to Activity Monitors registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **CPTR_EL3**.TAPA, for accesses to **CPACR** from EL1 and EL2, and accesses to **HCPTR** from EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- **MDCR_EL3**.TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- **CPTR_EL3**.TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- For information on other traps using EC value 0b000011, see 'Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32'.
- If FEAT_FGT is implemented, MCR or MRC access to some registers at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b0000101:

- **CPACR_EL1**.TTA for accesses to trace registers, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- **MDSCR_EL1**.TDCC, for accesses to the Debug Communications Channel (DCC) registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- If FEAT_FGT is implemented, **MDCR_EL2**.TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and **MDCR_EL3**.TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- **HCR_EL2**.TID0, for accesses to the **JIDR** register in the ID group 0 at EL0 and EL1 using AArch32, MRC access (coproc == 0b1110) trapped to EL2.
- **CPTR_EL2**.TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
• **MDCR_EL2.TDRA**, for accesses to Debug ROM registers **DBGDRAR** and AArch32-DBGDSAR using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.

• **MDCR_EL2.TDOSA**, for accesses to powerdown debug registers, using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.

• **MDCR_EL2.TDA**, for accesses to other debug registers, using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.

• **CPTR_EL3.TTA**, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.

• **MDCR_EL3.TDOSA**, for accesses to powerdown debug registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.

• **MDCR_EL3.TDA**, for accesses to other debug registers, using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b001000:

• **HCR_EL2.TID0**, for accesses to the **FPSID** register in ID group 0 at EL1 using AArch32 state, VMRS access trapped to EL2.

• **HCR_EL2.TID3**, for accesses to registers in ID group 3 including **MVFR0**, **MVFR1** and **MVFR2**, VMRS access trapped to EL2.

## ISS encoding for an exception from an LD64B or ST64B* instruction

<table>

### CV, bit [24]

Condition code valid.

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

• When an A32 instruction is trapped, CV is set to 1.

• When a T32 instruction is trapped, it is IMPLEMENTATIONDEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.
The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to $0b1110$.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to $0b1110$, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to $0b1110$, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Opc1, bits [19:16]**

The Opc1 value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [15]**

Reserved, RES0.

**Rt2, bits [14:10]**

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Rt, bits [9:5]**

The Rt value from the issued instruction, the first general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CRm, bits [4:1]**

The CRm value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction.

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Write to System register space. MCRR instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read from System register space. MRCC instruction.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.
The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000100:

- **CNTKCTL_EL1**, {EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **PMUSERENR_EL0**, {CR, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **AMUSERENR_EL0**, {EN}, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **HCR_EL2**, {TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **PMUSERENR_EL0**, {CR, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **AMUSERENR_EL0**, {EN}, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **HCR_EL2**, {TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **MDCR_EL2**, {TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **CPTR_EL2**, {TAM}, for accesses to Activity Monitors registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **MDCR_EL3**, {TPM, TPMCR}, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- **CPTR_EL3**, {TAM}, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.

If FEAT_FGT is implemented, **HDFGRTR_EL2**, PMCCNTR_EL0 for MRRC access and **HDFGWTR_EL2**, PMCCNTR_EL0 for MCRR access to PMCCNTR at EL0, trapped to EL2.

The following sections describe configuration settings for generating exceptions that are reported using EC value 0b001100:

- **MDSCR_EL1**, {TDCC}, for accesses to the Debug ROM registers DBGDSAR and DBGDRAR at EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- **MDCR_EL2**, {TDRA}, for accesses to Debug ROM registers DBGDRAR and AArchDBGDSAR using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- **MDCR_EL3**, {TDA}, for accesses to debug registers, using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.
- **CPACR_EL1**, {TTA}, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- **CPTR_EL2**, {TTA}, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- **CPTR_EL3**, {TTA}, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.

### Note

If the Armv8-A architecture is implemented with an ETMv4 implementation, MCRR and MRRC accesses to trace registers are **UNDEFINED** and the resulting exception is higher priority than an exception due to these traps.

### ISS encoding for an exception from an LDC or STC instruction

<table>

**CV, bit [24]**

Condition code valid.

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.
For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**imm8, bits [19:12]**

The immediate value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [11:10]**

Reserved, RES0.

**Rn, bits [9:5]**

The Rn value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See ‘Mapping of the general-purpose registers between the Execution states’.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Offset, bit [4]**

Indicates whether the offset is added or subtracted:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Subtract offset.</td>
</tr>
<tr>
<td>0b1</td>
<td>Add offset.</td>
</tr>
</tbody>
</table>

This bit corresponds to the U bit in the instruction encoding.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**AM, bits [3:1]**

Addressing mode. The permitted values of this field are:

<table>
<thead>
<tr>
<th>AM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Immediate unindexed.</td>
</tr>
<tr>
<td>0b01</td>
<td>Immediate post-indexed.</td>
</tr>
<tr>
<td>0b10</td>
<td>Immediate offset.</td>
</tr>
<tr>
<td>0b11</td>
<td>Immediate pre-indexed.</td>
</tr>
<tr>
<td>0b100</td>
<td>For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.</td>
</tr>
<tr>
<td>0b110</td>
<td>For a trapped STC instruction, this encoding is reserved.</td>
</tr>
</tbody>
</table>

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is **CONSTRAINED UNPREDICTABLE**, as described in 'Reserved values in System and memory-mapped registers and translation table entries'.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits \{P, W\} in the instruction encoding.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction.

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Write to memory. STC instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read from memory. LDC instruction.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000010:

- **MDSCR_EL1.TDCC**, for accesses using AArch32 state, LDC access to DBGDTRTXint or STC access to DBGDTRRXint trapped to EL1 or EL2.
- **MDCR_EL2.TDA**, for accesses using AArch32 state, LDC access to DBGDTRTXint or STC access to DBGDTRRXint MCR or MRC access trapped to EL2.
- **MDCR_EL3.TDA**, for accesses using AArch32 state, LDC access to DBGDTRTXint or STC access to DBGDTRRXint MCR or MRC access trapped to EL3.
- If FEAT_FGT is implemented, **MDCR_EL2.TDCC** for LDC and STC accesses to the DCC registers at EL0 and EL1 trapped to EL2, and **MDCR_EL3.TDCC** for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.

**ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEN and TFP traps**

<table>
<thead>
<tr>
<th>CV</th>
<th>COND</th>
<th>RES0</th>
</tr>
</thead>
</table>

The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SIMD and floating-point System registers.

For an implementation that does not include either SVE or support for floating-point and Advanced SIMD, the exception is reported using the EC value 0b000000.

**CV, bit [24]**

Condition code valid.
<table>
<thead>
<tr>
<th>CV</th>

<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [19:0]**

Reserved, RES0.

The following sections describe the configuration settings for the traps that are reported using EC value 0b000011:

- CPACR_EL1.FPEN, for accesses to SIMD and floating-point registers trapped to EL1.
- CPTR_EL2.TFP, for accesses to SIMD and floating-point registers trapped to EL2.
- CPTR_EL3.TFP, for accesses to SIMD and floating-point registers trapped to EL3.

**ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ**

|   | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|---|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|   |    | RES0 |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

The accesses covered by this trap include:

- Execution of SVE instructions.
- Accesses to the SVE System register, ZCR_ELx.

For an implementation that does not include SVE, the exception is reported using the EC value 0b000000.
The following sections describe the configuration settings for the traps that are reported using EC value 0b011001:

- **CPACR_EL1.ZEN**, for execution of SVE instructions and accesses to SVE registers at EL0 or EL1, trapped to EL2.
- **CPTR_EL2.ZEN**, for execution of SVE instructions and accesses to SVE registers at EL0, EL1, or EL2, trapped to EL2.
- **CPTR_EL2.TZ**, for execution of SVE instructions and accesses to SVE registers at EL0, EL1, or EL2, trapped to EL2.
- **CPTR_EL3.EZ**, for execution of SVE instructions and accesses to SVE registers from all Exception levels, trapped to EL3.

**ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault**

</tbody>
</table>

**Bits [24:16]**

Reserved, RES0.

**imm16, bits [15:0]**

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is **UNKNOWN**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see ‘SVC’ and ‘HVC’.

For A64 instructions, see ‘SVC’ and ‘HVC’.
If FEAT_FGT is implemented, \texttt{HFGITR_EL2} \{SVC\_EL1, SVC\_EL0\} control fine-grained traps on SVC execution.

**ISS encoding for an exception from SMC instruction execution in AArch32 state**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| CV | COND | CCKNOWNPASS | RES0 |

For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is \texttt{RES0}.

For an SMC instruction that is trapped to EL2 from EL1 because \texttt{HCR\_EL2}.TSC is 1, the ISS encoding is as shown in the diagram.

**CV, bit [24]**

Condition code valid.

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0}</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>\texttt{0b1}</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is \texttt{IMPLEMENTATION DEFINED} whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is valid only if CCKNOWNPASS is 1, otherwise it is \texttt{RES0}.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

**COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to \texttt{0b1110}.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to \texttt{0b1110}.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to \texttt{0b1110}, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is \texttt{IMPLEMENTATION DEFINED} whether:
  - CV is set to 0 and COND is set to an \texttt{UNKNOWN} value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is \texttt{IMPLEMENTATION DEFINED} whether the COND field is set to \texttt{0b1110}, or to the value of any condition that applied to the instruction.

This field is valid only if CCKNOWNPASS is 1, otherwise it is \texttt{RES0}.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.
**CCKNOWNPASS, bit [19]**

Indicates whether the instruction might have failed its condition code check.

<table>
<thead>
<tr>
<th>CCKNOWNPASS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The instruction was unconditional, or was conditional and passed its condition code check.</td>
</tr>
<tr>
<td>0b1</td>
<td>The instruction was conditional, and might have failed its condition code check.</td>
</tr>
</tbody>
</table>

**Note**

In an implementation in which an SMC instruction that fails its code check is not trapped, this field can always return the value 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [18:0]**

Reserved, **RES0**.

HCR_EL2.TSC describes the configuration settings for trapping SMC instructions to EL2.

‘System calls’ describes the case where these exceptions are trapped to EL3.

**ISS encoding for an exception from SMC instruction execution in AArch64 state**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| imm16 | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

**Bits [24:16]**

Reserved, **RES0**.

**imm16, bits [15:0]**

The value of the immediate field from the issued SMC instruction.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

HCR_EL2.TSC describes the configuration settings for trapping SMC from EL1 modes.

‘System calls’ describes the case where these exceptions are trapped to EL3.

**ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [24:22]**

Reserved, **RES0**.
Op0, bits [21:20]
The Op0 value from the issued instruction.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op2, bits [19:17]
The Op2 value from the issued instruction.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op1, bits [16:14]
The Op1 value from the issued instruction.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]
The CRn value from the issued instruction.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]
The Rt value from the issued instruction, the general-purpose register used for the transfer.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]
The CRm value from the issued instruction.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]
Indicates the direction of the trapped instruction.

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Write access, including MSR instructions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read access, including MRS instructions.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For exceptions caused by System instructions, see 'System instructions' subsection of 'Branches, exception generating and System instructions' for the encoding values returned by an instruction.

The following fields describe configuration settings for generating the exception that is reported using EC value 0b011000:

- **SCTLR_EL1.UCI**, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **SCTLR_EL1.UCT**, for accesses to **CTR_EL0** using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **SCTLR_EL1.DZE**, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **SCTLR_EL1.UMA**, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **CPACR_EL1.TTA**, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **MDSCR_EL1.TDCC**, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
If FEAT_FGT is implemented, MDCR_EL2.TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and MDCR_EL3.TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.

CNTKCTL_EL1.EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.

PMUSERENR_EL0.ER, CR, SW, EN, for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.

AMUSERENR_EL0.EN, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.

HCR_EL2.TRVM, TVM, for accesses to virtual memory control registers using AArch64 state, MSR or MRS access trapped to EL2.

HCR_EL2.TDZ, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL2.

HCR_EL2.TTLB, for execution of TLB maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.

HCR_EL2.TSW, TPC, TPU, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.

HCR_EL2.ACTLR, for accesses to the Auxiliary Control Register, ACTLR_EL1, using AArch64 state, MSR or MRS access trapped to EL2.

HCR_EL2.TIDCP, for accesses to lockdown, DMA, and TCM operations using AArch64 state, MSR or MRS access trapped to EL2.

HCR_EL2.TID1, TID2, TID3, for accesses to ID group 1, ID group 2 or ID group 3 registers, using AArch64 state, MSR or MRS access trapped to EL2.

CPTR_EL2.TTCPAC, for accesses to CPACR_EL1, using AArch64 state, MSR or MRS access trapped to EL2.

CPTR_EL2.TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL2.

MDCR_EL2.TTRF, for accesses to the trace filter control register, TRFCR_EL1, using AArch64 state, MSR or MRS access trapped to EL2.

MDCR_EL2.TDRA, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.

MDCR_EL2.TDOSA, for accesses to powerdown debug registers using AArch64 state, MSR or MRS access trapped to EL2.

CNTHCTL_EL2.EL1PCEN, EL1PCTEN, for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.

CPTR_EL2.TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.

HCR_EL2.APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL2.

HCR_EL2.TERR, FIEN, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL2.

MDCR_EL3.TTPM, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.

MDCR_EL2.TTTRF, for accesses to the trace filter control registers, TRFCR_EL1 and TRFCR_EL2, using AArch64 state, MSR or MRS access trapped to EL3.

MDCR_EL3.TDA, for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.

MDCR_EL2.TDOSA, for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.

MDCR_EL2.TPM, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.

MDCR_EL3.TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL3.
• If FEAT_EVT is implemented, the following registers control traps for EL1 and EL0 Cache controls that use this EC value:
  ◦ **HCR_EL2**. {TTLBOS, TTLBIS, TICAB, TOCU, TID4}.
  ◦ **HCR2**. {TTLBIS, TICAB, TOCU, TID4}.

• If FEAT_FGT is implemented:
  ◦ **SCR_EL3.FGTEn**, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
  ◦ **HFGRTR_EL2** for reads and **HFGWTR_EL2** for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
  ◦ **HFGITR_EL2** for execution of system instructions, MSR or MRS access trapped to EL2.
  ◦ **HDFGRTR_EL2** for reads and **HDFGWTR_EL2** for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
  ◦ **HAFGRTR_EL2** for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.

### ISS encoding for an IMPLEMENTATION DEFINED exception to EL3

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | IMPLEMENTATION DEFINED |

**IMPLEMENTATION DEFINED**, bits [24:0]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### ISS encoding for an exception from an Instruction Abort

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | SET | FnVEA | RES0 | S1PTW | RES0 | IFSC |

**Bits [24:13]**

Reserved, **RES0**.

**SET, bits [12:11]**

When **FEAT_RAS** is implemented:

Synchronous Error Type. When IFSC is 0b010000, describes the PE error state after taking the Instruction Abort exception.

<table>
<thead>
<tr>
<th>SET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Recoverable state (UER).</td>
</tr>
<tr>
<td>0b10</td>
<td>Uncontainable (UC).</td>
</tr>
<tr>
<td>0b11</td>
<td>Restartable state (UEO).</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Note**

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the IFSC code is 0b010000. It is **RES0** for all other aborts.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.
**FnV, bit [10]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<table>
<thead>
<tr>
<th>FnV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FAR is valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>FAR is not valid, and holds an <strong>UNKNOWN</strong> value.</td>
</tr>
</tbody>
</table>

This field is valid only if the IFSC code is **0b010000**. It is **RES0** for all other aborts.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**EA, bit [9]**

External abort type. This bit can provide an **IMPLEMENTATION DEFINED** classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [8]**

Reserved, **RES0**.

**S1PTW, bit [7]**

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

<table>
<thead>
<tr>
<th>S1PTW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault not on a stage 2 translation for a stage 1 translation table walk.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault on the stage 2 translation of an access for a stage 1 translation table walk.</td>
</tr>
</tbody>
</table>

For any abort other than a stage 2 fault this bit is **RES0**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [6]**

Reserved, **RES0**.

**IFSC, bits [5:0]**

Instruction Fault Status Code.
<table>
<thead>
<tr>

</table>
When FEAT_LPA2 is implemented

0b110000 TLB conflict abort.

0b110001 Unsupported atomic hardware update fault.

When FEAT_HAFDBS is implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see ‘The level associated with MMU faults’.

Note

Because Access flag faults and Permission faults can result only from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a Data Abort

| Bit 24 | Bit 23 | Bit 22 | Bit 21 | Bit 20 | Bit 19 | Bit 18 | Bit 17 | Bit 16 | Bit 15 | Bit 14 | Bit 13 | Bit 12 | Bit 11 | Bit 10 | Bit 9  | Bit 8  | Bit 7  | Bit 6  | Bit 5  | Bit 4  | Bit 3  | Bit 2  | Bit 1  | Bit 0  |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| 0      | 1      |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        | ISS  |

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this ISS encoding includes ISS2, bits[36:32].

ISV, bit [24]

Instruction Syndrome Valid. Indicates whether the syndrome information in ISS[23:14] is valid.

<table>
<thead>
<tr>
<th>ISV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No valid instruction syndrome. ISS[23:14] are RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>ISS[23:14] hold a valid instruction syndrome.</td>
</tr>
</tbody>
</table>

In ESR_EL2, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For other faults reported in ESR_EL2, ISV is 0 except for the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b111111, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback).
- AArch32 instructions where the instruction:
  - Is an LDR, LDA, LDRH, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, ST, STRT, STRH, STLH, STRHT, STRB, STL, or STRBT instruction.
  - Is not performing register writeback.
  - Is not using R15 as a source or destination register.

For these stage 2 aborts, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault. ISV is 0 for all other faults reported in ESR_EL1 or ESR_EL3.

When FEAT_RAS is implemented, ISV is 0 for any synchronous External abort.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.
When FEAT_RAS is not implemented, it is \textit{IMPLEMENTATION DEFINED} whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

When FEAT_MTE is implemented, for a synchronous Tag Check Fault abort taken to ELx, ESR_ELx.FNV is 0 and FAR_ELx is valid.

On a Warm reset, this field resets to an architecturally \textit{UNKNOWN} value.

\textbf{SAS, bits [23:22]}

\textbf{When ISV == \textquoteleft\textquoteleft 1\textquoteright\textquoteright:}

Syndrome Access Size. Indicates the size of the access attempted by the faulting operation.

\begin{tabular}{|c|c|}
\hline
\textbf{SAS} & \textbf{Meaning} \\
\hline
0b0 & Byte \\
0b01 & Halfword \\
0b10 & Word \\
0b11 & Doubleword \\
\hline
\end{tabular}

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

This field is \textit{UNKNOWN} when the value of ISV is \textit{UNKNOWN}.

On a Warm reset, this field resets to an architecturally \textit{UNKNOWN} value.

\textbf{Otherwise:}

Reserved, RES0.

\textbf{SSE, bit [21]}

\textbf{When ISV == \textquoteleft\textquoteleft 1\textquoteright\textquoteright:}

Syndrome Sign Extend. For a byte, halfword, or word load operation, indicates whether the data item must be sign extended.

\begin{tabular}{|c|c|}
\hline
\textbf{SSE} & \textbf{Meaning} \\
\hline
0b0 & Sign-extension not required. \\
0b1 & Data item must be sign-extended. \\
\hline
\end{tabular}

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

For all other operations, this field is 0.

This field is \textit{UNKNOWN} when the value of ISV is \textit{UNKNOWN}.

On a Warm reset, this field resets to an architecturally \textit{UNKNOWN} value.

\textbf{Otherwise:}

Reserved, RES0.

\textbf{SRT, bits [20:16]}

\textbf{When ISV == \textquoteleft\textquoteleft 1\textquoteright\textquoteright:}

Syndrome Register Transfer. When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xt.
If the exception was taken from an Exception level that is using AArch32, then this is the AArch64 view of the register. See ‘Mapping of the general-purpose registers between the Execution states’.

This field is **UNKNOWN** when the value of ISV is **UNKNOWN**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**SF, bit [15]**

**When ISV == ‘1’:**

Width of the register accessed by the instruction is Sixty-Four.

<table>
<thead>
<tr>
<th>SF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Instruction loads/stores a 32-bit wide register.</td>
</tr>
<tr>
<td>0b1</td>
<td>Instruction loads/stores a 64-bit wide register.</td>
</tr>
</tbody>
</table>

**Note**

This field specifies the register width identified by the instruction, not the Execution state.

When **FEAT_LS64** is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

This field is **UNKNOWN** when the value of ISV is **UNKNOWN**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**AR, bit [14]**

**When ISV == ‘1’:**

Acquire/Release.

<table>
<thead>
<tr>
<th>AR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Instruction did not have acquire/release semantics.</td>
</tr>
<tr>
<td>0b1</td>
<td>Instruction did have acquire/release semantics.</td>
</tr>
</tbody>
</table>

When **FEAT_LS64** is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

This field is **UNKNOWN** when the value of ISV is **UNKNOWN**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.
VNCR, bit [13]

When FEAT_NV2 is implemented:

Indicates that the fault came from use of VNCR_EL2 register by EL1 code.

<table>
<thead>
<tr>
<th>VNCR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The fault was not generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The fault was generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.</td>
</tr>
</tbody>
</table>

This field is 0 in ESR_EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SET, bits [12:11]

When FEAT_RAS is implemented and FEAT_LS64 is not implemented:

Synchronous Error Type. When DFSC is 0b010000, describes the PE error state after taking the Data Abort exception.

<table>
<thead>
<tr>
<th>SET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Recoverable state (UER).</td>
</tr>
<tr>
<td>0b10</td>
<td>Uncontainable (UC).</td>
</tr>
<tr>
<td>0b11</td>
<td>Restartable state (UEO).</td>
</tr>
</tbody>
</table>

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_LS64 is implemented:

Load/Store Type. Used when an LD64B, ST64B, ST64BV, or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

<table>
<thead>
<tr>
<th>LST</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>An ST64BV instruction generated the Data Abort.</td>
</tr>
<tr>
<td>0b10</td>
<td>An LD64B or ST64B instruction generated the Data Abort.</td>
</tr>
<tr>
<td>0b11</td>
<td>An ST64BV0 instruction generated the Data Abort.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field is valid only if the DFSC code is 0b110101. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
**FnV, bit [10]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<table>
<thead>
<tr>
<th>FnV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FAR is valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>FAR is not valid, and holds an <strong>UNKNOWN</strong> value.</td>
</tr>
</tbody>
</table>

This field is valid only if the DFSC code is **0b010000**. It is **RES0** for all other aborts.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**EA, bit [9]**

External abort type. This bit can provide an **IMPLEMENTATION DEFINED** classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**CM, bit [8]**

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

<table>
<thead>
<tr>
<th>CM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The <strong>DC ZVA</strong>, <strong>DC GVA</strong>, and <strong>DC GZVA</strong> instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**S1PTW, bit [7]**

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

<table>
<thead>
<tr>
<th>S1PTW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault not on a stage 2 translation for a stage 1 translation table walk.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault on the stage 2 translation of an access for a stage 1 translation table walk.</td>
</tr>
</tbody>
</table>

For any abort other than a stage 2 fault this bit is **RES0**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**WnR, bit [6]**

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

<table>
<thead>
<tr>
<th>WnR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Abort caused by an instruction reading from a memory location.</td>
</tr>
<tr>
<td>0b1</td>
<td>Abort caused by an instruction writing to a memory location.</td>
</tr>
</tbody>
</table>

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.
For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of \(0b110101\) or \(0b110001\), indicating an unsupported Exclusive or atomic access.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DFSC, bits [5:0]**

Data Fault Status Code.
<table>
<thead>
<tr>
<th>DFSC</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>Address size fault, level 0 of translation or translation table base register.</td>
<td></td>
</tr>
<tr>
<td>0b000001</td>
<td>Address size fault, level 1.</td>
<td></td>
</tr>
<tr>
<td>0b000010</td>
<td>Address size fault, level 2.</td>

<td>When FEAT_RAS is not implemented</td>
</tr>
</tbody>
</table>
0b100001 Alignment fault.
0b101001 Address size fault, level -1. When FEAT_LPA2 is implemented
0b101011 Translation fault, level -1. When FEAT_LPA2 is implemented
0b110000 TLB conflict abort.
0b110001 Unsupported atomic hardware update fault. When FEAT_HAFDBS is implemented
0b110100 IMPLEMENTATION DEFINED fault (Lockdown).
0b110101 IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).

All other values are reserved.

For more information about the lookup level associated with a fault, see ‘The level associated with MMU faults’.

Note

Because Access flag faults and Permission faults can result only from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a trapped floating-point exception

24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
RES0 TFV RES0 VECITR IDF RES0 I XF U FF OFF DZF IOF

Bit [24]

Reserved, RES0.

TFV, bit [23]

Trapped Fault Valid bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions.

<table>
<thead>
<tr>
<th>TFV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are UNKNOWN.</td>
</tr>
<tr>
<td>0b1</td>
<td>One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information, see ‘Floating-point exceptions and exception traps’.</td>
</tr>
</tbody>
</table>

It is IMPLEMENTATION DEFINED whether this field is set to 0 on an exception generated by a trapped floating point exception from a vector instruction.

Note

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from a vector instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [22:11]**

Reserved, **RES0**.

**VECITR, bits [10:8]**

For a trapped floating-point exception from an instruction executed in AArch32 state this field is **RES1**.

For a trapped floating-point exception from an instruction executed in AArch64 state this field is **UNKNOWN**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IDF, bit [7]**

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is **UNKNOWN**. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>IDF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Input denormal floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Input denormal floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [6:5]**

Reserved, **RES0**.

**IXF, bit [4]**

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is **UNKNOWN**. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>IXF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Inexact floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Inexact floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**UFF, bit [3]**

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is **UNKNOWN**. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>UFF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Underflow floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Underflow floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**OFF, bit [2]**

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is **UNKNOWN**. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>OFF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Overflow floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Overflow floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DZF, bit [1]**

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is **UNKNOWN**. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>DZF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Divide by Zero floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Divide by Zero floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IOF, bit [0]**

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is **UNKNOWN**. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>IOF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Invalid Operation floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Invalid Operation floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the FPCR.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the FPSCR.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.

**ISS encoding for an SError interrupt**

**IDS, bit [24]**

IMPLEMENTATION DEFINED syndrome.

<table>
<thead>
<tr>
<th>IDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bits [23:0] of the ISS field holds the fields described in this encoding.</td>
</tr>
</tbody>
</table>

**Note**

If FEAT_RAS is not implemented, bits [23:0] of the ISS field are RES0.

| 0b1 | Bits [23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError interrupt. |

**Note**

This field was previously called ISV.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [23:14]**

Reserved, RES0.
IESB, bit [13]

When FEAT_IESB is implemented:

Implicit error synchronization event.

<table>
<thead>
<tr>
<th>IESB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The SError interrupt was either not synchronized by the implicit error synchronization event or not taken immediately.</td>
</tr>
<tr>
<td>0b1</td>
<td>The SError interrupt was synchronized by the implicit error synchronization event and taken immediately.</td>
</tr>
</tbody>
</table>

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AET, bits [12:10]

When FEAT_RAS is implemented:

Asynchronous Error Type.

When DFSC is 0b010001, describes the PE error state after taking the SError interrupt exception.

<table>
<thead>
<tr>
<th>AET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Uncontainable (UC).</td>
</tr>
<tr>
<td>0b001</td>
<td>Unrecoverable state (UEU).</td>
</tr>
<tr>
<td>0b010</td>
<td>Restartable state (UEO).</td>
</tr>
<tr>
<td>0b011</td>
<td>Recoverable state (UER).</td>
</tr>
<tr>
<td>0b110</td>
<td>Corrected (CE).</td>
</tr>
</tbody>
</table>

All other values are reserved.

If multiple errors are taken as a single SError interrupt exception, the overall PE error state is reported.

Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EA, bit [9]

When FEAT_RAS is implemented:

External abort type. When DFSC is 0b010001, provides an IMPLEMENTATION DEFINED classification of External aborts.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**Bits [8:6]**

Reserved, RES0.

**DFSC, bits [5:0]**

*When FEAT_RAS is implemented:*

Data Fault Status Code.

<table>

**ISV, bit [24]**

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:
See the EX bit description for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [23:7]**

Reserved, RES0.

**EX, bit [6]**

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

<table>
<thead>
<tr>
<th>EX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An instruction other than a Load-Exclusive instruction was stepped.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Load-Exclusive instruction was stepped.</td>
</tr>
</tbody>
</table>

If the ISV bit is set to 0, this bit is RES0, indicating no syndrome data is available.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IFSC, bits [5:0]**

Instruction Fault Status Code.

<table>
<thead>
<tr>
<th>IFSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b100010</td>
<td>Debug exception.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Software Step exceptions'.

**ISS encoding for an exception from a Watchpoint exception**

<table>
<thead>
<tr>
<th>24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0 RES0VNCR RES0 CM RES0WnR DFSC</td>
</tr>
</tbody>
</table>

**Bits [24:15]**

Reserved, RES0.

**Bit [14]**

Reserved, RES0.

**VNCR, bit [13]**

When FEAT_NV2 is implemented:

Indicates that the watchpoint came from use of VNCR_EL2 register by EL1 code.

<table>
<thead>
<tr>
<th>VNCR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The watchpoint was not generated by the use of VNCR_EL2 by EL1 code.</td>
</tr>
<tr>
<td>0b1</td>
<td>The watchpoint was generated by the use of VNCR_EL2 by EL1 code.</td>
</tr>
</tbody>
</table>

This field is 0 in ESR_EL1.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**Bits [12:9]**

Reserved, **RES0**.

**CM, bit [8]**

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance or address translation instruction:

<table>
<thead>
<tr>
<th>CM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Watchpoint exception was not generated by the execution of one of the System instructions identified in the description of value 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Watchpoint exception was generated by either the execution of a cache maintenance instruction or by a synchronous Watchpoint exception on the execution of an address translation instruction. The <strong>DC ZVA</strong>, <strong>DC GVA</strong>, and <strong>DC GZVA</strong> instructions are not classified as a cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [7]**

Reserved, **RES0**.

**WnR, bit [6]**

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

<table>
<thead>
<tr>
<th>WnR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Watchpoint exception caused by an instruction reading from a memory location.</td>
</tr>
<tr>
<td>0b1</td>
<td>Watchpoint exception caused by an instruction writing to a memory location.</td>
</tr>
</tbody>
</table>

For Watchpoint exceptions on cache maintenance and address translation instructions, this bit always returns a value of 1.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is **UNPREDICTABLE** which watchpoint generates the Watchpoint exception.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**DFSC, bits [5:0]**

Data Fault Status Code.

<table>
<thead>
<tr>
<th>DFSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b100010</td>
<td>Debug exception.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
For more information about generating these exceptions, see 'Watchpoint exceptions'.

**ISS encoding for an exception from execution of a Breakpoint instruction**

<table>
<thead>
<tr>
<th>24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0 Comment</td>
</tr>
</tbody>
</table>

**Bits [24:16]**

Reserved, RES0.

**Comment, bits [15:0]**

Set to the instruction comment field value, zero extended as necessary.
For the AArch32 BKPT instructions, the comment field is described as the immediate field.
On a Warm reset, this field resets to an architecturally UNKNOWN value.
For more information about generating these exceptions, see 'Breakpoint instruction exceptions'.

**ISS encoding for an exception from an ERET, ERETA, or ERETAB instruction**

<table>
<thead>
<tr>
<th>24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0 ERET ERETA</td>
</tr>
</tbody>
</table>

This EC value applies when FEAT_FGT is implemented, or when HCR_EL2.NV is 1.

**Bits [24:2]**

Reserved, RES0.

**ERET, bit [1]**

Indicates whether an ERET or ERETA* instruction was trapped to EL2.

<table>
<thead>
<tr>
<th>ERET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERET instruction trapped to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>ERETA or ERETAB instruction trapped to EL2.</td>
</tr>
</tbody>
</table>

If this bit is 0, the ERETA field is RES0.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**ERETA, bit [0]**

Indicates whether an ERETA or ERETAB instruction was trapped to EL2.

<table>
<thead>
<tr>
<th>ERETA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERETA instruction trapped to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>ERETAB instruction trapped to EL2.</td>
</tr>
</tbody>
</table>

When the ERET field is 0, this bit is RES0.
On a Warm reset, this field resets to an architecturally UNKNOWN value.
For more information about generating these exceptions, see HCR_EL2.NV.
If FEAT_FGT is implemented, HFGITR_EL2.ERET controls fine-grained trap exceptions from ERET, ERETA and ERETAB execution.
ISS encoding for an exception from Branch Target Identification instruction

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 |    |    | BTYPE |

Bits [24:2]

Reserved, RES0.

BTYPE, bits [1:0]

This field is set to the PSTATE.BTYPE value that generated the Branch Target Exception.

For more information about generating these exceptions, see ‘The AArch64 application level programmers model’.

ISS encoding for an exception from a Pointer Authentication instruction when HCR_EL2.API == 0 || SCR_EL3.API == 0

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

<td></td>
<td>RES0</td>
<td>Exception as a result of an Instruction key or a Data key</td>
<td></td>
</tr>
</tbody>
</table>

Bits [24:2]

Reserved, RES0.

Bit [1]

This field indicates whether the exception is as a result of an Instruction key or a Data key.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>0b0</th>
<th>Instruction Key.</th>
<th>0b1</th>
<th>Data Key.</th>
</tr>
</thead>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**Bit [0]**

This field indicates whether the exception is as a result of an A key or a B key.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0     | A key.  
| 0b1     | B key.  

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

The following instructions generate an exception when the Pointer Authentication Code (PAC) is incorrect:

- AUTIASP, AUTIAZ, AUTIA1716.
- AUTIBSP, AUTIBZ, AUTIB1716.
- AUTIA, AUTDA, AUTIB, AUTDB.
- AUTIZA, AUTIZB, AUTDZA, AUTDZB.

It is **IMPLEMENTATION DEFINED** whether the following instructions generate an exception directly from the authorization failure, rather than changing the address in a way that will generate a translation fault when the address is accessed:

- RETAA, RETAB.
- BRAA, BRAB, BLRAA, BLRAB.
- BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETA, ERETAB.
- LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

**Accessing the ESR_EL2**

When **HCR_EL2.E2H** is 1, without explicit synchronization, access from EL2 using the mnemonic ESR_EL2 or ESR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

**MRS <Xt>, ESR_EL2**

ESR_EL3, Exception Syndrome Register (EL3)

The ESR_EL3 characteristics are:

Purpose

Holds syndrome information for an exception taken to EL3.

Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to ESR_EL3 are UNDEFINED.

Attributes

ESR_EL3 is a 64-bit register.

Field descriptions

The ESR_EL3 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

ESR_EL3 is made UNKNOWN as a result of an exception return from EL3.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL3, the value of ESR_EL3 is UNKNOWN. The value written to ESR_EL3 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

Bits [63:37]

Reserved, RES0.

ISS2, bits [36:32]

When FEAT_LS64 is implemented:

If a memory access generated by an ST64BV or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

For any other Data Abort, this field is RES0.

Otherwise:

Reserved, RES0.

EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.
Possible values of the EC field are:
<table>
<thead>
<tr>
<th>EC</th>
<th>Meaning</th>
<th>ISS encoding for exceptions with an unknown reason</th>
<th>ISS encoding for an exception from a WF* instruction</th>
<th>Applies when</th>
</tr>

</table>
0b000001 or 0b000011. This includes all instructions that cause exceptions that are part of the encoding space defined in 'System instruction class encoding overview', except for those exceptions reported using EC values 0b000000, 0b000001, or 0b000011.

0b011001 Access to SVE functionality trapped as a result of CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ, that is not reported using EC 0b000000.

0b011100 Exception from a Pointer Authentication instruction authentication failure

0b011111 IMPLEMENTATION DEFINED exception to EL3.

0b100000 Instruction Abort from a lower Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.

0b100001 Instruction Abort taken without a change in Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.

0b100010 PC alignment fault exception.

0b100100 Data Abort from a lower Exception level.
Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.

**0b100101**  
Data Abort taken without a change in Exception level. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.

**0b100110**  
SP alignment fault exception.

**0b101100**  
Trapped floating-point exception taken from AArch64 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.

**0b101111**  
SError interrupt.

**0b111000**  
BRK instruction execution in AArch64 state. This is reported in ESR_EL3 only if a BRK instruction is executed.

All other EC values are reserved by Arm, and:
ESR_EL3, Exception Syndrome Register (EL3)

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is **CONstrained UnPRe dictable**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IL, bit [25]**

Instruction Length for synchronous exceptions. Possible values of this bit are:

<table>
<thead>
<tr>
<th>IL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>16-bit instruction trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>32-bit instruction trapped. This value is also used when the exception is one of the following:</td>
</tr>
<tr>
<td></td>
<td>• An SError interrupt.</td>
</tr>
<tr>
<td></td>
<td>• An Instruction Abort exception.</td>
</tr>
<tr>
<td></td>
<td>• A PC alignment fault exception.</td>
</tr>
<tr>
<td></td>
<td>• An SP alignment fault exception.</td>
</tr>
<tr>

</tr>
<tr>
<td></td>
<td>• Any debug exception except for Breakpoint instruction exceptions.</td>
</tr>
<tr>
<td></td>
<td>• An exception reported using EC value 0b000000.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**ISS, bits [24:0]**

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number.

For an exception taken from AArch32 state, see 'Mapping of the general-purpose registers between the Execution states'.

If the AArch32 register descriptor is 0b1111, then:

- If the instruction that generated the exception was not **UnPRe dictable**, the field takes the value 0b11111.
- If the instruction that generated the exception was **UnPRe dictable**, the field takes an **UNKNOWN** value that must be either:
  - The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
  - The value 0b11111.

When the EC field is 0b000000, indicating an exception with an unknown reason, the ISS field is not valid, **RES0**.

**ISS encoding for exceptions with an unknown reason**

| 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10  9  8  7  6  5  4  3  2  1  0 |
|-------------------------------|-------------------|
| RES0                           |                   |

**Bits [24:0]**

Reserved, **RES0**.

When an exception is reported using this EC code the **IL** field is set to 1.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:
• The attempted execution of an instruction bit pattern that has no allocated instruction or that is not accessible at the current Exception level and Security state, including:
  ◦ A read access using a System register pattern that is not allocated for reads or that does not permit reads at the current Exception level and Security state.
  ◦ A write access using a System register pattern that is not allocated for writes or that does not permit writes at the current Exception level and Security state.
  ◦ Instruction encodings that are unallocated.
  ◦ Instruction encodings for instructions or System registers that are not implemented in the implementation.
• In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
• In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
• In AArch32 state, attempted execution of a short vector floating-point instruction.
• In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
• An exception generated because of the value of one of the SCTLR_EL1, {ITD, SED, CP15BEN} control bits.
• Attempted execution of:
  ◦ An HVC instruction when disabled by HCR_EL2.HCD or SCR_EL3.HCE.
  ◦ An SMC instruction when disabled by SCR_EL3.SMD.
  ◦ An HLT instruction when disabled by EDSCR.HDE.
• Attempted execution of an MSR or MRS instruction to access SP_EL0 when the value of SPSEL.SP is 0.
• Attempted execution of an MSR or MRS instruction using a _EL12 register name when HCR_EL2.E2H == 0.
• Attempted execution, in Debug state, of:
  ◦ A DCPS1 instruction when the value of HCR_EL2.TGE is 1 and EL2 is disabled or not implemented in the current Security state.
  ◦ A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.
  ◦ A DCPS3 instruction when the value of EDSCR.SDD is 1, or when EL3 is not implemented.
• When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using R13_mon. See ‘Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32’.
• In Debug state when the value of EDSCR.SDD is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.
• In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to SPSR_mon, SP_mon, or LR_mon.
• An exception that is taken to EL2 because the value of HCR_EL2.TGE is 1 that, if the value of HCR_EL2.TGE was 0 would have been reported with an ESR_ELx.EC value of 0b000111.

</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

• When an A32 instruction is trapped, CV is set to 1.
• When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:2]

Reserved, RES0.

TI, bits [1:0]

Trapped instruction. Possible values of this bit are:

<table>
<thead>
<tr>
<th>TI</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>WFI trapped.</td>
<td></td>
</tr>
<tr>

<td>When FEAT_WFxT is implemented</td>
</tr>
<tr>
<td>0b11</td>
<td>WFET trapped.</td>
<td>When FEAT_WFxT is implemented</td>
</tr>
</tbody>
</table>

When FEAT_WFxT is implemented, this is a two bit field as shown. Otherwise, bit[1] is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating this exception:

- SCTL_EL1.\{nTWE, nTWI\}.
- HCR_EL2.\{TWE, TWI\}.
- SCR_EL3.\{TWE, TWI\}.

<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.
For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to \(0b1110\).

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to \(0b1110\).
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to \(0b1110\), the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to \(0b1110\), or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Opc2, bits [19:17]**

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value \(0b000\).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Opc1, bits [16:14]**

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value \(0b111\).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CRn, bits [13:10]**

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Rt, bits [9:5]**

The Rt value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.
On a Warm reset, this field resets to an architecturally unknown value.

**CRm, bits [4:1]**

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value 0b0000.

On a Warm reset, this field resets to an architecturally unknown value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction.

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Write to System register space. MCR instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read from System register space. MRC or VMRS instruction.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally unknown value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000011:

- **CNTKCTL_EL1** (EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN), for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **PMUSERENR_EL0** (ER, CR, SW, EN), for accesses to Performance Monitor registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **AMUSERENR_EL0** EN, for accesses to Activity Monitors registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **HCR_EL2** (TRVM, TVM), for accesses to virtual memory control registers from EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **HCR_EL2**.TTLB, for execution of TLB maintenance instructions at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **HCR_EL1**.TSW, TPC, MPU, for execution of cache maintenance instructions at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **HCR_EL2**.TACR, for accesses to the Auxiliary Control Register at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **HCR_EL2**.TIDCP, for accesses to lockdown, DMA, and TCM operations at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **HCR_EL2**.TID1, TID2, TID3, for accesses to ID registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **CPTR_EL2**.TCPAC, for accesses to CPACR_EL1 or CPACR using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **HSTR_EL2**.T<n>, for accesses to System registers using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **CNTHCTL_EL2**.EL1PCEN, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **MDCR_EL2**.TPM, TPMCR, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **CPTR_EL2**.TAM, for accesses to Activity Monitors registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **MDCR_EL3**.TCPAC, for accesses to CPACR from EL1 and EL2, and accesses to HCPTR from EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- **MDCR_EL3**.TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- **CPTR_EL3**.TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- For information on other traps using EC value 0b000011, see ‘Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32’.
- If FEAT_FGT is implemented, MCR or MRC access to some registers at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000101:

- **CPACR_EL1**.TTA for accesses to trace registers, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
• **MDSCR_EL1.TDCC**, for accesses to the Debug Communications Channel (DCC) registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.

• If FEAT_FGT is implemented, **MDCR_EL2.TDCC** for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and **MDCR_EL3.TDCC** for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.

• **HCR_EL2.TID0**, for accesses to the **JIDR** register in the ID group 0 at EL0 and EL1 using AArch32, MRC access (coproc == 0b1110) trapped to EL2.

• **CPTER_EL2.TTA**, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.

• **MDCR_EL2.TDRA**, for accesses to Debug ROM registers **DBGDRAR** and AArch-DBGDSAR using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.

• **MDCR_EL2.TDOSA**, for accesses to powerdown debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.

• **MDCR_EL2.TDA**, for accesses to other debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.

• **CPTR_EL3.TTA**, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.

• **MDCR_EL3.TDOSA**, for accesses to powerdown debug registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.

• **MDCR_EL3.TDA**, for accesses to other debug registers, using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b001000:

• **HCR_EL2.TID0**, for accesses to the **FPSID** register in ID group 0 at EL1 using AArch32 state, VMRS access trapped to EL2.

• **HCR_EL2.TID3**, for accesses to registers in ID group 3 including **MVFR0**, **MVFR1**, and **MVFR2**, VMRS access trapped to EL2.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is **IMPLEMENTATION DEFINED** whether CV is set to 1 or set to 0. See the description of the COND field for more information.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to **0b1110**.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to **0b1110**.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to **0b1110**, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is **IMPLEMENTATION DEFINED** whether:
  - CV is set to 0 and COND is set to an **UNKNOWN** value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is **IMPLEMENTATION DEFINED** whether the COND field is set to **0b1110**, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Opc1, bits [19:16]**

The Opc1 value from the issued instruction.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [15]**

Reserved, RES0.

**Rt2, bits [14:10]**

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Rt, bits [9:5]**

The Rt value from the issued instruction, the first general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**CRm, bits [4:1]**

The CRm value from the issued instruction.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Direction, bit [0]

Indicates the direction of the trapped instruction.

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Write to System register space. MCRR instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read from System register space. MRRC instruction.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

The following fields describe configuration settings for generating exceptions that are reported using EC value **0b001100**:

- **CNTKCTL_EL1**, \{EL0PTEN, EL0VTEN, EL0PCTEN, ELOVCTEN\}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **PMUSERENR_EL0**, \{CR, EN\}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **AMUSERENR_EL0**, \{EN\}, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **HCR_EL2**, \{TRVM, TVM\}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **HSTR_EL2.T<n>**, for accesses to System registers using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **CNTHCTL_EL2**, \{EL1PCEN, EL1PCTEN\}, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **MDCR_EL2**, \{TPM, TPMCR\}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **CPTR_EL2.TAM**, for accesses to Activity Monitors registers registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **MDCR_EL3.TPM**, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- **CPTR_EL3.TAM**, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- If FEAT_FGT is implemented, **HDFGRTR_EL2**, PMCCNTR_EL0 for MRRC access and **HDFGWTR_EL2**, PMCCNTR_EL0 for MCRR access to **PMCCNTR** at EL0, trapped to EL2.

The following sections describe configuration settings for generating exceptions that are reported using EC value **0b001100**:

- **MDSCR_EL1.TDCC**, for accesses to the Debug ROM registers DBGDSAR and DBGDRAR at EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- **MDCR_EL2.TDRA**, for accesses to Debug ROM registers DBGDRAR and AArch-DBGDSAR using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- **MDCR_EL3.TDA**, for accesses to debug registers, using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.
- **CPACR_EL1.TTA** for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- **CPTR_EL2.TTA**, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- **CPTR_EL3.TTA**, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.

**Note**

If the Armv8-A architecture is implemented with an ETMv4 implementation, MCRR and MRRC accesses to trace registers are **UNDEFINED** and the resulting exception is higher priority than an exception due to these traps.

**ISS encoding for an exception from an LDC or STC instruction**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

**CV, bit [24]**

Condition code valid.

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**imm8, bits [19:12]**

The immediate value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [11:10]**

Reserved, RES0.

**Rn, bits [9:5]**

The Rn value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Offset, bit [4]

Indicates whether the offset is added or subtracted:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Subtract offset.</td>
</tr>
<tr>
<td>0b1</td>
<td>Add offset.</td>
</tr>
</tbody>
</table>

This bit corresponds to the U bit in the instruction encoding.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**AM, bits [3:1]**

Addressing mode. The permitted values of this field are:

<table>
<thead>
<tr>
<th>AM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Immediate unindexed.</td>
</tr>
<tr>
<td>0b001</td>
<td>Immediate post-indexed.</td>
</tr>
<tr>
<td>0b010</td>
<td>Immediate offset.</td>
</tr>
<tr>
<td>0b011</td>
<td>Immediate pre-indexed.</td>
</tr>
<tr>
<td>0b100</td>
<td>For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.</td>
</tr>
<tr>
<td>0b101</td>
<td>For a trapped STC instruction, this encoding is reserved.</td>
</tr>
</tbody>
</table>

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is **CONSTRAINED UNPREDICTABLE**, as described in 'Reserved values in System and memory-mapped registers and translation table entries'.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits \{P, W\} in the instruction encoding.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction.

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Write to memory. STC instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read from memory. LDC instruction.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000110:

- **MDSCR_EL1.TDCC**, for accesses using AArch32 state, LDC access to **DBGDTRXint** or STC access to **DBGDTRRXint** trapped to EL1 or EL2.
- **MDCR_EL2.TDA**, for accesses using AArch32 state, LDC access to **DBGDTRXint** or STC access to **DBGDTRRXint** MCR or MRC access trapped to EL2.
- **MDCR_EL3.TDA**, for accesses using AArch32 state, LDC access to **DBGDTRXint** or STC access to **DBGDTRRXint** MCR or MRC access trapped to EL3.
- If **FEAT_FGT** is implemented, **MDCR_EL2.TDCC** for LDC and STC accesses to the DCC registers at EL0 and EL1 trapped to EL2, and **MDCR_EL3.TDCC** for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.

**ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEN and TFP traps**

```
  24 23 22 21 20 19 18 17 16 15 14 13 12 11 10  9  8  7  6  5  4  3  2  1  0
 CV COND RES0
```

The accesses covered by this trap include:
• Execution of SVE or Advanced SIMD and floating-point instructions.
• Accesses to the Advanced SIMD and floating-point System registers.

For an implementation that does not include either SVE or support for floating-point and Advanced SIMD, the exception is reported using the EC value 0b000000.

**CV, bit [24]**

Condition code valid.

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

• When an A32 instruction is trapped, CV is set to 1.
• When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

• When an A32 instruction is trapped, CV is set to 1 and:
  ◦ If the instruction is conditional, COND is set to the condition code field value from the instruction.
  ◦ If the instruction is unconditional, COND is set to 0b1110.
• A conditional A32 instruction that is known to pass its condition code check can be presented either:
  ◦ With COND set to 0b1110, the value for unconditional.
  ◦ With the COND value held in the instruction.
• When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  ◦ CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  ◦ CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
• For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [19:0]**

Reserved, RES0.

The following sections describe the configuration settings for the traps that are reported using EC value 0b000111:

• **CPACR_EL1.FPEN**, for accesses to SIMD and floating-point registers trapped to EL1.
• **CPTR_EL2.TFP**, for accesses to SIMD and floating-point registers trapped to EL2.
• **CPTR_EL3.TFP**, for accesses to SIMD and floating-point registers trapped to EL3.
ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [24:16]**

Reserved, RES0.

**imm16, bits [15:0]**

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.
For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is "UNKNOWN".

On a Warm reset, this field resets to an architecturally "UNKNOWN" value.

In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see 'SVC' and 'HVC'.

For A64 instructions, see 'SVC' and 'HVC'.

If FEAT_FGT is implemented, HFGITR_EL2 {SVC_EL1, SVC_EL0} control fine-grained traps on SVC execution.

### ISS encoding for an exception from SMC instruction execution in AArch32 state

<table>
<thead>
<tr>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is "RES0".

For an SMC instruction that is trapped to EL2 from EL1 because HCR_EL2.TSC is 1, the ISS encoding is as shown in the diagram.

### CV, bit [24]

Condition code valid.

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is "IMPLEMENTATION DEFINED" whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is valid only if CKNOWNPASS is 1, otherwise it is "RES0".

On a Warm reset, this field resets to an architecturally "UNKNOWN" value.

### COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
With the COND value held in the instruction.

- When a T32 instruction is trapped, it is **IMPLEMENTATION DEFINED** whether:
  - CV is set to 0 and COND is set to an **UNKNOWN** value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is **IMPLEMENTATION DEFINED** whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is valid only if CCKNOWNPASS is 1, otherwise it is res0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**CCKNOWNPASS, bit [19]**

Indicates whether the instruction might have failed its condition code check.

<table>
<thead>
<tr>
<th>CCKNOWNPASS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The instruction was unconditional, or was conditional and passed its condition code check.</td>
</tr>
<tr>
<td>0b1</td>
<td>The instruction was conditional, and might have failed its condition code check.</td>
</tr>
</tbody>
</table>

**Note**

In an implementation in which an SMC instruction that fails it code check is not trapped, this field can always return the value 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [18:0]**

Reserved, res0.

HCR_EL2.TSC describes the configuration settings for trapping SMC instructions to EL2.

'System calls' describes the case where these exceptions are trapped to EL3.

**ISS encoding for an exception from SMC instruction execution in AArch64 state**

```
  24 23 22 21 20 19 18 17 16 15 14 13 12 11 10  9  8  7  6  5  4  3  2  1  0
  |RES0|imm16|
```

**Bits [24:16]**

Reserved, res0.

**imm16, bits [15:0]**

The value of the immediate field from the issued SMC instruction.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

HCR_EL2.TSC describes the configuration settings for trapping SMC from EL1 modes.
‘System calls' describes the case where these exceptions are trapped to EL3.

**ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state**

</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

For exceptions caused by System instructions, see ‘System instructions' subsection of 'Branches, exception generating and System instructions' for the encoding values returned by an instruction.
The following fields describe configuration settings for generating the exception that is reported using EC value 0b011000:

- **SCTLR_EL1.UCI**, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **SCTLR_EL1.UCT**, for accesses to **CTR_EL0** using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **SCTLR_EL1.DZE**, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **SCTLR_EL1.UMA**, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **CPACR_EL1.TTA**, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **MDSCR_EL1.TDCC**, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- If FEAT_FGT is implemented, **MDCR_EL2.TDCC** for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and **MDCR_EL3.TDCC** for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- **CNTKCTL_EL1.EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCCTEN** accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **PMUSERENR_EL0.ER, CR, SW, EN**, for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **AMUSERENR_EL0.ER, CR, SW, EN**, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **HCR_EL2.TRVM, TVM**, for accesses to virtual memory control registers using AArch64 state, MSR or MRS access trapped to EL2.
- **HCR_EL2.TID1, TID2, TID3**, for accesses to ID group 1, ID group 2 or ID group 3 registers, using AArch64 state, MSR or MRS access trapped to EL2.
- **CPTR_EL2.TCPAC**, for accesses to **CPACR_EL1**, using AArch64 state, MSR or MRS access trapped to EL2.
- **CPTR_EL2.TTA**, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL2.
- **MDCR_EL2.TRF**, for accesses to the trace filter control register, **TRFCR_EL1**, using AArch64 state, MSR or MRS access trapped to EL2.
- **MDCR_EL2.TDRA**, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.
- **MDCR_EL2.TDOSA**, for accesses to powerdown debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- **CNTHCTL_EL2.EL1PCEN, EL1PCCTEN**, for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.
- **DCR_EL2.TDA**, for accesses to registers using AArch64 state, MSR or MRS access trapped to EL2.
- **MDCR_EL2.TPM, TPMCR**, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL2.
- **CPTR_EL2.TAM**, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.
- **HCR_EL2.APK**, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL2.
- **HCR_EL2.NV, NV1**, for Nested virtualization register access, using AArch64 state, MSR or MRS access, trapped to EL2.
- **HCR_EL2.AT**, for execution of AT S1E* instructions, using AArch64 state, MSR or MRS access, trapped to EL2.
- **SCR_EL3.APK**, for accesses to RAS registers, using AArch64 state, MSR or MRS access, trapped to EL3.
- **SCR_EL3.APK**, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL3.
- **SCR_EL3.ST**, for accesses to the Counter-timer Physical Secure timer registers, using AArch64 state, MSR or MRS access trapped to EL3.
• **CPTR_EL3.TCPAC**, for accesses to **CPTR_EL2** and **CPACR_EL1** using AArch64 state, MSR or MRS access trapped to EL3.
• **CPTR_EL2.TTA**, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL3.
• **MDCR_EL3.TTRF**, for accesses to the trace filter control registers, **TRFCR_EL1** and **TRFCR_EL2**, using AArch64 state, MSR or MRS access trapped to EL3.
• **MDCR_EL3.TDA**, for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
• **MDCR_EL3.TTOSA**, for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
• **MDCR_EL3.TPM**, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.
• **CPTR_EL3.TAM**, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access, trapped to EL3.
• If **FEAT.EVT** is implemented, the following registers control traps for EL1 and EL0 Cache controls that use this EC value:
  - **HCR_EL2.{TTLBOS, TTLBIS, TICAB, TOCU, TID4}**.
  - **HCR2.{TTLBIS, TICAB, TOCU, TID4}**.
• If **FEAT_FGT** is implemented:
  - **SCR_EL3.FGTEn**, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
  - **HFGITR_EL2** for reads and **HFGWTR_EL2** for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
  - **HDFGRTR_EL2** for reads and **HDFGWTR_EL2** for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
  - **HAFGRTR_EL2** for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.

### ISS encoding for an IMPLEMENTATION DEFINED exception to EL3

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |

**IMPLEMENTATION DEFINED**, bits [24:0]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### ISS encoding for an exception from an Instruction Abort

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | SET | FnVEA | RES0 | S1PTW | RES0 | IFSC |

**Bits [24:13]**

Reserved, RES0.

**SET, bits [12:11]**

When **FEAT_RAS** is implemented:

Synchronous Error Type. When IFSC is 0b010000, describes the PE error state after taking the Instruction Abort exception.

<table>
<thead>
<tr>
<th>SET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Recoverable state (UER).</td>
</tr>
<tr>
<td>0b10</td>
<td>Uncontainable (UC).</td>
</tr>
<tr>
<td>0b11</td>
<td>Restartable state (UEO).</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Note**
Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**FnV, bit [10]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<table>
<thead>
<tr>
<th>FnV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FAR is valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>FAR is not valid, and holds an UNKNOWN value.</td>
</tr>
</tbody>
</table>

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EA, bit [9]**

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [8]**

Reserved, RES0.

**S1PTW, bit [7]**

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

<table>
<thead>
<tr>
<th>S1PTW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault not on a stage 2 translation for a stage 1 translation table walk.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault on the stage 2 translation of an access for a stage 1 translation table walk.</td>
</tr>
</tbody>
</table>

For any abort other than a stage 2 fault this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [6]**

Reserved, RES0.

**IFSC, bits [5:0]**

Instruction Fault Status Code.
<table>

<tr>
<td>0b101000</td>
<td>Address size fault, level -1.</td>
<td>When FEAT_LPA2 is implemented</td>
</tr>
</tbody>
</table>
Translation fault, level -1. When FEAT_LPA2 is implemented
TLB conflict abort.
Unsupported atomic hardware update fault.

All other values are reserved.

For more information about the lookup level associated with a fault, see ‘The level associated with MMU faults’.

Note

Because Access flag faults and Permission faults can result only from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage 2 translation that is translating a stage 1 translation walk.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a Data Abort

<table>
<thead>
<tr>
<th>ISV</th>
<th>SAS</th>
<th>SSE</th>
<th>SRT</th>
<th>SF</th>
<th>AR</th>
<th>VNCR</th>
<th>Bits[12:11]</th>
<th>Fr</th>
<th>V</th>
<th>EA</th>
<th>CM</th>
<th>S1PTW</th>
<th>WnR</th>
<th>DFSC</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No valid instruction syndrome. ISS[23:14] are RES0.</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>ISS[23:14] hold a valid instruction syndrome.</td>
<td></td>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

In ESR_EL2, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For other faults reported in ESR_EL2, ISV is 0 except for the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b11111, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback).
- AArch32 instructions where the instruction:
  - Is an LDR, LDA, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STL, or STRBT instruction.
  - Is not performing register writeback.
  - Is not using R15 as a source or destination register.

For these stage 2 aborts, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault. ISV is 0 for all other faults reported in ESR_EL1 or ESR_EL3.

When FEAT_RAS is implemented, ISV is 0 for any synchronous External abort.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.
When FEAT_RAS is not implemented, it is implementation defined whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

When FEAT_MTE is implemented, for a synchronous Tag Check Fault abort taken to ELx, ESR_ELx.FNV is 0 and FAR_ELx is valid.

On a Warm reset, this field resets to an architecturally unknown value.

**SAS, bits [23:22]**

*When ISV == '1':*

Syndrome Access Size. Indicates the size of the access attempted by the faulting operation.

<table>
<thead>
<tr>
<th>SAS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Byte</td>
</tr>
<tr>
<td>0b01</td>
<td>Halfword</td>
</tr>
<tr>
<td>0b10</td>
<td>Word</td>
</tr>
<tr>
<td>0b11</td>
<td>Doubleword</td>
</tr>
</tbody>
</table>

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

This field is unknown when the value of ISV is unknown.

On a Warm reset, this field resets to an architecturally unknown value.

*Otherwise:*

Reserved, RES0.

**SSE, bit [21]**

*When ISV == '1':*

Syndrome Sign Extend. For a byte, halfword, or word load operation, indicates whether the data item must be sign extended.

<table>
<thead>
<tr>
<th>SSE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sign-extension not required.</td>
</tr>
<tr>
<td>0b1</td>
<td>Data item must be sign-extended.</td>
</tr>
</tbody>
</table>

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

For all other operations, this field is 0.

This field is unknown when the value of ISV is unknown.

On a Warm reset, this field resets to an architecturally unknown value.

*Otherwise:*

Reserved, RES0.

**SRT, bits [20:16]**

*When ISV == '1':*

Syndrome Register Transfer. When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xt.
If the exception was taken from an Exception level that is using AArch32, then this is the AArch64 view of the register. See ‘Mapping of the general-purpose registers between the Execution states’.

This field is **UNKNOWN** when the value of ISV is **UNKNOWN**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**SF, bit [15]**

**When ISV == ‘1’:**

Width of the register accessed by the instruction is Sixty-Four.

<table>
<thead>
<tr>
<th>SF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Instruction loads/stores a 32-bit wide register.</td>
</tr>
<tr>
<td>0b1</td>
<td>Instruction loads/stores a 64-bit wide register.</td>
</tr>
</tbody>
</table>

**Note**

This field specifies the register width identified by the instruction, not the Execution state.

When FEAT LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

This field is **UNKNOWN** when the value of ISV is **UNKNOWN**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**AR, bit [14]**

**When ISV == ‘1’:**

Acquire/Release.

<table>
<thead>
<tr>
<th>AR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Instruction did not have acquire/release semantics.</td>
</tr>
<tr>
<td>0b1</td>
<td>Instruction did have acquire/release semantics.</td>
</tr>
</tbody>
</table>

When FEAT LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

This field is **UNKNOWN** when the value of ISV is **UNKNOWN**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.
VNCR, bit [13]

When FEAT_NV2 is implemented:

Indicates that the fault came from use of VNCR_EL2 register by EL1 code.

<table>
<thead>
<tr>
<th>VNCR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The fault was not generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The fault was generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.</td>
</tr>
</tbody>
</table>

This field is 0 in ESR_EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SET, bits [12:11]

When FEAT_RAS is implemented and FEAT_LS64 is not implemented:

Synchronous Error Type. When DFSC is 0b010000, describes the PE error state after taking the Data Abort exception.

<table>
<thead>
<tr>
<th>SET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Recoverable state (UER).</td>
</tr>
<tr>
<td>0b10</td>
<td>Uncontainable (UC).</td>
</tr>
<tr>
<td>0b11</td>
<td>Restartable state (UEO).</td>
</tr>
</tbody>
</table>

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_LS64 is implemented:

Load/Store Type. Used when an LD64B, ST64B, ST64BV, or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

<table>
<thead>
<tr>
<th>LST</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>An ST64BV instruction generated the Data Abort.</td>
</tr>
<tr>
<td>0b10</td>
<td>An LD64B or ST64B instruction generated the Data Abort.</td>
</tr>
<tr>
<td>0b11</td>
<td>An ST64BV0 instruction generated the Data Abort.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field is valid only if the DFSC code is 0b110101. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<table>
<thead>
<tr>
<th>FnV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FAR is valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>FAR is not valid, and holds an UNKNOWN value.</td>
</tr>
</tbody>
</table>

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

<table>
<thead>
<tr>
<th>CM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA, DC GVA, and DC GZVA instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

<table>
<thead>
<tr>
<th>S1PTW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault not on a stage 2 translation for a stage 1 translation table walk.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault on the stage 2 translation of an access for a stage 1 translation table walk.</td>
</tr>
</tbody>
</table>

For any abort other than a stage 2 fault this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

<table>
<thead>
<tr>
<th>WnR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Abort caused by an instruction reading from a memory location.</td>
</tr>
<tr>
<td>0b1</td>
<td>Abort caused by an instruction writing to a memory location.</td>
</tr>
</tbody>
</table>

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.
For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of \(0b110101\) or \(0b110001\), indicating an unsupported Exclusive or atomic access.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DFSC, bits [5:0]**

Data Fault Status Code.

</tbody>
</table>
Alignment fault.

Address size fault, level -1. When FEAT_LPA2 is implemented

Translation fault, level -1. When FEAT_LPA2 is implemented

TLB conflict abort.

Unsupported atomic hardware update fault. When FEAT_HAFDBS is implemented

IMPLEMENTATION DEFINED fault (Lockdown).

IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

Note

Because Access flag faults and Permission faults can result only from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**ISS encoding for an exception from a trapped floating-point exception**

| Bit 24 | Bit 23 | Bit 22 | Bit 21 | Bit 20 | Bit 19 | Bit 18 | Bit 17 | Bit 16 | Bit 15 | Bit 14 | Bit 13 | Bit 12 | Bit 11 | Bit 10 | Bit 9  | Bit 8  | Bit 7  | Bit 6  | Bit 5  | Bit 4  | Bit 3  | Bit 2  | Bit 1  | Bit 0  |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| RES0   | TFV    | RES0   | VECITR | IDF    | RES0   | IXF    | UFF    | OFF    | DZF    | IOF    |

**Bit [24]**

Reserved, RES0.

**TFV, bit [23]**

Trapped Fault Valid bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions.

<table>
<thead>
<tr>
<th>TFV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are UNKNOWN.</td>
</tr>
<tr>
<td>0b1</td>
<td>One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information, see 'Floating-point exceptions and exception traps'.</td>
</tr>
</tbody>
</table>

It is IMPLEMENTATION DEFINED whether this field is set to 0 on an exception generated by a trapped floating-point exception from a vector instruction.

**Note**

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from a vector instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [22:11]**

Reserved, RES0.

**VECITR, bits [10:8]**

For a trapped floating-point exception from an instruction executed in AArch32 state this field is RES1.
For a trapped floating-point exception from an instruction executed in AArch64 state this field is UNKNOWN.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IDF, bit [7]**

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>IDF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Input denormal floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Input denormal floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [6:5]**

Reserved, RES0.

**IXF, bit [4]**

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>IXF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Inexact floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Inexact floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**UFF, bit [3]**

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>UFF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Underflow floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Underflow floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**OFF, bit [2]**

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>OFF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Overflow floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Overflow floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**DZF, bit [1]**

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is **UNKNOWN**. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>DZF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Divide by Zero floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Divide by Zero floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IOF, bit [0]**

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is **UNKNOWN**. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>IOF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Invalid Operation floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Invalid Operation floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the FPSCR.\{IDE, IXE, UFE, OFE, DZE, IOE\} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the FPSCR.\{IDE, IXE, UFE, OFE, DZE, IOE\} bits enable each of the floating-point exception traps.

**ISS encoding for an SError interrupt**

```
| IDS | RES0 | IESB | AET | EA | RES0 | DFSC |
```

**IDS, bit [24]**

**IMPLEMENTATION DEFINED** syndrome.

<table>
<thead>
<tr>
<th>IDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bits [23:0] of the ISS field holds the fields described in this encoding.</td>
</tr>
</tbody>
</table>

**Note**

If FEAT_RAS is not implemented, bits [23:0] of the ISS field are RES0.

| 0b1  | Bits [23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError interrupt. |

**Note**

This field was previously called ISV.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [23:14]**

Reserved, RES0.
IESB, bit [13]

When FEAT_IESB is implemented:

Implicit error synchronization event.

<table>
<thead>
<tr>
<th>IESB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The SError interrupt was either not synchronized by the implicit error synchronization event or not taken immediately.</td>
</tr>
<tr>
<td>0b1</td>
<td>The SError interrupt was synchronized by the implicit error synchronization event and taken immediately.</td>
</tr>
</tbody>
</table>

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AET, bits [12:10]

When FEAT_RAS is implemented:

Asynchronous Error Type.

When DFSC is 0b010001, describes the PE error state after taking the SError interrupt exception.

<table>
<thead>
<tr>
<th>AET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Uncontainable (UC).</td>
</tr>
<tr>
<td>0b001</td>
<td>Unrecoverable state (UEU).</td>
</tr>
<tr>
<td>0b010</td>
<td>Restartable state (UEO).</td>
</tr>
<tr>
<td>0b011</td>
<td>Recoverable state (UER).</td>
</tr>
<tr>
<td>0b110</td>
<td>Corrected (CE).</td>
</tr>
</tbody>
</table>

All other values are reserved.

If multiple errors are taken as a single SError interrupt exception, the overall PE error state is reported.

Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EA, bit [9]

When FEAT_RAS is implemented:

External abort type. When DFSC is 0b010001, provides an IMPLEMENTATION DEFINED classification of External aborts.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

Bits [8:6]

Reserved, RES0.

DFSC, bits [5:0]

When FEAT_RAS is implemented:

Data Fault Status Code.

<table>
<thead>
<tr>
<th>DFSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>Uncategorized error.</td>
</tr>
<tr>
<td>0b010001</td>
<td>Asynchronous SError interrupt.</td>
</tr>
</tbody>
</table>

All other values are reserved.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ISS encoding for an exception from a Breakpoint or Vector Catch debug exception

| 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |
|------------------------|------------------------|
|                        |                        |
| RES0                   | IFSC                   |

Bits [24:6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code.

<table>
<thead>
<tr>
<th>IFSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b100010</td>
<td>Debug exception.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions:

- For exceptions from AArch64, see ‘Breakpoint exceptions’.
- For exceptions from AArch32, see ‘Breakpoint exceptions’ and ‘Vector Catch exceptions’.

ISS encoding for an exception from a Software Step exception

| 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |
|------------------------|------------------------|
| ISV                    | RES0                   | EX       | IFSC     |

ISV, bit [24]

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:
See the EX bit description for more information.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [23:7]**

Reserved, **RES0**.

**EX, bit [6]**

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

<table>
<thead>
<tr>
<th>EX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An instruction other than a Load-Exclusive instruction was stepped.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Load-Exclusive instruction was stepped.</td>
</tr>
</tbody>
</table>

If the ISV bit is set to 0, this bit is **RES0**, indicating no syndrome data is available.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IFSC, bits [5:0]**

Instruction Fault Status Code.

<table>
<thead>
<tr>
<th>IFSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b100010</td>
<td>Debug exception.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

For more information about generating these exceptions, see ‘Software Step exceptions’.

**ISS encoding for an exception from a Watchpoint exception**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0| RES0|VNC R| RES0| CM | RES0| WnR| DF SC|

**Bits [24:15]**

Reserved, **RES0**.

**Bit [14]**

Reserved, **RES0**.

**VNCR, bit [13]**

When **FEAT_NV2** is implemented:

Indicates that the watchpoint came from use of **VNCR_EL2** register by EL1 code.

<table>
<thead>
<tr>
<th>VNCR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The watchpoint was not generated by the use of <strong>VNCR_EL2</strong> by EL1 code.</td>
</tr>
<tr>
<td>0b1</td>
<td>The watchpoint was generated by the use of <strong>VNCR_EL2</strong> by EL1 code.</td>
</tr>
</tbody>
</table>

This field is 0 in **ESR_EL1**.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**Bits [12:9]**

Reserved, **RES0**.

**CM, bit [8]**

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance or address translation instruction:

<table>
<thead>
<tr>
<th>CM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Watchpoint exception was not generated by the execution of one of the System instructions identified in the description of value 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Watchpoint exception was generated by either the execution of a cache maintenance instruction or by a synchronous Watchpoint exception on the execution of an address translation instruction. The <strong>DC ZVA</strong>, <strong>DC GVA</strong>, and <strong>DC GZVA</strong> instructions are not classified as a cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [7]**

Reserved, **RES0**.

**WnR, bit [6]**

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

<table>
<thead>
<tr>
<th>WnR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Watchpoint exception caused by an instruction reading from a memory location.</td>
</tr>
<tr>
<td>0b1</td>
<td>Watchpoint exception caused by an instruction writing to a memory location.</td>
</tr>
</tbody>
</table>

For Watchpoint exceptions on cache maintenance and address translation instructions, this bit always returns a value of 1.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is **UNPREDICTABLE** which watchpoint generates the Watchpoint exception.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**DFSC, bits [5:0]**

Data Fault Status Code.

<table>
<thead>
<tr>
<th>DFSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b100010</td>
<td>Debug exception.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
For more information about generating these exceptions, see 'Watchpoint exceptions'.

**ISS encoding for an exception from execution of a Breakpoint instruction**

<table>
<thead>
<tr>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This EC value applies when FEAT_FGT is implemented, or when HCR_EL2.NV is 1.

**Bits [24:2]**

Reserved, RES0.

**ERET, bit [1]**

Indicates whether an ERET or ERETA* instruction was trapped to EL2.

<table>
<thead>
<tr>
<th>ERET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERET instruction trapped to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>ERETA or ERETAB instruction trapped to EL2.</td>
</tr>
</tbody>
</table>

If this bit is 0, the ERETA field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**ERETA, bit [0]**

Indicates whether an ERETA or ERETAB instruction was trapped to EL2.

<table>
<thead>
<tr>
<th>ERETA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERETA instruction trapped to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>ERETAB instruction trapped to EL2.</td>
</tr>
</tbody>
</table>

When the ERET field is 0, this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see HCR_EL2.NV.

If FEAT_FGT is implemented, HFGITR_EL2.ERET controls fine-grained trap exceptions from ERET, ERETA and ERETAB execution.

Bits [24:2]

Reserved, RES0.

Bit [1]

This field indicates whether the exception is as a result of an Instruction key or a Data key.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**Bit [0]**

This field indicates whether the exception is as a result of an A key or a B key.

<table>
<thead>
<tr>
<th>Meaning</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A key.</td>
</tr>
<tr>
<td>0b1</td>
<td>B key.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

The following instructions generate an exception when the Pointer Authentication Code (PAC) is incorrect:

- AUTIASP, AUTIAZ, AUTIA1716.
- AUTIBSP, AUTIBZ, AUTIB1716.
- AUTIA, AUTDA, AUTIB, AUTDB.
- AUTIZA, AUTIZB, AUTDZA, AUTDZB.

It is **IMPLEMENTATION DEFINED** whether the following instructions generate an exception directly from the authorization failure, rather than changing the address in a way that will generate a translation fault when the address is accessed:

- RETAA, RETAB.
- BRAA, BRAB, BLRAA, BLRAB.
- BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETTA, ERETAB.
- LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

**Accessing the ESR_EL3**

FAR_EL1, Fault Address Register (EL1)

The FAR_EL1 characteristics are:

**Purpose**

Holds the faulting Virtual Address for all synchronous Instruction or Data Abort, PC alignment fault and Watchpoint exceptions that are taken to EL1.

**Configuration**

AArch64 System register FAR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DFAR[31:0] (NS).

AArch64 System register FAR_EL1 bits [63:32] are architecturally mapped to AArch32 System register IFAR[31:0] (NS).

**Attributes**

FAR_EL1 is a 64-bit register.

**Field descriptions**

The FAR_EL1 bit assignments are:

| Bit 63 | Bit 62 | Bit 61 | Bit 60 | Bit 59 | Bit 58 | Bit 57 | Bit 56 | Bit 55 | Bit 54 | Bit 53 | Bit 52 | Bit 51 | Bit 50 | Bit 49 | Bit 48 | Bit 47 | Bit 46 | Bit 45 | Bit 44 | Bit 43 | Bit 42 | Bit 41 | Bit 40 | Bit 39 | Bit 38 | Bit 37 | Bit 36 | Bit 35 | Bit 34 | Bit 33 | Bit 32 |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| 63     | 62     | 61     | 60     | 59     | 58     | 57     | 56     | 55     | 54     | 53     | 52     | 51     | 50     | 49     | 48     | 47     | 46     | 45     | 44     | 43     | 42     | 41     | 40     | 39     | 38     | 37     | 36     | 35     | 34     | 33     | 32     |
|---------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| Faulting Virtual Address for synchronous exceptions taken to EL1 |
| Faulting Virtual Address for synchronous exceptions taken to EL1 |

**Bits [63:0]**

Faulting Virtual Address for synchronous exceptions taken to EL1. Exceptions that set the FAR_EL1 are Instruction Aborts (EC 0x20 or 0x21), Data Aborts (EC 0x24 or 0x25), PC alignment faults (EC 0x22), and Watchpoints (EC 0x34 or 0x35). ESR_EL1 EC holds the EC value for the exception.

For a synchronous External abort, if the VA that generated the abort was from an address range for which TCR_ELx.TBI[<0|1>] == 1 for the translation regime in use when the abort was generated, then the top eight bits of FAR_EL1 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if ESR_EL1.FnV is 0, and the FAR_EL1 is UNKNOWN if ESR_EL1.FnV is 1.

For all other exceptions taken to EL1, the FAR_EL1 is UNKNOWN.

If a memory fault that sets FAR_EL1, other than a Tag Check Fault, is generated from a data cache maintenance or other DC instruction, this field holds the address specified in the register argument of the instruction.

On an exception due to a Tag Check Fault caused by a data cache maintenance or other DC instruction, the address held in FAR_EL1 is IMPLEMENTATION DEFINED as one of the following:

- The lowest address that gave rise to the fault.
- The address specified in the register argument of the instruction as generated by MMU faults caused by DC ZVA.

If the exception that updates FAR_EL1 is taken from an Exception level that is using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR_ELx are 0x00000001:

- The faulting address was generated by a load or store instruction that sequentially incremented from address 0xFFFFFFFF. Such a load or store is CONSTRAINED UNPREDICTABLE.
- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.
For a Data Abort or Watchpoint exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see 'Address tagging in AArch64 state'.

For a synchronous Tag Check Fault abort, bits[63:60] are UNKNOWN.

Execution at EL0 makes FAR_EL1 become UNKNOWN.

---

**Note**

The address held in this field is an address accessed by the instruction fetch or data access that caused the exception that gave rise to the instruction or data abort. It is the lower address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores a mis-aligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

FAR_EL1 is made UNKNOWN on an exception return from EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Accessing the FAR_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic FAR_EL1 or FAR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

```plaintext

FAR_EL2, Fault Address Register (EL2)

The FAR_EL2 characteristics are:

**Purpose**

Holds the faulting Virtual Address for all synchronous Instruction or Data Abort, PC alignment fault and Watchpoint exceptions that are taken to EL2.

**Configuration**

AArch64 System register FAR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HDFAR[31:0].

AArch64 System register FAR_EL2 bits [63:32] are architecturally mapped to AArch32 System register HIFAR[31:0].

AArch64 System register FAR_EL2 bits [31:0] are architecturally mapped to AArch32 System register DFAR[31:0] when EL2 is implemented.

AArch64 System register FAR_EL2 bits [63:32] are architecturally mapped to AArch32 System register IFAR[31:0] when EL2 is implemented.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

FAR_EL2 is a 64-bit register.

**Field descriptions**

The FAR_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 |

| Faulting Virtual Address for synchronous exceptions taken to EL2 |
| Faulting Virtual Address for synchronous exceptions taken to EL2 |

**Bits [63:0]**

Faulting Virtual Address for synchronous exceptions taken to EL2. Exceptions that set the FAR_EL2 are Instruction Aborts (EC 0x20 or 0x21), Data Aborts (EC 0x24 or 0x25), PC alignment faults (EC 0x22), and Watchpoints (EC 0x34 or 0x35). ESR_EL2.EC holds the EC value for the exception.

For a synchronous External abort, if the VA that generated the abort was from an address range for which TCR_ELx.TBI{<0|1>} == 1 for the translation regime in use when the abort was generated, then the top eight bits of FAR_EL2 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if ESR_EL2.FnV is 0, and the FAR_EL2 is UNKNOWN if ESR_EL2.FnV is 1.

For all other exceptions taken to EL2, the FAR_EL2 is UNKNOWN.

If a memory fault that sets FAR_EL2, other than a Tag Check Fault, is generated from a data cache maintenance or other DC instruction, this field holds the address specified in the register argument of the instruction.

On an exception due to a Tag Check Fault caused by a data cache maintenance or other DC instruction, the address held in FAR_EL2 is IMPLEMENTATION DEFINED as one of the following:

- The lowest address that gave rise to the fault.
• The address specified in the register argument of the instruction as generated by MMU faults caused by DC ZVA.

If the exception that updates FAR_EL2 is taken from an Exception level that is using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR_ELx are 0x00000001:

• The faulting address was generated by a load or store instruction that sequentially incremented from address 0xFFFFFFFF. Such a load or store instruction is CONSTRAINED UNPREDICTABLE.
• The implementation treats such incrementing as setting bit[32] of the virtual address to 1.

For a Data Abort or Watchpoint exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see 'Address tagging in AArch64 state'.

For a synchronous Tag Check Fault abort, bits[63:60] are UNKNOWN.

Execution at EL1 or EL0 makes FAR_EL2 become UNKNOWN.

---

**Note**

The address held in this field is an address accessed by the instruction fetch or data access that caused the exception that gave rise to the instruction or data abort. It is the lower address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores a mis-aligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

FAR_EL2 is made UNKNOWN on an exception return from EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Accessing the FAR_EL2

Purpose

Holds the faulting Virtual Address for all synchronous Instruction or Data Abort and PC alignment fault exceptions that are taken to EL3.

Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to FAR_EL3 are UNDEFINED.

Attributes

FAR_EL3 is a 64-bit register.

Field descriptions

The FAR_EL3 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| Faulting Virtual Address for synchronous exceptions taken to EL3 |
| Faulting Virtual Address for synchronous exceptions taken to EL3 |

Bits [63:0]

Faulting Virtual Address for synchronous exceptions taken to EL3. Exceptions that set the FAR_EL3 are Instruction Aborts (EC 0x20 or 0x21), Data Aborts (EC 0x24 or 0x25), and PC alignment faults (EC 0x22). ESR_EL3.EC holds the EC value for the exception.

For a synchronous External abort, if the VA that generated the abort was from an address range for which TCR_ELx.TBI{<0|1>} == 1 for the translation regime in use when the abort was generated, then the top eight bits of FAR_EL3 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if ESR_EL3.FnV is 0, and the FAR_EL3 is UNKNOWN if ESR_EL3.FnV is 1.

For all other exceptions taken to EL3, the FAR_EL3 is UNKNOWN.

If a memory fault that sets FAR_EL3, other than a Tag Check Fault, is generated from a data cache maintenance or other DC instruction, this field holds the address specified in the register argument of the instruction.

On an exception due to a Tag Check Fault caused by a data cache maintenance or other DC instruction, the address held in FAR_EL3 is IMPLEMENTATION DEFINED as one of the following:

- The lowest address that gave rise to the fault.
- The address specified in the register argument of the instruction as generated by MMU faults caused by DC ZVA.

If the exception that updates FAR_EL3 is taken from an Exception Level using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR_ELx are 0x80000001:

- The faulting address was generated by a load or store instruction that sequentially incremented from address 0xffffffff. Such a load or store instruction is CONSTRAINED UNPREDICTABLE.
- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.

If a Data Abort or Watchpoint exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see ‘Address tagging in AArch64 state’.
For a synchronous Tag Check Fault abort, bits[63:60] are **UNKNOWN**.

Execution at EL2, EL1 or EL0 makes FAR_EL3 become **UNKNOWN**.

---

**Note**

The address held in this register is an address accessed by the instruction fetch or data access that caused the exception that actually gave rise to the instruction or data abort. It is the lowest address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores a mis-aligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

---

FAR_EL3 is made **UNKNOWN** on an exception return from EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Accessing the FAR_EL3

Accesses to this register use the following encodings:

**MRS <Xt>, FAR_EL3**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b110</td>

FPCR, Floating-point Control Register

The FPCR characteristics are:

**Purpose**

Controls floating-point behavior.

**Configuration**

The named fields in this register map to the equivalent fields in the AArch32 FPSCR.

It is **IMPLEMENTATION DEFINED** whether the Len and Stride fields can be programmed to non-zero values, which will cause some AArch32 floating-point instruction encodings to be **UNDEFINED**, or whether these fields are RAZ.

**Attributes**

FPCR is a 64-bit register.

**Field descriptions**

The FPCR bit assignments are:

**Bits [63:27]**

Reserved, RES0.

**AHP, bit [26]**

Alternative half-precision control bit.

<table>
<thead>
<tr>
<th>AHP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IEEE half-precision format selected.</td>
</tr>
<tr>
<td>0b1</td>
<td>Alternative half-precision format selected.</td>
</tr>
</tbody>
</table>

This bit is used only for conversions between half-precision floating-point and other floating-point formats.

The data-processing instructions added as part of the FEAT_FP16 extension always use the IEEE half-precision format, and ignore the value of this bit.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**DN, bit [25]**

Default NaN mode control bit.
DN, bit [23]

NaN operands propagate through to the output of a floating-point operation.

0b1

Any operation involving one or more NaNs returns the Default NaN.

If FPCR.AH is 1, this bit has no effect on the output of the FMAX, FMAXP, FMAXV, FMIN, FMINP, and FMINV instructions, and a default NaN is never returned as a result of these instructions.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

FZ, bit [24]

Flush-to-zero mode control bit.

0b0

Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard.

0b1

Flush-to-zero mode enabled.

If FPCR.AH is 1:

• This bit does not generate Input Denormal exceptions.
• This bit does not cause input denormal operands to be flushed to zero.
• When the output is flushed to zero:
  ◦ An Inexact floating-point exception is generated.
  ◦ The test for a denormalized number for half-precision, single-precision, and double-precision numbers occurs after rounding with an unbounded exponent.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

This bit has no effect on half-precision calculations.

If the result of an FMAX, FMAXP, FMAXV, FMIN, FMINP, or FMINV instruction is a denormalized number, it is not flushed to zero, regardless of the value of this bit.

Denormalized outputs of the following instructions, as determined after rounding with an unbounded exponent, are not affected by the value of this bit:

• The BFCVT, BFCVTN, BFCVTN2, BFCVTNT, BFMLALB, and BFMLALT instructions.
• Single-precision and double-precision FRECPE, FRECPS, FRECPX, FRSQRTE, and FRSQRTS instructions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

RMode, bits [23:22]

Rounding Mode control field.

0b00

Round to Nearest (RN) mode.

0b01

Round towards Plus Infinity (RP) mode.

0b10

Round towards Minus Infinity (RM) mode.

0b11

Round towards Zero (RZ) mode.

The specified rounding mode is used by both scalar and Advanced SIMD floating-point instructions.

If FPCR.AH is 1, then the following instructions use Round to Nearest mode regardless of the value of this bit:

• The FRECPE, FRECPS, FRECPX, FRSQRTE, and FRSQRTS instructions.
• The BFCVT, BFCVTN, BFCVTN2, BFCVTNT, BFMLALB, and BFMLALT instructions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Stride, bits [21:20]

This field has no function in AArch64 state, and non-zero values are ignored during execution in AArch64 state.

This field is included only for context saving and restoration of the AArch32 FPSCR.Stride field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

FZ16, bit [19]

When FEAT_FP16 is implemented:

Flush-to-zero mode control bit on half-precision data-processing instructions.

<table>
<thead>
<tr>
<th>FZ16</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard.</td>
</tr>
</tbody>
</table>
| 0b1  | Flush-to-zero mode enabled. If FPCR.AH is 1:  
  • When the output is flushed to zero:  
    ◦ An Inexact floating-point exception is generated.  
    ◦ The test for a denormalized number for half-precision, single-precision, and double-precision numbers occurs after rounding with an unbounded exponent. |

The value of this bit applies to both scalar and Advanced SIMD floating-point half-precision calculations. A half-precision floating-point number that is flushed to zero as a result of the value of the FZ16 bit does not generate an Input Denormal exception.

If the result of an FMAX, FMAXP, FMAXV, FMIN, FMINP, or FMINV instruction is a denormalized number, it is not flushed to zero, regardless of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Len, bits [18:16]

This field has no function in AArch64 state, and non-zero values are ignored during execution in AArch64 state.

This field is included only for context saving and restoration of the AArch32 FPSCR.Len field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IDE, bit [15]

Input Denormal floating-point exception trap enable.

<table>
<thead>
<tr>
<th>IDE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Untrapped exception handling selected. If the floating-point exception occurs, the FPSR.IDC bit is set to 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.IDC bit.</td>
</tr>
</tbody>
</table>

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**Bits [14:13]**

Reserved, RES0.

**IXE, bit [12]**

Inexact floating-point exception trap enable.

<table>
<thead>
<tr>
<th>IXE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Untracked exception handling selected. If the floating-point exception occurs, the FPSR.IXC bit is set to 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.IXC bit.</td>
</tr>
</tbody>
</table>

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

On a warm reset, this field resets to an architecturally UNKNOWN value.

**UFE, bit [11]**

Underflow floating-point exception trap enable.

<table>
<thead>
<tr>
<th>UFE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Untracked exception handling selected. If the floating-point exception occurs, the FPSR.UFC bit is set to 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trapped exception handling selected. If the floating-point exception occurs and Flush-to-zero is not enabled, the PE does not update the FPSR.UFC bit.</td>
</tr>
</tbody>
</table>

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

On a warm reset, this field resets to an architecturally UNKNOWN value.

**OFE, bit [10]**

Overflow floating-point exception trap enable.

<table>
<thead>
<tr>
<th>OFE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Untracked exception handling selected. If the floating-point exception occurs, the FPSR.OFC bit is set to 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.OFC bit.</td>
</tr>
</tbody>
</table>

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

On a warm reset, this field resets to an architecturally UNKNOWN value.

**DZE, bit [9]**

Divide by Zero floating-point exception trap enable.

<table>
<thead>
<tr>
<th>DZE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Untracked exception handling selected. If the floating-point exception occurs, the FPSR.DZC bit is set to 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.DZC bit.</td>
</tr>
</tbody>
</table>

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### IOE, bit [8]

Invalid Operation floating-point exception trap enable.

<table>
<thead>
<tr>
<th>IOE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Untrapped exception handling selected. If the floating-point exception occurs, the FPSR.IOC bit is set to 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.IOC bit.</td>
</tr>
</tbody>
</table>

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Bits [7:3]

Reserved, **RES0**.

### NEP, bit [2]

When FEAT_AFP is implemented:

Controls how the output elements other than the lowest element of the vector are determined for Advanced SIMD scalar instructions.

<table>
<thead>
<tr>
<th>NEP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not affect how the output elements other than the lowest are determined for Advanced SIMD scalar instructions.</td>
</tr>
<tr>
<td>0b1</td>
<td>The output elements other than the lowest are taken from the following registers:</td>
</tr>
<tr>
<td></td>
<td>• For 3-input scalar versions of the FMLA (by element) and FMLS (by element) instructions, the &lt;Hd&gt;, &lt;Sd&gt;, or &lt;Dd&gt; register.</td>
</tr>
<tr>
<td></td>
<td>• For 3-input versions of the FMADD, FMSUB, FNMAADD, and FNMSUB instructions, the &lt;Ha&gt;, &lt;Sa&gt;, or &lt;Da&gt; register.</td>
</tr>
<tr>
<td></td>
<td>• For 2-input scalar versions of the FACGE, FACGT, FCMGE (register), FCMGT (register) instructions, the &lt;Hm&gt;, &lt;Sm&gt;, or &lt;Dm&gt; register.</td>
</tr>
<tr>
<td></td>
<td>• For 2-input scalar versions of the FABD, FADD (scalar), FDIV (scalar), FMAX (scalar), FMAXNM (scalar), FMIN (scalar), FMINNM (scalar), FMUL (by element), FMUL (scalar), FMULX, FMUL (scalar), FRECPS, FRSSQRTS, and FSUB (scalar) instructions, the &lt;Hn&gt;, &lt;Sn&gt;, or &lt;Dn&gt; register.</td>
</tr>
<tr>
<td></td>
<td>• For 1-input scalar versions of the following instructions, the &lt;Hd&gt;, &lt;Sd&gt;, or &lt;Dd&gt; register:</td>
</tr>
<tr>
<td></td>
<td>• The (vector) versions of the FCVTAS, FCVTAU, FCVTMS, FCVTMU, FCVTNS, FCVTNU, FCVTPS, and FCVTPU instructions.</td>
</tr>
<tr>
<td></td>
<td>• The (vector, fixed-point) and (vector, integer) versions of the FCVTZS, FCVTZU, SCVTFS, and UCVTF instructions.</td>
</tr>
<tr>
<td></td>
<td>• The (scalar) versions of the FABS, FNEG, FRINT32X, FRINT32Z, FRINT64X, FRINT64Z, FRINTA, FRINTI, FRINTM, FRINTP, FRINTX, FRINTZ, and FSQRT instructions.</td>
</tr>
<tr>
<td></td>
<td>• The (integer) versions of the SCVTF and UCVTF instructions.</td>
</tr>
<tr>
<td></td>
<td>• The BFCVT, FCVT, FCVTXN, FRECPE, FRECPX, and FRSQRS instructions.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**AH, bit [1]**

When **FEAT_AFP** is implemented:

Alternate Handling. Controls alternate handling of denormalized floating-point numbers.
<table>
<thead>
<tr>
<th>AH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not affect handling of denormalized floating-point numbers. The sign-bit of the default NaN encoding is set to 1. For all floating-point instructions other than BFDOT and BFMMAL, detection of underflow occurs after rounding with an unbounded exponent. If an operation, other than FMAX, FMAXP, FMAXV, FMIN, FMINP, and FMINV, has two floating-point inputs in the &lt;Vn&gt;, &lt;Hn&gt;, &lt;Sn&gt;, or &lt;Dn&gt; register or the &lt;Vm&gt;, &lt;Hm&gt;, &lt;Sm&gt;, or &lt;Dm&gt; register, and two NaN inputs, then the output is derived from the NaN held in the &lt;Vn&gt;, &lt;Hn&gt;, &lt;Sn&gt;, or &lt;Dn&gt; register, regardless of whether any input is a signaling NaN or a quiet NaN. For the BFMLALB, BFMLALT, FCMLA, FMADD, FMA, FMLAL, FMLAL2, FMLS, FMLS, FMLSL, FMLS, FMSUB, FNMADD, and FNMSUB instructions, regardless of whether any input is a signaling NaN or a quiet NaN:</td>
</tr>
<tr>
<td></td>
<td>• If the operation has three NaN inputs, then the output is derived from the NaN held in the &lt;Vn&gt;, &lt;Hn&gt;, &lt;Sn&gt;, or &lt;Dn&gt; register.</td>
</tr>
<tr>
<td></td>
<td>• If the operation has two NaN inputs and the &lt;Vn&gt;, &lt;Hn&gt;, &lt;Sn&gt;, or &lt;Dn&gt; register holds a NaN, then the output is derived from the NaN held in that register.</td>
</tr>
<tr>
<td></td>
<td>• If the operation has two NaN inputs and the &lt;Vn&gt;, &lt;Hn&gt;, &lt;Sn&gt;, or &lt;Dn&gt; register does not hold a NaN, then the output is derived from the NaN held in the &lt;Hm&gt;, &lt;Sm&gt;, or &lt;Dm&gt; register.</td>
</tr>
<tr>
<td>0b1</td>
<td>The FMAX, FMAXP, FMAXV, FMIN, FMINP, and FMINV instructions change their algorithm to calculate the minimum and maximum so that:</td>
</tr>
<tr>
<td></td>
<td>• If the result is a denormalized number, it is not flushed to zero, regardless of FPCR.FZ or FPCR.FZ16.</td>
</tr>
<tr>
<td></td>
<td>• If either input is a quiet NaN or a signaling NaN, then the second operand is returned as the result of the instruction and an Invalid Operation floating-point exception is generated.</td>
</tr>
<tr>
<td></td>
<td>• If the two operands are +0 and -0 in any order, the second operand of the instruction is returned as the result of the instruction.</td>
</tr>
<tr>
<td></td>
<td>• FPCR.DN has no effect on the output and a default NaN is never returned as the result of the instruction.</td>
</tr>
</tbody>
</table>

The FCVTAS, FCVTAU, FCVTPS, FCVTPU, FCVTPS, FCVTPU, FJCVTZS, FJCVTZS, FRINT32X, FRINT32Z, FRINT64X, FRINT64Z, FRINTA, FRINTI, FRINTM, FRINTN, FRINTP, FRINTX, and FRINTZ instructions never generate an Input Denormal floating-point exception.

The BFVCVT, BFVCVTN2, BFVCVTNT, BFVCVTN2, BFVCVTNT, BFMLALB, and BFMLALT instructions: |
|     | • Use Round to Nearest rounding mode, regardless of the rounding mode selected in FPCR.RMode. |
|     | • Flush all denormalized inputs to zero, retaining the sign, regardless of FPCR.FIZ. |
|     | • Flush all denormalized outputs, as determined after rounding with an unbounded exponent, to zero, retaining the sign, regardless of FPCR.FZ. |
|     | • Do not generate any floating-point exceptions, regardless of their input or output values. |

The FRECEP, FRECPS, FRECPX, FRSLRTE, and FRSLRTS instructions: |
|     | • Use Round to Nearest rounding mode, regardless of the rounding mode selected in FPCR.RMode. |
|     | • Do not generate any floating-point exceptions. |
|     | • The single-precision and double-precision variants of these instructions: |
|     | ◦ Flush all denormalized inputs to zero, retaining the sign, regardless of FPCR.FIZ. |
|     | ◦ Flush all denormalized outputs, as determined after rounding with an unbounded exponent, to zero, retaining the sign, regardless of FPCR.FZ. |

When the output is flushed to zero: |
|     | • An Inexact floating-point exception is generated.
The test for a denormalized number for half-precision, single-precision, and double-precision numbers occurs after rounding with an unbounded exponent. If FPCR.FZ is 1, this does not cause any Input Denormal exceptions and does not cause input denormal operands to be flushed to zero. If FPCR.FIZ is 0, any operation that unpacks a denormalized floating-point number, other than a BFloat or half-precision number, will generate an Input Denormal floating-point exception, except when:

- One of the other operands of the instruction is a NaN.
- The operation also generates an Invalid Operation floating-point exception or a Divide by Zero floating-point exception.
- The operation was generated by a BFCVT, BFCVTN, BFCVTN2, or BFCVTNT instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**FIZ, bit [0]**

**When FEAT_AFP is implemented:**

Flush Inputs to Zero. Controls whether single-precision, double-precision, and BFloat16 input operands that are denormalized numbers are flushed to zero.

<table>
<thead>
<tr>
<th>FIZ</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0 | If FPCR.AH is 0, does not affect whether denormalized floating-point inputs are flushed to zero. If FPCR.AH is 1, any operation that unpacks a single-precision or double-precision denormalized floating-point number will generate an Input Denormal floating-point exception, except when:  
  - One of the other operands of the instruction is a NaN.  
  - The operation also generates an Invalid Operation floating-point exception or a Divide by Zero floating-point exception.  
  - The operation was generated by a BFCVTN, BFCVTN2, BFCVT, or a BFCVTNT instruction. |
| 0b1 | All single-precision, double-precision, and BFloat16 input operands that are denormalized numbers, except FABS and FNEG, are flushed to zero, retaining the sign. If FPCR.AH is 1 or FPCR.FZ is 0, denormalized numbers that are flushed to zero by this field do not generate an Input Denormal exception. |

The following instructions are not affected by the value of this bit:

- The BFCVT, BFCVTN, BFCVTN2, BFCVTNT, BFMLALB, and BFMLALT instructions.
- Single-precision and double-precision variants of the FRECPE, FRECPS, FRECPX, FRSQRTE, and FRSQRTS instructions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Accessing the FPCR**

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap priority when SDD == '1'" && CPTR_EL3.TFP == '1' then
        UNDEFINED;
    elsif !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && CPACR_EL1.FPEN != '11' then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x00);
        else
            AArch64.SystemAccessTrap(EL1, 0x07);
        endif
    else
        AArch64.SystemAccessTrap(EL2, 0x07);
    endif
else
    if PSTATE.EL == EL1 then

FPEXC32_EL2, Floating-Point Exception Control register

The FPEXC32_EL2 characteristics are:

**Purpose**

Allows access to the AArch32 register FPEXC from AArch64 state only. Its value has no effect on execution in AArch64 state.

**Configuration**

AArch64 System register FPEXC32_EL2 bits [31:0] are architecturally mapped to AArch32 System register FPEXC[31:0].

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to FPEXC32_EL2 are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

**Attributes**

FPEXC32_EL2 is a 64-bit register.

**Field descriptions**

The FPEXC32_EL2 bit assignments are:

| Bit 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| **RES0** |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [63:32]**

Reserved, RES0.

**EX, bit [31]**

Exception bit. From Armv8, this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EN, bit [30]**

Enables access to the Advanced SIMD and floating-point functionality from all Exception levels, except that setting this field to 0 does not disable the following:

- VMSR accesses to the FPEXC or FPSID.
- VMRS accesses from the FPEXC, FPSID, MVFR0, MVFR1, or MVFR2.
Meaning

Accesses to the **FPSCR**, and any of the SIMD and floating-point registers Q0-Q15, including their views as D0-D31 registers or S0-S31 registers, are **UNDEFINED** at all Exception levels.

This control permits access to the Advanced SIMD and floating-point functionality at all Exception levels.

Execution of floating-point and Advanced SIMD instructions in AArch32 state can be disabled or trapped by the following controls:

- **CPACR**.cp10, or, if executing at EL0, **CPACR_EL1**.FPEN.
- **FPEXC.EN**.
- If executing in Non-secure state:
  - **HCPTR**.TCP10, or if EL2 is using AArch64, **CPTR_EL2**.TFP.
  - **NSACR**.cp10, or if EL3 is using AArch64, **CPTR_EL3**.TFP.
- For Advanced SIMD instructions only:
  - **CPACR**.ASEDIS.
  - If executing in Non-secure state, **HCPTR**.TASE and **NSACR**.NSTRCDIS.

See the descriptions of the controls for more information.

**Note**

When executing at EL0 using AArch32:

- If EL1 is using AArch64 then behavior is as if the value of FPEXC.EN is 1.
- If EL2 is using AArch64 and enabled in the current Security state, and the value of **HCR_EL2**.(RW, TGE) is {1, 1} then behavior is as if the value of FPEXC.EN is 1.
- If EL2 is using AArch64 and enabled in the current Security state, and the value of **HCR_EL2**.(RW, TGE) is {0, 1} then it is **IMPLEMENTATION DEFINED** whether the behavior is:
  - As if the value of FPEXC.EN is 1.
  - Determined by the value of FPEXC32_EL2.EN, as described in this field description. However, Arm deprecates using the value of FPEXC32_EL2.EN to determine behavior.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**DEX, bit [29]**

Defined synchronous exception on floating-point execution.

This field identifies whether a synchronous exception generated by the attempted execution of an instruction was generated by an unallocated encoding. The instruction must be in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr() returning TRUE. This field also indicates whether the **FPEXC32_EL2.TFV** field is valid.

The meaning of this bit is:

<table>
<thead>
<tr>
<th>DEX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The exception was generated by the attempted execution of an unallocated instruction in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr(). If <strong>FPEXC32_EL2.TFV</strong> is RW then it is invalid and <strong>UNKNOWN</strong>. If <strong>FPEXC32_EL2.</strong>{IDF, IXF, UFF, OFF, DZF, IOF} are RW then they are invalid and <strong>UNKNOWN</strong>.</td>
</tr>
<tr>
<td>0b1</td>
<td>The exception was generated during the execution of an unallocated encoding. <strong>FPEXC32_EL2.TFV</strong> is valid and indicates the cause of the exception.</td>
</tr>
</tbody>
</table>

On an exception that sets this bit to 1 the exception-handling routine must clear this bit to 0.

On an implementation that both does not support trapping of floating-point exceptions and implements the AArch32 **FPSCR** {Stride, Len} fields as RAZ, this bit is **RES0**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
FP2V, bit [28]

FPINST2 instruction valid bit. From Armv8, this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

VV, bit [27]

VECITR valid bit. From Armv8, this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

TFV, bit [26]

Trapped Fault Valid bit. Valid only when the value of FPEXC.DEX is 1. When valid, it indicates the cause of the exception and therefore whether the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are valid.

<table>
<thead>
<tr>
<th>TFV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The exception was caused by the execution of a floating-point VABS, VADD, VDIV, VFMA, VFMS, VFNMA, VFNMS, VMLA, VMLS, VMOV, VMUL, VNEG, VNMLA, VNMLS, VNmul, VSQRT, or VSUB instruction when one or both of FPSCR. (Stride, Len) was non-zero. If the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are RW then they are invalid and UNKNOWN.</td>
</tr>
<tr>
<td>0b1</td>
<td>FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} indicate the presence of trapped floating-point exceptions that had occurred at the time of the exception. Bits are set for all trapped exceptions that had occurred at the time of the exception.</td>
</tr>
</tbody>
</table>

This bit returns a status value and ignores writes.

When the value of FPEXC.DEX is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On an implementation that supports the trapping of floating-point exceptions and implements FPSCR. {Stride, Len} as RAZ, this bit is RAO/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [25:11]

Reserved, RES0.

VECITR, bits [10:8]

Vector iteration count. From Armv8, this field is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IDF, bit [7]

Input Denormal trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Input Denormal exception occurred while FPSCR.IDE was 1:

<table>
<thead>
<tr>
<th>IDF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Input Denormal exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Input Denormal exception has occurred.</td>
</tr>
</tbody>
</table>

Input Denormal exceptions can occur only when FPSCR.FZ is 1.

Note
A half-precision floating-point value that is flushed to zero because the value of the FPSCR.FZ16 bit is 1 does not generate an Input Denormal exception.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC32_EL2.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [6:5]**

Reserved, RES0.

**IXF, bit [4]**

Inexact trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Inexact exception occurred while the FPSCR.IXE bit was 1:

<table>
<thead>
<tr>
<th>IXF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Inexact exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Inexact exception has occurred.</td>
</tr>
</tbody>
</table>

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**UFF, bit [3]**

Underflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Underflow exception occurred while the FPSCR.UFE was 1:

<table>
<thead>
<tr>
<th>UFF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Underflow exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Underflow exception has occurred.</td>
</tr>
</tbody>
</table>

Underflow trapped exceptions can occur:

- On half-precision data-processing instructions only when the FPSCR.FZ16 is 0.
- Otherwise only when the FPSCR.FZ is 0.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC32_EL2.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**OFF, bit [2]**

Overflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Overflow exception occurred while the FPSCR.OFE was 1:

<table>
<thead>
<tr>
<th>OFF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Overflow exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Overflow exception has occurred.</td>
</tr>
</tbody>
</table>

This bit must be cleared to 0 by the exception-handling routine.
When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DZF, bit [1]**

Divide by Zero trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether a Divide by Zero exception occurred while FPSCR.DZE was 1:

<table>
<thead>
<tr>
<th>DZF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Divide by Zero exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Divide by Zero exception has occurred.</td>
</tr>
</tbody>
</table>

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IOF, bit [0]**

Invalid Operation trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Invalid Operation exception occurred while FPSCR.IOE was 1:

<table>
<thead>
<tr>
<th>IOF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Invalid Operation exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Invalid Operation exception has occurred.</td>
</tr>
</tbody>
</table>

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the FPEXC32_EL2**

Accesses to this register use the following encodings:

MRS <Xt>, FPEXC32_EL2

**Bits [63:32]**

Reserved, RES0.

**N, bit [31]**

*When AArch32 is supported at any Exception level and AArch32 floating-point is implemented:*

Negative condition flag for AArch32 floating-point comparison operations.

**Note**

AArch64 floating-point comparisons set the PSTATE.N flag instead.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Z, bit [30]**

*When AArch32 is supported at any Exception level and AArch32 floating-point is implemented:*

Zero condition flag for AArch32 floating-point comparison operations.

**Note**

AArch64 floating-point comparisons set the PSTATE.Z flag instead.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**C, bit [29]**

*When AArch32 is supported at any Exception level and AArch32 floating-point is implemented:*

Carry condition flag for AArch32 floating-point comparison operations.

---

**Note**

AArch64 floating-point comparisons set the PSTATE.C flag instead.

---

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**V, bit [28]**

*When AArch32 is supported at any Exception level and AArch32 floating-point is implemented:*

Overflow condition flag for AArch32 floating-point comparison operations.

---

**Note**

AArch64 floating-point comparisons set the PSTATE.V flag instead.

---

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**QC, bit [27]**

Cumulative saturation bit, Advanced SIMD only. This bit is set to 1 to indicate that an Advanced SIMD integer operation has saturated since 0 was last written to this bit.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [26:8]**

Reserved, RES0.

**IDC, bit [7]**

Input Denormal cumulative floating-point exception bit. This bit is set to 1 to indicate that the Input Denormal floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the **FPCR.IDE** bit. This bit is set to 1 to indicate a floating-point exception only if **FPCR.IDE** is 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Bits [6:5]
Reserved, RES0.

IXC, bit [4]
Inexact cumulative floating-point exception bit. This bit is set to 1 to indicate that the Inexact exception floating-point has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.IXE bit. This bit is set to 1 to indicate a floating-point exception only if FPCR.IXE is 0.

The criteria for the Inexact floating-point exception to occur are different in Flush-to-zero mode. For details, see 'Flush-to-zero'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFC, bit [3]
Underflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Underflow floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.UFE bit. This bit is set to 1 to indicate a floating-point exception only if FPCR.UFE is 0 or Flush-to-zero is enabled.

The criteria for the Underflow floating-point exception to occur are different in Flush-to-zero mode. For details, see 'Flush-to-zero'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFC, bit [2]
Overflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Overflow floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.OFE bit. This bit is set to 1 to indicate a floating-point exception only if FPCR.OFE is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZC, bit [1]
Divide by Zero cumulative floating-point exception bit. This bit is set to 1 to indicate that the Divide by Zero floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.DZE bit. This bit is set to 1 to indicate a floating-point exception only if FPCR.DZE is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IOC, bit [0]
Invalid Operation cumulative floating-point exception bit. This bit is set to 1 to indicate that the Invalid Operation floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.IOE bit. This bit is set to 1 to indicate a floating-point exception only if FPCR.IOE is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the FPSR

**Bits [63:17]**

Reserved, RES0.

**RRND, bit [16]**

Controls generation of tag values by the IRG instruction.

<table>
<thead>
<tr>
<th>RRND</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IRG generates a tag value as defined by RandomTag().</td>
</tr>
<tr>
<td>0b1</td>

</tr>
<tr>
<td></td>
<td>distribution of tag values no worse than generated with</td>
</tr>
<tr>
<td></td>
<td>GCR_EL1.RRND == 0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Exclude, bits [15:0]**

Allocation Tag values excluded from selection by ChooseNonExcludedTag().

If all bits of GCR_EL1.Exclude are 1, then the Allocation Tag value 0 will be used.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

HACR_EL2, Hypervisor Auxiliary Control Register

The HACR_EL2 characteristics are:

**Purpose**

Controls trapping to EL2 of IMPLEMENTATION DEFINED aspects of EL1 or EL0 operation.

**Note**

Arm recommends that the values in this register do not cause unnecessary traps to EL2 when HCR_EL2.{E2H, TGE} == \{1, 1\}.

**Configuration**

AArch64 System register HACR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HACR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

HACR_EL2 is a 64-bit register.

**Field descriptions**

The HACR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63–32</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
<tr>
<td>31–0</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
</tbody>
</table>

**IMPLEMENTATION DEFINED, bits [63:0]**

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the HACR_EL2**

Accesses to this register use the following encodings:

Bits [63:50]

Reserved, RES0.

AMEVTYPER1<x>_EL0, bit [19+2x], for x = 15 to 0

Trap MRS reads of AMEVTYPER1<x>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER1<x> at EL0 using AArch32 when EL1 is using AArch64 to EL2.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.
AMEVCNTR1<x>_EL0, bit [18+2x], for x = 15 to 0

Trap MRS reads of AMEVCNTR1<x>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR1<x> at EL0 using AArch32 when EL1 is using AArch64 to EL2.

<table>
<thead>
<tr>

</tr>
<tr>
<td></td>
<td>• MRS reads of AMEVCNTR1&lt;x&gt;_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</td>
</tr>
<tr>
<td></td>
<td>• MRC reads of AMEVCNTR1&lt;x&gt; at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

AMCNTEN<x>, bit [17x], for x = 1 to 0

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

• At EL1 and EL0 using AArch64: MRS reads of AMCNTENCLR<x> EL0 and AMCNTENSET<x> EL0.
• At EL0 using Arch32 when EL1 is using AArch64: MRC reads of AMCNTENCLR<x> and AMCNTENSET<x>.

<table>

HCR_EL2, Hypervisor Configuration Register

The HCR_EL2 characteristics are:

**Purpose**

Provides configuration controls for virtualization, including defining whether various operations are trapped to EL2.

**Configuration**

AArch64 System register HCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HCR[31:0].

AArch64 System register HCR_EL2 bits [63:32] are architecturally mapped to AArch32 System register HCR2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

The bits in this register behave as if they are 0 for all purposes other than direct reads of the register if EL2 is not enabled in the current Security state.

**Attributes**

HCR_EL2 is a 64-bit register.

**Field descriptions**

The HCR_EL2 bit assignments are:

<table>

**TWEDEN, bits [63:60]**

When FEAT_TWED is implemented:

TWE Delay. A 4-bit unsigned number that, when HCR_EL2.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE* caused by HCR_EL2.TWE as \(2^{(\text{TWEDEL} + 8)}\) cycles.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**TWEDEn, bit [59]**

When FEAT_TWED is implemented:

TWE Delay Enable. Enables a configurable delayed trap of the WFE* instruction caused by HCR_EL2.TWE.

<table>
<thead>
<tr>
<th>TWEDEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The delay for taking the trap is IMPLEMENTATION DEFINED.</td>
</tr>
<tr>
<td>0b1</td>
<td>The delay for taking the trap is at least the number of cycles defined in HCR_EL2.TWEDEL.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, res0.

**TID5, bit [58]**

When FEAT_MTE2 is implemented:

Trap ID group 5. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

AArch64:

<table>
<thead>
<tr>
<th>TID5</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>The specified EL1 and EL0 accesses to ID group 5 registers are trapped to EL2.</td>
</tr>
</tbody>
</table>

When the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field has an Effective value of 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, res0.

**DCT, bit [57]**

When FEAT_MTE2 is implemented:

Default Cacheability Tagging. When HCR_EL2.DC is in effect, controls whether stage 1 translations are treated as Tagged or Untagged.

<table>
<thead>
<tr>
<th>DCT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 1 translations are treated as Untagged.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 1 translations are treated as Tagged.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, res0.

**ATA, bit [56]**

When FEAT_MTE2 is implemented:

Allocation Tag Access. When HCR_EL2.{E2H,TGE} != {1,1}, controls EL1 and EL0 access to Allocation Tags.

When access is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.
- MRS and MSR instructions at EL1 using GCR_EL1, RGSR_EL1, TFSR_EL1, TFSR_EL2, or TFSRE0_EL1 that are not UNDEFINED are trapped to EL2.
ATA

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

This field is permitted to be cached in a TLB.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TTLBOS, bit [55]

When FEAT_EVT is implemented:

Trap TLB maintenance instructions that operate on the Outer Shareable domain. Traps execution of those TLB maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

TLBI VMALLE1OS, TLBI VAE1OS, TLBI ASIDE1OS, TLBI VAAE1OS, TLBI VALE1OS, TLBI VAAL1OS, TLBI RVAE1OS, TLBI RVAAL1OS, and TLBI RVAALE1OS.

<table>
<thead>
<tr>
<th>TTLBOS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Execution of the specified instructions are trapped to EL2.</td>
</tr>
</tbody>
</table>

When FEAT_VHE is implemented, and the value of HCR_EL2.(E2H, TGE) is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TTLBIS, bit [54]

When FEAT_EVT is implemented:

Trap TLB maintenance instructions that operate on the Inner Shareable domain. Traps execution of those TLB maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

- When EL1 is using AArch64, TLBI VMALLE1IS, TLBI VAE1IS, TLBI ASIDE1IS, TLBI VAAE1IS, TLBI VALE1IS, TLBI VAAE1IS, TLBI RVAE1IS, TLBI RVAAL1IS, and TLBI RVAALE1IS.
- When EL1 is using AArch32, TLBIALLIS, TLBIMVAIS, TLBIASIDIS, TLBIMVAALIS, and TLBIMVAAALIS.

<table>
<thead>
<tr>
<th>TTLBIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Execution of the specified instructions are trapped to EL2.</td>
</tr>
</tbody>
</table>

When FEAT_VHE is implemented, and the value of HCR_EL2.(E2H, TGE) is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnSCXT, bit [53]
When `FEAT_CSV2` is implemented:

Enable Access to the `SCXTNUM_EL1` and `SCXTNUM_EL0` registers. The defined values are:

<table>
<thead>
<tr>
<th>EnSCXT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When (HCR_EL2.TGE==0 or HCR_EL2.E2H==0) and EL2 is enabled in the current Security state, EL1 and EL0 access to <code>SCXTNUM_EL0</code> and EL1 access to <code>SCXTNUM_EL1</code> is disabled by this mechanism, causing an exception to EL2, and the values of these registers to be treated as 0. When ((HCR_EL2.TGE==1 and HCR_EL2.E2H==1) and EL2 is enabled in the current Security state, EL0 access to <code>SCXTNUM_EL0</code> is disabled by this mechanism, causing an exception to EL2, and the value of this register to be treated as 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause accesses to <code>SCXTNUM_EL0</code> or <code>SCXTNUM_EL1</code> to be trapped.</td>
</tr>
</tbody>
</table>

When `FEAT_VHE` is implemented, and the value of `HCR_EL2.{E2H, TGE}` is `{1,1}`, this bit has no effect on execution at EL0.

On a Warm reset, this field resets to an architecturally `UNKNOWN` value.

Otherwise:

Reserved, RES0.

**TOCU, bit [52]**

When `FEAT_EVT` is implemented:

Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

- When `SCTLR_EL1.UCI` is 1, HCR_EL2.{TGE, E2H} is not `{1, 1}`, and EL0 is using AArch64, `IC IVAU, DC CVAU`.
- When EL1 is using AArch64, `IC IVAU, IC IALLU, DC CVAU`.
- When EL1 is using AArch32, `ICIMVAU, ICIALLU, DCCMVAU`.

**Note**

An exception generated because an instruction is `UNDEFINED` at EL0 is higher priority than this trap to EL2. In addition:

- `IC IALLUIS` and `IC IALLU` are always `UNDEFINED` at EL0 using AArch64.
- `ICIMVAU, ICIALLU, ICIALLUIS,` and `DCCMVAU` are always `UNDEFINED` at EL0 using AArch32.

<table>
<thead>
<tr>
<th>TOCU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Execution of the specified instructions are trapped to EL2.</td>
</tr>
</tbody>
</table>

If the Point of Unification is before any level of data cache, it is `IMPLEMENTATION DEFINED` whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is `IMPLEMENTATION DEFINED` whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When `FEAT_VHE` is implemented, and the value of `HCR_EL2.{E2H, TGE}` is `{1,1}`, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally `UNKNOWN` value.
Otherwise:

Reserved, RES0.

**AMVOFFEN, bit [51]**

*When FEAT_AMUv1p1 is implemented:*

Activity Monitors Virtual Offsets Enable.

<table>
<thead>
<tr>
<th>AMVOFFEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Virtualization of the Activity Monitors is disabled. Indirect reads of the virtual offset registers are zero.</td>
</tr>
<tr>
<td>0b1</td>
<td>Virtualization of the Activity Monitors is enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**TICAB, bit [50]**

*When FEAT_EVT is implemented:*

Trap ICIALLUIS/IC IALLUIS cache maintenance instructions. Traps execution of those cache maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

- When EL1 is using AArch64, **ICIALLUIS**.
- When EL1 is using AArch32, **ICIALLUIS**.

<table>
<thead>
<tr>
<th>TICAB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 execution of the specified instructions is trapped to EL2.</td>
</tr>
</tbody>
</table>

If the Point of Unification is before any level of instruction cache, it is **IMPLEMENTATION DEFINED** whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When **FEAT_VHE** is implemented, and the value of **HCR_EL2.(E2H, TGE)** is \{1, 1\}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**TID4, bit [49]**

*When FEAT_EVT is implemented:*

Trap ID group 4. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

**AArch64:**

- EL1 reads of **CCSIDR_EL1, CCSIDR2_EL1, CLIDR_EL1**, and **CSSELR_EL1**.
- EL1 writes to **CSSELR_EL1**.

**AArch32:**

- EL1 reads of **CCSIDR, CCSIDR2, CLIDR**, and **CSSELR**.
- EL1 writes to **CSSELR**.
<table>
<thead>
<tr>
<th>TID4</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>The specified EL1 and EL0 accesses to ID group 4 registers are trapped to EL2.</td>
</tr>
</tbody>
</table>

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1, 1\}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Bit [48]**

Reserved, RES0.

**FIEN, bit [47]**

**When FEAT_RASv1p1 is implemented:**

Fault Injection Enable. Unless this bit is set to 1, accesses to the ERXPFGCDN_EL1, ERXPFGCTL_EL1, and ERXPFGF_EL1 registers from EL1 generate a Trap exception to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18.

<table>
<thead>
<tr>
<th>FIEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to the specified registers from EL1 are trapped to EL2, when EL2 is enabled in the current Security state.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

If EL2 is disabled in the current Security state, the Effective value of HCR_EL2.FIEN is 0b1.

If ERRIDR_EL1.NUM is zero, meaning no error records are implemented, or no error record accessible using System registers is owned by a node that implements the RAS Common Fault Injection Model Extension, then this bit might be RES0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**FWB, bit [46]**

**When FEAT_S2FWB is implemented:**

Forced Write-Back. Defines the combined cacheability attributes in a 2 stage translation regime.

**Note**

When FEAT_MTE2 is implemented, if the stage 1 page or block descriptor specifies the Tagged attribute, the final memory type is Tagged only if the final cacheable memory type is Inner and Outer Write-back cacheable and the final allocation hints are Read-Allocate, Write-Allocate.
Meaning

<table>
<thead>
<tr>
<th>FWB</th>
<th>When this bit is 0, then:</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>• The combination of stage 1 and stage 2 translations on memory type and cacheability attributes are as described in the Armv8.0 architecture. For more information, see 'Combining the stage 1 and stage 2 attributes, EL1&amp;0 translation regime'.</td>
</tr>
<tr>
<td></td>
<td>• The encoding of the stage 2 memory type and cacheability attributes in bits[5:2] of the stage 2 page or block descriptors are as described in the Armv8.0 architecture.</td>
</tr>
<tr>
<td>0b1</td>
<td>When this bit is 1, then:</td>
</tr>
<tr>
<td></td>
<td>• Bit[5] of stage 2 page or block descriptor is RES0.</td>

<tr>
<td></td>
<td>◦ Bits[3:2] of stage 2 page or block descriptor are 0b10, the stage 2 memory type is Device-nGRE.</td>
</tr>
<tr>
<td></td>
<td>◦ Bits[3:2] of stage 2 page or block descriptor are 0b11, the stage 2 memory type is Device-GRE.</td>
</tr>
<tr>
<td></td>
<td>• If the stage 1 translation specifies a cacheable memory type, then the stage 1 cache allocation hint is applied to the final cache allocation hint where the final memory type is cacheable.</td>
</tr>
<tr>
<td></td>
<td>• If the stage 1 translation does not specify a cacheable memory type, then if the final memory type is cacheable, it is treated as read allocate, write allocate.</td>
</tr>
</tbody>
</table>

The stage 1 and stage 2 memory types are combined in the manner described in 'Combining the stage 1 and stage 2 attributes, EL1&0 translation regime'.

In Secure state, this bit applies to both the Secure stage 2 translation and the Non-secure stage 2 translation.

This bit is permitted to be cached in a TLB.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NV2, bit [45]

When FEAT_NV2 is implemented:

Nested Virtualization. Changes the behaviors of HCR_EL2.(NV1, NV) to provide a mechanism for hardware to transform reads and writes from System registers into reads and writes from memory.
When HCR_EL2.NV is 0, the Effective value of this field is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**AT, bit [44]**

When FEAT_NV is implemented:

Address Translation. EL1 execution of the following address translation instructions is trapped to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18:

- AT S1E0R, AT S1E0W, AT S1E1R, AT S1E1W, AT S1E1RP, AT S1E1WP.

<table>
<thead>
<tr>
<th>AT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 execution of the specified instructions is trapped to EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**NV1, bit [43]**

When FEAT_NV2 is implemented:

Nested Virtualization.

<table>
<thead>
<tr>
<th>NV1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If HCR_EL2.{NV2, NV} are both 1, accesses executed from EL1 to implemented EL12, EL02, or EL2 registers are transformed to loads and stores. If HCR_EL2.NV2 is 0 or HCR_EL2.{NV2, NV} == {1, 0}, this control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>If HCR_EL2.NV1 defines which EL1 register accesses are transformed to loads and stores. If HCR_EL2.NV2 is 1, accesses executed from EL1 to implemented EL2 registers are transformed to loads and stores. If HCR_EL2.NV2 is 0, EL1 accesses to VBAR_EL1, ELR_EL1, SPSR_EL1, and, when FEAT_CSV2 is implemented, SCXTNUM_EL1, are trapped to EL2, when EL2 is enabled in the current Security state, and are reported using EC syndrome value 0x18.</td>
</tr>
</tbody>
</table>

If HCR_EL2.NV2 is 1, the value of HCR_EL2.NV1 defines which EL1 register accesses are transformed to loads and stores. These transformed accesses have priority over the trapping of registers.

The trapping of EL1 registers caused by other control bits has priority over the transformation of these accesses.

If a register is specified that is not implemented by an implementation, then access to that register are UNDEFINED.

For the list of registers affected, see 'Enhanced support for nested virtualization'.
If HCR_EL2.{NV1, NV} is {0, 1}, any exception taken from EL1, and taken to EL1, causes the SPSR_EL1.M[3:2] to be set to 0b10, and not 0b01.

If HCR_EL2.{NV1, NV} is {1, 1}, then:

- The EL1 translation table Block and Page descriptors:
  - Bit[54] holds the PXN instead of the UXN.
  - Bit[53] is RES0.
  - Bit[6] is treated as 0 regardless of the actual value.
- If Hierarchical Permissions are enabled, the EL1 translation table Table descriptors are as follows:
  - Bit[61] is treated as 0 regardless of the actual value.
  - Bit[60] holds the PXNTable instead of the UXNTable.
  - Bit[59] is RES0.
- When executing at EL1, the PSTATE.PAN bit is treated as zero for all purposes except reading the value of the bit.
- When executing at EL1, the LDTR* instructions are treated as the equivalent LDR* instructions, and the STTR* instructions are treated as the equivalent STR* instructions.

If HCR_EL2.{NV1, NV} are {1, 0}, then the behavior is a CONSTRAINED UNPREDICTABLE choice of:

- Behaving as if HCR_EL2.NV is 1 and HCR_EL2.NV1 is 1 for all purposes other than reading than reading back the value of the HCR_EL2.NV bit.
- Behaving as if HCR_EL2.NV is 0 and HCR_EL2.NV1 is 0 for all purposes other than reading than reading back the value of the HCR_EL2.NV1 bit.
- Behaving with regard to the HCR_EL2.NV and HCR_EL2.NV1 bits behavior as defined in the rest of this description.

This bit is permitted to be cached in a TLB.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_NV is implemented:

Nested Virtualization. EL1 accesses to certain registers are trapped to EL2, when EL2 is enabled in the current Security state.

<table>
<thead>
<tr>
<th>NV1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 accesses to VBAR_EL1, ELR_EL1, SPSR_EL1, and, when FEAT_CSV2 is implemented, SCXNUM_EL1, are trapped to EL2, when EL2 is enabled in the current Security state, and are reported using EC syndrome value 0x18.</td>
</tr>
</tbody>
</table>

If HCR_EL2.NV is 1 and HCR_EL2.NV1 is 0, then the following effects also apply:

- Any exception taken from EL1, and taken to EL1, causes the SPSR_EL1.M[3:2] to be set to 0b10, and not 0b01.

If HCR_EL2.NV and HCR_EL2.NV1 are both set to 1, then the following effects also apply:

- The EL1 translation table Block and Page descriptors:
  - Bit[54] holds the PXN instead of the UXN.
  - Bit[53] is RES0.
  - Bit[6] is treated as 0 regardless of the actual value.
- If Hierarchical Permissions are enabled, the EL1 translation table Table descriptors are as follows:
  - Bit[61] is treated as 0 regardless of the actual value.
  - Bit[60] holds the PXNTable instead of the UXNTable.
  - Bit[59] is RES0.
- When executing at EL1, the PSTATE.PAN bit is treated as zero for all purposes except reading the value of the bit.
- When executing at EL1, the LDTR* instructions are treated as the equivalent LDR* instructions, and the STTR* instructions are treated as the equivalent STR* instructions.

If HCR_EL2.NV is 0 and HCR_EL2.NV1 is 1, then the behavior is a CONSTRAINED UNPREDICTABLE choice of:

- Behaving as if HCR_EL2.NV is 1 and HCR_EL2.NV1 is 1 for all purposes other than reading than reading back the value of the HCR_EL2.NV bit.
- Behaving as if HCR_EL2.NV is 0 and HCR_EL2.NV1 is 0 for all purposes other than reading than reading back the value of the HCR_EL2.NV1 bit.
• Behaving with regard to the HCR_EL2.NV and HCR_EL2.NV1 bits behavior as defined in the rest of this description.

This bit is permitted to be cached in a TLB.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**NV, bit [42]**

**When FEAT_NV2 is implemented:**

Nested Virtualization.

When HCR_EL2.NV2 is 1, redefines register accesses so that:

• Instructions accessing the Special purpose registers `SPSR_EL2` and `ELR_EL2` instead access `SPSR_EL1` and `ELR_EL1` respectively.

• Instructions accessing the System registers `ESR_EL2` and `FAR_EL2` instead access `ESR_EL1` and `FAR_EL1`.

When HCR_EL2.NV2 is 0, or if FEAT_NV2 is not implemented, traps functionality that is permitted at EL2 and would be **UNDEFINED** at EL1 if this field was 0, when EL2 is enabled in the current Security state. This applies to the following operations:

• EL1 accesses to Special-purpose registers that are not **UNDEFINED** at EL2.

• EL1 accesses to System registers that are not **UNDEFINED** at EL2.

• Execution of EL1 or EL2 translation regime address translation and TLB maintenance instructions for EL2 and above.

<table>
<thead>
<tr>
<th>NV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When this bit is set to 0, then the PE behaves as if HCR_EL2.NV2 is 0 for all purposes other than reading this register. This control does not cause any instructions to be trapped. When HCR_EL2.NV2 is 1, no FEAT_NV2 functionality is implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>When HCR_EL2.NV2 is 0, or if FEAT_NV2 is not implemented, EL1 accesses to the specified registers or the execution of the specified instructions are trapped to EL2, when EL2 is enabled in the current Security state. EL1 read accesses to the <code>CurrentEL</code> register return a value of 0x2. When HCR_EL2.NV2 is 1, this control redefines EL1 register accesses so that instructions accessing <code>SPSR_EL2</code>, <code>ELR_EL2</code>, <code>ESR_EL2</code>, and <code>FAR_EL2</code> instead access <code>SPSR_EL1</code>, <code>ELR_EL1</code>, <code>ESR_EL1</code>, and <code>FAR_EL1</code> respectively.</td>
</tr>
</tbody>
</table>

When HCR_EL2.NV2 is 0, or if FEAT_NV2 is not implemented, then:

• The System or Special-purpose registers for which accesses are trapped and reported using EC syndrome value 0x18 are as follows:
  ◦ Registers accessed using MRS or MSR with a name ending in _EL2, except `SP_EL2`.
  ◦ Registers accessed using MRS or MSR with a name ending in _EL12.
  ◦ Registers accessed using MRS or MSR with a name ending in _EL02.
  ◦ Special-purpose registers `SPSR_irq`, `SPSR_abt`, `SPSR_und` and `SPSR_fiq`, accessed using MRS or MSR.
  ◦ Special-purpose register `SP_EL1` accessed using the dedicated MRS or MSR instruction.

• The instructions for which the execution is trapped and reported using EC syndrome value 0x18 are as follows:
  ◦ EL2 translation regime Address Translation instructions and TLB maintenance instructions.
  ◦ EL1 translation regime Address Translation instructions and TLB maintenance instructions that are accessible only from EL2 and EL3.

• The instructions for which the execution is trapped as follows:
  ◦ SMC in an implementation that does not include EL3 and when HCR_EL2.TSC is 1. HCR_EL2.TSC bit is not RES0 in this case. This is reported using EC syndrome value 0x17.
  ◦ The ERET, ERETTAA, and ERETAB instructions, reported using EC syndrome value 0x1A.

**Note**
The priority of this trap is higher than the priority of the HCR_EL2.API trap. If both of these bits are set so that EL1 execution of an ERETAA or ERETAB instruction is trapped to EL2, then the syndrome reported is 0x1A.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**When FEAT_NV is implemented:**

Nested Virtualization. Traps functionality that is permitted at EL2 and would be **UNDEFINED** at EL1 if this field was 0, when EL2 is enabled in the current Security state. This applies to the following operations:

- EL1 accesses to Special-purpose registers that are not **UNDEFINED** at EL2.
- EL1 accesses to System registers that are not **UNDEFINED** at EL2.
- Execution of EL1 or EL2 translation regime address translation and TLB maintenance instructions for EL2 and above.

The possible values are:

<table>
<thead>
<tr>
<th>NV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 accesses to the specified registers or the execution of the specified instructions are trapped to EL2, when EL2 is enabled in the current Security state. EL1 read accesses to the <strong>CurrentEL</strong> register return a value of 0x2.</td>
</tr>
</tbody>
</table>

The System or Special-purpose registers for which accesses are trapped and reported using EC syndrome value 0x18 are as follows:

- Registers accessed using MRS or MSR with a name ending in _EL2, except **SP_EL2**.
- Registers accessed using MRS or MSR with a name ending in _EL12.
- Registers accessed using MRS or MSR with a name ending in _EL02.
- Special-purpose registers **SPSR_irq**, **SPSR_abt**, **SPSR_und** and **SPSR_fiq**, accessed using MRS or MSR.
- Special-purpose register **SP_EL1** accessed using the dedicated MRS or MSR instruction.

The instructions for which the execution is trapped and reported using EC syndrome value 0x18 are as follows:

- EL2 translation regime Address Translation instructions and TLB maintenance instructions.
- EL1 translation regime Address Translation instructions and TLB maintenance instructions that are accessible only from EL2 and EL3.

The execution of the ERET, ERETAA, and ERETAB instructions are trapped and reported using EC syndrome value 0x1A

**Note**

The priority of this trap is higher than the priority of the HCR_EL2.API trap. If both of these bits are set so that EL1 execution of an ERETAA or ERETAB instruction is trapped to EL2, then the syndrome reported is 0x1A.

The execution of the SMC instructions in an implementation that does not include EL3 and when HCR_EL2.TSC is 1 are trapped and reported using EC syndrome value 0x17. HCR_EL2.TSC bit is not **RES0** in this case.

This bit is permitted to be cached in a TLB.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.
API, bit [41]

When FEAT_PAuth is implemented:

Controls the use of instructions related to Pointer Authentication:

- In EL0, when HCR_EL2.TGE==0 or HCR_EL2.E2H==0, and the associated SCTLR_EL1.En<N><M>=1.
- In EL1, the associated SCTLR_EL1.En<N><M>=1.

Traps are reported using EC syndrome value 0x09. The Pointer Authentication instructions trapped are:

- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB.
- PACGA, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZB.
- RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETTA, ERETTAB, LDRAA and LDRAB.

<table>
<thead>
<tr>
<th>API</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0 | The instructions related to Pointer Authentication are trapped to EL2, when EL2 is enabled in the current Security state and the instructions are enabled for the EL1&0 translation regime, from:  
    - EL0 when HCR_EL2.TGE==0 or HCR_EL2.E2H==0.  
    - EL1.  
    If HCR_EL2.NV is 1, the HCR_EL2.NV trap takes precedence over the HCR_EL2.API trap for the ERETTA and ERETTAB instructions.  
    If EL2 is implemented and enabled in the current Security state and HFGITR_EL2.ERET == 1, execution at EL1 using AArch64 of ERETTA or ERETTAB instructions is reported with EC syndrome value 0x1A with its associated ISS field, as the fine-grained trap has higher priority than the HCR_EL2.API == 0. |
| 0b1 | This control does not cause any instructions to be trapped. |

If FEAT_PAuth is implemented but EL2 is not implemented or disabled in the current Security state, the system behaves as if this bit is 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APK, bit [40]

When FEAT_PAuth is implemented:

Trap registers holding “key” values for Pointer Authentication. Traps accesses to the following registers from EL1 to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18:

- APITKeyLo_EL1, APITKeyHI_EL1, APITKeyLo_EL1, APITKeyHI_EL1, APDKeyLo_EL1, APDKeyHi_EL1, APDKeyLo_EL1, APDKeyHi_EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
ID, bit [33]

Stage 2 Instruction access cacheability disable. For the EL1&0 translation regime, when EL2 is enabled in the current Security state and HCR_EL2.VM==1, this control forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

<table>
<thead>
<tr>
<th>ID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on stage 2 of the EL1&amp;0 translation regime.</td>
</tr>
<tr>
<td>0b1</td>
<td>Forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.</td>
</tr>
</tbody>
</table>

This bit has no effect on the EL2, EL2&0, or EL3 translation regimes.

When FEAT_VHE is implemented, and the value of HCR_EL2 (E2H, TGE) is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

CD, bit [32]

Stage 2 Data access cacheability disable. For the EL1&0 translation regime, when EL2 is enabled in the current Security state and HCR_EL2.VM==1, this control forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

<table>
<thead>
<tr>
<th>CD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on stage 2 of the EL1&amp;0 translation regime for data accesses and translation table walks.</td>
</tr>
<tr>
<td>0b1</td>
<td>Forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.</td>
</tr>
</tbody>
</table>

This bit has no effect on the EL2, EL2&0, or EL3 translation regimes.

When FEAT_VHE is implemented, and the value of HCR_EL2 (E2H, TGE) is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

RW, bit [31]

When AArch32 is supported at any Exception level:

Execution state control for lower Exception levels:

<table>
<thead>
<tr>
<th>RW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Lower levels are all AArch32.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Execution state for EL1 is AArch64. The Execution state for EL0 is determined by the current value of PSTATE.nRW when executing at EL0.</td>
</tr>
</tbody>
</table>

If AArch32 state is not supported by the implementation at EL1, then this bit is RAO/WI.

In an implementation that includes EL3, when EL2 is not enabled in Secure state, the PE behaves as if this bit has the same value as the SCR_EL3.RW bit for all purposes other than a direct read or write access of HCR_EL2.

The RW bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of HCR_EL2 (E2H, TGE) is {1, 1}, this field behaves as 1 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAO/WI.
TRVM, bit [30]

Trap Reads of Virtual Memory controls. Traps EL1 reads of the virtual memory control registers to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64 state, the following registers are trapped to EL2 and reported using EC syndrome value 0x18:
  - SCTLR_EL1, TTBR0_EL1, TTBR1_EL1, TCR_EL1, ESR_EL1, FAR_EL1, AFSR0_EL1, AFSR1_EL1, MAIR_EL1, AMAIR_EL1, CONTEXTIDR_EL1.

- If EL1 is using AArch32 state, accesses using MRC to the following registers are trapped to EL2 and reported using EC syndrome value 0x03, accesses using MRRC are trapped to EL2 and reported using EC syndrome value 0x04:
  - SCTLR, TTBR0, TTBR1, TTBCR, TTBCR2, DACR, DFSR, IFSR, DFAR, IFAR, ADFSR, AIFSR, PRRR, NMRR, MAIR0, MAIR1, AMAIR0, AMAIR1, CONTEXTIDR.

<table>
<thead>
<tr>
<th>TRVM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 read accesses to the specified Virtual Memory controls are trapped to EL2, when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

When **HCR_EL2.TGE** is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

**Note**

EL2 provides a second stage of address translation, that a hypervisor can use to remap the address map defined by a Guest OS. In addition, a hypervisor can trap attempts by a Guest OS to write to the registers that control the memory system. A hypervisor might use this trap as part of its virtualization of memory management.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

HCD, bit [29]

**When EL3 is not implemented:**

HVC instruction disable. Disables EL1 execution of HVC instructions, from both Execution states, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x00.

<table>
<thead>
<tr>
<th>HCD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>HVC instruction execution is enabled at EL2 and EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>HVC instructions are UNDEFINED at EL2 and EL1. Any resulting exception is taken to the Exception level at which the HVC instruction is executed.</td>
</tr>
</tbody>
</table>

**Note**

HVC instructions are always UNDEFINED at EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

TDZ, bit [28]

Trap **DC ZVA** instructions. Traps EL0 and EL1 execution of **DC ZVA** instructions to EL2, when EL2 is enabled in the current Security state, from AArch64 state only, reported using EC syndrome value 0x18.

If **FEAT_MTE2** is implemented, this trap also applies to **DC GVA** and **DC GZVA**.
TDZ

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0 This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1 In AArch64 state, any attempt to execute an instruction this trap applies to at EL1, or at EL0 when the instruction is not UNDEFINED at EL0, is trapped to EL2 when EL2 is enabled in the current Security state. Reading the DCZID_EL0 returns a value that indicates that the instructions this trap applies to are not supported.</td>
</tr>
</tbody>
</table>

When FEAT_VHE is implemented, and the value of HCR_EL2.E2H, TGE is \{1, 1\}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

TGE, bit [27]

Trap General Exceptions, from EL0.

<table>
<thead>
<tr>
<th>TGE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on execution at EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>When EL2 is not enabled in the current Security state, this control has no effect on execution at EL0. When EL2 is enabled in the current Security state, in all cases:</td>
</tr>
<tr>
<td>•</td>
<td>All exceptions that would be routed to EL1 are routed to EL2.</td>
</tr>
<tr>
<td>•</td>
<td>If EL1 is using AArch64, the SCTLR_EL1.M field is treated as being 0 for all purposes other than returning the result of a direct read of SCTLR_EL1.</td>
</tr>
<tr>
<td>•</td>
<td>If EL1 is using AArch32, the SCTLR.M field is treated as being 0 for all purposes other than returning the result of a direct read of SCTLR.</td>
</tr>
<tr>
<td>•</td>
<td>All virtual interrupts are disabled.</td>
</tr>
<tr>
<td>•</td>
<td>Any IMPLEMENTATION DEFINED mechanisms for signaling virtual interrupts are disabled.</td>
</tr>
<tr>
<td>•</td>
<td>An exception return to EL1 is treated as an illegal exception return.</td>
</tr>
<tr>
<td>•</td>
<td>The MDCR_EL2.TDRA, TDOSA, TDA, TDE fields are treated as being 1 for all purposes other than returning the result of a direct read of MDCR_EL2.</td>
</tr>
</tbody>
</table>

In addition, when EL2 is enabled in the current Security state, if:

| &bull; | HCR_EL2.E2H is 0, the Effective values of the HCR_EL2, \( \{\text{FMO, IMO, AMO}\} \) fields are 1. |
| &bull; | HCR_EL2.E2H is 1, the Effective values of the HCR_EL2, \( \{\text{FMO, IMO, AMO}\} \) fields are 0. |

For further information on the behavior of this bit when E2H is 1, see 'Behavior of HCR_EL2.E2H'.

HCR_EL2.TGE must not be cached in a TLB.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

TVM, bit [26]

Trap Virtual Memory controls. Traps EL1 writes to the virtual memory control registers to EL2, when EL2 is enabled in the current Security state, as follows:

| &bull; | If EL1 is using AArch64 state, the following registers are trapped to EL2 and reported using EC syndrome value 0x18: |
| &bull; | &middot; SCTLR_EL1, TTBR0_EL1, TTBR1_EL1, TCR_EL1, ESR_EL1, FAR_EL1, AFSR0_EL1, AFSR1_EL1, MAIR_EL1, AMAIR_EL1, CONTEXTIDR_EL1. |
| &bull; | If EL1 is using AArch32 state, accesses using MCR to the following registers are trapped to EL2 and reported using EC syndrome value 0x03, accesses using MCRR are trapped to EL2 and reported using EC syndrome value 0x04: |
| &bull; | &middot; SCTLR, TTBR0, TTBR1, TTBCR, TTBCR2, DACR, DFSR, IFSR, DFAR, IFAR, ADFSR, AIFSR, PRRR, NMRR, MAIR0, MAIR1, AMAIR0, AMAIR1, CONTEXTIDR. |
TVM

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 write accesses to the specified EL1 virtual memory control registers are trapped to EL2, when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

When **HCR_EL2.TGE** is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**TTLB, bit [25]**

Trap TLB maintenance instructions. Traps EL1 execution of TLB maintenance instructions to EL2, when EL2 is enabled in the current Security state, as follows:

- When EL1 is using AArch64 state, the following instructions are trapped to EL2 and reported using EC syndrome value 0x18:
  - TLBI VMALLE1, TLBI VAE1, TLBI ASIDE1, TLBI VAAE1, TLBI VALE1, TLBI VAALE1.
  - TLBI VMALLE1IS, TLBI VAE1IS, TLBI ASIDE1IS, TLBI VAAE1IS, TLBI VALE1IS, TLBI VAALE1IS.
  - If FEAT TLB IOS is implemented, this trap applies to TLBI VMMALLE1OS, TLBI VAE1OS, TLBI ASIDE1OS, TLBI VAAE1OS, TLBI VALE1OS, TLBI VAALE1OS.
  - If FEAT TLBIRANGE is implemented, this trap applies to TLBI RVAE1, TLBI RVAAE1, TLBI RVALE1, TLBI RVAALE1, TLBI RVAE1IS, TLBI RVAAE1IS, TLBI RVALE1IS, TLBI RVAALE1IS.
  - If FEAT TLB IOS and FEAT TLBIRANGE are implemented, this trap applies to TLBI RVAE1OS, TLBI RVAAE1OS, TLBI RVALE1OS, TLBI RVAALE1OS.

- When EL1 is using AArch32 state, the following instructions are trapped to EL2 and reported using EC syndrome value 0x03:
  - TLBIMVAI, TLBIMVAA, TLBIMVAIS, TLBIMVAIS, TLBIMVAAL, TLBIMVAAL.
  - TLBIMVA, TLBIMVAA, TLBIMVAIS, TLBIMVAAL.
  - DTBIMVA, DTBIMVAA, DTBIMVAIS, DTBIMVAAL.

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 execution of the specified TLB maintenance instructions are trapped to EL2, when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

When **HCR_EL2.TGE** is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

**Note**

The TLB maintenance instructions are **UNDEFINED** at EL0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**TPU, bit [24]**

Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state as follows:

- If EL0 is using AArch64 state and the value of **SCTLR_EL1.UCI** is not 0, the following instructions are trapped to EL2 and reported with EC syndrome value 0x18:
  - IC IVAU, DC CVAU. If the value of **SCTLR_EL1.UCI** is 0 these instructions are **UNDEFINED** at EL0 and any resulting exception is higher priority than this trap to EL2.
- If EL1 is using AArch64 state, the following instructions are trapped to EL2 and reported with EC syndrome value 0x18:
  - IC IVAU, IC IALLU, IC IALLUIS, DC CVAU.
- If EL1 is using AArch32 state, the following instructions are trapped to EL2 and reported with EC syndrome value 0x18:
  - ICIMVVAU, IC IALLU, IC IALLUIS, DCCMVAU.

**Note**
An exception generated because an instruction is **undefined** at EL0 is higher priority than this trap to EL2. In addition:

- **IC IALLUIS** and **IC IALLU** are always **undefined** at EL0 using AArch64.
- **ICIMVAU, ICIALLU, ICIALLUIS**, and **DCDMVAU** are always **undefined** at EL0 using AArch32.

<table>
<thead>
<tr>
<th>TPU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>

<tr>
<td>0b1</td>
<td>Execution of the specified instructions is trapped to EL2, when</td>
</tr>
<tr>
<td></td>
<td>EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

If the Point of Unification is before any level of data cache, it is **implementation defined** whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is **implementation defined** whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When FEAT_VHE is implemented, and the value of **HCR_EL2.\{E2H, TGE\}** is \{1, 1\}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally **unknown** value.

**TPCP, bit [23]**

**When FEAT_DPB is implemented:**

Trap data or unified cache maintenance instructions that operate to the Point of Coherency or Persistence. Traps execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state as follows:

- If EL0 is using AArch64 state and the value of **SCTLR_EL1.UCI** is not 0, the following instructions are trapped to EL2 and reported using EC syndrome value 0x18:
  - **DC CIVAC, DC CVAC, DC CVAP**. If the value of **SCTLR_EL1.UCI** is 0 these instructions are **undefined** at EL0 and any resulting exception is higher priority than this trap to EL2.
- If EL1 is using AArch64 state, the following instructions are trapped to EL2 and reported using EC syndrome value 0x18:
  - **DC IVAC, DC CIVAC, DC CVAC, DC CVAP**.
- If EL1 is using AArch32 state, the following instructions are trapped to EL2 and reported using EC syndrome value 0x03:
  - **DCIMVAC, DCCIMVAC, DCCMVAC**.

If FEAT_DPB2 is implemented, this trap also applies to **DC CVADP**.

If FEAT_MTE2 is implemented, this trap also applies to **DC CIGVAC, DC CIGDVAC, DC IGVAC, DC IGDVAC, DC CGVAC, DC CGDVAC, DC CGVAP**, and **DC CGDVAP**.

If FEAT_DPB2 and FEAT_MTE2 are implemented, this trap also applies to **DC CGVADP** and **DC CGDVADP**.

**Note**

- An exception generated because an instruction is **undefined** at EL0 is higher priority than this trap to EL2. In addition:
  - AArch64 instructions which invalidate by VA to the Point of Coherency are always **undefined** at EL0 using AArch64.
  - **DCIMVAC, DCCIMVAC**, and **DCCMVAC** are always **undefined** at EL0 using AArch32.
- In Armv8.0 and Armv8.1, this field is named TPC. From Armv8.2 it is named TPCP.

<table>
<thead>
<tr>
<th>TPCP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Execution of the specified instructions is trapped to EL2, when</td>
</tr>
<tr>
<td></td>
<td>EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

If the Point of Coherency is before any level of data cache, it is **implementation defined** whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.
If \( \text{HCR}_{EL2}.\{\text{E2H}, \text{TGE}\} \) is set to \( \{1, 1\} \), this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Trap data or unified cache maintenance instructions that operate to the Point of Coherency. Traps execution of those cache maintenance instructions to \( EL2 \), when \( EL2 \) is enabled in the current Security state as follows:

- If \( EL0 \) is using AArch64 state and the value of \( \text{SCTLR}_{EL1}.\text{UCI} \) is not 0, accesses to the following registers are trapped and reported using EC syndrome value \( 0x18 \):
  - \( \text{DC_CIVAC}, \text{DC_CVAC} \). However, if the value of \( \text{SCTLR}_{EL1}.\text{UCI} \) is 0 these instructions are **UNDEFINED** at \( EL0 \) and any resulting exception is higher priority than this trap to \( EL2 \).
- If \( EL1 \) is using AArch64 state, accesses to \( \text{DC_IVAC}, \text{DC_CIVAC}, \text{DC_CVAC} \) are trapped and reported using EC syndrome value \( 0x18 \).
- When \( EL1 \) is using AArch32, accesses to \( \text{DCIMVAC}, \text{DCCIMVAC}, \text{and DCCMVAC} \) are trapped and reported using EC syndrome value \( 0x03 \).

**Note**

- An exception generated because an instruction is **UNDEFINED** at \( EL0 \) is higher priority than this trap to \( EL2 \). In addition:
  - AArch64 instructions which invalidate by VA to the Point of Coherency are always **UNDEFINED** at \( EL0 \) using AArch64.
  - \( \text{DCIMVAC}, \text{DCCIMVAC}, \text{and DCCMVAC} \) are always **UNDEFINED** at \( EL0 \) using AArch32.
- In Armv8.0 and Armv8.1, this field is named TPC. From Armv8.2 it is named TPCP.

<table>
<thead>
<tr>
<th>TPC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Execution of the specified instructions is trapped to ( EL2 ), when ( EL2 ) is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

If the Point of Coherency is before any level of data cache, it is **IMPLEMENTATION DEFINED** whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

When \( \text{FEAT_VHE} \) is implemented, and the value of \( \text{HCR}_{EL2}.\{\text{E2H}, \text{TGE}\} \) is \( \{1, 1\} \), this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**TSW, bit [22]**

Trap data or unified cache maintenance instructions that operate by Set/Way. Traps execution of those cache maintenance instructions at \( EL1 \) to \( EL2 \), when \( EL2 \) is enabled in the current Security state as follows:

- If \( EL1 \) is using AArch64 state, accesses to \( \text{DC_ISW}, \text{DC_CSW}, \text{DC_CISW} \) are trapped to \( EL2 \), reported using EC syndrome value \( 0x18 \).
- If \( EL1 \) is using AArch32 state, accesses to \( \text{DCISW}, \text{DCCSW}, \text{DCCISW} \) are trapped to \( EL2 \), reported using EC syndrome value \( 0x03 \).

If \( \text{FEAT_MTE2} \) is implemented, this trap also applies to \( \text{DC IGSW}, \text{DC IGDSW}, \text{DC CGSW}, \text{DC CGDW}, \text{DC CIGSW}, \) and \( \text{DC CIGDSW} \).

**Note**

An exception generated because an instruction is **UNDEFINED** at \( EL0 \) is higher priority than this trap to \( EL2 \), and these instructions are always **UNDEFINED** at \( EL0 \).

<table>
<thead>
<tr>
<th>TSW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Execution of the specified instructions is trapped to ( EL2 ), when ( EL2 ) is enabled in the current Security state.</td>
</tr>
</tbody>
</table>
When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TACR, bit [21]**

Trap Auxiliary Control Registers. Traps EL1 accesses to the Auxiliary Control Registers to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64 state, accesses to ACTLR_EL1 to EL2, are trapped to EL2 and reported using EC syndrome value 0x18.
- If EL1 is using AArch32 state, accesses to ACTLR and, if implemented, ACTLR2 are trapped to EL2 and reported using EC syndrome value 0x03.

<table>
<thead>
<tr>
<th>TACR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 accesses to the specified registers are trapped to EL2, when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

**Note**

ACTLR_EL1 is not accessible at EL0

ACTLR, and ACTLR2 are not accessible at EL0.

The Auxiliary Control Registers are IMPLEMENTATION DEFINED registers that might implement global control bits for the PE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TIDCP, bit [20]**

Trap IMPLEMENTATION DEFINED functionality. Traps EL1 accesses to the encodings reserved for IMPLEMENTATION DEFINED functionality to EL2, when EL2 is enabled in the current Security state as follows:

- In AArch64 state, access to any of the encodings in the following reserved encoding spaces are trapped and reported using EC syndrome 0x18:
  - IMPLEMENTATION DEFINED System instructions, which are accessed using SYS and SYSL, with CRn == {11, 15}.
  - IMPLEMENTATION DEFINED System registers, which are accessed using MRS and MSR with the S3_<op1>_<Cn>_<Cm>_<op2> register name.
- In AArch32 state, MCR and MRC access to instructions with the following encodings are trapped and reported using EC syndrome 0x03:
  - All coproc==p15, CRn==c9, opc1 == {0-7}, CRm == {c0-c2, c5-c8}, opc2 == {0-7},
  - All coproc==p15, CRn==c10, opc1 =={0-7}, CRm == {c0, c1, c4, c8}, opc2 == {0-7},
  - All coproc==p15, CRn==c11, opc1=={0-7}, CRm == {c0-c8, c13}, opc2 == {0-7}.

When the value of HCR_EL2.TIDCP is 1, it is IMPLEMENTATION DEFINED whether any of this functionality accessed from EL0 is trapped to EL2. If it is not, then it is UNDEFINED, and any attempt to access it from EL0 generates an exception that is taken to EL1.

<table>
<thead>
<tr>
<th>TIDCP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 accesses to or execution of the specified encodings reserved for IMPLEMENTATION DEFINED functionality are trapped to EL2, when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

An implementation can also include IMPLEMENTATION DEFINED registers that provide additional controls, to give finer-grained control of the trapping of IMPLEMENTATION DEFINED features.

**Note**

Arm expects the trapping of EL0 accesses to these functions to EL2 to be unusual, and used only when the hypervisor is virtualizing EL0 operation. Arm
strongly recommends that unless the hypervisor must virtualize EL0 operation, an EL0 access to any of these functions is UNDEFINED, as it would be if the implementation did not include EL2. The PE then takes any resulting exception to EL1.

The trapping of accesses to these registers from EL1 is higher priority than an exception resulting from the register access being UNDEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TSC, bit [19]**

Trap SMC instructions. Traps EL1 execution of SMC instructions to EL2, when EL2 is enabled in the current Security state.

If execution is in AArch64 state, the trap is reported using EC syndrome value 0x17.

If execution is in AArch32 state, the trap is reported using EC syndrome value 0x13.

**Note**

HCR_EL2.TSC traps execution of the SMC instruction. It is not a routing control for the SMC exception. Trap exceptions and SMC exceptions have different preferred return addresses.

<table>
<thead>
<tr>
<th>TSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL3 is implemented, then any attempt to execute an SMC instruction at EL1 is trapped to EL2, when EL2 is enabled in the current Security state, regardless of the value of SCR_EL3.SMD. If EL3 is not implemented, FEAT_NV is implemented, and HCR_EL2.NV is 1, then any attempt to execute an SMC instruction at EL1 using AArch64 is trapped to EL2, when EL2 is enabled in the current Security state. If EL3 is not implemented, and either FEAT_NV is not implemented or HCR_EL2.NV is 0, then it is IMPLEMENTATION DEFINED whether:</td>
</tr>
<tr>
<td></td>
<td>• Any attempt to execute an SMC instruction at EL1 is trapped to EL2, when EL2 is enabled in the current Security state.</td>
</tr>
<tr>
<td></td>
<td>• Any attempt to execute an SMC instruction is UNDEFINED.</td>
</tr>
</tbody>
</table>

In AArch32 state, the Armv8-A architecture permits, but does not require, this trap to apply to conditional SMC instructions that fail their condition code check, in the same way as with traps on other conditional instructions.

SMC instructions are UNDEFINED at EL0.

If EL3 is not implemented and HCR_EL2.NV is 0, it is IMPLEMENTATION DEFINED whether this bit is:

- RES0.
- Implemented with the functionality as described in HCR_EL2.TSC.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TID3, bit [18]**

Trap ID group 3. Traps EL1 reads of group 3 ID registers to EL2, when EL2 is enabled in the current Security state, as follows:

In AArch64 state:

- Reads of the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - ID_PFR0_EL1, ID_PFR1_EL1, ID_PFR2_EL1, ID_DFR0_EL1, ID_AFR0_EL1, ID_MMFR0_EL1, ID_MMFR1_EL1, ID_MMFR2_EL1, ID_MMFR3_EL1, ID_ISAR0_EL1, ID_ISAR1_EL1.
HCR_EL2, Hypervisor Configuration Register

ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, ID_ISAR5_EL1, MVFR0_EL1, MVFR1_EL1, MVFR2_EL1.

- ID_AA64PFR0_EL1, ID_AA64PFR1_EL1, ID_AA64DFR0_EL1, ID_AA64DFR1_EL1, ID_AA64ISAR0_EL1, ID_AA64ISAR1_EL1, ID_AA64MMFR0_EL1, ID_AA64MMFR1_EL1, ID_AA64AFR0_EL1, ID_AA64AFR1_EL1.

- If FEAT_FGT is implemented:
  - ID_MMFR4_EL1 and ID_MMFR5_EL1 are trapped to EL2.
  - ID_AA64MMFR2_EL1 and ID_ISAR6_EL1 are trapped to EL2.
  - ID_DFR1_EL1 is trapped to EL2.
  - ID_AA64ZFR0_EL1 is trapped to EL2.
  - ID_AA64ISAR2_EL1 is trapped to EL2.
  - This field traps all MRS accesses to registers in the following range that are not already mentioned in this field description: Op0 == 3, op1 == 0, CRn == c0, CRm == {c1-c7}, op2 == {0-7}.

- If FEAT_FGT is not implemented:
  - ID_MMFR4_EL1 and ID_MMFR5_EL1 are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_MMFR4_EL1 or ID_MMFR5_EL1 are trapped to EL2.
  - ID_AA64MMFR2_EL1 and ID_ISAR6_EL1 are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_AA64MMFR2_EL1 or ID_ISAR6_EL1 are trapped to EL2.
  - ID_DFR1_EL1 is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_DFR1_EL1 are trapped to EL2.
  - ID_AA64ZFR0_EL1 is trapped to EL2, unless implemented as RAZ then it is IMPLEMENTATION DEFINED whether accesses to ID_AA64ZFR0_EL1 are trapped to EL2.
  - ID_AA64ISAR2_EL1 is trapped to EL2, unless implemented as RAZ then it is IMPLEMENTATION DEFINED whether accesses to ID_AA64ISAR2_EL1 are trapped to EL2.
  - Otherwise, it is IMPLEMENTATION DEFINED whether this bit traps MRS accesses to registers in the following range that are not already mentioned in this field description: Op0 == 3, op1 == 0, CRn == c0, CRm == {c1-c7}, op2 == {0-7}.

In AArch32 state:

- VMRS access to MVFR0, MVFR1, and MVFR2, are trapped to EL2, reported using EC syndrome value 0x08, unless access is also trapped by HCPTR which takes priority.

- MRC access to the following registers are trapped to EL2, reported using EC syndrome value 0x03:
  - ID_PFR0, ID_PFR1, ID_PFR2, ID_DFR0, ID_AFR0, ID_MMFR0, ID_MMFR1, ID_MMFR2, ID_MMFR3, ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, ID_ISAR4, ID_ISAR5.

- If FEAT_FGT is implemented:
  - ID_MMFR4 and ID_MMFR5 are trapped to EL2.
  - ID_ISAR6 is trapped to EL2.
  - ID_DFR1 is trapped to EL2.
  - This field traps all MRC accesses to encodings in the following range that are not already mentioned in this field description: coproc == p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}.

- If FEAT_FGT is not implemented:
  - ID_MMFR4 and ID_MMFR5 are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_MMFR4 or ID_MMFR5 are trapped.
ID_ISR6 is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_ISR6 are trapped to EL2.

ID_DFR1 is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_DFR1 are trapped to EL2.

Otherwise, it is IMPLEMENTATION DEFINED whether this bit traps all MRC accesses to registers in the following range not already mentioned in this field description with coproc == p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}.

TID3

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>The specified EL1 read accesses to ID group 3 registers are trapped to EL2, when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

TID2, bit [17]

Trap ID group 2. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64, reads of CTR_EL0, CCSIDR_EL1, CCSIDR2_EL1, CLIDR_EL1, and CSSELR_EL1 are trapped to EL2, reported using EC syndrome value 0x18.
- If EL0 is using AArch64 and the value of SCTLR_EL1.UCT is not 0, reads of CTR_EL0 are trapped to EL2, reported using EC syndrome value 0x18. If the value of SCTLR_EL1.UCT is 0 then EL0 reads of CTR_EL0 are UNDEFINED and any resulting exception takes precedence over this trap.
- If EL1 is using AArch64, writes to CSSELR_EL1 are trapped to EL2, reported using EC syndrome value 0x18.
- If EL1 is using AArch32, reads of CTR, CCSIDR, CCSIDR2, CLIDR, and CSSELR are trapped to EL2, reported using EC syndrome value 0x03.
- If EL1 is using AArch32, writes to CSSELR are trapped to EL2, reported using EC syndrome value 0x03.

TID2

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>The specified EL1 and EL0 accesses to ID group 2 registers are trapped to EL2, when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

When FEAT_VHE is implemented, and the value of HCR_EL2.(E2H, TGE) is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

TID1, bit [16]

Trap ID group 1. Traps EL1 reads of the following registers to EL2, when EL2 is enabled in the current Security state as follows:

- In AArch64 state, accesses of REVIDR_EL1, AIDR_EL1, reported using EC syndrome value 0x18.
- In AArch32 state, accesses of TCMTR, TLBTR, REVIDR, AIDR, reported using EC syndrome value 0x03.

TID1

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>The specified EL1 read accesses to ID group 1 registers are trapped to EL2, when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**TID0, bit [15]**

When AArch32 is supported at any Exception level:

Trap ID group 0. Traps the following register accesses to EL2:

- EL1 reads of the JIDR, reported using EC syndrome value 0x05.
- If the JIDR is RAZ from EL0, EL0 reads of the JIDR, reported using EC syndrome value 0x05.
- EL1 accesses using VMRS of the FPSID, reported using EC syndrome value 0x08.

**Note**

- It is IMPLEMENTATION DEFINED whether the JIDR is RAZ or UNDEFINED at EL0. If it is UNDEFINED at EL0 then any resulting exception takes precedence over this trap.
- The FPSID is not accessible at EL0 using AArch32.
- Writes to the FPSID are ignored, and not trapped by this control.

<table>
<thead>
<tr>
<th>TID0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>The specified EL1 read accesses to ID group 0 registers are trapped to EL2, when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

When FEAT_VHE is implemented, and the value of HCR_EL2.(E2H, TGE) is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TWE, bit [14]**

Traps EL0 and EL1 execution of WFE instructions to EL2, when EL2 is enabled in the current Security state, from both Execution states, reported using EC syndrome value 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFET instruction.

<table>
<thead>
<tr>
<th>TWE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any attempt to execute a WFE instruction at EL0 or EL1 is trapped to EL2, when EL2 is enabled in the current Security state, the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWE or SCTLR.EL1.nTWE.</td>
</tr>
</tbody>
</table>

In AArch32 state, the attempted execution of a conditional WFE instruction is trapped only if the instruction passes its condition code check.

**Note**

Since a WFE can complete at any time, even without a Wakeup event, the traps on WFE are not guaranteed to be taken, even if the WFE is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When FEAT_VHE is implemented, and the value of HCR_EL2.(E2H, TGE) is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information about when WFE instructions can cause the PE to enter a low-power state, see 'Wait for Event mechanism and Send event'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**TWI, bit [13]**

Traps EL0 and EL1 execution of WFI instructions to EL2, when EL2 is enabled in the current Security state, from both Execution states, reported using EC syndrome value 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFIT instruction.

<table>
<thead>
<tr>
<th>TWI Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0 This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1 Any attempt to execute a WFI instruction at EL0 or EL1 is trapped to EL2, when EL2 is enabled in the current Security state, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWI or SCTLR_EL1.nTWI.</td>
</tr>
</tbody>
</table>

In AArch32 state, the attempted execution of a conditional WFI instruction is trapped only if the instruction passes its condition code check.

**Note**

Since a WFI can complete at any time, even without a Wakeup event, the traps on WFI are not guaranteed to be taken, even if the WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information about when WFI instructions can cause the PE to enter a low-power state, see 'Wait for Interrupt'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DC, bit [12]**

Default Cacheability.

<table>
<thead>
<tr>
<th>DC Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0 This control has no effect on the EL1&amp;0 translation regime.</td>
</tr>
<tr>
<td>0b1 In both Security states:</td>
</tr>
<tr>
<td>• When EL1 is using AArch64, the PE behaves as if the value of the SCTLR_EL1.M field is 0 for all purposes other than returning the value of a direct read of SCTLR_EL1.</td>
</tr>
<tr>
<td>• When EL1 is using AArch32, the PE behaves as if the value of the SCTLR.M field is 0 for all purposes other than returning the value of a direct read of SCTLR.</td>
</tr>
<tr>
<td>• The PE behaves as if the value of the HCR_EL2.VM field is 1 for all purposes other than returning the value of a direct read of HCR_EL2.</td>
</tr>
<tr>
<td>• The memory type produced by stage 1 of the EL1&amp;0 translation regime is Normal Non-Shareable, Inner Write-Back Read-Allocate Write-Allocate, Outer Write-Back Read-Allocate Write-Allocate.</td>
</tr>
</tbody>
</table>

This field has no effect on the EL2, EL2&0, and EL3 translation regimes.

This field is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**BSU, bits [11:10]**

Barrier Shareability upgrade. This field determines the minimum shareability domain that is applied to any barrier instruction executed from EL1 or EL0:

<table>
<thead>
<tr>
<th>BSU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>No effect.</td>
</tr>
<tr>
<td>0b01</td>
<td>Inner Shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Full system.</td>
</tr>
</tbody>
</table>

This value is combined with the specified level of the barrier held in its instruction, using the same principles as combining the shareability attributes from two stages of address translation.

When FEAT_VHE is implemented, and the value of HCR_EL2.(E2H, TGE) is {1, 1}, this field behaves as 0b00 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**FB, bit [9]**

Force broadcast. Causes the following instructions to be broadcast within the Inner Shareable domain when executed from EL1:

AArch32: BPIALL, TLBIALL, TLBIMVA, TLBIASID, DTLBIALL, DTLBIMVA, DTLBIASID, ITLBIA, ITLBIMVA, ITLBIMVAS, TLBIMVE, TLBIMVAA.

AArch64: TLBIVVALL, TLBIVVAE1, TLBIVVAE1, TLBIVVAE1, TLBIVVAE1, TLBIVVAAE, TLBIVVAAE, TLBIVVAAE, TLBIVVAAE, TLBIVVAAE, TLBIVVAAE.

<table>
<thead>
<tr>
<th>FB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This field has no effect on the operation of the specified instructions.</td>
</tr>
<tr>
<td>0b1</td>
<td>When one of the specified instruction is executed at EL1, the instruction is broadcast within the Inner Shareable shareability domain.</td>
</tr>
</tbody>
</table>

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**VSE, bit [8]**

Virtual SError interrupt.

<table>
<thead>
<tr>
<th>VSE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This mechanism is not making a virtual SError interrupt pending.</td>
</tr>
<tr>
<td>0b1</td>
<td>A virtual SError interrupt is pending because of this mechanism.</td>
</tr>
</tbody>
</table>

The virtual SError interrupt is enabled only when the value of HCR_EL2.(TGE, AMO) is {0, 1}.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**VI, bit [7]**

Virtual IRQ Interrupt.

<table>
<thead>
<tr>
<th>VI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This mechanism is not making a virtual IRQ pending.</td>
</tr>
<tr>
<td>0b1</td>
<td>A virtual IRQ is pending because of this mechanism.</td>
</tr>
</tbody>
</table>

The virtual IRQ is enabled only when the value of HCR_EL2.(TGE, IMO) is {0, 1}.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
VF, bit [6]

Virtual FIQ Interrupt.

<table>
<thead>
<tr>
<th><strong>VF</strong></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This mechanism is not making a virtual FIQ pending.</td>
</tr>
<tr>
<td>0b1</td>
<td>A virtual FIQ is pending because of this mechanism.</td>
</tr>
</tbody>
</table>

The virtual FIQ is enabled only when the value of HCR_EL2.{TGE, FMO} is \{0, 1\}.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

AMO, bit [5]

Physical SError interrupt routing.

<table>
<thead>
<tr>
<th><strong>AMO</strong></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When executing at Exception levels below EL2, and EL2 is in EL1:</td>
</tr>
<tr>
<td></td>
<td>• Physical SError interrupts are not taken to EL2.</td>
</tr>
<tr>
<td></td>
<td>• When the value of HCR_EL2.TGE is 0, if the PE is executing at EL2</td>
</tr>
<tr>
<td></td>
<td>using AArch64, physical SError interrupts are not taken unless they</td>
</tr>
<tr>
<td></td>
<td>are routed to EL3 by the SCR_EL3.EA bit.</td>
</tr>
<tr>
<td></td>
<td>• Virtual SError interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>When executing at any Exception level, and EL2 is enabled in the</td>
</tr>
<tr>
<td></td>
<td>current Security state:</td>
</tr>
<tr>
<td></td>
<td>• Physical SError interrupts are taken to EL2, unless they are</td>
</tr>
<tr>
<td></td>
<td>routed to EL3.</td>
</tr>
<tr>
<td></td>
<td>• When the value of HCR_EL2.TGE is 0, then virtual SError interrupts</td>
</tr>
<tr>
<td></td>
<td>are enabled.</td>
</tr>
</tbody>
</table>

If EL2 is enabled in the current Security state and the value of HCR_EL2.TGE is 1:

- Regardless of the value of the AMO bit physical asynchronous External aborts and SError interrupts target EL2 unless they are routed to EL3.
- When FEAT VHE is not implemented, or if HCR_EL2.E2H is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.
- When FEAT VHE is implemented and HCR_EL2.E2H is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see 'Asynchronous exception routing'.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

IMO, bit [4]

Physical IRQ Routing.

<table>
<thead>
<tr>
<th><strong>IMO</strong></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When executing at Exception levels below EL2, and EL2 is in EL1:</td>
</tr>
<tr>
<td></td>
<td>• Physical IRQ interrupts are not taken to EL2.</td>
</tr>
<tr>
<td></td>
<td>• When the value of HCR_EL2.TGE is 0, if the PE is executing at EL2</td>
</tr>
<tr>
<td></td>
<td>using AArch64, physical IRQ interrupts are not taken unless they are</td>
</tr>
<tr>
<td></td>
<td>routed to EL3 by the SCR_EL3.IRQ bit.</td>
</tr>
<tr>
<td></td>
<td>• Virtual IRQ interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>When executing at any Exception level, and EL2 is enabled in the</td>
</tr>
<tr>
<td></td>
<td>current Security state:</td>
</tr>
<tr>
<td></td>
<td>• Physical IRQ interrupts are taken to EL2, unless they are routed to</td>
</tr>
<tr>
<td></td>
<td>EL3.</td>
</tr>
<tr>
<td></td>
<td>• When the value of HCR_EL2.TGE is 0, then Virtual IRQ interrupts</td>
</tr>
<tr>
<td></td>
<td>are enabled.</td>
</tr>
</tbody>
</table>

If EL2 is enabled in the current Security state, and the value of HCR_EL2.TGE is 1:

- Regardless of the value of the IMO bit, physical IRQ Interrupts target EL2 unless they are routed to EL3.
- When FEAT VHE is not implemented, or if HCR_EL2.E2H is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.
• When FEAT_VHE is implemented and HCR_EL2.E2H is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see 'Asynchronous exception routing'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**FMO, bit [3]**

Physical FIQ Routing.

<table>
<thead>
<tr>
<th>FMO</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0 | When executing at Exception levels below EL2, and EL2 is enabled in the current Security state:  
• Physical FIQ interrupts are not taken to EL2.  
• When the value of HCR_EL2.TGE is 0, if the PE is executing at EL2 using AArch64, physical FIQ interrupts are not taken unless they are routed to EL3 by the SCR_EL3.FIQ bit.  
• Virtual FIQ interrupts are disabled.  
| 0b1 | When executing at any Exception level, and EL2 is enabled in the current Security state:  
• Physical FIQ interrupts are taken to EL2, unless they are routed to EL3.  
• When HCR_EL2.TGE is 0, then Virtual FIQ interrupts are enabled. |

If EL2 is enabled in the current Security state and the value of HCR_EL2.TGE is 1:

• Regardless of the value of the FMO bit, physical FIQ Interrupts target EL2 unless they are routed to EL3.  
• When FEAT_VHE is not implemented, or if HCR_EL2.E2H is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.  
• When FEAT_VHE is implemented and HCR_EL2.E2H is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see 'Asynchronous exception routing'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**PTW, bit [2]**

Protected Table Walk. In the EL1&0 translation regime, a translation table access made as part of a stage 1 translation table walk is subject to a stage 2 translation. The combining of the memory type attributes from the two stages of translation means the access might be made to a type of Device memory. If this occurs, then the value of this bit determines the behavior:

<table>
<thead>
<tr>
<th>PTW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The translation table walk occurs as if it is to Normal Non-cacheable memory. This means it can be made speculatively.</td>
</tr>
<tr>
<td>0b1</td>
<td>The memory access generates a stage 2 Permission fault.</td>
</tr>
</tbody>
</table>

This field is permitted to be cached in a TLB.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SWIO, bit [1]**

Set/Way Invalidation Override. Causes EL1 execution of the data cache invalidate by set/way instructions to perform a data cache clean and invalidate by set/way:

<table>
<thead>
<tr>
<th>SWIO</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on the operation of data cache invalidate by set/way instructions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Data cache invalidate by set/way instructions perform a data cache clean and invalidate by set/way.</td>
</tr>
</tbody>
</table>
When the value of this bit is 1:

AArch32: **DCISW** performs the same invalidation as a **DCCISW** instruction.

AArch64: **DC ISW** performs the same invalidation as a **DC CISW** instruction.

This bit can be implemented as **RES1**.

When **HCR_EL2.TGE** is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**VM, bit [0]**

Virtualization enable. Enables stage 2 address translation for the EL1&0 translation regime, when EL2 is enabled in the current Security state.

<table>
<thead>
<tr>
<th>VM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL1&amp;0 stage 2 address translation disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1&amp;0 stage 2 address translation enabled.</td>
</tr>
</tbody>
</table>

When the value of this bit is 1, data cache invalidate instructions executed at EL1 perform a data cache clean and invalidate. For the invalidate by set/way instruction this behavior applies regardless of the value of the **HCR_EL2.SWIO** bit.

This bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of **HCR_EL2.{E2H, TGE}** is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the HCR_EL2**

Accesses to this register use the following encodings:

MRS <Xt>, HCR_EL2

HCRX_EL2, Extended Hypervisor Configuration Register

The HCRX_EL2 characteristics are:

**Purpose**

Provides configuration controls for virtualization, including defining whether various operations are trapped to EL2.

**Configuration**

This register is present only when FEAT_HCX is implemented. Otherwise, direct accesses to HCRX_EL2 are **UNDEFINED**.

If EL2 is not implemented, this register is **RES0** from EL3.

The bits in this register behave as if they are 0 for all purposes other than direct reads of the register if:

- EL2 is not enabled in the current Security state.
- SCR_EL3.HXEn is 0.

**Attributes**

HCRX_EL2 is a 64-bit register.

**Field descriptions**

The HCRX_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 |

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | FGTnXS | FnXS | EnASR | EnALS | EnAS0 |

**Bits [63:5]**

Reserved, RES0.

**FGTnXS, bit [4]**

**When FEAT_XS is implemented:**

Determines if the fine-grained traps in HFGITR_EL2 that apply to each of the TLBI maintenance instructions that are accessible at EL1 also apply to the corresponding TLBI maintenance instructions with the nXS qualifier.

<table>
<thead>
<tr>
<th>FGTnXS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The fine-grained trap in the HFGITR_EL2 that applies to a TLBI maintenance instruction at EL1 also applies to the corresponding TLBI instruction with the nXS qualifier at EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The fine-grained trap in the HFGITR_EL2 that applies to a TLBI maintenance instruction at EL1 does not apply to the corresponding TLBI instruction with the nXS qualifier at EL1.</td>
</tr>
</tbody>
</table>

**Otherwise:**

Reserved, RES0.
**FnXS, bit [3]**

*When FEAT_XS is implemented:*

Determines the behavior of TLBI instructions affected by the XS attribute.

This control bit also determines whether an AArch64 DSB instruction behaves as a DSB instruction with an nXS qualifier when executed at EL0 and EL1.

<table>
<thead>
<tr>
<th>FnXS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not have any effect on the behavior of the TLBI maintenance instructions.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLBI maintenance instruction without the nXS qualifier executed at EL1 behaves in the same way as the corresponding TLBI maintenance instruction with the nXS qualifier. An AArch64 DSB instruction executed at EL1 or EL0 behaves in the same way as the corresponding DSB instruction with the nXS qualifier executed at EL1 or EL0.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

*Otherwise:*

Reserved, RES0.

**EnASR, bit [2]**

*When FEAT_LS64 is implemented:*

When \( \text{HCR\_EL2.\{E2H, TGE\} \neq \{1, 1\} } \), traps execution of an ST64BV instruction at EL0 or EL1 to EL2.

<table>
<thead>
<tr>
<th>EnASR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Execution of an ST64BV instruction at EL0 is trapped to EL2 if the execution is not trapped by SCTL_EL1.EnASR. Execution of an ST64BV instruction at EL1 is trapped to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

A trap of an ST64BV instruction is reported using an ESR\_ELx.EC value of 0x0A, with an ISS code of 0x00000000.

On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to 0.

*Otherwise:*

Reserved, RES0.

**EnALS, bit [1]**

*When FEAT_LS64 is implemented:*

When \( \text{HCR\_EL2.\{E2H, TGE\} \neq \{1, 1\} } \), traps execution of an LD64B or ST64B instruction at EL0 or EL1 to EL2.

<table>
<thead>
<tr>
<th>EnALS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Execution of an LD64B or ST64B instruction at EL0 is trapped to EL2 if the execution is not trapped by SCTL_EL1.EnALS. Execution of an LD64B or ST64B instruction at EL1 is trapped to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

A trap of an LD64B or ST64B instruction is reported using an ESR\_ELx.EC value of 0x0A, with an ISS code of 0x00000002.

On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to 0.
Otherwise:
Reserved, RES0.

EnAS0, bit [0]

When FEAT_LS64 is implemented:

When HCR_EL2.{E2H, TGE} != {1, 1}, traps execution of an ST64BV0 instruction at EL0 or EL1 to EL2.

<table>
<thead>
<tr>
<th>EnAS0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Execution of an ST64BV0 instruction at EL0 is trapped to EL2 if the execution is not trapped by SCTLR_EL1.EnAS0. Execution of an ST64BV0 instruction at EL1 is trapped to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

A trap of an ST64BV0 instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x00000001.

On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to 0.

Otherwise:
Reserved, RES0.

</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

### PMCNTEN, bit [16]

**When FEAT_PMUv3 is implemented:**

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of \( \text{PMCNTENCLR}_{EL0} \) and \( \text{PMCNTENSET}_{EL0} \).
- At EL0 using Arch32 when EL1 is using AArch64: MRC reads of \( \text{PMCNTENCLR} \) and \( \text{PMCNTENSET} \).
PMCNTEN

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The operations listed above are not affected by this bit.</td>
</tr>
</tbody>
</table>
| 0b1 | If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 0b1, then, unless the read generates a higher priority exception:
  - MRS reads at EL1 and EL0 using AArch64 of PMCNTENCLR_EL0 and PMCNTENSET_EL0 are trapped to EL2 and reported with EC syndrome value 0x18.
  - MRC reads at EL0 using AArch32 of PMCNTENCLR and PMCNTENSET are trapped to EL2 and reported with EC syndrome value 0x03. |

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMCCNTR_EL0, bit [15]

When FEAT_PMUv3 is implemented:

Trap MRS reads of PMCCNTR_EL0 at EL1 and EL0 using AArch64 and MRC and MRRC reads of PMCCNTR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

<table>
<thead>
<tr>
<th>PMCCNTR_EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MRS reads of PMCCNTR_EL0 at EL1 and EL0 using AArch64 and MRC and MRRC reads of PMCCNTR at EL0 using AArch32 are not affected by this bit.</td>
</tr>
</tbody>
</table>
| 0b1 | If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 0b1, then, unless the read generates a higher priority exception:
  - MRS reads of PMCCNTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.
  - MRC and MRRC reads of PMCCNTR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03 (for MRC) or 0x04 (for MRRC). |

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMCCFILTR_EL0, bit [14]

When FEAT_PMUv3 is implemented:

Trap MRS reads of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMCCFILTR at EL0 using AArch32 when EL1 is using AArch64 to EL2.
PMCCFILTR_EL0 can also be accessed in AArch64 state using PMXEVTYPER_EL0 when PMSELR_EL0.SEL == 31, and PMCCFILTR can also be accessed in AArch32 state using PMXEVTYPER when PMSELR.SEL == 31.

Setting this bit to 1 has no effect on accesses to PMXEVTYPER_EL0 and PMXEVTYPER, regardless of the value of PMSELR_EL0.SEL or PMSELR.SEL.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### PMEVTYPEPERn_EL0, bit [13]

When FEAT_PMUv3 is implemented:

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of PMEVTYPEPER<\text{n}>_EL0 and PMXEVTYPER_EL0.
- At EL0 using Arch32 when EL1 is using AArch64: MRC reads of PMEVTYPEPER<\text{n}> and PMXEVTYPER.

<table>
<thead>
<tr>
<th>PMEVTYPEPERn_EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The operations listed above are not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state, HCR_EL2.(E2H,TGE) != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 0b1, then, unless the read generates a higher priority exception:</td>
</tr>
<tr>
<td></td>
<td>• MRS reads at EL1 and EL0 using AArch64 of PMEVTYPEPER&lt;\text{n}&gt;_EL0 and PMXEVTYPER_EL0 are trapped to EL2 and reported with EC syndrome value 0x18.</td>
</tr>
<tr>
<td></td>
<td>• MRC reads at EL0 using Arch32 of PMEVTYPEPER&lt;\text{n}&gt; and PMXEVTYPER are trapped to EL2 and reported with EC syndrome value 0x03.</td>
</tr>
</tbody>
</table>

When FEAT_FGT is implemented, then, regardless of the value of this bit, for each value n:

- If event counter n is not implemented, the following accesses are **UNDEFINED**:
  - In AArch64 state, a read of PMEVTYPEPER<\text{n}>_EL0, or, if n is not 31, a read of PMXEVTYPER_EL0 when PMSELR_EL0.SEL == n.
  - In AArch32 state, a read of PMEVTYPEPER<\text{n}>, or, if n is not 31, a read of PMXEVTYPER when PMSELR.SEL == n.
- If event counter n is implemented and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:
In AArch64 state, a read of PMEVTYPER<n>_EL0, or a read of PMXEVTYPER_EL0 when PMSELR_EL0.SEL == n, reported with EC syndrome value 0x18.

In AArch32 state, a read of PMEVTYPER<n>, or a read of PMXEVTYPER when PMSELR.SEL == n, reported with EC syndrome value 0x03.

See also HDFGRTR_EL2.PMCCFILTR_EL0.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**PMEVCNTRn_EL0, bit [12]**

*When FEAT_PMUv3 is implemented:*

Traps MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of PMEVCNTR<n>_EL0 and PMXEVCNTR_EL0.
- At EL0 using Arch32 when EL1 is using AArch64: MRC reads of PMEVCNTR<n> and PMXEVCNTR.

<table>
<thead>
<tr>
<th>PMEVCNTRn_EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The operations listed above are not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state, HCR_EL2.E2H,TGE != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3,FGTEn == 0b1, then, unless the read generates a higher priority exception:</td>
</tr>
<tr>
<td></td>
<td>• MRS reads at EL1 and EL0 using AArch64 of PMEVCNTR&lt;n&gt;_EL0 and PMXEVCNTR_EL0 are trapped to EL2 and reported with EC syndrome value 0x18.</td>
</tr>
<tr>
<td></td>
<td>• MRC reads at EL0 using AArch32 of PMEVCNTR&lt;n&gt; and PMXEVCNTR are trapped to EL2 and reported with EC syndrome value 0x03.</td>
</tr>
</tbody>
</table>

When FEAT_FGT is implemented, then, regardless of the value of this bit, for each value n:

- If event counter n is not implemented, the following accesses are UNDEFINED:
  - In AArch64 state, a read of PMEVCNTR<n>_EL0, or a read of PMXEVCNTR_EL0 when PMSELR_EL0.SEL == n.
  - In AArch32 state, a read of PMEVCNTR<n>, or a read of PMXEVCNTR when PMSELR.SEL == n.

- If event counter n is implemented, and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:
  - In AArch64 state, a read of PMEVCNTR<n>_EL0, or a read of PMXEVCNTR_EL0 when PMSELR_EL0.SEL == n, reported with EC syndrome value 0x18.
  - In AArch32 state, a read of PMEVCNTR<n>, or a read of PMXEVCNTR when PMSELR.SEL == n, reported with EC syndrome value 0x03.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**OSDLR_EL1, bit [11]**

*When FEAT_DoubleLock is implemented:*

Trap MRS reads of OSDLR_EL1 at EL1 using AArch64 to EL2.
OSDLR_EL1, Hypervisor Debug Fine-Grained Read Trap Register

<table>

        end if;
    else
        HDFGRTR_EL2 = X[t];
    end if;
elsif PSTATE.EL == EL3 then
    HDFGRTR_EL2 = X[t];
else
    HDFGRTR_EL2 = X[t];
end if;
The HDFGWTR_EL2 characteristics are:

**Purpose**

Provides controls for traps of MSR and MCR writes of debug, trace, PMU, and Statistical Profiling System registers.

**Configuration**

This register is present only when FEAT_FGT is implemented. Otherwise, direct accesses to HDFGWTR_EL2 are UNDEFINED.

**Attributes**

HDFGWTR_EL2 is a 64-bit register.

**Field descriptions**

The HDFGWTR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0, nPMSNEVFR_EL1</td>
<td>Reserved, 1 if EL2 is present and enabled, otherwise 0. If EL2 is enabled but not present, and nPMSNEVFR_EL1 is 1, a trap occurs.</td>
</tr>
<tr>
<td>62</td>
<td>nPMSNEVFR_EL1</td>
<td>If EL2 is implemented and enabled in the current Security state then MSR writes of PMSNEVFR_EL1 at EL1 using AArch64 are trapped to EL2, and reported with EC syndrome value 0x18, unless the write generates a higher priority exception. If this bit is 0, MSR writes of PMSNEVFR_EL1 are not affected by this bit.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE and treated as zero when EL3 is implemented and SCR_EL3.FGTEn == 0b0.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.
Bits [61:58]

Reserved, RES0.

**PMUSERENR_EL0, bit [57]**

When FEAT_PMUv3 is implemented:

Trap MSR writes of `PMUSERENR_EL0` at EL1 using AArch64 to EL2.

<table>
<thead>
<tr>
<th>PMUSERENR_EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MSR writes of <code>PMUSERENR_EL0</code> are not affected by this bit.</td>

<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGETn == 0b1, then MSR writes of TRCPRGCTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**Bit [43]**

Reserved, RES0.

**TRCOSLAR, bit [42]**

When System register access to the PE Trace Unit registers is implemented and FEAT_ETMv4 is implemented:

Trap MSR writes of TRCOSLAR at EL1 using AArch64 to EL2.

<table>
<thead>
<tr>
<th>TRCOSLAR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MSR writes of TRCOSLAR are not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGETn == 0b1, then MSR writes of TRCOSLAR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**TRCIMSPECn, bit [41]**

When FEAT_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MSR writes of TRCIMSPEC<n> at EL1 using AArch64 to EL2.
TRCIMSPEC<n> are not affected by this bit.

0b1 If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 0b1, then MSR writes of TRCIMSPEC<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

TRCIMSPEC<1-7> are optional. If TRCIMSPEC<n> is not implemented, a write of TRCIMSPEC<n> is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [40:38]

Reserved, RES0.

TRCCNTVRn, bit [37]

When FEAT_ETMv4 is implemented, TRCCNTVR<n> are implemented and System register access to the PE Trace Unit registers is implemented:

Trap MSR writes of TRCCNTVR<n> at EL1 using AArch64 to EL2.

0b0 MSR writes of TRCCNTVR<n> are not affected by this bit.

0b1 If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 0b1, then MSR writes of TRCCNTVR<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If Counter n is not implemented, a write of TRCCNTVR<n> is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCCLAIM, bit [36]

When FEAT_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- TRCCLAIMCLR.
- TRCCLAIMSET.
### TRCCLAIM

<table>
<thead>
<tr>
<th>TRCCLAIM</th>
<th>Meaning</th>
</tr>
</thead>

</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The operations listed above are not affected by this bit.</td>
</tr>
</tbody>
</table>
| 0b1     | If EL2 is implemented and enabled in the current Security state, HCR_EL2.{{E2H,TGE}} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 0b1, then, unless the write generates a higher priority exception:
  - MSR writes at EL1 and EL0 using AArch64 of PMCNTENCLR_EL0 and PMCNTENSET_EL0 are trapped to EL2 and reported with EC syndrome value 0x18.
  - MCR writes at EL0 using AArch32 of PMCNTENCLR and PMCNTENSET are trapped to EL2 and reported with EC syndrome value 0x03. |

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMCCNTR_EL0, bit [15]**

**When FEAT_PMUv3 is implemented:**

- Trap MSR writes of PMCCNTR_EL0 at EL1 and EL0 using AArch64 and MCR and MCRR writes of PMCCNTR at EL0 using AArch32 when EL1 is using AArch64 to EL2.
Meaning

0b0  MSR writes of PMCCNTR_EL0 at EL1 and EL0 using AArch64 and MCR and MCRR writes of PMCCNTR at EL0 using AArch32 are not affected by this bit.

0b1  If EL2 is implemented and enabled in the current Security state, HCR_EL2 {E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 0b1, then, unless the write generates a higher priority exception:

• MSR writes of PMCCNTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.
• MCR and MCRR writes of PMCCNTR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03 (for MCR) or 0x04 (for MCRR).

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Reserved, RES0.

PMCCFILTR_EL0, bit [14]

When FEAT_PMUv3 is implemented:

Trap MSR writes of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMCCFILTR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

Meaning

0b0  MSR writes of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMCCFILTR at EL0 using AArch32 are not affected by this bit.

0b1  If EL2 is implemented and enabled in the current Security state, HCR_EL2 {E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 0b1, then, unless the write generates a higher priority exception:

• MSR writes of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.
• MCR writes of PMCCFILTR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

PMCCFILTR_EL0 can also be accessed in AArch64 state using PMXEVTYPER_EL0 when PMSELR_EL0.SEL == 31, and PMCCFILTR can also be accessed in AArch32 state using PMXEVTYPER when PMSELR.SEL == 31.

Setting this bit to 1 has no effect on accesses to PMXEVTYPER_EL0 and PMXEVTYPER, regardless of the value of PMSELR_EL0.SEL or PMSELR.SEL.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Reserved, RES0.

PMEVTYPERn_EL0, bit [13]

When FEAT_PMUv3 is implemented:

Trap MSR writes and MCR writes of multiple System registers.

Enables a trap to EL2 the following operations:
• At EL1 and EL0 using AArch64: MSR writes of \texttt{PMEVTYPER<n>\_EL0} and \texttt{PMXEVTYPER\_EL0}
• At EL0 using Arch32 when EL1 is using AArch64: MCR writes of \texttt{PMEVTYPER<n>\_EL0} and \texttt{PMXEVTYPER}.

<table>
<thead>
<tr>
<th>PMEVTYPERn_EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The operations listed above are not affected by this bit.</td>
</tr>
</tbody>
</table>
| 0b1              | If EL2 is implemented and enabled in the current Security state, \texttt{HCR\_EL2.E2H,TGE} != \{1,1\}, EL1 is using AArch64, and either EL3 is not implemented or \texttt{SCR\_EL3.FGTEn} == 0b1, then, unless the write generates a higher priority exception:  
• MSR writes at EL1 and EL0 using AArch64 of \texttt{PMEVTYPER<n>\_EL0} and \texttt{PMXEVTYPER\_EL0} are trapped to EL2 and reported with EC syndrome value 0x18.  
• MCR writes at EL0 using AArch32 of \texttt{PMEVTYPER<n>} and \texttt{PMXEVTYPER} are trapped to EL2 and reported with EC syndrome value 0x03. |

When \texttt{FEAT\_FGT} is implemented, then, regardless of the value of this bit, for each value \texttt{n}:

• If event counter \texttt{n} is not implemented, the following accesses are \texttt{UNDEFINED}:
  ◦ In AArch64 state, a write of \texttt{PMEVTYPER<n>\_EL0}, or if \texttt{n} is not 31, a write of \texttt{PMXEVTYPER\_EL0} when \texttt{PMSELR\_EL0.SEL == n}.  
  ◦ In AArch32 state, a write of \texttt{PMEVTYPER<n>}, or if \texttt{n} is not 31, a write of \texttt{PMXEVTYPER} when \texttt{PMSELR.SEL == n}.  
• If event counter \texttt{n} is implemented and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:
  ◦ In AArch64 state, a write of \texttt{PMEVTYPER<n>\_EL0}, or a write of \texttt{PMXEVTYPER\_EL0} when \texttt{PMSELR\_EL0.SEL == n}, reported with EC syndrome value 0x18.  
  ◦ In AArch32 state, a write of \texttt{PMEVTYPER<n>}, or a write of \texttt{PMXEVTYPER} when \texttt{PMSELR.SEL == n}, reported with EC syndrome value 0x03.

See also HDFGWTR\_EL2.PMCCFILTR\_EL0.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

\textbf{Otherwise:}

Reserved, \texttt{RES0}.

\textbf{PMEVCNTRn\_EL0, bit [12]}

When \texttt{FEAT\_PMUv3} is implemented:

Trap MSR writes and MCR writes of multiple System registers.

Enables a trap to EL2 the following operations:

• At EL1 and EL0 using AArch64: MSR writes of \texttt{PMEVCNTR<n>\_EL0} and \texttt{PMXEVCNTR\_EL0}.  
• At EL0 using Arch32 when EL1 is using AArch64: MCR writes of \texttt{PMEVCNTR<n>\_EL0} and \texttt{PMXEVCNTR}.  

\texttt{HDFGWTR\_EL2, Hypervisor Debug Fine-Grained Write Trap Register}
Meaning

The operations listed above are not affected by this bit.

If EL2 is implemented and enabled in the current Security state, \( HCR\_{EL2} \{E2H,TGE\} \neq \{1,1\} \), EL1 is using AArch64, and either EL3 is not implemented or \( SCR\_{EL3}.FGTEn == 0b1 \), then, unless the write generates a higher priority exception:

- MSR writes at EL1 and EL0 using AArch64 of \( PMEVCNTR<\text{n}>_{EL0} \) and \( PMXEVCNTR\_EL0 \) are trapped to EL2 and reported with EC syndrome value 0x18.
- MCR writes at EL0 using AArch32 of \( PMEVCNTR<\text{n}> \) and \( PMXEVCNTR \) are trapped to EL2 and reported with EC syndrome value 0x03.

When FEAT\_FGT is implemented, then, regardless of the value of this bit, for each value \( \text{n} \):

- If event counter \( \text{n} \) is not implemented, the following accesses are UNDEFINED:
  - In AArch64 state, a write of \( PMEVCNTR<\text{n}>_{EL0} \) or a write of \( PMXEVCNTR\_EL0 \) when \( PMSELR\_EL0.SEL == \text{n} \).
  - In AArch32 state, a write of \( PMEVCNTR<\text{n}> \), or a write of \( PMXEVCNTR \) when \( PMSELR.SEL == \text{n} \).
- If event counter \( \text{n} \) is implemented, and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:
  - In AArch64 state, a write of \( PMEVCNTR<\text{n}>_{EL0} \), or a write of \( PMXEVCNTR\_EL0 \) when \( PMSELR\_EL0.SEL == \text{n} \), reported with EC syndrome value 0x18.
  - In AArch32 state, a write of \( PMEVCNTR<\text{n}> \), or a write of \( PMXEVCNTR \) when \( PMSELR.SEL == \text{n} \), reported with EC syndrome value 0x03.

On a Warm reset, in a system where the PE resets into EL2, this field resets to \( 0 \).

Otherwise:

Reserved, \( RES0 \).

**OSDLR\_EL1, bit [11]**

When FEAT\_DoubleLock is implemented:

Trap MSR writes of \( OSDLR\_EL1 \) at EL1 using AArch64 to EL2.

Meaning

MSR writes of \( OSDLR\_EL1 \) are not affected by this bit.

If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or \( SCR\_{EL3}.FGTEn == 0b1 \), then MSR writes of \( OSDLR\_EL1 \) at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to \( 0 \).

Otherwise:

Reserved, \( RES0 \).

**OSECCR\_EL1, bit [10]**

Trap MSR writes of \( OSECCR\_EL1 \) at EL1 using AArch64 to EL2.
Bit [9]
Reserved, RES0.

OSLAR_EL1, bit [8]
Trap MSR writes of OSLAR_EL1 at EL1 using AArch64 to EL2.

---

OSLAR_EL1 Meanings

HFGITR_EL2, Hypervisor Fine-Grained Instruction Trap Register

The HFGITR_EL2 characteristics are:

**Purpose**

Provides instruction trap controls.

**Configuration**

This register is present only when FEAT_FGT is implemented. Otherwise, direct accesses to HFGITR_EL2 are UNDEFINED.

**Attributes**

HFGITR_EL2 is a 64-bit register.

**Field descriptions**

The HFGITR_EL2 bit assignments are:

**Bits [63:55]**

Reserved, RES0.

**DCCVAC, bit [54]**

Trap execution of multiple instructions. Enables a trap on execution at EL1 and EL0 using AArch64 of any of the following AArch64 instructions to EL2:

- **DC CVAC**, if FEAT_MTE is implemented.
- **DC CGVAC**, if FEAT_MTE is implemented.
- **DC CGDVAC**, if FEAT_MTE is implemented.

<table>
<thead>
<tr>
<th>DCCVAC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Execution of the instructions listed above is not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state, <strong>HCR_EL2, {E2H,TGE} != {1,1}</strong>, and either EL3 is not implemented or <strong>SCR_EL3.FGTEn == 0b1</strong>, then execution at EL1 and EL0 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**SVC_EL1, bit [53]**

Trap execution of SVC at EL1 using AArch64 to EL2.
HFGITR_EL2, Hypervisor Fine-Grained Instruction Trap Register

<table>
<thead>
<tr>
<th>SVC_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>

<td>Execution of SVC is not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 0b1, then execution of SVC at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x15, unless the instruction generates a higher priority exception.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**SVC_EL0, bit [52]**

Trap execution of SVC at EL0 using AArch64 and execution of SVC at EL0 using AArch32 when EL1 is using AArch64 to EL2.

<table>
<thead>
<tr>
<th>SVC_EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Execution of SVC at EL0 using AArch64 and execution of SVC at EL0 using AArch32 is not affected by this bit.</td>
</tr>
</tbody>
</table>
| 0b1     | If EL2 is implemented and enabled in the current Security state, HCR_EL2.E2H,TGE != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 0b1, then, unless the instruction generates a higher priority exception:  
  - Execution of SVC at EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x15.  
  - Execution of SVC at EL0 using AArch32 is trapped to EL2 and reported with EC syndrome value 0x11. |

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**ERET, bit [51]**

Trap execution of multiple instructions. Enables a trap on execution at EL1 using AArch64 of any of the following AArch64 instructions to EL2:

- ERET.
- ERETTA, if FEAT_PAuth is implemented.
- ERETAB, if FEAT_PAuth is implemented.

<table>
<thead>
<tr>
<th>ERET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Execution of the instructions listed above is not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 0b1, then execution at EL1 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x1A, unless the instruction generates a higher priority exception.</td>
</tr>
</tbody>
</table>

If EL2 is implemented and enabled in the current Security state, HCR_EL2.API == 0b0, and this bit enables a fine-grained trap on the instruction, then execution at EL1 using AArch64 of ERETTA or ERETTAB instructions is trapped to EL2 and reported with EC syndrome value 0x1A with its associated ISS field, as the fine-grained trap has higher priority than the trap enabled by HCR_EL2.API == 0.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**CPPRCTX, bit [50]**

When FEAT_SPECRES is implemented:

Trap execution of CPP RCTX at EL1 and EL0 using AArch64 and execution of CPPRCTX at EL0 using AArch32 when EL1 is using AArch64 to EL2.
<table>
<thead>
<tr>
<th>CPPRCTX</th>
<th>Meaning</th>

**DCCSW, bit [5]**

Trap execution of multiple instructions. Enables a trap on execution at EL1 using AArch64 of any of the following AArch64 instructions to EL2:
• **DC CSW**, if FEAT_MTE is implemented.
• **DC CGSW**, if FEAT_MTE is implemented.

### DCCSW

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Execution of the instructions listed above is not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 0b1, then execution at EL1 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### DCISW, bit [4]

Trap execution of multiple instructions. Enables a trap on execution at EL1 using AArch64 of any of the following AArch64 instructions to EL2:

• **DC ISW**.
• **DC IGSW**, if FEAT_MTE is implemented.
• **DC IGDSW**, if FEAT_MTE is implemented.

### DCIVAC

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Execution of the instructions listed above is not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 0b1, then execution at EL1 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### DCIVAC, bit [3]

Trap execution of multiple instructions. Enables a trap on execution at EL1 using AArch64 of any of the following AArch64 instructions to EL2:

• **DC IVAC**.
• **DC IGVAC**, if FEAT_MTE is implemented.
• **DC IGDVAC**, if FEAT_MTE is implemented.

### DCIVAU, bit [2]

Trap execution of **IC IVAU** at EL1 and EL0 using AArch64 to EL2.
ICIVAU

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0  Execution of <strong>IC IVAU</strong> is not affected by this bit.</td>

The HFGRTR_EL2 characteristics are:

**Purpose**

Provides controls for traps of MRS and MRC reads of System registers.

**Configuration**

This register is present only when FEAT_FGT is implemented. Otherwise, direct accesses to HFGRTR_EL2 are UNDEFINED.

**Attributes**

HFGRTR_EL2 is a 64-bit register.

**Field descriptions**

The HFGRTR_EL2 bit assignments are:

**Bits [63:51]**

Reserved, RES0.

**nACCDATA_EL1, bit [50]**

When FEAT_LS64 is implemented:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If EL2 is implemented and enabled in the current Security state then MRS reads of ACCDATA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.</td>
</tr>
<tr>
<td>0b1</td>
<td>MRS reads of ACCDATA_EL1 are not affected by this bit.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE and treated as zero when EL3 is implemented and SCR_EL3 FGTEn == 0b0.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.
ERXADDR_EL1, bit [49]

When FEAT_RAS is implemented:

Trap MRS reads of ERXADDR_EL1 at EL1 using AArch64 to EL2.

<table>
<thead>
<tr>
<th>ERXADDR_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MRS reads of ERXADDR_EL1 are not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 0b1, then MRS reads of ERXADDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Reserved, RES0.

ERXPFGCDN_EL1, bit [48]

When FEAT_RASv1p1 is implemented:

Trap MRS reads of ERXPFGCDN_EL1 at EL1 using AArch64 to EL2.

<table>
<thead>
<tr>
<th>ERXPFGCDN_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MRS reads of ERXPFGCDN_EL1 are not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 0b1, then MRS reads of ERXPFGCDN_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Reserved, RES0.

ERXPFGCTL_EL1, bit [47]

When FEAT_RASv1p1 is implemented:

Trap MRS reads of ERXPFGCTL_EL1 at EL1 using AArch64 to EL2.

<table>
<thead>
<tr>
<th>ERXPFGCTL_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MRS reads of ERXPFGCTL_EL1 are not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 0b1, then MRS reads of ERXPFGCTL_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.
HFGTR_EL2, Hypervisor Fine-Grained Read Trap Register

Otherwise:
Reserved, RES0.

ERXPFGF_EL1, bit [46]

When FEAT_RAS is implemented:

Trap MRS reads of ERXPFGF_EL1 at EL1 using AArch64 to EL2.

<table>
<thead>
<tr>
<th>ERXPFGF_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MRS reads of ERXPFGF_EL1 are not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 0b1, then MRS reads of ERXPFGF_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

ERXMISCn_EL1, bit [45]

When FEAT_RAS is implemented:

Trap MRS reads of ERXMISC<n>_EL1 at EL1 using AArch64 to EL2.

<table>
<thead>
<tr>
<th>ERXMISCn_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MRS reads of ERXMISC&lt;n&gt;_EL1 are not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 0b1, then MRS reads of ERXMISC&lt;n&gt;_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

ERXSTATUS_EL1, bit [44]

When FEAT_RAS is implemented:

Trap MRS reads of ERXSTATUS_EL1 at EL1 using AArch64 to EL2.
**ERXSTATUS_EL1**

| Meaning | 
|---|---|
| **0b0** | MRS reads of **ERXSTATUS_EL1** are not affected by this bit. |
| **0b1** | If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or \( \text{SCR}_{EL3}.\text{FGTEn} == 0b1 \), then MRS reads of **ERXSTATUS_EL1** at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception. |

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**ERXCTRLR_EL1, bit [43]**

When FEAT_RAS is implemented:

Trap MRS reads of **ERXCTRLR_EL1** at EL1 using AArch64 to EL2.

| Meaning | 
|---|---|
| **0b0** | MRS reads of **ERXCTRLR_EL1** are not affected by this bit. |
| **0b1** | If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or \( \text{SCR}_{EL3}.\text{FGTEn} == 0b1 \), then MRS reads of **ERXCTRLR_EL1** at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception. |

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**ERXFR_EL1, bit [42]**

When FEAT_RAS is implemented:

Trap MRS reads of **ERXFR_EL1** at EL1 using AArch64 to EL2.

| Meaning | 
|---|---|
| **0b0** | MRS reads of **ERXFR_EL1** are not affected by this bit. |
| **0b1** | If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or \( \text{SCR}_{EL3}.\text{FGTEn} == 0b1 \), then MRS reads of **ERXFR_EL1** at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception. |

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.
ERRSEL_R_EL1, bit [41]

When FEAT_RAS is implemented:

Trap MRS reads of ERRSEL_R_EL1 at EL1 using AArch64 to EL2.

<table>
<thead>
<tr>
<th>ERRSEL_R_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MRS reads of ERRSEL_R_EL1 are not affected by this bit.</td>

HFGWTR_EL2, Hypervisor Fine-Grained Write Trap Register

The HFGWTR_EL2 characteristics are:

**Purpose**

Provides controls for traps of MSR and MCR writes of System registers.

**Configuration**

This register is present only when FEAT_FGT is implemented. Otherwise, direct accesses to HFGWTR_EL2 are UNDEFINED.

**Attributes**

HFGWTR_EL2 is a 64-bit register.

**Field descriptions**

The HFGWTR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>62</th>
<th>61</th>
<th>60</th>
<th>59</th>
<th>58</th>
<th>57</th>
<th>56</th>

</table>

**Bits [63:51]**

Reserved, RES0.

**nACCDATA_EL1, bit [50]**

When FEAT_LS64 is implemented:

Trap MSR writes of ACCDATA_EL1 at EL1 using AArch64 to EL2.

<table>
<thead>
<tr>
<th>nACCDATA_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If EL2 is implemented and enabled in the current Security state then MSR writes of ACCDATA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.</td>
</tr>
<tr>
<td>0b1</td>
<td>MSR writes of ACCDATA_EL1 are not affected by this bit.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE and treated as zero when EL3 is implemented and SCR_EL3 FGTEn == 0b0.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.
ERTXADD_EL1, bit [48]

When FEAT_RAS is implemented:

Trap MSR writes of ERXADDR_EL1 at EL1 using AArch64 to EL2.

<table>
<thead>
<tr>
<th>ERXADDR_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MSR writes of ERXADDR_EL1 are not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 0b1, then MSR writes of ERXADDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXPFGCDN_EL1, bit [48]

When FEAT_RASv1p1 is implemented:

Trap MSR writes of ERXPFGCDN_EL1 at EL1 using AArch64 to EL2.

<table>
<thead>
<tr>
<th>ERXPFGCDN_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MSR writes of ERXPFGCDN_EL1 are not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 0b1, then MSR writes of ERXPFGCDN_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXPFGCTL_EL1, bit [47]

When FEAT_RASv1p1 is implemented:

Trap MSR writes of ERXPFGCTL_EL1 at EL1 using AArch64 to EL2.

<table>
<thead>
<tr>
<th>ERXPFGCTL_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MSR writes of ERXPFGCTL_EL1 are not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 0b1, then MSR writes of ERXPFGCTL_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.
Otherwise:
Reserved, RES0.

Bit [46]
Reserved, RES0.

**ERXMISCn_EL1, bit [45]**

When FEAT_RAS is implemented:

Trap MSR writes of ERXMISC<n>_EL1 at EL1 using AArch64 to EL2.

<table>
<thead>
<tr>
<th>ERXMISCn_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MSR writes of ERXMISC&lt;n&gt;_EL1 are not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 0b1, then MSR writes of ERXMISC&lt;n&gt;_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:
Reserved, RES0.

**ERXSTATUS_EL1, bit [44]**

When FEAT_RAS is implemented:

Trap MSR writes of ERXSTATUS_EL1 at EL1 using AArch64 to EL2.

<table>
<thead>
<tr>
<th>ERXSTATUS_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MSR writes of ERXSTATUS_EL1 are not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>

HPFAR_EL2, Hypervisor IPA Fault Address Register

The HPFAR_EL2 characteristics are:

**Purpose**

Holds the faulting IPA for some aborts on a stage 2 translation taken to EL2.

**Configuration**

AArch64 System register HPFAR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HPFAR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

The HPFAR_EL2 is written for:

- Translation or Access faults in the second stage of translation.
- An abort in the second stage of translation performed during the translation table walk of a first stage translation, caused by a Translation fault, an Access flag fault, or a Permission fault.
- A stage 2 Address size fault.

For all other exceptions taken to EL2, this register is UNKNOWN.

**Note**

The address held in this register is an address accessed by the instruction fetch or data access that caused the exception that gave rise to the instruction or data abort. It is the lowest address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores a mis-aligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

**Attributes**

HPFAR_EL2 is a 64-bit register.

**Field descriptions**

The HPFAR_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| NS |    | RES0 |    | FIPA |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Execution at EL1 or EL0 makes HPFAR_EL2 become UNKNOWN.

**NS, bit [63]**

When FEAT_SEL2 is implemented:

Faulting IPA address space.
Meaning

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Faulting IPA is from the Secure IPA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>Faulting IPA is from the Non-secure IPA space.</td>
</tr>
</tbody>
</table>

For Data Aborts or Instruction Aborts taken to Non-secure EL2, this field is res0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, res0.

Bits [62:44]

        HPFAR_EL2 = X[t];
endif
```
HSTR_EL2, Hypervisor System Trap Register

The HSTR_EL2 characteristics are:

**Purpose**

Controls trapping to EL2 of EL1 or lower AArch32 accesses to the System register in the coproc == 0b1111 encoding space, by the CRn value used to access the register using MCR or MRC instruction. When the register is accessible using an MCRR or MRRC instruction, this is the CRm value used to access the register.

**Configuration**

AArch64 System register HSTR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HSTR[31:0]. If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

HSTR_EL2 is a 64-bit register.

**Field descriptions**

The HSTR_EL2 bit assignments are:

**When AArch32 is supported at any Exception level:**

<td>3</td>
<td>2</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

Bits [63:16, 14, 4]

Reserved, RES0.

\( T<n> \), bit [n], for n = 15, 13 to 5, 3 to 0

The remaining fields control whether EL0 and EL1 accesses, using MCR, MRC, MCRR, and MRRC instructions, to the System registers in the coproc == 0b1111 encoding space, are trapped to EL2 as follows:

- MCR or MRC accesses to these registers that are trapped to EL2 are reported using EC syndrome value 0x03, unless the access is UNDEFINED.
- MCRR or MRRC accesses to these registers that are trapped to EL2 are reported using EC syndrome value 0x04, unless the access is UNDEFINED.
### T<n>

<table>
<thead>
<tr>
<th>T&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on EL0 or EL1 accesses to System registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>System registers in the coproc == 0b1111 encoding space and CRn == &lt;n&gt; or CRm == &lt;n&gt; where T&lt;n&gt; is the name of this field, are trapped as follows:</td>
</tr>
<tr>
<td></td>
<td>• An EL1 MCR or MRC access is trapped to EL2.</td>
</tr>
<tr>
<td></td>
<td>• An EL0 MCR or MRC access is trapped to EL2, if the access is not UNDEFINED when the value of this field is 0.</td>
</tr>
<tr>
<td></td>
<td>• An EL1 MCRR or MRRC access is trapped to EL2.</td>
</tr>
<tr>
<td></td>
<td>• An EL0 MCRR or MRRC access is trapped to EL2, if the access is not UNDEFINED when the value of this field is 0.</td>
</tr>
</tbody>
</table>

It is IMPLEMENTATION DEFINED whether an EL0 access using AArch32 is trapped to EL2, or is UNDEFINED. If the access is UNDEFINED, and generates an exception that is taken to EL1 or EL2 using AArch64, this is reported with EC syndrome value 0x00.

#### Note

Arm expects that trapping to EL2 of EL0 accesses to these registers is unusual and used only when the hypervisor must virtualize EL0 operation. Arm recommends that, whenever possible, EL0 accesses to these registers behave as they would if the implementation did not include EL2. This means that, if the architecture does not support the EL0 access, then the register access instruction is treated as UNDEFINED and generates an exception that is taken to EL1.

For example, when HSTR_EL2.T7 is 1, for instructions executed at EL1:

- An MCR or MRC instruction with coproc set to 0b1111 and <CRn> set to c7 is trapped to EL2.
- An MCRR or MRRC instruction with coproc set to 0b1111 and <CRm> set to c7 is trapped to EL2.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IC IALLU, Instruction Cache Invalidate All to PoU

The IC IALLU characteristics are:

**Purpose**

Invalidate all instruction caches to Point of Unification.

**Configuration**

AArch64 System instruction IC IALLU performs the same function as AArch32 System instruction ICIALLU.

**Attributes**

IC IALLU is a 64-bit System instruction.

**Field descriptions**

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

**Executing the IC IALLU instruction**

When executing this instruction Xt should be encoded as 0b11111. If the Xt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Xt field is set to 0b11111.

Accesses to this instruction use the following encodings:

IC IALLU{, <Xt>}

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

    IC_IALLU();
else
    IC_IALLU();
```

Page 796
The IC IALLUIS characteristics are:

**Purpose**

Invalidate all instruction caches in Inner Shareable domain to Point of Unification.

**Configuration**

AArch64 System instruction IC IALLUIS performs the same function as AArch32 System instruction ICIALLUIS.

**Attributes**

IC IALLUIS is a 64-bit System instruction.

**Field descriptions**

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

**Executing the IC IALLUIS instruction**

When executing this instruction Xt should be encoded as 0b11111. If the Xt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Xt field is set to 0b11111.

Accesses to this instruction use the following encodings:

IC IVAU, Instruction Cache line Invalidate by VA to PoU

The IC IVAU characteristics are:

Purpose

Invalidate instruction cache by address to Point of Unification.

Configuration

AArch64 System instruction IC IVAU performs the same function as AArch32 System instruction ICIMVAU.

Attributes

IC IVAU is a 64-bit System instruction.

Field descriptions

The IC IVAU input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Virtual address to use</th>
<th>Virtual address to use</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</td>

<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing the IC IVAU instruction

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The instruction cache maintenance instruction (IC)'.

If EL0 access is enabled, when executed at EL0, this instruction requires read access permission to the VA, otherwise it is IMPLEMENTATION DEFINED whether it generates a Permission Fault, see 'Permission fault'.

Accesses to this instruction use the following encodings:

<table>
<thead>
<tr>
<th>IC IVAU{, &lt;Xt&gt;}</th>
</tr>
</thead>
<tbody>
<tr>
<td>op0</td>
</tr>
<tr>
<td>0b01</td>
</tr>
</tbody>

**Bits [63:32]**

Reserved, RES0.

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to 0.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

**Accessing the ICC_AP0R<n>_EL1**

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 0 active priorities) might result in UNPREDICTABLE behavior of the interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICC_AP0R1_EL1 is only implemented in implementations that support 6 or more bits of priority. ICC_AP0R2_EL1 and ICC_AP0R3_EL1 are only implemented in implementations that support 7 or more bits of priority. Unimplemented registers are UNDEFINED.

**Note**

The number of bits of preemption is indicated by ICH_VTR_EL2.PREbits.
Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- ICC_AP0R<n>_EL1.
- Secure ICC_AP1R<n>_EL1.
- Non-secure ICC_AP1R<n>_EL1.

Accesses to this register use the following encodings:

MRS <Xt>, ICC_AP0R<n>_EL1

ICC_ASGI1R_EL1, Interrupt Controller Alias Software Generated Interrupt Group 1 Register

The ICC_ASGI1R_EL1 characteristics are:

**Purpose**

Generates Group 1 SGIs for the Security state that is not the current Security state.

**Configuration**

AArch64 System register ICC_ASGI1R_EL1 performs the same function as AArch32 System register ICC_ASGI1R.

Under certain conditions a write to ICC_ASGI1R_EL1 can generate Group 0 interrupts, see 'Forwarding an SGI to a target PE' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Attributes**

ICC_ASGI1R_EL1 is a 64-bit register.

**Field descriptions**

The ICC_ASGI1R_EL1 bit assignments are:

<table>

<td>Aff2</td>
</tr>
</tbody>
</table>

**Bits [63:56]**

Reserved, RES0.

**Aff3, bits [55:48]**

The affinity 3 value of the affinity path of the luster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

**RS, bits [47:44]**

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value ((RS * 16) + n).

When ICC_CTLR_EL1.RSS==0, RS is RES0.

When ICC_CTLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a constrained unpredictable choice of:

- The write is ignored.
- The RS field is treated as 0.
**Bits [43:41]**

Reserved, RES0.

**IRM, bit [40]**

Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

<table>
<thead>
<tr>
<th>IRM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Interrupts routed to the PEs specified by Aff3.Aff2.Aff1. &lt;target list&gt;.</td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupts routed to all PEs in the system, excluding &quot;self&quot;.</td>
</tr>
</tbody>
</table>

**Aff2, bits [39:32]**

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

**Bits [31:28]**

Reserved, RES0.

**INTID, bits [27:24]**

The INTID of the SGI.

**Aff1, bits [23:16]**

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

**TargetList, bits [15:0]**

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

**Note**

This restricts a system to sending targeted SGIs to PEs with an affinity 0 number that is less than 16. If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

**Accessing the ICC_ASGI1R_EL1**

This register allows software executing in a Secure state to generate Non-secure Group 1 SGIs. It will also allow software executing in a Non-secure state to generate Secure Group 1 SGIs, if permitted by the settings of GICR_NSACR in the Redistributor corresponding to the target PE.
When `GICD_CTLR.DS==0`, Non-secure writes do not generate an interrupt for a target PE if not permitted by the `GICR_NSACR` register associated with the target PE. For more information, see 'Use of control registers for SGI forwarding'.

---

**Note**

Accesses at EL3 are treated as Secure regardless of the value of `SCR_EL3.NS`.

---

Accesses to this register use the following encodings:

The ICC_BPR0_EL1 characteristics are:

**Purpose**

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption.

**Configuration**

AArch64 System register ICC_BPR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICC_BPR0[31:0].

Virtual accesses to this register update ICH_VMCR_EL2.VBPR0.

**Attributes**

ICC_BPR0_EL1 is a 64-bit register.

**Field descriptions**

The ICC_BPR0_EL1 bit assignments are:

| Bits [63:3] | Reserved, RES0. |
| BinaryPoint, bits [2:0] |

The value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

<table>
<thead>
<tr>
<th>Binary point value</th>
<th>Group priority field</th>
<th>Subpriority field</th>
<th>Field with binary point</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>[7:1]</td>
<td>[0]</td>
<td>ggggggg.s</td>
</tr>
<tr>
<td>1</td>
<td>[7:2]</td>
<td>[1:0]</td>
<td>gggggg.ss</td>

<tr>
<td>2</td>
<td>[7:3]</td>
<td>[2:0]</td>
<td>gggggg.ss</td>
</tr>
<tr>
<td>3</td>
<td>[7:4]</td>
<td>[3:0]</td>
<td>gggg.ss</td>
</tr>
<tr>
<td>4</td>
<td>[7:5]</td>
<td>[4:0]</td>
<td>ggg.sss</td>
</tr>
<tr>
<td>5</td>
<td>[7:6]</td>
<td>[5:0]</td>
<td>gs.sssss</td>
</tr>
<tr>
<td>6</td>
<td>[7]</td>
<td>[6:0]</td>
<td>ssssssss</td>
</tr>
<tr>
<td>7</td>
<td>No preemption</td>
<td>[7:0]</td>
<td>.ssssssss</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ICC_BPR0_EL1**

The minimum binary point value is derived from the number of implemented priority bits. The number of priority bits is IMPLEMENTATION DEFINED, and reported by ICC_CTLR_EL1.PRIbits and ICC_CTLR_EL3.PRIbits.
An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is UNKNOWN.

Accesses to this register use the following encodings:

**Bits [63:3]**

Reserved, RES0.

**BinaryPoint, bits [2:0]**

If the GIC is configured to use separate binary point fields for Group 0 and Group 1 interrupts, the value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. For more information about priorities, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The minimum value of the Non-secure copy of this register is the minimum value of ICC_BPR0_EL1 + 1. The minimum value of the Secure copy of this register is the minimum value of ICC_BPR0_EL1.

If EL3 is implemented and ICC_CTLR_EL3.CBPR_EL1S is 1:

- When SCR_EL3.EEL2 is 1 and HCR_EL2.IMO is 1, Secure accesses to this register at EL1 access the state of ICV_BPR1_EL1.
- Otherwise, Secure accesses to this register at EL1 access the state of ICC_BPR0_EL1.

If EL3 is implemented and ICC_CTLR_EL3.CBPR_EL1NS is 1, Non-secure accesses to this register at EL1 or EL2 behave as follows, depending on the values of HCR_EL2.IMO and SCR_EL3.IRQ.
If EL3 is not implemented and ICC_CTLR_EL1.CBPR is 1, Non-secure accesses to this register at EL1 or EL2 behave as follows, depending on the values of HCR_EL2.IMO:

If EL3 is not implemented and ICC_CTLR_EL1.CBPR is 1, Non-secure accesses to this register at EL1 or EL2 behave as follows, depending on the values of HCR_EL2.IMO:

<table>
<thead>
<tr>
<th>HCR_EL2.IMO</th>
<th>SCR_EL3.IRQ</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>0b0</td>
<td>Non-secure EL1 and EL2 reads return ICC_BPR0_EL1 + 1 saturated to 0b111. Non-secure EL1 and EL2 writes are ignored.</td>
</tr>
<tr>
<td>0b0</td>

**ICC_CTLR_EL1, Interrupt Controller Control Register (EL1)**

The ICC_CTLR_EL1 characteristics are:

**Purpose**

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

**Configuration**

AArch64 System register ICC_CTLR_EL1 bits [31:0] (S) are architecturally mapped to AArch32 System register ICC_CTLR[31:0] (S).

AArch64 System register ICC_CTLR_EL1 bits [31:0] (NS) are architecturally mapped to AArch32 System register ICC_CTLR[31:0] (NS).

**Attributes**

ICC_CTLR_EL1 is a 64-bit register.

**Field descriptions**

The ICC_CTLR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>62</td>
<td>ExtRange, bit [19].</td>
</tr>
<tr>
<td>61</td>
<td>EXTRange, bit [19].</td>
</tr>
<tr>
<td>60</td>
<td>RSS.</td>
</tr>
<tr>
<td>59</td>
<td>RES0.</td>
</tr>
<tr>
<td>58</td>
<td>A3V.</td>
</tr>
<tr>
<td>57</td>
<td>SEIS.</td>
</tr>
<tr>
<td>56</td>
<td>IDbits.</td>
</tr>
<tr>
<td>55</td>
<td>PRIbits.</td>
</tr>
<tr>
<td>54</td>
<td>RES0.</td>
</tr>
<tr>
<td>53</td>
<td>PMHE.</td>
</tr>
<tr>
<td>52</td>
<td>RES0.</td>
</tr>
<tr>
<td>51</td>
<td>EOImode.</td>
</tr>
<tr>
<td>50</td>
<td>CBPR.</td>
</tr>
</tbody>
</table>

**Bits [63:20]**

Reserved, RES0.

**ExtRange, bit [19]**

Extended INTID range (read-only).

<table>
<thead>
<tr>
<th>ExtRange</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0      | CPU interface does not support INTIDs in the range 1024..8191.  
  - Behaviour is **UNPREDICTABLE** if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface. |
| 0b1      | CPU interface supports INTIDs in the range 1024..8191  
  - All INTIDs in the range 1024..8191 are treated as requiring deactivation. |

**Note**

Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.

If EL3 is implemented, ICC_CTLR_EL1.ExtRange is an alias of ICC_CTLR_EL3.ExtRange.
RSS, bit [18]

Range Selector Support. Possible values are:

<table>
<thead>
<tr>
<th>RSS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Targeted SGIs with affinity level 0 values of 0 - 15 are supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>Targeted SGIs with affinity level 0 values of 0 - 255 are supported.</td>
</tr>
</tbody>
</table>

This bit is read-only.

Bits [17:16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

<table>
<thead>
<tr>
<th>A3V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>The CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.</td>
</tr>
</tbody>
</table>

If EL3 is implemented, this bit is an alias of ICC_CTLR_EL3.A3V.

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports local generation of SEIs:

<table>
<thead>
<tr>
<th>SEIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CPU interface logic does not support local generation of SEIs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The CPU interface logic supports local generation of SEIs.</td>
</tr>
</tbody>
</table>

If EL3 is implemented, this bit is an alias of ICC_CTLR_EL3.SEIS.

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. The number of physical interrupt identifier bits supported:

<table>
<thead>
<tr>
<th>IDbits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>16 bits.</td>
</tr>
<tr>
<td>0b001</td>
<td>24 bits.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If EL3 is implemented, this field is an alias of ICC_CTLR_EL3.IDbits.

PRIbits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).

Note

This field always returns the number of priority bits implemented, regardless of the Security state of the access or the value of GICD_CTLR.DS.
For physical accesses, this field determines the minimum value of ICC_BPR0_EL1.

If EL3 is implemented, physical accesses return the value from ICC_CTLR_EL3.PRIbits.

If EL3 is not implemented, physical accesses return the value from this field.

**Bit [7]**

Reserved, RES0.

**PMHE, bit [6]**

Priority Mask Hint Enable. Controls whether the priority mask register is used as a hint for interrupt distribution:

<table>
<thead>
<tr>
<th>PMHE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disables use of ICC_PMR_EL1 as a hint for interrupt distribution.</td>
</tr>
<tr>
<td>0b1</td>
<td>Enables use of ICC_PMR_EL1 as a hint for interrupt distribution.</td>
</tr>
</tbody>
</table>

If EL3 is implemented, this bit is an alias of ICC_CTLR_EL3.PMHE. Whether this bit can be written as part of an access to this register depends on the value of GICD_CTLR.DS:

- If GICD_CTLR.DS == 0, this bit is read-only.
- If GICD_CTLR.DS == 1, this bit is read/write.

If EL3 is not implemented, it is IMPLEMENTATION DEFINED whether this bit is read-only or read-write:

- If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
- If this bit is read/write, it resets to zero.

**Bits [5:2]**

Reserved, RES0.

**EOImode, bit [1]**

EOI mode for the current Security state. Controls whether a write to an End of Interrupt register also deactivates the interrupt:

<table>
<thead>
<tr>
<th>EOImode</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR_EL1 are UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide priority drop functionality only. ICC_DIR_EL1 provides interrupt deactivation functionality.</td>
</tr>
</tbody>
</table>

The Secure ICC_CTLR_EL1.EOImode is an alias of ICC_CTLR_EL3.EOImode_EL1S.

The Non-secure ICC_CTLR_EL1.EOImode is an alias of ICC_CTLR_EL3.EOImode_EL1NS.

**CBPR, bit [0]**

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 interrupts:

<table>
<thead>
<tr>
<th>CBPR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts only. ICC_BPR1_EL1 determines the preemption group for Group 1 interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICC_BPR0_EL1 determines the preemption group for both Group 0 and Group 1 interrupts.</td>
</tr>
</tbody>
</table>
If EL3 is implemented:

- This bit is an alias of ICC_CTLR_EL3.CBPR_EL1\{S,NS\} where S or NS corresponds to the current Security state.
- If GICD_CTLR.DS == 0, this bit is read-only.
- If GICD_CTLR.DS == 1, this bit is read/write.

If EL3 is not implemented, this bit is read/write.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ICC_CTLR_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, ICC_CTLR_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>

  ICC_CTLR_EL1 = X[t];
end if
The ICC_CTLR_EL3 characteristics are:

## Purpose

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

## Configuration

AArch64 System register ICC_CTLR_EL3 bits [31:0] can be mapped to AArch32 System register ICC_MCTLR[31:0], but this is not architecturally mandated.

This register is present only when EL3 is implemented. Otherwise, direct accesses to ICC_CTLR_EL3 are undefined.

## Attributes

ICC_CTLR_EL3 is a 64-bit register.

## Field descriptions

The ICC_CTLR_EL3 bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:20</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>31:20</td>
<td><strong>ExtRange</strong> bit [19]</td>
</tr>
<tr>
<td></td>
<td>Extended INTID range (read-only).</td>
</tr>
</tbody>
</table>

**ExtRange**

<table>
<thead>
<tr>
<th>ExtRange</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>CPU interface does not support INTIDs in the range 1024..8191.</td>
</tr>
<tr>
<td></td>
<td>• Behaviour is <strong>UNPREDICTABLE</strong> if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong></td>
</tr>
<tr>
<td></td>
<td>Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.</td>
</tr>
<tr>
<td>0b1</td>
<td>CPU interface supports INTIDs in the range 1024..8191.</td>
</tr>
<tr>
<td></td>
<td>• All INTIDs in the range 1024..8191 are treated as requiring deactivation.</td>
</tr>
</tbody>
</table>

**RSS**, bit [18]

Range Selector Support.
Targeted SGIs with affinity level 0 values of 0-15 are supported.

Targeted SGIs with affinity level 0 values of 0-255 are supported.

This bit is read-only.

**nDS, bit [17]**

Disable Security not supported. Read-only and writes are ignored.

<table>
<thead>
<tr>
<th>nDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CPU interface logic supports disabling of security.</td>
</tr>
<tr>
<td>0b1</td>
<td>The CPU interface logic does not support disabling of security, and requires that security is not disabled.</td>
</tr>
</tbody>
</table>

**Bit [16]**

Reserved, RES0.

**A3V, bit [15]**

Affinity 3 Valid. Read-only and writes are ignored.

<table>
<thead>
<tr>
<th>A3V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CPU interface logic does not support non-zero values of the Aff3 field in SGI generation System registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>The CPU interface logic supports non-zero values of the Aff3 field in SGI generation System registers.</td>
</tr>
</tbody>
</table>

If EL3 is present, ICC_CTLR_EL1.A3V is an alias of ICC_CTLR_EL3.A3V

**SEIS, bit [14]**

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports generation of SEIs:

<table>
<thead>
<tr>
<th>SEIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CPU interface logic does not support generation of SEIs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The CPU interface logic supports generation of SEIs.</td>
</tr>
</tbody>
</table>

If EL3 is present, ICC_CTLR_EL1.SEIS is an alias of ICC_CTLR_EL3.SEIS

**IDbits, bits [13:11]**

Identifier bits. Read-only and writes are ignored. Indicates the number of physical interrupt identifier bits supported.

<table>
<thead>
<tr>
<th>IDbits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>16 bits.</td>
</tr>
<tr>
<td>0b01</td>
<td>24 bits.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If EL3 is present, ICC_CTLR_EL1.IDbits is an alias of ICC_CTLR_EL3.IDbits

**PRIbits, bits [10:8]**

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).
Note

This field always returns the number of priority bits implemented, regardless of the value of SCR_EL3.NS or the value of GICD_CTLR.DS.

The division between group priority and subpriority is defined in the binary point registers ICC_BPR0_EL1 and ICC_BPR1_EL1.

This field determines the minimum value of ICC_BPR0_EL1.

Bit [7]

Reserved, RES0.

PMHE, bit [6]

Priority Mask Hint Enable.

<table>
<thead>
<tr>
<th>PMHE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disables use of the priority mask register as a hint for interrupt distribution.</td>
</tr>
<tr>
<td>0b1</td>
<td>Enables use of the priority mask register as a hint for interrupt distribution.</td>
</tr>
</tbody>
</table>

Software must write ICC_PMR_EL1 to 0xFF before clearing this field to 0.

- An implementation might choose to make this field RAO/WI if priority-based routing is always used
- An implementation might choose to make this field RAZ/WI if priority-based routing is never used

If EL3 is present, ICC_CTLR_EL1.PMHE is an alias of ICC_CTLR_EL3.PMHE.

On a Warm reset, this field resets to 0.

RM, bit [5]

Routing Modifier. For legacy operation of EL1 software with GICC_CTLR.FIQEn set to 1, this bit indicates whether interrupts can be acknowledged or observed as the Highest Priority Pending Interrupt, or whether a special INTID value is returned.

Possible values of this bit are:

<table>
<thead>
<tr>
<th>RM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure Group 0 and Non-secure Group 1 interrupts can be acknowledged and observed as the highest priority interrupt at the Secure Exception level where the interrupt is taken.</td>
</tr>
<tr>
<td>0b1</td>
<td>When accessed at EL3 in AArch64 state:</td>
</tr>
<tr>
<td></td>
<td>• Secure Group 0 interrupts return a special INTID value of 1020. This affects accesses to ICC_IAR0_EL1 and ICC_HPP1R0_EL1.</td>
</tr>
<tr>
<td></td>
<td>• Non-secure Group 1 interrupts return a special INTID value of 1021. This affects accesses to ICC_IAR1_EL1 and ICC_HPP1R1_EL1.</td>
</tr>
</tbody>
</table>

Note

The Routing Modifier bit is supported in AArch64 only. In systems without EL3 the behavior is as if the value is 0. Software must ensure this bit is 0 when the Secure copy of ICC_SRE_EL1.SRE is 1, otherwise system behavior is UNPREDICTABLE. In systems without EL3 or where the Secure copy of ICC_SRE_EL1.SRE is RAO/WI, this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
EOImode_EL1NS, bit [4]

EOI mode for interrupts handled at Non-secure EL1 and EL2. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

<table>
<thead>
<tr>
<th>EOImode_EL1NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR_EL1 are UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide priority drop functionality only. ICC_DIR_EL1 provides interrupt deactivation functionality.</td>
</tr>
</tbody>
</table>

If EL3 is present, ICC_CTLR_EL1(NS).EOImode is an alias of ICC_CTLR_EL3.EOImode_EL1NS.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EOImode_EL1S, bit [3]

EOI mode for interrupts handled at Secure EL1 and EL2. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

<table>
<thead>
<tr>
<th>EOImode_EL1S</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR_EL1 are UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide priority drop functionality only. ICC_DIR_EL1 provides interrupt deactivation functionality.</td>
</tr>
</tbody>
</table>

If EL3 is present, ICC_CTLR_EL1(S).EOImode is an alias of ICC_CTLR_EL3.EOImode_EL1S.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EOImode_EL3, bit [2]

EOI mode for interrupts handled at EL3. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

<table>
<thead>
<tr>
<th>EOImode_EL3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR_EL1 are UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide priority drop functionality only. ICC_DIR_EL1 provides interrupt deactivation functionality.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

CBPR_EL1NS, bit [1]

Common Binary Point Register, EL1 Non-secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Non-secure interrupts at EL1 and EL2.

<table>
<thead>
<tr>
<th>CBPR_EL1NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts only. ICC_BPR1_EL1 determines the preemption group for Non-secure Group 1 interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts and Non-secure Group 1 interrupts. Non-secure accesses to GICC_BPR and ICC_BPR1_EL1 access the state of ICC_BPR0_EL1.</td>
</tr>
</tbody>
</table>

If EL3 is present, ICC_CTLR_EL1(NS).CBPR is an alias of ICC_CTLR_EL3.CBPR_EL1NS.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### CBPR_EL1S, bit [0]

Common Binary Point Register, EL1 Secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Secure interrupts at EL1 and EL2.

<table>
<thead>
<tr>
<th>CBPR_EL1S</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><strong>ICC_BPR0_EL1</strong> determines the preemption group for Group 0 interrupts only.</td>
</tr>
<tr>
<td></td>
<td><strong>ICC_BPR1_EL1</strong> determines the preemption group for Secure Group 1 interrupts.</td>
</tr>
</tbody>
</table>
| 0b1       | **ICC_BPR0_EL1** determines the preemption group for Group 0 interrupts and Secure Group 1 interrupts.  
|           | Secure EL1 accesses to **ICC_BPR1_EL1** access the state of **ICC_BPR0_EL1**. |

If EL3 is present, **ICC_CTLR_EL1(S).CBPR** is an alias of **ICC_CTLR_EL3.CBPR_EL1S**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Accessing the ICC_CTLR_EL3

Accesses to this register use the following encodings:

**MRS <Xt>, ICC_CTLR_EL3**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>

  if ICC_SRE_EL3.SRE == '0' then
    AArch64.SystemAccessTrap(EL3, 0x18);
  else
    ICC_CTLR_EL3 = X[t];
The ICC_DIR_EL1 characteristics are:

**Purpose**

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified interrupt.

**Configuration**

AArch64 System register ICC_DIR_EL1 performs the same function as AArch32 System register ICC_DIR.

**Attributes**

ICC_DIR_EL1 is a 64-bit register.

**Field descriptions**

The ICC_DIR_EL1 bit assignments are:

<table>
<thead>
<tr>

<td>RES0</td>
</tr>
</tbody>
</table>

RES0

INTID, bits [23:0]

The INTID of the interrupt to be deactivated.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR_EL1.IDbits and ICC_CTLR_EL3.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

**Accessing the ICC_DIR_EL1**

There are two cases when writing to ICC_DIR_EL1 that were UNPREDICTABLE for a corresponding GICv2 write to GICC_DIR:

- When EOImode == 0. GICv3 implementations must ignore such writes. In systems supporting system error generation, an implementation might generate an SEI.
- When EOImode == 1 but no EOI has been issued. The interrupt will be de-activated by the Distributor, however the active priority in the CPU interface for the interrupt will remain set (because no EOI was issued).

Accesses to this register use the following encodings:

MSR ICC_DIR_EL1, <Xt>
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap priority when SDD == '1'" && SCR_EL3.<IRQ,FIQ> == '11' then
    UNDEFINED;
  elsif ICC_SRE_EL1.SRE == '0' then
    AArch64.SystemAccessTrap(EL1, 0x18);
  else
    ICC_DIR_EL1 = X[t];
  end if
elsif PSTATE.EL == EL2 then
  if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap priority when SDD == '1'" && SCR_EL3.<IRQ,FIQ> == '11' then
    UNDEFINED;
  elsif ICC_SRE_EL2.SRE == '0' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    ICC_DIR_EL2 = X[t];
  end if
elsif PSTATE.EL == EL3 then
  if ICC_SRE_EL3.SRE == '0' then
    AArch64.SystemAccessTrap(EL3, 0x18);
  else
    ICC_DIR_EL3 = X[t];
  end if
end if

The ICC_EOIR0_EL1 characteristics are:

**Purpose**

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified Group 0 interrupt.

**Configuration**

AArch64 System register ICC_EOIR0_EL1 performs the same function as AArch32 System register ICC_EOIR0.

**Attributes**

ICC_EOIR0_EL1 is a 64-bit register.

**Field descriptions**

The ICC_EOIR0_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-24</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>23-0</td>
<td>INTID</td>
</tr>
</tbody>
</table>

**Bits [63:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID from the corresponding ICC_IAR0_EL1 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR_EL1.IDbits and ICC_CTLR_EL3.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the EOImode bit for the current Exception level and Security state is 0, a write to this register drops the priority for the interrupt, and also deactivates the interrupt.

If the EOImode bit for the current Exception level and Security state is 1, a write to this register only drops the priority for the interrupt. Software must write to ICC_DIR_EL1 to deactivate the interrupt.

The EOImode bit for the current Exception level and Security state is determined as follows:

- If EL3 is not implemented, the appropriate bit is ICC_CTLR_EL1.EOImode.
- If EL3 is implemented and the software is executing at EL3, the appropriate bit is ICC_CTLR_EL3.EOImode_EL3.
- If EL3 is implemented and the software is not executing at EL3, the bit depends on the current Security state:
  - If the software is executing in Secure state, the bit is ICC_CTLR_EL3.EOImode_EL1S.
  - If the software is executing in Non-secure state, the bit is ICC_CTLR_EL3.EOImode_EL1NS.
Accessing the ICC_EOIR0_EL1

A write to this register must correspond to the most recent valid read by this PE from an Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICC_IAR0_EL1, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

A write of a Special INTID is ignored. For more information, see ‘Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Accesses to this register use the following encodings:

MSR ICC_EOIR0_EL1, <Xt>

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>

<td>0b1000</td>
<td>0b001</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap priority when SDD == '1'" && SCR_EL3.FIQ == '1' then
    UNDEFINED;
  elsif ICC_SRE_EL1.SRE == '0' then
    AArch64.SystemAccessTrap(EL1, 0x18);
  elsif EL2Enabled() && ICH_HCR_EL2.TALL0 == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  elsif EL2Enabled() && HCR_EL2.FMO == '1' then
    ICC_EOIR0_EL1 = X[t];
  elsif HaveEL(EL3) && SCR_EL3.FIQ == '1' then
    if Halted() && EDSCR.SDD == '1' then
      UNDEFINED;
    else
      AArch64.SystemAccessTrap(EL3, 0x18);
  else
    ICC_EOIR0_EL1 = X[t];
elsif PSTATE.EL == EL2 then
  if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap priority when SDD == '1'" && SCR_EL3.FIQ == '1' then
    UNDEFINED;
  elsif ICC_SRE_EL2.SRE == '0' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  elsif HaveEL(EL3) && SCR_EL3.FIQ == '1' then
    if Halted() && EDSCR.SDD == '1' then
      UNDEFINED;
    else
      AArch64.SystemAccessTrap(EL3, 0x18);
  else
    ICC_EOIR0_EL1 = X[t];
elsif PSTATE.EL == EL3 then
  if ICC_SRE_EL3.SRE == '0' then
    AArch64.SystemAccessTrap(EL3, 0x18);
  else
    ICC_EOIR0_EL1 = X[t];
ICC_EOIR1_EL1, Interrupt Controller End Of Interrupt Register 1

The ICC_EOIR1_EL1 characteristics are:

**Purpose**

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified Group 1 interrupt.

**Configuration**

AArch64 System register ICC_EOIR1_EL1 performs the same function as AArch32 System register ICC_EOIR1.

**Attributes**

ICC_EOIR1_EL1 is a 64-bit register.

**Field descriptions**

The ICC_EOIR1_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |

**Bits [63:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID from the corresponding ICC_IAR1_EL1 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTRLR_EL1.IDbits and ICC_CTRLR_EL3.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the EOImode bit for the current Exception level and Security state is 0, a write to this register drops the priority for the interrupt, and also deactivates the interrupt.

If the EOImode bit for the current Exception level and Security state is 1, a write to this register only drops the priority for the interrupt. Software must write to ICC_DIR_EL1 to deactivate the interrupt.

The EOImode bit for the current Exception level and Security state is determined as follows:

- If EL3 is not implemented, the appropriate bit is ICC_CTRLR_EL1.EOImode.
- If EL3 is implemented and the software is executing at EL3, the appropriate bit is ICC_CTRLR_EL3.EOImode_EL3.
- If EL3 is implemented and the software is not executing at EL3, the bit depends on the current Security state:
  - If the software is executing in Secure state, the bit is ICC_CTRLR_EL3.EOImode_EL1S.
  - If the software is executing in Non-secure state, the bit is ICC_CTRLR_EL3.EOImode_EL1NS.
Accessing the ICC_EOIR1_EL1

A write to this register must correspond to the most recent valid read by this PE from an Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICC_IAR1_EL1, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

A write of a Special INTID is ignored. For more information, see ‘Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Accesses to this register use the following encodings:

  end
ICC_IAR0_EL1, Interrupt Controller Interrupt Acknowledge Register 0

The ICC_IAR0_EL1 characteristics are:

**Purpose**

The PE reads this register to obtain the INTID of the signaled Group 0 interrupt. This read acts as an acknowledge for the interrupt.

**Configuration**

AArch64 System register ICC_IAR0_EL1 performs the same function as AArch32 System register ICC_IAR0.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when PSTATE.{I,F} == {0,0}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers'.

**Attributes**

ICC_IAR0_EL1 is a 64-bit register.

**Bits [63:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID of the signaled interrupt.

This is the INTID of the highest priority pending interrupt, if that interrupt is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged at the current Security state and Exception level.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. These special INTIDs can be one of: 1020, 1021, or 1023. For more information, see ‘Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR_EL1.IDbits and ICC_CTLR_EL3.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

**Accessing the ICC_IAR0_EL1**

The ICC_IAR1_EL1 characteristics are:

**Purpose**

The PE reads this register to obtain the INTID of the signaled Group 1 interrupt. This read acts as an acknowledge for the interrupt.

**Configuration**

AArch64 System register ICC_IAR1_EL1 performs the same function as AArch32 System register ICC_IAR1.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when PSTATE.{I,F} == {0,0}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Attributes**

ICC_IAR1_EL1 is a 64-bit register.

**Field descriptions**

|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   0 |

**Bits [63:1]**

Reserved, RES0.

**Enable, bit [0]**

Enables Group 0 interrupts.

<table>
<thead>
<tr>
<th>Enable</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 0 interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 0 interrupts are enabled.</td>
</tr>
</tbody>
</table>

Virtual accesses to this register update ICH_VMCR_EL2.VENG0.

If the highest priority pending interrupt for that PE is a Group 0 interrupt using 1 of N model, then the interrupt will be targeted to another PE as a result of the Enable bit changing from 1 to 0.

On a Warm reset, this field resets to 0.

ICC_IGRPEN1_EL1, Interrupt Controller Interrupt Group 1 Enable register

The ICC_IGRPEN1_EL1 characteristics are:

**Purpose**

Controls whether Group 1 interrupts are enabled for the current Security state.

**Configuration**

AArch64 System register ICC_IGRPEN1_EL1 bits [31:0] (S) are architecturally mapped to AArch32 System register ICC_IGRPEN1[31:0] (S).

AArch64 System register ICC_IGRPEN1_EL1 bits [31:0] (NS) are architecturally mapped to AArch32 System register ICC_IGRPEN1[31:0] (NS).

**Attributes**

ICC_IGRPEN1_EL1 is a 64-bit register.

**Field descriptions**

The ICC_IGRPEN1_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    | RES0|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |

**Bits [63:1]**

Reserved, RES0.

**Enable, bit [0]**

Enables Group 1 interrupts for the current Security state.

<table>
<thead>
<tr>
<th>Enable</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 1 interrupts are disabled for the current Security state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 1 interrupts are enabled for the current Security state.</td>
</tr>
</tbody>
</table>

Virtual accesses to this register update ICH_VMCR_EL2.VENG1.

If EL3 is present:

- The Secure ICC_IGRPEN1_EL1.Enable bit is a read/write alias of the ICC_IGRPEN1_EL3.EnableGrp1S bit.
- The Non-secure ICC_IGRPEN1_EL1.Enable bit is a read/write alias of the ICC_IGRPEN1_EL3.EnableGrp1NS bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

On a Warm reset, this field resets to 0.

        end if;
    end if;
The ICC_IGRPEN1_EL3 characteristics are:

**Purpose**

Controls whether Group 1 interrupts are enabled or not.

**Configuration**

AArch64 System register ICC_IGRPEN1_EL3 bits [31:0] can be mapped to AArch32 System register ICC_MGRPEN1[31:0], but this is not architecturally mandated.

This register is present only when EL3 is implemented. Otherwise, direct accesses to ICC_IGRPEN1_EL3 are **UNDEFINED**.

**Attributes**

ICC_IGRPEN1_EL3 is a 64-bit register.

**Field descriptions**

The ICC_IGRPEN1_EL3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>31</td>
<td>EnableGrp1S</td>
<td></td>
<td>Enables Group 1 interrupts for the Secure state.</td>
</tr>
<tr>
<td>30</td>
<td>EnableGrp1NS</td>
<td></td>
<td>Enables Group 1 interrupts for the Non-secure state.</td>
</tr>
</tbody>
</table>

**Bits [63:2]**

Reserved, RES0.

**EnableGrp1S, bit [1]**

Enables Group 1 interrupts for the Secure state.

<table>
<thead>
<tr>
<th>EnableGrp1S</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure Group 1 interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure Group 1 interrupts are enabled.</td>
</tr>
</tbody>
</table>

The Secure ICC_IGRPEN1_EL1.Enable bit is a read/write alias of the ICC_IGRPEN1_EL3.EnableGrp1S bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

On a Warm reset, this field resets to 0.

**EnableGrp1NS, bit [0]**

Enables Group 1 interrupts for the Non-secure state.

<table>
<thead>
<tr>
<th>EnableGrp1NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure Group 1 interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure Group 1 interrupts are enabled.</td>
</tr>
</tbody>
</table>
The Non-secure ICC_IGRPEN1_EL1.Enable bit is a read/write alias of the ICC_IGRPEN1_EL3.EnableGrp1NS bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

On a Warm reset, this field resets to 0.

    end
ICC_PMRE1, Interrupt Controller Interrupt Priority Mask Register

The ICC_PMRE1 characteristics are:

**Purpose**

Provides an interrupt priority filter. Only interrupts with a higher priority than the value in this register are signaled to the PE.

Writes to this register must be high performance and must ensure that no interrupt of lower priority than the written value occurs after the write, without requiring an ISB or an exception boundary.

**Configuration**

AArch64 System register ICC_PMRE1 bits [31:0] are architecturally mapped to AArch32 System register ICC_PMRE[31:0].

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that writes to this register are self-synchronising. This ensures that no interrupts below the written PMR value will be taken after a write to this register is architecturally executed. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Attributes**

ICC_PMRE1 is a 64-bit register.

**Field descriptions**

The ICC_PMRE1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

**Bits [63:8]**

Reserved, RES0.

**Priority, bits [7:0]**

The priority mask level for the CPU interface. If the priority of an interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

The possible priority field values are as follows:
Implemented priority bits | Possible priority field values | Number of priority levels
---|---|---
[7:0] | 0x00-0xFF (0-255), all values | 256
[7:1] | 0x00-0xFE (0-254), even values only | 128
[7:2] | 0x00-0xFC (0-252), in steps of 4 | 64
[7:3] | 0x00-0xF8 (0-248), in steps of 8 | 32
[7:4] | 0x00-0xF0 (0-240), in steps of 16 | 16

Unimplemented priority bits are RAZ/WI.

On a Warm reset, this field resets to 0.

ICC_RPR_EL1, Interrupt Controller Running Priority Register

The ICC_RPR_EL1 characteristics are:

**Purpose**

Indicates the Running priority of the CPU interface.

**Configuration**

AArch64 System register ICC_RPR_EL1 performs the same function as AArch32 System register ICC_RPR.

**Attributes**

ICC_RPR_EL1 is a 64-bit register.

**Field descriptions**

The ICC_RPR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Positions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:8</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>7:0</td>
<td>Priority, bits [7:0]</td>
</tr>
</tbody>
</table>

**Priority, bits [7:0]**

The current running priority on the CPU interface. This is the group priority of the current active interrupt.

If there are no active interrupts on the CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

The priority returned is the group priority as if the BPR for the current Exception level and Security state was set to the minimum value of BPR for the number of implemented priority bits.

**Note**

If 8 bits of priority are implemented the group priority is bits[7:1] of the priority.

**Accessing the ICC_RPR_EL1**

Software cannot determine the number of implemented priority bits from a read of this register.

Accesses to this register use the following encodings:

MRS <Xt>, ICC_RPR_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>

    return ICC_RPR_EL1;
  endif
The ICC_SGI0R_EL1 characteristics are:

**Purpose**

Generates Secure Group 0 SGIs.

**Configuration**

AArch64 System register ICC_SGI0R_EL1 performs the same function as AArch32 System register ICC_SGI0R.

**Attributes**

ICC_SGI0R_EL1 is a 64-bit register.

**Field descriptions**

The ICC_SGI0R_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Index</th>
<th>Bit Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-56</td>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>55-48</td>
<td>Aff3</td>
<td>The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated. If the IRM bit is 1, this field is RES0.</td>
</tr>
<tr>
<td>47-44</td>
<td>RS</td>
<td>RangeSelector</td>
</tr>
<tr>
<td>43-41</td>
<td>INTID</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>42-11</td>
<td>Aff2</td>
<td>Reserved.</td>
</tr>
<tr>
<td>10-0</td>
<td>TargetList</td>
<td>Controls which group of 16 values is represented by the TargetList field. TargetList[n] represents aff0 value ((RS * 16) + n). When ICC_CTLR_EL1.RSS==0, RS is RES0. When ICC_CTLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a constrained unpredictable choice of:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The write is ignored.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The RS field is treated as 0.</td>
</tr>
</tbody>
</table>

**Bits [63:56]**

Reserved, RES0.

**Aff3, bits [55:48]**

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated. If the IRM bit is 1, this field is RES0.

**RS, bits [47:44]**

RangeSelector

Controls which group of 16 values is represented by the TargetList field. TargetList[n] represents aff0 value ((RS * 16) + n). When ICC_CTLR_EL1.RSS==0, RS is RES0.

When ICC_CTLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a constrained unpredictable choice of:

• The write is ignored.
• The RS field is treated as 0.

**Bits [43:41]**

Reserved, RES0.
Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

<table>
<thead>
<tr>
<th>IRM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.&lt;target list&gt;.</td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupts routed to all PEs in the system, excluding “self”.</td>
</tr>
</tbody>
</table>

**Aff2, bits [39:32]**

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

**Bits [31:28]**

Reserved, RES0.

**INTID, bits [27:24]**

The INTID of the SGI.

**Aff1, bits [23:16]**

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

**TargetList, bits [15:0]**

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

**Note**

This restricts a system to sending targeted SGIs to PEs with an affinity 0 number that is less than 16.

If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

**Accessing the ICC_SGI0R_EL1**

This register allows software executing in a Secure state to generate Group 0 SGIs. It will also allow software executing in a Non-secure state to generate Group 0 SGIs, if permitted by the settings of GICR_NSACR in the Redistributor corresponding to the target PE.

When GICD_CTLR.DS==0, Non-secure writes do not generate an interrupt for a target PE if not permitted by the GICR_NSACR register associated with the target PE. For more information, see ‘Use of control registers for SGI forwarding’ in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Note**
Accesses at EL3 are treated as Secure regardless of the value of SCR_EL3.NS.

Accesses to this register use the following encodings:

MSR ICC_SGI0R_EL1, <Xt>

ICC_SGI1R_EL1, Interrupt Controller Software Generated Interrupt Group 1 Register

The ICC_SGI1R_EL1 characteristics are:

**Purpose**

Generates Group 1 SGIs for the current Security state.

**Configuration**

AArch64 System register ICC_SGI1R_EL1 performs the same function as AArch32 System register ICC_SGI1R.

Under certain conditions a write to ICC_SGI1R_EL1 can generate Group 0 interrupts, see ‘Forwarding an SGI to a target PE’ in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Attributes**

ICC_SGI1R_EL1 is a 64-bit register.

**Field descriptions**

The ICC_SGI1R_EL1 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0| INTID | Aff3 | RES0 | IRM | Aff2 | RS  | RES0 | TargetList |
| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 09  | 08  | 07  | 06  | 05  | 04  | 03  | 02  | 01  | 00  |

**Bits [63:56]**

Reserved, RES0.

**Aff3, bits [55:48]**

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

**RS, bits [47:44]**

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value ((RS * 16) + n).

When ICC_CTLR_EL1.RSS==0, RS is RES0.

When ICC_CTLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a constrained unpredictable choice of:

- The write is ignored.
- The RS field is treated as 0.
Bits [43:41]
Reserved, RES0.

IRM, bit [40]
Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

<table>
<thead>
<tr>
<th>IRM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.&lt;target list&gt;.</td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupts routed to all PEs in the system, excluding &quot;self&quot;.</td>
</tr>
</tbody>
</table>

Aff2, bits [39:32]
The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.
If the IRM bit is 1, this field is RES0.

Bits [31:28]
Reserved, RES0.

INTID, bits [27:24]
The INTID of the SGI.

Aff1, bits [23:16]
The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.
If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]
Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.
If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

Note
This restricts a system to sending targeted SGIs to PEs with an affinity 0 number that is less than 16.
If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

Accessing the ICC_SGI1R_EL1

Note
Accesses at EL3 are treated as Secure regardless of the value of SCR_EL3.NS.
Accesses to this register use the following encodings:

**MSR ICC_SGI1R_EL1, <Xt>**

<table>
<thead>
<tr>

</tbody>
</table>

If EL3 is implemented and GICD_CTLR.DS == 0, this field is a read-only alias of ICC_SRE_EL3.DIB.

If EL3 is implemented and GICD_CTLR.DS == 1, and EL2 is not implemented, this field is a read-write alias of ICC_SRE_EL3.DIB.

If EL3 is not implemented and EL2 is implemented, this field is a read-only alias of ICC_SRE_EL2.DIB.

If GICD_CTLR.DS == 1 and EL2 is implemented, this field is a read-only alias of ICC_SRE_EL2.DIB.

In systems that do not support IRQ bypass, this field is RAO/WI.

On a Warm reset, this field resets to 0.
DFB, bit [1]

Disable FIQ bypass.

<table>
<thead>
<tr>
<th>DFB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FIQ bypass enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>FIQ bypass disabled.</td>
</tr>
</tbody>
</table>

If EL3 is implemented and \texttt{GICD_CTLR.DS == 0}, this field is a read-only alias of \texttt{ICC_SRE_EL3.DFB}.

If EL3 is implemented and \texttt{GICD_CTLR.DS == 1}, and EL2 is not implemented, this field is a read-write alias of \texttt{ICC_SRE_EL3.DFB}.

If EL3 is not implemented and EL2 is implemented, this field is a read-only alias of \texttt{ICC_SRE_EL2.DFB}.

If \texttt{GICD_CTLR.DS == 1} and EL2 is implemented, this field is a read-only alias of \texttt{ICC_SRE_EL2.DFB}.

In systems that do not support FIQ bypass, this field is RAO/WI.

On a Warm reset, this field resets to 0.

SRE, bit [0]

System Register Enable.

<table>
<thead>
<tr>
<th>SRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The memory-mapped interface must be used. Access at EL1 to any ICC_* System register other than ICC_SRE_EL1 is trapped to EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The System register interface for the current Security state is enabled.</td>
</tr>
</tbody>
</table>

If software changes this bit from 1 to 0 in the Secure instance of this register, the results are \textbf{UNPREDICTABLE}.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

If EL3 is implemented and \texttt{ICC_SRE_EL3.SRE==0} the Secure copy of this bit is RAZ/WI. If \texttt{ICC_SRE_EL3.SRE} is changed from zero to one, the Secure copy of this bit becomes \textbf{UNKNOWN}.

If EL2 is implemented and \texttt{ICC_SRE_EL2.SRE==0} the Non-secure copy of this bit is RAZ/WI. If \texttt{ICC_SRE_EL2.SRE} is changed from zero to one, the Non-secure copy of this bit becomes \textbf{UNKNOWN}.

If EL3 is implemented and \texttt{ICC_SRE_EL3.SRE==0} the Non-secure copy of this bit is RAZ/WI. If \texttt{ICC_SRE_EL3.SRE} is changed from zero to one, the Non-secure copy of this bit becomes \textbf{UNKNOWN}.

GICv3 implementations that do not require GICv2 compatibility might choose to make this bit RAO/WI. The following options are supported:

- The Non-secure copy of \texttt{ICC_SRE_EL1.SRE} can be RAO/WI if \texttt{ICC_SRE_EL2.SRE} is also RAO/WI. This means all Non-secure software, including VMs using only virtual interrupts, must access the GIC using System registers.
- The Secure copy of \texttt{ICC_SRE_EL1.SRE} can be RAO/WI if \texttt{ICC_SRE_EL3.SRE} and \texttt{ICC_SRE_EL2.SRE} are also RAO/WI. This means that all Secure software must access the GIC using System registers and all Non-secure accesses to registers for physical interrupts must use System registers.

\textbf{Note}

A VM using only virtual interrupts might still use memory-mapped access if the Non-secure copy of \texttt{ICC_SRE_EL1.SRE} is not RAO/WI.

On a Warm reset, this field resets to 0.

\textbf{Accessing the ICC_SRE_EL1}

Execution with \texttt{ICC_SRE_EL1.SRE set to 0} might make some System registers \textbf{UNKNOWN}.

Accesses to this register use the following encodings:

    ICC_SRE_EL1 = X[t];
end if
The ICC_SRE_EL2 characteristics are:

**Purpose**

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL2.

**Configuration**

AArch64 System register ICC_SRE_EL2 is architecturally mapped to AArch32 System register ICC_HSRE.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

ICC_SRE_EL2 is a 64-bit register.

**Field descriptions**

The ICC_SRE_EL2 bit assignments are:

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

**Enable, bit [3]**

Enable. Enables lower Exception level access to ICC_SRE_EL1.

<table>
<thead>
<tr>
<th>Enable</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When EL2 is implemented and enabled in the current Security state, EL1 accesses to ICC_SRE_EL1 trap to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 accesses to ICC_SRE_EL1 do not trap to EL2.</td>
</tr>
</tbody>
</table>

If ICC_SRE_EL2.SRE is RAO/WI, an implementation is permitted to make the Enable bit RAO/WI.

If ICC_SRE_EL2.SRE is 0, the Enable bit behaves as 1 for all purposes other than reading the value of the bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DIB, bit [2]**

Disable IRQ bypass.

<table>
<thead>
<tr>
<th>DIB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IRQ bypass enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>IRQ bypass disabled.</td>
</tr>
</tbody>
</table>
If EL3 is implemented and GICD_CTLR.DS is 0, this field is a read-only alias of ICC_SRE_EL3.DIB.

If EL3 is implemented and GICD_CTLR.DS is 1, this field is a read-write alias of ICC_SRE_EL3.DIB.

In systems that do not support IRQ bypass, this bit is RAO/WI.

On a Warm reset, this field resets to 0.

**DFB, bit [1]**

Disable FIQ bypass.

<table>
<thead>
<tr>
<th>DFB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FIQ bypass enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>FIQ bypass disabled.</td>
</tr>
</tbody>
</table>

If EL3 is implemented and GICD_CTLR.DS is 0, this field is a read-only alias of ICC_SRE_EL3.DFB.

If EL3 is implemented and GICD_CTLR.DS is 1, this field is a read-write alias of ICC_SRE_EL3.DFB.

In systems that do not support FIQ bypass, this bit is RAO/WI.

On a Warm reset, this field resets to 0.

**SRE, bit [0]**

System Register Enable.

<table>
<thead>
<tr>
<th>SRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The memory-mapped interface must be used. Access at EL2 to any ICH_* or ICC_* register other than ICC_SRE_EL1 or ICC_SRE_EL2, is trapped to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>The System register interface to the ICH_* registers and the EL1 and EL2 ICC_* registers is enabled for EL2.</td>
</tr>
</tbody>
</table>

If software changes this bit from 1 to 0, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

If EL3 is implemented and ICC_SRE_EL3.SRE==0 this bit is RAZ/WI. If ICC_SRE_EL3.SRE is changed from zero to one, this bit becomes UNKNOWN.

FEAT_GICv3 implementations that do not require GICv2 compatibility might choose to make this bit RAO/WI, but this is only allowed if ICC_SRE_EL3.SRE is also RAO/WI.

On a Warm reset, this field resets to 0.

**Accessing the ICC_SRE_EL2**

Execution with ICC_SRE_EL2.SRE set to 0 might make some System registers UNKNOWN.

Accesses to this register use the following encodings:

\[
\text{MRS <Xt>, ICC_SRE_EL2}
\]

<table>

ICC_SRE_EL3, Interrupt Controller System Register Enable register (EL3)

The ICC_SRE_EL3 characteristics are:

**Purpose**

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL3.

**Configuration**

AArch64 System register ICC_SRE_EL3 bits [31:0] can be mapped to AArch32 System register ICC_MSRE[31:0], but this is not architecturally mandated.

This register is present only when EL3 is implemented. Otherwise, direct accesses to ICC_SRE_EL3 are UNDEFINED.

**Attributes**

ICC_SRE_EL3 is a 64-bit register.

**Field descriptions**

The ICC_SRE_EL3 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RES0 | Enable | DIB | DFB | SRE |

**Bits [63:4]**

Reserved, RES0.

**Enable, bit [3]**

Enable. Enables lower Exception level access to ICC_SRE_EL1 and ICC_SRE_EL2.

<table>
<thead>
<tr>
<th>Enable</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL1 accesses to ICC_SRE_EL1 trap to EL3, unless these accesses are trapped to EL2 as a result of ICC_SRE_EL2.Enable == 0. EL2 accesses to ICC_SRE_EL1 and ICC_SRE_EL2 trap to EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 accesses to ICC_SRE_EL1 do not trap to EL3. EL2 accesses to ICC_SRE_EL1 and ICC_SRE_EL2 do not trap to EL3.</td>
</tr>
</tbody>
</table>

If ICC_SRE_EL3.SRE is RAO/WI, an implementation is permitted to make the Enable bit RAO/WI.

If ICC_SRE_EL3.SRE is 0, the Enable bit behaves as 1 for all purposes other than reading the value of the bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DIB, bit [2]**

Disable IRQ bypass.
DIB, bit [2]

Disable IRQ bypass.

<table>
<thead>
<tr>
<th>DIB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IRQ bypass enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>IRQ bypass disabled.</td>
</tr>
</tbody>
</table>

In systems that do not support IRQ bypass, this bit is RAO/WI.

On a Warm reset, this field resets to 0.

DFB, bit [1]

Disable FIQ bypass.

<table>
<thead>
<tr>
<th>DFB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FIQ bypass enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>FIQ bypass disabled.</td>
</tr>
</tbody>
</table>

In systems that do not support FIQ bypass, this bit is RAO/WI.

On a Warm reset, this field resets to 0.

SRE, bit [0]

System Register Enable.

<table>
<thead>
<tr>
<th>SRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The memory-mapped interface must be used. Access at EL3 to any ICH * or</td>
</tr>
<tr>
<td></td>
<td>ICC * register other than ICC_SRE_EL1, ICC_SRE_EL2, or ICC_SRE_EL3 is</td>
</tr>
<tr>
<td></td>
<td>trapped to EL3</td>
</tr>
<tr>
<td>0b1</td>
<td>The System register interface to the ICH * registers and the EL1, EL2,</td>
</tr>
<tr>
<td></td>
<td>and EL3 ICC * registers is enabled for EL3.</td>
</tr>
</tbody>
</table>

If software changes this bit from 1 to 0, the results are UNPREDICTABLE.

FEAT_GICv3 implementations that do not require GICv2 compatibility might choose to make this bit RAO/WI.

On a Warm reset, this field resets to 0.

Accessing the ICC_SRE_EL3

This register is always System register accessible.

Accesses to this register use the following encodings:

MRS <Xt>, ICC_SRE_EL3

<table>
<thead>

ICH_AP0R<n>_EL2, Interrupt Controller Hyp Active Priorities Group 0 Registers, n = 0 - 3

The ICH_AP0R<n>_EL2 characteristics are:

**Purpose**

Provides information about Group 0 virtual active priorities for EL2.

**Configuration**

AArch64 System register ICH_AP0R<n>_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_AP0R<n>[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

ICH_AP0R<n>_EL2 is a 64-bit register.

**Field descriptions**

The ICH_AP0R<n>_EL2 bit assignments are:

<table>
<thead>
<tr>

<tr>
<td>30</td>
<td>Bits [63:32] Reserved, RES0.</td>
</tr>
</tbody>
</table>

**P<x>, bit [x], for x = 31 to 0**

Provides the access to the virtual active priorities for Group 0 interrupts. Possible values of each bit are:

<table>
<thead>
<tr>
<th>P&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>There is no Group 0 interrupt active with this priority level, or all active Group 0 interrupts with this priority level have undergone priority-drop.</td>
</tr>
<tr>
<td>0b1</td>
<td>There is a Group 0 interrupt active with this priority level which has not undergone priority drop.</td>
</tr>
</tbody>
</table>

The correspondence between priority levels and bits depends on the number of bits of priority that are implemented.

If 5 bits of preemption are implemented (bits [7:3] of priority), then there are 32 preemption levels, and the active state of these preemption levels are held in ICH_AP0R0_EL2 in the bits corresponding to Priority[7:3].

If 6 bits of preemption are implemented (bits [7:2] of priority), then there are 64 preemption levels, and:

- The active state of preemption levels 0 - 124 are held in ICH_AP0R0_EL2 in the bits corresponding to 0:Priority[6:2].
- The active state of preemption levels 128 - 252 are held in ICH_AP0R1_EL2 in the bits corresponding to 1:Priority[6:2].
If 7 bits of preemption are implemented (bits [7:1] of priority), then there are 128 preemption levels, and:

- The active state of preemption levels 0 - 62 are held in ICH_AP0R0_EL2 in the bits corresponding to 00:Priority[5:1].
- The active state of preemption levels 64 - 126 are held in ICH_AP0R1_EL2 in the bits corresponding to 01:Priority[5:1].
- The active state of preemption levels 128 - 190 are held in ICH_AP0R2_EL2 in the bits corresponding to 10:Priority[5:1].
- The active state of preemption levels 192 - 254 are held in ICH_AP0R3_EL2 in the bits corresponding to 11:Priority[5:1].

Note

Having the bit corresponding to a priority set to 1 in both ICH_AP0R<n>_EL2 and ICH_AP1R<n>_EL2 might result in UNPREDICTABLE behavior of the interrupt prioritization system for virtual interrupts.

On a Warm reset, this field resets to 0.

Software must ensure that ICH_AP0R<n>_EL2 is 0 for legacy VMs otherwise behaviour is UNPREDICTABLE. For more information about support for legacy VMs, see ‘Support for legacy operation of VMs’ in ARM Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The active priorities for Group 0 and Group 1 interrupts for legacy VMs are held in ICH_AP1R<n>_EL2 and reads and writes to GICV_APR access ICH_AP1R<n>_EL2. This means that ICH_AP0R<n>_EL2 is inaccessible to legacy VMs.

Accessing the ICH_AP0R<n>_EL2

ICH_AP0R1_EL2 is only implemented in implementations that support 6 or more bits of preemption. ICH_AP0R2_EL2 and ICH_AP0R3_EL2 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

Note

The number of bits of preemption is indicated by ICH_VTR_EL2.PREbits

Writing to these registers with any value other than the last read value of the register (or 0x00000000 for a newly set up virtual machine) can result in UNPREDICTABLE behavior of the virtual interrupt prioritization system allowing either:

- Virtual interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution at EL1 or EL0.

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- ICH_AP0R<n>_EL2.
- ICH_AP1R<n>_EL2.

Having the bit corresponding to a priority set in both ICH_AP0R<n>_EL2 and ICH_AP1R<n>_EL2 can result in UNPREDICTABLE behavior of the interrupt prioritization system for virtual interrupts.

Accesses to this register use the following encodings:

MRS <Xt>, ICH_AP0R<n>_EL2

    ICH_AP0R_EL2[UInt(op2<1:0>)] = X[t];
ICH_AP1R<n>_EL2, Interrupt Controller Hyp Active Priorities Group 1 Registers, \( n = 0 - 3 \)

The ICH_AP1R<n>_EL2 characteristics are:

**Purpose**

Provides information about Group 1 virtual active priorities for EL2.

**Configuration**

AArch64 System register ICH_AP1R<n>_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_AP1R<n>[31:0].

If EL2 is not implemented, this register is \texttt{RES0}\( \text{ from EL3} \).

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

ICH_AP1R<n>_EL2 is a 64-bit register.

**Field descriptions**

The ICH_AP1R<n>_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bits (31:20)</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
<tbody>
<tr>
<td>P&lt;31&gt;, bit [31], for x = 0 to 31</td>
<td>Group 1 interrupt active priorities. Possible values of each bit are:</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>P&lt;31&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0}</td>
<td>There is no Group 1 interrupt active with this priority level, or all active Group 1 interrupts with this priority level have undergone priority-drop.</td>
</tr>
<tr>
<td>\texttt{0b1}</td>
<td>There is a Group 1 interrupt active with this priority level which has not undergone priority drop.</td>
</tr>
</tbody>
</table>

The correspondence between priority levels and bits depends on the number of bits of priority that are implemented.

If 5 bits of preemption are implemented (bits [7:3] of priority), then there are 32 preemption levels, and the active state of these preemption levels are held in ICH_AP1R0_EL2 in the bits corresponding to Priority[7:3].

If 6 bits of preemption are implemented (bits [7:2] of priority), then there are 64 preemption levels, and:

- The active state of preemption levels 0 - 124 are held in ICH_AP1R0_EL2 in the bits corresponding to 0:Priority[6:2].
- The active state of preemption levels 128 - 252 are held in ICH_AP1R1_EL2 in the bits corresponding to 1:Priority[6:2].
If 7 bits of preemption are implemented (bits [7:1] of priority), then there are 128 preemption levels, and:

- The active state of preemption levels 0 - 62 are held in ICH_AP1R0_EL2 in the bits corresponding to 00:Priority[5:1].
- The active state of preemption levels 64 - 126 are held in ICH_AP1R1_EL2 in the bits corresponding to 01:Priority[5:1].
- The active state of preemption levels 128 - 190 are held in ICH_AP1R2_EL2 in the bits corresponding to 10:Priority[5:1].
- The active state of preemption levels 192 - 254 are held in ICH_AP1R3_EL2 in the bits corresponding to 11:Priority[5:1].

**Note**

Having the bit corresponding to a priority set to 1 in both ICH_AP0R<n>_EL2 and ICH_AP1R<n>_EL2 might result in UNPREDICTABLE behavior of the interrupt prioritization system for virtual interrupts.

On a Warm reset, this field resets to 0.

This register is always used for legacy VMs, regardless of the group of the virtual interrupt. Reads and writes to GICV_APR<n> access ICH_AP1R<n>_EL2. For more information about support for legacy VMs, see ‘Support for legacy operation of VMs’ in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

### Accessing the ICH_AP1R<n>_EL2

ICH_AP1R1_EL2 is only implemented in implementations that support 6 or more bits of preemption. ICH_AP1R2_EL2 and ICH_AP1R3_EL2 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

**Note**

The number of bits of preemption is indicated by ICH_VTR_EL2.PREbits

Writing to these registers with any value other than the last read value of the register (or 0x00000000 for a newly set up virtual machine) can result in UNPREDICTABLE behavior of the virtual interrupt prioritization system allowing either:

ICH_EISR_EL2, Interrupt Controller End of Interrupt Status Register

The ICH_EISR_EL2 characteristics are:

**Purpose**

Indicates which List registers have outstanding EOI maintenance interrupts.

**Configuration**

AArch64 System register ICH_EISR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_EISR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

ICH_EISR_EL2 is a 64-bit register.

**Field descriptions**

The ICH_EISR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:16]</th>
<th>Status&lt;n&gt;, bit [n], for n = 15 to 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>636261605958857565554535251504948</td>
<td>RES0</td>
</tr>
<tr>
<td>31302928272625242322212019181716</td>
<td>Status15Status14Status13Status12Status11Status10Status9Status8Status7Status6Status5Status4Status3Status2Status1Status0</td>
</tr>
</tbody>
</table>

**Bits [63:16]**

Reserved, RES0.

**Status<n>, bit [n], for n = 15 to 0**

EOI maintenance interrupt status bit for List register <n>:

<table>
<thead>
<tr>
<th>Status&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>List register &lt;n&gt;, ICH_LR&lt;n&gt;_EL2, does not have an EOI maintenance interrupt.</td>
</tr>
<tr>
<td>0b1</td>
<td>List register &lt;n&gt;, ICH_LR&lt;n&gt;_EL2, has an EOI maintenance interrupt that has not been handled.</td>
</tr>
</tbody>
</table>

For any ICH_LR<n>_EL2, the corresponding status bit is set to 1 if all of the following are true:

- ICH_LR<n>_EL2.State is 0b00.
- ICH_LR<n>_EL2.HW is 0.
- ICH_LR<n>_EL2.EOI (bit [41]) is 1, indicating that when the interrupt corresponding to that List register is deactivated, a maintenance interrupt is asserted.

Otherwise the status bit takes the value 0.

**Accessing the ICH_EISR_EL2**

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && HCR_EL2.NV == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    UNDEFINED;
elsif PSTATE.EL == EL2 then
  if ICC_SRE_EL2.SRE == '0' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    return ICH_EISR_EL2;
elsif PSTATE.EL == EL3 then
  if ICC_SRE_EL3.SRE == '0' then
    AArch64.SystemAccessTrap(EL3, 0x18);
  else
    return ICH_EISR_EL2;
ICH_ELRSR_EL2, Interrupt Controller Empty List Register Status Register

The ICH_ELRSR_EL2 characteristics are:

**Purpose**

These registers can be used to locate a usable List register when the hypervisor is delivering an interrupt to a VM.

**Configuration**

AArch64 System register ICH_ELRSR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_ELRSR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

ICH_ELRSR_EL2 is a 64-bit register.

**Field descriptions**

**Bits [63:16]**

Reserved, RES0.

**Status<n>, bit [n], for n = 15 to 0**

Status bit for List register <n>, ICH_LR<n>_EL2:

<table>
<thead>
<tr>
<th>Status&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>List register ICH_LR&lt;n&gt;_EL2, if implemented, contains a valid interrupt. Using this List register can result in overwriting a valid interrupt.</td>
</tr>
<tr>
<td>0b1</td>
<td>List register ICH_LR&lt;n&gt;_EL2 does not contain a valid interrupt. The List register is empty and can be used without overwriting a valid interrupt or losing an EOI maintenance interrupt.</td>
</tr>
</tbody>
</table>

For any List register <n>, the corresponding status bit is set to 1 if ICH_LR<n>_EL2.State is 0b00 and either ICH_LR<n>_EL2.HW is 1 or ICH_LR<n>_EL2.EOI (bit [41]) is 0.

Otherwise the status bit takes the value 0.

**Accessing the ICH_ELRSR_EL2**

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if ICC_SRE_EL2.SRE == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ICH_ELRSR_EL2;
elsif PSTATE.EL == EL3 then
    if ICC_SRE_EL3.SRE == '0' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        return ICH_ELRSR_EL2;

ICH_HCR_EL2, Interrupt Controller Hyp Control Register

The ICH_HCR_EL2 characteristics are:

**Purpose**

Controls the environment for VMs.

**Configuration**

AArch64 System register ICH_HCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_HCR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

ICH_HCR_EL2 is a 64-bit register.

**Field descriptions**

The ICH_HCR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-32</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>31-27</td>
<td>EOIcount, bits [31:27]</td>
</tr>
<tr>
<td>26-16</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>15-0</td>
<td>Bits [63:32]</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**EOIcount, bits [31:27]**

This field is incremented whenever a successful write to a virtual EOIR or DIR register would have resulted in a virtual interrupt deactivation. That is either:

- A virtual write to EOIR with a valid interrupt identifier that is not in the LPI range (that is < 8192) when EOI mode is zero and no List Register was found.
- A virtual write to DIR with a valid interrupt identifier that is not in the LPI range (that is < 8192) when EOI mode is one and no List Register was found.

This allows software to manage more active interrupts than there are implemented List Registers.

It is **CONSTRAINED UNPREDICTABLE** whether a virtual write to EOIR that does not clear a bit in the Active Priorities registers (ICH_AP0R<n>_EL2/ICH_AP1R<n>_EL2) increments EOIcount. Permitted behaviors are:

- Increment EOIcount.
- Leave EOIcount unchanged.

On a Warm reset, this field resets to 0.

**Bits [26:16]**

Reserved, RES0.
**DVIM, bit [15]**

When `ICH_VTR_EL2.DVIM == 1`:

Directly-injected Virtual Interrupt Mask.

<table>
<thead>
<tr>
<th>DVIM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on the signalling of virtual interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>Virtual interrupts received via direct-injection are not presented to the virtual CPU interface and not considered when determining the highest priority pending virtual interrupt.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TDIR, bit [14]**

Trap EL1 writes to `ICC_DIR_EL1` and `ICV_DIR_EL1`.

<table>
<thead>
<tr>
<th>TDIR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL1 writes of <code>ICC_DIR_EL1</code> and <code>ICV_DIR_EL1</code> are not trapped to EL2, unless trapped by other mechanisms.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 writes of <code>ICV_DIR_EL1</code> are trapped to EL2. It is IMPLEMENTATIONDEFINED whether writes of <code>ICC_DIR_EL1</code> are trapped. Not trapping <code>ICC_DIR_EL1</code> writes is DEPRECATED.</td>
</tr>
</tbody>
</table>

Support for this bit is OPTIONAL, with support indicated by `ICH_VTR_EL2`.

If the implementation does not support this trap, this bit is RES0.

Arm deprecates not including this trap bit.

On a Warm reset, this field resets to 0.

**TSEI, bit [13]**

Trap all locally generated SEIs. This bit allows the hypervisor to intercept locally generated SEIs that would otherwise be taken at EL1.

<table>
<thead>
<tr>
<th>TSEI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Locally generated SEIs do not cause a trap to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Locally generated SEIs trap to EL2.</td>
</tr>
</tbody>
</table>

If `ICH_VTR_EL2.SEIS` is 0, this bit is RES0.

On a Warm reset, this field resets to 0.

**TALL1, bit [12]**

Trap all EL1 accesses to ICC_* and ICV_* System registers for Group 1 interrupts to EL2.

<table>
<thead>
<tr>
<th>TALL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL1 accesses to ICC_* and ICV_* registers for Group 1 interrupts proceed as normal.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 accesses to ICC_* and ICV_* registers for Group 1 interrupts trap to EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.
TALL0, bit [11]

Trap all EL1 accesses to ICC_* and ICV_* System registers for Group 0 interrupts to EL2.

<table>
<thead>
<tr>
<th>TALL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL1 accesses to ICC_* and ICV_* registers for Group 0 interrupts proceed as normal.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 accesses to ICC_* and ICV_* registers for Group 0 interrupts trap to EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

TC, bit [10]

Trap all EL1 accesses to System registers that are common to Group 0 and Group 1 to EL2.

<table>
<thead>
<tr>
<th>TC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL1 accesses to common registers proceed as normal.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 accesses to common registers trap to EL2.</td>
</tr>
</tbody>
</table>

This affects accesses to ICC_SGIO_R_EL1, ICC_SGI1R_EL1, ICC_ASGI1R_EL1, ICC_CTLR_EL1, ICC_DIR_EL1, ICC_PMR_EL1, ICC_RPR_EL1, ICC_CTLR_EL1, ICC_DIR_EL1, ICC_PMR_EL1, and ICV_RPR_EL1.

On a Warm reset, this field resets to 0.

Bit [9]

Reserved, RES0.

vSGIEOICount, bit [8]

When FEAT_GICv4p1 is implemented:

Controls whether deactivation of virtual SGIs can increment ICH_HCR_EL2.EOIcount

<table>
<thead>
<tr>
<th>vSGIEOICount</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Deactivation of virtual SGIs can increment ICH_HCR_EL2.EOIcount.</td>
</tr>
<tr>
<td>0b1</td>
<td>Deactivation of virtual SGIs does not increment ICH_HCR_EL2.EOIcount.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

VGrp1DIE, bit [7]

VM Group 1 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected vPE is disabled:

<table>
<thead>
<tr>
<th>VGrp1DIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled when ICH_VMCR_EL2.VENG1 is 0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

VGrp1EIE, bit [6]

VM Group 1 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected vPE is enabled:
ICH_HCR_EL2, Interrupt Controller Hyp Control Register

<table>
<thead>
<tr>
<th>VGrp1EIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled when ICH_VMCR_EL2.VENG1 is 1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**VGrp0DIE, bit [5]**

VM Group 0 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected vPE is disabled:

<table>
<thead>
<tr>
<th>VGrp0DIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled when ICH_VMCR_EL2.VENG0 is 0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**VGrp0EIE, bit [4]**

VM Group 0 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected vPE is enabled:

<table>
<thead>
<tr>
<th>VGrp0EIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled when ICH_VMCR_EL2.VENG0 is 1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**NPIE, bit [3]**

No Pending Interrupt Enable. Enables the signaling of a maintenance interrupt when there are no List registers with the State field set to 0b01 (pending):

<table>
<thead>
<tr>
<th>NPIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled while the List registers contain no interrupts in the pending state.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**LRENPIE, bit [2]**

List Register Entry Not Present Interrupt Enable. Enables the signaling of a maintenance interrupt while the virtual CPU interface does not have a corresponding valid List register entry for an EOI request:

<table>
<thead>
<tr>
<th>LRENPIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt is asserted while the EOICount field is not 0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**UIE, bit [1]**

Underflow Interrupt Enable. Enables the signaling of a maintenance interrupt when the List registers are empty, or hold only one valid entry:

<table>
<thead>
<tr>
<th>UIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt is asserted if none, or only one, of the List register entries is marked as a valid interrupt.</td>
</tr>
</tbody>
</table>
On a Warm reset, this field resets to 0.

**En, bit [0]**

Enable. Global enable bit for the virtual CPU interface:

<table>
<thead>
<tr>
<th>En</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Virtual CPU interface operation disabled.</td>
</tr>
<tr>
<td>01</td>
<td>Virtual CPU interface operation enabled.</td>
</tr>
</tbody>
</table>

When this field is set to 0:

- The virtual CPU interface does not signal any maintenance interrupts.
- The virtual CPU interface does not signal any virtual interrupts.
- A read of ICV_IAR0_EL1, ICV_IAR1_EL1, GICV_IAR or GICV_AIAR returns a spurious interrupt ID.

**Note**

This field is RES0 when SCR_EL3.{NS,EEL2}=={0,0}

On a Warm reset, this field resets to 0.

**Accessing the ICH_HCR_EL2**

Accesses to this register use the following encodings:

**MRS <Xt>, ICH_HCR_EL2**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>

         NVMem[0x4C0] = X[t];
     elsif EL2Enabled() && HCR_EL2.NV == '1' then
         AArch64.SystemAccessTrap(EL2, 0x18);
     else
         UNDEFINED;
     end
elsif PSTATE.EL == EL2 then
     if ICC_SRE_EL2.SRE == '0' then
         AArch64.SystemAccessTrap(EL2, 0x18);
     else
         ICH_HCR_EL2 = X[t];
     end
elsif PSTATE.EL == EL3 then
     if ICC_SRE_EL3.SRE == '0' then
         AArch64.SystemAccessTrap(EL3, 0x18);
     else
         ICH_HCR_EL2 = X[t];
end
ICH_LR<n>_EL2, Interrupt Controller List Registers, n = 0 - 15

The ICH_LR<n>_EL2 characteristics are:

**Purpose**

Provides interrupt context information for the virtual CPU interface.

**Configuration**

AArch64 System register ICH_LR<n>_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_LR<n>[31:0].

AArch64 System register ICH_LR<n>_EL2 bits [63:32] are architecturally mapped to AArch32 System register ICH_LRC<n>[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

If list register n is not implemented, then accesses to this register are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

ICH_LR<n>_EL2 is a 64-bit register.

**Field descriptions**

The ICH_LR<n>_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>State</th>
<th>HW</th>
<th>Group</th>
<th>RES0</th>
<th>Priority</th>
<th>RES0</th>
<th>pINTID</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 62 61 60</td>
<td>59 58 57 56</td>
<td>55 54 53 52</td>
<td>51 50 49 48</td>
<td>47 46 45 44</td>
<td>43 42 41 40</td>
<td>39 38 37 36</td>
</tr>
<tr>
<td>31 30 29 28</td>
<td>27 26 25 24</td>
<td>23 22 21 20</td>
<td>19 18 17 16</td>
<td>15 14 13 12</td>
<td>11 10 9 8</td>
<td>7 6 5 4</td>
</tr>
<tr>
<td>vINTID</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**State, bits [63:62]**

The state of the interrupt:

<table>
<thead>
<tr>
<th>State</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Invalid (Inactive).</td>
</tr>
<tr>
<td>0b01</td>
<td>Pending.</td>
</tr>
<tr>
<td>0b10</td>
<td>Active.</td>
</tr>
<tr>
<td>0b11</td>
<td>Pending and active.</td>
</tr>
</tbody>
</table>

The GIC updates these state bits as virtual interrupts proceed through the interrupt life cycle. Entries in the invalid state are ignored, except for the purpose of generating virtual maintenance interrupts.

For hardware interrupts, the pending and active state is held in the physical Distributor rather than the virtual CPU interface. A hypervisor must only use the pending and active state for software originated interrupts, which are typically associated with virtual devices, or SGIs.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
HW, bit [61]

Indicates whether this virtual interrupt maps directly to a hardware interrupt, meaning that it corresponds to a physical interrupt. Deactivation of the virtual interrupt also causes the deactivation of the physical interrupt with the ID that the pINTID field indicates.

<table>
<thead>
<tr>
<th>HW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The interrupt is triggered entirely by software. No notification is sent to the Distributor when the virtual interrupt is deactivated.</td>
</tr>
<tr>
<td>0b1</td>
<td>The interrupt maps directly to a hardware interrupt. A deactivate interrupt request is sent to the Distributor when the virtual interrupt is deactivated, using the pINTID field from this register to indicate the physical interrupt ID. If \texttt{ICH_VMCR_EL2.VEOIM} is 0, this request corresponds to a write to \texttt{ICC_EOIR0_EL1} or \texttt{ICC_EOIR1_EL1}. Otherwise, it corresponds to a write to \texttt{ICC_DIR_EL1}.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Group, bit [60]

Indicates the group for this virtual interrupt.

<table>
<thead>
<tr>
<th>Group</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This is a Group 0 virtual interrupt. \texttt{ICH_VMCR_EL2.VFIQEn} determines whether it is signaled as a virtual IRQ or as a virtual FIQ, and \texttt{ICH_VMCR_EL2.VENG0} enables signaling of this interrupt to the virtual machine.</td>
</tr>
<tr>
<td>0b1</td>
<td>This is a Group 1 virtual interrupt, signaled as a virtual IRQ. \texttt{ICH_VMCR_EL2.VENG1} enables the signaling of this interrupt to the virtual machine. If \texttt{ICH_VMCR_EL2.VCBPR} is 0, then \texttt{ICC_BPR1_EL1} determines if a pending Group 1 interrupt has sufficient priority to preempt current execution. Otherwise, \texttt{ICH_LR&lt;n&gt;_EL2} determines preemption.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [59:56]

Reserved, RES0.

Priority, bits [55:48]

The priority of this interrupt.

It is IMPLEMENTATION DEFINED how many bits of priority are implemented, though at least five bits must be implemented. Unimplemented bits are RES0 and start from bit[48] up to bit[50]. The number of implemented bits can be discovered from \texttt{ICH_VTR_EL2.PRIbits}. On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [47:45]

Reserved, RES0.

pINTID, bits [44:32]

Physical INTID, for hardware interrupts.

When \texttt{ICH_LR<n>_EL2.HW} is 0 (there is no corresponding physical interrupt), this field has the following meaning:

- Bits[44:42] : RES0.
- Bit[41] : EOI. If this bit is 1, then when the interrupt identified by vINTID is deactivated, a maintenance interrupt is asserted.
When ICH_LR<n>_EL2.HW is 1 (there is a corresponding physical interrupt):

- This field indicates the physical INTID. This field is only required to implement enough bits to hold a valid value for the implemented INTID size. Any unused higher order bits are RES0.
- When ICC_CTLR EL1.ExtRange is 0, then bits[44:42] of this field are RES0.
- If the value of pINTID is not a valid INTID, behavior is UNPREDICTABLE. If the value of pINTID indicates a PPI, this field applies to the PPI associated with this same physical PE ID as the virtual CPU interface requesting the deactivation.

A hardware physical identifier is only required in List Registers for interrupts that require deactivation. This means only 13 bits of Physical INTID are required, regardless of the number specified by ICC_CTLR_EL1.IDbits.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**vINTID, bits [31:0]**

Virtual INTID of the interrupt.

If the value of vINTID is 1020-1023 and ICH_LR<n>_EL2.State!=0b00 (Inactive), behavior is UNPREDICTABLE.

Behavior is UNPREDICTABLE if two or more List Registers specify the same vINTID when:

- ICH_LR<n>_EL2.State == 0b01.
- ICH_LR<n>_EL2.State == 0b10.
- ICH_LR<n>_EL2.State == 0b11.

It is IMPLEMENTATION DEFINED how many bits are implemented, though at least 16 bits must be implemented. Unimplemented bits are RES0. The number of implemented bits can be discovered from ICH_VTR_EL2.IDbits.

When ICC_SRE_EL1.SRE == 0, specifying a vINTID in the LPI range is UNPREDICTABLE.

---

**Note**

When a VM is using memory-mapped access to the GIC, software must ensure that the correct source PE ID is provided in bits[12:10].

---

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ICH_LR<n>_EL2**

Accesses to this register use the following encodings:

MRS <Xt>, ICH_LR<n>_EL2

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>

ICH_MISR_EL2, Interrupt Controller Maintenance Interrupt State Register

The ICH_MISR_EL2 characteristics are:

**Purpose**

Indicates which maintenance interrupts are asserted.

**Configuration**

AArch64 System register ICH_MISR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_MISR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

ICH_MISR_EL2 is a 64-bit register.

**Field descriptions**

The ICH_MISR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-8</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

**VGrp1D, bit [7]**

vPE Group 1 Disabled.

<table>
<thead>
<tr>
<th>VGrp1D</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>vPE Group 1 Disabled maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>01</td>
<td>vPE Group 1 Disabled maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when ICH_HCR_EL2.VGrp1DIE==1 and ICH_VMCR_EL2.VENG1==is 0.

On a Warm reset, this field resets to 0.

**VGrp1E, bit [6]**

vPE Group 1 Enabled.

<table>
<thead>
<tr>
<th>VGrp1E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>vPE Group 1 Enabled maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>01</td>
<td>vPE Group 1 Enabled maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when ICH_HCR_EL2.VGrp1EIE==1 and ICH_VMCR_EL2.VENG1==is 1.
On a Warm reset, this field resets to 0.

**VGrp0D, bit [5]**

vPE Group 0 Disabled.

<table>
<thead>
<tr>
<th>VGrp0D</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>vPE Group 0 Disabled maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>vPE Group 0 Disabled maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when $ICH_HCR_EL2.VGrp0DIE==1$ and $ICH_VMCR_EL2.VENG0==0$.

On a Warm reset, this field resets to 0.

**VGrp0E, bit [4]**

vPE Group 0 Enabled.

<table>
<thead>
<tr>
<th>VGrp0E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>vPE Group 0 Enabled maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>vPE Group 0 Enabled maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when $ICH_HCR_EL2.VGrp0EIE==1$ and $ICH_VMCR_EL2.VENG0==1$.

On a Warm reset, this field resets to 0.

**NP, bit [3]**

No Pending.

<table>
<thead>
<tr>
<th>NP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No Pending maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>No Pending maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when $ICH_HCR_EL2.NPIE==1$ and no List register is in pending state.

On a Warm reset, this field resets to 0.

**LRENP, bit [2]**

List Register Entry Not Present.

<table>
<thead>
<tr>
<th>LRENP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>List Register Entry Not Present maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>List Register Entry Not Present maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when $ICH_HCR_EL2.LRENPIE==1$ and $ICH_HCR_EL2.EOIcount$ is non-zero.

On a Warm reset, this field resets to 0.

**U, bit [1]**

Underflow.

<table>
<thead>
<tr>
<th>U</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Underflow maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Underflow maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when $ICH_HCR_EL2.UIE==1$ and zero or one of the List register entries are marked as a valid interrupt, that is, if the corresponding $ICH_LR<n>_EL2.State$ bits do not equal $0x0$.

On a Warm reset, this field resets to 0.
**EOI, bit [0]**

End Of Interrupt.

<table>
<thead>
<tr>
<th>EOI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>End Of Interrupt maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>End Of Interrupt maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when at least one bit in **ICH_EISR_EL2** is 1.

On a Warm reset, this field resets to 0.

The U and NP bits do not include the status of any pending/active 'VSet (IRI)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069) packets because these bits control generation of interrupts that allow software management of the contents of the List Registers (which are not affected by 'VSet (IRI)' packets).

**Accessing the ICH_MISR_EL2**

Accesses to this register use the following encodings:

```
MRS <Xt>, ICH_MISR_EL2
```

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b100</td>
<td>0b1100</td>
<td>0b1011</td>
<td>0b010</td>
</tr>
</tbody>
</table>

```java
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if ICC_SRE_EL2.SRE == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ICH_MISR_EL2;
elsif PSTATE.EL == EL3 then
    if ICC_SRE_EL3.SRE == '0' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        return ICH_MISR_EL2;
```

ICH_VMCR_EL2, Interrupt Controller Virtual Machine Control Register

The ICH_VMCR_EL2 characteristics are:

**Purpose**

Enables the hypervisor to save and restore the virtual machine view of the GIC state.

**Configuration**

AArch64 System register ICH_VMCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_VMCR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

ICH_VMCR_EL2 is a 64-bit register.

**Field descriptions**

The ICH_VMCR_EL2 bit assignments are:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Bits [63:32]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

**VPMR, bits [31:24]**

Virtual Priority Mask. The priority mask level for the virtual CPU interface. If the priority of a pending virtual interrupt is higher than the value indicated by this field, the interface signals the virtual interrupt to the PE.

This field is an alias of ICV_PMR_EL1.Priority.

**VBPR0, bits [23:21]**

Virtual Binary Point Register, Group 0. Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption, and also determines Group 1 interrupt preemption if ICH_VMCR_EL2.VCBPR == 1.

This field is an alias of ICV_BPR0_EL1.BinaryPoint.

The minimum value of this field is determined by ICH_VTR_EL2.PREbits. An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value.
**VBPR1, bits [20:18]**

Virtual Binary Point Register, Group 1. Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption if `ICH_VMCR_EL2.VCBPR == 0`.

This field is an alias of `ICV_BPR1_EL1.BinaryPoint`.

This field is always accessible to EL2 accesses, regardless of the setting of the `ICH_VMCR_EL2.VCBPR` field.

For Non-secure writes, the minimum value of this field is the minimum value of `ICH_VMCR_EL2.VBPR0` plus one.

For Secure writes, the minimum value of this field is the minimum value of `ICH_VMCR_EL2.VBPR0`.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value.

**Bits [17:10]**

Reserved, `RES0`.

**VEOIM, bit [9]**

Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt:

<table>
<thead>
<tr>
<th>VEOIM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><code>ICV_EOIR0_EL1</code> and <code>ICV_EOIR1_EL1</code> provide both priority drop and interrupt deactivation functionality. Accesses to <code>ICV_DIR_EL1</code> are UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b1</td>
<td><code>ICV_EOIR0_EL1</code> and <code>ICV_EOIR1_EL1</code> provide priority drop functionality only. <code>ICV_DIR_EL1</code> provides interrupt deactivation functionality.</td>
</tr>
</tbody>
</table>

This bit is an alias of `ICV_CTLR_EL1.EOImode`.

**Bits [8:5]**

Reserved, `RES0`.

**VCBPR, bit [4]**

Virtual Common Binary Point Register. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VCBPR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><code>ICV_BPR1_EL1</code> determines the preemption group for virtual Group 1 interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reads of <code>ICV_BPR1_EL1</code> return <code>ICV_BPR0_EL1</code> plus one, saturated to <code>0b11</code>. Writes to <code>ICV_BPR1_EL1</code> are ignored.</td>
</tr>
</tbody>
</table>

This field is an alias of `ICV_CTLR_EL1.CBPR`.

**VFIQEn, bit [3]**

Virtual FIQ enable. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VFIQEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 0 virtual interrupts are presented as virtual IRQs.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 0 virtual interrupts are presented as virtual FIQs.</td>
</tr>
</tbody>
</table>

This bit is an alias of `GICV_CTLR.FIQEn`.

In implementations where the Non-secure copy of `ICC_SRE_EL1.SRE` is always 1, this bit is `RES1`. 
VAckCtl, bit [2]

Virtual AckCtl. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VAckCtl</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns an INTID of 1022.</td>
</tr>
<tr>
<td>0b1</td>
<td>If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns the INTID of the corresponding interrupt.</td>
</tr>
</tbody>
</table>

This bit is an alias of GICV_CTLR.AckCtl.

This field is supported for backwards compatibility with GICv2. Arm deprecates the use of this field.

In implementations where the Non-secure copy of ICC_SRE_EL1.SRE is always 1, this bit is RES0.

VENG1, bit [1]

Virtual Group 1 interrupt enable. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VENG1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Virtual Group 1 interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Virtual Group 1 interrupts are enabled.</td>
</tr>
</tbody>
</table>

This bit is an alias of ICV_IGRPEN1_EL1.Enable.

VENG0, bit [0]

Virtual Group 0 interrupt enable. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VENG0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Virtual Group 0 interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Virtual Group 0 interrupts are enabled.</td>
</tr>
</tbody>
</table>

This bit is an alias of ICV_IGRPEN0_EL1.Enable.

Accessing the ICH_VMCR_EL2

When EL2 is using System register access, EL1 using either System register or memory-mapped access must be supported.

Accesses to this register use the following encodings:

MRS <Xt>, ICH_VMCR_EL2

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>

      ICH_VMCR_EL2 = X[t];
endif
ICH_VTR_EL2, Interrupt Controller VGIC Type Register

The ICH_VTR_EL2 characteristics are:

**Purpose**

Reports supported GIC virtualization features.

**Configuration**

AArch64 System register ICH_VTR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_VTR[31:0].

If EL2 is not implemented, all bits in this register are RES0 from EL3, except for nV4, which is RES1 from EL3. This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

ICH_VTR_EL2 is a 64-bit register.

**Field descriptions**

The ICH_VTR_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | PRIbits | PREbits | IDbits | SEISA3V | TDSDVIM | RES0 | ListRegs |

**Bits [63:32]**

Reserved, RES0.

**PRIbits, bits [31:29]**

Priority bits. The number of virtual priority bits implemented, minus one.

An implementation must implement at least 32 levels of virtual priority (5 priority bits).

This field is an alias of ICV_CTLR_EL1.PRIbits.

**PREbits, bits [28:26]**

The number of virtual preemption bits implemented, minus one.

An implementation must implement at least 32 levels of virtual preemption priority (5 preemption bits).

The value of this field must be less than or equal to the value of ICH_VTR_EL2.PRIbits.

The maximum value of this field is 6, indicating 7 bits of preemption.

This field determines the minimum value of ICH_VMCR_EL2.VBPR0.

**IDbits, bits [25:23]**

The number of virtual interrupt identifier bits supported:
### IDbits

<table>
<thead>
<tr>
<th>IDbits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>16 bits.</td>
</tr>
<tr>
<td>0b001</td>
<td>24 bits.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field is an alias of `ICV_CTLR_EL1.IDbits`.

### SEIS, bit [22]

SEI Support. Indicates whether the virtual CPU interface supports generation of SEIs:

<table>
<thead>
<tr>
<th>SEIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The virtual CPU interface logic does not support generation of SEIs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The virtual CPU interface logic supports generation of SEIs.</td>
</tr>
</tbody>
</table>

This bit is an alias of `ICV_CTLR_EL1.SEIS`.

### A3V, bit [21]

Affinity 3 Valid. Possible values are:

<table>
<thead>
<tr>
<th>A3V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>The virtual CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.</td>
</tr>
</tbody>
</table>

This bit is an alias of `ICV_CTLR_EL1.A3V`.

### nV4, bit [20]

Direct injection of virtual interrupts not supported. Possible values are:

<table>
<thead>
<tr>
<th>nV4</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CPU interface logic supports direct injection of virtual interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>The CPU interface logic does not support direct injection of virtual interrupts.</td>
</tr>
</tbody>
</table>

If FEAT_GICv4 is not implemented, this bit is `RES1`.

### TDS, bit [19]

Separate trapping of EL1 writes to `ICV_DIR_EL1` supported.

<table>
<thead>
<tr>
<th>TDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Implementation does not support <code>ICH_HCR_EL2.TDIR</code>.</td>
</tr>
<tr>
<td>0b1</td>
<td>Implementation supports <code>ICH_HCR_EL2.TDIR</code>.</td>
</tr>
</tbody>
</table>

### DVIM, bit [18]

Masking of directly-injected virtual interrupts.

<table>
<thead>
<tr>
<th>DVIM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Masking of Directly-injected Virtual Interrupts not supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>Masking of Directly-injected Virtual Interrupts is supported.</td>
</tr>
</tbody>
</table>

### Bits [17:5]

Reserved, `RES0`. 

ICH_VTR_EL2, Interrupt Controller VGIC Type Register

Page 902
ListRegs, bits [4:0]

The number of implemented List registers, minus one. For example, a value of 0b01111 indicates that the maximum of 16 List registers are implemented.

Accessing the ICH_VTR_EL2

Accesses to this register use the following encodings:

MRS <Xt>, ICH_VTR_EL2

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b100</td>
<td>0b1100</td>
<td>0b1011</td>
<td>0b001</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if ICC_SRE_EL2.SRE == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ICH_VTR_EL2;
elsif PSTATE.EL == EL3 then
    if ICC_SRE_EL3.SRE == '0' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        return ICH_VTR_EL2;
ICV_AP0R<n>_EL1, Interrupt Controller Virtual Active Priorities Group 0 Registers, n = 0 - 3

The ICV_AP0R<n>_EL1 characteristics are:

**Purpose**

Provides information about virtual Group 0 active priorities.

**Configuration**

AArch64 System register ICV_AP0R<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_AP0R<n>[31:0].

**Attributes**

ICV_AP0R<n>_EL1 is a 64-bit register.

**Field descriptions**

The ICV_AP0R<n>_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>62</td>
<td>IMPLEMENTATION DEFINED, bits [31:0]</td>
</tr>
<tr>
<td>31</td>
<td>IMPLEMENTATION DEFINED, bits [31:0]</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

**Accessing the ICV_AP0R<n>_EL1**

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 0 active priorities) might result in UNPREDICTABLE behavior of the virtual interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICV_AP0R1_EL1 is only implemented in implementations that support 6 or more bits of priority. ICV_AP0R2_EL1 and ICV_AP0R3_EL1 are only implemented in implementations that support 7 bits of priority. Unimplemented registers are UNDEFINED.

Writing to the active priority registers in any order other than the following order might result in UNPREDICTABLE behavior of the interrupt prioritization system:

- ICV_AP0R<n>_EL1.
• **ICV_AP0R<n>_EL1**.

Accesses to this register use the following encodings:

**Bits [63:3]**

Reserved, RES0.

**BinaryPoint, bits [2:0]**

The value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

<table>
<thead>
<tr>
<th>Binary point value</th>
<th>Group priority field</th>
<th>Subpriority field</th>
<th>Field with binary point</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>[7:1]</td>
<td>[0]</td>
<td>ggggggg.s</td>
</tr>
<tr>
<td>1</td>
<td>[7:2]</td>
<td>[1:0]</td>
<td>gggggg.ss</td>
</tr>
<tr>
<td>2</td>
<td>[7:3]</td>
<td>[2:0]</td>
<td>gggggg.sss</td>
</tr>
<tr>
<td>3</td>
<td>[7:4]</td>
<td>[3:0]</td>
<td>ggggg.ssss</td>
</tr>
<tr>
<td>4</td>
<td>[7:5]</td>
<td>[4:0]</td>
<td>ggg.sssss</td>
</tr>
<tr>
<td>5</td>
<td>[7:6]</td>
<td>[5:0]</td>
<td>gg.sssssss</td>
</tr>
<tr>
<td>6</td>
<td>[7]</td>
<td>[6:0]</td>
<td>g.ssssssss</td>
</tr>
<tr>
<td>7</td>
<td>No preemption</td>
<td>[7:0]</td>
<td>sssssss</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the ICV_BPR0_EL1**

The minimum binary point value is derived from the number of implemented preemption bits, as shown in the following table:
The number of implemented preemption bits is indicated by `ICH_VTR_EL2.PREbits`.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is `UNKNOWN`.

ICV_BPR1_EL1, Interrupt Controller Virtual Binary Point Register 1

The ICV_BPR1_EL1 characteristics are:

**Purpose**

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines virtual Group 1 interrupt preemption.

**Configuration**

AArch64 System register ICV_BPR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_BPR1[31:0].

**Attributes**

ICV_BPR1_EL1 is a 64-bit register.

**Field descriptions**

The ICV_BPR1_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Bit Assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-3</td>
<td>RES0</td>
</tr>
<tr>
<td>2-0</td>
<td>BinaryPoint</td>
</tr>
</tbody>
</table>

**Bits [63:3]**

Reserved, RES0.

**BinaryPoint, bits [2:0]**

If the GIC is configured to use separate binary point fields for virtual Group 0 and virtual Group 1 interrupts, the value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

<table>
<thead>
<tr>
<th>Binary point value</th>
<th>Group priority field</th>
<th>Subpriority field</th>
<th>Field with binary point</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>-</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>1</td>
<td>[7:1]</td>
<td>[0]</td>
<td>ggggggg.s</td>
</tr>
<tr>
<td>2</td>
<td>[7:2]</td>
<td>[1:0]</td>
<td>gggggg.sss</td>
</tr>
<tr>
<td>3</td>
<td>[7:3]</td>
<td>[2:0]</td>
<td>gggggg.sss</td>
</tr>
<tr>
<td>4</td>
<td>[7:4]</td>
<td>[3:0]</td>
<td>gggg.sssss</td>
</tr>
<tr>
<td>5</td>
<td>[7:5]</td>
<td>[4:0]</td>
<td>ggg.sssssss</td>
</tr>
<tr>
<td>6</td>
<td>[7:6]</td>
<td>[5:0]</td>
<td>gg.sssssss</td>
</tr>
<tr>
<td>7</td>
<td>[7]</td>
<td>[6:0]</td>
<td>g.sssssssss</td>
</tr>
</tbody>
</table>

Writing 0 to this field will set this field to its reset value.

If ICV_CTLR_EL1_CBPR is set to 1, Non-secure EL1 reads return ICV_BPR0_EL1 + 1 saturated to 0b111. Non-secure EL1 writes are ignored.

If ICV_CTLR_EL1_CBPR is set to 1, Secure EL1 reads return ICV_BPR0_EL1. Secure EL1 writes modify ICV_BPR0_EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing the ICV_BPR1_EL1

For Non-secure writes, the minimum value of this field is the minimum value of ICH_VMCR_EL2.VBPR0 plus one.

For Secure writes, the minimum value of this field is the minimum value of ICH_VMCR_EL2.VBPR0.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is UNKNOWN.

Accesses to this register use the following encodings:

MRS <Xt>, ICC_BPR1_EL1

**Bits [63:20]**

Reserved, RES0.

**ExtRange, bit [19]**

Extended INTID range (read-only).

<table>
<thead>
<tr>
<th>ExtRange</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0      | CPU interface does not support INTIDs in the range 1024..8191.  
- Behaviour is **UNPREDICTABLE** if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface.  
  
  **Note**  
  Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them. |
| 0b1      | CPU interface supports INTIDs in the range 1024..8191  
- All INTIDs in the range 1024..8191 are treated as requiring deactivation. |

ICV_CTLR_EL1.ExtRange is an alias of ICC_CTLR_EL1.ExtRange.

**RSS, bit [18]**

Range Selector Support. Possible values are:
Targeted SGIs with affinity level 0 values of 0 - 15 are supported.

Targeted SGIs with affinity level 0 values of 0 - 255 are supported.

This bit is read-only.

Bits [17:16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

<table>
<thead>
<tr>
<th>A3V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>The virtual CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.</td>
</tr>
</tbody>
</table>

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the virtual CPU interface supports local generation of SEIs:

<table>
<thead>
<tr>
<th>SEIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The virtual CPU interface logic does not support local generation of SEIs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The virtual CPU interface logic supports local generation of SEIs.</td>
</tr>
</tbody>
</table>

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. The number of virtual interrupt identifier bits supported:

<table>
<thead>
<tr>
<th>IDbits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>16 bits.</td>
</tr>
<tr>
<td>0b001</td>
<td>24 bits.</td>
</tr>
</tbody>
</table>

All other values are reserved.

PRibits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one. An implementation must implement at least 32 levels of physical priority (5 priority bits).

Note

This field always returns the number of priority bits implemented.

The division between group priority and subpriority is defined in the binary point registers ICV_BPR0_EL1 and ICV_BPR1_EL1.

Bits [7:2]

Reserved, RES0.

EOImode, bit [1]

Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt:
**EOImode**

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0 ICV_EOIR0_EL1 and ICV_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICV_DIR_EL1 are UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b1 ICV_EOIR0_EL1 and ICV_EOIR1_EL1 provide priority drop functionality only. ICV_DIR_EL1 provides interrupt deactivation functionality.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CBPR, bit [0]**

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both virtual Group 0 and virtual Group 1 interrupts:

<table>
<thead>
<tr>
<th>CBPR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0 ICV_BPR1_EL1 determines the preemption group for virtual Group 1 interrupts.</td>
<td></td>
</tr>
<tr>
<td>0b1 Reads of ICV_BPR1_EL1 return ICV_BPR0_EL1 plus one, saturated to 0b111. Writes to ICV_BPR1_EL1 are ignored.</td>
<td></td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ICV_CTLR_EL1**

ICV_DIR_EL1, Interrupt Controller Deactivate Virtual Interrupt Register

The ICV_DIR_EL1 characteristics are:

**Purpose**

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified virtual interrupt.

**Configuration**

AArch64 System register ICV_DIR_EL1 bits [31:0] performs the same function as AArch32 System register ICV_DIR[31:0].

**Attributes**

ICV_DIR_EL1 is a 64-bit register.

**Field descriptions**

The ICV_DIR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| RES0 | RES0 | INTID |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID of the virtual interrupt to be deactivated.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR_EL1.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

**Accessing the ICV_DIR_EL1**

When EOiMode == 0, writes are ignored. In systems supporting system error generation, an implementation might generate an SEI.

Accesses to this register use the following encodings:

MSR ICC_DIR_EL1, <Xt>

end
ICV_EOIR0_EL1, Interrupt Controller Virtual End Of Interrupt Register 0

The ICV_EOIR0_EL1 characteristics are:

**Purpose**

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified virtual Group 0 interrupt.

**Configuration**

AArch64 System register ICV_EOIR0_EL1 performs the same function as AArch32 System register ICV_EOIR0.

**Attributes**

ICV_EOIR0_EL1 is a 64-bit register.

**Field descriptions**

The ICV_EOIR0_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Bit Assignments</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
</tr>
<tr>
<td>62</td>
<td>RES0</td>
</tr>
<tr>
<td>61</td>
<td>INTID</td>
</tr>
<tr>
<td>60</td>
<td>...</td>
</tr>
<tr>
<td>0</td>
<td>...</td>
</tr>
</tbody>
</table>

**Bits [63:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID from the corresponding ICV_IAR0_EL1 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR_EL1.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the ICV_CTLR.EOImode bit is 0, a write to this register drops the priority for the virtual interrupt, and also deactivates the virtual interrupt.

If the ICV_CTLR.EOImode bit is 1, a write to this register only drops the priority for the virtual interrupt. Software must write to ICV_DIR_EL1 to deactivate the virtual interrupt.

**Accessing the ICV_EOIR0_EL1**

A write to this register must correspond to the most recent valid read by this vPE from a Virtual Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICV_IAR0_EL1, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

Accesses to this register use the following encodings:

```
MSR ICC_EOIR0_EL1, <Xt>
```

```
op0 | op1 | CRn | CRm | op2
```

end
ICV_IAR0_EL1, Interrupt Controller Virtual Interrupt Acknowledge Register 0

The ICV_IAR0_EL1 characteristics are:

**Purpose**

The PE reads this register to obtain the INTID of the signaled virtual Group 0 interrupt. This read acts as an acknowledge for the interrupt.

**Configuration**

AArch64 System register ICV_IAR0_EL1 performs the same function as AArch32 System register ICV_IAR0.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when PSTATE.{I,F} == {0,0}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Attributes**

ICV_IAR0_EL1 is a 64-bit register.

**Field descriptions**

The ICV_IAR0_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | RES0 | INTID |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID of the signaled virtual interrupt.

This is the INTID of the highest priority pending virtual interrupt, if that interrupt is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. This special INTID can take the value 1023 only. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR_EL1.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

**Accessing the ICV_IAR0_EL1**

Accesses to this register use the following encodings:

ICV_IAR1_EL1, Interrupt Controller Virtual Interrupt Acknowledge Register 1

The ICV_IAR1_EL1 characteristics are:

**Purpose**

The PE reads this register to obtain the INTID of the signaled virtual Group 1 interrupt. This read acts as an acknowledge for the interrupt.

**Configuration**

AArch64 System register ICV_IAR1_EL1 performs the same function as AArch32 System register ICV_IAR1.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when PSTATE.{I,F} == {0,0}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see ‘Observability of the effects of accesses to the GIC registers’ in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Attributes**

ICV_IAR1_EL1 is a 64-bit register.

ICV_IGRPEN0_EL1, Interrupt Controller Virtual Interrupt Group 0 Enable register

The ICV_IGRPEN0_EL1 characteristics are:

**Purpose**

Controls whether virtual Group 0 interrupts are enabled or not.

**Configuration**

AArch64 System register ICV_IGRPEN0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_IGRPEN0[31:0].

**Attributes**

ICV_IGRPEN0_EL1 is a 64-bit register.

**Field descriptions**

The ICV_IGRPEN0_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Enable</td>
</tr>
<tr>
<td>0</td>
<td>Virtual Group 0 interrupts are enabled.</td>
</tr>
<tr>
<td>0</td>
<td>Virtual Group 0 interrupts are disabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ICV_IGRPEN0_EL1**

Accesses to this register use the following encodings:

The ICV_PMR_EL1 characteristics are:

**Purpose**

Provides a virtual interrupt priority filter. Only virtual interrupts with a higher priority than the value in this register are signaled to the PE.

**Configuration**

AArch64 System register ICV_PMR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_PMR[31:0].

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that writes to this register are self-synchronising. This ensures that no interrupts below the written PMR value will be taken after a write to this register is architecturally executed. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Attributes**

ICV_PMR_EL1 is a 64-bit register.

**Field descriptions**

The ICV_PMR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:8]</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Priority, bits [7:0]</td>
<td>The priority mask level for the virtual CPU interface. If the priority of a virtual interrupt is higher than the value indicated by this field, the interface signals the virtual interrupt to the PE.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Implemented priority bits</th>
<th>Possible priority field values</th>
<th>Number of priority levels</th>
</tr>
</thead>
<tbody>
<tr>
<td>[7:0]</td>
<td>0x00-0xFF (0-255), all values</td>
<td>256</td>
</tr>
<tr>
<td>[7:1]</td>
<td>0x00-0xFE (0-254), even values only</td>
<td>128</td>
</tr>
<tr>
<td>[7:2]</td>
<td>0x00-0xFC (0-252), in steps of 4</td>
<td>64</td>
</tr>
<tr>
<td>[7:3]</td>
<td>0x00-0xF8 (0-248), in steps of 8</td>
<td>32</td>
</tr>
<tr>
<td>[7:4]</td>
<td>0x00-0xF0 (0-240), in steps of 16</td>
<td>16</td>
</tr>
</tbody>
</table>
Unimplemented priority bits are RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

ICV_RPR_EL1, Interrupt Controller Virtual Running Priority Register

The ICV_RPR_EL1 characteristics are:

**Purpose**

Indicates the Running priority of the virtual CPU interface.

**Configuration**

AArch64 System register ICV_RPR_EL1 performs the same function as AArch32 System register ICV_RPR.

**Attributes**

ICV_RPR_EL1 is a 64-bit register.

**Field descriptions**

The ICV_RPR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>0-62</td>
<td>Priority</td>
<td>The current running priority on the virtual CPU interface. This is the group priority of the current active virtual interrupt. If there are no active interrupts on the virtual CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority. The priority returned is the group priority as if the BPR for the current Exception level and Security state was set to the minimum value of BPR for the number of implemented priority bits.</td>
</tr>
</tbody>
</table>

**Bits [63:8]**

Reserved, RES0.

**Priority, bits [7:0]**

The current running priority on the virtual CPU interface. This is the group priority of the current active virtual interrupt.

If there are no active interrupts on the virtual CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

The priority returned is the group priority as if the BPR for the current Exception level and Security state was set to the minimum value of BPR for the number of implemented priority bits.

**Note**

If 8 bits of priority are implemented the group priority is bits[7:1] of the priority.

**Accessing the ICV_RPR_EL1**

If there are no active interrupts on the virtual CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

Software cannot determine the number of implemented priority bits from a read of this register.

Accesses to this register use the following encodings:
MRS <Xt>, ICC_RPR_EL1

**Bits [63:52]**

Reserved, RES0.

**MTPMU, bits [51:48]**

Multi-threaded PMU extension. Defined values are:

<table>
<thead>
<tr>
<th>MTPMU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, it is IMPLEMENTATION DEFINED whether PMEVTYPE&lt;n&gt;_EL0_MT and PMEVTYPE&lt;n&gt;_MT are read/write or RES0.</td>
</tr>
<tr>
<td>0b0001</td>
<td>FEAT_MTPMU and FEAT_PMUv3 implemented. PMEVTYPE&lt;n&gt;_EL0_MT and PMEVTYPE&lt;n&gt;_MT are read/write. When FEAT_MTPMU is disabled, the Effective values of PMEVTYPE&lt;n&gt;_EL0_MT and PMEVTYPE&lt;n&gt;_MT are 0.</td>
</tr>
<tr>
<td>0b1111</td>
<td>FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, PMEVTYPE&lt;n&gt;_EL0_MT and PMEVTYPE&lt;n&gt;_MT are RES0.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_MTPMU implements the functionality identified by the value 0b0001.

From Armv8.6, in an implementation that includes FEAT_PMUv3, the value 0b0000 is not permitted.

In an implementation that does not include FEAT_PMUv3, the value 0b0001 is not permitted.
Bits [47:44]

Reserved, RES0.

**TraceFilt, bits [43:40]**

Armv8.4 Self-hosted Trace Extension version. Defined values are:

<table>
<thead>
<tr>
<th>TraceFilt</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Armv8.4 Self-hosted Trace Extension not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Armv8.4 Self-hosted Trace Extension implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_TRF implements the functionality identified by the value 0b0001.

From Armv8.4, if an Embedded Trace Macrocell Architecture PE Trace Unit is implemented, the value 0b0000 is not permitted.

**DoubleLock, bits [39:36]**

OS Double Lock implemented. Defined values are:

<table>
<thead>
<tr>
<th>DoubleLock</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>OS Double Lock implemented. OSDLR_EL1 is RW.</td>
</tr>
<tr>
<td>0b1111</td>
<td>OS Double Lock not implemented. OSDLR_EL1 is RAZ/WI.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_DoubleLock implements the functionality identified by the value 0b0000.

In Armv8.0, the only permitted value is 0b0000.

If FEAT_Debugv8p2 is implemented and FEAT_DoPD is not implemented, the permitted values are 0b0000 and 0b1111.

If FEAT_DoPD is implemented, the only permitted value is 0b1111.

**PMSVer, bits [35:32]**

Statistical Profiling Extension version. Defined values are:

<table>
<thead>
<tr>
<th>PMSVer</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Statistical Profiling Extension not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Statistical Profiling Extension implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As 0b0001, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Support for the Event packet Alignment flag.</td>
</tr>
<tr>
<td></td>
<td>• If FEAT_SVE is implemented, support for the Scalable Vector extensions to Statistical Profiling.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As 0b0010, and adds:</td>
</tr>
<tr>
<td></td>
<td>• The last branch target Address packet.</td>
</tr>
<tr>
<td></td>
<td>• Discard mode.</td>
</tr>
<tr>
<td></td>
<td>• Extended event filtering, including the PMSNEVFR_EL1 System register.</td>
</tr>
<tr>
<td></td>
<td>• If FEAT_PMUv3 is implemented, controls to freeze the PMU event counters after an SPE buffer management event occurs.</td>
</tr>
<tr>
<td></td>
<td>• If FEAT_PMUv3 is implemented, the SAMPLE_FEED_BR,</td>
</tr>
<tr>
<td></td>
<td>SAMPLE_FEED_EVENT, SAMPLE_FEED_LAT,</td>
</tr>
<tr>
<td></td>
<td>SAMPLE_FEED_LD, SAMPLE_FEED_OP, and</td>
</tr>
<tr>
<td></td>
<td>SAMPLE_FEED_ST PMU events.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_SPE implements the functionality identified by the value 0b0001.

FEAT_SPEv1p1 implements the functionality identified by the value 0b0010.
FEAT_SPEv1p2 implements the functionality identified by the value 0b0011.

In Armv8.5, if FEAT_SPE is implemented, the value 0b0001 is not permitted.

From Armv8.7, if FEAT_SPE is implemented, the value 0b0010 is not permitted.

**CTX_CMPs, bits [31:28]**

Number of breakpoints that are context-aware, minus 1. These are the highest numbered breakpoints.

**Bits [27:24]**

Reserved, RES0.

**WRPs, bits [23:20]**

Number of watchpoints, minus 1. The value of 0b0000 is reserved.

**Bits [19:16]**

Reserved, RES0.

**BRPs, bits [15:12]**

Number of breakpoints, minus 1. The value of 0b0000 is reserved.

**PMU Ver, bits [11:8]**

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'

Defined values are:

<table>
<thead>
<tr>
<th>PMUVer</th>
<th>Meaning</th>

<td>• If EL2 is implemented, the MDCR_EL2.HCCD control bit.</td>
</tr>
<tr>
<td></td>
<td>• If EL3 is implemented, the MDCR_EL3.SCCD control bit.</td>
</tr>
<tr>
<td>0b0111</td>
<td>PMUv3 for Armv8.7. As 0b0110, and also includes support for:</td>
</tr>
<tr>
<td></td>
<td>• The PMCR_EL0.FZO and, if EL2 is implemented, MDCR_EL2.HPMFZO control bits.</td>
</tr>
<tr>
<td></td>
<td>• If EL3 is implemented, the MDCR_EL3.{MPMX,MCCD} control bits.</td>
</tr>
<tr>
<td>0b1111</td>
<td>IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value 0b0001.
FEAT_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT_PMUv3p7 implements the functionality identified by the value 0b0111.

In Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0001 is not permitted.

In Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.

In Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT_PMUv3 is implemented, the value 0b0110 is not permitted.

**TraceVer, bits [7:4]**

Trace support. Indicates whether System register interface to a PE trace unit is implemented. Defined values are:

<table>
<thead>
<tr>
<th>TraceVer</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>PE trace unit System registers not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>PE trace unit System registers implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

See the ETM Architecture Specification for more information.

A value of 0b0000 only indicates that no System register interface to a PE trace unit is implemented. A PE trace unit might nevertheless be implemented without a System register interface.

**DebugVer, bits [3:0]**

Debug architecture version. Indicates presence of Armv8 debug architecture. Defined values are:

<table>
<thead>
<tr>
<th>DebugVer</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0110</td>
<td>Armv8 debug architecture.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Armv8 debug architecture with Virtualization Host Extensions.</td>
</tr>
<tr>
<td>0b1000</td>
<td>Armv8.2 debug architecture.</td>
</tr>
<tr>
<td>0b1001</td>
<td>Armv8.4 debug architecture.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_Debugv8p2 adds the functionality identified by the value 0b1000.

FEAT_Debugv8p4 adds the functionality identified by the value 0b1001.

In Armv8.1, the value 0b0110 is not permitted.

In Armv8.2, the value 0b0111 is not permitted.

From Armv8.4, the value 0b1000 is not permitted.

**Accessing the ID_AA64DFR0_EL1**

Accesses to this register use the following encodings:

```
MRS <Xt>, ID_AA64DFR0_EL1

ID_AA64DFR1_EL1, AArch64 Debug Feature Register 1

The ID_AA64DFR1_EL1 characteristics are:

Purpose

Reserved for future expansion of top level information about the debug system in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

There are no configuration notes.

Attributes

ID_AA64DFR1_EL1 is a 64-bit register.

Field descriptions

The ID_AA64DFR1_EL1 bit assignments are:

**RNDR, bits [63:60]**

Indicates support for Random Number instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>RNDR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No Random Number instructions are implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>RNDR and RNDRRS registers are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_RNG implements the functionality identified by the value 0b0001.

From Armv8.5, the permitted values are 0b0000 and 0b0001.

**TLB, bits [59:56]**

Indicates support for Outer shareable and TLB range maintenance instructions. Defined values are:

<table>
<thead>
<tr>
<th>TLB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Outer shareable and TLB range maintenance instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Outer shareable TLB maintenance instructions are implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Outer shareable and TLB range maintenance instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_TLBIOS implements the functionality identified by the values 0b0001 and 0b0010.
FEAT_TLBIRANGE implements the functionality identified by the value 0b0010.

From Armv8.4, the only permitted value is 0b0010.

**TS, bits [55:52]**

Indicates support for flag manipulation instructions. Defined values are:

<table>
<thead>
<tr>
<th>TS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No flag manipulation instructions are implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>CFINV, RMIF, SETF16, and SETF8 instructions are implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>CFINV, RMIF, SETF16, SETF8, AXFLAG, and XAFLAG instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_FlagM implements the functionality identified by the value 0b0001.

FEAT_FlagM2 implements the functionality identified by the value 0b0010.

In Armv8.2, the permitted values are 0b0000 and 0b0001.

In Armv8.4, the only permitted value is 0b0001.

From Armv8.5, the only permitted value is 0b0010.

**FHM, bits [51:48]**

Indicates support for FMLAL and FMLSL instructions. Defined values are:

<table>
<thead>
<tr>
<th>FHM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>FMLAL and FMLSL instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>FMLAL and FMLSL instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_FHM implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

**DP, bits [47:44]**

Indicates support for Dot Product instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>DP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No Dot Product instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>UDOT and SDOT instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_DotProd implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

**SM4, bits [43:40]**

Indicates support for SM4 instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>SM4</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No SM4 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SM4E and SM4EKEY instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If FEAT_SM4 is not implemented, the value 0b0001 is reserved.
From Armv8.2, the permitted values are 0b0000 and 0b0001.

This field must have the same value as ID_AA64ISAR0_EL1.SM3.

**SM3, bits [39:36]**

Indicates support for SM3 instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>SM3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No SM3 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SM3SS1, SM3TT1A, SM3TT1B, SM3TT2A, SM3TT2B, SM3PARTW1, and SM3PARTW2 instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If FEAT_SM3 is not implemented, the value 0b0001 is reserved.

FEAT_SM3 implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

This field must have the same value as ID_AA64ISAR0_EL1.SM4.

**SHA3, bits [35:32]**

Indicates support for SHA3 instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>SHA3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No SHA3 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EOR3, RAX1, XAR, and BCAX instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If FEAT_SHA3 is not implemented, the value 0b0001 is reserved.

FEAT_SHA3 implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR0_EL1.SHA1 is 0b0000, this field must have the value 0b0000.

If the value of this field is 0b0001, ID_AA64ISAR0_EL1.SHA2 must have the value 0b0010.

**RDM, bits [31:28]**

Indicates support for SQRDMLAH and SQRDMLSH instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>RDM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No RDMA instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SQRDMLAH and SQRDMLSH instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_RDM implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

**Bits [27:24]**

Reserved, RES0.

**Atomic, bits [23:20]**

Indicates support for Atomic instructions in AArch64 state. Defined values are:
Atomic

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
</tr>
<tr>
<td>No Atomic instructions implemented.</td>
</tr>
<tr>
<td>0b0010</td>
</tr>
<tr>
<td>LDADD, LDCLR, LDOR, LDSET, LDSMAX, LDSMIN, LDUMAX, LDUMIN, CAS, CASP, and SWP instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_LSE implements the functionality identified by the value 0b0010.

From Armv8.1, the only permitted value is 0b0010.

CRC32, bits [19:16]

Indicates support for CRC32 instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>CRC32</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No CRC32 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>CRC32B, CRC32H, CRC32W, CRC32X, CRC32CB, CRC32CH, CRC32CW, and CRC32CX instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.1, the only permitted value is 0b0001.

SHA2, bits [15:12]

Indicates support for SHA2 instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>SHA2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No SHA2 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Implements instructions: SHA256H, SHA256H2, SHA256SU0, and SHA256SU1.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Implements instructions:</td>
</tr>
<tr>
<td></td>
<td>• SHA256H, SHA256H2, SHA256SU0, and SHA256SU1.</td>
</tr>
<tr>
<td></td>
<td>• SHA512H, SHA512H2, SHA512SU0, and SHA512SU1.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_SHA256 implements the functionality identified by the value 0b0001.

FEAT_SHA512 implements the functionality identified by the value 0b0010.

In Armv8, the permitted values are 0b0000 and 0b0001.

From Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

If the value of ID_AA64ISAR0_EL1.SHA1 is 0b0000, this field must have the value 0b0000.

If the value of this field is 0b0010, ID_AA64ISAR0_EL1.SHA3 must have the value 0b0001.

SHA1, bits [11:8]

Indicates support for SHA1 instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>SHA1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No SHA1 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_SHA1 implements the functionality identified by the value 0b0001.

From Armv8, the permitted values are 0b0000 and 0b0001.
If the value of ID_AA64ISAR0_EL1.SHA2 is 0b0000, this field must have the value 0b0000.

**AES, bits [7:4]**

Indicates support for AES instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>AES</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No AES instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>AESE, AESD, AESMC, and AESIMC instructions implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, plus PMULL/PMULL2 instructions operating on 64-bit data quantities.</td>
</tr>
</tbody>
</table>

FEAT_AES implements the functionality identified by the value 0b0001.

FEAT_PMULL implements the functionality identified by the value 0b0010.

All other values are reserved.

From Armv8, the permitted values are 0b0000 and 0b0010.

**Bits [3:0]**

Reserved, RES0.

**Accessing the ID_AA64ISAR0_EL1**

Accesses to this register use the following encodings:

```plaintext
MRS <Xt>, ID_AA64ISAR0_EL1
```

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

ID_AA64ISAR1_EL1, AArch64 Instruction Set Attribute Register 1

The ID_AA64ISAR1_EL1 characteristics are:

**Purpose**

Provides information about the features and instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

If ID_AA64ISAR1_EL1.{API, APA} == {0000, 0000}, then:

- The TCR_EL1.{TBID,TBID0}, TCR_EL2.{TBID0,TBID1}, TCR_EL3.TBID and TCR_EL3.TBID bits are **RES0**.
- APIAKeyHi_EL1, APIAKeyLo_EL1, APIBKeyHi_EL1, APIBKeyLo_EL1, APDKeyHi_EL1, APDKeyLo_EL1, APDBKeyHi_EL1, APDBKeyLo_EL1 are not allocated.
- SCTLR_ELx.EnIA, SCTLR_ELx.EnIB, SCTLR_ELx.EnDA, SCTLR_ELx.EnDB are all **RES0**.

If ID_AA64ISAR1_EL1.{GPI, GPA, API, APA} == {0000, 0000, 0000, 0000}, then:

- HCR_EL2.APK and HCR_EL2.API are **RES0**.
- SCR_EL3.APK and SCR_EL3.API are **RES0**.

**Attributes**

ID_AA64ISAR1_EL1 is a 64-bit register.

**Field descriptions**

The ID_AA64ISAR1_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>LS64</th>
<th>XS</th>
<th>I8MM</th>
<th>DGH</th>
<th>BF16</th>
<th>SPECRES</th>
<th>SB</th>
<th>FRINTTS</th>
</tr>
</thead>
<tbody>
<tr>
<td>GPI</td>
<td>GPA</td>
<td>LRPMC</td>
<td>FCMA</td>
<td>JSCVT</td>
<td>API</td>
<td>APA</td>
<td>DPB</td>
</tr>
</tbody>
</table>

**LS64, bits [63:60]**

Indicates support for LD64B and ST64B* instructions, and the **ACCDATA_EL1** register. Defined values of this field are:

<table>
<thead>
<tr>
<th>LS64</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>000000</td>
<td>The LD64B and ST64B* instructions, the <strong>ACCDATA_EL1</strong> register, and associated traps are not supported.</td>
</tr>
<tr>
<td>000001</td>
<td>The LD64B and ST64B instructions are supported.</td>
</tr>
<tr>
<td>000010</td>
<td>The LD64B, ST64B, and ST64BV instructions, and their associated traps are supported.</td>
</tr>
<tr>
<td>000011</td>
<td>The LD64 and ST64B* instructions, the <strong>ACCDATA_EL1</strong> register, and their associated traps are supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_LS64 implements the functionality identified by 0b0001.

FEAT_LS64_V implements the functionality identified by 0b0010.

FEAT_LS64_ACCDATA implements the functionality identified by 0b0011.
From Armv8.7, the permitted values are 0b0000, 0b0010, and 0b0011.

**XS, bits [59:56]**

Indicates support for the XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the HCRX_EL2.\{FGtnXS, FnXS\} fields in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>XS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the HCRX_EL2.{FGtnXS, FnXS} fields are not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the HCRX_EL2.{FGtnXS, FnXS} fields are supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_XS implements the functionality identified by 0b0001.

From Armv8.7, the only permitted value is 0b0001.

**I8MM, bits [55:52]**

Indicates support for Advanced SIMD and Floating-point Int8 matrix multiplication instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>I8MM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Int8 matrix multiplication instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SMMLA, SUDOT, UMMLA, USMMLA, and USDOT instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_I8MM implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as ID_AA64ZFR0_EL1.I8MM.

From Armv8.6, the only permitted value is 0b0001.

**DGH, bits [51:48]**

Indicates support for the Data Gathering Hint instruction. Defined values are:

<table>
<thead>
<tr>
<th>DGH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Data Gathering Hint is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Data Gathering Hint is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_DGH implements the functionality identified by 0b0001.

From ARMv8.0, the permitted values are 0b0000 and 0b0001.

If the DGH instruction has no effect in preventing the merging of memory accesses, the value of this field is 0b0000.

**BF16, bits [47:44]**

Indicates support for Advanced SIMD and Floating-point BFloat16 instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>BF16</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>BFloat16 instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>BFCVT, BFCVTN, BFCVTN2, BFDOT, BFMLALB, BFMLALT, and BFMLA instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.
FEAT_BF16 implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as ID_AA64ZFR0_EL1.BF16.

From Armv8.6, the only permitted value is 0b0001.

**SPECRES, bits [43:40]**

Indicates support for prediction invalidation instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>SPECRES</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>CFP RCTX, DVP RCTX, and CPP RCTX instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>CFP RCTX, DVP RCTX, and CPP RCTX instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_SPECRES implements the functionality identified by 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

**SB, bits [39:36]**

Indicates support for SB instruction in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>SB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SB instruction is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SB instruction is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_SB implements the functionality identified by 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

**FRINTTS, bits [35:32]**

Indicates support for the FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are implemented. Defined values are:

<table>
<thead>
<tr>
<th>FRINTTS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_FRINTTS implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

**GPI, bits [31:28]**

Indicates support for an IMPLEMENTATION DEFINED algorithm is implemented in the PE for generic code authentication in AArch64 state. Defined values are:
**GPI**, bits [27:24]

Indicates whether QARMA or Architected algorithm is implemented in the PE for generic code authentication in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>GPA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Generic Authentication using an Architected algorithm is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Generic Authentication using the QARMA algorithm is implemented. This includes the PACGA instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR1_EL1.GPA is non-zero, this field must have the value 0b0000.

**LRCPC**, bits [23:20]

Indicates support for weaker release consistency, RCpc, based model. Defined values are:

<table>
<thead>
<tr>
<th>LRCPC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The LDAPR*, LDAPUR*, and STLUR* instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The LDAPR* instructions are implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>The LDAPR*, LDAPUR*, and STLUR* instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR1_EL1.GPI is non-zero, this field must have the value 0b0000.

**FCMA**, bits [19:16]

Indicates support for complex number addition and multiplication, where numbers are stored in vectors. Defined values are:

<table>
<thead>
<tr>
<th>FCMA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The FCMLA and FCADD instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The FCMLA and FCADD instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_FCMA implements the functionality identified by the value 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.
From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

**JSCVT, bits [15:12]**

Indicates support for JavaScript conversion from double precision floating point values to integers in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>JSCVT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The FJCVTZS instruction is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The FJCVTZS instruction is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_JSCVT implements the functionality identified by 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

**API, bits [11:8]**

Indicates whether an IMPLEMENTATION DEFINED algorithm is implemented in the PE for address authentication, in AArch64 state. This applies to all Pointer Authentication instructions other than the PACGA instruction. Defined values are:

<table>
<thead>
<tr>
<th>API</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Address Authentication using an IMPLEMENTATION DEFINED algorithm is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC() and HaveEnhancedPAC2() functions returning FALSE.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC() function returning TRUE, and the HaveEnhancedPAC2() function returning FALSE.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.</td>
</tr>
<tr>
<td>0b0100</td>
<td>Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_PAuth implements the functionality added by the values 0b0000, 0b0001, and 0b0010.

FEAT_PAuth2 implements the functionality added by the value 0b0011.

FEAT_FPAC implements the functionality added by the values 0b0100 and 0b0101.

From Armv8.6, the permitted values are 0b0011, 0b0100, and 0b0101.

If the value of ID_AA64ISAR1_EL1.APA is non-zero, this field must have the value 0b0000.
APA, bits [7:4]

Indicates whether QARMA or Architected algorithm is implemented in the PE for address authentication, in AArch64 state. This applies to all Pointer Authentication instructions other than the PACGA instruction. Defined values are:

<table>
<thead>
<tr>
<th>APA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Address Authentication using an Architected algorithm is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Address Authentication using the QARMA algorithm is implemented, with the HaveEnhancedPAC() and HaveEnhancedPAC2() functions returning FALSE.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Address Authentication using the QARMA algorithm is implemented, with the HaveEnhancedPAC() function returning TRUE and the HaveEnhancedPAC2() function returning FALSE.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Address Authentication using the QARMA algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning FALSE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.</td>
</tr>
<tr>
<td>0b0100</td>
<td>Address Authentication using the QARMA algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Address Authentication using the QARMA algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning TRUE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_PAuth implements the functionality added by the values 0b0000, 0b0001, and 0b0010.

FEAT_PAuth2 implements the functionality added by the value 0b0011.

FEAT_FPAC implements the functionality added by the values 0b0100 and 0b0101.

From Armv8.6, the permitted values are 0b0011, 0b0100, and 0b0101.

If the value of the ID_AA64ISAR1_EL1.API is non-zero, this field must have the value 0b0000.

DPB, bits [3:0]

Data Persistence writeback. Indicates support for the DC CVAP and DC CVADP instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>DPB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>DC CVAP not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>DC CVAP supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>DC CVAP and DC CVADP supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_DPB implements the functionality identified by the value 0b0001.

FEAT_DPB2 implements the functionality identified by the value 0b0010.

In Armv8.2, the permitted values are 0b0001 and 0b0010.

From Armv8.5, the only permitted value is 0b0010.

**Accessing the ID_AA64ISAR1_EL1**

Accesses to this register use the following encodings:
MRS <Xt>, ID_AA64ISAR1_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>
<td>0b0000</td>
<td>0b0110</td>
<td>0b001</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
  if IsFeatureImplemented(FEAT_IDST) then
    if EL2Enabled() && HCR_EL2.TGE == '1' then
      AArch64.SystemAccessTrap(EL2, 0x18);
    else
      AArch64.SystemAccessTrap(EL1, 0x18);
  else
    UNDEFINED;

elsif PSTATE.EL == EL3 then
  return ID_AA64ISAR1_EL1;
ID_AA64ISAR2_EL1, AArch64 Instruction Set Attribute Register 2

The ID_AA64ISAR2_EL1 characteristics are:

**Purpose**

Provides information about the features and instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see Principles of the ID scheme for fields in ID registers.

**Configuration**

This register is present only from Armv8.7. Otherwise, direct accesses to ID_AA64ISAR2_EL1 are **UNDEFINED**.

**Attributes**

ID_AA64ISAR2_EL1 is a 64-bit register.

**Field descriptions**

The ID_AA64ISAR2_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-8</td>
<td>RES0</td>
</tr>
<tr>
<td>7-4</td>
<td>RPRES</td>
</tr>
<tr>
<td>3-0</td>
<td>WFxT</td>
</tr>
</tbody>
</table>

**Bits [63:8]**

Reserved, RES0.

**RPRES, bits [7:4]**

When FPCR.AH is 1, indicates support for 12 bits of mantissa in reciprocal and reciprocal square root instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>RPRES</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Reciprocal and reciprocal square root estimates give 8 bits of mantissa.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Reciprocal and reciprocal square root estimates give 12 bits of mantissa.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_RPRES implements the functionality identified by the value 0b0001.

From Armv8.7, if Advanced SIMD and floating-point is implemented, the only permitted value is 0b0001.

**WFxT, bits [3:0]**

Indicates support for the WFET and WFIT instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>WFxT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>WFET and WFIT are not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>WFET and WFIT are supported.</td>
</tr>
</tbody>
</table>
All other values are reserved.

FEAT_WFxT implements the functionality identified by the value 0b0001.

From Armv8.7, the only permitted value is 0b0001.

**Accessing the ID_AA64ISAR2_EL1**

Accesses to this register use the following encodings:

The ID_AA64MMFR0_EL1 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

There are no configuration notes.

**Attributes**

ID_AA64MMFR0_EL1 is a 64-bit register.

**Field descriptions**

The ID_AA64MMFR0_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>ECV</th>
<th>FGT</th>
<th>RES0</th>
<th>ExS</th>
<th>TGran4</th>
<th>TGran64</th>
<th>TGran16</th>

<td>20</td>
</tr>
</tbody>
</table>

**ECV, bits [63:60]**

Indicates presence of Enhanced Counter Virtualization. Defined values are:

<table>
<thead>
<tr>
<th>ECV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Enhanced Counter Virtualization is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Enhanced Counter Virtualization is implemented. Supports CNTHCTL_EL2, (EL1TVT, EL1TVCT, EL1NVPT, EL1NVVCT, EVNTIS), CNTKCTL_EL1, EVNTIS, CNTPCTSS_EL0 counter views, and CNTVCTSS_EL0 counter views. Extends the PMSR_EL1.PCT, PMSR_EL2.PCT, TRFCR_EL1.TS, and TRFCR_EL2.TS fields.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As 0b0001, and also includes support for CNTHCTL_EL2.ECV and CNTPOFF_EL2.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_ECV implements the functionality identified by the values 0b0001 and 0b0010.

From Armv8.6, the only permitted values are 0b0001 and 0b0010.

**FGT, bits [59:56]**

Indicates presence of the Fine-Grained Trap controls:

- If EL2 is implemented, the HAFGRTR_EL2, HDFGRTR_EL2, HDFGWTR_EL2, HFRGRTR_EL2, HFGITR_EL2, and HFGWTR_EL2 registers, and their associated traps.
- If EL2 is implemented, MDCR_EL2.TDCC.
- If EL3 is implemented, MDCR_EL3.TDCC.
• If both EL2 and EL3 are implemented, SCR_EL3.FGTEn.

Defined values are:

<table>
<thead>
<tr>
<th>FGT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The fine-grained trap controls are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The fine-grained trap controls are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_FGT implements the functionality identified by the value 0b0001.

From Armv8.6, the only permitted value is 0b0001.

**Bits [55:48]**

Reserved, RES0.

**ExS, bits [47:44]**

Indicates support for disabling context synchronizing exception entry and exit. Defined values are:

<table>
<thead>
<tr>
<th>ExS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>All exception entries and exits are context synchronization events.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Non-context synchronizing exception entry and exit are supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_ExS implements the functionality identified by the value 0b0001.

**TGran4_2, bits [43:40]**

Indicates support for 4KB memory granule size at stage 2. Defined values are:

<table>
<thead>
<tr>
<th>TGran4_2</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Support for 4KB granule at stage 2 is identified in the ID_AArch64MMFR0_EL1.TGran4 field.</td>
<td></td>
</tr>
<tr>
<td>0b0001</td>
<td>4KB granule not supported at stage 2.</td>
<td></td>
</tr>
<tr>
<td>0b0010</td>
<td>4KB granule supported at stage 2.</td>
<td></td>
</tr>
<tr>
<td>0b0011</td>
<td>4KB granule at stage 2 supports 52-bit input and output addresses. When FEAT_LPA2 is implemented</td>
<td></td>
</tr>
</tbody>
</table>

All other values are reserved.

The 0b0000 value is deprecated.

**TGran64_2, bits [39:36]**

Indicates support for 64KB memory granule size at stage 2. Defined values are:

<table>
<thead>
<tr>
<th>TGran64_2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Support for 64KB granule at stage 2 is identified in the ID_AArch64MMFR0_EL1.TGran64 field.</td>
</tr>
<tr>
<td>0b0001</td>
<td>64KB granule not supported at stage 2.</td>
</tr>
<tr>
<td>0b0010</td>
<td>64KB granule supported at stage 2.</td>
</tr>
</tbody>
</table>

All other values are reserved.

The 0b0000 value is deprecated.
### TGran16_2, bits [35:32]

Indicates support for 16KB memory granule size at stage 2. Defined values are:

<table>
<thead>
<tr>
<th>TGran16_2</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Support for 16KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran16 field.</td>
<td></td>
</tr>
<tr>
<td>0b0001</td>
<td>16KB granule not supported at stage 2.</td>
<td></td>
</tr>
<tr>
<td>0b0010</td>
<td>16KB granule supported at stage 2.</td>
<td></td>
</tr>
<tr>
<td>0b0011</td>
<td>16KB granule at stage 2 supports 52-bit input and output addresses.</td>
<td>When FEAT_LPA2 is implemented</td>
</tr>
</tbody>
</table>

All other values are reserved.

The 0b0000 value is deprecated.

### TGran4, bits [31:28]

Indicates support for 4KB memory translation granule size. Defined values are:

<table>
<thead>
<tr>
<th>TGran4</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>4KB granule supported.</td>
<td></td>
</tr>
<tr>
<td>0b0001</td>
<td>4KB granule supports 52-bit input and output addresses.</td>
<td>When FEAT_LPA2 is implemented</td>
</tr>
<tr>
<td>0b1111</td>
<td>4KB granule not supported.</td>
<td></td>
</tr>
</tbody>
</table>

All other values are reserved.

### TGran64, bits [27:24]

Indicates support for 64KB memory translation granule size. Defined values are:

<table>
<thead>
<tr>
<th>TGran64</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>64KB granule supported.</td>
</tr>
<tr>
<td>0b1111</td>
<td>64KB granule not supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

### TGran16, bits [23:20]

Indicates support for 16KB memory translation granule size. Defined values are:

<table>
<thead>
<tr>
<th>TGran16</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>16KB granule not supported.</td>
<td></td>
</tr>
<tr>
<td>0b0001</td>
<td>16KB granule supported.</td>
<td></td>
</tr>
<tr>
<td>0b0010</td>
<td>16KB granule supports 52-bit input and output addresses.</td>
<td>When FEAT_LPA2 is implemented</td>
</tr>
</tbody>
</table>

All other values are reserved.

### BigEndEL0, bits [19:16]

Indicates support for mixed-endian at EL0 only. Defined values are:

<table>
<thead>
<tr>
<th>BigEndEL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No mixed-endian support at EL0. The SCTLR_EL1.E0E bit has a fixed value.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Mixed-endian support at EL0. The SCTLR_EL1.E0E bit can be configured.</td>
</tr>
</tbody>
</table>

All other values are reserved.
This field is invalid and is RES0 if ID_AA64MMFR0_EL1.BigEnd is not 0b0000.

**SNSMem, bits [15:12]**

Indicates support for a distinction between Secure and Non-secure Memory. Defined values are:

<table>
<thead>
<tr>
<th>SNSMem</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Does not support a distinction between Secure and Non-secure Memory.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Does support a distinction between Secure and Non-secure Memory.</td>
</tr>
</tbody>
</table>

**Note**

If EL3 is implemented, the value 0b0000 is not permitted.

All other values are reserved.

**BigEnd, bits [11:8]**

Indicates support for mixed-endian configuration. Defined values are:

<table>
<thead>
<tr>
<th>BigEnd</th>
<th>Meaning</th>
</tr>

</tr>
<tr>
<td>0b0001</td>
<td>Mixed-endian support. The 'SCTLR_ELx'.EE and SCTLR_EL1.E0E bits can be configured.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**ASIDBits, bits [7:4]**

Number of ASID bits. Defined values are:

<table>
<thead>
<tr>
<th>ASIDBits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>8 bits.</td>
</tr>
<tr>
<td>0b0010</td>
<td>16 bits.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**PARange, bits [3:0]**

Physical Address range supported. Defined values are:

<table>
<thead>
<tr>
<th>PARange</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>32 bits, 4GB.</td>
</tr>
<tr>
<td>0b0001</td>

</tr>
<tr>
<td>0b0101</td>
<td>48 bits, 256TB.</td>
</tr>
<tr>
<td>0b0110</td>
<td>52 bits, 4PB.</td>
</tr>
</tbody>
</table>

All other values are reserved.

The value 0b0110 is permitted only if the implementation includes FEAT_LPA, otherwise it is reserved.

**Accessing the ID_AA64MMFR0_EL1**

Accesses to this register use the following encodings:
MRS <Xt>, ID_AA64MMFR0_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

The ID_AA64MMFR1_EL1 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

There are no configuration notes.

**Attributes**

ID_AA64MMFR1_EL1 is a 64-bit register.

**Field descriptions**

The ID_AA64MMFR1_EL1 bit assignments are:

<table>

**Bits [63:48]**

Reserved, RES0.

**AFP, bits [47:44]**

Indicates support for FPCR.\{AH, FIZ, NEP\}. Defined values are:

<table>
<thead>
<tr>
<th>AFP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The FPCR.{AH, FIZ, NEP} fields are not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The FPCR.{AH, FIZ, NEP} fields are supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_AFP implements the functionality identified by the value 0b0001.

From Armv8.7, if Advanced SIMD and floating-point is implemented, the only permitted value is 0b0001.

**HCX, bits [43:40]**

Indicates support for HCRX_EL2 and its associated EL3 trap. Defined values are:

<table>
<thead>
<tr>
<th>HCX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>HCRX_EL2 and its associated EL3 trap are not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>HCRX_EL2 and its associated EL3 trap are supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.
FEAT_HCX implements the functionality identified by the value 0b0001.

From Armv8.7, if EL2 is implemented, the only permitted value is 0b0001.

ETS, bits [39:36]

Indicates support for Enhanced Translation Synchronization. Defined values are:

<table>
<thead>
<tr>
<th>ETS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Enhanced Translation Synchronization is not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Enhanced Translation Synchronization is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_ETS implements the functionality identified by the value 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.7, the only permitted value is 0b0001.

TWED, bits [35:32]

Indicates support for the configurable delayed trapping of WFE. Defined values are:

<table>
<thead>
<tr>
<th>TWED</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Configurable delayed trapping of WFE is not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Configurable delayed trapping of WFE is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_TWED implements the functionality identified by the value 0b0001.

From Armv8.6, the permitted values are 0b0000 and 0b0001.

XNX, bits [31:28]

Indicates support for execute-never control distinction by Exception level at stage 2. Defined values are:

<table>
<thead>
<tr>
<th>XNX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Distinction between EL0 and EL1 execute-never control at stage 2 not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Distinction between EL0 and EL1 execute-never control at stage 2 supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_XNX implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

SpecSEI, bits [27:24]

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:

<table>
<thead>
<tr>
<th>SpecSEI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The PE never generates an SError interrupt due to an External abort on a speculative read.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The PE might generate an SError interrupt due to an External abort on a speculative read.</td>
</tr>
</tbody>
</table>

All other values are reserved.
PAN, bits [23:20]

Privileged Access Never. Indicates support for the PAN bit in PSTATE, SPSR_EL1, SPSR_EL2, SPSR_EL3, and DSPSR_EL0. Defined values are:

<table>
<thead>
<tr>
<th>PAN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>PAN not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>PAN supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>PAN supported and AT_S1E1RP and AT_S1E1WP instructions supported.</td>
</tr>
<tr>
<td>0b0011</td>
<td>PAN supported, AT_S1E1RP and AT_S1E1WP instructions supported, and SCTLR_EL1.EPAN and SCTLR_EL2.EPAN bits supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_PAN implements the functionality identified by the value 0b0001.

FEAT_PAN2 implements the functionality added by the value 0b0010.

FEAT_PAN3 implements the functionality added by the value 0b0011.

In Armv8.1, the permitted values are 0b0001 and 0b0011.

From Armv8.2, the permitted values are 0b0010 and 0b0011.

From Armv8.7, the only permitted value is 0b0011.

LO, bits [19:16]

LORegions. Indicates support for LORegions. Defined values are:

<table>
<thead>
<tr>
<th>LO</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>LORegions not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>LORegions supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_LOR implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

HPDS, bits [15:12]

Hierarchical Permission Disables. Indicates support for disabling hierarchical controls in translation tables. Defined values are:

<table>
<thead>
<tr>
<th>HPDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Disabling of hierarchical controls not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Disabling of hierarchical controls supported with the TCR_EL1. (HPD1, HPD0), TCR_EL2. HPD or TCR_EL2. (HPD1, HPD0), and TCR_EL3. HPD bits.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for value 0b0001, and adds possible hardware allocation of bits[62:59] of the translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_HPDS implements the functionality identified by the value 0b0001.

FEAT_HPDS2 implements the functionality identified by the value 0b0010.

From Armv8.1, the value 0b0000 is not permitted.

VH, bits [11:8]

Virtualization Host Extensions. Defined values are:
<table>
<thead>
<tr>
<th>VH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Virtualization Host Extensions not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Virtualization Host Extensions supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_VHE implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

**VMIDBits, bits [7:4]**

Number of VMID bits. Defined values are:

<table>
<thead>
<tr>
<th>VMIDBits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>8 bits</td>
</tr>
<tr>
<td>0b0010</td>
<td>16 bits</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_VMID16 implements the functionality identified by the value 0b0010.

From Armv8.1, the permitted values are 0b0000 and 0b0010.

**HAFDBS, bits [3:0]**

Hardware updates to Access flag and Dirty state in translation tables. Defined values are:

<table>
<thead>
<tr>
<th>HAFDBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Hardware update of the Access flag and dirty state are not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Hardware update of the Access flag is supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Hardware update of both the Access flag and dirty state is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_HAFDBS implements the functionality identified by the values 0b0001 and 0b0010.

From Armv8.1, the permitted values are 0b0000, 0b0001, and 0b0010.

ID_AA64MMFR2_EL1, AArch64 Memory Model Feature Register 2

The ID_AA64MMFR2_EL1 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

**Attributes**

ID_AA64MMFR2_EL1 is a 64-bit register.

**Field descriptions**

The ID_AA64MMFR2_EL1 bit assignments are:

<table>
<thead>
<tr>

**E0PD, bits [63:60]**

Indicates support for the E0PD mechanism. Defined values are:

<table>
<thead>
<tr>
<th>E0PD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>E0PD mechanism is not implemented.</td>
</tr>
<tr>
<td>0001</td>
<td>E0PD mechanism is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_E0PD implements the functionality identified by the value 0b0001.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If FEAT_E0PD is implemented, FEAT_CSV3 must be implemented.

**EVT, bits [59:56]**

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the HCR_EL2, {TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps. Defined values are:
<table>
<thead>
<tr>
<th>EVT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td><code>HCR_EL2</code> <code>{TTLBOS, TTLBIS, TOCU, TICAB, TID4}</code> traps are not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td><code>HCR_EL2</code> <code>{TOCU, TICAB, TID4}</code> traps supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td><code>HCR_EL2</code> <code>{TTLBOS, TTLBIS}</code> traps are not supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_EVT implements the functionality identified by the values 0b0001 and 0b010.

If EL2 is not implemented, the only permitted value is 0b0000.

In Armv8.2, the permitted values are 0b0000, 0b0001, and 0b010.

From Armv8.5, the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0010 when EL2 is implemented.

**BBM, bits [55:52]**

Allows identification of the requirements of the hardware to have break-before-make sequences when changing block size for a translation.

<table>
<thead>
<tr>
<th>BBM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Level 0 support for changing block size is supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Level 1 support for changing block size is supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Level 2 support for changing block size is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_BBM implements the functionality identified by the values 0b0000, 0b0001, and 0b010.

From Armv8.4, the permitted values are 0b0000, 0b0001, and 0b010.

**TTL, bits [51:48]**

Indicates support for TTL field in address operations. Defined values are:

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>TLB maintenance instructions by address have bits[47:44] as RES0.</td>
</tr>
<tr>
<td>0b0001</td>
<td>TLB maintenance instructions by address have bits[47:44] holding the TTL field.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_TTL implements the functionality identified by the value 0b0001.

This field affects TLBI IPAS2E1, TLBI IPAS2E1IS, TLBI IPAS2E1OS, TLBI IPAS2LE1, TLBI IPAS2LE1IS, TLBI IPAS2LE1OS, TLBI VAE1, TLBI VAE1IS, TLBI VAE1OS, TLBI VAAE1, TLBI VAAE1IS, TLBI VAAE1OS, TLBI VAAE1OS, TLBI VAAE2, TLBI VAAE2IS, TLBI VAAE2OS, TLBI VALE1, TLBI VALE1IS, TLBI VALE1OS, TLBI VALE2, TLBI VALE2IS, TLBI VALE2OS, TLBI VALE3, TLBI VALE3IS, TLBI VALE3OS.

From Armv8.4, the only permitted value is 0b0001.

**Bits [47:44]**

Reserved, RES0.

**FWB, bits [43:40]**

Indicates support for `HCR_EL2`.FWB. Defined values are:
### FWB

<table>
<thead>
<tr>
<th>FWB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>HCR_EL2.FWB bit is not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>HCR_EL2.FWB is supported.</td>
</tr>
</tbody>
</table>

All other values reserved.

FEAT_S2FWB implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

### IDS, bits [39:36]

Indicates the value of ESR_ELx.EC that reports an exception generated by a read access to the feature ID space. Defined values are:

<table>
<thead>
<tr>
<th>IDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>An exception which is generated by a read access to the feature ID space, other than a trap caused by HCR_EL2.TIDx, SCTLR_EL1.UCT, or SCTLR_EL2.UCT, is reported by ESR_ELx.EC == 0x0.</td>
</tr>
<tr>
<td>0b0001</td>
<td>All exceptions generated by an AArch64 read access to the feature ID space are reported by ESR_ELx.EC == 0x18.</td>
</tr>
</tbody>
</table>

All other values are reserved.

The Feature ID space is defined as the System register space in AArch64 with op0==3, op1=={0, 1, 3}, CRn==0, CRm=={0-7}, op2=={0-7}.

FEAT_IDST implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

### AT, bits [35:32]

Identifies support for unaligned single-copy atomicity and atomic functions. Defined values are:

<table>
<thead>
<tr>
<th>AT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Unaligned single-copy atomicity and atomic functions are not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Unaligned single-copy atomicity and atomic functions with a 16-byte address range aligned to 16-bytes are supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_LSE2 implements the functionality identified by the value 0b0001.

In Armv8.2, the permitted values are 0b0000 and 0b0001.

From Armv8.4, the only permitted value is 0b0001.

### ST, bits [31:28]

Identifies support for small translation tables. Defined values are:

<table>
<thead>
<tr>
<th>ST</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The maximum value of the TCR_ELx.{T0SZ,T1SZ} and VTCR_EL2.T0SZ fields is 39.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The maximum value of the TCR_ELx.{T0SZ,T1SZ} and VTCR_EL2.T0SZ fields is 48 for 4KB and 16KB granules, and 47 for 64KB granules.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_TTST implements the functionality identified by the value 0b0001.

If FEAT_SEL2 is implemented, the only permitted value is 0b0001.

In an implementation which does not support FEAT_SEL2, the permitted values are 0b0000 and 0b0001.
**NV, bits [27:24]**

Nested Virtualization. If EL2 is implemented, indicates support for the use of nested virtualization. Defined values are:

<table>
<thead>
<tr>
<th>NV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Nested virtualization is not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The HCR_EL2.NV, HCR_EL2.NV1, HCR_EL2.AT bits are implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>The VNCR_EL2 register and the HCR_EL2.{AT, NV, NV1, NV2} bits are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If EL2 is not implemented, the only permitted value is 0b0000.

FEAT_NV implements the functionality identified by the value 0b0001.

FEAT_NV2 implements the functionality identified by the value 0b0010.

In Armv8.3, if EL2 is implemented, the permitted values are 0b0000 and 0b0001.

From Armv8.4, if EL2 is implemented, the permitted values are 0b0000, 0b0001, and 0b0010.

**CCIDX, bits [23:20]**

Support for the use of revised CCSIDR_EL1 register format. Defined values are:

<table>
<thead>
<tr>
<th>CCIDX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>32-bit format implemented for all levels of the CCSIDR_EL1.</td>
</tr>
<tr>
<td>0b0001</td>
<td>64-bit format implemented for all levels of the CCSIDR_EL1.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_CCIDX implements the functionality identified by the value 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

**VARange, bits [19:16]**

Indicates support for a larger virtual address. Defined values are:

<table>
<thead>
<tr>
<th>VARange</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>VMSAv8-64 supports 48-bit VAs.</td>
</tr>
<tr>
<td>0b0001</td>
<td>VMSAv8-64 supports 52-bit VAs when using the 64KB translation granule. The other translation granules support 48-bit VAs.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_LVA implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

**IESB, bits [15:12]**

Indicates support for the IESB bit in the SCTLR_ELx registers. Defined values are:

<table>
<thead>
<tr>
<th>IESB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>IESB bit in the SCTLR_ELx registers is not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>IESB bit in the SCTLR_ELx registers is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_IESB implements the functionality identified by the value 0b0001.
LSM, bits [11:8]
Indicates support for LSMAOE and nTLSMD bits in \texttt{SCTLR\_EL1} and \texttt{SCTLR\_EL2}. Defined values are:

<table>
<thead>
<tr>
<th>LSM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>LSMAOE and nTLSMD bits not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>LSMAOE and nTLSMD bits supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

\texttt{FEAT\_LSMAOC} implements the functionality identified by the value 0b0001.

UAO, bits [7:4]
User Access Override. Defined values are:

<table>
<thead>
<tr>
<th>UAO</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>UAO not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>UAO supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

\texttt{FEAT\_UAO} implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

CnP, bits [3:0]
Indicates support for Common not Private translations. Defined values are:

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Common not Private translations not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Common not Private translations supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

\texttt{FEAT\_TTCNP} implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

**Accessing the ID\_AA64MMFR2\_EL1**
Accesses to this register use the following encodings:

\texttt{MRS <Xt>, ID\_AA64MMFR2\_EL1}

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b00</td>
<td>0b0000</td>
<td>0b0111</td>
<td>0b010</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
  if IsFeatureImplemented(FEAT_IDST) then
    if EL2Enabled() && HCR_EL2.TGE == '1' then
      AArch64.SystemAccessTrap(EL2, 0x18);

    return ID_AA64MMFR2_EL1;
elsif PSTATE.EL == EL2 then
  return ID_AA64MMFR2_EL1;
elsif PSTATE.EL == EL3 then
  return ID_AA64MMFR2_EL1;
The ID_AA64PFR0_EL1 characteristics are:

**Purpose**

Provides additional information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

The external register EDPFR gives information from this register.

**Attributes**

ID_AA64PFR0_EL1 is a 64-bit register.

**Field descriptions**

The ID_AA64PFR0_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

| CSV3 | CSV2 | RES0 | DIT | AMU | MPAM | SEL2 | SVE |
| RAS | GIC | AdvSIMD | FP | EL3 | EL2 | EL1 | EL0 |

**CSV3, bits [63:60]**

Speculative use of faulting data. Defined values are:

<table>
<thead>
<tr>
<th>CSV3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>This Device does not disclose whether data loaded under speculation with a permission or domain fault can be used to form an address or generate condition codes or SVE predicate values to be used by instructions newer than the load in the speculative sequence</td>
</tr>
<tr>
<td>0b0001</td>
<td>Data loaded under speculation with a permission or domain fault cannot be used to form an address or generate condition codes or SVE predicate values to be used by instructions newer than the load in the speculative sequence</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_CSV3 implements the functionality identified by the value 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If FEAT_E0PD is implemented, FEAT_CSV3 must be implemented.

**CSV2, bits [59:56]**

Speculative use of out of context branch targets. Defined values are:
This Device does not disclose whether branch targets trained in one hardware described context can affect speculative execution in a different hardware described context.

Branch targets trained in one hardware described context can only affect speculative execution in a different hardware described context in a hard-to-determine way. Contexts do not include the SCXTNUM_ELx register contexts, and these registers are not supported.

Branch targets trained in one hardware described context can only affect speculative execution in a different hardware described context in a hard-to-determine way. Contexts include the SCXTNUM_ELx register contexts, and these registers are supported.

All other values are reserved.

In Armv8.0, the permitted values are 0b0000, 0b0001, and 0b0010.

From Armv8.5, the permitted values are 0b0001 and 0b0010.

Bits [55:52]

Reserved, RES0.

DIT, bits [51:48]

Data Independent Timing. Defined values are:

<table>
<thead>
<tr>
<th>DIT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>AArch64 does not guarantee constant execution time of any instructions.</td>
</tr>
<tr>
<td>0b0001</td>
<td>AArch64 provides the PSTATE.DIT mechanism to guarantee constant execution time of certain instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_DIT implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

AMU, bits [47:44]

Indicates support for Activity Monitors Extension. Defined values are:

<table>
<thead>
<tr>
<th>AMU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Activity Monitors Extension is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>FEAT_AMUv1 is implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_AMUv1 implements the functionality identified by the value 0b0001.

FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

MPAM, bits [43:40]

Indicates support for MPAM Extension. Defined values are:
MPAM

<table>
<thead>
<tr>
<th>MPAM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>If ID_AA64PFR1_EL1.MPAM_frac == 0b0000, MPAM Extension is not implemented. If ID_AA64PFR1_EL1.MPAM_frac == 0b0001, MPAM Extension version 0.1 is implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>If ID_AA64PFR1_EL1.MPAM_frac == 0b0000, MPAM Extension version 1.0 is implemented. If ID_AA64PFR1_EL1.MPAM_frac == 0b0001, MPAM Extension version 1.1 is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

SEL2, bits [39:36]

Secure EL2. Defined values are:

<table>
<thead>
<tr>
<th>SEL2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Secure EL2 is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Secure EL2 is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_SEL2 implements the functionality identified by the value 0b0001.

SVE, bits [35:32]

Scalable Vector Extension. Defined values are:

<table>
<thead>
<tr>
<th>SVE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SVE architectural state and programmers’ model are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SVE architectural state and programmers’ model are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If implemented, refer to ID_AA64ZFR0_EL1 for information about which SVE instructions are available.

RAS, bits [31:28]

RAS Extension version. Defined values are:

<table>
<thead>
<tr>
<th>RAS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No RAS Extension.</td>
</tr>
<tr>
<td>0b0001</td>
<td>RAS Extension present.</td>
</tr>
<tr>
<td>0b0010</td>
<td>FEAT_RASv1p1 present. As 0b0001, and adds support for:</td>
</tr>
<tr>
<td></td>
<td>• If EL3 is implemented, FEAT_DoubleFault.</td>
</tr>
<tr>
<td></td>
<td>• Additional ERX_MISC&lt;m&gt; EL1 System registers.</td>
</tr>
<tr>
<td></td>
<td>• Additional System registers ERXPFGCDN_EL1, ERXPFGCTL_EL1, and ERXPFGF_EL1, and the SCR_EL3, FIEN and HCR_EL2, FIEN trap controls, to support the optional RAS Common Fault Injection Model Extension.</td>
</tr>
<tr>
<td></td>
<td>Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR&lt;n&gt;STATUS and support for the optional RAS Timestamp and RAS Common Fault Injection Model Extensions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_RAS implements the functionality identified by the value 0b0001.

FEAT_RASv1p1 and FEAT_DoubleFault implement the functionality identified by the value 0b0010.

In Armv8.0 and Armv8.1, the permitted values are 0b0000 and 0b0001.

In Armv8.2, the only permitted value is 0b0001.
From Armv8.4, if FEAT_DoubleFault is implemented, the only permitted value is 0b0010.

From Armv8.4, when FEAT_DoubleFault is not implemented, and ERRIDR_EL1 is 0, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010.

---

**Note**

When the value of this field is 0b0001, ID_AA64PFR1_EL1.RAS_frac indicates whether FEAT_RASv1p1 is implemented.

---

**GIC, bits [27:24]**

System register GIC CPU interface. Defined values are:

<table>
<thead>
<tr>
<th>GIC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>GIC CPU interface system registers not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.</td>
</tr>
<tr>
<td>0b0011</td>
<td>System register interface to version 4.1 of the GIC CPU interface is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**AdvSIMD, bits [23:20]**

Advanced SIMD. Defined values are:

<table>
<thead>
<tr>
<th>AdvSIMD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Advanced SIMD is implemented, including support for the following SISD and SIMD operations:</td>
</tr>
<tr>
<td></td>
<td>• Integer byte, halfword, word and doubleword element operations.</td>
</tr>
<tr>
<td></td>
<td>• Single-precision and double-precision floating-point arithmetic.</td>
</tr>
<tr>
<td></td>
<td>• Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.</td>
</tr>
<tr>
<td>0b0001</td>
<td>As for 0b0000, and also includes support for half-precision floating-point arithmetic.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Advanced SIMD is not implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field must have the same value as the FP field.

The permitted values are:

- 0b0000 in an implementation with Advanced SIMD support that does not include the FEAT_FP16 extension.
- 0b0001 in an implementation with Advanced SIMD support that includes the FEAT_FP16 extension.
- 0b1111 in an implementation without Advanced SIMD support.

**FP, bits [19:16]**

Floating-point. Defined values are:

<table>
<thead>
<tr>
<th>FP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Floating-point is implemented, and includes support for:</td>
</tr>
<tr>
<td></td>
<td>• Single-precision and double-precision floating-point types.</td>
</tr>
<tr>
<td></td>
<td>• Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.</td>
</tr>
<tr>
<td>0b0001</td>
<td>As for 0b0000, and also includes support for half-precision floating-point arithmetic.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Floating-point is not implemented.</td>
</tr>
</tbody>
</table>
All other values are reserved.

This field must have the same value as the AdvSIMD field.

The permitted values are:

- \(0b0000\) in an implementation with floating-point support that does not include the FEAT_FP16 extension.
- \(0b0001\) in an implementation with floating-point support that includes the FEAT_FP16 extension.
- \(0b1111\) in an implementation without floating-point support.

**EL3, bits [15:12]**

EL3 Exception level handling. Defined values are:

<table>
<thead>
<tr>
<th>EL3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL3 is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EL3 can be executed in AArch64 state only.</td>
</tr>
<tr>
<td>0b0010</td>
<td>EL3 can be executed in either AArch64 or AArch32 state.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**EL2, bits [11:8]**

EL2 Exception level handling. Defined values are:

<table>
<thead>
<tr>
<th>EL2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL2 is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EL2 can be executed in AArch64 state only.</td>
</tr>
<tr>
<td>0b0010</td>
<td>EL2 can be executed in either AArch64 or AArch32 state.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**EL1, bits [7:4]**

EL1 Exception level handling. Defined values are:

<table>
<thead>
<tr>
<th>EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>EL1 can be executed in AArch64 state only.</td>
</tr>
<tr>
<td>0b0010</td>
<td>EL1 can be executed in either AArch64 or AArch32 state.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**EL0, bits [3:0]**

EL0 Exception level handling. Defined values are:

<table>
<thead>
<tr>
<th>EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>EL0 can be executed in AArch64 state only.</td>
</tr>
<tr>
<td>0b0010</td>
<td>EL0 can be executed in either AArch64 or AArch32 state.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Accessing the ID_AA64PFR0_EL1**

Accesses to this register use the following encodings:

```
MRS <Xt>, ID_AA64PFR0_EL1
```

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>

The ID_AA64PFR1_EL1 characteristics are:

**Purpose**

Reserved for future expansion of information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

There are no configuration notes.

**Attributes**

ID_AA64PFR1_EL1 is a 64-bit register.

**Field descriptions**

The ID_AA64PFR1_EL1 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0| MPAM_frac | RAS_frac | MTE | SSBS | BT |
| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |

**Bits [63:20]**

Reserved, RES0.

**MPAM_frac, bits [19:16]**

MPAM Extension fractional field. Defined values are:

<table>
<thead>
<tr>
<th>MPAM_frac</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>If ID_AA64PFR0_EL1.MPAM == 0b0000, MPAM Extension not implemented. If ID_AA64PFR0_EL1.MPAM == 0b0001, MPAM Extension v1.0 is implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>If ID_AA64PFR0_EL1.MPAM == 0b0000, implements MPAM v0.1, which is like v1.1 but reduces support for Secure PARTIDs. If ID_AA64PFR0_EL1.MPAM == 0b0001, implements MPAM v1.1 and adds support for MPAM2_EL2.TIDR to provide trapping of MPAMIDR_EL1 when MPAMHCR_EL2 is not present.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**RAS_frac, bits [15:12]**

RAS Extension fractional field. Defined values are:
<table>
<thead>
<tr>
<th>RAS_frac</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>If ( \text{ID_AA64PFR0_EL1_RAS} == 0b0001 ), RAS Extension implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>If ( \text{ID_AA64PFR0_EL1_RAS} == 0b0001 ), as 0b0000 and adds support for:</td>
</tr>
<tr>
<td></td>
<td>- Additional ERXMISC(&lt;m&gt;) EL1 System registers.</td>
</tr>
<tr>
<td></td>
<td>- Additional System registers ( \text{ERXPFGCDN_EL1} ), ( \text{ERXPFGCTL_EL1} ), and ( \text{ERXPFGF_EL1} ), and the ( \text{SCR_EL3} ), ( \text{FIEN} ) and ( \text{HCR_EL2} ), ( \text{FIEN} ) trap controls, to support the optional RAS Common Fault Injection Model Extension.</td>
</tr>
<tr>
<td></td>
<td>Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ( \text{ERR&lt;n&gt;STATUS} ), and support for the optional RAS Timestamp and RAS Common Fault Injection Model Extensions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_RASv1p1 implements the functionality identified by the value 0b0001.

This field is valid only if \( \text{ID\_AA64PFR0\_EL1\_RAS} == 0b0001 \).

### MTE, bits [11:8]

Support for the Memory Tagging Extension. Defined values are:

<table>
<thead>
<tr>
<th>MTE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Memory Tagging Extension is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Instruction-only Memory Tagging Extension is implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Full Memory Tagging Extension is implemented.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Memory Tagging Extension is implemented with support for asymmetric Tag Check Fault handling.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_MTE implements the functionality identified by the value 0b0001.

FEAT_MTE2 implements the functionality identified by the value 0b0010

FEAT_MTE3 implements the functionality identified by the value 0b0011.

In Armv8.5, the permitted values are 0b0000, 0b0001 and 0b0010.

From Armv8.7, the value 0b0001 is not permitted.

### SSBS, bits [7:4]

Speculative Store Bypasing controls in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>SSBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>AArch64 provides no mechanism to control the use of Speculative Store Bypasing.</td>
</tr>
<tr>
<td>0b0001</td>
<td>AArch64 provides the PSTATE.SBSB mechanism to mark regions that are Speculative Store Bypasing Safe.</td>
</tr>
<tr>
<td>0b0010</td>
<td>AArch64 provides the PSTATE.SBSB mechanism to mark regions that are Speculative Store Bypasing Safe, and the MSR and MRS instructions to directly read and write the PSTATE.SBSB field.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_SSBS implements the functionality identified by the value 0b0001.

FEAT_SSBS2 implements the functionality identified by the value 0b0010.
**BT, bits [3:0]**

Branch Target Identification mechanism support in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>BT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The Branch Target Identification mechanism is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The Branch Target Identification mechanism is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_BTI implements the functionality identified by the value 0b0001.

From Armv8.5, the only permitted value is 0b0001.

**Accessing the ID_AA64PFR1_EL1**

Accesses to this register use the following encodings:

```c
MRS <Xt>, ID_AA64PFR1_EL1
```

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b00</td>
<td>0b0000</td>
<td>0b1000</td>
<td>0b001</td>
</tr>
</tbody>
</table>

```c
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_AA64PFR1_EL1;
elsif PSTATE.EL == EL2 then
    return ID_AA64PFR1_EL1;
elsif PSTATE.EL == EL3 then
    return ID_AA64PFR1_EL1;
```

ID_AA64ZFR0_EL1, SVE Feature ID register 0

The ID_AA64ZFR0_EL1 characteristics are:

**Purpose**

Provides additional information about the implemented features of the AArch64 Scalable Vector Extension, when the ID_AA64PFR0_EL1.SVE field is not zero.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

**Note**

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

**Attributes**

ID_AA64ZFR0_EL1 is a 64-bit register.

**Field descriptions**

The ID_AA64ZFR0_EL1 bit assignments are:

```
  | 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
---|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
 RES0|  F64MM|  F32MM| RES0|  I8MM| RES0|  SVEver |
 RES0|  BF16| RES0| RES0| RES0| RES0|      |
 31 | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  |  9  |  8  |  7  |  6  |  5  |  4  |  3  |  2  |  1  |  0  |
```

Bits [63:60]

Reserved, RES0.

**F64MM, bits [59:56]**

Indicates support for SVE FP64 double-precision floating-point matrix multiplication instructions. Defined values are:

<table>
<thead>
<tr>
<th>F64MM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>FP64 matrix multiplication and related instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>FP64 variant of the FMMLA instruction, and LD1RO* instructions are implemented. The 128-bit element variations of TRN1, TRN2, UZP1, UZP2, ZIP1, and ZIP2 are also implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_F64MM implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.
### F32MM, bits [55:52]

Indicates support for the SVE FP32 single-precision floating-point matrix multiplication instruction. Defined values are:

<table>
<thead>
<tr>
<th>F32MM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>FP32 matrix multiplication instruction is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>FP32 variant of the FMMLA instruction is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_F32MM implements the functionality identified by 0b0001.

From Arm v8.2, the permitted values are 0b0000 and 0b0001.

### Bits [51:48]

Reserved, RES0.

### I8MM, bits [47:44]

Indicates support for SVE Int8 matrix multiplication instructions. Defined values are:

<table>
<thead>
<tr>
<th>I8MM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Int8 matrix multiplication instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SMMLA, SUDOT, UMMLA, USMMLA, and USDOT instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_I8MM implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as ID_AA64ISAR1_EL1.I8MM.

From Armv8.6, the only permitted value is 0b0001.

### Bits [43:24]

Reserved, RES0.

### BF16, bits [23:20]

Indicates support for SVE BFloat16 instructions. Defined values are:

<table>
<thead>
<tr>
<th>BF16</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>BFloat16 instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>BFCVT, BFCVTNT, BFDOT, BFMLALB, BFMLALT, and BFMLMA instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_BF16 implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as ID_AA64ISAR1_EL1.BF16.

From Armv8.6, the only permitted value is 0b0001.

### Bits [19:4]

Reserved, RES0.
**SVEver, bits [3:0]**

Indicates support for SVE version 2. Defined values are:

<table>
<thead>
<tr>
<th>SVEver</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SVE instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved. This field is valid only if the ID_AA64PFR0_EL1.SVE field is not zero.

**Accessing the ID_AA64ZFR0_EL1**

Accesses to this register use the following encodings:

**MRS <Xt>, ID_AA64ZFR0_EL1**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>

        return ID_AA64ZFR0_EL1;
```
**ID_AFR0_EL1, AArch32 Auxiliary Feature Register 0**

The ID_AFR0_EL1 characteristics are:

**Purpose**

Provides information about the IMPLEMENTATION DEFINED features of the PE in AArch32 state.

Must be interpreted with the Main ID Register, MIDR_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch64 System register ID_AFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_AFR0[31:0].

**Attributes**

ID_AFR0_EL1 is a 64-bit register.

**Field descriptions**

The ID_AFR0_EL1 bit assignments are:

**When AArch32 is supported at any Exception level:**

<table>
<thead>
<tr>
<th>Bits [63:16]</th>

<tr>
<td>0b0001</td>
<td>Armv8.4 Self-hosted Trace Extension implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_TRF implements the functionality added by the value 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

**PerfMon, bits [27:24]**

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'
Defined values are:

<table>
<thead>
<tr>
<th>PerfMon</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Performance Monitors Extension not implemented.</td>

<tr>
<td>0b1111</td>
<td>IMPLEMENTATION DEFINED form of performance monitors supported. PMUv3 not supported. Arm does not recommend this value for new implementations.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value 0b0011.

FEAT_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT_PMUv3p7 implements the functionality identified by the value 0b0111.

In any Armv8 implementation, the values 0b0001 and 0b0010 are not permitted.

From Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0011 is not permitted.

From Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.

From Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT_PMUv3 is implemented, the value 0b0110 is not permitted.

**Note**

In Armv7, the value 0b0000 can mean that PMUv1 is implemented. PMUv1 is not permitted in an Armv8 implementation.

**MProfDbg, bits [23:20]**

M Profile Debug. Support for memory-mapped debug model for M profile processors. Defined values are:

<table>
<thead>
<tr>
<th>MProfDbg</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for M profile Debug architecture, with memory-mapped access.</td>

</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.
MMapTrc, bits [19:16]

Memory Mapped Trace. Support for memory-mapped trace model. Defined values are:

<table>
<thead>
<tr>
<th>MMapTrc</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for Arm trace architecture, with memory-mapped access.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

See the ETM Architecture Specification for more information.

CopTrc, bits [15:12]

Support for System registers-based trace model, using registers in the coproc == 0b1110 encoding space. Defined values are:

<table>
<thead>
<tr>
<th>CopTrc</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for Arm trace architecture, with System registers access.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

See the ETM Architecture Specification for more information.

MMapDbg, bits [11:8]

Memory Mapped Debug. Support for v7 memory-mapped debug model, for A and R profile processors.

In Armv8-A, this field is RES0.

The optional memory map defined by Armv8 is not compatible with Armv7.

CopSDbg, bits [7:4]

Support for a System registers-based Secure debug model, using registers in the coproc = 0b1110 encoding space, for an A profile processor that includes EL3.

If EL3 is not implemented and the implemented Security state is Non-secure state, this field is RES0. Otherwise, this field reads the same as bits [3:0].

CopDbg, bits [3:0]

Support for System registers-based debug model, using registers in the coproc == 0b1110 encoding space, for A and R profile processors. Defined values are:
CopDbg | Meaning
---|---
0b0000 | Not supported.
0b0010 | Support for Armv6, v6 Debug architecture, with System registers access.
0b0011 | Support for Armv6, v6.1 Debug architecture, with System registers access.
0b0100 | Support for Armv7, v7 Debug architecture, with System registers access.
0b0101 | Support for Armv7, v7.1 Debug architecture, with System registers access.
0b0110 | Support for Armv8 debug architecture, with System registers access.
0b0111 | Support for Armv8 debug architecture, with System registers access, and Virtualization Host Extensions.
0b1000 | Support for Armv8.2 debug architecture.
0b1001 | Support for Armv8.4 debug architecture.

All other values are reserved.

FEAT_Debugv8p2 adds the functionality identified by the value 0b1000.

FEAT_Debugv8p4 adds the functionality identified by the value 0b1001.

In Armv8.0, the only permitted value is 0b0110.

In Armv8.1, the only permitted value is 0b0111.

In Armv8.2, the only permitted value is 0b1000.

From Armv8.4, the only permitted value is 0b1001.

**Otherwise:**

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
</tr>
<tr>
<td><strong>UNKNOWN</strong></td>
</tr>
</tbody>
</table>

**Bits [63:0]**

Reserved, UNKNOWN.

**Accessing the ID_DFR0_EL1**

Accesses to this register use the following encodings:

\[
\text{MRS } \langle Xt \rangle, \text{ ID_DFR0_EL1}
\]

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>

<td>0b0001</td>
<td>0b010</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_DFR0_EL1;
else if PSTATE.EL == EL2 then
    return ID_DFR0_EL1;
else if PSTATE.EL == EL3 then
    return ID_DFR0_EL1;
The ID_DFR1_EL1 characteristics are:

**Purpose**

Provides top level information about the debug system in AArch32.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch64 System register ID_DFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_DFR1[31:0].

**Note**

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

**Attributes**

ID_DFR1_EL1 is a 64-bit register.

**Field descriptions**

The ID_DFR1_EL1 bit assignments are:

**When AArch32 is supported at any Exception level:**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

**MTPMU, bits [3:0]**

Multi-threaded PMU extension. Defined values are:

<table>
<thead>
<tr>
<th>MTPMU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, it is IMPLEMENTATION DEFINED whether PMEVTYPER&lt;n&gt;.MT are read/write or RES0.</td>
</tr>
<tr>
<td>0b0001</td>
<td>FEAT_MTPMU and FEAT_PMUv3 implemented. PMEVTYPER&lt;n&gt;.MT are read/write. When FEAT_MTPMU is disabled, the Effective values of PMEVTYPER&lt;n&gt;.MT are 0.</td>
</tr>
<tr>
<td>0b1111</td>
<td>FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, PMEVTYPER&lt;n&gt;.MT are RES0.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_MTPMU implements the functionality identified by the value 0b0001.
From Armv8.6, in an implementation that includes FEAT_PMUv3, the value 0b0000 is not permitted. In an implementation that does not include FEAT_PMUv3, the value 0b0001 is not permitted.

**Otherwise:**

| Bits [63:0] | Reserved, UNKNOWN. |

### Accessing the ID_DFR1_EL1

Accesses to this register use the following encodings:

\[
\begin{array}{|c|c|c|c|c|}
\hline
\text{op0} & \text{op1} & \text{CRn} & \text{CRm} & \text{op2} \\
\hline
0b11 & 0b000 & 0b0000 & 0b0011 & 0b101 \\
\hline
\end{array}
\]

```plaintext
if PSTATE.EL == EL0 then
  if IsFeatureImplemented(FEAT_IDST) then
    if EL2Enabled() && HCR_EL2.TGE == '1' then
      AArch64.SystemAccessTrap(EL2, 0x18);
    else

  elsif PSTATE.EL == EL2 then
    return ID_DFR1_EL1;
  elsif PSTATE.EL == EL3 then
    return ID_DFR1_EL1;
```
The ID_ISAR0_EL1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with `ID_ISAR1_EL1`, `ID_ISAR2_EL1`, `ID_ISAR3_EL1`, `ID_ISAR4_EL1`, and `ID_ISAR5_EL1`.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch64 System register ID_ISAR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register `ID_ISAR0[31:0]`.

**Attributes**

ID_ISAR0_EL1 is a 64-bit register.

**Field descriptions**

The ID_ISAR0_EL1 bit assignments are:

**When AArch32 is supported at any Exception level:**

<table>
<thead>

</tr>
<tr>
<td>0b0100</td>
<td>As for 0b0011, and adds generic MCRR2 and MRRC2.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

### CmpBranch, bits [15:12]

Indicates the implemented combined Compare and Branch instructions in the T32 instruction set. Defined values are:

<table>
<thead>
<tr>
<th>CmpBranch</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds CBNZ and CBZ.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### BitField, bits [11:8]

Indicates the implemented BitField instructions. Defined values are:

<table>
<thead>
<tr>
<th>BitField</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>

</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### BitCount, bits [7:4]

Indicates the implemented Bit Counting instructions. Defined values are:

<table>
<thead>
<tr>
<th>BitCount</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds CLZ.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### Swap, bits [3:0]

Indicates the implemented Swap instructions in the A32 instruction set. Defined values are:
All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

### Otherwise:

<p>| | | | | | | | | | | | | | | | | |</p>

  elsif PSTATE.EL == EL2 then
    return ID_ISAR0_EL1;
  elsif PSTATE.EL == EL3 then
    return ID_ISAR0_EL1;
```
The ID_ISAR1_EL1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch64 System register ID_ISAR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR1[31:0].

**Attributes**

ID_ISAR1_EL1 is a 64-bit register.

**Field descriptions**

The ID_ISAR1_EL1 bit assignments are:

**When AArch32 is supported at any Exception level:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Jazelle | Interwork | Immediate | IfThen | Extend | Except AR | Except | Endian |

**Bits [63:32]**

Reserved, RES0.

**Jazelle, bits [31:28]**

Indicates the implemented Jazelle extension instructions. Defined values are:

<table>
<thead>
<tr>
<th>Jazelle</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No support for Jazelle.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the BXJ instruction and the J bit in the PSR. This setting might indicate a trivial implementation of the Jazelle extension.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**Interwork, bits [27:24]**

Indicates the implemented Interworking instructions. Defined values are:
## Interwork

<table>
<thead>
<tr>
<th>Interwork</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the BX instruction, and the T bit in the PSR.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the BLX instruction. PC loads have BX-like behavior.</td>
</tr>
<tr>
<td>0b0110</td>
<td>As for 0b0010, and guarantees that data-processing instructions in the A32 instruction set with the PC as the destination and the S bit clear have BX-like behavior.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0110.

## Immediate, bits [23:20]

Indicates the implemented data-processing instructions with long immediates. Defined values are:

<table>
<thead>
<tr>
<th>Immediate</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
</tbody>
</table>
| 0b0001    | Adds:  
  - The MOVT instruction.  
  - The MOV instruction encodings with zero-extended 16-bit immediates.  
  - The T32 ADD and SUB instruction encodings with zero-extended 12-bit immediates, and the other ADD, ADR, and SUB encodings cross-referenced by the pseudocode for those encodings. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

## IfThen, bits [19:16]

Indicates the implemented If-Then instructions in the T32 instruction set. Defined values are:

<table>
<thead>
<tr>
<th>IfThen</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the IT instructions, and the IT bits in the PSRs.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

## Extend, bits [15:12]

Indicates the implemented Extend instructions. Defined values are:

<table>
<thead>
<tr>
<th>Extend</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No scalar sign-extend or zero-extend instructions are implemented, where scalar instructions means non-Advanced SIMD instructions.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SXTB, SXTH, UXTB, and UXTH instructions.</td>
</tr>
<tr>
<td>0b0100</td>
<td>As for 0b0001, and adds the SXTB16, SXTAB, SXTAB16, SXTAH, UXTOB16, UXTOB, UXTOB16, and UXTOAH instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

## Except_AR, bits [11:8]

Indicates the implemented A and R profile exception-handling instructions. Defined values are:
Except, bits [7:4]

Indicates the implemented exception-handling instructions in the A32 instruction set. Defined values are:

<table>
<thead>
<tr>
<th>Except</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented. This indicates that the User bank and Exception return forms of the LDM and STM instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the LDM (exception return), LDM (user registers), and STM (user registers) instruction versions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Endian, bits [3:0]
