TTBR1, Translation Table Base Register 1

The TTBR1 characteristics are:

**Purpose**

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the PL1&0 translation regime, and other information for this translation regime.

**Configuration**

AArch32 System register TTBR1 bits [63:0] are architecturally mapped to AArch64 System register TTBR1_EL1[63:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TTBR1 are UNDEFINED.

TTBR1 is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

**TTBCR** EAE determines which TTBR1 format is used:

- **TTBCR** EAE == 0b0: 32-bit format is used. TTBR1[63:32] are ignored.
- **TTBCR** EAE == 0b1: 64-bit format is used.

Used in conjunction with the **TTBCR**. When the 64-bit TTBR1 format is used, cacheability and shareability information is held in the TTBCR, not in TTBR1.

**Attributes**

TTBR1 is a 64-bit register.

**Field descriptions**

The TTBR1 bit assignments are:

**When TTBCR.EAE == 0:**

<table>

<td></td>
</tr>
<tr>
<td>32</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**TTB1, bits [31:7]**

Translation table base address, bits[31:14]. Register bits [13:7] are RES0, with the additional requirement that if these bits are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [13:7] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
IRGN, bits [6, 0]

Inner region bits. IRGN[1:0] indicate the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

<table>
<thead>
<tr>
<th>IRGN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>01</td>
<td>Normal memory, Inner Write-Back Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>10</td>
<td>Normal memory, Inner Write-Through Cacheable.</td>
</tr>
<tr>
<td>11</td>
<td>Normal memory, Inner Write-Back no Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

Note

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for Armv7 without the Multiprocessing Extensions can run unmodified on an implementation that includes the functionality introduced by the ARMv7 Multiprocessing Extensions.

The IRGN field is split as follows:

- IRGN[1] is TTBR1[6].
- IRGN[0] is TTBR1[0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

NOS, bit [5]

Not Outer Shareable. When the value of TTBR1.S is 1, indicates whether the memory associated with a translation table walk is Inner Shareable or Outer Shareable:

<table>
<thead>
<tr>
<th>NOS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Memory is Outer Shareable.</td>
</tr>
<tr>
<td>01</td>
<td>Memory is Inner Shareable.</td>
</tr>
</tbody>
</table>

This bit is ignored when the value of TTBR1.S is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

RGN, bits [4:3]

Region bits. Indicates the Outer cacheability attributes for the memory associated with the translation table walks:

<table>
<thead>
<tr>
<th>RGN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>01</td>
<td>Normal memory, Outer Write-Back Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>10</td>
<td>Normal memory, Outer Write-Through Cacheable.</td>
</tr>
<tr>
<td>11</td>
<td>Normal memory, Outer Write-Back no Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMP, bit [2]

The effect of this bit is IMPLEMENTATION DEFINED. If the translation table implementation does not include any IMPLEMENTATION DEFINED features this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [1]

Shareable. Indicates whether the memory associated with the translation table walks is Non-shareable:
Meaning

<table>
<thead>
<tr>
<th>S</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Memory is Non-shareable.</td>
</tr>
<tr>
<td>0b1</td>
<td>Memory is shareable. The TTBR1.NOS field indicates whether the memory is Inner Shareable or Outer Shareable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### When TTBCR.EAE == 1:

<table>
<thead>
<tr>
<th>Bits</th>
<th>63:56</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>55:48</td>
<td>ASID, bits</td>
</tr>
<tr>
<td></td>
<td>47:1</td>
<td>BADDR, bits</td>
</tr>
<tr>
<td></td>
<td></td>
<td>CnP</td>
</tr>
</tbody>
</table>

#### Bits [63:56]

Reserved, RES0.

#### ASID, bits [55:48]

An ASID for the translation table base address. The TTBCR.A1 field selects either TTBR0.ASID or TTBR1.ASID.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

#### BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are **CONSTRAINED UNPREDICTABLE**, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of TTBCR.T1SZ as follows:

- If TTBCR.T1SZ is 0 or 1, x = 5 - TTBCR.T1SZ.
- If TTBCR.T1SZ is greater than 1, x = 14 - TTBCR.T1SZ.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

#### CnP, bit [0]

**When FEAT_TTCNP is implemented:**

Common not Private. When TTBCR.EAE == 1, this bit indicates whether each entry that is pointed to by TTBR1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1.CnP is 1.
### CnP

<table>
<thead>
<tr>
<th>Meaning</th>
<th>CnP</th>
</tr>
</thead>
<tbody>
<tr>
<td>The translation table entries pointed to by this instance of TTBR1, for the current ASID, are permitted to differ from corresponding entries for this instance of TTBR1 for other PEs in the Inner Shareable domain. This is not affected by:</td>
<td></td>
</tr>
<tr>
<td>• The value of TTBR1.CnP on those other PEs.</td>
<td></td>
</tr>
<tr>
<td>• The value of TTBCR.EAE on those other PEs.</td>
<td></td>
</tr>
<tr>
<td>• The value of the current ASID or, for the Non-secure instance of TTBR1, the value of the current VMID.</td>
<td></td>
</tr>
<tr>
<td>The translation table entries pointed to by this instance of TTBR1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1.CnP is 1 for this instance of TTBR1 and all of the following apply:</td>
<td></td>
</tr>
<tr>
<td>• The translation table entries are pointed to by this instance of TTBR1.</td>
<td></td>
</tr>
<tr>
<td>• The value of the applicable TTBCR.EAE field is 1.</td>
<td></td>
</tr>
<tr>
<td>• The ASID is the same as the current ASID.</td>
<td></td>
</tr>
<tr>
<td>• For the Non-secure instance of TTBR1, the VMID is the same as the current VMID.</td>
<td></td>
</tr>
</tbody>
</table>

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

### Note

If the value of the TTBR1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see ‘CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values’.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Otherwise:

Reserved, RES0.

### Accessing the TTBR1

Accesses to this register use the following encodings:

```
MRC{<c>{<q>}} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>

VBAR, Vector Base Address Register

The VBAR characteristics are:

**Purpose**

When high exception vectors are not selected, holds the vector base address for exceptions that are not taken to Monitor mode or to Hyp mode.

Software must program VBAR(NS) with the required initial value as part of the PE boot sequence.

**Configuration**

AArch32 System register VBAR bits [31:0] are architecturally mapped to AArch64 System register VBAR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to VBAR are UNDEFINED.

**Attributes**

VBAR is a 32-bit register.

**Field descriptions**

The VBAR bit assignments are:

VDFSR, Virtual SError Exception Syndrome Register

The VDFSR characteristics are:

**Purpose**

Provides the syndrome value reported to software on taking a virtual SError interrupt exception to EL1, or on executing an ESB instruction at EL1.

When a virtual SError interrupt is taken, the syndrome value is reported in DFRS (AET, ExT) and the remainder of the DFRS is set as defined by VMSAv8-32. For more information, see 'The AArch32 Virtual Memory System Architecture'.

If the virtual SError interrupt is deferred by an ESB instruction, then the syndrome value is written to VDISR.

**Configuration**

AArch32 System register VDFSR bits [31:0] are architecturally mapped to AArch64 System register VSESR_EL2[31:0] when the highest implemented Exception level is using AArch64.

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to VDFSR are UNDEFINED.

If EL2 is not implemented, then VDFSR is res0 from Monitor mode when SCR.NS == 1.

**Attributes**

VDFSR is a 32-bit register.

**Field descriptions**

The VDFSR bit assignments are:

<table>
<thead>
<tr>
<th>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0  AET  RES0ExT  RES0</td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**AET, bits [15:14]**

When a virtual SError interrupt is taken to EL1 using AArch32, DFRS[15:4] is set to VDFSR.AET.
When a virtual SError interrupt is deferred by an ESB instruction, VDISR[15:4] is set to VDFSR.AET.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [13]**

Reserved, RES0.

**ExT, bit [12]**

When a virtual SError interrupt is taken to EL1 using AArch32, DFRS[12] is set to VDFSR.ExT.
When a virtual SError interrupt is deferred by an ESB instruction, VDISR[12] is set to VDFSR.ExT.
On a Warm reset, this field resets to an architecturally UNKNOWN value.
Bits [11:0]  
Reserved, RES0.

**Accessing the VDFSR**

Direct reads and writes of VDFSR are **UNDEFINED** if EL3 is implemented and using AArch32 in all Secure privileged modes other than Monitor mode.

If EL2 is not implemented, then VDFSR is **RES0** from Monitor mode when SCR.NS == 1.

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

**VDISR, Virtual Deferred Interrupt Status Register**

The VDISR characteristics are:

**Purpose**

Records that an SError interrupt has been consumed by an ESB instruction.

**Configuration**

AArch32 System register VDISR bits [31:0] are architecturally mapped to AArch64 System register VDISR_EL2[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to VDISR are UNDEFINED.

If EL2 is not implemented, then VDISR is RES0 from Monitor mode when SCR.NS == 1.

**Attributes**

VDISR is a 32-bit register.

**Field descriptions**

The VDISR bit assignments are:

**When TTBCR.EAE == 0:**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>

</tbody>
</table>

A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from VDFSR.AET.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

The value copied from VDFSR.ExT.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Bit [11]

Reserved, RES0.

FS, bits [10, 3:0]

Fault status code. Set to 0b10110 when an ESB instruction defers a virtual SError interrupt.

<table>
<thead>
<tr>
<th>FS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10110</td>
<td>Asynchronous SError interrupt.</td>
</tr>
</tbody>
</table>

All other values are reserved.

The FS field is split as follows:

- FS[4] is VDISR[10].
- FS[3:0] is VDISR[3:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

Format.

Set to TTBCR.EAE when an ESB instruction defers a virtual SError interrupt.

<table>
<thead>
<tr>
<th>LPAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Using the Short-descriptor translation table format.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:4]

Reserved, RES0.

When TTBCR.EAE == 1:

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |
|---------------------------------------------|--|-----------------|--|-----------------|--|-----------------|--|-----------------|--|-----------------|--|-----------------|--|

A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from VDFSRAET.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.
ExT, bit [12]

The value copied from VDFSR.ExT.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

LPAE, bit [9]

Format.
Set to TTBCR.EAE when an ESB instruction defers a virtual SError interrupt.

<table>
<thead>
<tr>
<th>LPAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>Using the Long-descriptor translation table format.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status code. Set to 0b010001 when an ESB instruction defers a virtual SError interrupt.

<table>
<thead>
<tr>
<th>STATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b010001</td>
<td>Asynchronous SError interrupt.</td>
</tr>
</tbody>
</table>

All other values are reserved.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the VDISR

Direct reads and writes of VDFSR are UNDEFINED if EL3 is implemented and using AArch32 in all Secure privileged modes other than Monitor mode.

An indirect write to VDISR made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of DISR occurring in program order after the ESB instruction.

If EL2 is not implemented, then VDISR is RES0 from Monitor mode when SCR.NS == 1.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}\{<q>\} <\text{coproc}>, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#\}<\text{opc2}>

**VMPIDR, Virtualization Multiprocessor ID Register**

The VMPIDR characteristics are:

**Purpose**

Holds the value of the Virtualization Multiprocessor ID. This is the value returned by Non-secure EL1 reads of MPIDR.

**Configuration**

AArch32 System register VMPIDR bits [31:0] are architecturally mapped to AArch64 System register VMPIDR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to VMPIDR are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, this register takes the value of the MPIDR.

**Attributes**

VMPIDR is a 32-bit register.

**Field descriptions**

The VMPIDR bit assignments are:

<table>
<thead>
<tr>
<th></th>
<th>M</th>
<th>U</th>
<th>RES0</th>
<th>MT</th>
<th>Aff2</th>
<th>Aff1</th>
<th>Aff0</th>
</tr>
</thead>
<tbody>
<tr>

<td>3</td>
<td>2</td>
</tr>
<tr>
<td>0</td>
<td></td>
<td></td>
<td></td>
<td>1</td>
<td>0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**M, bit [31]**

Indicates whether this implementation includes the functionality introduced by the ARMv7 Multiprocessing Extensions. The possible values of this bit are:

<table>
<thead>
<tr>
<th>M</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This implementation does not include the ARMv7 Multiprocessing Extensions functionality.</td>
</tr>
<tr>
<td>0b1</td>
<td>This implementation includes the ARMv7 Multiprocessing Extensions functionality.</td>
</tr>
</tbody>
</table>

From Armv8 this bit is RES1.

**U, bit [30]**

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. The possible values of this bit are:

<table>
<thead>
<tr>
<th>U</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Processor is part of a multiprocessor system.</td>
</tr>
<tr>
<td>0b1</td>
<td>Processor is part of a uniprocessor system.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in MPIDR.U.

**Bits [29:25]**

Reserved, RES0.
MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of Aff0 for more information about affinity levels. The possible values of this bit are:

<table>
<thead>
<tr>
<th>MT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Performance of PEs at the lowest affinity level is largely independent.</td>
</tr>
<tr>
<td>0b1</td>
<td>Performance of PEs at the lowest affinity level is very interdependent.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in MPIDR.MT.

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in MPIDR.Aff2.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in MPIDR.Aff1.

Aff0, bits [7:0]

Affinity level 0. This is the affinity level that is most significant for determining PE behavior. Higher affinity levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in MPIDR.Aff0.

Accessing the VMPIDR

Accesses to this register use the following encodings:

\[

VPI DR, Virtualization Processor ID Register

The VPI DR characteristics are:

Purpose

Holds the value of the Virtualization Processor ID. This is the value returned by Non-secure EL1 reads of MIDR.

Configuration

AArch32 System register VPI DR bits [31:0] are architecturally mapped to AArch64 System register VPI DR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to VPI DR are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, this register takes the value of the MIDR.

Attributes

VPI DR is a 32-bit register.

Field descriptions

The VPI DR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Implementer | Variant | Architecture | PartNum | Revision |

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

<table>
<thead>
<tr>
<th>Hex representation</th>
<th>ASCII representation</th>
<th>Implementer</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x41</td>
<td>A</td>
<td>Arm Limited</td>
</tr>
<tr>
<td>0x42</td>
<td>B</td>
<td>Broadcom Corporation</td>
</tr>
<tr>
<td>0x43</td>
<td>C</td>
<td>Cavium Inc.</td>
</tr>
<tr>
<td>0x44</td>
<td>D</td>
<td>Digital Equipment Corporation</td>
</tr>
<tr>
<td>0x49</td>
<td>I</td>
<td>Infineon Technologies AG</td>
</tr>
<tr>
<td>0x40</td>
<td>M</td>
<td>Motorola or Freescale Semiconductor Inc.</td>
</tr>
<tr>
<td>0x4E</td>
<td>N</td>
<td>NVIDIA Corporation</td>
</tr>
<tr>
<td>0x50</td>
<td>P</td>
<td>Applied Micro Circuits Corporation</td>
</tr>
<tr>
<td>0x51</td>
<td>Q</td>
<td>Qualcomm Inc.</td>
</tr>
<tr>
<td>0x56</td>
<td>V</td>
<td>Marvell International Ltd.</td>
</tr>
<tr>
<td>0x69</td>
<td>i</td>
<td>Intel Corporation</td>
</tr>
</tbody>
</table>

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in MIDR. Implementer.

Variant, bits [23:20]

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.
On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in MIDR.Variant.

**Architecture, bits [19:16]**

Architecture version. Defined values are:

<table>
<thead>
<tr>
<th>Architecture</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>Armv4.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Armv4T.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Armv5 (obsolete).</td>
</tr>
<tr>
<td>0b0100</td>
<td>Armv5T.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Armv5TE.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Armv5TEJ.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Armv6.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Architectural features are individually identified in the ID.* registers, see ‘ID registers’.</td>
</tr>
</tbody>
</table>

All other values are reserved.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in MIDRArchitecture.

**PartNum, bits [15:4]**

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in MIDR.PartNum.

**Revision, bits [3:0]**

An IMPLEMENTATION DEFINED revision number for the device.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in MIDR.Revision.

**Accessing the VPIDR**

Accesses to this register use the following encodings:

\[
\text{MRC\{<c>\}{<q}> <coproc>, \{#<opc1>, <Rt>, <CRn>, <CRm>\}, \{#<opc2>\}}
\]

\[

VTCR, Virtualization Translation Control Register

The VTCR characteristics are:

**Purpose**

The control register for stage 2 of the Non-secure PL1&0 translation regime.

**Note**

This stage of translation always uses the Long-descriptor translation table format.

**Configuration**

AArch32 System register VTCR bits [31:0] are architecturally mapped to AArch64 System register VTCR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to VTCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

VTCR is a 32-bit register.

**Field descriptions**

The VTCR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES1 | RES0 | HWU62 | HWU61 | HWU60 | HWU59 | RES0 | SH0 | ORGN0 | RGNO | SL0 | RES0 | S | T0SZ |

**Bit [31]**

Reserved, RES1.

**Bits [30:29]**

Reserved, RES0.

**HWU62, bit [28]**

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 2 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU62</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[62] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[62] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

**HWU61, bit [27]**

*When FEAT_HPDS2 is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 2 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU61</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[61] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[61] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

**HWU60, bit [26]**

*When FEAT_HPDS2 is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 2 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU60</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[60] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[60] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

**HWU59, bit [25]**

*When FEAT_HPDS2 is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 2 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU59</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[59] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[59] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

Bits [24:14]

Reserved, RES0.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using VTTBR.

<table>
<thead>
<tr>
<th>SH0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using VTTBR.

<table>
<thead>
<tr>
<th>ORGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using VTTBR.

<table>
<thead>
<tr>
<th>IRGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

SL0, bits [7:6]

Starting level for translation table walks using VTTBR.

<table>
<thead>
<tr>
<th>SL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Start at level 2</td>
</tr>
<tr>
<td>0b01</td>
<td>Start at level 1</td>
</tr>
</tbody>
</table>

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of T0SZ, then a stage 2 level 1 Translation fault is generated.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Bit [5]
Reserved, RES0.

S, bit [4]
Sign extension bit. This bit must be programmed to the value of T0SZ[3]. If it is not, then the behavior is CONSTRAINED UNPREDICTABLE and the stage 2 T0SZ value is treated as an UNKNOWN value, see 'Misprogramming VTCR.S'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

T0SZ, bits [3:0]
The size offset of the memory region addressed by VTTBR. The region size is $2^{(32-T0SZ)}$ bytes.

This field holds a four-bit signed integer value, meaning it supports values from -8 to 7.

Note
This is different from the other translation control registers, where TnSZ holds a three-bit unsigned integer, supporting values from 0 to 7.

If this field is programmed to a value that is not consistent with the programming of SL0 then a stage 2 level 1 Translation fault is generated.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the VTCR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

  if SCR.NS == '0' then
    UNDEFINED;
  else
    VTCR = R[t];
VTTBR, Virtualization Translation Table Base Register

The VTTBR characteristics are:

**Purpose**

Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the Non-secure PL1&0 translation regime, and other information for this translation regime.

**Configuration**

AArch32 System register VTTBR bits [63:0] are architecturally mapped to AArch64 System register \texttt{VTTBR_EL2[63:0]}.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to VTTBR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

VTTBR is a 64-bit register.

**Field descriptions**

The VTTBR bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | VMID | BADDR | CnP |

Bits [63:56]

Reserved, RES0.

VMID, bits [55:48]

The VMID for the translation table.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of \texttt{VTCR.SL0} and \texttt{VTCR.T0SZ} as follows:

- If \texttt{VTCR.SL0} is 0b00, meaning that lookup starts at level 2, then x is 14 - \texttt{VTCR.T0SZ}.
- If \texttt{VTCR.SL0} is 0b01, meaning that lookup starts at level 1, then x is 5 - \texttt{VTCR.T0SZ}.
- If \texttt{VTCR.SL0} is either 0b10 or 0b11 then a stage 2 level 1 Translation fault is generated.
If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

**CnP, bit [0]**

**When FEAT_TTCNP is implemented:**

Common not Private. This bit indicates whether each entry that is pointed to by VTTBR is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VTTBR.CnP is 1.

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The translation table entries pointed to by VTTBR are permitted to differ from the entries for VTTBR for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.</td>
</tr>
<tr>
<td>0b1</td>
<td>The translation table entries pointed to by VTTBR are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VTTBR.CnP is 1 and the VMID is the same as the current VMID.</td>
</tr>
</tbody>
</table>

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

**Note**

If the value of the VTTBR.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VTTBRs do not point to the same translation table entries when the VMID value is the same as the current VMID, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Accessing the VTTBR**

Accesses to this register use the following encodings:

\[
\text{MRRC}\{<c>\}\{<q>\} \ <\text{coproc}\>, \{#\}<\text{opc1}\>, \ <\text{Rt}\>, \ <\text{Rt2}\>, \ <\text{CRm}\>
\]

# System Register index by instruction and encoding

Below are indexes for registers and operations accessed in the following ways:

For AArch32

- MCR/MRC
- MCRR/MRRC
- MRS/MSR
- VMRS/VMSR

For AArch64

- AT
- CFP
- CPP
- DC
- DVP
- IC
- MRS/MSR
- TLBI

## Registers and operations in AArch32

### Accessed using MCR/MRC:

# System Register index by functional group

Below are indexes for registers with the following main functional groups:

- **ID**
- **Memory**
- **Other**
- **Exception**
- **PSTATE**
- **Cache**
- **Address**
- **TLB**
- **PMU**
- **Reset**
- **Thread**
- **IMP DEF**
- **Timer**
- **Debug**
- **CTI**
- **Virt**
- **Secure**
- **Float**
- **Legacy**
- **GIC**
- **GICD**
- **GICC**
- **GICR**
- **GICH**
- **GICV**
- **GITS**
- **RAS**
- **MPAM**
- **Pointer authentication**
- **AMU**
- **GIC ITS registers**

## In the ID functional group:

### System Register index by functional group

#### Exec state | Name | Description
--- | --- | ---
AArch32 | MIDR | Main ID Register
AArch32 | MPIDR | Multiprocessor Affinity Register
AArch32 | REVIDR | Revision ID Register
AArch32 | TCMTR | TCM Type Register
AArch32 | TLBTR | TLB Type Register
AArch64 | CCSIDR2_EL1 | Current Cache Size ID Register 2
AArch64 | CCSIDR_EL1 | Current Cache Size ID Register
AArch64 | CLIDR_EL1 | Cache Level ID Register
AArch64 | CSSEL_EL1 | Cache Size Selection Register
AArch64 | CTR_EL0 | Cache Type Register
AArch64 | DCZID_EL0 | Data Cache Zero ID register
AArch64 | GMID_EL1 | Multiple tag transfer ID register
AArch64 | ID AA64AFR0_EL1 | AArch64 Auxiliary Feature Register 0
AArch64 | ID AA64AFR1_EL1 | AArch64 Auxiliary Feature Register 1
AArch64 | ID AA64DFR0_EL1 | AArch64 Debug Feature Register 0
AArch64 | ID AA64DFR1_EL1 | AArch64 Debug Feature Register 1
AArch64 | ID AA64ISAR0_EL1 | AArch64 Instruction Set Attribute Register 0
AArch64 | ID AA64ISAR1_EL1 | AArch64 Instruction Set Attribute Register 1
AArch64 | ID AA64ISAR2_EL1 | AArch64 Instruction Set Attribute Register 2
AArch64 | ID AA64MMFR0_EL1 | AArch64 Memory Model Feature Register 0
AArch64 | ID AA64MMFR1_EL1 | AArch64 Memory Model Feature Register 1
AArch64 | ID AA64MMFR2_EL1 | AArch64 Memory Model Feature Register 2
AArch64 | ID AA64PFRO_EL1 | AArch64 Processor Feature Register 0
AArch64 | ID AA64PFR1_EL1 | AArch64 Processor Feature Register 1
AArch64 | ID AA64ZFR0_EL1 | SVE Feature ID register 0
AArch64 | ID AFRO_EL1 | AArch32 Auxiliary Feature Register 0
AArch64 | ID DFR0_EL1 | AArch32 Debug Feature Register 0
AArch64 | ID DFR1_EL1 | Debug Feature Register 1
AArch64 | ID ISAR0_EL1 | AArch32 Instruction Set Attribute Register 0
AArch64 | ID ISAR1_EL1 | AArch32 Instruction Set Attribute Register 1
AArch64 | ID ISAR2_EL1 | AArch32 Instruction Set Attribute Register 2
AArch64 | ID ISAR3_EL1 | AArch32 Instruction Set Attribute Register 3
AArch64 | ID ISAR4_EL1 | AArch32 Instruction Set Attribute Register 4
AArch64 | ID ISAR5_EL1 | AArch32 Instruction Set Attribute Register 5
AArch64 | ID ISAR6_EL1 | AArch32 Instruction Set Attribute Register 6
AArch64 | ID MMFR0_EL1 | AArch32 Memory Model Feature Register 0
AArch64 | ID MMFR1_EL1 | AArch32 Memory Model Feature Register 1
AArch64 | ID MMFR2_EL1 | AArch32 Memory Model Feature Register 2
AArch64 | ID MMFR3_EL1 | AArch32 Memory Model Feature Register 3
AArch64 | ID MMFR4_EL1 | AArch32 Memory Model Feature Register 4
AArch64 | ID MMFR5_EL1 | AArch32 Memory Model Feature Register 5
AArch64 | ID PFR0_EL1 | AArch32 Processor Feature Register 0
AArch64 | ID PFR1_EL1 | AArch32 Processor Feature Register 1
AArch64 | ID PFR2_EL1 | AArch32 Processor Feature Register 2
AArch64 | MIDR_EL1 | Main ID Register
AArch64 | MPAMIDR_EL1 | MPAM ID Register (EL1)
AArch64 | MPIDR_EL1 | Multiprocessor Affinity Register
AArch64 | REVIDR_EL1 | Revision ID Register
External | EDA32PF | External Debug Auxiliary Processor Feature Register
External | EDDR | External Debug Feature Register
External | EDPR | External Debug Processor Feature Register
External | MIDR_EL1 | Main ID Register

AMCFGR, Activity Monitors Configuration Register

The AMCFGR characteristics are:

**Purpose**

Global configuration register for the activity monitors.

Provides information on supported features, the number of counter groups implemented, the total number of activity monitor event counters implemented, and the size of the counters. AMCFGR is applicable to both the architected and the auxiliary counter groups.

**Configuration**

External register AMCFGR bits [31:0] are architecturally mapped to AArch64 System register AMCFGR_EL0[31:0].

External register AMCFGR bits [31:0] are architecturally mapped to AArch32 System register AMCFGR[31:0].

The power domain of AMCFGR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCFGR are RES0.

**Attributes**

AMCFGR is a 32-bit register.

**Field descriptions**

The AMCFGR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-28</td>
<td>NCG</td>
<td>Defines the number of counter groups. The number of implemented counter groups is defined as [AMCFGR,NCG + 1]. If the number of implemented auxiliary activity monitor event counters is zero, this field has a value of 0b0000. Otherwise, this field has a value of 0b0001.</td>
</tr>
<tr>
<td>27-25</td>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>24</td>
<td>HDBG</td>
<td>Halt-on-debug supported. From Armv8, this feature must be supported, and so this bit is 0b1.</td>
</tr>
<tr>
<td>23-20</td>
<td>RAZ</td>
<td>Reservation.</td>
</tr>
<tr>
<td>19-16</td>
<td>SIZE</td>
<td>Size.</td>
</tr>
<tr>

<td></td>
<td></td>
</tr>
<tr>
<td>9-5</td>
<td></td>
<td></td>
</tr>
<tr>
<td>4-0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**NCG, bits [31:28]**

Defines the number of counter groups.

The number of implemented counter groups is defined as [AMCFGR,NCG + 1].

If the number of implemented auxiliary activity monitor event counters is zero, this field has a value of 0b0000. Otherwise, this field has a value of 0b0001.

**Bits [27:25]**

Reserved, RES0.

**HDBG, bit [24]**

Halt-on-debug supported.

From Armv8, this feature must be supported, and so this bit is 0b1.

<table>
<thead>
<tr>
<th>HDBG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>AMCR,HDBG is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>AMCR,HDBG is read/write.</td>
</tr>
</tbody>
</table>
Bits [23:14]

Reserved, RAZ.

SIZE, bits [13:8]

Defines the size of activity monitor event counters.

The size of the activity monitor event counters implemented by the Activity Monitors Extension is defined as [AMCFGR.SIZE + 1].

From Armv8, the counters are 64-bit, and so this field is 0b111111.

---

**Note**

Software also uses this field to determine the spacing of counters in the memory-map. From Armv8, the counters are at doubleword-aligned addresses.

---

N, bits [7:0]

Defines the number of activity monitor event counters.

The total number of counters implemented in all groups by the Activity Monitors Extension is defined as [AMCFGR.N + 1].

### Accessing the AMCFGR

**AMCFGR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xE00</td>
<td>AMCFGR</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
The AMCGCR characteristics are:

**Purpose**

Provides information on the number of activity monitor event counters implemented within each counter group.

**Configuration**

External register AMCGCR bits [31:0] are architecturally mapped to AArch64 System register `AMCGCR_EL0[31:0]`. External register AMCGCR bits [31:0] are architecturally mapped to AArch32 System register `AMCGCR[31:0]`. The power domain of AMCGCR is IMPLEMENTATION DEFINED. This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCGCR are RES0.

**Attributes**

AMCGCR is a 32-bit register.

**Field descriptions**

The AMCGCR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>31</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**CG1NC, bits [15:8]**

Counter Group 1 Number of Counters. The number of counters in the auxiliary counter group.

In an implementation that includes FEAT_AMUv1, the permitted range of values is 0 to 16.

**CG0NC, bits [7:0]**

Counter Group 0 Number of Counters. The number of counters in the architected counter group.

In an implementation that includes FEAT_AMUv1, the value of this field is 4.

**Accessing the AMCGCR**

AMCGCR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xCE0</td>
<td>AMCGCR</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
AMCIDR0, Activity Monitors Component Identification Register 0

The AMCIDR0 characteristics are:

**Purpose**

Provides information to identify an activity monitors component.

For more information, see 'About the Component identification scheme'.

**Configuration**

The power domain of AMCIDR0 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMCIDR0 is a 32-bit register.

**Field descriptions**

The AMCIDR0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | PRMBL_0 |

**Bits [31:8]**

Reserved, RES0.

**PRMBL_0, bits [7:0]**

Preamble.

Reads as 0x0D.

**Accessing the AMCIDR0**

AMCIDR0 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFF0</td>
<td>AMCIDR0</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
AMCIDR1, Activity Monitors Component Identification Register 1

The AMCIDR1 characteristics are:

**Purpose**

Provides information to identify an activity monitors component.

For more information, see 'About the Component identification scheme'.

**Configuration**

The power domain of AMCIDR1 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMCIDR1 is a 32-bit register.

**Field descriptions**

The AMCIDR1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | CLASS | PRMBL_1 |

**Bits [31:8]**

Reserved, RES0.

**CLASS, bits [7:4]**

Component class.

<table>
<thead>
<tr>
<th>CLASS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1001</td>
<td>CoreSight component.</td>
</tr>
</tbody>
</table>

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

**PRMBL_1, bits [3:0]**

Preamble.

Reads as 0b0000.
Accessing the AMCIDR1

AMCIDR1 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFF4</td>
<td>AMCIDR1</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
AMCIDR2, Activity Monitors Component Identification Register 2

The AMCIDR2 characteristics are:

**Purpose**

Provides information to identify an activity monitors component.

For more information, see 'About the Component identification scheme'.

**Configuration**

The power domain of AMCIDR2 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMCIDR2 is a 32-bit register.

**Field descriptions**

The AMCIDR2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30-8</td>
<td>PRMBL_2</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_2, bits [7:0]**

Preamble.

Reads as 0x05.

**Accessing the AMCIDR2**

**AMCIDR2 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFF8</td>
<td>AMCIDR2</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
AMCIDR3, Activity Monitors Component Identification Register 3

The AMCIDR3 characteristics are:

**Purpose**

Provides information to identify an activity monitors component.

For more information, see 'About the Component identification scheme'.

**Configuration**

The power domain of AMCIDR3 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMCIDR3 is a 32-bit register.

**Field descriptions**

The AMCIDR3 bit assignments are:

<table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_3, bits [7:0]**

Preamble.

Reads as 0xB1.

**Accessing the AMCIDR3**

**AMCIDR3 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFFC</td>
<td>AMCIDR3</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
AMCNTENCLR0, Activity Monitors Count Enable Clear Register 0

The AMCNTENCLR0 characteristics are:

Purpose

Disable control bits for the architected s event counters, AMEVCTR0<n>.

Configuration

External register AMCNTENCLR0 bits [31:0] are architecturally mapped to AArch64 System register
AMCNTENCLR0_EL0[31:0].

External register AMCNTENCLR0 bits [31:0] are architecturally mapped to AArch32 System register
AMCNTENCLR0[31:0].

The power domain of AMCNTENCLR0 is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR0 are
RES0.

Attributes

AMCNTENCLR0 is a 32-bit register.

Field descriptions

The AMCNTENCLR0 bit assignments are:

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>bit [n], for n = 31 to 0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Activity monitor event counter disable bit for AMEVCTR0&lt;n&gt;.</td>
</tr>
<tr>
<td></td>
<td>Bits [31:N] are RAZ/WI. N is the value in AMCGCR.CG0NC.</td>
</tr>
<tr>
<td></td>
<td>Possible values of each bit are:</td>
</tr>
<tr>
<td>0b0</td>
<td>When read, means that AMEVCTR0&lt;n&gt; is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that AMEVCTR0&lt;n&gt; is enabled. When written, disables AMEVCTR0&lt;n&gt;.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.

Accessing the AMCNTENCLR0

AMCNTENCLR0 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xC20</td>
<td>AMCNTENCLR0</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
AMCNTENCLR1, Activity Monitors Count Enable Clear Register 1

The AMCNTENCLR1 characteristics are:

Purpose

Disable control bits for the auxiliary activity monitors event counters, AMEVCNTR1<n>.

Configuration

External register AMCNTENCLR1 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENCLR1_EL0[31:0].

External register AMCNTENCLR1 bits [31:0] are architecturally mapped to AArch32 System register AMCNTENCLR1[31:0].

The power domain of AMCNTENCLR1 is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR1 are RES0.

Attributes

AMCNTENCLR1 is a 32-bit register.

Field descriptions

The AMCNTENCLR1 bit assignments are:

|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |ayy

P<n>, bit [n], for n = 31 to 0

Activity monitor event counter disable bit for AMEVCNTR1<n>.

Bits [31:N] are RAZ/WI. N is the value in AMCGCR.CG1NC.

Possible values of each bit are:

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that AMEVCNTR1&lt;n&gt; is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that AMEVCNTR1&lt;n&gt; is enabled. When written, disables AMEVCNTR1&lt;n&gt;.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.

Accessing the AMCNTENCLR1

If the number of auxiliary activity monitor event counters implemented is zero, reads of AMCNTENCLR1 are RAZ/WI. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

Note
The number of auxiliary activity monitor event counters implemented is zero exactly when AMCFGR.NCG == 0b0000.

**AMCNTENCLR1 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xC24</td>
<td>AMCNTENCLR1</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
AMCNTENSET0, Activity Monitors Count Enable Set Register 0

The AMCNTENSET0 characteristics are:

**Purpose**

Enable control bits for the architected activity monitors event counters, AMEVCNTR0\(n\).

**Configuration**

External register AMCNTENSET0 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENSET0_EL0[31:0].

External register AMCNTENSET0 bits [31:0] are architecturally mapped to AArch32 System register AMCNTENSET0[31:0].

The power domain of AMCNTENSET0 is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET0 are RES0.

**Attributes**

AMCNTENSET0 is a 32-bit register.

**Field descriptions**

The AMCNTENSET0 bit assignments are:

\[
\begin{array}{ccccccccccccccccccc}
\end{array}
\]

\(P<n>, \text{ bit } [n], \text{ for } n = 31 \text{ to } 0\)

Activity monitor event counter enable bit for AMEVCNTR0\(n\).

Bits [31:N] are RAZ/WI. N is the value in AMCGCR.CG0NC.

Possible values of each bit are:

<table>
<thead>
<tr>
<th>(P&lt;n&gt;)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that AMEVCNTR0(n) is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that AMEVCNTR0(n) is enabled. When written, enables AMEVCNTR0(n).</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.

**Accessing the AMCNTENSET0**

AMCNTENSET0 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xC00</td>
<td>AMCNTENSET0</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
AMCNTENSET1, Activity Monitors Count Enable Set Register 1

The AMCNTENSET1 characteristics are:

**Purpose**

Enable control bits for the auxiliary activity monitors event counters, AMEVCNTR1<n>.

**Configuration**

External register AMCNTENSET1 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENSET1_EL0[31:0].

External register AMCNTENSET1 bits [31:0] are architecturally mapped to AArch32 System register AMCNTENSET1[31:0].

The power domain of AMCNTENSET1 is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET1 are RES0.

**Attributes**

AMCNTENSET1 is a 32-bit register.

**Field descriptions**

The AMCNTENSET1 bit assignments are:

<table>
<thead>
<tr>
<th>P&lt;n&gt;, bit [n], for n = 31 to 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
</tr>
<tr>
<td>----</td>
</tr>
</tbody>
</table>

Activity monitor event counter enable bit for AMEVCNTR1<n>.

Bits [31:N] are RAZ/WI. N is the value in AMCGCR.CG1NC.

Possible values of each bit are:

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that AMEVCNTR1&lt;n&gt; is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that AMEVCNTR1&lt;n&gt; is enabled. When written, enables AMEVCNTR1&lt;n&gt;.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.

**Accessing the AMCNTENSET1**

If the number of auxiliary activity monitor event counters implemented is zero, reads of AMCNTENSET1 are RAZ/WI. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

**Note**
The number of auxiliary activity monitor counters implemented is zero exactly when \texttt{AMCFG.NCG} \texttt{== 0b0000}.

\textbf{AMCNTENSET1 can be accessed through the memory-mapped interfaces:}

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xC04</td>
<td>AMCNTENSET1</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
AMCR, Activity Monitors Control Register

The AMCR characteristics are:

**Purpose**

Global control register for the activity monitors implementation. AMCR is applicable to both the architected and the auxiliary counter groups.

**Configuration**

External register AMCR bits [31:0] are architecturally mapped to AArch64 System register AMCR_EL0[31:0].

External register AMCR bits [31:0] are architecturally mapped to AArch32 System register AMCR[31:0].

The power domain of AMCR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCR are RES0.

**Attributes**

AMCR is a 32-bit register.

**Field descriptions**

The AMCR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>30</td>
<td>HDBG</td>
</tr>
<tr>
<td>29</td>
<td>RAZ/WI</td>
</tr>
</tbody>
</table>

**Bits [31:11]**

Reserved, RES0.

**HDBG, bit [10]**

This bit controls whether activity monitor counting is halted when the PE is halted in Debug state.

<table>
<thead>
<tr>
<th>HDBG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Activity monitors do not halt counting when the PE is halted in Debug state.</td>
</tr>
<tr>
<td>1</td>
<td>Activity monitors halt counting when the PE is halted in Debug state.</td>
</tr>
</tbody>
</table>

**Bits [9:0]**

Reserved, RAZ/WI.

**Accessing the AMCR**

AMCR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xE04</td>
<td>AMCR</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
AMDEVAFF0, Activity Monitors Device Affinity Register

The AMDEVAFF0 characteristics are:

**Purpose**

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the AMU component relates to.

**Configuration**

The power domain of AMDEVAFF0 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMDEVAFF0 is a 32-bit register.

**Field descriptions**

The AMDEVAFF0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>MPIDR_EL1lo</td>
</tr>
</tbody>
</table>

**MPIDR_EL1lo, bits [31:0]**

MPIDR_EL1 low half. Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented Exception level.

**Accessing the AMDEVAFF0**

AMDEVAFF0 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFA8</td>
<td>AMDEVAFF0</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
AMDEVAFF1, Activity Monitors Device Affinity Register

The AMDEVAFF1 characteristics are:

**Purpose**

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the AMU component relates to.

**Configuration**

The power domain of AMDEVAFF1 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMDEVAFF1 is a 32-bit register.

**Field descriptions**

The AMDEVAFF1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

MPIDR_EL1hi, bits [31:0]

MPIDR_EL1 hi half. Read-only copy of the high half of MPIDR_EL1, as seen from the highest implemented Exception level.

**Accessing the AMDEVAFF1**

AMDEVAFF1 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFAC</td>
<td>AMDEVAFF1</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
AMDEVARCH, Activity Monitors Device Architecture Register

The AMDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the AMU component.

Configuration

The power domain of AMDEVARCH is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMDEVARCH is a 32-bit register.

Field descriptions

The AMDEVARCH bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ARCHITECT | PRESENT | REVISION | ARCHID |

ARCHITECT, bits [31:21]

Defines the architecture of the component. For AMU, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

PRESENT, bit [20]

When set to 1, indicates that the DEVARCH is present.

This field is 1 in Armv8.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

<table>
<thead>
<tr>
<th>REVISION</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Architecture revision is AMUv1.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARCHID, bits [15:0]

Defines this part to be an AMU component. For architectures defined by Arm this is further subdivided.

For AMU:
• Bits [15:12] are the architecture version, 0x0.
• Bits [11:0] are the architecture part number, 0xA66.

This corresponds to AMU architecture version AMUv1.

**Accessing the AMDEVARCH**

**AMDEVARCH can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFBC</td>
<td>AMDEVARCH</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
AMDEVTYPE, Activity Monitors Device Type Register

The AMDEVTYPE characteristics are:

**Purpose**

Indicates to a debugger that this component is part of a PE's performance monitor interface.

**Configuration**

The power domain of AMDEVTYPE is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMDEVTYPE is a 32-bit register.

**Field descriptions**

The AMDEVTYPE bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Bit Assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>Bits [31:8]</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>SUB</td>
<td>Bits [7:4]</td>
<td>Subtype. Reads as 0x1, to indicate this is a component within a PE.</td>
</tr>
<tr>
<td>MAJOR</td>
<td>Bits [3:0]</td>
<td>Major type. Reads as 0x6, to indicate this is a performance monitor component.</td>
</tr>
</tbody>
</table>

**Accessing the AMDEVTYPE**

AMDEVTYPE can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFCC</td>
<td>AMDEVTYPE</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
AMEVCNTR0\(<n>\), Activity Monitors Event Counter Registers 0, n = 0 - 15

The AMEVCNTR0\(<n>\) characteristics are:

**Purpose**

Provides access to the architected activity monitor event counters.

**Configuration**

External register AMEVCNTR0\(<n>\) bits [63:0] are architecturally mapped to AArch64 System register AMEVCNTR0\(<n>_EL0[63:0]\).

External register AMEVCNTR0\(<n>\) bits [63:0] are architecturally mapped to AArch32 System register AMEVCNTR0\(<n>[63:0]\).

The power domain of AMEVCNTR0\(<n>\) is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR0\(<n>\) are RES0.

**Attributes**

AMEVCNTR0\(<n>\) is a 64-bit register.

**Field descriptions**

The AMEVCNTR0\(<n>\) bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**ACNT, bits [63:0]**

Architected activity monitor event counter n.

Value of architected activity monitor event counter n, where n is the number of this register and is a number from 0 to 15.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

On a Cold reset, this field resets to 0.

**Accessing the AMEVCNTR0\(<n>\)**

If \(<n>\) is greater than or equal to the number of architected activity monitor event counters, reads of AMEVCNTR0\(<n>\) are RAZ/WI. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.
AMEVCNTR0\(<n>\) can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0x000 + (8 * n)</td>
<td>AMEVCNTR0(&lt;n&gt;)</td>
<td>31:0</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0x004 + (8 * n)</td>
<td>AMEVCNTR0(&lt;n&gt;)</td>
<td>63:32</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
AMEVCNTR1<n>, Activity Monitors Event Counter Registers 1, n = 0 - 15

The AMEVCNTR1<n> characteristics are:

**Purpose**

Provides access to the auxiliary activity monitor event counters.

**Configuration**

External register AMEVCNTR1<n> bits [63:0] are architecturally mapped to AArch64 System register AMEVCNTR1<n>_EL0[63:0].

External register AMEVCNTR1<n> bits [63:0] are architecturally mapped to AArch32 System register AMEVCNTR1<n>[63:0].

The power domain of AMEVCNTR1<n> is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR1<n> are RES0.

**Attributes**

AMEVCNTR1<n> is a 64-bit register.

**Field descriptions**

The AMEVCNTR1<n> bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| ACNT | ACNT |

**ACNT, bits [63:0]**

Auxiliary activity monitor event counter n.

Value of auxiliary activity monitor event counter n, where n is the number of this register and is a number from 0 to 15.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

On a Cold reset, this field resets to 0.

**Accessing the AMEVCNTR1<n>**

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads of AMEVCNTR1<n> are RAZ/WI. Software must treat reserved accesses as RES0. See ‘Access requirements for reserved and unallocated registers’.

**Note**

AMECGCR.CG1NC identifies the number of auxiliary activity monitor event counters.
AMEVCNTR1<\(n\)> can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>(0x100 + (8 \times n))</td>
<td>AMEVCNTR1&lt;(n)&gt;</td>
<td>31:0</td>
</tr>
</tbody>
</table>

Accesses on this interface are \textbf{RO}.

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>(0x104 + (8 \times n))</td>
<td>AMEVCNTR1&lt;(n)&gt;</td>
<td>63:32</td>
</tr>
</tbody>
</table>

Accesses on this interface are \textbf{RO}.
AMEVTYPER0\(<n>\), Activity Monitors Event Type Registers 0, n = 0 - 15

The AMEVTYPER0\(<n>\) characteristics are:

**Purpose**

Provides information on the events that an architected activity monitor event counter AMEVCNTR0\(<n>\) counts.

**Configuration**

External register AMEVTYPER0\(<n>\) bits [31:0] are architecturally mapped to AArch64 System register AMEVTYPER0\(<n>_EL0[31:0]\).

External register AMEVTYPER0\(<n>\) bits [31:0] are architecturally mapped to AArch32 System register AMEVTYPER0\(<n>[31:0]\).

The power domain of AMEVTYPER0\(<n>\) is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER0\(<n>\) are RES0.

**Attributes**

AMEVTYPER0\(<n>\) is a 32-bit register.

**Field descriptions**

The AMEVTYPER0\(<n>\) bit assignments are:

<table>
<thead>
<tr>
<th>Bit Positions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 - 25</td>
<td>Reserved, RAZ.</td>
</tr>
<tr>
<td>24 - 16</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>15 - 0</td>
<td>Event to count. The event number of the event that is counted by the architected activity monitor event counter AMEVCNTR0(&lt;n&gt;). The value of this field is architecturally mandated for each architected counter.</td>

<td>Memory stall cycles</td>
<td>When n == 3</td>
</tr>
</tbody>
</table>
Accessing the AMEVTYPE0<n>

If <n> is greater than or equal to the number of architected activity monitor event counters, reads of AMEVTYPE0<n> are RAZ/WI. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

---

**Note**

AMCGCR.CG0NC identifies the number of architected activity monitor event counters.

---

**AMEVTYPE0<n> can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0x400 + (4 * n)</td>
<td>AMEVTYPE0&lt;n&gt;</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
The AMEVTYPER1\(<n>\) characteristics are:

**Purpose**

Provides information on the events that an auxiliary activity monitor event counter AMEVCNTR1\(<n>\) counts.

**Configuration**

External register AMEVTYPER1\(<n>\) bits [31:0] are architecturally mapped to AArch64 System register AMEVTYPER1\(<n>_EL0[31:0]\).

External register AMEVTYPER1\(<n>\) bits [31:0] are architecturally mapped to AArch32 System register AMEVTYPER1\(<n>_E[31:0]\).

The power domain of AMEVTYPER1\(<n>\) is implementation defined.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER1\(<n>\) are RES0.

**Attributes**

AMEVTYPER1\(<n>\) is a 32-bit register.

**Field descriptions**

The AMEVTYPER1\(<n>\) bit assignments are:

<table>
<thead>

<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

**Bits [31:25]**

Reserved, RAZ.

**Bits [24:16]**

Reserved, RES0.

**evtCount, bits [15:0]**

Event to count. The event number of the event that is counted by the auxiliary activity monitor event counter AMEVCNTR1\(<n>\).

It is implementation defined what values are supported by each counter.

If software writes a value to this field which is not supported by the corresponding counter AMEVCNTR1\(<n>\), then:

- It is unpredictable which event will be counted.
- The value read back is unknown.

**Note**

The event counted by AMEVCNTR1\(<n>\) might be fixed at implementation. In this case, the field is read-only and writes are undefined.
If the corresponding counter AMEVCNTR1<n> is enabled, writes to this register have **UNPREDICTABLE** results.

**Accessing the AMEVTYPER1<n>**

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads of AMEVTYPER1<n> are RAZ/WI. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

---

**Note**

AMEGCR.CG1NC identifies the number of auxiliary activity monitor event counters.

---

AMEVTYPER1<n> can be accessed through the memory-mapped interfaces:

<table>

</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0x480 + (4 * n)</td>
<td>AMEVTYPER1&lt;n&gt;</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
AMIIDR, Activity Monitors Implementation Identification Register

The AMIIDR characteristics are:

**Purpose**

Defines the implementer and revisions of the AMU.

**Configuration**

The power domain of AMIIDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMIIDR are RES0.

**Attributes**

AMIIDR is a 32-bit register.

**Field descriptions**

The AMIIDR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>

</tbody>
</table>

**ProductID, bits [31:20]**

This field is an AMU part identifier.

The value of this field is IMPLEMENTATION DEFINED.

If **AMPIDR0** is implemented, **AMPIDR0**.PART_0 matches bits [27:20] of this field.

If **AMPIDR1** is implemented, **AMPIDR1**.PART_1 matches bits [31:28] of this field.

**Variant, bits [19:16]**

This field distinguishes product variants or major revisions of the product.

The value of this field is IMPLEMENTATION DEFINED.

If **AMPIDR2** is implemented, **AMPIDR2**.REVISION matches AMIIDR.Variant.

**Revision, bits [15:12]**

This field distinguishes minor revisions of the product.

The value of this field is IMPLEMENTATION DEFINED.

If **AMPIDR3** is implemented, **AMPIDR3**.REVAND matches AMIIDR.Revision.

**Implementer, bits [11:0]**

Contains the JEP106 code of the company that implemented the AMU.

For an Arm implementation, this field reads as 0x43B.
Bits [11:8] contain the JEP106 continuation code of the implementer.

Bit 7 is RES0

Bits [6:0] contain the JEP106 identity code of the implementer.

If AMPIDR4 is implemented, AMPIDR4.DES_2 matches bits [11:8] of this field.
If AMPIDR2 is implemented, AMPIDR2.DES_1 matches bits [6:4] of this field.
If AMPIDR1 is implemented, AMPIDR1.DES_0 matches bits [3:0] of this field.

**Accessing the AMIIDR**

AMIIDR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xE08</td>
<td>AMIIDR</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
The AMPIDR0 characteristics are:

**Purpose**

Provides information to identify an activity monitors component.

For more information, see 'About the Peripheral identification scheme'.

**Configuration**

The power domain of AMPIDR0 is **IMPLEMENTATION DEFINED**.

Implementation of this register is **OPTIONAL**.

This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMPIDR0 is a 32-bit register.

**Field descriptions**

The AMPIDR0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | PART_0 |

**Bits [31:8]**

Reserved, RES0.

**PART_0, bits [7:0]**

Part number, least significant byte.

The value of this field is **IMPLEMENTATION DEFINED**.

**Accessing the AMPIDR0**

AMPIDR0 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFE0</td>
<td>AMPIDR0</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
**AMPIDR1, Activity Monitors Peripheral Identification Register 1**

The AMPIDR1 characteristics are:

**Purpose**

Provides information to identify an activity monitors component.

For more information, see 'About the Peripheral identification scheme'.

**Configuration**

The power domain of AMPIDR1 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMPIDR1 is a 32-bit register.

**Field descriptions**

The AMPIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:2</td>
<td>Reserved, RES0</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
<tr>
<td>7:4</td>
<td>Designer, least significant</td>
<td>0b1011 for Arm Limited</td>
</tr>
<tr>
<td></td>
<td>nibble of JEP106 ID code</td>
<td></td>
</tr>
<tr>
<td>3:0</td>
<td>Part number, most significant</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
</tbody>
</table>

**Accessing the AMPIDR1**

**AMPIDR1 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFE4</td>
<td>AMPIDR1</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
The AMPIDR2 characteristics are:

Purpose

Provides information to identify an activity monitors component.
For more information, see 'About the Peripheral identification scheme'.

Configuration

The power domain of AMPIDR2 is IMPLEMENTATION DEFINED.
Implementation of this register is OPTIONAL.
This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMPIDR2 is a 32-bit register.

Field descriptions

The AMPIDR2 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    | RES0 |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | REVISION | JEDEC | DES_1 |

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.
The value of this field is IMPLEMENTATION DEFINED.

JEDEC, bit [3]

RAO. Indicates a JEP106 identity code is used.

DES_1, bits [2:0]

Designer, most significant bits of JEP106 ID code.
The value of this field is IMPLEMENTATION DEFINED. For Arm Limited, this field is 0b011.
Accessing the AMPIDR2

AMPIDR2 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFE8</td>
<td>AMPIDR2</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
AMPIDR3, Activity Monitors Peripheral Identification Register 3

The AMPIDR3 characteristics are:

**Purpose**

Provides information to identify an activity monitors component.

For more information, see 'About the Peripheral identification scheme'.

**Configuration**

The power domain of AMPIDR3 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMPIDR3 is a 32-bit register.

**Field descriptions**

The AMPIDR3 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>REVAND</td>
<td>CMOD</td>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**REVAND, bits [7:4]**

Part minor revision. Parts using AMPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.

The value of this field is IMPLEMENTATION DEFINED.

**CMOD, bits [3:0]**

Customer modified. Indicates someone other than the Designer has modified the component.

The value of this field is IMPLEMENTATION DEFINED.

**Accessing the AMPIDR3**

AMPIDR3 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFEC</td>
<td>AMPIDR3</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
AMPIDR4, Activity Monitors Peripheral Identification Register 4

The AMPIDR4 characteristics are:

**Purpose**

Provides information to identify an activity monitors component.

For more information, see 'About the Peripheral identification scheme'.

**Configuration**

The power domain of AMPIDR4 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMPIDR4 is a 32-bit register.

**Field descriptions**

The AMPIDR4 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | SIZE | DES_2 |

**Bits [31:8]**

Reserved, RES0.

**SIZE, bits [7:4]**

Size of the component. \( \log_2 \) of the number of 4KB pages from the start of the component to the end of the component ID registers.

This field reads as \( 0b0000 \).

**DES_2, bits [3:0]**

Designer. JEP106 continuation code, least significant nibble.

The value of this field is IMPLEMENTATION DEFINED. For Arm Limited, this field is \( 0b0100 \).

**Accessing the AMPIDR4**

AMPIDR4 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFD0</td>
<td>AMPIDR4</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
ASICCTL, CTI External Multiplexer Control register

The ASICCTL characteristics are:

**Purpose**

Can be used to provide IMPLEMENTATION DEFINED controls for the CTI. For example, the register might be used to control multiplexors for additional IMPLEMENTATION DEFINED triggers. The IMPLEMENTATION DEFINED controls provided by this register might modify the architecturally defined behavior of the CTI.

**Note**

The architecturally-defined triggers must not be multiplexed.

**Configuration**

It is IMPLEMENTATION DEFINED whether ASICCTL is implemented in the Core power domain or in the Debug power domain.

If it is implemented in the Core power domain then it is IMPLEMENTATION DEFINED whether it is in the Cold reset domain or the Warm reset domain.

This register must reset to a value that supports the architecturally-defined behavior of the CTI. Changing the value of the register from its reset value causes IMPLEMENTATION DEFINED behavior that might differ from the architecturally-defined behavior of the CTI.

Other than the requirements listed in this register description, all aspects of the reset behavior of the ASICCTL are IMPLEMENTATION DEFINED.

**Attributes**

ASICCTL is a 32-bit register.

**Field descriptions**

The ASICCTL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
</tbody>
</table>

**Accessing the ASICCTL**

ASICCTL can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x144</td>
<td>ASICCTL</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are RO.
- Otherwise accesses to this register are IMPDEF.
The CNTACR\<n> characteristics are:

**Purpose**

Provides top-level access controls for the elements of a timer frame. CNTACR\<n> provides the controls for frame CNTBaseN.

In addition to the CNTACR\<n> control:

- CNTNSAR controls whether CNTACR\<n> is accessible by Non-secure accesses.
- If frame CNTEL0BaseN is implemented, the CNTEL0ACR in frame CNTBaseN provides additional control of accesses to frame CNTEL0BaseN.

**Configuration**

The power domain of CNTACR\<n> is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Implemented only if the value of CNTTIDR.Frame\<n> is 1.

An implementation of the counters might not provide configurable access to some or all of the features. In this case, the associated field in the CNTACR\<n> register is:

- RAZ/WI if access is always denied.
- RAO/WI if access is always permitted.

**Attributes**

CNTACR\<n> is a 32-bit register.

**Field descriptions**

The CNTACR\<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RWPT | RWVT | RVOFF | RFRQ | RVCTR | RPCT |

**Bits [31:6]**

Reserved, RES0.

**RWPT, bit [5]**

Read/write access to the EL1 Physical Timer registers CNTP_CVAL, CNTP_TVAL, and CNTP_CTL in frame \<n>. The possible values of this bit are:

<table>
<thead>
<tr>
<th>RWPT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No access to the EL1 Physical Timer registers in frame &lt;n&gt;. The registers are RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read/write access to the EL1 Physical Timer registers in frame &lt;n&gt;.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.
RWVT, bit [4]

Read/write access to the Virtual Timer register CNTV_CVAL, CNTV_TVAL, and CNTV_CTL, in frame <n>. The possible values of this bit are:

<table>
<thead>
<tr>
<th>RWVT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No access to the Virtual Timer registers in frame &lt;n&gt;. The registers are RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read/write access to the Virtual Timer registers in frame &lt;n&gt;.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

RVOFF, bit [3]

Read-only access to CNTVOFF, in frame <n>. The possible values of this bit are:

<table>
<thead>
<tr>
<th>RVOFF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No access to CNTVOFF in frame &lt;n&gt;. The register is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read-only access to CNTVOFF in frame &lt;n&gt;.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

RFRQ, bit [2]

Read-only access to CNTFRQ, in frame <n>. The possible values of this bit are:

<table>
<thead>
<tr>
<th>RFRQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No access to CNTFRQ in frame &lt;n&gt;. The register is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read-only access to CNTFRQ in frame &lt;n&gt;.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

RVCT, bit [1]

Read-only access to CNTVCT, in frame <n>. The possible values of this bit are:

<table>
<thead>
<tr>
<th>RVCT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No access to CNTVCT in frame &lt;n&gt;. The register is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read-only access to CNTVCT in frame &lt;n&gt;.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

RPCT, bit [0]

Read-only access to CNTPCT, in frame <n>. The possible values of this bit are:

<table>
<thead>
<tr>
<th>RPCT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No access to CNTPCT in frame &lt;n&gt;. The register is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read-only access to CNTPCT in frame &lt;n&gt;.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the CNTACR<n>

In a system that recognizes two Security states:

- CNTACR<n> is always accessible by Secure accesses.
- CNTNSAR.NS<n> determines whether CNTACR<n> is accessible by Non-secure accesses.

CNTACR<n> can be accessed through the memory-mapped interfaces:
<table>
<thead>
<tr>
<th>Timer</th>
<th>CNTCTLBase $\times 0x40 + (4 \times n)$</th>
<th>CNTACR(\langle n\rangle)</th>
</tr>
</thead>
</table>

Accesses on this interface are **RW**.
CNTCR, Counter Control Register

The CNTCR characteristics are:

Purpose

Enables the counter, controls the counter frequency setting, and controls counter behavior during debug.

Configuration

The power domain of CNTCR is IMPLEMENTATION DEFINED.

For more information, see ‘Power and reset domains for the system level implementation of the Generic Timer’.

Attributes

CNTCR is a 32-bit register.

Field descriptions

The CNTCR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | FCREQ | RES0 | SCEN | HDBG | EN |

Bits [31:18]

Reserved, RES0.

FCREQ, bits [17:8]

Frequency change request. Indicates the number of the entry in the Frequency modes table to select.

Selecting an unimplemented entry, or an entry that contains 0, has no effect on the counter.

The maximum number of entries in the Frequency modes table is IMPLEMENTATION DEFINED up to a maximum of 1004 entries, see ‘The Frequency modes table’. An implementation is only required to implement an FCREQ field that can hold values from 0 to the highest supported Frequency modes table entry. Any unrequired most-significant bits of FCREQ can be implemented as RES0.

On a Warm reset, this field resets to 0.

Bits [7:3]

Reserved, RES0.

SCEN, bit [2]

When FEAT_CNTSC is implemented:

Scale Enable.

<table>
<thead>
<tr>
<th>SCEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Scaling is not enabled. The counter value is incremented by 0x1.0000000 for each counter tick.</td>
</tr>
<tr>
<td>0b1</td>
<td>Scaling is enabled. The counter is incremented by CNTSCR.ScaleVal for each counter tick.</td>
</tr>
</tbody>
</table>
The SCEN bit can only be changed when the counter is disabled, when CNTCR.EN == 0.

If the value of CNTCR.SCEN changes when CNTCR.EN == 1 then:

- The counter value becomes UNKNOWN.
- The counter value remains UNKNOWN on future ticks of the clock.

When the CNTCV register in the CNTControlBase frame of the memory mapped counter module is written to, the accumulated fraction information is reset to zero.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HDBG, bit [1]

Halt-on-debug. Controls whether a Halt-on-debug signal halts the system counter:

<table>
<thead>
<tr>
<th>HDBG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>System counter ignores Halt-on-debug.</td>
</tr>
<tr>
<td>0b1</td>
<td>Asserted Halt-on-debug signal halts system counter update.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EN, bit [0]

Enables the counter:

<table>
<thead>
<tr>
<th>EN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>System counter disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>System counter enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**Accessing the CNTCR**

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

**CNTCR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x000</td>
<td>CNTCR</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
CNTCV, Counter Count Value register

The CNTCV characteristics are:

**Purpose**

Indicates the current count value.

**Configuration**

The power domain of CNTCV is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

**Attributes**

CNTCV is a 64-bit register.

**Field descriptions**

The CNTCV bit assignments are:

```
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|    | CountValue |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|    | CountValue |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
```

**CountValue, bits [63:0]**

Indicates the counter value.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTCV**

<table>
<thead>
<tr>
<th>Frame</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>CNTControlBase</td>
<td>RW</td>
</tr>
<tr>
<td>CNTReadBase</td>
<td>RO</td>
</tr>
</tbody>
</table>

A write to CNTCV must be visible in the CNTPCT register of each running processor in a finite time.

For the instance of the register in the CNTControlBase frame:

- In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, and therefore this register instance, is implemented only in the Secure memory map.
- If the counter is enabled, the effect of writing to the register is UNKNOWN.

In an implementation that supports 64-bit atomic memory accesses, this register must be accessible using a 64-bit atomic access.

CNTCV can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x008</td>
<td>CNTCV</td>
<td>63:0</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTReadBase</td>
<td>0x000</td>
<td>CNTCV</td>
<td>63:0</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
The CNTEL0ACR characteristics are:

**Purpose**

An implementation of CNTEL0ACR in the frame at CNTBaseN controls whether the **CNTPCT**, **CNTVCT**, **CNTFRO**, EL1 Physical Timer, and Virtual Timer registers are visible in the frame at CNTEL0BaseN.

**Configuration**

The power domain of CNTEL0ACR is **IMPLEMENTATION DEFINED**.

Implementation of this register is **OPTIONAL**.

For more information, see ‘Power and reset domains for the system level implementation of the Generic Timer’.

**Attributes**

CNTEL0ACR is a 32-bit register.

**Field descriptions**

The CNTEL0ACR bit assignments are:

<table>
<thead>
<tr>
<th>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>
<th>RES0</th>
<th>ELOPTEN</th>
<th>ELOVTEN</th>
<th>RES0</th>
<th>ELOVCTEN</th>
<th>ELOPCTEN</th>
</tr>
</thead>
</table>

**Bits [31:10]**

Reserved, RES0.

**ELOPTEN, bit [9]**

Second view read/write access control for the EL1 Physical Timer registers. This bit controls whether the **CNTP_CVAL**, **CNTP_TVAL**, and **CNTP_CTL** registers in the current CNTBaseN frame are also accessible in the corresponding CNTEL0BaseN frame. The possible values of this bit are:

<table>
<thead>
<tr>
<th>ELOPTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No access. Registers are RES0 in the second view.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access permitted. If the registers are accessible in the current frame then they are accessible in the second view.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**ELOVTEN, bit [8]**

Second view read/write access control for the Virtual Timer registers. This bit controls whether the **CNTV_CVAL**, **CNTV_TVAL**, and **CNTV_CTL** registers in the current CNTBaseN frame are also accessible in the corresponding CNTEL0BaseN frame. The possible values of this bit are:

<table>
<thead>
<tr>
<th>ELOVTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No access. Registers are RES0 in the second view.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access permitted. If the registers are accessible in the current frame then they are accessible in the second view.</td>
</tr>
</tbody>
</table>
The definition of this bit means that, if the Virtual Timer registers are not implemented in the current CNTBaseN frame, then the Virtual Timer register addresses are RES0 in the corresponding CNTEL0BaseN frame, regardless of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [7:2]**

Reserved, RES0.

**ELOVCTEN, bit [1]**

Second view read access control for CNTVCT and CNTFRQ. The possible values of this bit are:

<table>
<thead>
<tr>
<th>ELOVCTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>CNTVCT is not visible in the second view. If EL0PCTEN is set to 0, CNTFRQ is not visible in the second view.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access permitted. If CNTVCT and CNTFRQ are visible in the current frame then they are visible in the second view.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**ELOPCTEN, bit [0]**

Second view read access control for CNTPCT and CNTFRQ. The possible values of this bit are:

<table>
<thead>
<tr>
<th>ELOPCTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>CNTPCT is not visible in the second view. If EL0VCTEN is set to 0, CNTFRQ is not visible in the second view.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access permitted. If CNTPCT and CNTFRQ are visible in the current frame then they are visible in the second view.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTEL0ACR**

CNTEL0ACR can be implemented in any implemented CNTBaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

If CNTEL0ACR is not implemented in an implemented CNTBaseN frame:

- The register location in that frame is RAZ/WI.
- If the corresponding CNTEL0BaseN frame is implemented, the registers CNTFRQ, CNTP_CTL, CNTP_CVAL, CNTP_TVAL, CNTPCT, CNTV_CTL, CNTV_CVAL, CNTV_TVAL, and CNTVCT are not visible in that frame.

**CNTEL0ACR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x014</td>
<td>CNTEL0ACR</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
CNTFID0, Counter Frequency ID

The CNTFID0 characteristics are:

Purpose

Indicates the base frequency of the system counter.

Configuration

The power domain of CNTFID0 is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

The possible frequencies for the system counter are stored in the Frequency modes table as 32-bit words starting with the base frequency, CNTFID0. For more information, see 'The Frequency modes table'.

The final entry in the Frequency modes table must be followed by a 32-bit word of zero value, to mark the end of the table.

Typically, the Frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.

If the Frequency modes table is in read/write memory, Arm strongly recommends that the table is not updated once the system is running.

Attributes

CNTFID0 is a 32-bit register.

Field descriptions

The CNTFID0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Frequency</td>
</tr>
</tbody>
</table>

Frequency, bits [31:0]

The base frequency of the system counter, in Hz.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the CNTFID0

It is IMPLEMENTATION DEFINED whether this register is RO or RW

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTFID0 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x020</td>
<td>CNTFID0</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO or RW.
The CNTFID<n> characteristics are:

**Purpose**

Indicates alternative system counter update frequencies.

**Configuration**

The power domain of CNTFID<n> is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

The possible frequencies for the system counter are stored in the Frequency modes table as 32-bit words starting with the base frequency, CNTFID0, see 'The Frequency modes table'.

The number of CNTFID<n> registers is IMPLEMENTATION DEFINED, and the only required CNTFID<n> register is CNTFID0.

The final entry in the Frequency modes table must be followed by a 32-bit word of zero value, to mark the end of the table.

The architecture can support up to 1004 entries in the Frequency modes table, including the zero-word end marker, and the number of entries is IMPLEMENTATION DEFINED up to this limit. For an implementation that includes registers in the IMPLEMENTATION DEFINED register space 0x0C0-0x0FC, the maximum number of entries in the Frequency modes table is 40, including the zero-word end marker.

Typically, the Frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.

If the Frequency modes table is in read/write memory, Arm strongly recommends that the table is not updated once the system is running.

**Attributes**

CNTFID<n> is a 32-bit register.

**Field descriptions**

The CNTFID<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | Frequency

**Frequency, bits [31:0]**

A system counter update frequency, in Hz. Must be an exact divisor of the base frequency. Arm strongly recommends that all frequency values in the Frequency modes table are integer power-of-two divisors of the base frequency.

When the system timer is operating at a lower frequency than the base frequency, the increment applied at each counter update is given by:

increment = (base frequency) / (selected frequency)

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**Accessing the CNTFID<\(n\)>**

It is **IMPLEMENTATION DEFINED** whether this register is **RO or RW**

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes these registers, is implemented only in the Secure memory map.

**CNTFID<\(n\)> can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x020 + (4 * (n))</td>
<td>CNTFID&lt;(n)&gt;</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO or RW**.
CNTFRQ, Counter-timer Frequency

The CNTFRQ characteristics are:

**Purpose**

This register is provided so that software can discover the frequency of the system counter. The instance of the register in the CNTCTLBase frame must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

**Configuration**

The power domain of CNTFRQ is IMPLEMENTATION DEFINED.

For more information see 'Power and reset domains for the system level implementation of the Generic Timer'.

**Attributes**

CNTFRQ is a 32-bit register.

**Field descriptions**

The CNTFRQ bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Clock frequency</td>
</tr>
</tbody>
</table>

Bits [31:0]

Clock frequency. Indicates the system counter clock frequency, in Hz.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTFRQ**

CNTFRQ must be implemented as an RW register in the CNTCTLBase frame.

In a system that recognizes two Security states, the instance of the register in the CNTCTLBase frame is only accessible by Secure accesses.

CNTFRQ can be implemented as a RO register in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTFRQ is accessible in that frame, as a RO register, if the value of CNTACR<n>.RFRQ is 1.
- Otherwise, the CNTFRQ address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTFRQ is accessible as a RO register in that frame if both:
  - CNTFRQ is accessible in the corresponding CNTBaseN frame.
Either the value of CNTEL0ACR.EL0VCTEN is 1 or the value of CNTEL0ACR.EL0PCTEN is 1.

- Otherwise, the CNTFRQ address in that frame is RAZ/WI.

**CNTFRQ can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x010</td>
<td>CNTFRQ</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.

<table>
<thead>
<tr>
<th>Component</th>

Accesses on this interface are RO.
CNTID, Counter Identification Register

The CNTID characteristics are:

Purpose

Indicates whether counter scaling is implemented.

Configuration

The power domain of CNTID is IMPLEMENTATION DEFINED.

This register is present only when FEAT_CNTSC is implemented. Otherwise, direct accesses to CNTID are RES0.

Attributes

CNTID is a 32-bit register.

Field descriptions

The CNTID bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>

</tr>
</tbody>
</table>

Bits [31:4]

Reserved, RES0.

CNTSC, bits [3:0]

Indicates whether Counter Scaling is implemented

<table>
<thead>
<tr>
<th>CNTSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Counter scaling is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Counter scaling is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Accessing the CNTID

In a system that supports Secure and Non-secure memory maps, the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTID can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x1C</td>
<td>CNTID</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
CNTNSAR, Counter-timer Non-secure Access Register

The CNTNSAR characteristics are:

**Purpose**

Provides the highest-level control of whether frames CNTBaseN and CNTEL0BaseN are accessible by Non-secure accesses.

**Configuration**

The power domain of CNTNSAR is **IMPLEMENTATION DEFINED**.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

**Attributes**

CNTNSAR is a 32-bit register.

**Field descriptions**

The CNTNSAR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>Reserved</td>
<td>NS&lt;n&gt; for n = 7 to 0</td>
</tr>
<tr>
<td>NS0 to NS7</td>
<td>Non-secure access to frame n. The possible values of this bit are:</td>
<td></td>
</tr>
</tbody>
</table>

### Bits [31:8]

**Reserved, RES0.**

**NS<n>, bit [n], for n = 7 to 0**

Non-secure access to frame n. The possible values of this bit are:

<table>
<thead>
<tr>
<th>NS&lt;n&gt;</th>
<th>Meaning</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure access only. Behaves as RES0 to Non-secure accesses.</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>Secure and Non-secure accesses permitted.</td>
<td></td>
</tr>
</tbody>
</table>

This bit also determines whether, in the CNTCTLLBase frame, CNTACR<n> and CNTVOFF<n> are accessible to Non-secure accesses.

If frame CNTBase<n>:

- Is not implemented, then NS<n> is RES0.
- Is not Configurable access, and is accessible only by Secure accesses, then NS<n> is RES0.
- Is not Configurable access, and is accessible by both Secure and Non-secure accesses, then NS<n> is RES1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the CNTNSAR**

In a system that recognizes two Security states, this register is only accessible by Secure accesses.

**CNTNSAR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CNTNSAR, Counter-timer Non-secure Access Register</td>
<td>Page 3308</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Timer</td>
<td>CNTCTLBase</td>
<td>0x004</td>
<td>CNTNSAR</td>
</tr>
<tr>
<td>-------</td>
<td>------------</td>
<td>-------</td>
<td>---------</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
The CNTP_CTL characteristics are:

**Purpose**

Control register for the EL1 physical timer.

**Configuration**

The power domain of CNTP_CTL is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

**Attributes**

CNTP_CTL is a 32-bit register.

**Field descriptions**

The CNTP_CTL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>2</td>
<td>Status of the timer, this bit indicates</td>
</tr>
<tr>
<td></td>
<td>whether the timer condition is met.</td>
</tr>
<tr>
<td>1</td>
<td>Interrupt mask bit, permitted values are</td>
</tr>
<tr>
<td></td>
<td>Timer interrupt is not masked by the</td>
</tr>
<tr>
<td></td>
<td>IMASK bit.</td>
</tr>
<tr>
<td>0</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>

Bits [31:3]

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the ENABLE bit is 1, ISTatus indicates whether the timer condition is met. ISTatus takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>

For more information, see the description of the ISTATUS bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
ENABLE, bit [0]

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from `CNTP_TVAL` continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Accessing the CNTP_CTL

`CNTP_CTL` can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- `CNTP_CTL` is accessible in that frame if the value of `CNTACR<n>.RWPT` is 1.
- Otherwise, the `CNTP_CTL` address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- `CNTP_CTL` is accessible in that frame if both:
  - `CNTP_CTL` is accessible in the corresponding CNTBaseN frame:
  - The value of `CNTEL0ACR.EL0PTEN` is 1.
- Otherwise, the `CNTP_CTL` address in that frame is RAZ/WI.

**CNTP_CTL can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x02C</td>
<td>CNTP_CTL</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x02C</td>
<td>CNTP_CTL</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
CNTP_CVAL, Counter-timer Physical Timer CompareValue

The CNTP_CVAL characteristics are:

**Purpose**

Holds the 64-bit compare value for the EL1 physical timer.

**Configuration**

The power domain of CNTP_CVAL is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

**Attributes**

CNTP_CVAL is a 64-bit register.

**Field descriptions**

The CNTP_CVAL bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**CompareValue, bits [63:0]**

Holds the EL1 physical timer CompareValue.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTP_CTL.ISTATUS is set to 1.
- An interrupt is generated if CNTP_CTL.IMASK is 0.

When CNTP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTP_CVAL**

CNTP_CVAL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTP_CVAL is accessible in that frame if the value of CNTACR<n>.RWPT is 1.
• Otherwise, the CNTP_CVAL address in that frame is RAZ/WI.

For an implemented CNTELOBaseN frame:

• CNTP_CVAL is accessible in that frame if both:
  ◦ CNTP_CVAL is accessible in the corresponding CNTBaseN frame:
  ◦ The value of CNTELOACR_EL0PTEN is 1.
• Otherwise, the CNTP_CVAL address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTP_CVAL register must be accessible as an atomic 64-bit value.

**CNTP_CVAL can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x020</td>

CNTP_TVAL, Counter-timer Physical Timer TimerValue

The CNTP_TVAL characteristics are:

**Purpose**

Holds the timer value for the EL1 physical timer.

**Configuration**

The power domain of CNTP_TVAL is **IMPLEMENTATION DEFINED**.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

**Attributes**

CNTP_TVAL is a 32-bit register.

**Field descriptions**

The CNTP_TVAL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**TimerValue, bits [31:0]**

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If CNTP_CTL.ENABLE is 0, the value returned is **UNKNOWN**.
- If CNTP_CTL.ENABLE is 1, the value returned is (CompareValue - CNTPCT).

On a write of this register, CompareValue is set to (CNTPCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTP_CTL.ISTATUS is set to 1.
- If CNTP_CTL.IMASK is 0, an interrupt is generated.

When CNTP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count, so the TimerValue view appears to continue to count down.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the CNTP_TVAL**

CNTP_TVAL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.
For an implemented CNTBaseN frame:

- CNTP_TVAL is accessible in that frame if the value of CNTACR<n> RWPT is 1.
- Otherwise, the CNTP_TVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_TVAL is accessible in that frame if both:
  - CNTP_TVAL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR EL0PTEN is 1.
- Otherwise, the CNTP_TVAL address in that frame is RAZ/WI.

**CNTP_TVAL can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x028</td>
<td>CNTP_TVAL</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x028</td>
<td>CNTP_TVAL</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
CNTPCT, Counter-timer Physical Count

The CNTPCT characteristics are:

**Purpose**

Holds the 64-bit physical count value.

**Configuration**

The power domain of CNTPCT is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

**Attributes**

CNTPCT is a 64-bit register.

**Field descriptions**

The CNTPCT bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Physical count value</td>
</tr>
<tr>
<td>62</td>
<td>Physical count value</td>
</tr>
<tr>
<td>31</td>
<td>Physical count value</td>
</tr>
<tr>
<td>30</td>
<td>Physical count value</td>
</tr>
</tbody>
</table>

**Bits [63:0]**

Physical count value.

**Accessing the CNTPCT**

CNTPCT can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame, as a RO register.

'CNTCTRL base status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTPCT is accessible in that frame, as a RO register, if the value of CNTACR<RPCT> is 1.
- Otherwise, the CNTPCT address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTPCT is accessible in that frame if both:
  - CNTPCT is accessible in the corresponding CNTBaseN frame.
  - The value of CNTEL0ACR EL0PCTEN is 1.
- Otherwise, the CNTPCT address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTPCT register must be accessible as an atomic 64-bit value.
### CNTPCT can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x000</td>
<td>CNTPCT</td>
<td>31:0</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x004</td>
<td>CNTPCT</td>
<td>63:32</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x000</td>
<td>CNTPCT</td>
<td>31:0</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x004</td>
<td>CNTPCT</td>
<td>63:32</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
The CNTSCR characteristics are:

**Purpose**

Enables the counter, controls the counter frequency setting, and controls counter behavior during debug.

**Configuration**

The power domain of CNTSCR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_CNTSC is implemented. Otherwise, direct accesses to CNTSCR are RES0.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

**Attributes**

CNTSCR is a 32-bit register.

**Field descriptions**

The CNTSCR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | ScaleVal

**ScaleVal, bits [31:0]**

Scale Value

When counter scaling is enabled, ScaleVal is the amount added to the counter value for every counter tick.

Counter tick is defined as one period of the current operating frequency of the Generic counter.

ScaleVal is expressed as an unsigned fixed point number with an 8-bit integer value and a 24-bit fractional value.

CNTSCR.ScaleVal can only be changed when CNTCR.EN == 0. If the value of this field is changed when CNTCR.EN == 1:

- The counter value becomes UNKNOWN.
- The counter value remains UNKNOWN on future ticks of the clock.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTSCR**

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

**CNTSCR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x10</td>
<td>CNTSCR</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
CNTSR, Counter Status Register

The CNTSR characteristics are:

**Purpose**

Provides counter frequency status information.

**Configuration**

The power domain of CNTSR is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

**Attributes**

CNTSR is a 32-bit register.

**Field descriptions**

The CNTSR bit assignments are:

|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| FCACK |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| RES0 |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| DBGH |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |

**FCACK, bits [31:8]**

Frequency change acknowledge. Indicates the currently selected entry in the Frequency modes table, see 'The Frequency modes table'.

On a Warm reset, this field resets to 0.

**Bits [7:2]**

Reserved, RES0.

**DBGH, bit [1]**

Indicates whether the counter is halted because the Halt-on-debug signal is asserted:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Counter is not halted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Counter is halted.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [0]**

Reserved, RES0.

**Accessing the CNTSR**

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.
CNTSR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x004</td>
<td>CNTSR</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
CNTTIDR, Counter-timer Timer ID Register

The CNTTIDR characteristics are:

**Purpose**

Indicates the implemented timers in the memory map, and their features. For each value of N from 0 to 7 it indicates whether:

- Frame CNTBaseN is a view of an implemented timer.
- Frame CNTBaseN has a second view, CNTEL0BaseN.
- Frame CNTBaseN has a virtual timer capability.

**Configuration**

The power domain of CNTTIDR is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

**Attributes**

CNTTIDR is a 32-bit register.

**Field descriptions**

The CNTTIDR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Frame7 | Frame6 | Frame5 | Frame4 | Frame3 | Frame2 | Frame1 | Frame0 |

**Frame<n>, bits [4n+3:4n], for n = 7 to 0**

A 4-bit field indicating the features of frame CNTBase<n>.

Bit[3] of the field is RES0.

Bit[2], the FEL0 subfield, indicates whether frame CNTBase<n> has a second view, CNTEL0Base<n>. The possible values of this bit are:

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Frame&lt;n&gt; does not have a second view. The CNTEL0ACR register in the first view of the frame is RES0</td>
</tr>
<tr>
<td>0b1</td>
<td>Frame&lt;n&gt; has a second view, CNTEL0Base&lt;n&gt;</td>
</tr>
</tbody>
</table>

If bit[0] is 0, bit[2] is RES0.

Bit[1], the FVI subfield, indicates whether both:

- Frame CNTBase<n> implements the virtual timer registers CNTV_CVAL, CNTV_TVAL, and CNTV_CTL.
- This CNTCTLBase frame implements the virtual timer offset register CNTVOFF<n>.

The possible values of bit[1] are:

<table>
<thead>
<tr>
<th>Bit[1]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Frame&lt;n&gt; does not have virtual capability. The virtual time and offset registers are RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Frame&lt;n&gt; has virtual capability. The virtual time and offset registers are implemented</td>
</tr>
</tbody>
</table>

If bit[0] is 0, bit[1] is RES0.
Bit[0], the FI subfield, indicates whether frame CNTBase<n> is implemented. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Bit[0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Frame&lt;n&gt; is not implemented. All registers associated with the frame are RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Frame&lt;n&gt; is implemented</td>
</tr>
</tbody>
</table>

### Accessing the CNTTIDR

In a system that recognizes two Security states this register is accessible by both Secure and Non-secure accesses.

**CNTTIDR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTLBase</td>
<td>0x008</td>
<td>CNTTIDR</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
CNTV_CTL, Counter-timer Virtual Timer Control

The CNTV_CTL characteristics are:

**Purpose**

Control register for the virtual timer.

**Configuration**

The power domain of CNTV_CTL is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

**Attributes**

CNTV_CTL is a 32-bit register.

**Field descriptions**

The CNTV_CTL bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>ISTATUS</td>
<td>IMASK</td>
<td>ENABLE</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>

For more information, see the description of the ISTATUS bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
ENABLE, bit [0]

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTV_TVAL continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Accessing the CNTV_CTL

CNTV_CTL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_CTL is accessible in that frame if the value of CNTACR<n>.RWVT is 1.
- Otherwise, the CNTV_CTL address in that frame is RAZ/NI.

For an implemented CNTEL0BaseN frame:

- CNTV_CTL is accessible in that frame if both:
  - CNTV_CTL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0VTEN is 1.
- Otherwise, the CNTV_CTL address in that frame is RAZ/NI.

### CNTV_CTL can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x03C</td>
<td>CNTV_CTL</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x03C</td>
<td>CNTV_CTL</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
The CNTV_CVAL characteristics are:

**Purpose**

Holds the 64-bit compare value for the virtual timer.

**Configuration**

The power domain of CNTV_CVAL is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

**Attributes**

CNTV_CVAL is a 64-bit register.

**Field descriptions**

The CNTV_CVAL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>CompareValue</td>
</tr>
<tr>
<td>62</td>
<td>CompareValue</td>
</tr>
<tr>
<td>...</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td>CompareValue</td>
</tr>
</tbody>
</table>

**CompareValue, bits [63:0]**

Holds the virtual timer CompareValue.

When CNTV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTV_CTL.ISTATUS is set to 1.
- An interrupt is generated if CNTV_CTL.IMASK is 0.

When CNTV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTV_CVAL**

CNTV_CVAL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBases status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_CVAL is accessible in that frame if the value of CNTACR<n>.RWVT is 1.
• Otherwise, the CNTV_CVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

• CNTV_CVAL is accessible in that frame if both:
  ◦ CNTV_CVAL is accessible in the corresponding CNTBaseN frame:
  ◦ The value of CNTEL0ACR_EL0VTEN is 1.
  • Otherwise, the CNTV_CVAL address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTV_CVAL register must be accessible as an atomic 64-bit value.

CNTV_CVAL can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x030</td>
<td>CNTV_CVAL</td>
<td>31:0</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x034</td>
<td>CNTV_CVAL</td>
<td>63:32</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x030</td>
<td>CNTV_CVAL</td>
<td>31:0</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

<table>
<thead>
<tr>

<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x034</td>
<td>CNTV_CVAL</td>
<td>63:32</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
CNTV_TVAL, Counter-timer Virtual Timer TimerValue

The CNTV_TVAL characteristics are:

**Purpose**

Holds the timer value for the virtual timer.

**Configuration**

The power domain of CNTV_TVAL is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

**Attributes**

CNTV_TVAL is a 32-bit register.

**Field descriptions**

The CNTV_TVAL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>TimerValue</td>
</tr>
</tbody>
</table>

**TimerValue, bits [31:0]**

The TimerValue view of the virtual timer.

On a read of this register:

- If CNTV_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTV_CTL.ENABLE is 1, the value returned is (CompareValue - CNTVCT).

On a write of this register, CompareValue is set to (CNTVCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTV_CTL.ISTATUS is set to 1.
- If CNTV_CTL.IMASK is 0, an interrupt is generated.

When CNTV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count, so the TimerValue view appears to continue to count down.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTV_TVAL**

CNTV_TVAL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.
For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_TVAL is accessible in that frame if the value of CNTACR<n>.RWVT is 1.
- Otherwise, the CNTV_TVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV_TVAL is accessible in that frame if both:
  - CNTV_TVAL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0VTEN is 1.
- Otherwise, the CNTV_TVAL address in that frame is RAZ/WI.

**CNTV_TVAL can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x038</td>
<td>CNTV_TVAL</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

<table>

CNTVCT, Counter-timer Virtual Count

The CNTVCT characteristics are:

Purpose

Holds the 64-bit virtual count value.

Configuration

The power domain of CNTVCT is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTVCT is a 64-bit register.

Field descriptions

The CNTVCT bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

Virtual count value

Virtual count value

Bits [63:0]

Virtual count value.

Accessing the CNTVCT

CNTVCT can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame, as a RO register.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTVCT is accessible in that frame, as a RO register, if the value of CNTACR<n>.RVCT is 1.
- Otherwise, the CNTVCT address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTVCT is accessible in that frame if both:
  - CNTVCT is accessible in the corresponding CNTBaseN frame.
  - The value of CNTEL0ACR.EL0VCTEN is 1.
- Otherwise, the CNTVCT address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTVCT register must be accessible as an atomic 64-bit value.
CNTVCT can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x008</td>

<td>CNTVCT</td>
<td>63:32</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
CNTVOFF, Counter-timer Virtual Offset

The CNTVOFF characteristics are:

Purpose

Holds the 64-bit virtual offset for a CNTBaseN frame that has virtual timer capability. This is the offset between real time and virtual time.

Configuration

The power domain of CNTVOFF is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTVOFF is a 64-bit register.

Field descriptions

The CNTVOFF bit assignments are:

| Bit 63 | Bit 62 | Bit 61 | Bit 60 | Bit 59 | Bit 58 | Bit 57 | Bit 56 | Bit 55 | Bit 54 | Bit 53 | Bit 52 | Bit 51 | Bit 50 | Bit 49 | Bit 48 | Bit 47 | Bit 46 | Bit 45 | Bit 44 | Bit 43 | Bit 42 | Bit 41 | Bit 40 | Bit 39 | Bit 38 | Bit 37 | Bit 36 | Bit 35 | Bit 34 | Bit 33 | Bit 32 |
|--------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
|        |       | Virtual offset |       |       | Virtual offset |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |

Bits [63:0]

Virtual offset.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the CNTVOFF

CNTVOFF is implemented, as a RO register, in any implemented CNTBaseN frame that has virtual timer capability.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTVOFF is accessible in that frame, as a RO register, if the value of CNTACR<n>.RVOFF is 1.
- Otherwise, the CNTVOFF address in that frame is RAZ/WI.

Note

CNTVOFF is never visible in any CNTEL0BaseN frame. This means that the CNTVOFF address in any implemented CNTEL0BaseN frame is RAZ/WI.

In an implementation that supports 64-bit atomic accesses, a CNTVOFF{<n>} register must be accessible as an atomic 64-bit value.
CNTVOFF can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x018</td>
<td>31:0</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x01C</td>
<td>63:32</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
The CNTVOFF<n> characteristics are:

**Purpose**

Holds the 64-bit virtual offset for frame CNTBase<n>. This is the offset between real time and virtual time.

**Configuration**

The power domain of CNTVOFF<n> is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

**Attributes**

CNTVOFF<n> is a 64-bit register.

**Field descriptions**

The CNTVOFF<n> bit assignments are:

<table>

**Bits [63:0]**

Virtual offset.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTVOFF<n>**

In the CNTCTLBase frame a CNTVOFF<n> register must be implemented, as a RW register, for each CNTBaseN frame that has virtual timer capability. For more information, see ‘CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames’.

---

**Note**

The value of <n> in an instance of CNTVOFF<n> specifies the value of N for the associated CNTBaseN frame.

---

In a system that recognizes two Security states, for any CNTVOFF<n> register in the CNTCTLBase frame:

- CNTVOFF<n> is always accessible by Secure accesses.
- CNTNSAR.NS<n> determines whether CNTVOFF<n> is accessible by Non-secure accesses.

The register location of any unimplemented CNTVOFF<n> register in the CNTCTLBase frame is RAZ/WI.

The CNTVOFF<n> register is accessible in the CNTBaseN frame using CNTVOFF.

In an implementation that supports 64-bit atomic accesses, then the CNTVOFF<n> registers must be accessible as atomic 64-bit values.
CNTVOFF\(<n>\), Counter-timer Virtual Offsets, \(n = 0 - 7\)

CNTVOFF\(<n>\) can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTLBase</td>
<td>(0x080 + (8 \times n))</td>
<td>31:0</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTLBase</td>
<td>(0x084 + (8 \times n))</td>
<td>63:32</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
CounterID\(<n>\), Counter ID registers, \(n = 0 - 11\)

The CounterID\(<n>\) characteristics are:

**Purpose**

IMPLEMENTATION DEFINED identification registers 0 to 11 for the memory-mapped Generic Timer.

**Configuration**

The power domain of CounterID\(<n>\) is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

These registers are implemented independently in each of the implemented Generic Timer memory-mapped frames.

If the implementation of the Counter ID registers requires an architecture version, the value for this version of the Arm Generic Timer is version 0.

The Counter ID registers can be implemented as a set of CoreSight ID registers, comprising Peripheral ID Registers and Component ID Registers. An implementation of these registers for the Generic Timer must use a Component class value of 0xF.

**Attributes**

CounterID\(<n>\) is a 32-bit register.

**Field descriptions**

The CounterID\(<n>\) bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| IMPLEMENTATION DEFINED |

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

**Accessing the CounterID\(<n>\)**

These registers must be implemented, as RO registers, in every implemented Generic Timer memory-mapped frame.

For the CNTCTLBase frame, in a system that recognizes two Security states these registers are accessible by both Secure and Non-secure accesses.

For the CNTControlBase frame, in a system that supports Secure and Non-secure memory maps the frame is implemented only in the Secure memory map, meaning these registers are implemented only in the Secure memory map.

For the CNTBaseN frames, 'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.
CounterID<n> can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0xFD0 + (4 * n)</td>
<td>CounterID&lt;n&gt;</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.

<table>
<thead>
<tr>

Accesses on this interface are **RO**.
CTIAPPCLEAR, CTI Application Trigger Clear register

The CTIAPPCLEAR characteristics are:

**Purpose**

Clears bits of the Application Trigger register.

**Configuration**

CTIAPPCLEAR is in the Debug power domain.

**Attributes**

CTIAPPCLEAR is a 32-bit register.

**Field descriptions**

The CTIAPPCLEAR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>APPCLEAR31</td>
<td>APPCLEAR30</td>
<td>APPCLEAR29</td>
<td>APPCLEAR28</td>
<td>APPCLEAR27</td>
<td>APPCLEAR26</td>
<td>APPCLEAR25</td>
<td>APPCLEAR24</td>
<td>APPCLEAR23</td>
<td>APPCLEAR22</td>
<td>APPCLEAR21</td>
<td>APPCLEAR20</td>
<td>APPCLEAR19</td>
<td>APPCLEAR18</td>
<td>APPCLEAR17</td>
<td>APPCLEAR16</td>
<td>APPCLEAR15</td>
<td>APPCLEAR14</td>
<td>APPCLEAR13</td>
<td>APPCLEAR12</td>
<td>APPCLEAR11</td>
<td>APPCLEAR10</td>
<td>APPCLEAR9</td>
<td>APPCLEAR8</td>
<td>APPCLEAR7</td>
<td>APPCLEAR6</td>
<td>APPCLEAR5</td>
<td>APPCLEAR4</td>
<td>APPCLEAR3</td>
<td>APPCLEAR2</td>
<td>APPCLEAR1</td>
<td>APPCLEAR0</td>
</tr>
</tbody>
</table>

APPCLEAR<x>, bit [x], for x = 31 to 0

Application trigger <x> disable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Writing to this bit has the following effect:

<table>
<thead>
<tr>
<th>APBOX=0x0</th>
<th>0b0</th>
<th>0b1</th>
</tr>
</thead>
<tbody>
<tr>
<td>No effect.</td>
<td>Clear corresponding bit in CTIAPPTRIG to 0 and clear the corresponding channel event.</td>
<td></td>
</tr>
</tbody>
</table>

If the ECT does not support multicycle channel events, use of CTIAPPCLEAR is deprecated and the debugger must only use CTIAPPULSE.

**Accessing the CTIAPPCLEAR**

CTIAPPCLEAR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x018</td>
<td>CTIAPPCLEAR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are WI.
- When !SoftwareLockStatus() accesses to this register are WO.
CTIAPPPULSE, CTI Application Pulse register

The CTIAPPPULSE characteristics are:

**Purpose**

Causes event pulses to be generated on ECT channels.

**Configuration**

CTIAPPPULSE is in the Debug power domain.

**Attributes**

CTIAPPPULSE is a 32-bit register.

**Field descriptions**

The CTIAPPPULSE bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| APPPULSE31 | APPPULSE30 | APPPULSE29 | APPPULSE28 | APPPULSE27 | APPPULSE26 | APPPULSE25 | APPPULSE24 | APPPULSE23 | APPPULSE22 | APPPULSE21 | APPPULSE20 | APPPULSE19 | APPPULSE18 | APPPULSE17 | APPPULSE16 | APPPULSE15 | APPPULSE14 | APPPULSE13 | APPPULSE12 | APPPULSE11 | APPPULSE10 | APPPULSE9 | APPPULSE8 | APPPULSE7 | APPPULSE6 | APPPULSE5 | APPPULSE4 | APPPULSE3 | APPPULSE2 | APPPULSE1 | APPPULSE0 |

APPPULSE<x>, bit [x], for x = 31 to 0

Generate event pulse on ECT channel <x>.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Writing to this bit has the following effect:

<table>
<thead>
<tr>
<th>APPPULSE&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>Channel &lt;x&gt; event pulse generated.</td>
</tr>
</tbody>
</table>

**Note**

- The CTIAPPPULSE operation does not affect the state of the Application Trigger register, CTIAPPTRIG. If the channel is active, either because of an earlier event or from the application trigger, then the value written to CTIAPPPULSE might have no effect.
- Multiple pulse events that occur close together might be merged into a single pulse event.

**Accessing the CTIAPPPULSE**

It is constrained unpredictable whether a write to CTIAPPPULSE generates an event on a channel if CTICONTROL.GLBEN is 0.

CTIAPPPULSE can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x01C</td>
<td>CTIAPPPULSE</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are WI.
- When !SoftwareLockStatus() accesses to this register are WO.
CTIAPPSET, CTI Application Trigger Set register

The CTIAPPSET characteristics are:

**Purpose**

Sets bits of the Application Trigger register.

**Configuration**

CTIAPPSET is in the Debug power domain.

**Attributes**

CTIAPPSET is a 32-bit register.

**Field descriptions**

The CTIAPPSET bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>APPSET31</td>
</tr>
<tr>
<td>30</td>
<td>APPSET30</td>
</tr>
<tr>
<td>29</td>
<td>APPSET29</td>
</tr>
<tr>
<td>28</td>
<td>APPSET28</td>

<td>APPSET25</td>
</tr>
<tr>
<td>24</td>
<td>APPSET24</td>
</tr>
<tr>
<td>23</td>
<td>APPSET23</td>
</tr>
<tr>
<td>22</td>
<td>APPSET22</td>
</tr>
<tr>
<td>21</td>
<td>APPSET21</td>
</tr>
<tr>
<td>20</td>
<td>APPSET20</td>
</tr>
<tr>
<td>19</td>
<td>APPSET19</td>
</tr>
<tr>
<td>18</td>
<td>APPSET18</td>
</tr>
<tr>
<td>17</td>
<td>APPSET17</td>
</tr>
<tr>
<td>16</td>
<td>APPSET16</td>
</tr>
<tr>
<td>15</td>
<td>APPSET15</td>
</tr>
<tr>
<td>14</td>
<td>APPSET14</td>
</tr>
<tr>
<td>13</td>
<td>APPSET13</td>
</tr>
<tr>
<td>12</td>
<td>APPSET12</td>
</tr>
<tr>
<td>11</td>
<td>APPSET11</td>
</tr>
<tr>
<td>10</td>
<td>APPSET10</td>
</tr>
<tr>
<td>9</td>
<td>APPSET9</td>
</tr>
<tr>
<td>8</td>
<td>APPSET8</td>
</tr>
<tr>
<td>7</td>
<td>APPSET7</td>
</tr>
<tr>
<td>6</td>
<td>APPSET6</td>
</tr>
<tr>
<td>5</td>
<td>APPSET5</td>
</tr>
<tr>
<td>4</td>
<td>APPSET4</td>
</tr>
<tr>
<td>3</td>
<td>APPSET3</td>
</tr>
<tr>
<td>2</td>
<td>APPSET2</td>
</tr>
<tr>
<td>1</td>
<td>APPSET1</td>
</tr>
<tr>
<td>0</td>
<td>APPSET0</td>
</tr>
</tbody>
</table>

APPSET<x>, bit [x], for x = 31 to 0

Application trigger <x> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

<table>
<thead>
<tr>
<th>APPSET&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Reading this means the application trigger is inactive. Writing this has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reading this means the application trigger is active. Writing this sets the corresponding bit in CTIAPPTRIG to 1 and generates a channel event.</td>
</tr>
</tbody>
</table>

If the ECT does not support multicycle channel events, use of CTIAPPSET is deprecated and the debugger must only use CTIAPPULSE.

On an External debug reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CTIAPPSET**

CTIAPPSET can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x014</td>
<td>CTIAPPSET</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are RO.
- When !SoftwareLockStatus() accesses to this register are RW.
The CTIAUTHSTATUS characteristics are:

**Purpose**

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for CTI.

**Configuration**

CTIAUTHSTATUS is in the Debug power domain.

This register is **OPTIONAL**, and is required for CoreSight compliance.

**Attributes**

CTIAUTHSTATUS is a 32-bit register.

**Field descriptions**

The CTIAUTHSTATUS bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>RAZ</td>
</tr>
<tr>
<td>29</td>
<td>NSNID</td>
</tr>
<tr>
<td>28</td>
<td>NSID</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**Bits [7:4]**

Reserved, RAZ.

**NSNID, bits [3:2]**

If EL3 is implemented, this field holds the same value as DBGAUTHSTATUS_EL1.NSNID.

If EL3 is not implemented and the implemented Security state is Secure state, this field holds the same value as DBGAUTHSTATUS_EL1.SNID.

**NSID, bits [1:0]**

If EL3 is implemented, this field holds the same value as DBGAUTHSTATUS_EL1.NSID.

If EL3 is not implemented and the implemented Security state is Secure state, this field holds the same value as DBGAUTHSTATUS_EL1.SID.

**Accessing the CTIAUTHSTATUS**

CTIAUTHSTATUS can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFB8</td>
<td>CTIAUTHSTATUS</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
CTICHINSTATUS, CTI Channel In Status register

The CTICHINSTATUS characteristics are:

**Purpose**

Provides the raw status of the ECT channel inputs to the CTI.

**Configuration**

CTICHINSTATUS is in the Debug power domain.

**Attributes**

CTICHINSTATUS is a 32-bit register.

**Field descriptions**

The CTICHINSTATUS bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHIN31</td>
<td>CHIN30</td>
<td>CHIN29</td>
<td>CHIN28</td>
<td>CHIN27</td>
<td>CHIN26</td>
<td>CHIN25</td>
<td>CHIN24</td>
<td>CHIN23</td>
<td>CHIN22</td>
<td>CHIN21</td>
<td>CHIN20</td>
<td>CHIN19</td>
<td>CHIN18</td>
<td>CHIN17</td>
</tr>
</tbody>
</table>

CHIN<n>, bit [n], for n = 31 to 0

Input channel <n> status.

Bits [31:N] are RAZ. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

<table>
<thead>
<tr>
<th>CHIN&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Input channel &lt;n&gt; is inactive.</td>
</tr>
<tr>
<td>0b1</td>
<td>Input channel &lt;n&gt; is active.</td>
</tr>
</tbody>
</table>

If the ECT channels do not support multicycle events then it is IMPLEMENTATION DEFINED whether an input channel can be observed as active.

**Accessing the CTICHINSTATUS**

CTICHINSTATUS can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x138</td>
<td>CTICHINSTATUS</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
The CTICHOUTSTATUS characteristics are:

**Purpose**

Provides the status of the ECT channel outputs from the CTI.

**Configuration**

CTICHOUTSTATUS is in the Debug power domain.

**Attributes**

CTICHOUTSTATUS is a 32-bit register.

**Field descriptions**

The CTICHOUTSTATUS bit assignments are:

| Bit | CHOUT31 | CHOUT30 | CHOUT29 | CHOUT28 | CHOUT27 | CHOUT26 | CHOUT25 | CHOUT24 | CHOUT23 | CHOUT22 | CHOUT21 | CHOUT20 | CHOUT19 | CHOUT18 | CHOUT17 | CHOUT16 | CHOUT15 | CHOUT14 | CHOUT13 | CHOUT12 | CHOUT11 | CHOUT10 | CHOUT9 | CHOUT8 | CHOUT7 | CHOUT6 | CHOUT5 | CHOUT4 | CHOUT3 | CHOUT2 | CHOUT1 | CHOUT0 |
|-----|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|

CHOUT<n>, bit [n], for n = 31 to 0

Output channel <n> status.

Bits [31:N] are RAZ. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Possible values of this bit are:

<table>
<thead>
<tr>
<th>CHOUT&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Output channel &lt;n&gt; is inactive.</td>
</tr>
<tr>
<td>0b1</td>
<td>Output channel &lt;n&gt; is active.</td>
</tr>
</tbody>
</table>

If the ECT channels do not support multicycle events then it is IMPLEMENTATION DEFINED whether an output channel can be observed as active.

**Note**

The value in CTICHOUTSTATUS is after gating by the channel gate. For more information, see CTIGATE.

**Accessing the CTICHOUTSTATUS**

CTICHOUTSTATUS can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x13C</td>
<td>CTICHOUTSTATUS</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
CTICIDR0, CTI Component Identification Register 0

The CTICIDR0 characteristics are:

**Purpose**

Provides information to identify a CTI component.

For more information, see 'About the Component Identification scheme'.

**Configuration**

CTICIDR0 is in the Debug power domain.

Implementation of this register is **OPTIONAL**.

This register is required for CoreSight compliance.

**Attributes**

CTICIDR0 is a 32-bit register.

**Field descriptions**

The CTICIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-8</td>
<td>Reserved, RES0</td>
<td></td>
</tr>
<tr>
<td>7-0</td>
<td>Preamble, PRMBL_0</td>
<td>0x0D</td>
</tr>
</tbody>
</table>

**Accessing the CTICIDR0**

CTICIDR0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFF0</td>
<td>CTICIDR0</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
CTICIDR1, CTI Component Identification Register 1

The CTICIDR1 characteristics are:

**Purpose**

Provides information to identify a CTI component.

For more information, see 'About the Component Identification scheme'.

**Configuration**

CTICIDR1 is in the Debug power domain.

Implementation of this register is **OPTIONAL**.

This register is required for CoreSight compliance.

**Attributes**

CTICIDR1 is a 32-bit register.

**Field descriptions**

The CTICIDR1 bit assignments are:

<table>
<thead>
<tr>

**CLASS, bits [7:4]**

Component class.

<table>
<thead>
<tr>
<th>CLASS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1001</td>
<td>CoreSight component.</td>
</tr>
</tbody>
</table>

Other values are defined by the CoreSight Architecture.

This field reads as **0x9**.

**PRMBL_1, bits [3:0]**

Preamble. RAZ.

Reads as **0b0000**.

**Accessing the CTICIDR1**

CTICIDR1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFF4</td>
<td>CTICIDR1</td>
</tr>
</tbody>
</table>
Accesses on this interface are **RO**.
CTICIDR2, CTI Component Identification Register 2

The CTICIDR2 characteristics are:

**Purpose**

Provides information to identify a CTI component.

For more information, see 'About the Component Identification scheme'.

**Configuration**

CTICIDR2 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

**Attributes**

CTICIDR2 is a 32-bit register.

**Field descriptions**

The CTICIDR2 bit assignments are:

|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|    |    | RES0 |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [31:8]**

Reserved, RES0.

**PRMBL_2, bits [7:0]**

Preamble.

Reads as 0x05.

**Accessing the CTICIDR2**

CTICIDR2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFF8</td>
<td>CTICIDR2</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
CTICDR3, CTI Component Identification Register 3

The CTICDR3 characteristics are:

**Purpose**

Provides information to identify a CTI component.

For more information, see 'About the Component Identification scheme'.

**Configuration**

CTICDR3 is in the Debug power domain.

Implementation of this register is **OPTIONAL**.

This register is required for CoreSight compliance.

**Attributes**

CTICDR3 is a 32-bit register.

**Field descriptions**

The CTICDR3 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | PRMBL_3 |

**Bits [31:8]**

Reserved, RES0.

**PRMBL_3, bits [7:0]**

Preamble.

Reads as 0xB1.

**Accessing the CTICDR3**

**CTICDR3 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFFC</td>
<td>CTICDR3</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
CTICLAIMCLR, CTI CLAIM Tag Clear register

The CTICLAIMCLR characteristics are:

Purpose

Used by software to read the values of the CLAIM bits, and to clear CLAIM tag bits to 0.

Configuration

CTICLAIMCLR is in the Debug power domain.

Implementation of this register is **OPTIONAL**.

Attributes

CTICLAIMCLR is a 32-bit register.

Field descriptions

The CTICLAIMCLR bit assignments are:

CLAIM31 CLAIM30 CLAIM29 CLAIM28 CLAIM27 CLAIM26 CLAIM25 CLAIM24 CLAIM23 CLAIM22 CLAIM21 CLAIM20 CLAIM19 CLAIM18 CLAIM17 CLAIM16 CLAIM15 CLAIM14 CLAIM13 CLAIM12 CLAIM11 CLAIM10 CLAIM9 CLAIM8 CLAIM7 CLAIM6 CLAIM5 CLAIM4 CLAIM3 CLAIM2 CLAIM1 CLAIM0

CLAIM<x>, bit [x], for x = 31 to 0

CLAIM tag clear bit.

For values of x greater than or equal to the IMPLEMENTATION DEFINED number of CLAIM tags, this bit is RAZ/SBZ. Software can rely on these bits reading as zero, and must use a Should-Be-Zero policy on writes. Implementations must ignore writes.

For other values of x, reads return the value of CLAIM[x] and the behavior on writes is:

<table>
<thead>
<tr>
<th>CLAIM&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Indirectly clear CLAIM[x] to 0.</td>
</tr>
</tbody>
</table>

A single write to CTICLAIMCLR can clear multiple tags to 0.

An External Debug reset clears the CLAIM tag bits to 0.

Accessing the CTICLAIMCLR

CTICLAIMCLR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFA4</td>
<td>CTICLAIMCLR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.
The CTICLAIMSET characteristics are:

**Purpose**

Used by software to set CLAIM bits to 1.

**Configuration**

CTICLAIMSET is in the Debug power domain.

Implementation of this register is **OPTIONAL**.

**Attributes**

CTICLAIMSET is a 32-bit register.

**Field descriptions**

The CTICLAIMSET bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLAIM31</td>
<td>CLAIM30</td>
<td>CLAIM29</td>
<td>CLAIM28</td>
<td>CLAIM27</td>
<td>CLAIM26</td>
<td>CLAIM25</td>
<td>CLAIM24</td>
<td>CLAIM23</td>
<td>CLAIM22</td>
<td>CLAIM21</td>
<td>CLAIM20</td>
<td>CLAIM19</td>
</tr>
</tbody>
</table>

CLAIM<x>, bit [x], for x = 31 to 0

CLAIM tag set bit.

For values of x greater than or equal to the IMPLEMENTATION DEFINED number of CLAIM tags, this bit is RAZ/SBZ. Software can rely on these bits reading as zero, and must use a Should-Be-Zero policy on writes. Implementations must ignore writes.

For other values of x, the bit is RAO and the behavior on writes is:

<table>
<thead>
<tr>
<th>CLAIM&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Indirectly set CLAIM[x] tag to 1.</td>
</tr>
</tbody>
</table>

A single write to CTICLAIMSET can set multiple tags to 1.

An External Debug reset clears the CLAIM tag bits to 0.

**Accessing the CTICLAIMSET**

CTICLAIMSET can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFA0</td>
<td>CTICLAIMSET</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.
CTICONTROL, CTI Control register

The CTICONTROL characteristics are:

**Purpose**

Controls whether the CTI is enabled.

**Configuration**

CTICONTROL is in the Debug power domain.

**Attributes**

CTICONTROL is a 32-bit register.

**Field descriptions**

The CTICONTROL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| RES0 | GLBEN |

**Bits [31:1]**

Reserved, RES0.

**GLBEN, bit [0]**

Enables or disables the CTI mapping functions. Possible values of this field are:

<table>
<thead>
<tr>
<th>GLBEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>CTI mapping functions and application trigger disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>CTI mapping functions and application trigger enabled.</td>
</tr>
</tbody>
</table>

When GLBEN is 0, the input channel to output trigger, input trigger to output channel, and application trigger functions are disabled and do not signal new events on either output triggers or output channels. If a previously asserted output trigger has not been acknowledged, it remains asserted after the mapping functions are disabled. All output triggers are disabled by CTI reset.

If the ECT supports multicycle channel events any existing output channel events will be terminated.

On an External debug reset, this field resets to 0.

**Accessing the CTICONTROL**

CTICONTROL can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x000</td>
<td>CTICONTROL</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.
The CTIDEVAFF0 characteristics are:

**Purpose**

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

**Configuration**

CTIDEVAFF0 is in the Debug power domain.

If the CTI is CTIv1, this register is *OPTIONAL*. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

In an Armv8.5 compliant implementation, the CTI must be CTIv2.

If this register is implemented, then CTIDEVAFF1 must also be implemented. If the CTI of a PE does not implement the CTI Device Affinity registers, the CTI block of the external debug memory map must be located 64KB above the debug registers in the external debug interface.

**Attributes**

CTIDEVAFF0 is a 32-bit register.

**Field descriptions**

The CTIDEVAFF0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>MPIDR_EL1lo, bits [31:0]</td>
</tr>
</tbody>
</table>

MPIDR_EL1lo, bits [31:0]

MPIDR_EL1 low half. Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented Exception level.

**Accessing the CTIDEVAFF0**

CTIDEVAFF0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFA8</td>
<td>CTIDEVAFF0</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
The CTIDEVAFF1 characteristics are:

**Purpose**

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

**Configuration**

CTIDEVAFF1 is in the Debug power domain.

If the CTI is CTIv1, this register is **OPTIONAL**. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

In an Armv8.5 compliant implementation, the CTI must be CTIv2.

If this register is implemented, then CTIDEVAFF0 must also be implemented. If the CTI of a PE does not implement the CTI Device Affinity registers, the CTI block of the external debug memory map must be located 64KB above the debug registers in the external debug interface.

**Attributes**

CTIDEVAFF1 is a 32-bit register.

**Field descriptions**

The CTIDEVAFF1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

MPIDR_EL1hi, bits [31:0]

MPIDR_EL1 high half. Read-only copy of the high half of MPIDR_EL1, as seen from the highest implemented Exception level.

**Accessing the CTIDEVAFF1**

CTIDEVAFF1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFAC</td>
<td>CTIDEVAFF1</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
CTIDEVARCH, CTI Device Architecture register

The CTIDEVARCH characteristics are:

**Purpose**

Identifies the programmers' model architecture of the CTI component.

**Configuration**

CTIDEVARCH is in the Debug power domain.

If the CTI is CTIv1, this register is **OPTIONAL**. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

In an Armv8.5 compliant implementation, the CTI must be CTIv2.

If this register is not implemented, CTIDEVAFF0 and CTIDEVAFF1 are also not implemented.

**Attributes**

CTIDEVARCH is a 32-bit register.

**Field descriptions**

The CTIDEVARCH bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    | ARCHITECT | PRESENT | REVISION | ARCHID |    |

**ARCHITECT, bits [31:21]**

Defines the architecture of the component. For CTI, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

**PRESENT, bit [20]**

When set to 1, indicates that the DEVARCH is present.

This field is 1 in Armv8.

**REVISION, bits [19:16]**

Revision.

Defines the architecture revision of the component.

<table>
<thead>
<tr>
<th>REVISION</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>First revision.</td>
<td></td>
</tr>
<tr>
<td>0b0001</td>
<td>As 0b0000, and also adds support for CTIDEVCCTL.</td>
<td>When FEAT_DoPD is implemented</td>
</tr>
</tbody>
</table>

All other values are reserved.
ARCHID, bits [15:0]

Defines this part to be an Armv8 debug component. For architectures defined by Arm this is further subdivided.

For CTI:

- Bits [15:12] are the architecture version, 0x1.
- Bits [11:0] are the architecture part number, 0xA14.

This corresponds to CTI architecture version CTIv2.

**Accessing the CTIDEVARCH**

CTIDEVARCH can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFBC</td>
<td>CTIDEVARCH</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
CTIDEVCTL, CTI Device Control register

The CTIDEVCTL characteristics are:

**Purpose**

Provides target-specific device controls

**Configuration**

CTIDEVCTL is in the Debug power domain.

This register is present only when FEAT_DoPD is implemented. Otherwise, direct accesses to CTIDEVCTL are RES0.

**Attributes**

CTIDEVCTL is a 32-bit register.

**Field descriptions**

The CTIDEVCTL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>30</td>
<td>RCE</td>
</tr>
<tr>
<td>29</td>
<td>OSUCE</td>
</tr>
</tbody>
</table>

**Bits [31:2]**

Reserved, RES0.

**RCE, bit [1]**

Reset Catch Enable.

<table>
<thead>
<tr>
<th>RCE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Reset Catch debug event disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reset Catch debug event enabled.</td>
</tr>
</tbody>
</table>

On an External debug reset, this field resets to 0.

**OSUCE, bit [0]**

OS Unlock Catch Enable

<table>
<thead>
<tr>
<th>OSUCE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>OS Unlock Catch debug event disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>OS Unlock Catch debug event enabled.</td>
</tr>
</tbody>
</table>

On an External debug reset, this field resets to 0.

**Accessing the CTIDEVCTL**

CTIDEVCTL can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x150</td>
<td>CTIDEVCTL</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When `SoftwareLockStatus()` accesses to this register are **RO**.
- When `!SoftwareLockStatus()` accesses to this register are **RW**.
The CTIDEVID characteristics are:

**Purpose**

Describes the CTI component to the debugger.

**Configuration**

CTIDEVID is in the Debug power domain.

**Attributes**

CTIDEVID is a 32-bit register.

**Field descriptions**

The CTIDEVID bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>[31:26] RES0</td>
<td>Reserved, 0</td>
</tr>
<tr>
<td>[25:24] INOUT</td>
<td>Input/output options. Indicates presence of the input gate. If the CTM is not implemented or CTIv2 is not implemented, this field is RAZ.</td>
</tr>
<tr>
<td>[23:22] NUMCHAN</td>
<td>Number of ECT channels implemented. IMPLEMENTATION DEFINED. For Armv8, valid values are:</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>NUMCHAN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>3 channels (0..2) implemented.</td>
</tr>
<tr>
<td>0b00100</td>
<td>4 channels (0..3) implemented.</td>
</tr>
<tr>
<td>0b00101</td>
<td>5 channels (0..4) implemented.</td>
</tr>
<tr>
<td>0b00110</td>
<td>6 channels (0..5) implemented.</td>
</tr>
<tr>
<td></td>
<td>and so on up to 0b100000, 32 channels (0..31) implemented.</td>
</tr>
<tr>
<td></td>
<td>All other values are reserved.</td>
</tr>
</tbody>
</table>
Bits [15:14]

Reserved, RES0.

NUMTRIG, bits [13:8]

Number of triggers implemented. IMPLEMENTATION DEFINED. This is one more than the index of the largest trigger, rather than the actual number of triggers.

For Armv8, valid values are:

<table>
<thead>
<tr>
<th>NUMTRIG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000011</td>
<td>Up to 3 triggers (0..2) implemented.</td>
</tr>
<tr>
<td>0b001000</td>
<td>Up to 8 triggers (0..7) implemented.</td>
</tr>
<tr>
<td>0b001001</td>
<td>Up to 9 triggers (0..8) implemented.</td>
</tr>
<tr>
<td>0b001010</td>
<td>Up to 10 triggers (0..9) implemented.</td>
</tr>
</tbody>
</table>

...and so on up to 0b100000, 32 triggers (0..31) implemented.

All other values are reserved. If the PE contains a Trace extension, this field must be at least 0b001000. There is no guarantee that any of the implemented triggers, including the highest numbered, are connected to any components.

Bits [7:5]

Reserved, RES0.

EXTMUXNUM, bits [4:0]

Number of multiplexors available on triggers. This value is used in conjunction with External Control register, ASICCTL.

Accessing the CTIDEVID

CTIDEVID can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFC8</td>
<td>CTIDEVID</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
CTIDEVID1, CTI Device ID register 1

The CTIDEVID1 characteristics are:

**Purpose**

Reserved for future information about the CTI component to the debugger.

**Configuration**

CTIDEVID1 is in the Debug power domain.

**Attributes**

CTIDEVID1 is a 32-bit register.

**Field descriptions**

The CTIDEVID1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

Accessing the CTIDEVID1

CTIDEVID1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFC4</td>
<td>CTIDEVID1</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
CTIDEVID2, CTI Device ID register 2

The CTIDEVID2 characteristics are:

**Purpose**

Reserved for future information about the CTI component to the debugger.

**Configuration**

CTIDEVID2 is in the Debug power domain.

**Attributes**

CTIDEVID2 is a 32-bit register.

**Field descriptions**

The CTIDEVID2 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 |

**Bits [31:0]**

Reserved, RES0.

**Accessing the CTIDEVID2**

**CTIDEVID2 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFC0</td>
<td>CTIDEVID2</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
CTIDEVTYPE, CTI Device Type register

The CTIDEVTYPE characteristics are:

**Purpose**

Indicates to a debugger that this component is part of a PEs cross-trigger interface.

**Configuration**

CTIDEVTYPE is in the Debug power domain.

Implementation of this register is **OPTIONAL**.

**Attributes**

CTIDEVTYPE is a 32-bit register.

**Field descriptions**

The CTIDEVTYPE bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>SUB</td>
<td>MAJOR</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SUB, bits [7:4]**

Subtype. Must read as 0x1 to indicate this is a component within a PE.

**MAJOR, bits [3:0]**

Major type. Must read as 0x4 to indicate this is a cross-trigger component.

**Accessing the CTIDEVTYPE**

CTIDEVTYPE can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFCC</td>
<td>CTIDEVTYPE</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
CTIGATE, CTI Channel Gate Enable register

The CTIGATE characteristics are:

**Purpose**

Determines whether events on channels propagate through the CTM to other ECT components, or from the CTM into the CTI.

**Configuration**

CTIGATE is in the Debug power domain.

**Attributes**

CTIGATE is a 32-bit register.

**Field descriptions**

The CTIGATE bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>GATE31</td>
</tr>
<tr>
<td>30</td>
<td>GATE30</td>
</tr>
<tr>
<td>29</td>
<td>GATE29</td>
</tr>
<tr>
<td>28</td>
<td>GATE28</td>
</tr>
<tr>
<td>27</td>
<td>GATE27</td>
</tr>
<tr>
<td>26</td>
<td>GATE26</td>
</tr>
<tr>
<td>25</td>
<td>GATE25</td>
</tr>
<tr>
<td>24</td>
<td>GATE24</td>
</tr>
<tr>
<td>23</td>
<td>GATE23</td>
</tr>
<tr>
<td>22</td>
<td>GATE22</td>
</tr>
<tr>
<td>21</td>
<td>GATE21</td>
</tr>
<tr>
<td>20</td>
<td>GATE20</td>
</tr>
<tr>
<td>19</td>
<td>GATE19</td>
</tr>
<tr>
<td>18</td>
<td>GATE18</td>
</tr>
<tr>
<td>17</td>
<td>GATE17</td>
</tr>
<tr>
<td>16</td>
<td>GATE16</td>
</tr>
<tr>
<td>15</td>
<td>GATE15</td>
</tr>
<tr>
<td>14</td>
<td>GATE14</td>
</tr>
<tr>

<td>GATE2</td>
</tr>
<tr>
<td>1</td>
<td>GATE1</td>
</tr>
<tr>
<td>0</td>
<td>GATE0</td>
</tr>
</tbody>
</table>

GATE<x>, bit [x], for x = 31 to 0

Channel <x> gate enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

<table>
<thead>
<tr>
<th>GATE&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disable output and, if CTIDEVID.INOUT == 0b01, input channel &lt;x&gt; propagation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Enable output and, if CTIDEVID.INOUT == 0b01, input channel &lt;x&gt; propagation.</td>
</tr>
</tbody>
</table>

If GATE[x] is set to 0, no new events will be propagated to the ECT, and if the ECT supports multicycle channel events any existing output channel events will be terminated.

On an External debug reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CTIGATE**

CTIGATE can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x140</td>
<td>CTIGATE</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.
CTIINEN\(<n>\), CTI Input Trigger to Output Channel Enable registers, \(n = 0 - 31\)

The CTIINEN\(<n>\) characteristics are:

**Purpose**

Enables the signaling of an event on output channels when input trigger event \(n\) is received by the CTI.

**Configuration**

CTIINEN\(<n>\) is in the Debug power domain.

If input trigger \(n\) is not connected, the behavior of CTIINEN\(<n>\) is IMPLEMENTATION DEFINED.

**Attributes**

CTIINEN\(<n>\) is a 32-bit register.

**Field descriptions**

The CTIINEN\(<n>\) bit assignments are:

<table>
<thead>
<tr>
<th>INEN&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Input trigger (&lt;n&gt;) will not generate an event on output channel (&lt;x&gt;).</td>
</tr>
<tr>
<td>0b1</td>
<td>Input trigger (&lt;n&gt;) will generate an event on output channel (&lt;x&gt;).</td>
</tr>
</tbody>
</table>

On an External debug reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CTIINEN\(<n>\)**

CTIINEN\(<n>\) can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x020 + (4 * (n))</td>
<td>CTIINEN(&lt;n&gt;)</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are RO.
- When !SoftwareLockStatus() accesses to this register are RW.
CTIINTACK, CTI Output Trigger Acknowledge register

The CTIINTACK characteristics are:

**Purpose**

Can be used to deactivate the output triggers.

**Configuration**

CTIINTACK is in the Debug power domain.

**Attributes**

CTIINTACK is a 32-bit register.

**Field descriptions**

The CTIINTACK bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>ACK31</td>
</tr>
<tr>
<td>30</td>
<td>ACK30</td>
</tr>
<tr>
<td>29</td>
<td>ACK29</td>
</tr>
<tr>
<td>28</td>
<td>ACK28</td>
</tr>
<tr>
<td>27</td>
<td>ACK27</td>
</tr>
<tr>
<td>26</td>
<td>ACK26</td>
</tr>
<tr>
<td>25</td>
<td>ACK25</td>
</tr>
<tr>
<td>24</td>
<td>ACK24</td>
</tr>
<tr>
<td>23</td>
<td>ACK23</td>
</tr>
<tr>
<td>22</td>

<td>ACK19</td>
</tr>
<tr>
<td>18</td>
<td>ACK18</td>
</tr>
<tr>
<td>17</td>
<td>ACK17</td>
</tr>
<tr>
<td>16</td>
<td>ACK16</td>
</tr>
<tr>
<td>15</td>
<td>ACK15</td>
</tr>
<tr>
<td>14</td>
<td>ACK14</td>
</tr>
<tr>
<td>13</td>
<td>ACK13</td>
</tr>
<tr>
<td>12</td>
<td>ACK12</td>
</tr>
<tr>
<td>11</td>
<td>ACK11</td>
</tr>
<tr>
<td>10</td>
<td>ACK10</td>
</tr>
<tr>
<td>9</td>
<td>ACK9</td>
</tr>
<tr>
<td>8</td>
<td>ACK8</td>
</tr>
<tr>
<td>7</td>
<td>ACK7</td>
</tr>
<tr>
<td>6</td>
<td>ACK6</td>
</tr>
<tr>
<td>5</td>
<td>ACK5</td>
</tr>
<tr>
<td>4</td>
<td>ACK4</td>
</tr>
<tr>
<td>3</td>
<td>ACK3</td>
</tr>
<tr>
<td>2</td>
<td>ACK2</td>
</tr>
<tr>
<td>1</td>
<td>ACK1</td>
</tr>
<tr>
<td>0</td>
<td>ACK0</td>
</tr>
</tbody>
</table>

**ACK<n>, bit [n], for n = 31 to 0**

Acknowledge for output trigger <n>.

Bits [31:N] are RAZ/WI. N is the number of CTI triggers implemented as defined by the CTIDEVID[NUMTRIG] field.

If any of the following is true, writes to ACK<n> are ignored:

- n >= CTIDEVID[NUMTRIG], the number of implemented triggers.
- Output trigger n is not active.
- The channel mapping function output, as controlled by CTIOUTEN<n>, is still active.

Otherwise, if any of the following are true, it is IMPLEMENTATION DEFINED whether writes to ACK<n> are ignored:

- Output trigger n is not implemented.
- Output trigger n is not connected.
- Output trigger n is self-acknowledging and does not require software acknowledge.

Otherwise, the behavior on writes to ACK<n> is as follows:

<table>
<thead>
<tr>
<th>ACK&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No effect</td>
</tr>
<tr>
<td>0b1</td>
<td>Deactivate the trigger.</td>
</tr>
</tbody>
</table>

**Accessing the CTIINTACK**

A debugger must read CTITRIGOUTSTATUS to confirm that the output trigger has been acknowledged before generating any event that must be ordered after the write to CTIINTACK, such as a write to CTIAPPWUE to activate another trigger.

**CTIINTACK can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x010</td>
<td>CTIINTACK</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When `SoftwareLockStatus()` accesses to this register are `WI`.
- When `!SoftwareLockStatus()` accesses to this register are `WO`.
CTIITCTRL, CTI Integration mode Control register

The CTIITCTRL characteristics are:

**Purpose**

Enables the CTI to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

**Configuration**

It is IMPLEMENTATION DEFINED whether CTIITCTRL is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

**Attributes**

CTIITCTRL is a 32-bit register.

**Field descriptions**

The CTIITCTRL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| RES0 | IME |

**Bits [31:1]**

Reserved, RES0.

**IME, bit [0]**

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

<table>
<thead>
<tr>
<th>IME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Integration mode enabled.</td>
</tr>
</tbody>
</table>

The following resets apply:

- If the register is implemented in the Core power domain:
  - On a Cold reset, this field resets to 0.
  - On an External debug reset, the value of this field is unchanged.
  - On a Warm reset, the value of this field is unchanged.

- If the register is implemented in the External debug power domain:
  - On a Cold reset, the value of this field is unchanged.
  - On an External debug reset, this field resets to 0.
  - On a Warm reset, the value of this field is unchanged.
Accessing the CTIITCTRL

CTIITCTRL can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xF00</td>
<td>CTIITCTRL</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register are IMPDEF.
CTILAR, CTI Lock Access Register

The CTILAR characteristics are:

**Purpose**

Allows or disallows access to the CTI registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

**Configuration**

CTILAR is in the Debug power domain.

If FEAT_Debugv8p4 is implemented, the Software Lock is not implemented.

Software uses CTILAR to set or clear the lock, and CTILSR to check the current status of the lock.

**Attributes**

CTILAR is a 32-bit register.

**Field descriptions**

The CTILAR bit assignments are:

---

**When the Software Lock is implemented:**

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>KEY</td>
<td></td>
<td></td>
<td></td>
<td></td>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**KEY, bits [31:0]**

Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component’s registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component’s registers through a memory-mapped interface.

---

**Otherwise:**

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Otherwise

**Bits [31:0]**

Reserved, RES0.
Accessing the CTILAR

CTILAR can be accessed through a memory-mapped access to the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFB0</td>
<td>CTILAR</td>
</tr>
</tbody>
</table>

Accesses on this interface are WO.
CTILSR, CTI Lock Status Register

The CTILSR characteristics are:

**Purpose**

Indicates the current status of the Software Lock for CTI registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

**Configuration**

CTILSR is in the Debug power domain.

If FEAT_Debugv8p4 is implemented, the Software Lock is not implemented.

Software uses CTILAR to set or clear the lock, and CTILSR to check the current status of the lock.

**Attributes**

CTILSR is a 32-bit register.

**Field descriptions**

The CTILSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>nTT</td>
</tr>
<tr>
<td>29</td>
<td>SLK</td>
</tr>
<tr>
<td>28</td>
<td>SLI</td>
</tr>
</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**nTT, bit [2]**

Not thirty-two bit access required. RAZ.

**SLK, bit [1]**

*When the Software Lock is implemented:*

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when the Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when the Software Lock is implemented, possible values of this field are:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Lock clear. Writes are permitted to this component’s registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>Lock set. Writes to this component's registers are ignored, and reads have no side effects.</td>
</tr>
</tbody>
</table>

On an External debug reset, this field resets to 1.
Otherwise:
Reserved, RAZ.

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

<table>
<thead>
<tr>
<th>SLI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Software Lock not implemented or not memory-mapped access.</td>
</tr>
<tr>
<td>0b1</td>
<td>Software Lock implemented and memory-mapped access.</td>
</tr>
</tbody>
</table>

Accessing the CTILSR

CTILSR can be accessed through a memory-mapped access to the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFB4</td>
<td>CTILSR</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
CTIOUTEN<\n>, CTI Input Channel to Output Trigger Enable registers, n = 0 - 31

The CTIOUTEN<\n> characteristics are:

**Purpose**

Defines which input channels generate output trigger n.

**Configuration**

CTIOUTEN<\n> is in the Debug power domain.

If output trigger n is not connected, the behavior of CTIOUTEN<\n> is IMPLEMENTATION DEFINED.

**Attributes**

CTIOUTEN<\n> is a 32-bit register.

**Field descriptions**

The CTIOUTEN<\n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| OUTEN31 | OUTEN30 | OUTEN29 | OUTEN28 | OUTEN27 | OUTEN26 | OUTEN25 | OUTEN24 | OUTEN23 | OUTEN22 | OUTEN21 | OUTEN20 | OUTEN19 | OUTEN18 | OUTEN17 | OUTEN16 | OUTEN15 | OUTEN14 | OUTEN13 | OUTEN12 | OUTEN11 | OUTEN10 | OUTEN9 | OUTEN8 | OUTEN7 | OUTEN6 | OUTEN5 | OUTEN4 | OUTEN3 | OUTEN2 | OUTEN1 | OUTEN0 |

OUTEN<\x>, bit \([x]\), for \(x = 31\) to \(0\)

Input channel <\x\> to output trigger <\n\> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID_NUMCHAN field.

Possible values of this bit are:

<table>
<thead>
<tr>
<th>OUTEN&lt;\x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An event on input channel &lt;\x&gt; will not cause output trigger &lt;\n&gt; to be asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>An event on input channel &lt;\x&gt; will cause output trigger &lt;\n&gt; to be asserted.</td>
</tr>
</tbody>
</table>

On an External debug reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CTIOUTEN<\n>**

CTIOUTEN<\n> can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x0A0 + (4 * (n))</td>
<td>CTIOUTEN&lt;\n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are RO.
- When !SoftwareLockStatus() accesses to this register are RW.
CTIOUTEN<n>, CTI Input Channel to Output Trigger Enable registers, n = 0 · 31

CTIPIDR0, CTI Peripheral Identification Register 0

The CTIPIDR0 characteristics are:

**Purpose**

Provides information to identify a CTI component.

For more information, see 'About the Peripheral identification scheme'.

**Configuration**

CTIPIDR0 is in the Debug power domain.

Implementation of this register is **OPTIONAL**.

This register is required for CoreSight compliance.

**Attributes**

CTIPIDR0 is a 32-bit register.

**Field descriptions**

The CTIPIDR0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| **RES0** |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | PART_0 |

**Bits [31:8]**

Reserved, RES0.

**PART_0, bits [7:0]**

Part number, least significant byte.

**Accessing the CTIPIDR0**

CTIPIDR0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFE0</td>
<td>CTIPIDR0</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
CTIPIDR1, CTI Peripheral Identification Register 1

The CTIPIDR1 characteristics are:

**Purpose**

Provides information to identify a CTI component.

For more information, see 'About the Peripheral identification scheme'.

**Configuration**

CTIPIDR1 is in the Debug power domain.

Implementation of this register is **OPTIONAL**.

This register is required for CoreSight compliance.

**Attributes**

CTIPIDR1 is a 32-bit register.

**Field descriptions**

The CTIPIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>30</td>
<td>Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is (0b1011).</td>
</tr>
<tr>
<td>29</td>
<td>Part number, most significant nibble.</td>
</tr>
</tbody>
</table>

**Accessing the CTIPIDR1**

CTIPIDR1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFE4</td>
<td>CTIPIDR1</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
The CTIPIDR2 characteristics are:

**Purpose**

Provides information to identify a CTI component.
For more information, see 'About the Peripheral identification scheme'.

**Configuration**

CTIPIDR2 is in the Debug power domain.
Implementation of this register is **OPTIONAL**.
This register is required for CoreSight compliance.

**Attributes**

CTIPIDR2 is a 32-bit register.

**Field descriptions**

The CTIPIDR2 bit assignments are:

</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**REVISION, bits [7:4]**

Part major revision. Parts can also use this field to extend Part number to 16-bits.

**JEDEC, bit [3]**

RAO. Indicates a JEP106 identity code is used.

**DES_1, bits [2:0]**

Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is 0b011.

**Accessing the CTIPIDR2**

CTIPIDR2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFE8</td>
<td>CTIPIDR2</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
CTIPIDR3, CTI Peripheral Identification Register 3

The CTIPIDR3 characteristics are:

**Purpose**

Provides information to identify a CTI component.

For more information, see 'About the Peripheral identification scheme'.

**Configuration**

CTIPIDR3 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

**Attributes**

CTIPIDR3 is a 32-bit register.

**Field descriptions**

The CTIPIDR3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:8</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>7:4</td>
<td>REVAND, Part minor revision</td>
</tr>
<tr>
<td>3:0</td>
<td>CMOD, Customer modified</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**REVAND, bits [7:4]**

Part minor revision. Parts using CTIPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.

**CMOD, bits [3:0]**

Customer modified. Indicates someone other than the Designer has modified the component.

**Accessing the CTIPIDR3**

CTIPIDR3 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFEC</td>
<td>CTIPIDR3</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
CTIPIDR4, CTI Peripheral Identification Register 4

The CTIPIDR4 characteristics are:

**Purpose**

Provides information to identify a CTI component.

For more information, see 'About the Peripheral identification scheme'.

**Configuration**

CTIPIDR4 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

**Attributes**

CTIPIDR4 is a 32-bit register.

**Field descriptions**

The CTIPIDR4 bit assignments are:

|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| RES0 | SIZE | DES_2 |

**Bits [31:8]**

Reserved, RES0.

**SIZE, bits [7:4]**

Size of the component. RAZ. \( \log_2 \) of the number of 4KB pages from the start of the component to the end of the component ID registers.

**DES_2, bits [3:0]**

Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is 0b0100.

**Accessing the CTIPIDR4**

CTIPIDR4 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFD0</td>
<td>CTIPIDR4</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
The CTITRIGINSTATUS characteristics are:

**Purpose**

Provides the status of the trigger inputs.

**Configuration**

CTITRIGINSTATUS is in the Debug power domain.

**Attributes**

CTITRIGINSTATUS is a 32-bit register.

**Field descriptions**

The CTITRIGINSTATUS bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| TRIN31 | TRIN30 | TRIN29 | TRIN28 | TRIN27 | TRIN26 | TRIN25 | TRIN24 | TRIN23 | TRIN22 | TRIN21 | TRIN20 | TRIN19 | TRIN18 | TRIN17 | TRIN16 | TRIN15 | TRIN14 | TRIN13 | TRIN12 | TRIN11 | TRIN10 | TRIN9 | TRIN8 | TRIN7 | TRIN6 | TRIN5 | TRIN4 | TRIN3 | TRIN2 | TRIN1 | TRIN0 |

TRIN<n>, bit [n], for n = 31 to 0

Trigger input <n> status.

Bits [31:N] are RAZ. N is the number of CTI triggers implemented as defined by the CTIDEVID.NUMTRIG field.

<table>
<thead>
<tr>
<th>TRIN&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Input trigger n is inactive.</td>
</tr>
<tr>
<td>0b1</td>
<td>Input trigger n is active.</td>
</tr>
</tbody>
</table>

Not implemented and not-connected input triggers are always inactive.

It is IMPLEMENTATION DEFINED whether an input trigger that does not support multicycle events can be observed as active.

**Accessing the CTITRIGINSTATUS**

CTITRIGINSTATUS can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x130</td>
<td>CTITRIGINSTATUS</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
CTITRIGOUTSTATUS, CTI Trigger Out Status register

The CTITRIGOUTSTATUS characteristics are:

**Purpose**

Provides the raw status of the trigger outputs, after processing by any IMPLEMENTATION DEFINED trigger interface logic. For output triggers that are self-acknowledging, this is only meaningful if the CTI implements multicycle channel events.

**Configuration**

CTITRIGOUTSTATUS is in the Debug power domain.

**Attributes**

CTITRIGOUTSTATUS is a 32-bit register.

**Field descriptions**

The CTITRIGOUTSTATUS bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>TROUT31</td>
<td>TROUT30</td>
<td>TROUT29</td>
<td>TROUT28</td>
<td>TROUT27</td>
<td>TROUT26</td>
<td>TROUT25</td>
<td>TROUT24</td>
<td>TROUT23</td>
<td>TROUT22</td>
<td>TROUT21</td>
<td>TROUT20</td>
<td>TROUT19</td>
<td>TROUT18</td>
<td>TROUT17</td>
<td>TROUT16</td>
<td>TROUT15</td>
<td>TROUT14</td>
<td>TROUT13</td>
<td>TROUT12</td>
<td>TROUT11</td>
<td>TROUT10</td>
<td>TROUT9</td>
<td>TROUT8</td>
<td>TROUT7</td>
<td>TROUT6</td>
<td>TROUT5</td>
<td>TROUT4</td>
<td>TROUT3</td>
<td>TROUT2</td>
<td>TROUT1</td>
<td>TROUT0</td>
</tr>
</tbody>
</table>

TROUT<><n>, bit [n], for n = 31 to 0

Trigger output <n> status.

Bits [31:N] are RAZ. N is the value in CTIDEVID.NUMTRIG.

If n < N, and output trigger <n> is implemented and connected, and either the trigger is not self-acknowledging or the CTI implements multicycle channel events, then permitted values for TROUT<n> are:

<table>
<thead>
<tr>
<th>TROUT&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Output trigger n is inactive.</td>
</tr>
<tr>
<td>0b1</td>
<td>Output trigger n is active.</td>
</tr>
</tbody>
</table>

Otherwise when n < N it is IMPLEMENTATION DEFINED whether TROUT<n> behaves as described here or is RAZ.

**Accessing the CTITRIGOUTSTATUS**

CTITRIGOUTSTATUS can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x134</td>
<td>CTITRIGOUTSTATUS</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
DBGAUTHSTATUS_EL1, Debug Authentication Status register

The DBGAUTHSTATUS_EL1 characteristics are:

**Purpose**

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

**Configuration**

External register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGAUTHSTATUS_EL1[31:0].

External register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGAUTHSTATUS[31:0].

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

DBGAUTHSTATUS_EL1 is a 32-bit register.

**Field descriptions**

The DBGAUTHSTATUS_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-8</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

**SNID, bits [7:6]**

When FEAT_Debugv8p4 is implemented:

Secure non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.SID.

Otherwise:

Secure non-invasive debug.

<table>
<thead>
<tr>
<th>SNID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 1.</td>
</tr>
<tr>
<td>0b10</td>
<td>Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE.</td>
</tr>
<tr>
<td>0b11</td>
<td>Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE.</td>
</tr>
</tbody>
</table>

All other values are reserved.
**SID, bits [5:4]**

Secure invasive debug.

<table>
<thead>
<tr>
<th>SID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 1.</td>
</tr>
<tr>
<td>0b10</td>
<td>Implemented and disabled. ExternalSecureInvasiveDebugEnabled() == FALSE.</td>
</tr>
<tr>
<td>0b11</td>
<td>Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**NSNID, bits [3:2]**

When FEAT_Debugv8p4 is implemented:

Non-secure non-invasive debug.

<table>
<thead>
<tr>
<th>NSNID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.</td>
</tr>
<tr>
<td>0b11</td>
<td>Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.</td>
</tr>
</tbody>
</table>

If the Effective value of SCR_EL3.NS is 1, or if EL3 is implemented and EL2 is not implemented, this field reads as 0b11.

All other values are reserved.

Otherwise:

Non-secure non-invasive debug.

<table>
<thead>
<tr>
<th>NSNID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.</td>
</tr>
<tr>
<td>0b10</td>
<td>Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE.</td>
</tr>
<tr>
<td>0b11</td>
<td>Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**NSID, bits [1:0]**

Non-secure invasive debug.

<table>
<thead>
<tr>
<th>NSID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.</td>
</tr>
<tr>
<td>0b10</td>
<td>Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE.</td>
</tr>
<tr>
<td>0b11</td>
<td>Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Accessing the DBGAUTHSTATUS_EL1**

DBGAUTHSTATUS_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
</table>
This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
The DBGCR<n>_EL1 characteristics are:

**Purpose**

Holds control information for a breakpoint. Forms breakpoint n together with value register DBGVR<n>_EL1.

**Configuration**

External register DBGCR<n>_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGCR<n>_EL1[31:0].

External register DBGCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGCR<n>[31:0].

DBGCR<n>_EL1 is in the Core power domain.

If breakpoint n is not implemented then accesses to this register are:

- RES0 when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess().
- A CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR otherwise.

**Attributes**

DBGCR<n>_EL1 is a 32-bit register.

**Field descriptions**

The DBGCR<n>_EL1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | BT | LBN | SSC | HMC | RES0 | BAS | RES0 | PMC | E |

When the E field is zero, all the other fields in the register are ignored.

**Bits [31:24]**

Reserved, RES0.

**BT, bits [23:20]**

Breakpoint Type. Possible values are:
### DBGBCR<n>_EL1, Debug Breakpoint Control Registers, n = 0 - 15

<table>
<thead>
<tr>
<th>BT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Unlinked instruction address match. DBGVR&lt;n&gt;_EL1 is the address of an instruction.</td>
</tr>
<tr>
<td>0b0001</td>
<td>As 0b0000 but linked to a Context matching breakpoint.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Unlinked Context ID match. When FEAT_VHE is implemented, EL2 is using AArch64, and the Effective value of HCR_EL2.E2H is 1, if either the PE is executing at EL0 with HCR_EL2.TGE set to 1 or the PE is executing at EL2, then DBGVR&lt;n&gt;_EL1.ContextID must match the CONTEXTIDR_EL2 value. Otherwise, DBGVR&lt;n&gt;_EL1.ContextID must match the CONTEXTIDR_EL1 value.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As 0b0010, with linking enabled.</td>
</tr>
<tr>
<td>0b0100</td>
<td>Unlinked instruction address mismatch. DBGBVR&lt;n&gt;_EL1 is the address of an instruction to be stepped.</td>
</tr>
<tr>
<td>0b0101</td>
<td>As 0b0100, with linking enabled.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Unlinked CONTEXTIDR_EL1 match. DBGVR&lt;n&gt;_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1.</td>

<tr>
<td>0b0111</td>
<td>As 0b0110, with linking enabled.</td>
</tr>
<tr>
<td>0b1000</td>
<td>Unlinked VMID match. DBGVR&lt;n&gt;_EL1.VMID is a VMID compared against VTTBR_EL2.VMID.</td>
</tr>
<tr>
<td>0b1001</td>
<td>As 0b1000, with linking enabled.</td>
</tr>
<tr>
<td>0b1010</td>
<td>Unlinked VMID and Context ID match. DBGVR&lt;n&gt;_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1, and DBGVR&lt;n&gt;_EL1.VMID is a VMID compared against VTTBR_EL2.VMID.</td>
</tr>
<tr>
<td>0b1011</td>
<td>As 0b1010, with linking enabled.</td>
</tr>
<tr>
<td>0b1100</td>
<td>Unlinked CONTEXTIDR_EL2 match. DBGVR&lt;n&gt;_EL1.ContextID2 is a Context ID compared against CONTEXTIDR_EL2.</td>
</tr>
<tr>
<td>0b1101</td>
<td>As 0b1100, with linking enabled.</td>
</tr>
<tr>
<td>0b1110</td>
<td>Unlinked Full Context ID match. DBGVR&lt;n&gt;_EL1.ContextID is compared against CONTEXTIDR_EL1, and DBGVR&lt;n&gt;_EL1.ContextID2 is compared against CONTEXTIDR_EL2.</td>
</tr>
<tr>
<td>0b1111</td>
<td>As 0b1110, with linking enabled.</td>
</tr>
</tbody>
</table>

Constraints on breakpoint programming mean some values are reserved under certain conditions.

For more information on the operation of the SSC, HMC, and PMC fields, and on the effect of programming this field to a reserved value, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' and 'Reserved DBGBCR<n>_EL1.BT values'.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

#### LBN, bits [19:16]

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an **UNKNOWN** value.

This field is ignored when the value of DBGBCR<n>_EL1.E is 0.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

#### SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information, including the effect of programming the fields to a reserved set of values, see 'Reserved DBGBCR<n>_EL1.{SSC, HMC, PMC} values'.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see DBGBCR<n>_EL1, SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [12:9]

Reserved, RES0.

BAS, bits [8:5]

When AArch32 is supported at any Exception level:

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints in either AArch32 or AArch64 state, the permitted values are:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Match instruction at</th>
<th>Constraint for debuggers</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0011</td>
<td>DBGVR&lt;n&gt;_EL1</td>
<td>Use for T32 instructions</td>
</tr>
<tr>
<td>0b1100</td>
<td>DBGVR&lt;n&gt;_EL1 + 2</td>
<td>Use for T32 instructions</td>
</tr>
<tr>
<td>0b1111</td>
<td>DBGVR&lt;n&gt;_EL1</td>
<td>Use for A64 and A32 instructions</td>
</tr>
</tbody>
</table>

All other values are reserved.

For more information, see 'Using the BAS field in Address Match breakpoints'.

For Address mismatch breakpoints in an AArch32 stage 1 translation regime, the permitted values are:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Match instruction at</th>
<th>Constraint for debuggers</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>-</td>
<td>Use for a match anywhere breakpoint</td>
</tr>
<tr>
<td>0b0011</td>
<td>DBGVR&lt;n&gt;_EL1</td>
<td>Use for stepping T32 instructions</td>
</tr>
<tr>
<td>0b1100</td>
<td>DBGVR&lt;n&gt;_EL1 + 2</td>
<td>Use for stepping T32 instructions</td>
</tr>
<tr>
<td>0b1111</td>
<td>DBGVR&lt;n&gt;_EL1</td>
<td>Use for stepping A64 and A32 instructions</td>
</tr>
</tbody>
</table>

For more information, see 'Using the BAS field in Address Match breakpoints'.

For Context matching breakpoints, this field is RES1 and ignored.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bits [4:3]

Reserved, RES0.

PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the DBGBCR<n>_EL1, SSC description.
For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**E**, bit [0]

Enable breakpoint **DBGBVR<n>_EL1**. Possible values are:

<table>
<thead>
<tr>
<th>E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Breakpoint disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Breakpoint enabled.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the DBGBCR<n> _EL1**

**Note**

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

**DBGBCR<n>_EL1 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x408 + (16 * n)</td>
<td>DBGBCR&lt;n&gt; _EL1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.
The DBGBVR\textsubscript{n} EL1 characteristics are:

**Purpose**

Holds a virtual address, or a VMID and/or a context ID, for use in breakpoint matching. Forms breakpoint \textit{n} together with control register DBGBCR\textsubscript{n} EL1.

**Configuration**

External register DBGBVR\textsubscript{n} EL1 bits [63:0] are architecturally mapped to AArch64 System register DBGBVR\textsubscript{n} EL1[63:0].

External register DBGBVR\textsubscript{n} EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGBVR\textsubscript{n} [31:0].

External register DBGBVR\textsubscript{n} EL1 bits [63:32] are architecturally mapped to AArch32 System register DBGXVR\textsubscript{n} [31:0].

DBGBVR\textsubscript{n} EL1 is in the Core power domain.

How this register is interpreted depends on the value of DBGBCR\textsubscript{n} EL1 BT.

- When DBGBCR\textsubscript{n} EL1 BT is 0b000x, this register holds a virtual address.
- When DBGBCR\textsubscript{n} EL1 BT is 0b001x, 0b011x, or 0b110x, this register holds a Context ID.
- When DBGBCR\textsubscript{n} EL1 BT is 0b100x, this register holds a VMID.
- When DBGBCR\textsubscript{n} EL1 BT is 0b101x, this register holds a VMID and a Context ID.
- When DBGBCR\textsubscript{n} EL1 BT is 0b111x, this register holds two Context ID values.

For other values of DBGBCR\textsubscript{n} EL1 BT, this register is RES0.

If breakpoint \textit{n} is not implemented then accesses to this register are:

- RES0 when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess().
- A CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR otherwise.

**Attributes**

DBGBVR\textsubscript{n} EL1 is a 64-bit register.

**Field descriptions**

The DBGBVR\textsubscript{n} EL1 bit assignments are:

**When DBGBCR\textsubscript{n} EL1.BT == 0b000x:**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-62</td>
<td>RES[14:4]</td>
</tr>
<tr>
<td>58-57</td>
<td>Bits[52:49]</td>
</tr>
<tr>
<td>48-47</td>
<td>VA[48:2]</td>
</tr>
<tr>
<td>31-0</td>
<td>RES0</td>
</tr>
</tbody>
</table>

**RESS[14:4], bits [63:53]:**

Reserved, Sign extended. Software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:
• The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
• The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

VA[52:49], bits [52:49]

When FEAT_LVA is implemented:

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

VA[48:2], bits [48:2]

If the address is being matched in an AArch64 stage 1 translation regime:

- This field contains bits[48:2] of the address for comparison.
- When FEAT_LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, VA[52:49] are RESS.

If the address is being matched in an AArch32 stage 1 translation regime, the first 20 bits of this field are RES0, and the rest of the field contains bits[31:2] of the address for comparison.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT == 0b001x:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | ContextID |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against CONTEXTIDR_EL2 when (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented), EL2 is using AArch64, HCR_EL2.E2H is 1, and either:

- The PE is executing at EL2.
- HCR_EL2.TGE is 1, the PE is executing at EL0, and EL2 is enabled in the current Security state.

Otherwise, the value is compared against the following:

- CONTEXTIDR when the PE is executing at AArch32.
- CONTEXTIDR_EL1 when the PE is executing at AArch64.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
When DBGBCR\(_{n}\)\_EL1.BT == 0b011x, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented):

<table>
<thead>
<tr>
<th>Bits [63:32]</th>
<th>RESERVED, RES0</th>
</tr>
</thead>
</table>

**ContextID, bits [31:0]**

Context ID value for comparison against CONTEXTIDR_EL1.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR\(_{n}\)\_EL1.BT == 0b100x and EL2 is implemented:

<table>
<thead>
<tr>
<th>Bits [63:48]</th>
<th>RESERVED, RES0</th>
</tr>
</thead>
</table>

**VMID[15:8], bits [47:40]**

When FEAT_VHE is implemented and VTCR_EL2.VS == 1:

Extension to VMID[7:0]. See DBGBVR\(_{n}\)\_EL1.VMID[7:0] for more details.

If EL2 is using AArch32, this field is RES0.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**VMID[7:0], bits [39:32]**

VMID value for comparison.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- VTCR_EL2.VS is 0.
- FEAT_VMID16 is not implemented.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [31:0]**

Reserved, RES0.
When DBGBCR<n>_EL1.BT == 0b101x and EL2 is implemented:

<p>| | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>62</td>
<td>61</td>
<td>60</td>
</tr>
<tr>
<td>59</td>
<td>58</td>
<td>57</td>
<td>56</td>
</tr>
<tr>
<td>55</td>
<td>54</td>
<td>53</td>
<td>52</td>
</tr>
<tr>
<td>51</td>
<td>50</td>
<td>49</td>
<td>48</td>
</tr>
<tr>
<td>47</td>
<td>46</td>
<td>45</td>
<td>44</td>
</tr>
<tr>
<td>43</td>
<td>42</td>
<td>41</td>
<td>40</td>
</tr>
<tr>
<td>39</td>
<td>38</td>
<td>37</td>
<td>36</td>
</tr>
<tr>
<td>35</td>
<td>34</td>
<td>33</td>
<td>32</td>
</tr>
<tr>
<td>RES0</td>
<td>VMID[15:8]</td>
<td>VMID[7:0]</td>
<td></td>
</tr>
</tbody>
</table>

Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

When FEAT_VMID16 is implemented and VTCR_EL2.VS == 1:

Extension to VMID[7:0]. See DBGVR<n>_EL1.VMID[7:0] for more details.

If EL2 is using AArch32, or if the implementation has an 8-bit VMID, this field is RES0.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- VTCR_EL2.VS is 0.
- FEAT_VMID16 is not implemented.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

ContextID, bits [31:0]

Context ID value for comparison.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>_EL1.BT == 0b110x, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented):

<p>| | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>62</td>
<td>61</td>
<td>60</td>
</tr>
<tr>
<td>59</td>
<td>58</td>
<td>57</td>
<td>56</td>
</tr>
<tr>
<td>55</td>
<td>54</td>
<td>53</td>
<td>52</td>

<td>38</td>
<td>37</td>
<td>36</td>
</tr>
<tr>
<td>35</td>
<td>34</td>
<td>33</td>
<td>32</td>
</tr>
<tr>
<td>ContextID2</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

ContextID2, bits [63:32]

Context ID value for comparison.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

Reserved, RES0.
When DBGBCR<n>_EL1.BT == 0b111x, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented):

<table>
<thead>
<tr>
<th>ContextID2</th>
<th>ContextID</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</td>
<td></td>
</tr>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
<td></td>
</tr>
</tbody>
</table>

ContextID2, bits [63:32]

Context ID value for comparison against CONTEXTIDR_EL2.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the DBGBVR<n>_EL1

**Note**

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

DBGBVR<n>_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x400 + (16 * n)</td>
<td>DBGBVR&lt;n&gt;_EL1</td>
<td>63:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
The DBGCLAIMCLR_EL1 characteristics are:

**Purpose**

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0.

The architecture does not define any functionality for the CLAIM tag bits.

**Note**

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the DBGCLAIMSET_EL1 register.

**Configuration**

External register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGCLAIMCLR_EL1[31:0].

External register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGCLAIMCLR[31:0].

DBGCLAIMCLR_EL1 is in the Core power domain.

An implementation must include eight CLAIM tag bits.

**Attributes**

DBGCLAIMCLR_EL1 is a 32-bit register.

**Field descriptions**

The DBGCLAIMCLR_EL1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| RAZ/SBZ | CLAIM |

**Bits [31:8]**

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

**CLAIM, bits [7:0]**

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.

Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

On a Cold reset, this field resets to 0.
Accessing the DBGCLAIMCLR_EL1

DBGCLAIMCLR_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFA4</td>
<td>DBGCLAIMCLR_EL1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
DBGCLAIMSET_EL1, Debug CLAIM Tag Set register

The DBGCLAIMSET_EL1 characteristics are:

Purpose

Used by software to set the CLAIM tag bits to 1.

The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the DBGCLAIMCLR_EL1 register.

Configuration

External register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGCLAIMSET_EL1[31:0].

External register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGCLAIMSET[31:0].

DBGCLAIMSET_EL1 is in the Core power domain.

An implementation must include eight CLAIM tag bits.

Attributes

DBGCLAIMSET_EL1 is a 32-bit register.

Field descriptions

The DBGCLAIMSET_EL1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RAZ/SBZ |
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | CLAIM |

Bits [31:8]

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

CLAIM, bits [7:0]

Set CLAIM tag bits.

This field is RAO.

Writing a 1 to one of these bits sets the corresponding CLAIM tag bit to 1. This is an indirect write to the CLAIM tag bits. A single write operation can set multiple CLAIM tag bits to 1.

Writing 0 to one of these bits has no effect.
Accessing the DBGCLAIMSET_EL1

DBGCLAIMSET_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFA0</td>
<td>DBGCLAIMSET_EL1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
DBGDTRRX_EL0, Debug Data Transfer Register, Receive

The DBGDTRRX_EL0 characteristics are:

**Purpose**

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communications Channel.

**Configuration**

External register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to AArch64 System register DBGDTRRX_EL0[31:0].

External register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRRXint[31:0].

DBGDTRRX_EL0 is in the Core power domain.

**Attributes**

DBGDTRRX_EL0 is a 32-bit register.

**Field descriptions**

The DBGDTRRX_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Index</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>Update DTRRX</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Update DTRRX.

Writes to this register:

- If RXfull is set to 1, set DTRRX to UNKNOWN.
- If RXfull is set to 0, update the value in DTRRX.

After the write, RXfull is set to 1.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRRX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull remains unchanged.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
Accessing the DBGDTRRX_EL0

If EDSCR.ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in memory access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

DBGDTRRX_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x080</td>
<td>DBGDTRRX_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
DBGDTRTX_EL0, Debug Data Transfer Register, Transmit

The DBGDTRTX_EL0 characteristics are:

**Purpose**

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communication Channel.

**Configuration**

External register DBGDTRTX_EL0 bits [31:0] are architecturally mapped to AArch64 System register DBGDTRTX_EL0[31:0].

External register DBGDTRTX_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRTXint[31:0].

DBGDTRTX_EL0 is in the Core power domain.

**Attributes**

DBGDTRTX_EL0 is a 32-bit register.

**Field descriptions**

The DBGDTRTX_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Return DTRTX</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Return DTRTX.

Reads of this register:

- If TXfull is set to 1, return the last value written to DTRTX.
- If TXfull is set to 0, return an UNKNOWN value.

After the read, TXfull is cleared to 0.

Writes to this register:

- If TXfull is set to 1, set DTRTX to UNKNOWN.
- If TXfull is set to 0, update the value in DTRTX.

After the write, TXfull remains unchanged.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
**Accessing the DBGDTRTX_EL0**

If `EDSCR.ITE == 0` when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in memory access mode that has not completed execution is **CONSTRAINED UNPREDICTABLE**, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an **UNKNOWN** state.

**DBGDTRTX_EL0 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x08C</td>
<td>DBGDTRTX_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `IsCorePowered(), !DoubleLockStatus(), !OSLockStatus()` and `SoftwareLockStatus()` accesses to this register are **RO**.
- When `IsCorePowered(), !DoubleLockStatus(), !OSLockStatus()` and `!SoftwareLockStatus()` accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.
DBGWCR<n>_EL1, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n>_EL1 characteristics are:

**Purpose**

Holds control information for a watchpoint. Forms watchpoint n together with value register DBGWVR<n>_EL1.

**Configuration**

External register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGWCR<n>_EL1[31:0].

External register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGWCR<n>[31:0].

DBGWCR<n>_EL1 is in the Core power domain.

If watchpoint n is not implemented then accesses to this register are:

- When IsCorePowered() && !DoubleLockStatus() && !IOSLockStatus() && AllowExternalDebugAccess(), RES0.
- Otherwise, a CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR.

**Attributes**

DBGWCR<n>_EL1 is a 32-bit register.

**Field descriptions**

The DBGWCR<n>_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>MASK</td>
</tr>
<tr>
<td>29</td>
<td>RES0</td>
</tr>
<tr>
<td>28</td>
<td>WT</td>
</tr>
<tr>
<td>27</td>
<td>LBN</td>
</tr>
<tr>
<td>26</td>
<td>SSC</td>
</tr>
<tr>
<td>25</td>
<td>HMC</td>
</tr>
<tr>
<td>24</td>
<td>BAS</td>
</tr>
<tr>
<td>23</td>
<td>LSC</td>
</tr>
<tr>
<td>22</td>
<td>PAC</td>
</tr>
<tr>
<td>21</td>
<td>E</td>
</tr>
</tbody>
</table>

When the E field is zero, all the other fields in the register are ignored.

**Bits [31:29]**

Reserved, RES0.

**MASK, bits [28:24]**

Address mask. Only objects up to 2GB can be watched using a single mask.

<table>
<thead>
<tr>
<th>MASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00000</td>
<td>No mask.</td>
</tr>
<tr>
<td>0b00001</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b00010</td>
<td>Reserved.</td>
</tr>
</tbody>
</table>

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCR<n>_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.
Other values mask the corresponding number of address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [23:21]**

Reserved, RES0.

**WT, bit [20]**

Watchpoint type. Possible values are:

<table>
<thead>
<tr>
<th>WT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Unlinked data address match.</td>
</tr>
<tr>
<td>0b1</td>
<td>Linked data address match.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**LBN, bits [19:16]**

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**SSC, bits [15:14]**

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**HMC, bit [13]**

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**BAS, bits [12:5]**

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by DBGWVR<n>_EL1 is being watched.

<table>
<thead>
<tr>
<th>BAS</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xxxx1xxxx</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1</td>
</tr>
<tr>
<td>xxxxx1x</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1 + 1</td>
</tr>
<tr>
<td>xxxxx1xx</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1 + 2</td>
</tr>
<tr>
<td>xxxx1xxx</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1 + 3</td>
</tr>
</tbody>
</table>

In cases where DBGWVR<n>_EL1 addresses a double-word:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Description, if DBGWVR&lt;n&gt;_EL1[2] == 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>xxx1xxxx</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1 + 4</td>
</tr>
<tr>
<td>xx1xxxxxx</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1 + 5</td>
</tr>
<tr>
<td>x1xxxxxxx</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1 + 6</td>
</tr>
<tr>
<td>1xxxxxxxx</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1 + 7</td>
</tr>
</tbody>
</table>
If \( \text{DBGWVR}_\text{n}_\text{EL1}[2] == 1 \), only BAS\[3:0\] is used. Arm deprecates setting \( \text{DBGWVR}_\text{n}_\text{EL1}[2] == 1 \).

The valid values for BAS are non-zero binary number all of whose set bits are contiguous. All other values are reserved and must not be used by software. See 'Reserved DBGWCR\<\text{n}>.BAS values'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

### LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

<table>
<thead>
<tr>
<th>LSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>001</td>
<td>Match instructions that load from a watchpointed address.</td>
</tr>
<tr>
<td>010</td>
<td>Match instructions that store to a watchpointed address.</td>
</tr>
<tr>
<td>011</td>
<td>Match instructions that load from or store to a watchpointed address.</td>
</tr>
</tbody>
</table>

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

### PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint \( n \) is generated. This field must be interpreted along with the SSC and HMC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

### E, bit [0]

Enable watchpoint \( n \). Possible values are:

<table>
<thead>
<tr>
<th>E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Watchpoint disabled.</td>
</tr>
<tr>
<td>01</td>
<td>Watchpoint enabled.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## Accessing the DBGWCR\<n>_EL1

**Note**

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

### DBGWCR\<n>_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x808 + (16 * ( n ))</td>
<td>DBGWCR&lt;n&gt;_EL1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
**DBGWVR<n>_EL1, Debug Watchpoint Value Registers, n = 0 - 15**

The **DBGWVR<n>_EL1** characteristics are:

**Purpose**

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register **DBGWCR<n>_EL1**.

**Configuration**

External register **DBGWVR<n>_EL1** bits [63:0] are architecturally mapped to AArch64 System register **DBGWVR<n>_EL1[63:0]**.

External register **DBGWVR<n>_EL1** bits [31:0] are architecturally mapped to AArch32 System register **DBGWVR<n>[31:0]**.

**DBGWVR<n>_EL1** is in the Core power domain.

If watchpoint n is not implemented then accesses to this register are:

- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess(), RES0.
- Otherwise, a CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR.

**Attributes**

**DBGWVR<n>_EL1** is a 64-bit register.

**Field descriptions**

The **DBGWVR<n>_EL1** bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

**RESS[14:4]**, bits [63:53]

Reserved. Sign extended. Hardware and software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

**VA[52:49]**, bits [52:49]

When **FEAT_LVA** is implemented:

On a Cold reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

**VA[48:2], bits [48:2]**

Bits[48:2] of the address value for comparison.

When FEAT_IVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, VA[52:49] are RESS.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [1:0]**

Reserved, RES0.

**Accessing the DBGWVR<n>_EL1**

---

**Note**

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

---

**DBGWVR<n>_EL1 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x800 + (16 * n)</td>
<td>DBGWVR&lt;n&gt;_EL1</td>
<td>63:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.
The EDAA32PFR characteristics are:

**Purpose**

Provides information about implemented PE features.

**Note**

The register mnemonic, EDAA32PFR, is derived from previous definitions of this register that defined this register only when AArch64 was not supported at any Exception level.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

It is IMPLEMENTATION DEFINED whether EDAA32PFR is implemented in the Core power domain or in the Debug power domain.

**Attributes**

EDAA32PFR is a 64-bit register.

**Field descriptions**

The EDAA32PFR bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | MSA frac | EL3 | EL2 | PMSA | VMSA |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:20]**

Reserved, RES0.

**MSA_frac, bits [19:16]**

When EDAA32PFR.PMSA == 0b0000 and EDAA32PFR.VMSA == 0b1111:

Memory System Architecture fractional field. This holds the information on additional Memory System Architectures supported. Defined values are:

<table>
<thead>
<tr>
<th>MSA_frac</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>PMSAv8-64 supported in all translation regimes. VMSAv8-64 not supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>PMSAv8-64 supported in all translation regimes. In addition to PMSAv8-64, stage 1 EL1&amp;0 translation regime also supports VMSAv8-64.</td>
</tr>
</tbody>
</table>

All other values are reserved.
Otherwise:

Reserved, RES0.

**EL3, bits [15:12]**

When EDPFR.EL3 == 0b0000:

AArch32 EL3 Exception level handling. Defined values are:

<table>
<thead>
<tr>
<th>EL3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL3 is not implemented or can be executed in AArch64 state.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EL3 can be executed in AArch32 state only.</td>
</tr>
</tbody>
</table>

All other values are reserved.

*Note*

EDPFR.EL3 indicates whether EL3 can only be executed in AArch32 state.

Otherwise:

Reserved, RAZ.

**EL2, bits [11:8]**

When EDPFR.EL2 == 0b0000:

AArch32 EL2 Exception level handling. Defined values are:

<table>
<thead>
<tr>
<th>EL2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL2 is not implemented or can be executed in AArch64 state.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EL2 can be executed in AArch32 state only.</td>
</tr>
</tbody>
</table>

All other values are reserved.

*Note*

EDPFR.EL2 indicates whether EL2 can only be executed in AArch32 state.

Otherwise:

Reserved, RAZ.

**PMSA, bits [7:4]**

Indicates support for a 32-bit PMSA. Defined values are:

<table>
<thead>
<tr>
<th>PMSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>PMSA-32 not supported.</td>
</tr>
<tr>
<td>0b0100</td>
<td>PMSA-32 supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**VMSA, bits [3:0]**
When $\text{EDAA32PFR.PMSA} \neq 0b0000$:

Indicates support for a VMSA in addition to a 32-bit PMSA Defined values are:

<table>
<thead>
<tr>
<th>VMSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>VMSA not supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

When $\text{EDAA32PFR.PMSA} == 0b0000$:

Defined values are:

<table>
<thead>
<tr>
<th>VMSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>VMSAv8-64 supported.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Memory system architecture described by</td>
</tr>
<tr>
<td></td>
<td>$\text{EDAA32PFR.MSA}_{frac}$.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Otherwise:

Reserved, RAZ.

**Accessing the EDAA32PFR**

**EDAA32PFR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xD60</td>
<td>EDAA32PFR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When $\text{IsCorePowered()}$ and $\text{!DoubleLockStatus()}$ accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.
EDACR, External Debug Auxiliary Control Register

The EDACR characteristics are:

**Purpose**

Allows implementations to support **IMPLEMENTATION DEFINED** controls.

**Configuration**

It is **IMPLEMENTATION DEFINED** whether EDACR is implemented in the Core power domain or in the Debug power domain.

If FEAT_DoPD is implemented, this register is implemented in the Core power domain.

If FEAT_DoPD is not implemented, the power domain that this register is implemented in is **IMPLEMENTATION DEFINED**.

Changing this register from its reset value causes **IMPLEMENTATION DEFINED** behavior, including possible deviation from the architecturally-defined behavior.

If the EDACR contains any control bits that must be preserved over power down, then these bits must be accessible by the external debug interface when the OS Lock is locked, **OSLSR_EL1** OSLK == 1, and when the Core is powered off.

**Attributes**

EDACR is a 32-bit register.

**Field descriptions**

The EDACR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**IMPLEMENTATION DEFINED**

**IMPLEMENTATION DEFINED**, bits [31:0]

**IMPLEMENTATION DEFINED**.

The following resets apply:

- If the register is implemented in the Core power domain:
  - On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
  - On an External debug reset, the value of this field is unchanged.
  - On a Warm reset, the value of this field is unchanged.

- If the register is implemented in the External debug power domain:
  - On a Cold reset, the value of this field is unchanged.
  - On an External debug reset, this field resets to an architecturally **UNKNOWN** value.
  - On a Warm reset, the value of this field is unchanged.
Accessing the EDACR

EDACR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x094</td>
<td>EDACR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register are IMPDEF.
EDCIDR0, External Debug Component Identification Register 0

The EDCIDR0 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Component Identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDCIDR0 is a 32-bit register.

Field descriptions

The EDCIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-8</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>7-0</td>
<td>PRMBL_0, Preamble</td>
</tr>
</tbody>
</table>

Accessing the EDCIDR0

EDCIDR0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFF0</td>
<td>EDCIDR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
The EDCIDR1 characteristics are:

**Purpose**

Provides information to identify an external debug component.

For more information, see 'About the Component Identification scheme'.

**Configuration**

Implementation of this register is **OPTIONAL**.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDCIDR1 is a 32-bit register.

**Field descriptions**

The EDCIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>CLASS</td>
<td>PRMBL_1</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**CLASS, bits [7:4]**

Component class.

<table>
<thead>
<tr>
<th>CLASS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1001</td>
<td>CoreSight component.</td>
</tr>
</tbody>
</table>

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

**PRMBL_1, bits [3:0]**

Preamble.

Reads as 0b0000.
Accessing the EDCIDR1

EDCIDR1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFF4</td>
<td>EDCIDR1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
EDCIDR2, External Debug Component Identification Register 2

The EDCIDR2 characteristics are:

**Purpose**

Provides information to identify an external debug component.

For more information, see 'About the Component Identification scheme'.

**Configuration**

Implementation of this register is **OPTIONAL**.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDCIDR2 is a 32-bit register.

**Field descriptions**

The EDCIDR2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>PRMBL_2</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_2, bits [7:0]**

Preamble.

Reads as 0x05.

**Accessing the EDCIDR2**

**EDCIDR2 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFF8</td>
<td>EDCIDR2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
EDCIDR3, External Debug Component Identification Register 3

The EDCIDR3 characteristics are:

**Purpose**

Provides information to identify an external debug component.

For more information, see 'About the Component Identification scheme'.

**Configuration**

Implementation of this register is **OPTIONAL**.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDCIDR3 is a 32-bit register.

**Field descriptions**

The EDCIDR3 bit assignments are:

|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

**Bits [31:8]**

Reserved, RES0.

**PRMBL_3, bits [7:0]**

Preamble.

Reads as 0xB1.

**Accessing the EDCIDR3**

EDCIDR3 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFFC</td>
<td>EDCIDR3</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
EDCDSR, External Debug Context ID Sample Register

The EDCDSR characteristics are:

**Purpose**

Contains the sampled value of the Context ID, captured on reading EDCSR[31:0].

**Configuration**

EDCDSR is in the Core power domain.

This register is present only when FEAT_PCSRv8 is implemented and FEAT_PCSRv8p2 is not implemented. Otherwise, direct accesses to EDCDSR are RES0.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

**Note**

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

**Attributes**

EDCDSR is a 32-bit register.

**Field descriptions**

The EDCDSR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**CONTEXTIDR, bits [31:0]**

Context ID. The value of CONTEXTIDR that is associated with the most recent EDCSR sample. When the most recent EDCSR sample was generated:

- If EL1 is using AArch64, then the Context ID is sampled from CONTEXTIDR_EL1.
- If EL1 is using AArch32, then the Context ID is sampled from CONTEXTIDR.
- If EL3 is implemented and is using AArch32, then CONTEXTIDR is a banked register, and EDCDSR samples the current banked copy of CONTEXTIDR for the Security state that is associated with the most recent EDCSR sample.

Because the value written to EDCDSR is an indirect read of CONTEXTIDR, it is CONstrained UNPredictable whether EDCDSR is set to the original or new value if EDCSR samples:

- An instruction that writes to CONTEXTIDR.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the EDCDSR**

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

EDCDSR, External Debug Context ID Sample Register
EDCIDSR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xA4</td>
<td>EDCIDSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
EDDEVAFF0, External Debug Device Affinity register 0

The EDDEVAFF0 characteristics are:

**Purpose**

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

**Configuration**

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

EDDEVAFF0 is a 32-bit register.

**Field descriptions**

The EDDEVAFF0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>MPIDR_EL1lo</td>
<td>MPIDR_EL1 low half. Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented Exception level.</td>
</tr>
</tbody>
</table>

**Accessing the EDDEVAFF0**

**EDDEVAFF0 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFA8</td>
<td>EDDEVAFF0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
EDDEVAFF1, External Debug Device Affinity register 1

The EDDEVAFF1 characteristics are:

**Purpose**

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

**Configuration**

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

EDDEVAFF1 is a 32-bit register.

**Field descriptions**

The EDDEVAFF1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**MPIDR_EL1hi, bits [31:0]**

MPIDR_EL1 high half. Read-only copy of the high half of MPIDR_EL1, as seen from the highest implemented Exception level.

**Accessing the EDDEVAFF1**

**EDDEVAFF1 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFAC</td>
<td>EDDEVAFF1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
EDDEVARCH, External Debug Device Architecture register

The EDDEVARCH characteristics are:

**Purpose**

Identifies the programmers' model architecture of the external debug component.

**Configuration**

Implementation of this register is **OPTIONAL**.

If FEAT_DoPD is implemented, this register is in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

EDDEVARCH is a 32-bit register.

**Field descriptions**

The EDDEVARCH bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ARCHITECT | PRESENT | REVISION | ARCHVER | ARCHPART |

**ARCHITECT, bits [31:21]**

Defines the architecture of the component. For debug, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

**PRESENT, bit [20]**

When set to 1, indicates that the DEVARCH is present.

This field is 1 in Armv8.

**REVISION, bits [19:16]**

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

For debug, the revision defined by Armv8-A is 0x0.

All other values are reserved.

**ARCHVER, bits [15:12]**

Defines the architecture version of the component. This is the same value as ID_AA64FR0_EL1, DebugVer and DBGDIDR, Version. The defined values of this field are:
<table>
<thead>
<tr>
<th>ARCHVER</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0110</td>
<td>Armv8.0 Debug architecture.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Armv8.0 Debug architecture with Virtualization Host Extensions.</td>
</tr>
<tr>
<td>0b1000</td>
<td>Armv8.2 Debug architecture.</td>
</tr>
<tr>
<td>0b1001</td>
<td>Armv8.4 Debug architecture.</td>
</tr>
</tbody>
</table>

FEAT_Debugv8p4 adds the functionality indicated by the value 0b1001. FEAT_Debugv8p2 adds the functionality indicated by the value 0b1000. If FEAT_VHE is not implemented, the only permitted value is 0b0110.

The fields ARCHVER and ARCHPART together form the field ARCHID, so that ARCHVER is ARCHID[15:12].

**ARCHPART, bits [11:0]**

<table>
<thead>
<tr>
<th>ARCHPART</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0xA15</td>
<td>The part number of the Armv8-A debug component.</td>
</tr>
</tbody>
</table>

The fields ARCHVER and ARCHPART together form the field ARCHID, so that ARCHPART is ARCHID[11:0].

**Accessing the EDDEVARCH**

EDDEVARCH can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFBC</td>
<td>EDDEVARCH</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
EDDEVID, External Debug Device ID register 0

The EDDEVID characteristics are:

**Purpose**

Provides extra information for external debuggers about features of the debug implementation.

**Configuration**

If FEAT_DoPD is implemented, this register is in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

EDDEVID is a 32-bit register.

**Field descriptions**

The EDDEVID bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:28</td>
<td>AuxRegs</td>
</tr>
<tr>
<td>27:24</td>
<td>DebugPower</td>
</tr>
<tr>
<td>23:8</td>
<td>PCSample</td>
</tr>
<tr>
<td>19:16</td>
<td>RES0</td>
</tr>
<tr>
<td>15:12</td>
<td>RES0</td>
</tr>
<tr>
<td>11:8</td>
<td>AuxRegs</td>
</tr>
<tr>
<td>7:4</td>
<td>DebugPower</td>
</tr>
<tr>
<td>3:0</td>
<td>RES0</td>
</tr>
</tbody>
</table>

**Bits [31:28]**

Reserved, RES0.

**AuxRegs, bits [27:24]**

Indicates support for Auxiliary registers. Defined values are:

<table>
<thead>
<tr>
<th>AuxRegs</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for External Debug Auxiliary Control Register, EDACR.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Bits [23:8]**

Reserved, RES0.

**DebugPower, bits [7:4]**

Indicates support for the FEAT_DoPD feature. Defined values are:

<table>
<thead>
<tr>
<th>DebugPower</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>FEAT_DoPD not implemented. Registers in the external debug interface register map are implemented in a mix of the Debug and Core power domains.</td>
</tr>
<tr>
<td>0b0001</td>
<td>FEAT_DoPD implemented. All registers in the external debug interface register map are implemented in the Core power domain.</td>
</tr>
</tbody>
</table>

FEAT_DoPD implements the functionality added by the value 0b0001.
All other values are reserved.

**PCSample, bits [3:0]**

Indicates the level of PC Sample-based Profiling support using external debug registers. Defined values are:

<table>
<thead>
<tr>
<th>PCSample</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>PC Sample-based Profiling Extension is not implemented in the external debug registers space.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Only EDPCSR and EDCIDSR are implemented. This option is only permitted if EL3 and EL2 are not implemented.</td>
</tr>
<tr>
<td>0b0011</td>
<td>EDPCSR, EDCIDSR, and EDVIDSR are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

When FEAT_PCSRv8p2 is implemented, the only permitted value is 0b0000.

**Note**

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of PMDEVID.PCSample.

**Accessing the EDDEVID**

**EDDEVID can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFC8</td>
<td>EDDEVID</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
EDDEVID1, External Debug Device ID register 1

The EDDEVID1 characteristics are:

**Purpose**

Provides extra information for external debuggers about features of the debug implementation.

**Configuration**

If FEAT_DoPD is implemented, this register is in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

EDDEVID1 is a 32-bit register.

**Field descriptions**

The EDDEVID1 bit assignments are:

|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| RES0 | PCSROffset |

**Bits [31:4]**

Reserved, RES0.

**PCSROffset, bits [3:0]**

This field indicates the offset applied to PC samples returned by reads of EDPCSR. Permitted values of this field in Armv8 are:

<table>
<thead>
<tr>
<th>PCSROffset</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EDPCSR not implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>EDPCSR implemented, and samples have no offset applied and do not sample the instruction set state in AArch32 state.</td>
</tr>
</tbody>
</table>

When FEAT_PCSRv8p2 is implemented, the only permitted value is 0b0000.

**Note**

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of PMDEVID.PCSample.

**Accessing the EDDEVID1**

**EDDEVID1 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFC4</td>
<td>EDDEVID1</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
EDDEVID2, External Debug Device ID register 2

The EDDEVID2 characteristics are:

**Purpose**

Reserved for future descriptions of features of the debug implementation.

**Configuration**

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

EDDEVID2 is a 32-bit register.

**Field descriptions**

The EDDEVID2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:0</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

**Accessing the EDDEVID2**

**EDDEVID2 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFC0</td>
<td>EDDEVID2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
EDDEVTYPE, External Debug Device Type register

The EDDEVTYPE characteristics are:

**Purpose**

Indicates to a debugger that this component is part of a PE’s debug logic.

**Configuration**

Implementation of this register is **OPTIONAL**.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

EDDEVTYPE is a 32-bit register.

**Field descriptions**

The EDDEVTYPE bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
<td></td>
</tr>
<tr>
<td>29</td>
<td>SUB</td>
<td>0x1</td>
</tr>
<tr>
<td>28</td>
<td>MAJOR</td>
<td>0x5</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SUB, bits [7:4]**

Subtype. Must read as 0x1 to indicate this is a component within a PE.

**MAJOR, bits [3:0]**

Major type. Must read as 0x5 to indicate this is a debug logic component.

**Accessing the EDDEVTYPE**

EDDEVTYPE can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFCC</td>
<td>EDDEVTYPE</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
EDDFR, External Debug Feature Register

The EDDFR characteristics are:

**Purpose**

Provides top level information about the debug system.

**Note**

Debuggers must use EDDEVARCH to determine the Debug architecture version.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

It is IMPLEMENTATION DEFINED whether EDDFR is implemented in the Core power domain or in the Debug power domain.

**Attributes**

EDDFR is a 64-bit register.

**Field descriptions**

The EDDFR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>43-40</td>
<td>TraceFilt</td>
<td>Armv8.4 Self-hosted Trace Extension version. Defined values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0b0000: Armv8.4 Self-hosted Trace Extension is not implemented.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0b0001: Armv8.4 Self-hosted Trace Extension is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_TRF implements the functionality added by 0b0001.

From Armv8.4, the permitted values are 0b0000 and 0b0001.

**Bits [39:32]**

Reserved, UNKNOWN.
CTX_CMPs, bits [31:28]

Number of breakpoints that are context-aware, minus 1. These are the highest numbered breakpoints.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64DFR0_EL1.CTX_CMPs.

Bits [27:24]

Reserved, RES0.

WRPs, bits [23:20]

Number of watchpoints, minus 1. The value of 0b0000 is reserved.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64DFR0_EL1.WRPs.

Bits [19:16]

Reserved, RES0.

BRPs, bits [15:12]

Number of breakpoints, minus 1. The value of 0b0000 is reserved.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64DFR0_EL1.BRPs.

PMUVer, bits [11:8]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'

Defined values are:

<table>
<thead>
<tr>
<th>PMUVer</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Performance Monitors Extension not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Performance Monitors Extension, PMUv3 implemented.</td>
</tr>
<tr>
<td>0b0100</td>
<td>PMUv3 for Armv8.1. As 0b0001, and also includes support for:</td>
</tr>
<tr>
<td></td>
<td>• Extended 16-bit PMEVTYPER&lt;n&gt;_EL0(evtCount field.</td>
</tr>
<tr>
<td></td>
<td>• If EL2 is implemented, the MDCR_EL2.HPMD control bit.</td>
</tr>
<tr>
<td>0b0101</td>
<td>PMUv3 for Armv8.4. As 0b0100, and also includes support for the PMMIR_EL1 register.</td>
</tr>
<tr>
<td>0b0110</td>
<td>PMUv3 for Armv8.5. As 0b0101, and also includes support for:</td>
</tr>
<tr>
<td></td>
<td>• 64-bit event counters.</td>
</tr>
<tr>
<td></td>
<td>• If EL2 is implemented, the MDCR_EL2.HCCD control bit.</td>
</tr>
<tr>
<td></td>
<td>• If EL3 is implemented, the MDCR_EL3.SCCD control bit.</td>
</tr>
<tr>
<td>0b0111</td>
<td>PMUv3 for Armv8.7. As 0b0110, and also includes support for:</td>
</tr>
<tr>
<td></td>
<td>• The PMCR_EL0.FZO and, if EL2 is implemented, MDCR_EL2.HPMFZO control bits.</td>
</tr>
<tr>
<td></td>
<td>• If EL3 is implemented, the MDCR_EL3.{MPMX,MCCD} control bits.</td>
</tr>
<tr>
<td>0b1111</td>
<td>IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.</td>
</tr>
</tbody>
</table>

All other values are reserved.
FEAT_PMUv3 implements the functionality identified by the value 0b0001.

FEAT_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT_PMUv3p7 implements the functionality identified by the value 0b0111.

From Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0001 is not permitted.

From Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.

From Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT_PMUv3 is implemented, the value 0b0110 is not permitted.

**TraceVer, bits [7:4]**

Trace support. Indicates whether System register interface to a PE trace unit is implemented. Defined values are:

<table>
<thead>
<tr>
<th>TraceVer</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>PE trace unit System registers not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>PE trace unit System registers implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

A value of 0b0000 only indicates that no System register interface to a PE trace unit is implemented. A PE trace unit might nevertheless be implemented without a System register interface.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64DFR0_EL1.TraceVer.

**Bits [3:0]**

Reserved, UNKNOWN.

**Accessing the EDDFR**

**EDDFR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xD28</td>
<td>EDDFR</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are RO.
- Otherwise accesses to this register are IMPDEF.

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xD2C</td>
<td>EDDFR</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are RO.
- Otherwise accesses to this register are IMPDEF.
EDECCR, External Debug Exception Catch Control Register

The EDECCR characteristics are:

**Purpose**

Controls Exception Catch debug events.

**Configuration**

External register EDECCR bits [31:0] are architecturally mapped to AArch64 System register OSECCR_EL1[31:0].

External register EDECCR bits [31:0] are architecturally mapped to AArch32 System register DBGOSECCR[31:0].

EDECCR is in the Core power domain.

**Attributes**

EDECCR is a 32-bit register.

**Field descriptions**

The EDECCR bit assignments are:

When FEAT_Debugv8p2 is implemented:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | NSR3 | NSR2 | NSR1 | NSR0 | SR3 | SR2 | SR1 | SR0 | NSE3 | NSE2 | NSE1 | NSE0 | SE3 | SE2 | SE1 | SE0 |

Bits [31:16]

- Reserved, RES0.

**NSR<n>, bit [n+12], for n = 3 to 0**

Controls Non-secure exception catch on exception return to EL<n> in conjunction with NSE<n>. For information, see 'Summary of Exception Catch debug event control'.

<table>
<thead>
<tr>
<th>NSR&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If the corresponding NSE&lt;n&gt; bit is 0, then Exception Catch debug events are disabled for Non-secure Exception level &lt;n&gt;. If the corresponding NSE&lt;n&gt; bit is 1, then Exception Catch debug events are enabled for exception entry, reset entry and exception return to Non-secure Exception level &lt;n&gt;.</td>
</tr>
<tr>
<td>0b1</td>
<td>If the corresponding NSE&lt;n&gt; bit is 0, then Exception Catch debug events are enabled for exception returns to Non-secure Exception level &lt;n&gt;. If the corresponding NSE&lt;n&gt; bit is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure Exception level &lt;n&gt;.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the PE behaves as if SCR_EL3.NS is set to 0, this field is reserved, RES0.

**Note**
It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level is permitted to generate an Exception Catch debug event.

A value of the NSR field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the NSR field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for NSR by a read of EDECCR is UNKNOWN.

On a Cold reset, this field resets to 0.

**SR<n>, bit [n+8], for n = 3 to 0**

Controls Secure exception catch on exception return to EL<n> in conjunction with SE<n>. For information, see ‘Summary of Exception Catch debug event control’.

<table>
<thead>
<tr>
<th>SR&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If the corresponding SE&lt;n&gt; bit is 0, then Exception Catch debug events are disabled for Secure Exception level &lt;n&gt;. If the corresponding SE&lt;n&gt; bit is 1, then Exception Catch debug events are enabled for exception entry, reset entry and exception return to Secure Exception level &lt;n&gt;.</td>
</tr>
<tr>
<td>0b1</td>
<td>If the corresponding SE&lt;n&gt; bit is 0, then Exception Catch debug events are enabled for exception returns to Secure Exception level &lt;n&gt;. If the corresponding SE&lt;n&gt; bit is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure Exception level &lt;n&gt;.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the PE behaves as if SCR_EL3.NS is set to 1, this field is reserved, RES0.

**Note**

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level is permitted to generate an Exception Catch debug event.

A value of the SR field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the SR field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for SR by a read of EDECCR is UNKNOWN.

On a Cold reset, this field resets to 0.

**NSE<n>, bit [n+4], for n = 3 to 0**

Coarse-grained Non-secure exception catch for EL<n>. This controls whether Exception Catch debug events are enabled for Non-secure EL<n>. This also controls:

- The behavior of exception catch on exception entry to EL<n>.
- The behavior of exception catch on exception return to EL<n> in conjunction with NSR<n>.

<table>
<thead>
<tr>
<th>NSE&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If the corresponding NSR&lt;n&gt; bit is 0, then Exception Catch debug events are disabled for Non-secure Exception level &lt;n&gt;. If the corresponding NSR&lt;n&gt; bit is 1, then Exception Catch debug events are enabled for exception returns to Non-secure Exception level &lt;n&gt;.</td>
</tr>
<tr>
<td>0b1</td>
<td>If the corresponding NSR&lt;n&gt; bit is 0, then Exception Catch debug events are enabled for exception entry, reset entry and exception return to Non-secure Exception level &lt;n&gt;. If the corresponding NSR&lt;n&gt; bit is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure Exception level &lt;n&gt;.</td>
</tr>
</tbody>
</table>
If EL3 is not implemented and the PE behaves as if \texttt{SCR\_EL3\_NS} is set to 0, this field is reserved, \texttt{RES0}.

A value of the NSE field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the NSE field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for NSE by a read of EDECCR is \texttt{UNKNOWN}.

On a Cold reset, this field resets to 0.

**SE\textsubscript{\textit{n}}, bit \textit{[n]}, for n = 3 to 0**

Coarse-grained Secure exception catch for EL\textsubscript{\textit{n}}. This field controls whether Exception Catch debug events are enabled for Secure EL\textsubscript{\textit{n}}.

- The behavior of exception catch on exception entry to EL\textsubscript{\textit{n}}.
- The behavior of exception catch on exception return to EL\textsubscript{\textit{n}} in conjunction with SR\textsubscript{\textit{n}}.

<table>
<thead>
<tr>
<th>SE\textsubscript{\textit{n}}</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0}</td>
<td>If the corresponding SR\textsubscript{\textit{n}} bit is 0, then Exception Catch debug events are disabled for Secure Exception level \textsubscript{\textit{n}}. If the corresponding SR\textsubscript{\textit{n}} bit is 1, then Exception Catch debug events are enabled for exception returns to Secure Exception level \textsubscript{\textit{n}}.</td>
</tr>
<tr>
<td>\texttt{0b1}</td>
<td>If the corresponding SR\textsubscript{\textit{n}} bit is 0, then Exception Catch debug events are enabled for exception entry, reset entry and exception return to Secure Exception level \textsubscript{\textit{n}}. If the corresponding SR\textsubscript{\textit{n}} bit is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure Exception level \textsubscript{\textit{n}}.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the PE behaves as if \texttt{SCR\_EL3\_NS} is set to 1, this field is reserved, \texttt{RES0}.

A value of the SE field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the SE field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for SE by a read of EDECCR is \texttt{UNKNOWN}.

On a Cold reset, this field resets to 0.

**Otherwise:**

<table>
<thead>
<tr>
<th>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0 NSE3 NSE2 NSE1 NSE0 SE3 SE2 SE1 SE0</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, \texttt{RES0}.

**NSE\textsubscript{\textit{n}}, bit \textit{[n+4]}, for n = 3 to 0**

Coarse-grained Non-secure exception catch. If EL3 and EL2 are not implemented and the PE behaves as if \texttt{SCR\_EL3\_NS} is set to 0, this field is reserved, \texttt{RES0}. Otherwise, possible values for this field are:

<table>
<thead>
<tr>
<th>NSE\textsubscript{\textit{n}}</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0}</td>
<td>Exception Catch debug events are disabled for Non-secure Exception level \textsubscript{\textit{n}}.</td>
</tr>
<tr>
<td>\texttt{0b1}</td>
<td>Exception Catch debug events are enabled for Non-secure Exception level \textsubscript{\textit{n}}.</td>
</tr>
</tbody>
</table>

A value of the NSE field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the NSE field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for NSE by a read of EDECCR is \texttt{UNKNOWN}. 
On a Cold reset, this field resets to 0.

**SE<n>, bit [n], for n = 3 to 0**

Coarse-grained Secure exception catch.

<table>
<thead>
<tr>
<th>SE&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Exception Catch debug events are disabled for Secure Exception level &lt;n&gt;.</td>
</tr>
<tr>
<td>0b1</td>
<td>Exception Catch debug events are enabled for Secure Exception level &lt;n&gt;.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the PE behaves as if SCR_EL3_NS is set to 1, this field is reserved, RES0.

A value of the SE field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the SE field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for SE by a read of EDECCR is UNKNOWN.

On a Cold reset, this field resets to 0.

**Accessing the EDECCR**

EDECCR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x098</td>
<td>EDECCR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
The EDECR characteristics are:

**Purpose**

Controls Halting debug events.

**Configuration**

If FEAT_DoPD is implemented, this register is in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

EDECR is a 32-bit register.

**Field descriptions**

The EDECR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>SS</td>
<td>RCE</td>
<td>OSUCE</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**SS, bit [2]**

Halting step enable. Possible values of this field are:

<table>
<thead>
<tr>
<th>SS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Halting step debug event disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Halting step debug event enabled.</td>
</tr>
</tbody>
</table>

If the value of EDECR.SS is changed when the PE is in Non-debug state, behavior is **CONSTRAINED UNPREDICTABLE** as described in 'Changing the value of EDECR.SS when not in Debug state'.

On a Cold reset, when FEAT_DoPD is implemented, this field resets to 0.

On an External debug reset, when FEAT_DoPD is not implemented, this field resets to 0.

**RCE, bit [1]**

**When FEAT_DoPD is not implemented:**

Reset Catch Enable.

<table>
<thead>
<tr>
<th>RCE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Reset Catch debug event disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reset Catch debug event enabled.</td>
</tr>
</tbody>
</table>

On an External debug reset, this field resets to 0.
Otherwise:

Reserved, RES0.

**OSUCE, bit [0]**

When FEAT_DoPD is not implemented:

OS Unlock Catch Enable.

<table>
<thead>
<tr>
<th>OSUCE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>OS Unlock Catch debug event disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>OS Unlock Catch debug event enabled.</td>
</tr>
</tbody>
</table>

On an External debug reset, this field resets to 0.

Otherwise:

Reserved, RES0.

**Accessing the EDECR**

**EDECR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x024</td>
<td>EDECR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When (FEAT_DoPD is not implemented or IsCorePowered()) and SoftwareLockStatus() accesses to this register are **RO**.
- When (FEAT_DoPD is not implemented or IsCorePowered()) and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.
EDESR, External Debug Event Status Register

The EDESR characteristics are:

**Purpose**

Indicates the status of internally pending Halting debug events.

**Configuration**

EDESR is in the Core power domain.

**Attributes**

EDESR is a 32-bit register.

**Field descriptions**

The EDESR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**SS, bit [2]**

*When FEAT_DoPD is implemented:*

Halting step debug event pending. Possible values of this field are:

<table>
<thead>
<tr>
<th>SS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Reading this means that a Halting step debug event is not pending.</td>
</tr>
<tr>
<td></td>
<td>Writing this means no action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reading this means that a Halting step debug event is pending.</td>
</tr>
<tr>
<td></td>
<td>Writing this clears the pending Halting step debug event.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.

*Otherwise:*

Halting step debug event pending. Possible values of this field are:

<table>
<thead>
<tr>
<th>SS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Reading this means that a Halting step debug event is not pending.</td>
</tr>
<tr>
<td></td>
<td>Writing this means no action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reading this means that a Halting step debug event is pending.</td>
</tr>
<tr>
<td></td>
<td>Writing this clears the pending Halting step debug event.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to the value in EDECR.SS.

**RC, bit [1]**

Reset Catch debug event pending. Possible values of this field are:
**RC, bit [0]**

Reset Catch debug event pending. Possible values of this field are:

<table>
<thead>
<tr>
<th>RC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Reading this means that a Reset Catch debug event is not pending. Writing this means no action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reading this means that a Reset Catch debug event is pending. Writing this clears the pending Reset Catch debug event.</td>
</tr>
</tbody>
</table>

On a Warm reset, when FEAT_DoPD is implemented, this field resets to the value in `CTIDEVCTL.RCE`. On a Warm reset, when FEAT_DoPD is not implemented, this field resets to the value in `EDECR.RCE`.

**OSUC, bit [0]**

OS Unlock Catch debug event pending. Possible values of this field are:

<table>
<thead>
<tr>
<th>OSUC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Reading this means that an OS Unlock Catch debug event is not pending. Writing this means no action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reading this means that an OS Unlock Catch debug event is pending. Writing this clears the pending OS Unlock Catch debug event.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**Accessing the EESR**

If a request to clear a pending Halting debug event is received at or about the time when halting becomes allowed, it is **CONSTRAINED UNPREDICTABLE** whether the event is taken.

If Core power is removed while a Halting debug event is pending, it is lost. However, it might become pending again when the Core is powered back on and Cold reset.

**EESR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x020</td>
<td>EESR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.
**EDITCTRL, External Debug Integration mode Control register**

The EDITCTRL characteristics are:

**Purpose**

Enables the external debug to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

**Configuration**

It is IMPLEMENTATION DEFINED whether EDITCTRL is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

**Attributes**

EDITCTRL is a 32-bit register.

**Field descriptions**

The EDITCTRL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-1</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>0</td>
<td>Integration mode enable (IME).</td>
</tr>
</tbody>
</table>

**IME, bit [0]**

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

<table>
<thead>
<tr>
<th>IME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Integration mode enabled.</td>
</tr>
</tbody>
</table>

The following resets apply:

- Whichever power domain the register is implemented in, this field resets to 0.
- Otherwise, the value of this field is unchanged.

**Accessing the EDITCTRL**

EDITCTRL can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xF00</td>
<td>EDITCTRL</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
EDITCTRL, External Debug Integration mode Control register

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register are **IMPDEF**.
EDITR, External Debug Instruction Transfer Register

The EDITR characteristics are:

**Purpose**

Used in Debug state for passing instructions to the PE for execution.

**Configuration**

EDITR is in the Core power domain.

**Attributes**

EDITR is a 32-bit register.

**Field descriptions**

The EDITR bit assignments are:

**When AArch32 is supported at any Exception level and in AArch32 state:**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    | T32Second |    | T32First |

T32Second, bits [31:16]

Second halfword of the T32 instruction to be executed on the PE. When EDITR contains a 16-bit T32 instruction, this field is ignored. For more information, see 'Behavior in Debug state'.

T32First, bits [15:0]

First halfword of the T32 instruction to be executed on the PE.

**When AArch64 is supported at any Exception level and in AArch64 state:**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    | A64 instruction to be executed on the PE |

Bits [31:0]

A64 instruction to be executed on the PE.

**Accessing the EDITR**

If EDSQRITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any instruction issued through the ITR in Normal access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

EDITR ignores writes if the PE is in Non-debug state.
EDITR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x084</td>
<td>EDITR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **WI**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **WO**.
- Otherwise accesses to this register generate an error response.
EDLAR, External Debug Lock Access Register

The EDLAR characteristics are:

**Purpose**

Allows or disallows access to the external debug registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

**Configuration**

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Software uses EDLAR to set or clear the lock, and EDLSR to check the current status of the lock.

**Attributes**

EDLAR is a 32-bit register.

**Field descriptions**

The EDLAR bit assignments are:

**When Software Lock is implemented:**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| **KEY** |

**KEY, bits [31:0]**

Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory-mapped interface.

**Otherwise:**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| **RES0** |

Otherwise

**Bits [31:0]**

Reserved, RES0.
Accessing the EDLAR

EDLAR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFB0</td>
<td>EDLAR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are WO.
- Otherwise accesses to this register generate an error response.
EDLSR, External Debug Lock Status Register

The EDLSR characteristics are:

**Purpose**

Indicates the current status of the software lock for external debug registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

**Configuration**

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Software uses EDLAR to set or clear the lock, and EDLSR to check the current status of the lock.

**Attributes**

EDLSR is a 32-bit register.

**Field descriptions**

The EDLSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>nTT</td>
</tr>
<tr>
<td>29</td>
<td>SLK</td>
</tr>
<tr>
<td>28</td>
<td>SLI</td>
</tr>
</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**nTT, bit [2]**

Not thirty-two bit access required. RAZ.

**SLK, bit [1]**

**When Software Lock is implemented:**

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when Software Lock is implemented, possible values of this field are:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Lock clear. Writes are permitted to this component's registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>Lock set. Writes to this component's registers are ignored, and reads have no side effects.</td>
</tr>
</tbody>
</table>

On a Cold reset, when FEAT_DoPD is implemented, this field resets to 1.

On an External debug reset, when FEAT_DoPD is not implemented, this field resets to 1.
Otherwise:

Reserved, RAZ.

**SLI, bit [0]**

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

<table>
<thead>
<tr>
<th>SLI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Software Lock not implemented or not memory-mapped access.</td>
</tr>
<tr>
<td>0b1</td>
<td>Software Lock implemented and memory-mapped access.</td>
</tr>
</tbody>
</table>

**Accessing the EDLSR**

**EDLSR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFB4</td>
<td>EDLSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
The EDPCSR characteristics are:

**Purpose**

Holds a sampled instruction address value.

**Configuration**

EDPCSR is in the Core power domain.

This register is present only when FEAT_PCSRv8 is implemented and FEAT_PCSRv8p2 is not implemented. Otherwise, direct accesses to EDPCSR are \texttt{RES0}.

EDPCSR is a pair of 32-bit registers.

If FEAT_VHE is implemented, the format of this register differs depending on the value of EDSCR.SC2.

Implemented only if the \texttt{OPTIONAL} PC Sample-based Profiling Extension is implemented in the external debug registers space.

**Note**

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

**Attributes**

EDPCSR is a 64-bit register.

**Field descriptions**

The EDPCSR bit assignments are:

**When FEAT_VHE is not implemented or EDSCR.SC2 == 0:**

**Bits [63:32]**

PC Sample high word, EDPCSRhi. If \texttt{EDVIDSR.HV} == 0 then this field is RAZ, otherwise bits [63:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from \texttt{EDVIDSR.\{NS,E2,E3\}}.

On a Cold reset, this field resets to an architecturally \texttt{UNKNOWN} value.

**Bits [31:0]**

PC Sample low word. EDPCSRlo, bits[31:0] of the sampled instruction address value.

EDPCSRlo reads as \texttt{0xFFFFFFFF} when any of the following are true:
The PE is in Debug state.
PC Sample-based profiling is prohibited.

If an instruction has retired since the PE left Reset state, then the first read of EDPCSR[31:0] is permitted but not required to return 0xFFFFFFFF.

EDPCSRlo reads as an UNKNOWN value when any of the following are true:

- The PE is in Reset state.
- No instruction has retired since the PE left Reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No instruction has retired since the last read of EDPCSR[31:0].

For the cases where a read of EDPCSR[31:0] returns 0xFFFFFFFF or an UNKNOWN value, the read has the side-effect of setting EDPCSRhi, EDCIDSR, and EDVIDSR to UNKNOWN values.

Otherwise, a read of EDPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to EDPCSRhi, EDCIDSR, and EDVIDSR. The translation regime that EDPCSR samples can be determined from EDVIDSR.\{NS,E2,E3\}.

For a read of EDPCSR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and EDPCSRhi, EDCIDSR, and EDVIDSR are unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

When FEAT_VHE is implemented and EDSRCR.SC2 == 1:

<table>
<thead>
<tr>
<th>NS</th>
<th>EL</th>
<th>RES0</th>
<th>PC Sample high word, EDPCSRhi</th>
<th>PC Sample low word</th>
<th>EDPCSR, External Debug Program Counter Sample Register</th>
</tr>
</thead>
</table>

**NS, bit [63]**
Non-secure state sample. Indicates the Security state that is associated with the most recent EDPCSR sample or, when it is read as a single atomic 64-bit read, the current EDPCSR sample. The translation regime that EDPCSR samples can be determined from EDPCSR.\{NS,EL\}.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sample is from Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Sample is from Non-secure state.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**EL, bits [62:61]**
Exception level status sample. Indicates the Exception level that is associated with the most recent EDPCSR sample or, when it is read as a single atomic 64-bit read, the current EDPCSR sample. The translation regime that EDPCSR samples can be determined from EDPCSR.\{NS,EL\}.

<table>
<thead>
<tr>
<th>EL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Sample is from EL0.</td>
</tr>
<tr>
<td>0b01</td>
<td>Sample is from EL1.</td>
</tr>
<tr>
<td>0b10</td>
<td>Sample is from EL2.</td>
</tr>
<tr>
<td>0b11</td>
<td>Sample is from EL3.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [60:56]**
Reserved, RES0.
Bits [55:32]

PC Sample high word, EDPCSRhi. Bits [55:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

PC Sample low word. EDPCSRlo, bits[31:0] of the sampled instruction address value.

EDPCSRlo reads as 0xFFFFFFFF when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If an instruction has retired since the PE left Reset state, then the first read of EDPCSR[31:0] is permitted but not required to return 0xFFFFFFFF.

EDPCSRlo reads as an UNKNOWN value when any of the following are true:

- The PE is in Reset state.
- No instruction has retired since the PE left Reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No instruction has retired since the last read of EDPCSR[31:0].

For the cases where a read of EDPCSR[31:0] returns 0xFFFFFFFF or an UNKNOWN value, the read has the side-effect of setting EDPCSRhi, EDCIDSR, and EDVIDSR to UNKNOWN values.

Otherwise, a read of EDPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to EDPCSRhi, EDCIDSR, and EDVIDSR. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

For a read of EDPCSR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and EDPCSRhi, EDCIDSR, and EDVIDSR are unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the EDPCSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'

EDPCSR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x0A0</td>
<td>EDPCSR</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x0AC</td>
<td>EDPCSR</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
EDPFR, External Debug Processor Feature Register

The EDPFR characteristics are:

**Purpose**

Provides information about implemented PE features.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

It is IMPLEMENTATION DEFINED whether EDPFR is implemented in the Core power domain or in the Debug power domain.

**Attributes**

EDPFR is a 64-bit register.

**Field descriptions**

The EDPFR bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| UNKNOWN | UNKNOWN | RES0 | UNKNOWN | AMU | UNKNOWN | SEL2 | SVE |
| UNKNOWN | GIC | AdvSIMD | FP | EL3 | EL2 | EL1 | EL0 |

**Bits [63:60]**

From Armv8.5:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

**Bits [59:56]**

From Armv8.5:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

**Bits [55:52]**

Reserved, RES0.
Bits [51:48]
From Armv8.4:
Reserved, UNKNOWN.

Otherwise:
Reserved, RES0.

AMU, bits [47:44]
Indicates support for Activity Monitors Extension. Defined values are:

<table>
<thead>
<tr>
<th>AMU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Activity Monitors Extension is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>FEAT_AMUv1 is implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_AMUv1 implements the functionality identified by the value 0b0001.

FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0010.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

Bits [43:40]
From Armv8.2:
Reserved, UNKNOWN.

Otherwise:
Reserved, RES0.

SEL2, bits [39:36]
Secure EL2. Defined values are:

<table>
<thead>
<tr>
<th>SEL2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Secure EL2 is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Secure EL2 is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

SVE, bits [35:32]
Scalable Vector Extension. Defined values are:

<table>
<thead>
<tr>
<th>SVE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SVE is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SVE is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Bits [31:28]
From Armv8.2:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

**GIC, bits [27:24]**

System register GIC interface support. Defined values are:

<table>
<thead>
<tr>
<th>GIC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>GIC CPU interface system registers not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.</td>
</tr>
<tr>
<td>0b0011</td>
<td>System register interface to version 4.1 of the GIC CPU interface is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of `ID_AA64PFR0_EL1.GIC`.

**AdvSIMD, bits [23:20]**

Advanced SIMD. Defined values are:

<table>
<thead>
<tr>
<th>AdvSIMD</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0000 | Advanced SIMD is implemented, including support for the following SISD and SIMD operations:  
• Integer byte, halfword, word and doubleword element operations.  
• Single-precision and double-precision floating-point arithmetic.  
• Conversions between single-precision and half-precision data types, and double-precision and half-precision data types. |
| 0b0001 | As for 0b0000, and also includes support for half-precision floating-point arithmetic. |
| 0b1111 | Advanced SIMD is not implemented.                                      |

All other values are reserved.

This field must have the same value as the FP field.

The permitted values are:

• 0b0000 in an implementation with Advanced SIMD support, that does not include the FEAT_FP16 extension.  
• 0b0001 in an implementation with Advanced SIMD support, that includes the FEAT_FP16 extension.  
• 0b1111 in an implementation without Advanced SIMD support.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of `ID_AA64PFR0_EL1.AdvSIMD`.

**FP, bits [19:16]**

Floating-point. Defined values are:
Meaning

<table>
<thead>
<tr>
<th>FP</th>
<th>Floating-point is implemented, and includes support for:</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>• Single-precision and double-precision floating-point types.</td>
</tr>
<tr>
<td></td>
<td>• Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.</td>
</tr>
<tr>
<td>0b0001</td>
<td>As for 0b0000, and also includes support for half-precision floating-point arithmetic.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Floating-point is not implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field must have the same value as the AdvSIMD field.

The permitted values are:

- 0b0000 in an implementation with floating-point support, that does not include the FEAT_FP16 extension.
- 0b0001 in an implementation with floating-point support, that includes the FEAT_FP16 extension.
- 0b1111 in an implementation without floating-point support.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64PFR0_EL1.FP.

### EL3, bits [15:12]

AArch64 EL3 Exception level handling. Defined values are:

<table>
<thead>
<tr>
<th>EL3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL3 is not implemented or cannot be executed in AArch64 state.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EL3 can be executed in AArch64 state only.</td>
</tr>
<tr>
<td>0b0010</td>
<td>EL3 can be executed in both Execution states.</td>
</tr>
</tbody>
</table>

When the value of EDAA32PFR.EL3 is non-zero, this field must be 0b0000.

All other values are reserved.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64PFR0_EL1.EL3.

### EL2, bits [11:8]

AArch64 EL2 Exception level handling. Defined values are:

<table>
<thead>
<tr>
<th>EL2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL2 is not implemented or cannot be executed in AArch64 state.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EL2 can be executed in AArch64 state only.</td>
</tr>
<tr>
<td>0b0010</td>
<td>EL2 can be executed in both Execution states.</td>
</tr>
</tbody>
</table>

When the value of EDAA32PFR.EL2 is non-zero, this field must be 0b0000.

All other values are reserved.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64PFR0_EL1.EL2.

### EL1, bits [7:4]

AArch64 EL1 Exception level handling. Defined values are:

<table>
<thead>
<tr>
<th>EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL1 cannot be executed in AArch64 state.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EL1 can be executed in AArch64 state only.</td>
</tr>
<tr>
<td>0b0010</td>
<td>EL1 can be executed in both Execution states.</td>
</tr>
</tbody>
</table>
All other values are reserved.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64PFR0_EL1.EL0.

### EL0, bits [3:0]

AArch64 EL0 Exception level handling. Defined values are:

<table>
<thead>
<tr>
<th>EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL0 cannot be executed in AArch64 state.</td>
</tr>
<tr>
<td></td>
<td>EL0 can be executed in AArch32 state only.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EL0 can be executed in AArch64 state only.</td>
</tr>
<tr>
<td>0b0010</td>
<td>EL0 can be executed in both Execution states.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64PFR0_EL1.EL0.

### Accessing the EDPFR

**EDPFR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xD20</td>
<td>EDPFR</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xD24</td>
<td>EDPFR</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.
The EDPIDR0 characteristics are:

**Purpose**

Provides information to identify an external debug component.
For more information, see 'About the Peripheral identification scheme'.

**Configuration**

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDPIDR0 is a 32-bit register.

**Field descriptions**

The EDPIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>30</td>
<td>PART_0</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PART_0, bits [7:0]**

Part number, least significant byte.

**Accessing the EDPIDR0**

EDPIDR0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFE0</td>
<td>EDPIDR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
**EDPIDR1, External Debug Peripheral Identification Register 1**

The EDPIDR1 characteristics are:

**Purpose**

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

**Configuration**

Implementation of this register is **OPTIONAL**.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDPIDR1 is a 32-bit register.

**Field descriptions**

The EDPIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td>Reserved</td>
</tr>
<tr>
<td>30</td>
<td>DES_0</td>
<td>Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is 0b1011.</td>
</tr>
<tr>
<td>29</td>
<td>PART_1</td>
<td>Part number, most significant nibble.</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**DES_0, bits [7:4]**

Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is 0b1011.

**PART_1, bits [3:0]**

Part number, most significant nibble.

**Accessing the EDPIDR1**

**EDPIDR1 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFE4</td>
<td>EDPIDR1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
EDPIDR2, External Debug Peripheral Identification Register 2

The EDPIDR2 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is \textit{OPTIONAL}.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDPIDR2 is a 32-bit register.

Field descriptions

The EDPIDR2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit positions</th>
<th>Bit name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[31:8]</td>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>[7:4]</td>
<td>REVISION</td>
<td>Part major revision. Parts can also use this field to extend Part number to 16-bits.</td>
</tr>
<tr>
<td>[3]</td>
<td>JEDEC</td>
<td>RAO. Indicates a JEP106 identity code is used.</td>
</tr>
<tr>
<td>[2:0]</td>
<td>DES_1</td>
<td>Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is 0b011.</td>
</tr>
</tbody>
</table>

Accessing the EDPIDR2

EDPIDR2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFE8</td>
<td>EDPIDR2</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
EDPIDR3, External Debug Peripheral Identification Register 3

The EDPIDR3 characteristics are:

**Purpose**

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

**Configuration**

Implementation of this register is *OPTIONAL*.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDPIDR3 is a 32-bit register.

**Field descriptions**

The EDPIDR3 bit assignments are:

<table>

</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**REVAND, bits [7:4]**

Part minor revision. Parts using EDPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.

**CMOD, bits [3:0]**

Customer modified. Indicates someone other than the Designer has modified the component.

**Accessing the EDPIDR3**

EDPIDR3 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFEC</td>
<td>EDPIDR3</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
EDPIDR4, External Debug Peripheral Identification Register 4

The EDPIDR4 characteristics are:

**Purpose**

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

**Configuration**

Implementation of this register is **OPTIONAL**.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDPIDR4 is a 32-bit register.

**Field descriptions**

The EDPIDR4 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>SIZE</td>
</tr>
<tr>
<td>29</td>
<td>DES_2</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SIZE, bits [7:4]**

Size of the component. RAZ. Log2 of the number of 4KB pages from the start of the component to the end of the component ID registers.

**DES_2, bits [3:0]**

Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is 0b0100.

**Accessing the EDPIDR4**

**EDPIDR4 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFD0</td>
<td>EDPIDR4</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
EDPRCR, External Debug Power/Reset Control Register

The EDPRCR characteristics are:

**Purpose**

Controls the PE functionality related to powerup, reset, and powerdown.

**Configuration**

EDPRCR contains fields that are in the Core power domain and fields that are in the Debug power domain.

If FEAT_DoPD is implemented then all fields in this register are in the Core power domain.

CORENPDRQ is the only field that is mapped between the EDPRCR and DBGPRCR and DBGPRCR_EL1.

**Attributes**

EDPRCR is a 32-bit register.

**Field descriptions**

The EDPRCR bit assignments are:

**When FEAT_DoPD is implemented:**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | CWRR | CORENPDRQ |

**Bits [31:2]**

Reserved, RES0.

**CWRR, bit [1]**

Warm reset request.

The extent of the reset is IMPLEMENTATION DEFINED, but must be one of:

- The request is ignored.
- Only this PE is Warm reset.
- This PE and other components of the system, possibly including other PEs, are Warm reset.

Arm deprecates use of this bit, and recommends that implementations ignore the request.

<table>
<thead>
<tr>
<th>CWRR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Request Warm reset.</td>
</tr>
</tbody>
</table>

This field is in the Core power domain

The PE ignores writes to this bit if any of the following are true:

- ExternalInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Non-secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Secure state.
• ExternalSecureInvasiveDebugEnabled() == FALSE and EL3 is implemented.

In an implementation that includes the recommended external debug interface, this bit drives the DBGRSTREQ signal.

On a Warm reset, this field resets to 0.

Accessing this field has the following behavior:

• When OSLockStatus() or SoftwareLockStatus(), access to this field is RAZ/WI.
• Otherwise, access to this field is WO/RAZ.

CORENPDRQ, bit [0]

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

<table>
<thead>
<tr>
<th>CORENPDRQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If the system responds to a powerdown request, it powers down Core power domain.</td>
</tr>
<tr>
<td>0b1</td>
<td>If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.</td>
</tr>
</tbody>
</table>

When this bit reads as UNKNOWN, the PE ignores writes to this bit.

This field is in the Core power domain, and permitted accesses to this field map to the DBGPRCR CORENPDRQ and DBGPRCR_EL1 CORENPDRQ fields.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the Cold reset value on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states, see 'Core power domain power states'.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a Cold reset, if the powerup request is implemented and the powerup request has been asserted, this field is an IMPLEMENTATION DEFINED choice of 0 or 1. If the powerup request is not asserted, this field is set to 0.

Accessing this field has the following behavior:

• When OSLockStatus(), access to this field is UNKNOWN/WI.
• When SoftwareLockStatus(), access to this field is RO.
• Otherwise, access to this field is RW.

Otherwise:

<table>
<thead>
<tr>
<th>Bits [31:4]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

COREPURQ, bit [3]

Core powerup request. Allows a debugger to request that the power controller power up the core, enabling access to the debug register in the Core power domain, and that the power controller emulates powerdown.
This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

<table>
<thead>
<tr>
<th>COREPURQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not request power up of the Core power domain.</td>
</tr>
<tr>
<td>0b1</td>
<td>Request power up of the Core power domain, and emulation of powerdown.</td>
</tr>
</tbody>
</table>

In an implementation that includes the recommended external debug interface, this bit drives the DBGPWRUPREQ signal.

This field is in the Debug power domain and can be read and written when the Core power domain is powered off.

**Note**

 Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On an External debug reset, this field resets to 0.

Accessing this field has the following behavior:

- When SoftwareLockStatus(), access to this field is RO.
- Otherwise, access to this field is RW.

**Bit [2]**

Reserved, RES0.

**CWRR, bit [1]**

Warm reset request.

The extent of the reset is IMPLEMENTATION DEFINED, but must be one of:

- The request is ignored.
- Only this PE is Warm reset.
- This PE and other components of the system, possibly including other PEs, are Warm reset.

Arm deprecates use of this bit, and recommends that implementations ignore the request.

<table>
<thead>
<tr>
<th>CWRR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Request Warm reset.</td>
</tr>
</tbody>
</table>

This field is in the Core power domain

The PE ignores writes to this bit if any of the following are true:

- ExternalInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Non-secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE and EL3 is implemented.

In an implementation that includes the recommended external debug interface, this bit drives the DBGRSTREQ signal.

On a Warm reset, this field resets to 0.

Accessing this field has the following behavior:

- When !IsCorePowered(), or DoubleLockStatus(), or OSLockStatus() or SoftwareLockStatus(), access to this field is RAZ/WI.
- Otherwise, access to this field is WO/RAZ.
CORENPDRQ, bit [0]

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

<table>
<thead>
<tr>
<th>CORENPDRQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If the system responds to a powerdown request, it powers down Core power domain.</td>
</tr>
<tr>
<td>0b1</td>
<td>If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.</td>
</tr>
</tbody>
</table>

When this bit reads as UNKNOWN, the PE ignores writes to this bit.

This field is in the Core power domain, and permitted accesses to this field map to the DBGPRCR, CORENPDRQ and DBGPRCR_EL1, CORENPDRQ fields.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of EDPRCR, COREPURQ on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states, see 'Core power domain power states'.

Note

 Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a Cold reset, this field resets to the value in EDPRCR, COREPURQ.

Accessing this field has the following behavior:

- When !IsCorePowered(), or DoubleLockStatus() or OSLockStatus(), access to this field is UNKNOWN/WI.
- When SoftwareLockStatus(), access to this field is RO.
- Otherwise, access to this field is RW.

Accessing the EDPRCR

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.

EDPRCR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x310</td>
<td>EDPRCR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When (FEAT_DoPD is not implemented or IsCorePowered()) and SoftwareLockStatus() accesses to this register are RO.
- When (FEAT_DoPD is not implemented or IsCorePowered()) and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
EDPRSR, External Debug Processor Status Register

The EDPRSR characteristics are:

**Purpose**

Holds information about the reset and powerdown state of the PE.

**Configuration**

EDPRSR contains fields that are in the Core power domain and fields that are in the Debug power domain.

If FEAT_DoPD is implemented then all fields in this register are in the Core power domain.

**Attributes**

EDPRSR is a 32-bit register.

**Field descriptions**

The EDPRSR bit assignments are:

\[
\begin{array}{ccccccccccccc}
\hline
\text{RES0} & \text{SDR} & \text{SPMAD} & \text{EPMAD} & \text{SDAD} & \text{EDAD} & \text{DLK} & \text{OSLK} & \text{HALTED} & \text{SR} & \text{R} & \text{SPD} & \text{PU} \\
\end{array}
\]

**Bits [31:12]**

Reserved, RES0.

**SDR, bit [11]**

Sticky Debug Restart. Set to 1 when the PE exits Debug state.

Permitted values are:

<table>
<thead>
<tr>
<th>SDR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The PE has not restarted since EDPRSR was last read.</td>
</tr>
<tr>
<td>0b1</td>
<td>The PE has restarted since EDPRSR was last read.</td>
</tr>
</tbody>
</table>

**Note**

If a reset occurs when the PE is in Debug state, the PE exits Debug state. SDR is \textit{UNKNOWN} on Warm reset, meaning a debugger must also use the SR bit to determine whether the PE has left Debug state.

If The Core power domain is powered up, then following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is \textit{CONSTRAINED UNPREDICTABLE} whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

On a Warm reset, this field resets to an architecturally \textit{UNKNOWN} value.

Accessing this field has the following behavior:

- When (FEAT_DoPD is not implemented and !IsCorePowered()), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is \textit{UNKNOWN/WI}. 

Page 3482
When SoftwareLockStatus(), access to this field is RO.

Otherwise, access to this field is RC/WI.

**SPMAD, bit [10]**

When FEAT_Debugv8p4 is implemented:

Sticky EPMAD error. Set to 1 if an external debug interface access to a Performance Monitors register returns an error because AllowExternalPMUAccess() == FALSE.

Permitted values are:

<table>
<thead>
<tr>
<th>SPMAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No Non-secure external debug interface accesses to the external Performance Monitors registers have failed because AllowExternalPMUAccess() == FALSE for the access since EDPRSR was last read.</td>
</tr>
<tr>
<td>0b1</td>
<td>At least one Non-secure external debug interface access to the external Performance Monitors register has failed and returned an error because AllowExternalPMUAccess() == FALSE for the access since EDPRSR was last read.</td>
</tr>
</tbody>
</table>

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, this bit clears to 0.
- If FEAT_DoubleLock is implemented, and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- When (FEAT_DoPD is not implemented and !IsCorePowered()), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is UNKNOWN/WI.
- When SoftwareLockStatus(), access to this field is RO.
- Otherwise, access to this field is RC/WI.

**Otherwise:**

Sticky EPMAD error.

<table>
<thead>
<tr>
<th>SPMAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No external debug interface accesses to the Performance Monitors registers have failed because AllowExternalPMUAccess() == FALSE since EDPRSR was last read.</td>
</tr>
<tr>
<td>0b1</td>
<td>At least one external debug interface access to the Performance Monitors registers has failed and returned an error because AllowExternalPMUAccess() == FALSE since EDPRSR was last read.</td>
</tr>
</tbody>
</table>

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, this bit clears to 0.
- If FEAT_DoubleLock is implemented, and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- When (FEAT_DoPD is not implemented and !IsCorePowered()), or OSIStatus(), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is UNKNOWN/WI.
- When SoftwareLockStatus(), access to this field is RO.
• Otherwise, access to this field is RC/WI.

**EPMAD, bit [9]**

*When FEAT_Debugv8p4 is implemented:*

External Performance Monitors Access Disable status.

<table>
<thead>
<tr>
<th>EPMAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>External Non-secure Performance Monitors access enabled. AllowExternalPMUAccess() == TRUE for a Non-secure access.</td>
</tr>
<tr>
<td>0b1</td>
<td>External Non-secure Performance Monitors access disabled. AllowExternalPMUAccess() == FALSE for a Non-secure access.</td>
</tr>
</tbody>
</table>

This field is in the Core power domain.

Accessing this field has the following behavior:

- When (FEAT_DoPD is not implemented and !IsCorePowered()), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

**Otherwise:**

External Performance Monitors access disable status.

<table>
<thead>
<tr>
<th>EPMAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>External Performance Monitors access enabled. AllowExternalPMUAccess() == TRUE.</td>
</tr>
<tr>
<td>0b1</td>
<td>External Performance Monitors access disabled. AllowExternalPMUAccess() == FALSE.</td>
</tr>
</tbody>
</table>

This field is in the Core power domain.

Accessing this field has the following behavior:

- When (FEAT_DoPD is not implemented and !IsCorePowered()), or OSLockStatus(), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

**SDAD, bit [8]**

*When FEAT_Debugv8p4 is implemented:*

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because AllowExternalDebugAccess() == FALSE.

<table>
<thead>
<tr>
<th>SDAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No Non-secure external debug interface accesses to the debug registers have failed because AllowExternalDebugAccess() == FALSE for the access since EDPRSR was last read.</td>
</tr>
<tr>
<td>0b1</td>
<td>At least one Non-secure external debug interface access to the debug registers has failed and returned an error because AllowExternalDebugAccess() == FALSE for the access since EDPRSR was last read.</td>
</tr>
</tbody>
</table>

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

On a Cold reset, this field resets to 0.
EDPRSR, External Debug Processor Status Register

Accessing this field has the following behavior:

- When (FEAT_DoPD is not implemented and !IsCorePowered()), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

**Otherwise:**

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because AllowExternalDebugAccess() == FALSE.

<table>
<thead>
<tr>
<th>SDAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No external debug interface accesses to the debug registers have failed because AllowExternalDebugAccess() == FALSE since EDPRSR was last read.</td>
</tr>
<tr>
<td>0b1</td>
<td>At least one external debug interface access to the debug registers has failed and returned an error because AllowExternalDebugAccess() == FALSE since EDPRSR was last read.</td>
</tr>
</tbody>
</table>

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is **CONSTRAINED UNPREDICTABLE** whether this bit clears to 0 or is unchanged.

This bit is **UNKNOWN** on reads if OSLockStatus() == TRUE and external debug writes to OSLAR_EL1 do not return an error when AllowExternalDebugAccess() == FALSE.

This field is in the Core power domain.

On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- When (FEAT_DoPD is not implemented and !IsCorePowered()), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

**EDAD, bit [7]**

**When FEAT_Debugv8p4 is implemented:**

External Debug Access Disable status.

<table>
<thead>
<tr>
<th>EDAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>External Non-secure access to breakpoint registers, watchpoint registers, and OSLAR_EL1 enabled. AllowExternalDebugAccess() == TRUE for a Non-secure access.</td>
</tr>
<tr>
<td>0b1</td>
<td>External Non-secure access to breakpoint registers, watchpoint registers, and OSLAR_EL1 disabled. AllowExternalDebugAccess() == FALSE for a Non-secure access.</td>
</tr>
</tbody>
</table>

This field is in the Core power domain.

Accessing this field has the following behavior:

- When (FEAT_DoPD is not implemented and !IsCorePowered()), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

**When FEAT_Debugv8p2 is implemented:**

External Debug Access Disable status.
**EDAD**

<table>
<thead>
<tr>
<th>EDAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>External access to breakpoint registers, watchpoint registers, and OSLAR_EL1 enabled. AllowExternalDebugAccess() == TRUE.</td>
</tr>
<tr>
<td>0b1</td>
<td>External access to breakpoint registers, watchpoint registers, and OSLAR_EL1 disabled. AllowExternalDebugAccess() == FALSE.</td>
</tr>
</tbody>
</table>

This bit is not valid and reads **UNKNOWN** if OSLockStatus() == TRUE and external debug writes to OSLAR_EL1 do not return an error when AllowExternalDebugAccess() == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When (FEAT_DoPD is not implemented and !IsCorePowered()), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

### Otherwise:

External Debug Access Disable status.

<table>
<thead>
<tr>
<th>EDAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>External access to breakpoint registers, watchpoint registers, and OSLAR_EL1 enabled. AllowExternalDebugAccess() == TRUE.</td>
</tr>
<tr>
<td>0b1</td>
<td>External access to breakpoint registers, watchpoint registers disabled. It is <strong>IMPLEMENTATION DEFINED</strong> whether accesses to OSLAR_EL1 are enabled or disabled. AllowExternalDebugAccess() == FALSE.</td>
</tr>
</tbody>
</table>

This field is in the Core power domain.

Accessing this field has the following behavior:

- When (FEAT_DoPD is not implemented and !IsCorePowered()), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

### DLK, bit [6]

#### When FEAT_Debugv8p4 is implemented:

This field is **RES0**.

#### When FEAT_Debugv8p2 is implemented and FEAT_DoubleLock is implemented:

Double Lock.

From Armv8.2, this field is deprecated.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When IsCorePowered() and !DoubleLockStatus(), access to this field is **RAZ/WI**.
- Otherwise, access to this field is **UNKNOWN/WI**.

#### When FEAT_DoubleLock is implemented:

Double Lock.

This field returns the result of the pseudocode function DoubleLockStatus().
If the Core power domain is powered up and DoubleLockStatus() == TRUE, it is IMPLEMENTATION DEFINED whether:

- EDPRSR.PU reads as 1, EDPRSR.DLK reads as 1, and EDPRSR.SPD is UNKNOWN.
- EDPRSR.PU reads as 0, EDPRSR.DLK is UNKNOWN, and EDPRSR.SPD reads as 0.

This field is in the Core power domain.

<table>
<thead>
<tr>
<th>DLK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>DoubleLockStatus() returns FALSE.</td>
</tr>
<tr>
<td>0b1</td>
<td>DoubleLockStatus() returns TRUE and the Core power domain is powered up.</td>
</tr>
</tbody>
</table>

Accessing this field has the following behavior:

- When FEAT_DoPD is not implemented and !IsCorePowered(), access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

Otherwise:

Reserved, RES0.

OSLK, bit [5]

OS Lock status bit.

A read of this bit returns the value of OLSR_EL1.OSLK.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When (FEAT_DoPD is not implemented and !IsCorePowered()), DoubleLockStatus() and EDPRSR.R == 1, access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

HALTED, bit [4]

Halted status bit.

<table>
<thead>
<tr>
<th>HALTED</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PE is in Non-debug state.</td>
</tr>
<tr>
<td>0b1</td>
<td>PE is in Debug state.</td>
</tr>
</tbody>
</table>

This field is in the Core power domain.

Accessing this field has the following behavior:

- When FEAT_DoPD is not implemented and !IsCorePowered(), access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

SR, bit [3]

Sticky core Reset status bit.

Permitted values are:

<table>
<thead>
<tr>
<th>SR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The non-debug logic of the PE is not in reset state and has not been reset since the last time EDPRSR was read.</td>
</tr>
<tr>
<td>0b1</td>
<td>The non-debug logic of the PE is in reset state or has been reset since the last time EDPRSR was read.</td>
</tr>
</tbody>
</table>

If EDPRSR.PU reads as 1 and EDPRSR.R reads as 0, which means that the Core power domain is in a powerup state and that the non-debug logic of the PE is not in reset state, then following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
• If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

On a Warm reset, this field resets to 1.

Accessing this field has the following behavior:
• When (FEAT_DoPD is not implemented and !IsCorePowered()) or DoubleLockStatus(), access to this field is UNKNOWN/WI.
• When SoftwareLockStatus(), access to this field is RO.
• Otherwise, access to this field is RC/WI.

R, bit [2]

PE Reset status bit.
Permitted values are:

<table>
<thead>
<tr>
<th>R</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The non-debug logic of the PE is not in reset state.</td>
</tr>
<tr>
<td>0b1</td>
<td>The non-debug logic of the PE is in reset state.</td>
</tr>
</tbody>
</table>

If FEAT_DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information, see 'EDPRSR.{DLK, R} and reset state'.

This field is in the Core power domain.

Accessing this field has the following behavior:
• When (FEAT_DoPD is not implemented and !IsCorePowered()) or DoubleLockStatus(), access to this field is UNKNOWN/WI.
• Otherwise, access to this field is RO.

SPD, bit [1]

Sticky core Powerdown status bit.

If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, then:
• If FEAT_Debugv8p2 is implemented, this bit reads as 0.
• If FEAT_Debugv8p2 is not implemented, this bit might read as 0 or 1.

For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'.

<table>
<thead>
<tr>
<th>SPD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If EDPRSR.PU is 0, it is not known whether the state of the debug registers in the Core power domain is lost. If EDPRSR.PU is 1, the state of the debug registers in the Core power domain has not been lost.</td>
</tr>
<tr>
<td>0b1</td>
<td>The state of the debug registers in the Core power domain has been lost.</td>
</tr>
</tbody>
</table>

If the Core power domain is powered up, then, following a read of EDPRSR:
• If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
• If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

When FEAT_DoPD is not implemented and the Core power domain is in either retention or powerdown state, the value of EDPRSR.SPD is IMPLEMENTATION DEFINED. For more information, see 'EDPRSR.SPD when the Core domain is in either retention or powerdown state'.

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'.

This field is in the Core power domain.
On a Cold reset, this field resets to 1.

Accessing this field has the following behavior:

- When FEAT_DoPD is not implemented and !IsCorePowered(), access to this field is RAZ/WI.
- When IsCorePowered() and DoubleLockStatus(), access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

**PU, bit [0]**

When FEAT_DoPD is implemented:

Core powerup status bit.

Access to this field is RAO/WI.

When FEAT_Debugv8p2 is implemented:

Core Powerup status bit. Indicates whether the debug registers in the Core power domain can be accessed.

<table>
<thead>
<tr>
<th>PU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Either the Core power domain is in a low-power or powerdown state, or FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, meaning the debug registers in the Core power domain cannot be accessed.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Core power domain is in a powerup state, and either FEAT DoubleLock is not implemented or DoubleLockStatus() == FALSE, meaning the debug registers in the Core power domain can be accessed.</td>
</tr>
</tbody>
</table>

If FEAT_DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information, see 'EDPRSR.{DLK, R} and reset state'

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'

Access to this field is RO.

Otherwise:

Core Powerup status bit. Indicates whether the debug registers in the Core power domain can be accessed.

When the Core power domain is powered-up and DoubleLockStatus() == TRUE, then the value of EDPRSR.PU is IMPLEMENTATION DEFINED. See the description of the DLK bit for more information.

Otherwise, permitted values are:

<table>
<thead>
<tr>
<th>PU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Core power domain is in a low-power or powerdown state where the debug registers in the Core power domain cannot be accessed.</td>
</tr>
<tr>
<td>0b1</td>
<td>Core power domain is in a powerup state where the debug registers in the Core power domain can be accessed.</td>
</tr>
</tbody>
</table>

If FEAT_DoubleLock is implemented, the Core power domain is powered up, and DoubleLockStatus() == TRUE, it is IMPLEMENTATION DEFINED whether this bit reads as 0 or 1.

If FEAT_DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information see 'EDPRSR.{DLK, R} and reset state'

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'.

Access to this field is RO.
Accessing the EDPRSR

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.

If the Core power domain is powered up (EDPRSR.PU == 1), then following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, then:
  - EDPRSR.{SDR, SPMAD, SDAD, SPD} are cleared to 0.
  - EDPRSR.SR is cleared to 0 if the non-debug logic of the PE is not in reset state (EDPRSR.R == 0).
- Otherwise it is CONSTRAINED UNPREDICTABLE whether or not this clearing occurs.

If FEAT_DoPD is not implemented and the Core power domain is powered down (EDPRSR.PU == 0), then:

- EDPRSR.{SDR, SPMAD, SDAD, SR} are all UNKNOWN, and are either reset or restored on being powered up.
- EDPRSR.SPD is not cleared following a read of EDPRSR. See the SPD bit description for more information.

The clearing of bits is an indirect write to EDPRSR.

EDPRSR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x314</td>
<td>EDPRSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
EDCR, External Debug Reserve Control Register

The EDCR characteristics are:

**Purpose**

This register is used to allow imprecise entry to Debug state and clear sticky bits in ESCR.

**Configuration**

EDCR is in the Core power domain.

**Attributes**

EDCR is a 32-bit register.

**Field descriptions**

The EDCR bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Bit 31</th>
<th>Bit 30</th>
<th>Bit 29</th>
<th>Bit 28</th>
<th>Bit 27</th>
<th>Bit 26</th>
<th>Bit 25</th>
<th>Bit 24</th>
<th>Bit 23</th>
<th>Bit 22</th>
<th>Bit 21</th>
<th>Bit 20</th>
<th>Bit 19</th>
<th>Bit 18</th>
<th>Bit 17</th>
<th>Bit 16</th>
<th>Bit 15</th>
<th>Bit 14</th>
<th>Bit 13</th>
<th>Bit 12</th>
<th>Bit 11</th>
<th>Bit 10</th>
<th>Bit 9</th>
<th>Bit 8</th>
<th>Bit 7</th>
<th>Bit 6</th>
<th>Bit 5</th>
<th>Bit 4</th>
<th>Bit 3</th>
<th>Bit 2</th>
<th>Bit 1</th>
<th>Bit 0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:5]**

Reserved, RES0.

**CBRRQ, bit [4]**

Allow imprecise entry to Debug state. The actions on writing to this bit are:

<table>
<thead>
<tr>
<th>CBRRQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Allow imprecise entry to Debug state, for example by canceling pending bus accesses.</td>
</tr>
</tbody>
</table>

Setting this bit to 1 allows a debugger to request imprecise entry to Debug state. An External Debug Request debug event must be pending before the debugger sets this bit to 1.

This feature is optional. If this feature is not implemented, writes to this bit are ignored.

**CSPA, bit [3]**

Clear Sticky Pipeline Advance. This bit is used to clear the ESCR.PipeAdv bit to 0. The actions on writing to this bit are:

<table>
<thead>
<tr>
<th>CSPA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Clear the ESCR.PipeAdv bit to 0.</td>
</tr>
</tbody>
</table>

**CSE, bit [2]**

Clear Sticky Error. Used to clear the ESCR cumulative error bits to 0. The actions on writing to this bit are:
<table>
<thead>
<tr>
<th>CSE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Clear the EDSCR (TXU, RXO, ERR) bits, and, if the PE is in Debug state, the EDSCR.ITO bit, to 0.</td>
</tr>
</tbody>
</table>

**Bits [1:0]**

Reserved, RES0.

**Accessing the EDRCR**

**EDRCR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x090</td>
<td>EDRCR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **WI**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **WO**.
- Otherwise accesses to this register generate an error response.
EDSCR, External Debug Status and Control Register

The EDSCR characteristics are:

**Purpose**

Main control register for the debug implementation.

**Configuration**

External register EDSCR bits [30:29] are architecturally mapped to AArch64 System register MDCCSR_EL0[30:29].

EDSCR is in the Core power domain.

**Attributes**

EDSCR is a 32-bit register.

**Field descriptions**

The EDSCR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| TFO | RXfull | TXfull | TXU | PipeAdv | ITE | INTdis | TDA | MASC | 2 | NS | RES0 | SDD | RES0 | HDE | RW | EL | ERR | STATUS |

**TFO, bit [31]**

When FEAT_TRF is implemented:

Trace Filter Override. Overrides the Trace Filter controls allowing the external debugger to trace any visible Exception level.

<table>
<thead>
<tr>
<th>TFO</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>000</td>
<td>Trace Filter controls are not affected.</td>
</tr>
<tr>
<td>001</td>
<td>Trace Filter controls in TRFCR_EL1, TRFCR_EL2 are ignored. Trace Filter controls TRFCR and HTRFCR are ignored.</td>
</tr>
</tbody>
</table>

When OLSR_EL1.OSLK == 1, this bit can be indirectly read and written through the MDSCR_EL1 and DBGDSCRExt System registers.

This bit is ignored by the PE when ExternalSecureNoninvasiveDebugEnabled() == FALSE and the Effective value of MDCR_EL3.STE == 1.

On a Cold reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**RXfull, bit [30]**

DTRRX full.

On a Cold reset, this field resets to 0.

Access to this field is RO.
**TXfull, bit [29]**

DTRTX full.

On a Cold reset, this field resets to 0.

Access to this field is **RO**.

**ITO, bit [28]**

ITR overrun.

If the PE is in Non-debug state, this bit is **UNKNOWN**. ITO is set to 0 on entry to Debug state.

Access to this field is **RO**.

**RXO, bit [27]**

DTRRX overrun.

On a Cold reset, this field resets to 0.

Access to this field is **RO**.

**TXU, bit [26]**

DTRTX underrun.

On a Cold reset, this field resets to 0.

Access to this field is **RO**.

**PipeAdv, bit [25]**

Pipeline advance. Set to 1 every time the PE pipeline retires one or more instructions. Cleared to 0 by a write to **EDRCR.CSPA**.

The architecture does not define precisely when this bit is set to 1. It requires only that this happen periodically in Non-debug state to indicate that software execution is progressing.

Access to this field is **RO**.

**ITE, bit [24]**

ITR empty.

If the PE is in Non-debug state, this bit is **UNKNOWN**. It is always valid in Debug state.

Access to this field is **RO**.

**INTdis, bits [23:22]**

When **FEAT_Debugv8p4** is implemented:

Interrupt disable. Disables taking interrupts in Non-Debug state.

<table>
<thead>
<tr>
<th><strong>INTdis</strong></th>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Masking of interrupts is controlled by PSTATE and interrupt routing controls.</td>
</tr>
<tr>
<td>0b01</td>
<td>If <strong>ExternalSecureDebugEnabled() == TRUE</strong>, then all interrupts, including virtual and SError interrupts, are masked. If <strong>ExternalSecureDebugEnabled() == FALSE</strong>, then all interrupts targeting Non-secure state are masked.</td>
</tr>
</tbody>
</table>
When \texttt{OSLSR\_EL1\_OSLK} == 1, this field can be indirectly read and written through the \texttt{MDSCR\_EL1} and \texttt{DBGDSCR\_Ext} System registers.

This field is ignored by the PE and treated as zero when \texttt{ExternalDebugEnabled}() == FALSE.

When \texttt{FEAT\_Debugv8p4} is implemented, bit[23] of the register is \texttt{RES0}.

On a Cold reset, this field resets to 0.

\textbf{Otherwise:}

Interrupt disable.

When \texttt{OSLSR\_EL1\_OSLK} == 1, this field can be indirectly read and written through the \texttt{MDSCR\_EL1} and \texttt{DBGDSCR\_Ext} System registers.

<table>
<thead>
<tr>
<th>INTdis</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Do not disable interrupts.</td>
</tr>
<tr>
<td>0b01</td>
<td>Disable interrupts taken to Non-secure EL1.</td>
</tr>
<tr>
<td>0b10</td>
<td>Disable interrupts taken only to Non-secure EL1 and Non-secure EL2. If \texttt{ExternalSecureInvasiveDebugEnabled}() == TRUE, also disable interrupts taken to Secure EL1.</td>
</tr>
<tr>
<td>0b11</td>
<td>Disable interrupts taken only to Non-secure EL1 and Non-secure EL2. If \texttt{ExternalSecureInvasiveDebugEnabled}() == TRUE, also disable all other interrupts.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.

\textbf{TDA, bit [21]}

Traps accesses to the following debug System registers:

- AArch64: \texttt{DBGBCR<n>\_EL1}, \texttt{DBGVR<n>\_EL1}, \texttt{DBGWCR<n>\_EL1}, \texttt{DBGWVR<n>\_EL1}.
- AArch32: \texttt{DBGBCR<n>}, \texttt{DBGVR<n>}, \texttt{DBGXVR<n>}, \texttt{DBGWCR<n>}, \texttt{DBGWVR<n>}.

The possible values of this field are:

<table>
<thead>
<tr>
<th>TDA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to debug System registers do not generate a Software Access Debug event.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to debug System registers generate a Software Access Debug event, if \texttt{OSLSR_EL1_OSLK} is 0 and if halting is allowed.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.

\textbf{MA, bit [20]}

Memory access mode. Controls the use of memory-access mode for accessing ITR and the DCC. This bit is ignored if in Non-debug state and set to zero on entry to Debug state.

Possible values of this field are:

<table>
<thead>
<tr>
<th>MA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal access mode.</td>
</tr>
<tr>
<td>0b1</td>
<td>Memory access mode.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.

\textbf{SC2, bit [19]}

When \texttt{FEAT\_PCSRv8} is implemented, (\texttt{FEAT\_VHE} is implemented or \texttt{FEAT\_Debugv8p2} is implemented) and \texttt{FEAT\_PCSRv8p2} is not implemented:

Sample \texttt{CONTEXTIDR\_EL2}. Controls whether the PC Sample-based Profiling Extension samples \texttt{CONTEXTIDR\_EL2} or \texttt{VTTBR\_EL2} VMID.
On a Cold reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**NS, bit [18]**

Non-secure status. When in Debug state, gives the current Security state:

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure state, IsSecure() == TRUE.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure state, IsSecure() == FALSE.</td>
</tr>
</tbody>
</table>

In Non-debug state, this bit is **UNKNOWN**.

Access to this field is **RO**.

**Bit [17]**

Reserved, RES0.

**SDD, bit [16]**

Secure debug disabled.

On entry to Debug state:

- If entering in Secure state, SDD is set to 0.
- If entering in Non-secure state, SDD is set to the inverse of ExternalSecureInvasiveDebugEnabled().

In Debug state, the value of the SDD bit does not change, even if ExternalSecureInvasiveDebugEnabled() changes.

In Non-debug state:

- SDD returns the inverse of ExternalSecureInvasiveDebugEnabled(). If the authentication signals that control ExternalSecureInvasiveDebugEnabled() change, a context synchronization event is required to guarantee their effect.
- This bit is unaffected by the Security state of the PE.

If EL3 is not implemented and the implementation is Non-secure, this bit is **RES1**.

Access to this field is **RO**.

**Bit [15]**

Reserved, RES0.

**HDE, bit [14]**

Halting debug enable. The possible values of this field are:

<table>
<thead>
<tr>
<th>HDE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Halting disabled for Breakpoint, Watchpoint and Halt Instruction debug events.</td>
</tr>
<tr>
<td>0b1</td>
<td>Halting enabled for Breakpoint, Watchpoint and Halt Instruction debug events.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.
**RW, bits [13:10]**

Exception level Execution state status. In Debug state, each bit gives the current Execution state of each Exception level.

<table>
<thead>
<tr>
<th>RW</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>All Exception levels are using AArch64 or the PE is in Non-debug state.</td>
<td></td>
</tr>
<tr>
<td>0b1110</td>
<td>The PE is in Debug state. EL0 is using AArch32. All other Exception levels are using AArch64. Only permitted if the PE is executing at EL0.</td>
<td>When AArch32 is supported at any Exception level</td>
</tr>
<tr>
<td>0b110x</td>
<td>The PE is in Debug state. EL0 and EL1 are using AArch32. EL2 and EL3 are using AArch64. Only permitted if EL2 is implemented and enabled in the current Security state.</td>
<td>When AArch32 is supported at any Exception level</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The PE is in Debug state. EL0, EL1, and, if implemented in the current Security state, EL2 are using AArch32. EL3 is using AArch64.</td>
<td>When AArch32 is supported at any Exception level</td>
</tr>
<tr>
<td>0b0xxx</td>
<td>The PE is in Debug state. All Exception levels are using AArch32.</td>
<td>When AArch32 is supported at any Exception level</td>
</tr>
</tbody>
</table>

In Non-debug state, this field is RAO.

Access to this field is RO.

**EL, bits [9:8]**

Exception level. In Debug state, this gives the current Exception level of the PE.

In Non-debug state, this field is RAZ.

Access to this field is RO.

**A, bit [7]**

SErrror interrupt pending. In Debug state, indicates whether an SError interrupt is pending:

- If \( \text{HCR EL2.\{AMO, TGE\}} = \{1, 0\} \), EL2 is enabled in the current Security state, and the PE is executing at EL0 or EL1, a virtual SError interrupt.
- Otherwise, a physical SError interrupt.

<table>
<thead>
<tr>
<th>A</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No SError interrupt pending.</td>
</tr>
<tr>
<td>0b1</td>
<td>SError interrupt pending.</td>
</tr>
</tbody>
</table>

A debugger can read EDSCR to check whether an SError interrupt is pending without having to execute further instructions. A pending SError might indicate data from target memory is corrupted.

UNKNOWN in Non-debug state.

Access to this field is RO.

**ERR, bit [6]**

Cumulative error flag. This bit is set to 1 following exceptions in Debug state and on any signaled overrun or underrun on the DTR or EDITR.

On a Cold reset, this field resets to 0.
Access to this field is RO.

**STATUS, bits [5:0]**

Debug status flags.

<table>
<thead>
<tr>
<th>STATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000001</td>
<td>PE is restarting, exiting Debug state.</td>
</tr>
<tr>
<td>0b000010</td>
<td>PE is in Non-debug state.</td>
</tr>
<tr>
<td>0b000111</td>
<td>Breakpoint.</td>
</tr>
<tr>
<td>0b010011</td>
<td>External debug request.</td>
</tr>
<tr>
<td>0b011011</td>
<td>Halting step, normal.</td>
</tr>
<tr>
<td>0b011111</td>
<td>Halting step, exclusive.</td>
</tr>
<tr>
<td>0b100011</td>
<td>OS Unlock Catch.</td>
</tr>
<tr>
<td>0b100111</td>
<td>Reset Catch.</td>
</tr>
<tr>
<td>0b101011</td>
<td>Watchpoint.</td>
</tr>
<tr>
<td>0b101111</td>
<td>HLT instruction.</td>
</tr>
<tr>
<td>0b110011</td>
<td>Software access to debug register.</td>
</tr>
<tr>
<td>0b110111</td>
<td>Exception Catch.</td>
</tr>
<tr>
<td>0b111011</td>
<td>Halting step, no syndrome.</td>
</tr>
</tbody>
</table>

All other values of STATUS are reserved.

Access to this field is RO.

**Accessing the EDSCR**

EDSCR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x088</td>
<td>EDSCR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()` and `SoftwareLockStatus()` accesses to this register are **RO**.
- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()` and `!SoftwareLockStatus()` accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.
EDVIDSR, External Debug Virtual Context Sample Register

The EDVIDSR characteristics are:

**Purpose**

Contains sampled values captured on reading EDPCSR[31:0].

**Configuration**

EDVIDSR is in the Core power domain.

This register is present only when FEAT_PCSRv8 is implemented and FEAT_PCSRv8p2 is not implemented. Otherwise, direct accesses to EDVIDSR are RES0.

If FEAT_VHE is implemented, the format of this register differs depending on the value of EDSCR.SC2.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

When the PC Sample-based Profiling Extension is implemented in the external debug registers space, if EL2 is not implemented and EL3 is not implemented, it is IMPLEMENTATION DEFINED whether EDVIDSR is implemented.

**Note**

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

**Attributes**

EDVIDSR is a 32-bit register.

**Field descriptions**

The EDVIDSR bit assignments are:

When **FEAT_VHE is not implemented or EDSCR.SC2 == 0:**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>NS</td>
</tr>
<tr>
<td>30</td>
<td>E2</td>
</tr>
<tr>
<td>29</td>
<td>E3</td>
</tr>
<tr>
<td>28</td>
<td>HV</td>
</tr>
<tr>
<td>27</td>
<td>RES0</td>
</tr>
<tr>
<td>26</td>
<td>VMID[15:8]</td>
</tr>
<tr>
<td>25</td>
<td>VMID</td>
</tr>
</tbody>
</table>

This format applies in all Armv8.0 implementations.

**NS, bit [31]**

Non-secure state sample. Indicates the Security state associated with the most recent EDPCSR sample.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sample is from Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Sample is from Non-secure state.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**E2, bit [30]**
When EL2 is implemented:

Exception level 2 status sample. Indicates whether the most recent EDPCSR sample was associated with EL2.

<table>
<thead>
<tr>
<th>E2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sample is not from EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Sample is from EL2.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally unknown value.

Otherwise:

Reserved, RES0.

E3, bit [29]

When EL3 is implemented and the highest implemented Exception level is using AArch64 state:

Exception level 3 status sample. Indicates whether the most recent EDPCSR sample was associated with EL3 using AArch64.

<table>
<thead>
<tr>
<th>E3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sample is not from EL3 using AArch64.</td>
</tr>
<tr>
<td>0b1</td>
<td>Sample is from EL3 using AArch64.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally unknown value.

Otherwise:

Reserved, RES0.

HV, bit [28]

EDPCSRhi (EDPCSR[63:32]) valid. Indicates whether bits [63:32] of the most recent EDPCSR sample might be nonzero:

<table>
<thead>
<tr>
<th>HV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bits[63:32] of the most recent EDPCSR sample are zero.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bits[63:32] of the most recent EDPCSR sample might be nonzero.</td>
</tr>
</tbody>
</table>

An EDVIDSR.HV value of 1 does not mean that the value of EDPCSRhi is nonzero. An EDVIDSR.HV value of 0 is a hint that EDPCSRhi (EDPCSR[63:32]) does not need to be read.

On a Cold reset, this field resets to an architecturally unknown value.

Bits [27:16]

Reserved, RES0.

VMID[15:8], bits [15:8]

When FEAT_VMID16 is implemented and EL2 is implemented:

Extension to VMID[7:0]. See VMID[7:0] for more details.

On a Cold reset, this field resets to an architecturally unknown value.

Otherwise:

Reserved, RES0.
VMID, bits [7:0]
When EL2 is implemented:

VMID sample. The VMID associated with the most recent EDPCSRlo (EDPCSR[31:0]) sample. When the most recent EDPCSR sample was generated:

• This field is RES0 if any of the following apply:
  ◦ The PE is executing in Secure state.
  ◦ The PE is executing at EL2.
• Otherwise:
  ◦ If EL2 is using AArch64 and either FEAT_VMID16 is not implemented or VTCR_EL2.VS is 1, this field is set to VTTBR_EL2.VMID.
  ◦ If EL2 is using AArch64, FEAT_VMID16 is implemented, and VTCR_EL2.VS is 0, PMVIDSR.VMID[7:0] is set to VTTBR_EL2.VMID[7:0] and PMVIDSR.VMID[15:8] is RES0.
  ◦ If EL2 is using AArch32, this field is set to VTTBR.VMID.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented) and EDSR.SC2 == 1:

CONTEXTIDR_EL2, bits [31:0]

Context ID. The value of CONTEXTIDR_EL2 that is associated with the most recent EDPCSR sample. When the most recent EDPCSR sample was generated:

• If EL2 was using AArch64 and the PE was executing in Non-secure state, then this field is set to the Context ID sampled from CONTEXTIDR_EL2.
• If EL2 was using AArch32 or the PE was executing in Secure state, then this field is set to an UNKNOWN value.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the EDVIDSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

EDVIDSR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x0A8</td>
<td>EDVIDSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are RO.
• Otherwise accesses to this register generate an error response.
EDWAR, External Debug Watchpoint Address Register

The EDWAR characteristics are:

**Purpose**

Returns the virtual data address being accessed when a Watchpoint Debug Event was triggered.

**Configuration**

EDWAR is in the Core power domain.

**Attributes**

EDWAR is a 64-bit register.

**Field descriptions**

The EDWAR bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Watchpoint address | Watchpoint address |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

**Bits [63:0]**

Watchpoint address. The data virtual address being accessed when a Watchpoint Debug Event was triggered and caused entry to Debug state. This address must be within a naturally-aligned block of memory of power-of-two size no larger than the DC ZVA block size.

The value of this register is **UNKNOWN** if the PE is in Non-debug state, or if Debug state was entered other than for a Watchpoint debug event.

The value of EDWAR[63:32] is **UNKNOWN** if Debug state was entered for a Watchpoint debug event taken from AArch32 state.

The EDWAR is subject to the same alignment rules as the reporting of a watchpointed address in the FAR. See 'Determining the memory location that caused a Watchpoint exception'.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the EDWAR**

**EDWAR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x030</td>
<td>EDWAR</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x034</td>
<td>EDWAR</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
• When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
• Otherwise accesses to this register generate an error response.
ERRCIDR0, Component Identification Register 0

The ERRCIDR0 characteristics are:

**Purpose**

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.

**Configuration**

Implementation of this register is **OPTIONAL**.

ERRCIDR0 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRCIDR0 is a 32-bit register.

**Field descriptions**

The ERRCIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Index</th>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-8</td>
<td>RES0</td>
<td>Reserved</td>
</tr>
<tr>
<td>7-0</td>
<td>PRMBL_0</td>
<td>Component identification preamble, segment 0. Reads as 0x0D.</td>
</tr>
</tbody>
</table>

**Accessing the ERRCIDR0**

**ERRCIDR0 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFF0</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
**ERRCIDR1, Component Identification Register 1**

The ERRCIDR1 characteristics are:

**Purpose**

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.

**Configuration**

Implementation of this register is **OPTIONAL**.

ERRCIDR1 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRCIDR1 is a 32-bit register.

**Field descriptions**

The ERRCIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RES0, Bits [31:8]</td>
</tr>
<tr>
<td></td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td></td>
<td>CLASS, Bits [7:4]</td>
</tr>
<tr>
<td></td>
<td>Component class</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>CLASS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>Generic peripheral with IMPLEMENTATION DEFINED register layout.</td>
</tr>
</tbody>
</table>

Other values are defined by the CoreSight Architecture.

This field reads as 0xF.

**PRMBL_1, Bits [3:0]**

Component identification preamble, segment 1.

Reads as 0b0000.

**Accessing the ERRCIDR1**

ERRCIDR1 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFF4</td>
</tr>
</tbody>
</table>
Accesses on this interface are **RO**.
The ERRCIDR2 characteristics are:

**Purpose**

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.

**Configuration**

Implementation of this register is **OPTIONAL**.

ERRCIDR2 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRCIDR2 is a 32-bit register.

**Field descriptions**

The ERRCIDR2 bit assignments are:

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0| PRMBL_2 |

**Bits [31:8]**

Reserved, RES0.

**PRMBL_2, bits [7:0]**

Component identification preamble, segment 2.

Reads as 0x05.

**Accessing the ERRCIDR2**

**ERRCIDR2 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFF8</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
The ERRCIDR3 characteristics are:

**Purpose**

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.

**Configuration**

Implementation of this register is **OPTIONAL**.

ERRCIDR3 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRCIDR3 is a 32-bit register.

**Field descriptions**

The ERRCIDR3 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 |
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | PRMBL_3 |

**Bits [31:8]**

Reserved, RES0.

**PRMBL_3, bits [7:0]**

Component identification preamble, segment 3.

Reads as 0xB1.

**Accessing the ERRCIDR3**

**ERRCIDR3 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFFC</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
ERRCRICR0, Critical Error Interrupt Configuration Register 0

The ERRCRICR0 characteristics are:

**Purpose**

Critical Error Interrupt configuration register.

**Configuration**

This register is present only when (the Critical Error Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRCRICR0 are RES0.

ERRCRICR0 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRCRICR0 is a 64-bit register.

**Field descriptions**

The ERRCRICR0 bit assignments are:

When the Critical Error Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

<table>
<thead>
<tr>
<th>Bit(s)</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:56]</td>
<td>Bits [63:56]</td>
</tr>
<tr>
<td>[1:0]</td>
<td>Bits [1:0]</td>
</tr>
</tbody>
</table>

**Bits [63:56]**

Reserved, RES0.

**ADDR, bits [55:2]**

Message Signaled Interrupt address. (ERRCRICR0.ADDR << 2) is the address that the component writes to when signaling the Critical Error Interrupt. Bits [1:0] of the address are always zero.

The physical address size supported by the component is IMPLEMENTATION DEFINED. Unimplemented high-order physical address bits are RES0.

On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

**Bits [1:0]**

Reserved, RES0.
When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing the ERRCRICR0

ERRCRICR0 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xEA0</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
ERRCRICR1, Critical Error Interrupt Configuration Register 1

The ERRCRICR1 characteristics are:

**Purpose**

Critical Error Interrupt configuration register.

**Configuration**

This register is present only when (the Critical Error Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRCRICR1 are RES0.

ERRCRICR1 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRCRICR1 is a 32-bit register.

**Field descriptions**

The ERRCRICR1 bit assignments are:

*When the Critical Error Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:*

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  |  9  |  8  |  7  |  6  |  5  |  4  |  3  |  2  |  1  |  0  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |
| **DATA** |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

**DATA, bits [31:0]**

Payload for the message signaled interrupt.

On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

*When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:*

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  |  9  |  8  |  7  |  6  |  5  |  4  |  3  |  2  |  1  |  0  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |
| **IMPLEMENTATION DEFINED** |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

**Accessing the ERRCRICR1**

ERRCRICR1 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xEA8</td>
</tr>
</tbody>
</table>
Accesses on this interface are **RW**.
ERRCRICR2, Critical Error Interrupt Configuration Register 2

The ERRCRICR2 characteristics are:

**Purpose**

Critical Error Interrupt control and configuration register.

**Configuration**

This register is present only when (the Critical Error Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRCRICR2 are RES0.

ERRCRICR2 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRCRICR2 is a 32-bit register.

**Field descriptions**

The ERRCRICR2 bit assignments are:

**When the Critical Error Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>30</td>
<td>IRQEN</td>
<td>Message signaled interrupt enable. Enables generation of message signaled interrupts.</td>
</tr>
<tr>
<td>29</td>
<td>NSMSI</td>
<td>Message signaled interrupt enable.</td>
</tr>
<tr>
<td>28</td>
<td>SH</td>
<td>Message signaled interrupts are always enabled.</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**IRQEN, bit [7]**

**When the component supports disabling message signaled interrupts:**

<table>
<thead>
<tr>
<th>IRQEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Enabled.</td>
</tr>
</tbody>
</table>

On an Error recovery reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

Message signaled interrupt enable.

Message signaled interrupts are always enabled.
**NSMSI, bit [6]**

When the component supports configuring the Security attribute for message signaled interrupts and the component does not allow Non-secure writes to ERRCRICR2:

Security attribute. Defines the physical address space for message signaled interrupts.

<table>
<thead>
<tr>
<th>NSMSI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure.</td>
</tr>
</tbody>
</table>

On an Error recovery reset, this field resets to an implementation defined value.

When the component allows Non-secure writes to ERRCRICR2:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute used for message signaled interrupts is Non-secure.

Otherwise:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute for message signaled interrupts is implementation defined.

**SH, bits [5:4]**

When the component supports configuring the Shareability domain:

Shareability. Defines the Shareability domain for message signaled interrupts.

<table>
<thead>
<tr>
<th>SH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Not shared.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field is ignored when ERRCRICR2.MemAttr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

On an Error recovery reset, this field resets to an architecturally unknown value.

Otherwise:

Reserved, RES0.

Shareability.

The Shareability domain for message signaled interrupts is implementation defined.
**MemAttr, bits [3:0]**

When the component supports configuring the memory type for message signaled interrupts:

Memory type. Defines the memory type and attributes for message signaled interrupts.

<table>
<thead>
<tr>
<th>MemAttr</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Device-nGnRnE memory.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Device-nGnRE memory.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Device-nGRE memory.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Device-GRE memory.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Normal memory, Inner Non-cacheable, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Normal memory, Inner Write-Through, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Normal memory, Inner Write-Back, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b1001</td>
<td>Normal memory, Inner Non-cacheable, Outer Write-Through.</td>
</tr>
<tr>
<td>0b1010</td>
<td>Normal memory, Inner Write-Through, Outer Write-Through.</td>
</tr>
<tr>
<td>0b1011</td>
<td>Normal memory, Inner Write-Back, Outer Write-Through.</td>
</tr>
<tr>
<td>0b1101</td>
<td>Normal memory, Inner Non-cacheable, Outer Write-Back.</td>
</tr>
<tr>
<td>0b1110</td>
<td>Normal memory, Inner Write-Through, Outer Write-Back.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Normal memory, Inner Write-Back, Outer Write-Back.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Note**

This is the same format as the VMSAv8-64 stage 2 memory region attributes.

On an Error recovery reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

Memory type.

The memory type used for message signaled interrupts is **IMPLEMENTATION DEFINED**.

**When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:**

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

**IMPLEMENTATION DEFINED, bits [31:0]**

**IMPLEMENTATION DEFINED.**

**Accessing the ERRCRICR2**

**ERRCRICR2 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>

Accesses on this interface are **RW**.
ERRDEVAFF, Device Affinity Register

The ERRDEVAFF characteristics are:

**Purpose**

For a group of error records that has affinity with a single PE or a group of PEs, ERRDEVAFF is a copy of `MPIDR_EL1` or part of `MPIDR_EL1`:

- If the group of error records has affinity with a single PE, the affinity level is 0, ERRDEVAFF reads the same value as `MPIDR_EL1`, and ERRDEVAFF.F0V reads-as-one to indicate affinity level 0.
- If the group of error records has affinity with a group of PEs, the affinity level is 1, 2, or 3, parts of ERRDEVAFF reads the same value as parts of `MPIDR_EL1`, and the rest of ERRDEVAFF indicates the level.

For example, if the group of PEs is a subset of the PEs at affinity level 1 then all of the following are true:

- All the PEs in the group have the same values in `MPIDR_EL1`.\{Aff3,Aff2\}, and these values are equal to ERRDEVAFF.\{Aff3,Aff2\}.
- ERRDEVAFF.Aff1 is nonzero and not 0x80, and ERRDEVAFF.\{Aff0,F0V\} read-as-zero, to indicate at least affinity level 1. The subset of PEs at level 1 that the group of error records has affinity with is indicated by the least-significant set bit in ERRDEVAFF.Aff1. In this example, if ERRDEVAFF.Aff1[2:0] is 0b100, then the group of error records has affinity with the up-to 8 PEs that have `MPIDR_EL1`.Aff1[7:3] == ERRDEVAFF.Aff1[7:3].

If RAS System Architecture v1.1 is not implemented, ERRDEVAFF can only describe a group of error records that is affine with a single PE or all the PEs at an affinity level.

**Configuration**

This register is present only when the group of error records has affinity with a PE or cluster of PEs. Otherwise, direct accesses to ERRDEVAFF are `RES0`.

ERRDEVAFF is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRDEVAFF is a 64-bit register.

**Field descriptions**

The ERRDEVAFF bit assignments are:

<table>
<thead>
<tr>
<th>Bit Index</th>
<th>Bit Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-40</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>39-32</td>
<td>PE affinity level 3. The <code>MPIDR_EL1</code>.Aff3 field, viewed from the highest Exception level of the associated PE or PEs.</td>
</tr>
<tr>
<td>31</td>
<td>Indicates that the ERRDEVAFF.Aff0 field is valid.</td>
</tr>
</tbody>
</table>

**Bits [63:40]**

Reserved, RES0.

**Aff3, bits [39:32]**

PE affinity level 3. The `MPIDR_EL1`.Aff3 field, viewed from the highest Exception level of the associated PE or PEs.

**F0V, bit [31]**

 Indicates that the ERRDEVAFF.Aff0 field is valid.
### F0V

<table>
<thead>
<tr>
<th><strong>F0V</strong></th>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERRDEVAFF.Aff0 is not valid, and the PE affinity is above level 0 or a subset of level 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>ERRDEVAFF.Aff0 is valid, and the PE affinity is at level 0.</td>
</tr>
</tbody>
</table>

#### U, bit [30]

When ERRDEVAFF.F0V == 1:

Uniprocessor: The MPIDR_EL1.U bit, viewed from the highest Exception level of the associated PE.

Otherwise:

Reserved, UNKNOWN.

#### Bits [29:25]

Reserved, RES0.

#### MT, bit [24]

When ERRDEVAFF.F0V == 1:

Multithreaded. The MPIDR_EL1.MT bit, viewed from the highest Exception level of the associated PE.

Otherwise:

Reserved, UNKNOWN.

#### Aff2, bits [23:16]

When affine with a PE or PEs at affinity level 2 or below:

PE affinity level 2. The MPIDR_EL1.Aff2 field, viewed from the highest Exception level of the associated PE or PEs.

When affine with a sub-set of PEs at affinity level 2:

PE affinity level 2. Defines part of the MPIDR_EL1.Aff2 field, viewed from the highest Exception level of the associated PEs.

<table>
<thead>
<tr>
<th><strong>Aff2</strong></th>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>0bxxxxxxx1</td>
<td>ERRDEVAFF.Aff2[7:1] is the value of MPIDR_EL1.Aff2[7:1], viewed from the highest Exception level of the associated PEs.</td>
</tr>

<tr>
<td>0bx1000000</td>
<td>ERRDEVAFF.Aff2[7] is the value of MPIDR_EL1.Aff2[7], viewed from the highest Exception level of the associated PEs.</td>
</tr>
</tbody>
</table>
Otherwise:

PE affinity level 2. Indicates whether the PE affinity is at level 3.

<table>
<thead>
<tr>
<th>Aff2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x80</td>
<td>PE affinity is at level 3.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Aff1, bits [15:8]**

When affine with a PE or PEs at affinity level 1 or below:

PE affinity level 1. The \texttt{MPIDR\_EL1.Aff1} field, viewed from the highest Exception level of the associated PE or PEs.

When affine with a sub-set of PEs at affinity level 1:

PE affinity level 1. Defines part of the \texttt{MPIDR\_EL1.Aff1} field, viewed from the highest Exception level of the associated PEs.

<table>
<thead>
<tr>
<th>Aff1</th>

</tr>
<tr>
<td>0bxx1000000</td>
<td>\texttt{ERRDEVAFF.Aff1}[7:5] is the value of \texttt{MPIDR_EL1.Aff1}[7:5], viewed from the highest Exception level of the associated PEs.</td>
</tr>
<tr>
<td>0bx10000000</td>
<td>\texttt{ERRDEVAFF.Aff1}[7] is the value of \texttt{MPIDR_EL1.Aff1}[7], viewed from the highest Exception level of the associated PEs.</td>
</tr>
</tbody>
</table>

Otherwise:

PE affinity level 1. Indicates whether the PE affinity is at level 2.

<table>
<thead>
<tr>
<th>Aff1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x00</td>
<td>PE affinity is above level 2 or a subset of level 2.</td>
</tr>
<tr>
<td>0x80</td>
<td>PE affinity is at level 2.</td>
</tr>
</tbody>
</table>

**Aff0, bits [7:0]**

When affine with a PE at affinity level 0:

PE affinity level 0. The \texttt{MPIDR\_EL1.Aff0} field, viewed from the highest Exception level of the associated PE.

When affine with a sub-set of PEs at affinity level 0:

PE affinity level 0. Defines part of the \texttt{MPIDR\_EL1.Aff0} field, viewed from the highest Exception level of the associated PEs.
ERRDEVAFF, Device Affinity Register

<table>

</table>

Accesses on this interface are RO.
ERRDEVARCH, Device Architecture Register

The ERRDEVARCH characteristics are:

**Purpose**

Provides discovery information for the component.

**Configuration**

ERRDEVARCH is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRDEVARCH is a 32-bit register.

**Field descriptions**

The ERRDEVARCH bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>

</tr>
</tbody>
</table>

**ARCHITECT, bits [31:21]**

Architect. Defines the architect of the component. Bits [31:28] are the JEP106 continuation code (JEP106 bank ID, minus 1) and bits [27:21] are the JEP106 ID code.

<table>
<thead>
<tr>
<th>ARCHITECT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01000111011</td>
<td>JEP106 continuation code 0x4, ID code 0x3B. Arm Limited.</td>
</tr>
</tbody>
</table>

Other values are defined by the JEDEC JEP106 standard.

This field reads as 0x23B.

**PRESENT, bit [20]**

DEVARCH Present. Defines that the DEVARCH register is present.

<table>
<thead>
<tr>
<th>PRESENT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Device Architecture information not present.</td>
</tr>
<tr>
<td>0b1</td>
<td>Device Architecture information present.</td>
</tr>
</tbody>
</table>

This bit reads as 0b1.

**REVISION, bits [19:16]**

Revision. Defines the architecture revision of the component.
### REVISION

<table>
<thead>
<tr>
<th>Meaning</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS System Architecture v1.0.</td>
<td>0000</td>
</tr>
</tbody>
</table>
| RAS System Architecture v1.1. As 0b0000 and also:  
  - Simplifies ERR<n>STATUS.  
  - Adds support for additional ERR<n>MISC<m> registers.  
  - Adds support for the optional RAS Timestamp Extension.  
  - Adds support for the optional RAS Common Fault Injection Model Extension. | 0001 |

All other values are reserved.

### ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component.

<table>
<thead>
<tr>
<th>ARCHVER</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>RAS System Architecture v1.0</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHVER is ARCHID[15:12].

This field reads as 0b0000.

### ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

<table>
<thead>
<tr>
<th>ARCHPART</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0xA00</td>
<td>RAS System Architecture.</td>
</tr>
</tbody>
</table>

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHPART is ARCHID[11:0].

This field reads as 0xA00.

### Accessing the ERRDEVARCH

**ERRDEVARCH, Device Architecture Register**

**ERRDEVARCH can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFBC</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
ERRDEVID, Device Configuration Register

The ERRDEVID characteristics are:

**Purpose**

Provides discovery information for the component.

**Configuration**

ERRDEVID is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRDEVID is a 32-bit register.

**Field descriptions**

The ERRDEVID bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>16</td>
<td>NUM</td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**NUM, bits [15:0]**

Highest numbered index of the error records in this group, plus one. Each implemented record is owned by a node. A node might own multiple records.

This manual describes a group of error records accessed via a standard 4KB memory-mapped peripheral. For a 4KB peripheral, up to 24 error records can be accessed if the Common Fault Injection Model is implemented, and up to 56 otherwise.

This field reads as an IMPLEMENTATION DEFINED value.

**Accessing the ERRDEVID**

ERRDEVID can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFC8</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
ERRERICR0, Error Recovery Interrupt Configuration Register 0

The ERRERICR0 characteristics are:

**Purpose**

Error Recovery Interrupt configuration register.

**Configuration**

This register is present only when (the Error Recovery Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRERICR0 are RES0.

ERRERICR0 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRERICR0 is a 64-bit register.

**Field descriptions**

The ERRERICR0 bit assignments are:

**When the Error Recovery Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | ADDR | ADDR | RES0 |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:56]**

Reserved, RES0.

**ADDR, bits [55:2]**

Message Signaled Interrupt address. (ERRERICR0.ADDR << 2) is the address that the component writes to when signaling the Error Recovery Interrupt. Bits [1:0] of the address are always zero.

The physical address size supported by the component is IMPLEMENTATION DEFINED. Unimplemented high-order physical address bits are RES0.

On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

**Bits [1:0]**

Reserved, RES0.
When the implementation does not use the recommended layout for the ERRIRQCR\(<n>\) registers:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ![IMPLEMENTATION DEFINED](image1)
| ![IMPLEMENTATION DEFINED](image2) |

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

**Accessing the ERRERICR0**

ERRERICR0 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xE90</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
ERRERICR1, Error Recovery Interrupt Configuration Register 1

The ERRERICR1 characteristics are:

**Purpose**

Error Recovery Interrupt configuration register.

**Configuration**

This register is present only when (the Error Recovery Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRERICR1 are RES0.

ERRERICR1 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRERICR1 is a 32-bit register.

**Field descriptions**

The ERRERICR1 bit assignments are:

**When the Error Recovery Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| DATA | DATA, bits [31:0] | Payload for the message signaled interrupt. | On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

**When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| IMPLEMENTATION DEFINED, bits [31:0] | IMPLEMENTATION DEFINED. |

**Accessing the ERRERICR1**

ERRERICR1 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xE98</td>
</tr>
</tbody>
</table>
Accesses on this interface are **RW**.
ERRERICR2, Error Recovery Interrupt Configuration Register 2

The ERRERICR2 characteristics are:

**Purpose**

Error Recovery Interrupt control and configuration register.

**Configuration**

This register is present only when (the Error Recovery Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRERICR2 are RES0.

ERRERICR2 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRERICR2 is a 32-bit register.

**Field descriptions**

The ERRERICR2 bit assignments are:

### When the Error Recovery Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>IRQEN</td>
</tr>
<tr>
<td>29</td>
<td>NSMSI</td>
</tr>
<tr>
<td>28</td>
<td>SH</td>
</tr>
<tr>
<td>27</td>
<td>MemAttr</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**IRQEN, bit [7]**

When the component supports disabling message signaled interrupts:

Message signaled interrupt enable. Enables generation of message signaled interrupts.

<table>
<thead>
<tr>
<th>IRQEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Enabled.</td>
</tr>
</tbody>
</table>

On an Error recovery reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

Message signaled interrupt enable.

Message signaled interrupts are always enabled.
NSMSI, bit [6]

When the component supports configuring the Security attribute for message signaled interrupts and the component does not allow Non-secure writes to ERRERICR2:

Security attribute. Defines the physical address space for message signaled interrupts.

<table>
<thead>
<tr>
<th>NSMSI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure</td>
</tr>
</tbody>
</table>

On an Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

When the component allows Non-secure writes to ERRERICR2:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute used for message signaled interrupts is Non-secure.

Otherwise:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute for message signaled interrupts is IMPLEMENTATION DEFINED.

SH, bits [5:4]

When the component supports configuring the Shareability domain:

Shareability. Defines the Shareability domain for message signaled interrupts.

<table>
<thead>
<tr>
<th>SH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Not shared</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field is ignored when ERRERICR2.MemAttr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Shareability.

The Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.
MemAttr, bits [3:0]

When the component supports configuring the memory type for message signaled interrupts:

Memory type. Defines the memory type and attributes for message signaled interrupts.

<table>
<thead>
<tr>
<th>MemAttr</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Device-nGnRnE memory.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Device-nGnRE memory.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Device-nGRE memory.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Device-GRE memory.</td>
</tr>
<tr>
<td>0b0100</td>
<td>Normal memory, Inner Non-cacheable, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Normal memory, Inner Write-Through, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Normal memory, Inner Write-Back, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b0101</td>

Accesses on this interface are RW.
ERRFHICR0, Fault Handling Interrupt Configuration Register 0

The ERRFHICR0 characteristics are:

**Purpose**

Fault Handling Interrupt configuration register.

**Configuration**

This register is present only when (the Fault Handling Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRFHICR0 are RES0.

ERRFHICR0 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRFHICR0 is a 64-bit register.

**Field descriptions**

The ERRFHICR0 bit assignments are:

When the Fault Handling Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

<table>
<thead>
<tr>

Accesses on this interface are \texttt{RW}.

ERRFHICR1, Fault Handling Interrupt Configuration Register 1

The ERRFHICR1 characteristics are:

Purpose

Fault Handling Interrupt configuration register.

Configuration

This register is present only when (the Fault Handling Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRFHICR1 are RES0.

ERRFHICR1 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRFHICR1 is a 32-bit register.

Field descriptions

The ERRFHICR1 bit assignments are:

When the Fault Handling Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing the ERRFHICR1

ERRFHICR1 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xE88</td>
</tr>
</tbody>
</table>
Accesses on this interface are RW.
ERRFHICR2, Fault Handling Interrupt Configuration Register 2

The ERRFHICR2 characteristics are:

**Purpose**

Fault Handling Interrupt control and configuration register.

**Configuration**

This register is present only when (the Fault Handling Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRFHICR2 are RES0.

ERRFHICR2 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRFHICR2 is a 32-bit register.

**Field descriptions**

The ERRFHICR2 bit assignments are:

When the Fault Handling Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  |  9  |  8  |  7  |  6  |  5  |  4  |  3  |  2  |  1  |  0  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0 | IRQEN | NSMSI | SH | MemAttr |

**Bits [31:8]**

Reserved, RES0.

**IRQEN, bit [7]**

When the component supports disabling message signaled interrupts:

Message signaled interrupt enable. Enables generation of message signaled interrupts.

<table>
<thead>
<tr>
<th>IRQEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Enabled.</td>
</tr>
</tbody>
</table>

On an Error recovery reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

Message signaled interrupt enable.

Message signaled interrupts are always enabled.
NSMSI, bit [6]

When the component supports configuring the Security attribute for message signaled interrupts and the component does not allow Non-secure writes to ERRFHICR2:

Security attribute. Defines the physical address space for message signaled interrupts.

<table>
<thead>
<tr>
<th>NSMSI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure.</td>
</tr>
</tbody>
</table>

On an Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

When the component allows Non-secure writes to ERRFHICR2:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute used for message signaled interrupts is Non-secure.

Otherwise:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute for message signaled interrupts is IMPLEMENTATION DEFINED.

SH, bits [5:4]

When the component supports configuring the Shareability domain:

Shareability. Defines the Shareability domain for message signaled interrupts.

<table>
<thead>
<tr>
<th>SH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Not shared.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field is ignored when ERRFHICR2.MemAttr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Shareability.

The Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.
MemAttr, bits [3:0]

When the component supports configuring the memory type for message signaled interrupts:

Memory type. Defines the memory type and attributes for message signaled interrupts.

<table>
<thead>
<tr>
<th>MemAttr</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Device-nGnRnE memory.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Device-nGnRE memory.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Device-nGRE memory.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Device-GRE memory.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Normal memory, Inner Non-cacheable, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Normal memory, Inner Write-Through, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Normal memory, Inner Write-Back, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b1001</td>
<td>Normal memory, Inner Non-cacheable, Outer Write-Through.</td>
</tr>
<tr>
<td>0b1010</td>
<td>Normal memory, Inner Write-Through, Outer Write-Through.</td>
</tr>
<tr>
<td>0b1011</td>
<td>Normal memory, Inner Write-Back, Outer Write-Through.</td>
</tr>
<tr>
<td>0b1101</td>
<td>Normal memory, Inner Non-cacheable, Outer Write-Back.</td>
</tr>
<tr>
<td>0b1110</td>
<td>Normal memory, Inner Write-Through, Outer Write-Back.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Normal memory, Inner Write-Back, Outer Write-Back.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Note

This is the same format as the VMSA v8-64 stage 2 memory region attributes.

On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Memory type.

The memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

<table>
<thead>
<tr>
<th>Offset</th>
<th>IMPLEMENTATION DEFINED</th>
</tr>
</thead>
<tbody>
<tr>
<td>0xE8C</td>
<td></td>
</tr>
</tbody>
</table>

Accessing the ERRFHIRCR2

ERRFHIRCR2 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xE8C</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
The ERRGSR characteristics are:

**Purpose**

Shows the status for the records in the group.

**Configuration**

ERRGSR is implemented only as part of a memory-mapped group of error records.

This manual describes a group of error records accessed via a standard 4KB memory-mapped peripheral. For a 4KB peripheral, up to 24 error records can be accessed if the Common Fault Injection Model is implemented, and up to 56 otherwise.

**Attributes**

ERRGSR is a 64-bit register.

**Field descriptions**

The ERRGSR bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:56]</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>S&lt;m&gt;</strong>, bit [m], for m = 55 to 0</td>
<td>When error record &lt;m&gt; is implemented and error record &lt;m&gt; supports this type of reporting:</td>
</tr>
<tr>
<td>The status for error record &lt;m&gt;. A read-only copy of ERR&lt;m&gt;STATUS.V.</td>
<td></td>
</tr>
<tr>
<td><strong>S&lt;m&gt;</strong></td>
<td>Meaning</td>
</tr>
<tr>
<td>0b0</td>
<td>No error.</td>
</tr>
<tr>
<td>0b1</td>
<td>One or more errors.</td>
</tr>
</tbody>
</table>

If the Common Fault Injection Model is implemented, up-to 24 records can be implemented meaning bits [55:24] are RES0.

**Otherwise:**

Reserved, RES0.

**Accessing the ERRGSR**

ERRGSR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Accesses on this interface are RO.
ERRIIDR, Implementation Identification Register

The ERRIIDR characteristics are:

**Purpose**

Defines the implementer of the component.

**Configuration**

Implementation of this register is **OPTIONAL**.

This register is present only when RAS System Architecture v1.1 is implemented.

**Attributes**

ERRIIDR is a 32-bit register.

**Field descriptions**

The ERRIIDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>ProductID</td>
</tr>
<tr>
<td>30</td>
<td></td>
</tr>
<tr>
<td>29</td>
<td></td>
</tr>
<tr>
<td>28</td>
<td></td>
</tr>
<tr>
<td>27</td>
<td></td>
</tr>
<tr>
<td>26</td>
<td></td>
</tr>
<tr>
<td>25</td>
<td></td>
</tr>
<tr>
<td>24</td>
<td></td>
</tr>
<tr>
<td>23</td>
<td></td>
</tr>
<tr>
<td>22</td>
<td></td>
</tr>
<tr>
<td>21</td>
<td></td>
</tr>
<tr>
<td>20</td>
<td></td>
</tr>
<tr>
<td>19</td>
<td></td>
</tr>
<tr>
<td>18</td>
<td></td>
</tr>
<tr>
<td>17</td>

<td></td>
</tr>
<tr>
<td>13</td>
<td></td>
</tr>
<tr>
<td>12</td>
<td></td>
</tr>
<tr>
<td>11</td>
<td></td>
</tr>
<tr>
<td>10</td>
<td></td>
</tr>
<tr>
<td>9</td>
<td></td>
</tr>
<tr>
<td>8</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td>Implementer</td>
</tr>
</tbody>
</table>

**ProductID, bits [31:20]**

Part number, bits [11:0]. The part number is selected by the designer of the component.

If ERRIIDR0 and ERRIIDR1 are implemented, ERRIIDR0.PART_0 matches bits [7:0] of ERRIIDR.ProductID and ERRIIDR1.PART_1 matches bits [11:8] of ERRIIDR.ProductID.

**Variant, bits [19:16]**

Component major revision.

This field distinguishes product variants or major revisions of the product.

If ERRIIDR2 is implemented, ERRIIDR2.REVISION matches ERRIIDR.Variant.

**Revision, bits [15:12]**

Component minor revision.

This field distinguishes minor revisions of the product.

If ERRIIDR3 is implemented, ERRIIDR3.REVAND matches ERRIIDR.Revision.

**Implementer, bits [11:0]**

Contains the JEP106 code of the company that implemented the RAS component. For an Arm implementation, this field has the value 0x43B.

Bits [11:8] contain the JEP106 continuation code of the implementer, and bits [6:0] contain the JEP106 identity code of the implementer. Bit 7 is RES0.
If \texttt{ERRPIDR4} is implemented, \texttt{ERRPIDR2} is implemented, and \texttt{ERRPIDR1} is implemented, \texttt{ERRPIDR4.DE5_2} matches bits [11:8] of \texttt{ERRIIDR}\texttt{.Implementer}, \texttt{ERRPIDR2.DE5_1} matches bits [6:4] of \texttt{ERRIIDR}\texttt{.Implementer}, and \texttt{ERRPIDR1.DE5_0} matches bits [3:0] of \texttt{ERRIIDR}\texttt{.Implementer}.

### Accessing the ERRIIDR

erriidr can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xE10</td>
</tr>
</tbody>
</table>

Accesses on this interface are \texttt{RO}.
ERRIMPDEF<n>, IMPLEMENTATION DEFINED Register <n>, n = 0 - 191

The ERRIMPDEF<n> characteristics are:

**Purpose**

IMPLEMENTATION DEFINED RAS extensions.

**Configuration**

This register is present only when the RAS Common Fault Injection Model Extension is not implemented, ERRDEVID.NUM <= 32 and an implementation implements ERRIMPDEF<n>. Otherwise, direct accesses to ERRIMPDEF<n> are RES0.

**Attributes**

ERRIMPDEF<n> is a 64-bit register.

**Field descriptions**

The ERRIMPDEF<n> bit assignments are:

<table>

**IMPLEMENTATION DEFINED, bits [63:0]**

**IMPLEMENTATION DEFINED.**

**Accessing the ERRIMPDEF<n>**

ERRIMPDEF<n> can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x800 + (8 * n)</td>
<td>ERRIMPDEF&lt;n&gt;</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
ERRIRQCR\(<n>\), Generic Error Interrupt Configuration Register, n = 0 - 15

The ERRIRQCR\(<n>\) characteristics are:

**Purpose**

The ERRIRQCR\(<n>\) registers are reserved for IMPLEMENTATION DEFINED interrupt configuration registers.

The architecture provides a recommended layout for the ERRIRQCR\(<n>\) registers. These registers are named:

- **ERRFHIRC0**, **ERRFHIRC1**, and **ERRFHIRC2** for the fault handling interrupt controls.
- **ERRERICR0**, **ERRERICR1**, and **ERRERICR2** for the error recovery interrupt controls.
- **ERRCIRC0**, **ERRCIRC1**, and **ERRCIRC2** for the critical error interrupt controls.
- **ERRROS** for the status register.

This section describes the generic, IMPLEMENTATION DEFINED, format.

**Configuration**

This register is present only when the interrupt configuration registers are implemented. Otherwise, direct accesses to ERRIRQCR\(<n>\) are RES0.

ERRIRQCR\(<n>\) is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRIRQCR\(<n>\) is a 64-bit register.

**Field descriptions**

The ERRIRQCR\(<n>\) bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-0</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
</tbody>
</table>

**IMPLEMENTATION DEFINED, bits [63:0]**

IMPLEMENTATION DEFINED controls. The content of these registers is IMPLEMENTATION DEFINED.

**Accessing the ERRIRQCR\(<n>\)**

ERRIRQCR\(<n>\) can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xE80  + (8 * (&lt;n&gt;))</td>
<td>ERRIRQCR(&lt;n&gt;)</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
ERRIRQSR, Error Interrupt Status Register

The ERRIRQSR characteristics are:

**Purpose**

Interrupt status register.

**Configuration**

This register is present only when interrupt configuration registers are implemented. Otherwise, direct accesses to ERRIRQSR are read-only.

ERRIRQSR is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRIRQSR is a 64-bit register.

**Field descriptions**

The ERRIRQSR bit assignments are:

**When the implementation uses the recommended layout for the ERRIRQCR<n> registers:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | CRIERR | CRIERR | ERIERR | ERIERR |

Bits [63:6]

Reserved, RES0.

**CRIERR, bit [5]**

**When the Critical Error Interrupt is implemented:**

Critical Error Interrupt error.

<table>
<thead>
<tr>
<th>CRIERR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Critical Error Interrupt write has not returned an error since this bit was last cleared to zero.</td>
</tr>
<tr>
<td>0b1</td>
<td>Critical Error Interrupt write has returned an error since this bit was last cleared to zero.</td>
</tr>
</tbody>
</table>

This bit is read/write-one-to-clear.

On an Error recovery reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**CRI, bit [4]**
When the **Critical Error Interrupt** is implemented:

Critical Error Interrupt write in progress.

<table>
<thead>
<tr>
<th>CRI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Critical Error Interrupt write not in progress.</td>
</tr>
<tr>
<td>0b1</td>
<td>Critical Error Interrupt write in progress.</td>
</tr>
</tbody>
</table>

Software must not disable an interrupt whilst the write is in progress.

**Note**

This bit does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

To determine whether an interrupt is active, software must examine the individual **ERR<n>STATUS** registers.

Access to this field is RO.

**Otherwise:**

Reserved, RES0.

**ERIERR, bit [3]**

When the **Error Recovery Interrupt** is implemented:

Error Recovery Interrupt error.

<table>
<thead>
<tr>
<th>ERIERR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Error Recovery Interrupt write has not returned an error since this bit was last cleared to zero.</td>
</tr>
<tr>
<td>0b1</td>
<td>Error Recovery Interrupt write has returned an error since this bit was last cleared to zero.</td>
</tr>
</tbody>
</table>

This bit is read/write-one-to-clear.

On an Error recovery reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**ERI, bit [2]**

When the **Error Recovery Interrupt** is implemented:

Error Recovery Interrupt write in progress.

<table>
<thead>
<tr>
<th>ERI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Error Recovery Interrupt write not in progress.</td>
</tr>
<tr>
<td>0b1</td>
<td>Error Recovery Interrupt write in progress.</td>
</tr>
</tbody>
</table>

Software must not disable an interrupt whilst the write is in progress.

**Note**

This bit does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.
To determine whether an interrupt is active, software must examine the individual `ERR<n>STATUS` registers.

Access to this field is RO.

Otherwise:

Reserved, RES0.

**FHIERR, bit [1]**

When the Fault Handling Interrupt is implemented:

Fault Handling Interrupt error.

<table>
<thead>
<tr>
<th>FHIERR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault Handling Interrupt write has not returned an error since this bit was last cleared to zero.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault Handling Interrupt write has returned an error since this bit was last cleared to zero.</td>
</tr>
</tbody>
</table>

This bit is read/write-one-to-clear:

On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**FHI, bit [0]**

When the Fault Handling Interrupt is implemented:

Fault Handling Interrupt write in progress.

<table>
<thead>
<tr>
<th>FHI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault Handling Interrupt write not in progress.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault Handling Interrupt write in progress.</td>
</tr>
</tbody>
</table>

Software must not disable an interrupt whilst the write is in progress.

**Note**

This bit does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

To determine whether an interrupt is active, software must examine the individual `ERR<n>STATUS` registers.

Access to this field is RO.

Otherwise:

Reserved, RES0.
When the implementation does not use the recommended layout for the ERRIRQ<Cr> registers:

**IMPLEMENTATION DEFINED, bits [63:0]**

**Accessing the ERRIRQSR**

ERRIRQSR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xEF8</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
**ERR<n>ADDR, Error Record Address Register, n = 0 - 65534**

The ERR<n>ADDR characteristics are:

**Purpose**

If an address is associated with a detected error, then it is written to ERR<n>ADDR when the error is recorded. It is *IMPLEMENTATION DEFINED* how the recorded address maps to the software-visible physical address. Software might have to reconstruct the actual physical addresses using the identity of the node and knowledge of the system.

**Configuration**

This register is present only when error record <n> is implemented and error record <n> includes an address associated with an error. Otherwise, direct accesses to ERR<n>ADDR are *RES0*.

ERR<q>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

**Attributes**

ERR<n>ADDR is a 64-bit register.

**Field descriptions**

The ERR<n>ADDR bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NS</td>
<td>63</td>
<td>Non-secure attribute.</td>
</tr>
<tr>
<td>SI</td>
<td>62</td>
<td>Secure Incorrect.</td>
</tr>
<tr>
<td>AI</td>
<td>61</td>
<td>Actual Incorrect.</td>
</tr>
<tr>
<td>VA</td>
<td>60</td>
<td>Virtual Address.</td>
</tr>
<tr>
<td>RES0</td>
<td>59</td>
<td>Reserved.</td>
</tr>
<tr>
<td>PADDR</td>
<td>58</td>
<td>Physical Address.</td>
</tr>
</tbody>
</table>

**NS, bit [63]**

Non-secure attribute.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERR&lt;n&gt;ADDR.PADDR is a Secure address.</td>
</tr>
<tr>
<td>0b1</td>
<td>ERR&lt;n&gt;ADDR.PADDR is a Non-secure address.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally *UNKNOWN* value.

**SI, bit [62]**

Secure Incorrect. Indicates whether ERR<n>ADDR.NS is valid.

<table>
<thead>
<tr>
<th>SI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERR&lt;n&gt;ADDR.NS is correct. That is, it matches the programmers’ view of the Non-secure attribute for this recorded location.</td>
</tr>
<tr>
<td>0b1</td>
<td>ERR&lt;n&gt;ADDR.NS might not be correct, and might not match the programmers’ view of the Non-secure attribute for the recorded location.</td>
</tr>
</tbody>
</table>

It is *IMPLEMENTATION DEFINED* whether this bit is read-only or read/write.

On a Cold reset, this field resets to an architecturally *UNKNOWN* value.
AI, bit [61]

Address Incorrect. Indicates whether ERR<n>ADDR.PADDR is a valid physical address that is known to match the programmers’ view of the physical address for the recorded location.

<table>
<thead>
<tr>
<th>AI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERR&lt;n&gt;ADDR.PADDR is a valid physical address. That is, it matches the programmers' view of the physical address for the recorded location.</td>
</tr>
<tr>
<td>0b1</td>
<td>ERR&lt;n&gt;ADDR.PADDR might not be a valid physical address, and might not match the programmers' view of the physical address for the recorded location.</td>
</tr>
</tbody>
</table>

It is IMPLEMENTATION DEFINED whether this bit is read-only or read/write.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

VA, bit [60]

Virtual Address. Indicates whether ERR<n>ADDR.PADDR field is a virtual address.

<table>
<thead>
<tr>
<th>VA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERR&lt;n&gt;ADDR.PADDR is not a virtual address.</td>
</tr>
<tr>
<td>0b1</td>
<td>ERR&lt;n&gt;ADDR.PADDR is a virtual address.</td>
</tr>
</tbody>
</table>

No context information is provided for the virtual address. When ERR<n>ADDR.VA == 0b1, ERR<n>ADDR.{NS,SI,VI} read as {0,1,1}.

Support for this bit is optional. If this bit is not implemented and ERR<n>ADDR.PADDR field is a virtual address, then ERR<n>ADDR.{NS,SI,VI} read as {0,1,1}.

It is IMPLEMENTATION DEFINED whether this bit is read-only or read/write.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [59:56]

Reserved, RES0.

PADDR, bits [55:0]

Physical Address. Address of the recorded location. If the physical address size implemented by this component is smaller than the size of this field, then high-order bits are unimplemented and either RES0 or have a fixed read-only IMPLEMENTATION DEFINED value. Low-order address bits might also be unimplemented and RES0, for example, if the physical address is always aligned to the size of a protection granule.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the ERR<n>ADDR

ERR<n>ADDR ignores writes if all of the following are true:

- Any of the following are true:
  - The RAS Common Fault Injection Model Extension is implemented by the node that owns this error record and ERR<q>PFGF.AV == 0b0.
  - The RAS Common Fault Injection Model Extension is not implemented by the node that owns this error record.
  - ERR<n>STATUS.AV == 0b1.

ERR<n>ADDR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x018 + (64 * n)</td>
<td>ERR&lt;n&gt;ADDR</td>
</tr>
</tbody>
</table>
Accesses on this interface are **RW**.
The ERR<n>CTRL characteristics are:

**Purpose**

The error control register contains enable bits for the node that writes to this record:

- Enabling error detection and correction.
- Enabling the critical error, error recovery, and fault handling interrupts.
- Enabling in-band error response for Uncorrected errors.

For each bit, if the node does not support the feature, then the bit is RES0. The definition of each record is IMPLEMENTATION DEFINED.

**Configuration**

This register is present only when error record <n> is implemented and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>CTRL are RES0.

ERR<n>FR describes the features implemented by the node.

**Attributes**

ERR<n>CTRL is a 64-bit register.

**Field descriptions**

The ERR<n>CTRL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>

</tbody>
</table>

**IMPLEMENTATION DEFINED, bits [63:32]**

Reserved for IMPLEMENTATION DEFINED controls. Must permit SBZP write policy for software.

**Bits [31:14]**

Reserved, RES0.

**CI, bit [13]**

When ERR<n>FR.CI == 0b10:

Critical error interrupt enable. When enabled, the critical error interrupt is generated for a critical error condition.

<table>
<thead>
<tr>
<th>CI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Critical error interrupt not generated for critical errors. Critical errors are treated as Uncontained errors.</td>
</tr>
<tr>
<td>0b1</td>
<td>Critical error interrupt generated for critical errors.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

Bit [12]
Reserved, RES0.

**WDUI, bit [11]**

**When ERR<n>FR.DUI == 0b11:**

Error recovery interrupt for deferred errors on writes enable.

When enabled, the error recovery interrupt is generated for detected Deferred errors on writes.

<table>
<thead>
<tr>
<th><strong>WDUI</strong></th>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Error recovery interrupt not generated for deferred errors on writes.</td>
</tr>
<tr>
<td>0b1</td>
<td>Error recovery interrupt generated for deferred errors on writes.</td>
</tr>
</tbody>
</table>

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:
Reserved, RES0.

**DUI, bit [10]**

**When ERR<n>FR.DUI == 0b10:**

Error recovery interrupt for deferred errors enable.

When ERR<n>FR.DUI == 0b10, this control applies to errors arising from both reads and writes.

When enabled, the error recovery interrupt is generated for all detected Deferred errors.

<table>
<thead>
<tr>
<th><strong>DUI</strong></th>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Error recovery interrupt not generated for deferred errors.</td>
</tr>
<tr>
<td>0b1</td>
<td>Error recovery interrupt generated for deferred errors.</td>
</tr>
</tbody>
</table>

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**When ERR<n>FR.DUI == 0b11:**

Error recovery interrupt for deferred errors on reads enable.

When ERR<n>FR.DUI == 0b11, this bit is named RDUI.

When enabled, the error recovery interrupt is generated for detected Deferred errors on reads.

<table>
<thead>
<tr>
<th><strong>RDUI</strong></th>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Error recovery interrupt not generated for deferred errors on reads.</td>
</tr>
<tr>
<td>0b1</td>
<td>Error recovery interrupt generated for deferred errors on reads.</td>
</tr>
</tbody>
</table>
The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**WCFI, bit [9]**

*When ERR<n>FR.CFI == 0b11:*

Fault handling interrupt for Corrected errors on writes enable.

When enabled:

- If the node implements Corrected error counters for writes, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 0b1. For more information, see ERR<n>MISC0.
- Otherwise, the fault handling interrupt is also generated for detected Corrected errors on writes.

<table>
<thead>
<tr>
<th>WCFI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault handling interrupt not generated for Corrected errors on writes.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault handling interrupt generated for Corrected errors on writes.</td>
</tr>
</tbody>
</table>

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**CFI, bit [8]**

*When ERR<n>FR.CFI == 0b10:*

Fault handling interrupt for Corrected errors enable.

When ERR<n>FR.CFI == 0b10, this control applies to errors arising from both reads and writes.

When enabled:

- If the node implements Corrected error counters, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 0b1. For more information, see ERR<n>MISC0.
- Otherwise, the fault handling interrupt is also generated for all detected Corrected errors.

<table>
<thead>
<tr>
<th>CFI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault handling interrupt not generated for Corrected errors.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault handling interrupt generated for Corrected errors.</td>
</tr>
</tbody>
</table>

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

*When ERR<n>FR.CFI == 0b11:*

Fault handling interrupt for Corrected errors on reads enable.

When ERR<n>FR.CFI == 0b11, this bit is named RCFI.
When enabled:

- If the node implements Corrected error counters for reads, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 0b1. For more information, see ERR<n>MISC0.
- Otherwise, the fault handling interrupt is also generated for detected Corrected errors on reads.

<table>
<thead>
<tr>
<th>RCFI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault handling interrupt not generated for Corrected errors on reads.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault handling interrupt generated for Corrected errors on reads.</td>
</tr>
</tbody>
</table>

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**WUE, bit [7]**

When ERR<n>FR.UE == 0b11:

In-band Uncorrected error reporting on writes enable.

When enabled, responses to writes that detect an Uncorrected error that cannot be deferred are signaled in-band as a detected Uncorrected error (External Abort).

<table>
<thead>
<tr>
<th>WUE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>External Abort response for Uncorrected errors on writes disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>External Abort response for Uncorrected errors on writes enabled.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**WFI, bit [6]**

When ERR<n>FR.FI == 0b11:

Fault handling interrupt on writes enable.

When enabled:

- The fault handling interrupt is generated for detected Deferred errors and Uncorrected errors.
- If the corresponding fault handling interrupt for Corrected errors control is not implemented:
  - If the node implements Corrected error counters for writes, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 0b1.
  - Otherwise, the fault handling interrupt is also generated for detected Corrected errors on writes.

<table>
<thead>
<tr>
<th>WFI</th>

</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault handling interrupt on writes disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault handling interrupt on writes enabled.</td>
</tr>
</tbody>
</table>

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

**WUI, bit [5]**

When ERR\(n>FR.UI = 0b11\):

Uncorrected error recovery interrupt on writes enable.

When enabled, the error recovery interrupt is generated for detected Uncorrected errors on writes that are not deferred.

<table>
<thead>
<tr>
<th>WUI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Error recovery interrupt on writes disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Error recovery interrupt on writes enabled.</td>
</tr>
</tbody>
</table>

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

**UE, bit [4]**

When ERR\(n>FR.UE = 0b10\):

In-band Uncorrected error reporting enable.

When ERR\(n>FR.UE = 0b10\), this control applies to errors arising from both reads and writes.

When enabled, responses to transactions that detect an Uncorrected error that cannot be deferred are signaled in-band as a detected Uncorrected error (External Abort).

<table>
<thead>
<tr>
<th>UE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>External Abort response for Uncorrected errors disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>External Abort response for Uncorrected errors enabled.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR\(n>FR.UE = 0b11\):

In-band Uncorrected error reporting on reads enable.

When ERR\(n>FR.UE = 0b11\), this bit is named RUE.

When enabled, responses to reads that detect an Uncorrected error that cannot be deferred are signaled in-band as a detected Uncorrected error (External Abort).

<table>
<thead>
<tr>
<th>RUE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>External Abort response for Uncorrected errors on reads disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>External Abort response for Uncorrected errors on reads enabled.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.
**FI, bit [3]**

When \( \text{ERR}_n^{<}\text{FR}.\text{FI} == 0b10 \):

Fault handling interrupt enable.

When \( \text{ERR}_n^{<}\text{FR}.\text{FI} == 0b10 \), this control applies to errors arising from both reads and writes.

When enabled:

- The fault handling interrupt is generated for all detected Deferred errors and Uncorrected errors.
- If the fault handling interrupt for Corrected errors control is not implemented:
  - If the node implements Corrected error counters, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 0b1.
  - Otherwise, the fault handling interrupt is also generated for all detected Corrected errors.

<table>
<thead>
<tr>
<th>FI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault handling interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault handling interrupt enabled.</td>
</tr>
</tbody>
</table>

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

When \( \text{ERR}_n^{<}\text{FR}.\text{FI} == 0b11 \):

Fault handling interrupt on reads enable.

When \( \text{ERR}_n^{<}\text{FR}.\text{FI} == 0b11 \), this bit is named RFI.

When enabled:

- The fault handling interrupt is generated for detected Deferred errors and Uncorrected errors.
- If the corresponding fault handling interrupt for Corrected errors control is not implemented:
  - If the node implements Corrected error counters for reads, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 0b1.
  - Otherwise, the fault handling interrupt is also generated for detected Corrected errors on reads.

<table>
<thead>
<tr>
<th>RFI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault handling interrupt on reads disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault handling interrupt on reads enabled.</td>
</tr>
</tbody>
</table>

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**UI, bit [2]**

When \( \text{ERR}_n^{<}\text{FR}.\text{UI} == 0b10 \):

Uncorrected error recovery interrupt enable.

When \( \text{ERR}_n^{<}\text{FR}.\text{UI} == 0b10 \), this control applies to errors arising from both reads and writes.

When enabled, the error recovery interrupt is generated for all detected Uncorrected errors that are not deferred.

<table>
<thead>
<tr>
<th>UI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Error recovery interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Error recovery interrupt enabled.</td>
</tr>
</tbody>
</table>
The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**When ERR<n>FR.UI == 0b11:**

Uncorrected error recovery interrupt on reads enable.

When ERR<n>FR.UI == 0b11, this bit is named RUI.

When enabled, the error recovery interrupt is generated for detected Uncorrected errors on reads that are not deferred.

<table>
<thead>
<tr>
<th>RUI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Error recovery interrupt on reads disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Error recovery interrupt on reads enabled.</td>
</tr>
</tbody>
</table>

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES\(0\).

**IMPLEMENTATION DEFINED, bit [1]**

Reserved for IMPLEMENTATION DEFINED controls. Must permit SBZP write policy for software.

**ED, bit [0]**

**When ERR<n>FR.ED == 0b10:**

Error reporting and logging enable. When disabled, the node behaves as if error detection and correction are disabled, and no errors are recorded or signaled by the node. Arm recommends that, when disabled, correct error detection and correction codes are written for writes, unless disabled by an IMPLEMENTATION DEFINED control for error injection.

<table>
<thead>
<tr>
<th>ED</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Error reporting disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Error reporting enabled.</td>
</tr>
</tbody>
</table>

It is IMPLEMENTATION DEFINED whether the node fully disables error detection and correction when reporting is disabled. That is, even with error reporting disabled, the node might continue to silently correct errors. Uncorrectable errors might result in corrupt data being silently propagated by the node.

**Note**

If this node requires initialization after Cold reset to prevent signaling false errors, then Arm recommends this bit is set to 0b0 on Cold reset, meaning errors are not reported from Cold reset. This allows boot software to initialize a node without signaling errors. Software can enable error reporting after the node is initialized. Otherwise, the Cold reset value is IMPLEMENTATION DEFINED. If the Cold reset value is 0b1, the reset values of other controls in this register are also IMPLEMENTATION DEFINED and should not be UNKNOWN.

On a Cold reset, this field resets to an IMPLEMENTATION DEFINED value.

**Otherwise:**

Reserved, RES\(0\).
Accessing the ERR\text{n}\text{CTRL}

ERR\text{n}\text{CTRL} can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x008 + (64 * n)</td>
<td>ERR\text{n}\text{CTRL}</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
ERR<n>FR, Error Record Feature Register, n = 0 - 65534

The ERR<n>FR characteristics are:

**Purpose**

Defines whether <n> is the first record owned by a node:

- If <n> is the first error record owned by a node, then ERR<n>FR.ED != 0b00.
- If <n> is not the first error record owned by a node, then ERR<n>FR.ED == 0b00.

If <n> is the first record owned by the node, defines which of the common architecturally-defined features are implemented by the node and, of the implemented features, which are software programmable.

**Configuration**

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>FR are RES0.

**Attributes**

ERR<n>FR is a 64-bit register.

**Field descriptions**

The ERR<n>FR bit assignments are:

When ERR<n>FR.ED != 0b00:

<td>Error handling interrupt is supported and controllable using ERR&lt;n&gt;CTLR.WUI for writes and ERR&lt;n&gt;CTLR.RUI for reads.</td>
</tr>
</tbody>
</table>

**IMPLEMENTATION DEFINED, bits [3:2]**

IMPLEMENTATION DEFINED.

**ED, bits [1:0]**

Error reporting and logging. Indicates whether error record <n> is the first record owned the node, and, if so, whether it implements the controls for enabling and disabling error reporting and logging.

<table>
<thead>
<tr>
<th>ED</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>Error reporting and logging always enabled. ERR&lt;n&gt;CTLR.ED is RES0.</td>
</tr>
<tr>
<td>0b10</td>
<td>Error reporting and logging is controllable using ERR&lt;n&gt;CTLR.ED.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**When ERR<n>FR.ED == 0b00:**

<table>
<thead>
<tr>
<th>Bits [63:2]</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
</table>

**ED, bits [1:0]**

Error reporting and logging. Indicates error record <n> is not the first record owned by the node.

<table>
<thead>
<tr>
<th>ED</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Error record &lt;n&gt; is not the first record owned by the node.</td>
</tr>
</tbody>
</table>

This field reads as 0b00.

**Accessing the ERR<n>FR**

ERR<n>FR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x000 + (64 * n)</td>
<td>ERR&lt;n&gt;FR</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
The ERR<n>MISC0 characteristics are:

**Purpose**

*IMPLEMENTATION DEFINED* error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

If the node that owns error record <n> implements architecturally-defined error counters (*ERR<q>FR.CEC != 0b000*), and error record <n> can record countable errors, then ERR<n>MISC0 implements the architecturally-defined error counter or counters.

**Configuration**

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC0 are RES0.

*ERR<q>FR* describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For *IMPLEMENTATION DEFINED* fields in ERR<n>MISC0, writing zero returns the error record to an initial quiescent state.

In particular, if any *IMPLEMENTATION DEFINED* syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

**Note**

Arm recommends that any *IMPLEMENTATION DEFINED* syndrome field that can generate a Fault Handling, Error Recovery, Critical, or *IMPLEMENTATION DEFINED* interrupt request is disabled at Cold reset and is enabled by software writing an *IMPLEMENTATION DEFINED* nonzero value to an *IMPLEMENTATION DEFINED* field in *ERR<q>CTRL*.

**Attributes**

ERR<n>MISC0 is a 64-bit register.

**Field descriptions**

The ERR<n>MISC0 bit assignments are:

**When ERR<q>FR.CEC == 0b000:**

<table>
<thead>
<tr>
<th>Bit Assignment</th>

**IMPLEMENTATION DEFINED, bits [31:0]**

**IMPLEMENTATION DEFINED** syndrome.

### Accessing the ERR<n>MISC0

Reads from ERR<n>MISC0 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and ERR<n>PFGF.MV is 0b1, then some parts of this register are read/write when ERR<n>STATUS.MV == 0b1. See ERR<n>PFGF.MV for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When ERR<n>STATUS.MV == 0b1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

---

**Note**

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

### ERR<n>MISC0 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x820 + (64 * n)</td>
<td>ERR&lt;n&gt;MISC0</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
ERR<n>MISC1, Error Record Miscellaneous Register 1, n = 0 - 65534

The ERR<n>MISC1 characteristics are:

**Purpose**

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

**Configuration**

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC1 are RES0.

ERR<q>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC1, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

**Note**

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERR<q>CTLR.

**Attributes**

ERR<n>MISC1 is a 64-bit register.

**Field descriptions**

The ERR<n>MISC1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| **IMPLEMENTATION DEFINED** | **IMPLEMENTATION DEFINED** |

**IMPLEMENTATION DEFINED, bits [63:0]**

IMPLEMENTATION DEFINED syndrome.
Accessing the ERR<n>MISC1

Reads from ERR<n>MISC1 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and ERR<n>PFGF.MV is 0b1, then some parts of this register are read/write when ERR<n>STATUS.MV == 0b1. See ERR<n>PFGF.MV for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When ERR<n>STATUS.MV == 0b1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

**Note**

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

**ERR<n>MISC1 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x028 + (64 * n)</td>
<td>ERR&lt;n&gt;MISC1</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
ERR<n>MISC2, Error Record Miscellaneous Register 2, n = 0 - 65534

The ERR<n>MISC2 characteristics are:

**Purpose**

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

**Configuration**

This register is present only when (an implementation implements ERR<n>MISC2 or RAS System Architecture v1.1 is implemented) and error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC2 are RES0.

ERR<q>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC2, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

If RAS System Architecture v1.1 is not implemented, Arm recommendes that ERR<n>MISC2 does not require zeroing to return the record to a quiescent state.

**Note**

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERR<q>CTRL.

**Attributes**

ERR<n>MISC2 is a 64-bit register.

**Field descriptions**

The ERR<n>MISC2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| IMPLEMENTATION DEFINED | IMPLEMENTATION DEFINED |

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED syndrome.
Accessing the ERR<n>MISC2

Reads from ERR<n>MISC2 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and ERR<n>PFGF.MV is 0b1, then some parts of this register are read/write when ERR<n>STATUS.MV == 0b1. See ERR<n>PFGF.MV for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When ERR<n>STATUS.MV == 0b1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

Note

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<n>MISC2 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x030 + (64 * n)</td>
<td>ERR&lt;n&gt;MISC2</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
ERR<n>MISC3, Error Record Miscellaneous Register 3, n = 0 - 65534

The ERR<n>MISC3 characteristics are:

**Purpose**

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

If the node that owns error record n supports the RAS Timestamp Extension (ERR<q>FR.TS != 0b00), then ERR<n>MISC3 contains the timestamp value for error record n when the error was detected. Otherwise the contents of ERR<n>MISC3 are IMPLEMENTATION DEFINED.

**Configuration**

This register is present only when (an implementation implements ERR<n>MISC3 or RAS System Architecture v1.1 is implemented) and error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC3 are RES0.

ERR<q>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC3, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

If RAS System Architecture v1.1 is not implemented, Arm recommended that ERR<n>MISC3 does not require zeroing to return the record to a quiescent state.

**Note**

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERR<q>CTRL.

**Attributes**

ERR<n>MISC3 is a 64-bit register.

**Field descriptions**

The ERR<n>MISC3 bit assignments are:
When ERR<q>FR.TS != 0b00:

TS, bits [63:0]

Timestamp. Timestamp value recorded when the error was detected. Valid only if ERR<n>STATUS.V == 0b1.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO or RW.

When ERR<q>FR.TS == 0b00:

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED syndrome.

Accessing the ERR<n>MISC3

Reads from ERR<n>MISC3 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and ERR<q>PFGF.MV is 0b1, then some parts of this register are read/write when ERR<n>STATUS.MV == 0b1. See ERR<n>PFGF.MV for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When ERR<n>STATUS.MV == 0b1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

Note

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<n>MISC3 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x638 + (64 * n)</td>
<td>ERR&lt;n&gt;MISC3</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
The ERR<n>PFGCDN characteristics are:

**Purpose**

Generates one of the errors enabled in the corresponding ERR<n>PFGCTL register.

**Configuration**

This register is present only when error record <n> is implemented, the node implements the RAS Common Fault Injection Model Extension (ERR<n>FR.INJ != 0b00) and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>PFGCDN are reserved.

ERR<n>FR describes the features implemented by the node.

**Attributes**

ERR<n>PFGCDN is a 64-bit register.

**Field descriptions**

The ERR<n>PFGCDN bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | CDN |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

**Bits [63:32]**

Reserved, RES0.

**CDN, bits [31:0]**

Countdown value.

This field is copied to Error Generation Counter when either:

- Software writes ERR<n>PFGCTL.CDNEN with 1.
- The Error Generation Counter decrements to zero and ERR<n>PFGCTL.R == 0b1.

While ERR<n>PFGCTL.CDNEN == 0b1 and the Error Generation Counter is nonzero, the counter decrements by 1 for each cycle at an IMPLEMENTATION DEFINED clock rate. When the counter reaches 0, one of the errors enabled in the ERR<n>PFGCTL register is generated.

**Note**

The current Error Generation Counter value is not visible to software.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
Accessing the ERR\textless n\textgreater PFGCDN

ERR\textless n\textgreater PFGCDN can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x810 + (64 * n)</td>
<td>ERR\textless n\textgreater PFGCDN</td>
</tr>
</tbody>
</table>

Accesses on this interface are \textbf{RW}.
**ERR<n>PFGCTL, Pseudo-fault Generation Control Register, n = 0 - 65534**

The ERR<n>PFGCTL characteristics are:

**Purpose**

Enables controlled fault generation.

**Configuration**

This register is present only when error record <n> is implemented, the node implements the RAS Common Fault Injection Model Extension (ERR<n>FR.INJ != 0b00) and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>PFGCTL are RES0.

ERR<n>FR describes the features implemented by the node.

**Attributes**

ERR<n>PFGCTL is a 64-bit register.

**Field descriptions**

The ERR<n>PFGCTL bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| CDNEN | R | RES0 | MV | AV | VN | ER | CI | CE | DE | UE | O | UE0 | UE1 | UEU | UC | OF |

**Bits [63:32]**

Reserved, RES0.

**CDNEN, bit [31]**

Countdown Enable. Controls transfers from the value that is held in the ERR<n>PFGCDN into the Error Generation Counter and enables this counter.

<table>
<thead>
<tr>
<th>CDNEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Error Generation Counter is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Error Generation Counter is enabled. On a write of 0b1 to this bit, the Error Generation Counter is set to ERR&lt;n&gt;PFGCDN.CDN.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.

**R, bit [30]**

Restart. Controls whether, upon reaching zero, the Error Generation Counter restarts from the ERR<n>PFGCDN value or stops.

<table>
<thead>
<tr>
<th>R</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>On reaching 0, the Error Generation Counter will stop.</td>
</tr>
<tr>
<td>0b1</td>
<td>On reaching 0, the Error Generation Counter is set to ERR&lt;n&gt;PFGCDN.CDN.</td>
</tr>
</tbody>
</table>
This bit is \texttt{RES0} if the node does not support this control.

On a Cold reset, this field resets to an architecturally \texttt{UNKNOWN} value.

**Bits [29:13]**

Reserved, \texttt{RES0}.

**MV, bit [12]**

Miscellaneous syndrome. The value that is written to \texttt{ERR<n>STATUS.MV} when an injected error is recorded.

<table>
<thead>
<tr>
<th>MV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>\texttt{ERR&lt;n&gt;STATUS.MV} is set to 0b0 when an injected error is recorded.</td>
</tr>
<tr>
<td>0b1</td>
<td>\texttt{ERR&lt;n&gt;STATUS.MV} is set to 0b1 when an injected error is recorded.</td>
</tr>
</tbody>
</table>

This bit reads-as-one if the node always records some syndrome in \texttt{ERR<n>MISC<m>}, setting \texttt{ERR<n>STATUS.MV} to 1, when an injected error is recorded. This bit is \texttt{RES0} if the node does not support this control.

On a Cold reset, this field resets to an architecturally \texttt{UNKNOWN} value.

**AV, bit [11]**

Address syndrome. The value that is written to \texttt{ERR<n>STATUS.AV} when an injected error is recorded.

<table>
<thead>
<tr>
<th>AV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>\texttt{ERR&lt;n&gt;STATUS.AV} is set to 0b0 when an injected error is recorded.</td>
</tr>
<tr>
<td>0b1</td>
<td>\texttt{ERR&lt;n&gt;STATUS.AV} is set to 0b1 when an injected error is recorded.</td>
</tr>
</tbody>
</table>

This bit reads-as-one if the node always sets \texttt{ERR<n>STATUS.AV} to 0b1 when an injected error is recorded. This bit is \texttt{RES0} if the node does not support this control.

On a Cold reset, this field resets to an architecturally \texttt{UNKNOWN} value.

**PN, bit [10]**

Poison flag. The value that is written to \texttt{ERR<n>STATUS.PN} when an injected error is recorded.

<table>
<thead>
<tr>
<th>PN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>\texttt{ERR&lt;n&gt;STATUS.PN} is set to 0b0 when an injected error is recorded.</td>
</tr>
<tr>
<td>0b1</td>
<td>\texttt{ERR&lt;n&gt;STATUS.PN} is set to 0b1 when an injected error is recorded.</td>
</tr>
</tbody>
</table>

This bit is \texttt{RES0} if the node does not support this control.

On a Cold reset, this field resets to an architecturally \texttt{UNKNOWN} value.

**ER, bit [9]**

Error Reported flag. The value that is written to \texttt{ERR<n>STATUS.ER} when an injected error is recorded.

<table>
<thead>
<tr>
<th>ER</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>\texttt{ERR&lt;n&gt;STATUS.ER} is set to 0b0 when an injected error is recorded.</td>
</tr>
<tr>
<td>0b1</td>
<td>\texttt{ERR&lt;n&gt;STATUS.ER} is set to 0b1 when an injected error is recorded.</td>
</tr>
</tbody>
</table>

This bit is \texttt{RES0} if the node does not support this control.

On a Cold reset, this field resets to an architecturally \texttt{UNKNOWN} value.
CI, bit [8]

Critical Error flag. The value that is written to \texttt{ERR<n>STATUS.CI} when an injected error is recorded.

\begin{table}[ht]
\centering
\begin{tabular}{|c|p{14em}|}
\hline
CI & Meaning \\
\hline
0b0 & \texttt{ERR<n>STATUS.CI} is set to 0b0 when an injected error is recorded. \\
0b1 & \texttt{ERR<n>STATUS.CI} is set to 0b1 when an injected error is recorded. \\
\hline
\end{tabular}
\end{table}

This bit is \texttt{RES0} if the node does not support this control.

On a Cold reset, this field resets to an architecturally \texttt{UNKNOWN} value.

CE, bits [7:6]

Corrected Error generation enable. Controls the type of Corrected Error condition that might be generated.

\begin{table}[ht]
\centering
\begin{tabular}{|c|p{14em}|}
\hline
CE & Meaning \\
\hline
0b00 & No error of this type will be generated. \\
0b01 & A non-specific Corrected Error, that is, a Corrected Error that is recorded as \texttt{ERR<n>STATUS.CE} == 0b10, might be generated when the Error Generation Counter decrements to zero. \\
0b10 & A transient Corrected Error; that is, a Corrected Error that is recorded as \texttt{ERR<n>STATUS.CE} == 0b01, might be generated when the Error Generation Counter decrements to zero. \\
0b11 & A persistent Corrected Error; that is, a Corrected Error that is recorded as \texttt{ERR<n>STATUS.CE} == 0b11, might be generated when the Error Generation Counter decrements to zero. \\
\hline
\end{tabular}
\end{table}

The set of permitted values for this field is defined by \texttt{ERR<n>PFGF.CE}. This field is \texttt{RES0} if the node does not support this control.

On a Cold reset, this field resets to an architecturally \texttt{UNKNOWN} value.

DE, bit [5]

Deferred Error generation enable. Controls whether this type of error condition might be generated. It is IMPLEMENTATION DEFINED whether the error is generated if the data is not consumed.

\begin{table}[ht]
\centering
\begin{tabular}{|c|p{14em}|}
\hline
DE & Meaning \\
\hline
0b0 & No error of this type will be generated. \\
0b1 & An error of this type might be generated when the Error Generation Counter decrements to zero. \\
\hline
\end{tabular}
\end{table}

This bit is \texttt{RES0} if the node does not support this control.

On a Cold reset, this field resets to an architecturally \texttt{UNKNOWN} value.

UEO, bit [4]

Latent or Restartable Error generation enable. Controls whether this type of error condition might be generated. It is IMPLEMENTATION DEFINED whether the error is generated if the data is not consumed.

\begin{table}[ht]
\centering
\begin{tabular}{|c|p{14em}|}
\hline
UEO & Meaning \\
\hline
0b0 & No error of this type will be generated. \\
0b1 & An error of this type might be generated when the Error Generation Counter decrements to zero. \\
\hline
\end{tabular}
\end{table}

This bit is \texttt{RES0} if the node does not support this control.

On a Cold reset, this field resets to an architecturally \texttt{UNKNOWN} value.
UER, bit [3]

Signaled or Recoverable Error generation enable. Controls whether this type of error condition might be generated. It is IMPLEMENTATION DEFINED whether the error is generated if the data is not consumed.

<table>
<thead>
<tr>
<th>UER</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No error of this type will be generated.</td>
</tr>
<tr>
<td>0b1</td>
<td>An error of this type might be generated when the Error Generation Counter decrements to zero.</td>
</tr>
</tbody>
</table>

This bit is RES0 if the node does not support this control.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

UEU, bit [2]

Unrecoverable Error generation enable. Controls whether this type of error condition might be generated. It is IMPLEMENTATION DEFINED whether the error is generated if the data is not consumed.

<table>
<thead>
<tr>
<th>UEU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No error of this type will be generated.</td>
</tr>
<tr>
<td>0b1</td>
<td>An error of this type might be generated when the Error Generation Counter decrements to zero.</td>
</tr>
</tbody>
</table>

This bit is RES0 if the node does not support this control.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

UC, bit [1]

Uncontainable Error generation enable. Controls whether this type of error condition might be generated. It is IMPLEMENTATION DEFINED whether the error is generated if the data is not consumed.

<table>
<thead>
<tr>
<th>UC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No error of this type will be generated.</td>
</tr>
<tr>
<td>0b1</td>
<td>An error of this type might be generated when the Error Generation Counter decrements to zero.</td>
</tr>
</tbody>
</table>

This bit is RES0 if the node does not support this control.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

OF, bit [0]

Overflow flag. The value that is written to `ERR<n>STATUS.OF` when an injected error is recorded.

<table>
<thead>
<tr>
<th>OF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><code>ERR&lt;n&gt;STATUS.OF</code> is set to 0b0 when an injected error is recorded.</td>
</tr>
<tr>
<td>0b1</td>
<td><code>ERR&lt;n&gt;STATUS.OF</code> is set to 0b1 when an injected error is recorded.</td>
</tr>
</tbody>
</table>

This bit is RES0 if the node does not support this control.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ERR<n>PFGCTL**

`ERR<n>PFGCTL` can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x808</td>
<td>ERR&lt;n&gt;PFGCTL</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
ERR<n>PFGCTL, Pseudo-fault Generation Control Register, n = 0 - 65534
ERR<n>PFGF, Pseudo-fault Generation Feature Register, n = 0 - 65534

The ERR<n>PFGF characteristics are:

**Purpose**

Defines which common architecturally-defined fault generation features are implemented.

**Configuration**

This register is present only when error record <n> is implemented, the node implements the RAS Common Fault Injection Model Extension (ERR<n>FR.INJ != 0b00) and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>PFGF are RES0.

ERR<n>FR describes the features implemented by the node.

**Attributes**

ERR<n>PFGF is a 64-bit register.

**Field descriptions**

The ERR<n>PFGF bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | R | SYN | RES0 | MV | AV | PN | ER | CI | CE | DE | UE | QU | UE | UJ | UE | UC | OF |

**Bits [63:31]**

Reserved, RES0.

**R, bit [30]**

Restartable. Support for Error Generation Counter restart mode.

<table>
<thead>
<tr>
<th>R</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The node does not support this feature.</td>
</tr>
<tr>
<td>0b1</td>
<td>Feature controllable.</td>
</tr>
</tbody>
</table>

**SYN, bit [29]**

Syndrome. Fault syndrome injection.

<table>
<thead>
<tr>
<th>SYN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When an injected error is recorded, the node sets ERR&lt;n&gt;STATUS. {IERR, SERR} to IMPLEMENTATION DEFINED values. ERR&lt;n&gt;STATUS. {IERR, SERR} are UNKNOWN when ERR&lt;n&gt;STATUS.V == 0b0.</td>
</tr>
<tr>
<td>0b1</td>
<td>When an injected error is recorded, the node does not update the ERR&lt;n&gt;STATUS. {IERR, SERR} fields. ERR&lt;n&gt;STATUS. {IERR, SERR} are writable when ERR&lt;n&gt;STATUS.V == 0b0.</td>
</tr>
</tbody>
</table>

**Note**
If ERR\textsubscript{n}>PFGF.SYN == 0b1, software can write specific values into the \texttt{ERR\textsubscript{n}>STATUS}.\{IERR, SERR\} fields when setting up a fault injection event. The sets of values that can be written to these fields is \texttt{IMPLEMENTATION DEFINED}.

**Bits [28:13]**

Reserved, RES0.

**MV, bit [12]**

Miscellaneous syndrome.

Additional syndrome injection. Defines whether software can control all or part of the syndrome recorded in the ERR\textsubscript{n}>MISC\textsubscript<m> registers when an injected error is recorded.

It is \texttt{IMPLEMENTATION DEFINED} which syndrome fields in ERR\textsubscript{n}>MISC\textsubscript<m> this refers to, as some fields might always be recorded by an error. For example, a Corrected Error counter.

<table>
<thead>
<tr>
<th>MV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When an injected error is recorded, the node might record \texttt{IMPLEMENTATION DEFINED} additional syndrome in ERR\textsubscript{n}&gt;MISC\textsubscript&lt;m&gt;. If any syndrome is recorded in ERR\textsubscript{n}&gt;MISC\textsubscript&lt;m&gt;, then ERR\textsubscript{n}&gt;STATUS.MV is set to 0b1.</td>
</tr>
</tbody>
</table>
| 0b1 | When an injected error is recorded, the node does not update all the syndrome fields in the ERR\textsubscript{n}>MISC\textsubscript<m> and does one of:  
• The node does not update any fields in ERR\textsubscript{n}>MISC\textsubscript<m> and sets ERR\textsubscript{n}>STATUS.MV to ERR\textsubscript{n}>PFGCTL.MV.  
• The node records some syndrome in ERR\textsubscript{n}>MISC\textsubscript<m> and sets ERR\textsubscript{n}>STATUS.MV to 0b1. ERR\textsubscript{n}>PFGCTL.MV is \texttt{RAO}.  
The syndrome fields that the node does not update are unchanged and are writable when ERR\textsubscript{n}>STATUS.MV == 0b0. |

**Note**

If ERR\textsubscript{n}>PFGF.MV == 0b1, software can write specific values into the ERR\textsubscript{n}>MISC\textsubscript<m> registers when setting up a fault injection event. The values that can be written to these registers are \texttt{IMPLEMENTATION DEFINED}.

**AV, bit [11]**

Address syndrome. Address syndrome injection.

<table>
<thead>
<tr>
<th>AV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When an injected error is recorded, the node either sets ERR\textsubscript{n}&gt;ADDR and ERR\textsubscript{n}&gt;STATUS.AV for the access, or leaves these unchanged.</td>
</tr>
</tbody>
</table>
| 0b1 | When an injected error is recorded, the node does not update ERR\textsubscript{n}>ADDR and does one of:  
• Sets ERR\textsubscript{n}>STATUS.AV to ERR\textsubscript{n}>PFGCTL.AV.  
• Sets ERR\textsubscript{n}>STATUS.AV to 0b1. ERR\textsubscript{n}>PFGCTL.AV is \texttt{RAO}.  
ERR\textsubscript{n}>ADDR is writable when ERR\textsubscript{n}>STATUS.AV == 0b0. |

**Note**

If ERR\textsubscript{n}>PFGF.AV == 0b1, software can write a specific value into ERR\textsubscript{n}>ADDR when setting up a fault injection event.

**PN, bit [10]**

Poison flag. Describes how the fault generation feature of the node sets the ERR\textsubscript{n}>STATUS.PN status flag.
### PN

<table>
<thead>
<tr>
<th>Meaning</th>
<th>0b0</th>
<th>0b1</th>
</tr>
</thead>
<tbody>
<tr>
<td>When an injected error is recorded, it is IMPLEMENTATION DEFINED</td>
<td>When an injected error is recorded, ERR&lt;n&gt;STATUS.PN to 0b1.</td>
<td>When an injected error is recorded, ERR&lt;n&gt;STATUS.PN is set to</td>
</tr>
<tr>
<td>whether the node sets ERR&lt;n&gt;STATUS.PN to 0b1.</td>
<td></td>
<td>ERR&lt;n&gt;PFGCTL.PN.</td>
</tr>
</tbody>
</table>

This behavior replaces the architecture-defined rules for setting the PN bit.

This bit reads-as-zero if the node does not support this flag.

### ER, bit [9]

Error Reported flag. Describes how the fault generation feature of the node sets the ERR<n>STATUS.ER status flag.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>0b0</th>
<th>0b1</th>
</tr>
</thead>
<tbody>
<tr>
<td>When an injected error is recorded, the node sets ERR&lt;n&gt;STATUS.ER</td>
<td>When an injected error is recorded, ERR&lt;n&gt;STATUS.ER is set to</td>
<td></td>
</tr>
<tr>
<td>according to the architecture-defined rules for setting the ER bit.</td>
<td>ERR&lt;n&gt;PFGCTL.ER.</td>
<td></td>
</tr>
</tbody>
</table>

This bit reads-as-zero if the node does not support this flag.

### CI, bit [8]

Critical Error flag. Describes how the fault generation feature of the node sets the ERR<n>STATUS.CI status flag.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>0b0</th>
<th>0b1</th>
</tr>
</thead>
<tbody>
<tr>
<td>When an injected error is recorded, it is IMPLEMENTATION DEFINED</td>
<td>When an injected error is recorded, ERR&lt;n&gt;STATUS.CI to 0b1.</td>
<td>When an injected error is recorded, ERR&lt;n&gt;STATUS.CI is set to</td>
</tr>
<tr>
<td>whether the node sets ERR&lt;n&gt;STATUS.CI to 0b1.</td>
<td></td>
<td>ERR&lt;n&gt;PFGCTL.CI.</td>
</tr>
</tbody>
</table>

This behavior replaces the architecture-defined rules for setting the CI bit.

This bit reads-as-zero if the node does not support this flag.

### CE, bits [7:6]

Corrected Error generation. Describes the types of Corrected Error that the fault generation feature of the node can generate.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>0b00</th>
<th>0b01</th>
<th>0b11</th>
</tr>
</thead>
<tbody>
<tr>
<td>The fault generation feature of the node cannot generate this type of</td>
<td>The fault generation feature of the node allows generation of a</td>
<td>The fault generation feature of the node allows generation of</td>
<td></td>
</tr>
<tr>
<td>error.</td>
<td>non-specific Corrected Error, that is, a Corrected Error that is</td>
<td>transient or persistent Corrected Errors, that is, Corrected</td>
<td></td>
</tr>
<tr>
<td></td>
<td>recorded as ERR&lt;n&gt;STATUS.CE == 0b10.</td>
<td>Errors that are recorded as ERR&lt;n&gt;STATUS.CE == 0b01 and 0b11.</td>
<td></td>
</tr>
</tbody>
</table>

All other values are reserved.

If ERR<n>FR.FRX is 0b1 then ERR<n>FR.CE indicates whether the node supports this type of error.

This field reads-as-zeros if the node does not support this type of error.

### DE, bit [5]

Deferred Error generation. Describes whether the fault generation feature of the node can generate this type of error.
If $\text{ERR}_n\text{FR}.\text{FRX}$ is 0b1 then $\text{ERR}_n\text{FR}.\text{DE}$ indicates whether the node supports this type of error.

This bit reads-as-zero if the node does not support this type of error.

### UEO, bit [4]

Latent or Restartable Error generation. Describes whether the fault generation feature of the node can generate this type of error.

<table>
<thead>
<tr>
<th>UEO</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The fault generation feature of the node cannot generate this type of error.</td>
</tr>
<tr>
<td>0b1</td>
<td>The fault generation feature of the node allows generation of this type of error.</td>
</tr>
</tbody>
</table>

If $\text{ERR}_n\text{FR}.\text{FRX}$ is 0b1 then $\text{ERR}_n\text{FR}.\text{UEO}$ indicates whether the node supports this type of error.

This bit reads-as-zero if the node does not support this type of error.

### UER, bit [3]

Signaled or Recoverable Error generation. Describes whether the fault generation feature of the node can generate this type of error.

<table>
<thead>
<tr>
<th>UER</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The fault generation feature of the node cannot generate this type of error.</td>
</tr>
<tr>
<td>0b1</td>
<td>The fault generation feature of the node allows generation of this type of error.</td>
</tr>
</tbody>
</table>

If $\text{ERR}_n\text{FR}.\text{FRX}$ is 0b1 then $\text{ERR}_n\text{FR}.\text{UER}$ indicates whether the node supports this type of error.

This bit reads-as-zero if the node does not support this type of error.

### UEU, bit [2]

Unrecoverable Error generation. Describes whether the fault generation feature of the node can generate this type of error.

<table>
<thead>
<tr>
<th>UEU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The fault generation feature of the node cannot generate this type of error.</td>
</tr>
<tr>
<td>0b1</td>
<td>The fault generation feature of the node allows generation of this type of error.</td>
</tr>
</tbody>
</table>

If $\text{ERR}_n\text{FR}.\text{FRX}$ is 0b1 then $\text{ERR}_n\text{FR}.\text{UEU}$ indicates whether the node supports this type of error.

This bit reads-as-zero if the node does not support this type of error.

### UC, bit [1]

Uncontainable Error generation. Describes whether the fault generation feature of the node can generate this type of error.

<table>
<thead>
<tr>
<th>UC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The fault generation feature of the node cannot generate this type of error.</td>
</tr>
<tr>
<td>0b1</td>
<td>The fault generation feature of the node allows generation of this type of error.</td>
</tr>
</tbody>
</table>
If `ERR<n>FR.FR` is 0b1 then `ERR<n>FR.UC` indicates whether the node supports this type of error.

This bit reads-as-zero if the node does not support this type of error.

**OF, bit [0]**

Overflow flag. Describes how the fault generation feature of the node sets the `ERR<n>STATUS.OF` status flag.

<table>
<thead>
<tr>
<th>OF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When an injected error is recorded, the node sets <code>ERR&lt;n&gt;STATUS.OF</code> according to the architecture-defined rules for setting the OF bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>When an injected error is recorded, <code>ERR&lt;n&gt;STATUS.OF</code> is set to <code>ERR&lt;n&gt;PFGCTL.OF</code>. This behavior replaces the architecture-defined rules for setting the OF bit.</td>
</tr>
</tbody>
</table>

This bit reads-as-zero if the node does not support this flag.

**Accessing the `ERR<n>PFGF`**

`ERR<n>PFGF` can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x800 + (64 * n)</td>
<td><code>ERR&lt;n&gt;PFGF</code></td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
ERR\(n\)STATUS, Error Record Primary Status Register, \(n = 0 - 65534\)

The ERR\(n\)STATUS characteristics are:

**Purpose**

Contains status information for error record \(\textless n\rangle\), including:

- Whether any error has been detected (valid).
- Whether any detected error was not corrected, and returned to a Requester.
- Whether any detected error was not corrected and deferred.
- Whether an error record has been discarded because additional errors have been detected before the first error was handled by software (overflow).
- Whether any error has been reported.
- Whether the other error record registers contain valid information.
- Whether the error was reported because poison data was detected or because a corrupt value was detected by an error detection code.
- A primary error code.
- An IMPLEMENTATION DEFINED extended error code.

Within this register:

- The \{AV, V, MV\} bits are valid bits that define whether error record \(\textless n\rangle\) registers are valid.
- The \{UE, OF, CE, DE, UET\} bits encode the types of error or errors recorded.
- The \{CI, ER, PN, IERR, SERR\} fields are syndrome fields.

**Configuration**

This register is present only when error record \(\textless n\rangle\) is implemented. Otherwise, direct accesses to ERR\(n\)STATUS are \texttt{RES0}.

ERR\(q\)FR describes the features implemented by the node that owns error record \(\textless n\rangle\). \(q\) is the index of the first error record owned by the same node as error record \(\textless n\rangle\). If the node owns a single record, then \(q = n\).

For IMPLEMENTATION DEFINED fields in ERR\(n\)STATUS, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

**Note**

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERR\(q\)CTRL.

**Attributes**

ERR\(n\)STATUS is a 64-bit register.

**Field descriptions**

The ERR\(n\)STATUS bit assignments are:
When RAS System Architecture v1.1 is implemented:

<table>
<thead>
<tr>
<th>Bits [63:32]</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
</table>
| AV, bit [31] | \(0b0\) \(ERR<n>ADDR\) not valid.  
\(0b1\) \(ERR<n>ADDR\) contains an address associated with the highest priority error recorded by this record. |

This bit is read/write-one-to-clear.  
On a Cold reset, this field resets to 0.

<table>
<thead>
<tr>
<th>Otherwise:</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
</table>
| V, bit [30] | \(0b0\) \(ERR<n>STATUS\) not valid.  
\(0b1\) \(ERR<n>STATUS\) valid. At least one error has been recorded. |

This bit is read/write-one-to-clear.  
On a Cold reset, this field resets to 0.

<table>
<thead>
<tr>
<th>UE, bit [29]</th>
<th>Uncorrected Error.</th>
</tr>
</thead>
<tbody>
<tr>
<td>(0b0)</td>
<td>No errors have been detected, or all detected errors have been either corrected or deferred.</td>
</tr>
<tr>
<td>(0b1)</td>
<td>At least one detected error was not corrected and not deferred.</td>
</tr>
</tbody>
</table>

When clearing \(ERR<n>STATUS. V\) to \(0b0\), if this bit is nonzero, then Arm recommends that software write \(0b1\) to this bit to clear this bit to zero.  
This bit is not valid and reads \textit{UNKNOWN} if \(ERR<n>STATUS. V == 0b0\).  
This bit is read/write-one-to-clear.  
On a Cold reset, this field resets to an architecturally \textit{UNKNOWN} value.

<p>| ER, bit [28] | Error Reported. |</p>
<table>
<thead>
<tr>
<th>ER</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No in-band error (External Abort) reported.</td>
</tr>
</tbody>
</table>
| 0b1 | An External Abort was signaled by the component to the Requester making the access or other transaction. This can be because any of the following are true:  
  * The applicable one of the `ERR<q>CTRL`.{WUE,RUE,UE} bits is implemented and was set to 0b1 when an Uncorrected error was detected.  
  * The applicable one of the `ERR<q>CTRL`.{WUE,RUE,UE} bits is not implemented and the component always reports errors. |

It is IMPLEMENTATION DEFINED whether this bit can be set to 0b1 by a Deferred error.

When clearing `ERR<n>STATUS.V` to 0b0, if this bit is nonzero, then Arm recommends that software write 0b1 to this bit to clear this bit to zero.

This bit is not valid and reads UNKNOWN if any of the following are true:

- `ERR<n>STATUS.V == 0b0`.  
- `ERR<n>STATUS.UE == 0b0` and this bit is never set to 0b1 by a Deferred error.  
- `ERR<n>STATUS.{UE,DE} == {0,0}` and this bit can be set to 0b1 by a Deferred error.

This bit is read/write-one-to-clear.

**Note**

An External Abort signaled by the component might be masked and not generate any exception.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**OF, bit [27]**

Overflow.

Indicates that multiple errors have been detected. This bit is set to 0b1 when one of the following occurs:

- A Corrected error counter is implemented, an error is counted, and the counter overflows.  
- `ERR<n>STATUS.V` was previously set to 0b1, a Corrected error counter is not implemented, and a Corrected error is recorded.  
- `ERR<n>STATUS.V` was previously set to 0b1, and a type of error other than a Corrected error is recorded.

Otherwise, this bit is unchanged when an error is recorded.

If a Corrected error counter is implemented:

- A direct write that modifies the counter overflow flag indirectly might set this bit to an UNKNOWN value.  
- A direct write to this bit that clears this bit to zero might indirectly set the counter overflow flag to an UNKNOWN value.

<table>
<thead>
<tr>
<th>OF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Since this bit was last cleared to zero, no error syndrome has been discarded and, if a Corrected error counter is implemented, it has not overflowed.</td>
</tr>
<tr>
<td>0b1</td>
<td>Since this bit was last cleared to zero, at least one error syndrome has been discarded or, if a Corrected error counter is implemented, it might have overflowed.</td>
</tr>
</tbody>
</table>

When clearing `ERR<n>STATUS.V` to 0b0, if this bit is nonzero, then Arm recommends that software write 0b1 to this bit to clear this bit to zero.

This bit is not valid and reads UNKNOWN if `ERR<n>STATUS.V == 0b0`.  

This bit is read/write-one-to-clear.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**MV, bit [26]**
When error record \( n \) includes an additional information for an error:

Miscellaneous Registers Valid.

<table>
<thead>
<tr>
<th>MV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERR( n )MISC(&lt;m&gt; ) not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The IMPLEMENTATION DEFINED contents of the ERR( n )MISC(&lt;m&gt; ) registers contains additional information for an error recorded by this record.</td>
</tr>
</tbody>
</table>

This bit is read/write-one-to-clear.

Note

If the ERR\( n \)MISC\(<m> \) registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded.

On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES\( 0 \).

CE, bits [25:24]

Corrected Error.

<table>
<thead>
<tr>
<th>CE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>No errors were corrected.</td>
</tr>
<tr>
<td>0b01</td>
<td>At least one transient error was corrected.</td>
</tr>
<tr>
<td>0b10</td>
<td>At least one error was corrected.</td>
</tr>
<tr>
<td>0b11</td>
<td>At least one persistent error was corrected.</td>
</tr>
</tbody>
</table>

The mechanism by which a component or node detects whether a correctable error is transient or persistent is IMPLEMENTATION DEFINED. If no such mechanism is implemented, then the node sets this field to 0b10 when a corrected error is recorded.

When clearing ERR\( n \)STATUS.V to 0b0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

This field is not valid and reads UNKNOWN if ERR\( n \)STATUS.V == 0b0.

This field is read/write-ones-to-clear. Writing a value other than all-zeros or all-ones sets this field to an UNKNOWN value.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

DE, bit [23]

Deferred Error.

<table>
<thead>
<tr>
<th>DE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No errors were deferred.</td>
</tr>
<tr>
<td>0b1</td>
<td>At least one error was not corrected and deferred.</td>
</tr>
</tbody>
</table>

Support for deferring errors is IMPLEMENTATION DEFINED.

When clearing ERR\( n \)STATUS.V to 0b0, if this bit is nonzero, then Arm recommends that software write 0b1 to this bit to clear this bit to zero.

This bit is not valid and reads UNKNOWN if ERR\( n \)STATUS.V == 0b0.
This bit is read/write-one-to-clear:
On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**PN, bit [22]**

Poison.

<table>
<thead>
<tr>
<th>PN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Uncorrected error or Deferred error recorded because a corrupt value was detected, for example, by an error detection code (EDC), or Corrected error recorded.</td>
</tr>
<tr>
<td>0b1</td>
<td>Uncorrected error or Deferred error recorded because a poison value was detected.</td>
</tr>
</tbody>
</table>

When clearing ERR<\n>STATUS.V to 0b0, if this bit is nonzero, then Arm recommends that software write 0b1 to this bit to clear this bit to zero.

This bit is not valid and reads **UNKNOWN** if any of the following are true:

- ERR<\n>STATUS.V == 0b0.
- ERR<\n>STATUS.{DE,UE} == {0,0}.

This bit is read/write-one-to-clear.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**UET, bits [21:20]**

Uncorrected Error Type. Describes the state of the component after detecting or consuming an Uncorrected error.

<table>
<thead>
<tr>
<th>UET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Uncorrected error; Uncontainable error (UC).</td>
</tr>
<tr>
<td>0b01</td>
<td>Uncorrected error; Unrecoverable error (UE).</td>
</tr>
<tr>
<td>0b10</td>
<td>Uncorrected error; Latent or Restartable error (UEO).</td>
</tr>
<tr>
<td>0b11</td>
<td>Uncorrected error; Signaled or Recoverable error (UER).</td>
</tr>
</tbody>
</table>

When clearing ERR<\n>STATUS.V to 0b0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

This field is not valid and reads **UNKNOWN** if any of the following are true:

- ERR<\n>STATUS.V == 0b0.
- ERR<\n>STATUS.UE == 0b0.

This field is read/write-ones-to-clear. Writing a value other than all-zeros or all-ones sets this field to an **UNKNOWN** value.

**Note**

Software might use the information in the error record registers to determine what recovery is necessary.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**CI, bit [19]**

Critical Error. Indicates whether a critical error condition has been recorded.

<table>
<thead>
<tr>
<th>CI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No critical error condition.</td>
</tr>
<tr>
<td>0b1</td>
<td>Critical error condition.</td>
</tr>
</tbody>
</table>

When clearing ERR<\n>STATUS.V to 0b0, if this bit is nonzero, then Arm recommends that software write 0b1 to this bit to clear this bit to zero.
This bit is not valid and reads **UNKNOWN** if ERR<\(n\)>STATUS.V == 0b0.

This bit is read/write-one-to-clear.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [18:16]**

Reserved, **RES0**.

**IERR, bits [15:8]**

**IMPLEMENTATION DEFINED** error code. Used with any primary error code ERR<\(n\)>STATUS.SERR value. Further **IMPLEMENTATION DEFINED** information can be placed in the ERR<\(n\)>MISC<\(m\)> registers.

The implemented set of valid values that this field can take is **IMPLEMENTATION DEFINED**. If any value not in this set is written to this register, then the value read back from this field is **UNKNOWN**.

---

**Note**

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

---

This field is not valid and reads **UNKNOWN** if all of the following are true:

- Any of the following are true:
  - The RAS Common Fault Injection Model Extension is implemented by the node that owns this error record and ERR<\(q\)>PFGE.SYN == 0b0.
  - The RAS Common Fault Injection Model Extension is not implemented by the node that owns this error record.
- ERR<\(n\)>STATUS.V == 0b0.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**SERR, bits [7:0]**

Architecturally-defined primary error code. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry.
<table>

<td>Reserved, RES0.</td>
</tr>
<tr>
<td>AV bit [31]</td>
<td><strong>AV, bit [31]</strong></td>
</tr>
</tbody>
</table>

**When error record <n> includes an address associated with an error:**

- **Address Valid.**

<table>
<thead>
<tr>
<th>AV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERR&lt;n&gt;ADDR not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>ERR&lt;n&gt;ADDR contains an address associated with the highest priority error recorded by this record.</td>
</tr>
</tbody>
</table>

This bit ignores writes if ERR<n>STATUS.{CE,DE,UE} != {0b00,0,0}, and the highest priority of these is not being cleared to zero in the same write.

This bit is read/write-one-to-clear.

On a Cold reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

- **V bit [30]**

**Status Register Valid.**

<table>
<thead>
<tr>
<th>V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERR&lt;n&gt;STATUS not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>ERR&lt;n&gt;STATUS valid. At least one error has been recorded.</td>
</tr>
</tbody>
</table>

This bit ignores writes if ERR<n>STATUS.{CE,DE,UE} != {0b00,0,0}, and is not being cleared to 0b0 in the same write.

This bit is read/write-one-to-clear.

On a Cold reset, this field resets to 0.

**UE bit [29]**

**Uncorrected Error.**
**ERR<n>STATUS, Error Record Primary Status Register, n = 0 - 65534**

<table>
<thead>
<tr>
<th>UE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No errors have been detected, or all detected errors have been either corrected or deferred.</td>
</tr>
<tr>
<td>0b1</td>
<td>At least one detected error was not corrected and not deferred.</td>
</tr>
</tbody>
</table>

When clearing ERR<n>STATUS.V to 0b0, if this bit is nonzero, then Arm recommends that software write 0b1 to this bit to clear this bit to zero.

This bit is not valid and reads UNKNOWN if ERR<n>STATUS.V == 0b0. This bit ignores writes if ERR<n>STATUS.OF == 0b1 and is not being cleared to 0b0 in the same write.

This bit is read/write-one-to-clear.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**ER, bit [28]**

Error Reported.

<table>
<thead>
<tr>
<th>ER</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No in-band error (External Abort) reported.</td>
</tr>
<tr>
<td>0b1</td>
<td>An External Abort was signaled by the component to the Requester making the access or other transaction. This can be because any of the following are true:</td>
</tr>
</tbody>
</table>
  - The applicable one of the ERR<q>CTLR.{WUE,RUE,UE} bits is implemented and was set to 0b1 when an Uncorrected error was detected. |
  - The applicable one of the ERR<q>CTLR.{WUE,RUE,UE} bits is not implemented and the component always reports errors. |

It is IMPLEMENTATION DEFINED whether this bit can be set to 0b1 by a Deferred error.

If this bit is nonzero, then Arm recommends that software write 0b1 to this bit to clear this bit to zero, when any of:

- Clearing ERR<n>STATUS.V to 0b0.
- Clearing ERR<n>STATUS.UE to 0b0, if this bit is never set to 0b1 by a Deferred error.
- Clearing ERR<n>STATUS.{UE,DE} to {0,0}, if this bit can be set to 0b1 by a Deferred error.

This bit is not valid and reads UNKNOWN if any of the following are true:

- ERR<n>STATUS.V == 0b0.
- ERR<n>STATUS.UE == 0b0 and this bit is never set to 0b1 by a Deferred error.
- ERR<n>STATUS.{UE,DE} == {0,0} and this bit can be set to 0b1 by a Deferred error.

This bit ignores writes if ERR<n>STATUS.{CE,DE,UE} !={0b00,0,0}, and the highest priority of these is not being cleared to zero in the same write.

This bit is read/write-one-to-clear.

**Note**

An External Abort signaled by the component might be masked and not generate any exception.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**OF, bit [27]**

Overflow.

Indicates that multiple errors have been detected. This bit is set to 0b1 when one of the following occurs:

- An Uncorrected error is detected and ERR<n>STATUS.UE == 0b1.
- A Deferred error is detected, ERR<n>STATUS.UE == 0b0 and ERR<n>STATUS.DE == 0b1.
- A Corrected error is detected, no Corrected error counter is implemented, ERR<n>STATUS.UE == 0b0, ERR<n>STATUS.DE == 0b0, and ERR<n>STATUS.CE != 0b00. ERR<n>STATUS.CE might be updated for the new Corrected error.
A Corrected error counter is implemented, ERR<n>STATUS.UE == 0b0, ERR<n>STATUS.DE == 0b0, and the counter overflows.

It is IMPLEMENTATION DEFINED whether this bit is set to 0b1 when one of the following occurs:

- A Deferred error is detected and ERR<n>STATUS.UE == 0b1.
- A Corrected error is detected, no Corrected error counter is implemented, and either or both the ERR<n>STATUS.UE or ERR<n>STATUS.DE bits are set to 0b1.
- A Corrected error counter is implemented, either or both the ERR<n>STATUS.UE or ERR<n>STATUS.DE bits are set to 0b1, and the counter overflows.

It is IMPLEMENTATION DEFINED whether this bit is cleared to 0b0 when one of the following occurs:

- An Uncorrected error is detected and ERR<n>STATUS.UE == 0b0.
- A Deferred error is detected, ERR<n>STATUS.UE == 0b0 and ERR<n>STATUS.DE == 0b0.
- A Corrected error is detected, ERR<n>STATUS.UE == 0b0, ERR<n>STATUS.DE == 0b0 and ERR<n>STATUS.CE == 0b0.

The IMPLEMENTATION DEFINED clearing of this bit might also depend on the value of the other error status bits.

If a Corrected error counter is implemented:

- A direct write that modifies the counter overflow flag indirectly might set this bit to an UNKNOWN value.
- A direct write to this bit that clears this bit to 0b0 might indirectly set the counter overflow flag to an UNKNOWN value.

<table>
<thead>
<tr>
<th>OF</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0    | If ERR<n>STATUS.UE == 0b1, then no error syndrome for an Uncorrected error has been discarded.  
        |   If ERR<n>STATUS.UE == 0b0 and ERR<n>STATUS.DE == 0b1, then no error syndrome for a Deferred error has been discarded.  
        |   If ERR<n>STATUS.UE == 0b0, ERR<n>STATUS.DE == 0b0, and a Corrected error counter is implemented, then the counter has not overflowed.  
        |   If ERR<n>STATUS.UE == 0b0, ERR<n>STATUS.DE == 0b0, ERR<n>STATUS.CE != 0b00, and no Corrected error counter is implemented, then no error syndrome for a Corrected error has been discarded.  |
| 0b1    | At least one error syndrome has been discarded or, if a Corrected error counter is implemented, it might have overflowed. |

When clearing ERR<n>STATUS.V to 0b0, if this bit is nonzero, then Arm recommends that software write 0b1 to this bit to clear this bit to zero.

This bit is not valid and reads UNKNOWN if ERR<n>STATUS.V == 0b0.

This bit is read/write-one-to-clear.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**MV, bit [26]**

*When error record <n> includes an additional information for an error:*

<table>
<thead>
<tr>
<th>MV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERR&lt;n&gt;MISC&lt;m&gt; not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The IMPLEMENTATION DEFINED contents of the ERR&lt;n&gt;MISC&lt;m&gt; registers contains additional information for an error recorded by this record.</td>
</tr>
</tbody>
</table>

This bit ignores writes if ERR<n>STATUS.{CE,DE,UE} != \{0b00,0,0\}, and the highest priority of these is not being cleared to zero in the same write.
This bit is read/write-one-to-clear:

**Note**

If the ERR<n>MISC<m> registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded.

On a Cold reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**CE, bits [25:24]**

Corrected Error.

<table>
<thead>
<tr>
<th>CE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>No errors were corrected.</td>
</tr>
<tr>
<td>0b01</td>
<td>At least one transient error was corrected.</td>
</tr>
<tr>
<td>0b10</td>
<td>At least one error was corrected.</td>
</tr>
<tr>
<td>0b11</td>
<td>At least one persistent error was corrected.</td>
</tr>
</tbody>
</table>

The mechanism by which a component or node detects whether a correctable error is transient or persistent is **IMPLEMENTATION DEFINED**. If no such mechanism is implemented, then the node sets this field to 0b10 when a corrected error is recorded.

When clearing ERR<n>STATUS.V to 0b0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

This field is not valid and reads **UNKNOWN** if ERR<n>STATUS.V == 0b0. This field ignores writes if ERR<n>STATUS.OF == 0b1 and is not being cleared to 0b0 in the same write.

This field is read/write-ones-to-clear. Writing a value other than all-zeros or all-ones sets this field to an **UNKNOWN** value.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**DE, bit [23]**

Deferred Error.

<table>
<thead>
<tr>
<th>DE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No errors were deferred.</td>
</tr>
<tr>
<td>0b1</td>
<td>At least one error was not corrected and deferred.</td>
</tr>
</tbody>
</table>

Support for deferring errors is **IMPLEMENTATION DEFINED**.

When clearing ERR<n>STATUS.V to 0b0, if this bit is nonzero, then Arm recommends that software write 0b1 to this bit to clear this bit to zero.

This bit is not valid and reads **UNKNOWN** if ERR<n>STATUS.V == 0b0. This bit ignores writes if ERR<n>STATUS.OF == 0b1 and is not being cleared to 0b0 in the same write.

This bit is read/write-one-to-clear.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**PN, bit [22]**

Poison.
### PN Meaning

<table>
<thead>
<tr>
<th>PN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Uncorrected error or Deferred error recorded because a corrupt value was detected, for example, by an error detection code (EDC), or Corrected error recorded.</td>
</tr>
<tr>
<td>0b1</td>
<td>Uncorrected error or Deferred error recorded because a poison value was detected.</td>
</tr>
</tbody>
</table>

If this bit is nonzero, then Arm recommends that software write 0b1 to this bit to clear this bit to zero, when any of:

- Clearing ERR<\text{n}>STATUS.V to 0b0.
- Clearing both ERR<\text{n}>STATUS.{DE, UE} to 0b0.

This bit is not valid and reads *UNKNOWN* if any of the following are true:

- ERR<\text{n}>STATUS.V == 0b0.
- ERR<\text{n}>STATUS.{DE,UE} == \{0,0\}.

This bit ignores writes if ERR<\text{n}>STATUS.{CE,DE,UE} != \{0b00,0,0\}, and the highest priority of these is not being cleared to zero in the same write.

This bit is read/write-one-to-clear.

On a Cold reset, this field resets to an architecturally *UNKNOWN* value.

### UET, bits [21:20]

Uncorrected Error Type. Describes the state of the component after detecting or consuming an Uncorrected error.

<table>
<thead>
<tr>
<th>UET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Uncorrected error, Uncontainable error (UC).</td>
</tr>
<tr>
<td>0b01</td>
<td>Uncorrected error, Unrecoverable error (UEU).</td>
</tr>
<tr>
<td>0b10</td>
<td>Uncorrected error, Latent or Restartable error (UEO).</td>
</tr>
<tr>
<td>0b11</td>
<td>Uncorrected error, Signaled or Recoverable error (UER).</td>
</tr>
</tbody>
</table>

If this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero, when any of:

- Clearing ERR<\text{n}>STATUS.V to 0b0.
- Clearing ERR<\text{n}>STATUS.UE to 0b0.

This field is not valid and reads *UNKNOWN* if any of the following are true:

- ERR<\text{n}>STATUS.V == 0b0.
- ERR<\text{n}>STATUS.UE == 0b0.

This field ignores writes if ERR<\text{n}>STATUS.{CE,DE,UE} != \{0b00,0,0\}, and the highest priority of these is not being cleared to zero in the same write.

This field is read/write-ones-to-clear. Writing a value other than all-zeros or all-ones sets this field to an *UNKNOWN* value.

**Note**

Software might use the information in the error record registers to determine what recovery is necessary.

On a Cold reset, this field resets to an architecturally *UNKNOWN* value.

### Bits [19:16]

Reserved, RES0.

### IERR, bits [15:8]

IMPLEMENTATION DEFINED error code. Used with any primary error code ERR<\text{n}>STATUS.SERR value. Further IMPLEMENTATION DEFINED information can be placed in the ERR<\text{n}>MISC<m> registers.
The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

**Note**

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

This field is not valid and reads UNKNOWN if all of the following are true:

- Any of the following are true:
  - The RAS Common Fault Injection Model Extension is implemented by the node that owns this error record and \( \text{ERR<q>PFGF.SYN} == \text{0b0} \).
  - The RAS Common Fault Injection Model Extension is not implemented by the node that owns this error record.
  - \( \text{ERR<n>STATUS.V} == \text{0b0} \).

This field ignores writes if \( \text{ERR<n>STATUS.{CE,DE,UE}} != \{0b00,0,0\} \), and the highest priority of these is not being cleared to zero in the same write.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**SERR, bits [7:0]**

Architecturally-defined primary error code. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry.
<table>

<tr>
<td>0x19</td>
<td>Error recorded by PCIe error logs. Indicates that the component has recorded an error in a PCIe error log. This might be the PCIe device status register, AER, DVSEC, or other mechanisms defined by PCIe.</td>
</tr>
</tbody>
</table>

All other values are reserved.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

**Note**

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

This field is not valid and reads UNKNOWN if all of the following are true:
• Any of the following are true:
  ○ The RAS Common Fault Injection Model Extension is implemented by the node that owns this error record and \( \text{ERR}<q>\text{PFGF}.\text{SYN} == 0b0 \).
  ○ The RAS Common Fault Injection Model Extension is not implemented by the node that owns this error record.
• \( \text{ERR}<n>\text{STATUS}.V == 0b0 \).

This field ignores writes if \( \text{ERR}<n>\text{STATUS.} \{\text{CE,DE,UE}\} != \{0b00,0,0\} \), and the highest priority of these is not being cleared to zero in the same write.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ERR<sub>n</sub>STATUS**

The \{AV, V, UE, ER, OF, MV, CE, DE, PN, UET, CI\} fields are write-one-to-clear, meaning writes of zero are ignored, and a write of one or all-ones to the field clears the field to zero. The \{IERR, SERR\} fields are read/write fields, although the set of implemented valid values is IMPLEMENTATION DEFINED. See also \( \text{ERR}<n>\text{PFGF}.\text{SYN} \).

After reading \( \text{ERR}<n>\text{STATUS} \), software must clear the valid bits in the register to allow new errors to be recorded. However, between reading the register and clearing the valid bits, a new error might have overwritten the register. To prevent this error being lost by software, the register prevents updates to fields that might have been updated by a new error.

When RAS System Architecture v1.0 is implemented:

• Writes to the \{UE, DE, CE\} fields are ignored if the OF bit is set and is not being cleared.
• Writes to the V bit are ignored if any of the \{UE, DE, CE\} fields are nonzero and are not being cleared.
• Writes to the \{AV, MV\} bits and \{ER, PN, UET, IERR, SERR\} syndrome fields are ignored if the highest priority error status field is nonzero and not being cleared. The error status fields in priority order from highest to lowest, are UE, DE, and CE.

When RAS System Architecture v1.1 is implemented, a write to the register is ignored if all of:

• Any of \{V, UE, OF, CE, DE\} fields are nonzero before the write.
• The write does not clear the nonzero \{V, UE, OF, CE, DE\} fields to zero by writing ones to the applicable field or fields.

Some of the fields in \( \text{ERR}<n>\text{STATUS} \) are also defined as UNKNOWN where certain combinations of the \{V, DE, UE\} status fields are zero. The rules for writes to \( \text{ERR}<n>\text{STATUS} \) allow a node to implement such a field as a fixed read-only value.

For example, when RAS System Architecture v1.1 is implemented, a write to \( \text{ERR}<n>\text{STATUS} \) when \( \text{ERR}<n>\text{STATUS.V} \) is 1 results in either \( \text{ERR}<n>\text{STATUS.V} \) field being cleared to zero, or \( \text{ERR}<n>\text{STATUS.V} \) not changing. Since all fields in \( \text{ERR}<n>\text{STATUS} \), other than \{AV, V, MV\}, usually read as UNKNOWN values when \( \text{ERR}<n>\text{STATUS.V} \) is zero, this means those fields can be implemented as read-only if applicable.

To ensure correct and portable operation, when software is clearing the valid bits in the register to allow new errors to be recorded, Arm recommends that software:

• Determine which fields to clear to zero by reading \( \text{ERR}<n>\text{STATUS} \).
• Write ones to all the write-one-to-clear fields that are nonzero.
• Write zero to all the read/write fields.
• Write zero to all the write-one-to-clear fields that are zero.

Otherwise, these fields might not have the correct value when a new fault is recorded.

An exception is when the node supports writing to these fields as part of fault injection. See also \( \text{ERR}<n>\text{PFGF}.\text{SYN} \).

\( \text{ERR}<n>\text{STATUS} \) can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x010  + (64 * n)</td>
<td>ERR&lt;n&gt;STATUS</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
ERRPIDR0, Peripheral Identification Register 0

The ERRPIDR0 characteristics are:

**Purpose**

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.

**Configuration**

Implementation of this register is **OPTIONAL**.

ERRPIDR0 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRPIDR0 is a 32-bit register.

**Field descriptions**

The ERRPIDR0 bit assignments are:

| Bit 31 | Bit 30 | Bit 29 | Bit 28 | Bit 27 | Bit 26 | Bit 25 | Bit 24 | Bit 23 | Bit 22 | Bit 21 | Bit 20 | Bit 19 | Bit 18 | Bit 17 | Bit 16 | Bit 15 | Bit 14 | Bit 13 | Bit 12 | Bit 11 | Bit 10 | Bit 9 | Bit 8 | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
|        |        |        |        |        |        |        | RES0   |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |

**Bits [31:8]**

Reserved, RES0.

**PART_0, bits [7:0]**

Part number, bits [7:0].

The part number is selected by the designer of the component. The designer chooses whether to use a 12-bit or a 16-bit part number:

- If a 12-bit part number is used, it is stored in ERRPIDR1.PART_1 and ERRPIDR0.PART_0. There are 8 bits, ERRPIDR2.REVISION and ERRPIDR3.REVAND, available to define the revision of the component.
- If a 16-bit part number is used, it is stored in ERRPIDR2.PART_2, ERRPIDR1.PART_1 and ERRPIDR0.PART_0. There are 4 bits, ERRPIDR3.REVISION, available to define the revision of the component.

This field reads as an **IMPLEMENTATION DEFINED** value.

**Accessing the ERRPIDR0**

**ERRPIDR0 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFE0</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
The ERRPIDR1 characteristics are:

**Purpose**

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.

**Configuration**

Implementation of this register is *optional*.

ERRPIDR1 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRPIDR1 is a 32-bit register.

**Field descriptions**

The ERRPIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>

<td>• If a 12-bit part number is used, it is stored in ERRPIDR1.PART_1 and ERRPIDR0.PART_0. There are 8 bits, ERRPIDR2.REVISION and ERRPIDR3.REVAND, available to define the revision of the component.</td>
</tr>
<tr>
<td>27</td>
<td>• If a 16-bit part number is used, it is stored in ERRPIDR2.PART_2, ERRPIDR1.PART_1 and ERRPIDR0.PART_0. There are 4 bits, ERRPIDR3.REVISION, available to define the revision of the component.</td>
</tr>
</tbody>
</table>

**Note**

For a component designed by Arm Limited, the JEP106 identification code is 0x3B.
This field reads as an IMPLEMENTATION DEFINED value.

**Accessing the ERRPIDR1**

ERRPIDR1 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFE4</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
**ERRPIDR2, Peripheral Identification Register 2**

The ERRPIDR2 characteristics are:

**Purpose**

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.

**Configuration**

Implementation of this register is **OPTIONAL**.

ERRPIDR2 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRPIDR2 is a 32-bit register.

**Field descriptions**

The ERRPIDR2 bit assignments are:

**When the component uses a 12-bit part number:**

<table>
<thead>
<tr>
<th>Bit</th>

</tr>
<tr>
<td>5</td>
<td>DES_1</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**REVISION, bits [7:4]**

Component major revision. ERRPIDR2.REVISION and ERRPIDR3.REVAND together form the revision number of the component, with ERRPIDR2.REVISION being the most significant part and ERRPIDR3.REVAND the least significant part. When a component is changed, ERRPIDR2.REVISION or ERRPIDR3.REVAND are increased to ensure that software can differentiate the different revisions of the component. If ERRPIDR2.REVISION is increased then ERRPIDR3.REVAND should be set to 0b0000.

This field reads as an **IMPLEMENTATION DEFINED** value.

**JEDEC, bit [3]**

JEDEC-assigned JEP106 implementer code is used.

Reads as 0b1.

**DES_1, bits [2:0]**

Designer, JEP106 identification code, bits [6:4]. ERRPIDR1.DES_0 and ERRPIDR2.DES_1 together form the JEDEC-assigned JEP106 identification code for the designer of the component. The parity bit in the JEP106 identification code is not included. The code identifies the designer of the component, which might not be not the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.
This field reads as an IMPLEMENTATION DEFINED value.

**Note**

For a component designed by Arm Limited, the JEP106 identification code is 0x3B.

**When the component uses a 16-bit part number:**

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>

<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PART_2, bits [7:4]**

Part number, bits [15:12].

The part number is selected by the designer of the component. The designer chooses whether to use a 12-bit or a 16-bit part number:

- If a 12-bit part number is used, it is stored in `ERRPIDR1.PART_1` and `ERRPIDR0.PART_0`. There are 8 bits, `ERRPIDR2.REVISION` and `ERRPIDR3.REVAND`, available to define the revision of the component.
- If a 16-bit part number is used, it is stored in `ERRPIDR2.PART_2`, `ERRPIDR1.PART_1` and `ERRPIDR0.PART_0`. There are 4 bits, `ERRPIDR3.REVISION`, available to define the revision of the component.

This field reads as an IMPLEMENTATION DEFINED value.

**JEDEC, bit [3]**

JEDEC-assigned JEP106 implementer code is used.

Reads as 0b1.

**DES_1, bits [2:0]**

Designer JEP106 identification code, bits [6:4]. `ERRPIDR1.DES_0` and `ERRPIDR2.DES_1` together form the JEDEC-assigned JEP106 identification code for the designer of the component. The parity bit in the JEP106 identification code is not included. The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

This field reads as an IMPLEMENTATION DEFINED value.

**Note**

For a component designed by Arm Limited, the JEP106 identification code is 0x3B.

**Accessing the ERRPIDR2**

ERRPIDR2 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFE8</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
ERRPIDR3, Peripheral Identification Register 3

The ERRPIDR3 characteristics are:

**Purpose**

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.

**Configuration**

Implementation of this register is **OPTIONAL**.

ERRPIDR3 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRPIDR3 is a 32-bit register.

**Field descriptions**

The ERRPIDR3 bit assignments are:

**When the component uses a 12-bit part number:**

|   | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
|---|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|   | RES0 | REVAND | CMOD |

**Bits [31:8]**

Reserved, RES0.

**REVAND, bits [7:4]**

Component minor revision. ERRPIDR2.REVISION and ERRPIDR3.REVAND together form the revision number of the component, with ERRPIDR2.REVISION being the most significant part and ERRPIDR3.REVAND the least significant part. When a component is changed, ERRPIDR2.REVISION or ERRPIDR3.REVAND are increased to ensure that software can differentiate the different revisions of the component. If ERRPIDR2.REVISION is increased then ERRPIDR3.REVAND should be set to 0b0000.

This field reads as an **IMPLEMENTATION DEFINED** value.

**CMOD, bits [3:0]**

Customer Modified.

Indicates the component has been modified.

A value of 0b0000 means the component is not modified from the original design.

Any other value means the component has been modified in an **IMPLEMENTATION DEFINED** way.

For any two components with the same Unique Component Identifier:

- If the value of the CMOD fields of both components equals zero, the components are identical.
- If the CMOD fields of both components have the same non-zero value, it does not necessarily mean that they have the same modifications.
If the value of the CMOD field of either of the two components is non-zero, they might not be identical, even though they have the same Unique Component Identifier. This field reads as an IMPLEMENTATION DEFINED value.

**When the component uses a 16-bit part number:**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    | RES0 |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | CMOD |

**Bits [31:8]**

Reserved, RES0.

**REVISION, bits [7:4]**

Component revision. When a component is changed, ERRPIDR3.REVISION is increased to ensure that software can differentiate the different revisions of the component. This field reads as an IMPLEMENTATION DEFINED value.

**CMOD, bits [3:0]**

Customer Modified.

Indicates the component has been modified.

A value of 0b0000 means the component is not modified from the original design.

Any other value means the component has been modified in an IMPLEMENTATION DEFINED way.

For any two components with the same Unique Component Identifier:

- If the value of the CMOD fields of both components equals zero, the components are identical.
- If the CMOD fields of both components have the same non-zero value, it does not necessarily mean that they have the same modifications.
- If the value of the CMOD field of either of the two components is non-zero, they might not be identical, even though they have the same Unique Component Identifier.

This field reads as an IMPLEMENTATION DEFINED value.

**Accessing the ERRPIDR3**

**ERRPIDR3 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFEC</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
ERRPIDR4, Peripheral Identification Register 4

The ERRPIDR4 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

ERRPIDR4 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRPIDR4 is a 32-bit register.

Field descriptions

The ERRPIDR4 bit assignments are:

<table>
<thead>
<tr>
<th>Bit positions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>RES0, SIZE, DES_2</td>
</tr>
</tbody>
</table>

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component.

The distance from the start of the address space used by this component to the end of the component identification registers.

A value of 0b0000 means one of the following is true:

- The component uses a single 4KB block.
- The component uses an IMPLEMENTATION DEFINED number of 4KB blocks.

Any other value means the component occupies $2^\text{ERRPIDR4.SIZE}$ 4KB blocks.

Using this field to indicate the size of the component is deprecated. This field might not correctly indicate the size of the component. Arm recommends that software determine the size of the component from the Unique Component Identifier fields, and other IMPLEMENTATION DEFINED registers in the component.

This field reads as an IMPLEMENTATION DEFINED value.

DES_2, bits [3:0]

Designer, JEP106 continuation code. This is the JEDEC-assigned JEP106 bank identifier for the designer of the component, minus 1. The code identifies the designer of the component, which might not be not the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

This field reads as an IMPLEMENTATION DEFINED value.
Note

For a component designed by Arm Limited, the JEP106 bank is 5, meaning this field has the value 0x4.

Accessing the ERRPIDR4

ERRPIDR4 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFD0</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
GICC_ABPR, CPU Interface Aliased Binary Point Register

The GICC_ABPR characteristics are:

**Purpose**

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption.

**Configuration**

The reset value of this register is defined as \( \text{minimum GICC_BPR.Binary_Point + 1} \), resulting in a permitted range of \( 0x1-0x4 \).

In systems that support two Security states:

- This register is an alias of the Non-secure copy of GICC_BPR.
- Non-secure accesses to this register return a shifted value of the binary point.
- If ICC_CTLR_EL3.CBPR_EL1NS == 1, Secure accesses to this register access ICC_BPR0_EL1.

**Attributes**

GICC_ABPR is a 32-bit register.

**Field descriptions**

The GICC_ABPR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-3</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>2-0</td>
<td>Binary_Point</td>
</tr>
</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**Binary_Point, bits [2:0]**

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. The following list describes how this field determines the interrupt priority bits assigned to the group priority field:

- Secure ICC_BPR1_EL1 Binary Point when CBPR == 0' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069), for the processing of Group 1 interrupts in a GIC implementation that supports interrupt grouping, when GICC_CTLR.CBPR == 0.
- Non-secure ICC_BPR1_EL1 Binary Point when CBPR == 0' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069), for all other cases.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the GICC_ABPR**

This register is used only when System register access is not enabled. When System register access is enabled, the System registers ICC_BPR0_EL1 and ICC_BPR1_EL1 provide equivalent functionality.
GICC_ABPR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC CPU interface</td>
<td>0x001C</td>
<td>GICC_ABPR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RW.
- When an access is Secure accesses to this register are RW.
- When an access is Non-secure accesses to this register are RW.
The GICC_AEOIR characteristics are:

**Purpose**

A write to this register performs priority drop for the specified Group 1 interrupt and, if the appropriate `GICC_CTLR.EOImodeS` or `GICC_CTLR.EOImodeNS` field == 0, also deactivates the interrupt.

**Configuration**

When `GICD_CTLR.DS==0`, this register is an alias of the Non-secure view of `GICC_EOIR`. A Secure access to this register is identical to a Non-secure access to `GICC_EOIR`.

**Attributes**

GICC_AEOIR is a 32-bit register.

**Field descriptions**

The GICC_AEOIR bit assignments are:

<table>

</tr>
</tbody>
</table>

**Bits [31:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID of the signaled interrupt.

**Note**

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

**Accessing the GICC_AEOIR**

A write to this register must correspond to the most recently acknowledged Group 1 interrupt. If a value other than the last value read from `GICC_AIAR` is written to this register, the effect is UNPREDICTABLE.

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, `ICC_EOIR1` provides equivalent functionality.
- For AArch64 implementations, `ICC_EOIR1_EL1` provides equivalent functionality.
When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

**GICC_AEOIR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC CPU interface</td>
<td>0x0024</td>
<td>GICC_AEOIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTRL.RS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.
The GICC_AHPPIR characteristics are:

### Purpose

If the highest priority pending interrupt is in Group 1, this register provides the INTID of the highest priority pending interrupt on the CPU interface.

### Configuration

If `GICD_CTLR.DS==0`, this register is an alias of the Non-secure view of `GICC_HPPIR`. A Secure access to this register is identical to a Non-secure access to `GICC_HPPIR`.

### Attributes

GICC_AHPPIR is a 32-bit register.

### Field descriptions

The GICC_AHPPIR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RE0 | INTID |

**Bits [31:24]**

Reserved, RE0.

**INTID, bits [23:0]**

The INTID of the signalled interrupt.

#### Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RE0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RE0.

### Accessing the GICC_AHPPIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, `ICC_HPPIR1` provides equivalent functionality.
- For AArch64 implementations, `ICC_HPPIR1_EL1` provides equivalent functionality.

If the highest priority pending interrupt is in Group 0, a read of this register returns the special INTID 1023.

Interrupt identifiers corresponding to an interrupt group that is not enabled are ignored.
If the highest priority pending interrupt is a direct interrupt that is both individually enabled in the Distributor and part of an interrupt group that is enabled in the Distributor, and the interrupt group is disabled in the CPU interface for this PE, this register returns the special INTID 1023.

For more information about pending interrupts that are not considered when determining the highest priority pending interrupt, see 'Preemption' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

**GICC_AHPPIR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC CPU interface</td>
<td>0x0028</td>
<td>GICC_AHPPIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RO.
- When an access is Secure accesses to this register are RO.
- When an access is Non-secure accesses to this register are RO.
GICC_AIAR, CPU Interface Aliased Interrupt Acknowledge Register

The GICC_AIAR characteristics are:

**Purpose**

Provides the INTID of the signaled Group 1 interrupt. A read of this register by the PE acts as an acknowledge for the interrupt.

**Configuration**

When **GICD_CTLR.DS==0**, this register is an alias of the Non-secure view of **GICC_IAR**. A Secure access to this register is identical to a Non-secure access to **GICC_IAR**.

**Attributes**

GICC_AIAR is a 32-bit register.

**Field descriptions**

The GICC_AIAR bit assignments are:

Page 3621
This interface is accessible as follows:

- When GICD CTLR.DS == 0 accesses to this register are RO.
- When an access is Secure accesses to this register are RO.
- When an access is Non-secure accesses to this register are RO.
GICC_APR<n>, CPU Interface Active Priorities Registers, n = 0 - 3

The GICC_APR<n> characteristics are:

**Purpose**

Provides information about interrupt active priorities.

**Configuration**

The contents of these registers are **IMPLEMENTATION DEFINED** with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

When GICD_CTLR_DS == 0, these registers are Banked, and Non-secure accesses do not affect Secure operation. The Secure copies of these registers hold active priorities for Group 0 interrupts, and the Non-secure copies provide a Non-secure view of the active priorities for Group 1 interrupts.

GICC_APR1 is only implemented in implementations that support 6 or more bits of priority. GICC_APR2 and GICC_APR3 are only implemented in implementations that support 7 bits of priority.

When GICD_CTLR_DS==1, these registers hold the active priorities for Group 0 interrupts, and the active priorities for Group 1 interrupts are held by the GICC_NSAPR<n> registers.

**Attributes**

GICC_APR<n> is a 32-bit register.

**Field descriptions**

The GICC_APR<n> bit assignments are:

|   31  |  30  |  29  |  28  |  27  |  26  |  25  |  24  |  23  |  22  |  21  |  20  |  19  |  18  |  17  |  16  |  15  |  14  |  13  |  12  |  11  |  10  |  9   |  8   |  7   |  6   |  5   |  4   |  3   |  2   |  1   |  0   |
|-------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
|       |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

**IMPLEMENTATION DEFINED,** bits [31:0]

**IMPLEMENTATION DEFINED.**

On a Warm reset, this field resets to 0.

**Accessing the GICC_APR<n>**

These registers are used only when System register access is not enabled. When System register access is enabled the following registers provide equivalent functionality:

- In AArch64:
  - For Group 0, ICC_AP0R<n>_EL1.
  - For Group 1, ICC_AP1R<n>_EL1.
- In AArch32:
  - For Group 0, ICC_AP0R<n>.
  - For Group 1, ICC_AP1R<n>.

GICC_APR<n> can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
</table>

Page 3623
This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are \textbf{RW}.
- When an access is Secure accesses to this register are \textbf{RW}.
- When an access is Non-secure accesses to this register are \textbf{RW}.
**GICC_BPR, CPU Interface Binary Point Register**

The GICC_BPR characteristics are:

**Purpose**

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field.

**Configuration**

In systems that support two Security states:

- This register is Banked.
- The Secure instance of this register determines Group 0 interrupt preemption.
- The Non-secure instance of this register determines Group 1 interrupt preemption.

In systems that support only one Security state, when `GICC_CTLR.CBPR == 0`, this register determines only Group 0 interrupt preemption.

When `GICC_CTLR.CBPR == 1`, this register determines interrupt preemption for both Group 0 and Group 1 interrupts.

**Attributes**

GICC_BPR is a 32-bit register.

**Field descriptions**

The GICC_BPR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**Binary_Point, bits [2:0]**

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. The following list describes how this field determines the interrupt priority bits assigned to the group priority field:

- 'Secure ICC_BPR1_EL1 Binary Point when CBPR == 0' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069), for the processing of Group 1 interrupts in a GIC implementation that supports interrupt grouping, when `GICC_CTLR.CBPR == 0`.
- 'Non-secure ICC_BPR1_EL1 Binary Point when CBPR == 0' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069), for all other cases.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Note**

Aliasing the Non-secure GICC_BPR as `GICC_ABPR` in a multiprocessor system permits a PE that can make only Secure accesses to configure the preemption setting for Group 1 interrupts by accessing `GICC_ABPR`. 
Accessing the GICC_BPR

This register is used only when System register access is not enabled. When System register access is enabled this register is RAZ/WI, and the System registers ICC_BPR0_EL1 and ICC_BPR1_EL1 provide equivalent functionality.

GICC_BPR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC CPU interface</td>
<td>0x0008</td>
<td>GICC_BPR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RW.
- When an access is Secure accesses to this register are RW.
- When an access is Non-secure accesses to this register are RW.
GICC_CTLR, CPU Interface Control Register

The GICC_CTLR characteristics are:

**Purpose**

Controls the CPU interface, including enabling of interrupt groups, interrupt signal bypass, binary point registers used, and separation of priority drop and interrupt deactivation.

---

**Note**

If the GIC implementation supports two Security states, independent EOI controls are provided for accesses from each Security state. Secure accesses handle both Group 0 and Group 1 interrupts, and Non-secure accesses handle Group 1 interrupts only.

---

**Configuration**

In a GIC implementation that supports two Security states:

- This register is Banked.
- The register bit assignments are different in the Secure and Non-secure copies.

**Attributes**

GICC_CTLR is a 32-bit register.

**Field descriptions**

The GICC_CTLR bit assignments are:

When GICD_CTLR.DS==0, Non-secure access:

</tr>
</tbody>
</table>

---

**Note**

An implementation is permitted to make this bit RAO/WI.
On a Warm reset, this field resets to 0.

**Bits [8:7]**

Reserved, RES0.

**IRQBypDisGrp1, bit [6]**

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 1:

<table>
<thead>
<tr>
<th>IRQBypDisGrp1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The bypass IRQ signal is signaled to the PE.</td>
</tr>
<tr>
<td>0b1</td>
<td>The bypass IRQ signal is not signaled to the PE.</td>
</tr>
</tbody>
</table>

If System register access is enabled for EL3 and ICC_SRE_EL3.DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this field resets to 0.

**FIQBypDisGrp1, bit [5]**

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 1:

<table>
<thead>
<tr>
<th>FIQBypDisGrp1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The bypass FIQ signal is signaled to the PE.</td>
</tr>
<tr>
<td>0b1</td>
<td>The bypass FIQ signal is not signaled to the PE.</td>
</tr>
</tbody>
</table>

If System register access is enabled for EL3 and ICC_SRE_EL3.DFB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this field resets to 0.

**Bits [4:1]**

Reserved, RES0.

**EnableGrp1, bit [0]**

This Non-secure field enables the signaling of Group 1 interrupts by the CPU interface to a target PE:

<table>
<thead>
<tr>
<th>EnableGrp1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 1 interrupt signaling is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 1 interrupt signaling is enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**When GICD_CTLR.DS==0, Secure access:**

<table>

<tbody>
<tr>
<td>0b0</td>
<td>The bypass IRQ signal is signaled to the PE.</td>
</tr>
<tr>
<td>0b1</td>
<td>The bypass IRQ signal is not signaled to the PE.</td>
</tr>
</tbody>
</table>

If System register access is enabled for EL3 and ICC_SRE_EL3.DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this field resets to 0.
FIQBypDisGrp1, bit [7]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 1:

<table>
<thead>
<tr>
<th>FIQBypDisGrp1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The bypass FIQ signal is signaled to the PE.</td>
</tr>
<tr>
<td>0b1</td>
<td>The bypass FIQ signal is not signaled to the PE.</td>
</tr>
</tbody>
</table>

If System register access is enabled for EL3 and `ICC_SRE_EL3.DFB` == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see ‘Interrupt bypass support’ in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this field resets to 0.

IRQBypDisGrp0, bit [6]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 0:

<table>
<thead>
<tr>
<th>IRQBypDisGrp0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The bypass IRQ signal is signaled to the PE.</td>
</tr>
<tr>
<td>0b1</td>
<td>The bypass IRQ signal is not signaled to the PE.</td>
</tr>
</tbody>
</table>

If System register access is enabled for EL3 and `ICC_SRE_EL3.DIB` == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see ‘Interrupt bypass support’ in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this field resets to 0.

FIQBypDisGrp0, bit [5]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 0:

<table>
<thead>
<tr>
<th>FIQBypDisGrp0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The bypass FIQ signal is signaled to the PE.</td>
</tr>
<tr>
<td>0b1</td>
<td>The bypass FIQ signal is not signaled to the PE.</td>
</tr>
</tbody>
</table>

If System register access is enabled for EL3 and `ICC_SRE_EL3.DIB` == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see ‘Interrupt bypass support’ in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this field resets to 0.

CBPR, bit [4]

Controls whether `GICC_BPR` provides common control of preemption to Group 0 and Group 1 interrupts:
CBPR | Meaning
---|---
0b0 | GICC_BPR determines preemption for Group 0 interrupts only.
0b1 | GICC_BPR determines preemption for both Group 0 and Group 1 interrupts.

This field is an alias of ICC_CTRLR_EL3.CBPR_EL1NS.

In a GIC that supports two Security states, when CBPR == 1:

- A Non-secure read of GICC_BPR returns the value of Secure GICC_BPR.Binary_Point, incremented by 1, and saturated to 0b111.
- Non-secure writes of GICC_BPR are ignored.

On a Warm reset, this field resets to 0.

**FIQEn, bit [3]**

Controls whether the CPU interface signals Group 0 interrupts to a target PE using the FIQ or IRQ signal:

<table>
<thead>
<tr>
<th>FIQEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 0 interrupts are signaled using the IRQ signal.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 0 interrupts are signaled using the FIQ signal.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**Bit [2]**

Reserved, RES0.

**EnableGrp1, bit [1]**

This Non-secure field enables the signaling of Group 1 interrupts by the CPU interface to a target PE:

<table>
<thead>
<tr>
<th>EnableGrp1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 1 interrupt signaling is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 1 interrupt signaling is enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**EnableGrp0, bit [0]**

Enables the signaling of Group 0 interrupts by the CPU interface to a target PE:

<table>
<thead>
<tr>
<th>EnableGrp0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 0 interrupt signaling is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 0 interrupt signaling is enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**When GICD_CTRLR.DS == 1:**

<table>
<thead>
<tr>
<th>RES0</th>
<th>EOLmode</th>
<th>RQByDisGrp1</th>
<th>FIQByDisGrp1</th>
<th>RQByDisGrp0</th>
<th>FIQByDisGrp0</th>
</tr>
</thead>
<tbody>
<tr>
<td>31302928272625242322212019181716151413121110</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:10]**

Reserved, RES0.
EOImode, bit [9]

Controls the behavior of accesses to GICC_EOIR, GICC_AEOIR, and GICC_DIR.

<table>
<thead>
<tr>
<th>EOImode</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>GICC_EOIR and GICC_AEOIR provide both priority drop and interrupt deactivation functionality. Accesses to GICC_DIR are UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b1</td>
<td>GICC_EOIR and GICC_AEOIR provide priority drop functionality only. GICC_DIR provides interrupt deactivation functionality.</td>
</tr>
</tbody>
</table>

Note

An implementation is permitted to make this bit RAO/WI.

This field shares state with GICC_CTLR EOimodeS.

On a Warm reset, this field resets to 0.

IRQBypDisGrp1, bit [8]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 1:

<table>
<thead>
<tr>
<th>IRQBypDisGrp1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The bypass IRQ signal is signaled to the PE.</td>
</tr>
<tr>
<td>0b1</td>
<td>The bypass IRQ signal is not signaled to the PE.</td>
</tr>
</tbody>
</table>

If System register access is enabled for EL3 and ICC_SRE_EL3.DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see ‘Interrupt bypass support’ in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this field resets to 0.

FIQBypDisGrp1, bit [7]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 1:

<table>
<thead>
<tr>
<th>FIQBypDisGrp1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The bypass FIQ signal is signaled to the PE.</td>
</tr>
<tr>
<td>0b1</td>
<td>The bypass FIQ signal is not signaled to the PE.</td>
</tr>
</tbody>
</table>

If System register access is enabled for EL3 and ICC_SRE_EL3.DFB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see ‘Interrupt bypass support’ in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this field resets to 0.

IRQBypDisGrp0, bit [6]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 0:
###IRQBypDisGrp0, bit [0]

<table>
<thead>
<tr>
<th>IRQBypDisGrp0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The bypass IRQ signal is signaled to the PE.</td>
</tr>
<tr>
<td>0b1</td>
<td>The bypass IRQ signal is not signaled to the PE.</td>
</tr>
</tbody>
</table>

If System register access is enabled for EL3 and ICC_SRE_EL3.DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this field resets to 0.

###FIQBypDisGrp0, bit [5]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 0:

<table>
<thead>
<tr>
<th>FIQBypDisGrp0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The bypass FIQ signal is signaled to the PE.</td>
</tr>
<tr>
<td>0b1</td>
<td>The bypass FIQ signal is not signaled to the PE.</td>
</tr>
</tbody>
</table>

If System register access is enabled for EL3 and ICC_SRE_EL3.DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this field resets to 0.

###CBPR, bit [4]

Controls whether GICC_BPR provides common control of preemption to Group 0 and Group 1 interrupts:

<table>
<thead>
<tr>
<th>CBPR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>GICC_BPR determines preemption for Group 0 interrupts only.</td>
</tr>
<tr>
<td></td>
<td>GICC_ABPR determines preemption for Group 1 interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>GICC_BPR determines preemption for both Group 0 and Group 1 interrupts.</td>
</tr>
</tbody>
</table>

This field is an alias of ICC_CTLR_EL3.CBPR_EL1NS.

In a GIC that supports two Security states, when CBPR == 1:

- A Non-secure read of GICC_BPR returns the value of Secure GICC_BPR.Binary_Point, incremented by 1, and saturated to 0b111.
- Non-secure writes of GICC_BPR are ignored.

On a Warm reset, this field resets to 0.

###FIQEn, bit [3]

Controls whether the CPU interface signals Group 0 interrupts to a target PE using the FIQ or IRQ signal:

<table>
<thead>
<tr>
<th>FIQEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 0 interrupts are signaled using the IRQ signal.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 0 interrupts are signaled using the FIQ signal.</td>
</tr>
</tbody>
</table>

Group 1 interrupts are signaled using the IRQ signal only.

If an implementation supports two Security states, this bit is permitted to be RAO/WI.

On a Warm reset, this field resets to 0.
Bit [2]

Reserved, RES0.

EnableGrp1, bit [1]

This Non-secure field enables the signaling of Group 1 interrupts by the CPU interface to a target PE:

<table>
<thead>
<tr>
<th>EnableGrp1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 1 interrupt signaling is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 1 interrupt signaling is enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

EnableGrp0, bit [0]

Enables the signaling of Group 0 interrupts by the CPU interface to a target PE:

<table>
<thead>
<tr>
<th>EnableGrp0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 0 interrupt signaling is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 0 interrupt signaling is enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

Accessing the GICC_CTLR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_CTLR and ICC_MCTLR provide equivalent functionality.
- For AArch64 implementations, ICC_CTLR_EL1 and ICC_CTLR_EL3 provide equivalent functionality.

GICC_CTLR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC CPU interface</td>
<td>0x0000</td>
<td>GICC_CTLR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RW.
- When an access is Secure accesses to this register are RW.
- When an access is Non-secure accesses to this register are RW.
GICC_DIR, CPU Interface Deactivate Interrupt Register

The GICC_DIR characteristics are:

Purpose

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified interrupt.

Configuration

Attributes

GICC_DIR is a 32-bit register.

Field descriptions

The GICC_DIR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | INTID |

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Accessing the GICC_DIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_DIR provides equivalent functionality.
- For AArch64 implementations, ICC_DIR_EL1 provides equivalent functionality.

Writes to this register have an effect only in the following cases:

- When GICD_CTLR.DS == 1, if GICC_CTLR.EOImode == 1.
- In GIC implementations that support two Security states:
  - If the access is Secure and GICC_CTLR.EOImodeS == 1.
  - If the access is Non-secure and GICC_CTLR.EOImodeNS == 1.

The following writes must be ignored:
• Writes to this register when the corresponding EOImode field in GICC_CTLR == 0. In systems that support system error generation, an implementation might generate a system error.
• Writes to this register when the corresponding EOImode field in GICC_CTLR == 0 and the corresponding interrupt is not active. In systems that support system error generation, an implementation might generate a system error. In implementations using the GIC Stream Protocol Interface, these writes correspond to a Deactivate packet for an interrupt that is not active. For more information, see 'Deactivate (ICC)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

If the corresponding EOImode field in GICC_CTLR is 1 and this register is written to without a corresponding write to GICC_EOIR or GICC_AEOIR, the interrupt is deactivated but the bit corresponding to it in the active priorities registers remains set.

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

**GICC_DIR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC CPU interface</td>
<td>0x1000</td>
<td>GICC_DIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When GICD_CTLR.DS == 0 accesses to this register are **WO**.
• When an access is Secure accesses to this register are **WO**.
• When an access is Non-secure accesses to this register are **WO**.
GICC_EOIR, CPU Interface End Of Interrupt Register

The GICC_EOIR characteristics are:

Purpose

A write to this register performs priority drop for the specified interrupt and, if the appropriate GICC_CTLR.EOiModeS or GICC_CTLR.EOiModeNS field == 0, also deactivates the interrupt.

Configuration

If GICD_CTLR.DS==0:

- This register is Common.
- GICC_AEOIR is an alias of the Non-secure view of this register.

For Secure writes when GICD_CTLR.DS==0, or for Secure and Non-secure writes when GICD_CTLR.DS==1, the register provides functionality for Group 0 interrupts.

For Non-secure writes when GICD_CTLR.DS==1, the register provides functionality for Group 1 interrupts.

Attributes

GICC_EOIR is a 32-bit register.

Field descriptions

The GICC_EOIR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | INTID |

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

For every read of a valid INTID from GICC_IAR, the connected PE must perform a matching write to GICC_EOIR. The value written to GICC_EOIR must be the INTID from GICC_IAR. Reads of INTIDs 1020-1023 do not require matching writes.

Note
Arm recommends that software preserves the entire register value read from GICC_IAR, and writes that value back to GICC_EOIR on completion of interrupt processing.

For nested interrupts, the order of writes to this register must be the reverse of the order of interrupt acknowledgement. Behavior is UNPREDICTABLE if:

- This ordering constraint is not maintained.
- The value written to this register does not match an active interrupt, or the ID of a spurious interrupt.
- The value written to this register does not match the last valid interrupt value read from GICC_IAR.

For general information about the effect of writes to end of interrupt registers, and about the possible separation of the priority drop and interrupt deactivate operations, see 'Interrupt lifecycle' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

If GICC_CTLR.EOImodeS == 0:

- GICC_CTLR.EOImodeS controls the behavior of Secure accesses to GICC_EOIR and GICC_AEOIR.
- GICC_CTLR.EOImodeNS controls the behavior of Non-secure accesses to GICC_EOIR and GICC_AEOIR.

Accessing the GICC_EOIR

The following writes must be ignored:

- Writes of INTIDs 1020-1023.
- Secure writes corresponding to Group 1 interrupts. In systems that support system error generation, an implementation might generate a system error. In this case, GIC behavior is predictable, and the highest Secure active priority (in the Secure copy of GICC_APR<n>) will be reset if the highest active priority is Secure. System behavior is UNPREDICTABLE.
- Non-secure writes corresponding to Group 0 interrupts when GICC_CTLR.EOImodeS == 1. In systems that support system error generation, an implementation might generate a system error. In this case, GIC behavior is predictable, and the highest Non-secure active priority (in the Non-secure copy of GICC_APR<n>) will be reset if the highest active priority is Non-secure. System behavior is UNPREDICTABLE.

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_EOIR0 and ICC_EOIR1 provide equivalent functionality.
- For AArch64 implementations, ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide equivalent functionality.

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

**GICC_EOIR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC CPU interface</td>
<td>0x0010</td>
<td>GICC_EOIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTRLR.DS == 0 accesses to this register are WO.
- When an access is Secure accesses to this register are WO.
- When an access is Non-secure accesses to this register are WO.
GICC_HPPIR, CPU Interface Highest Priority Pending Interrupt Register

The GICC_HPPIR characteristics are:

**Purpose**

Provides the INTID of the highest priority pending interrupt on the CPU interface.

**Configuration**

If \texttt{GICD_CTLR.DS==0}:

- This register is Common.
- \texttt{GICC_AHPPIR} is an alias of the Non-secure view of this register.

**Attributes**

GICC_HPPIR is a 32-bit register.

**Field descriptions**

The GICC_HPPIR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td></td>
</tr>
<tr>

<tr>
<td>2</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td>INTID</td>
</tr>
</tbody>
</table>

**Bits [31:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID of the signaled interrupt.

**Note**

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

**Accessing the GICC_HPPIR**

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, \texttt{ICC_HPPIR0} and \texttt{ICC_HPPIR1} provide equivalent functionality.
- For AArch64 implementations, \texttt{ICC_HPPIR0_EL1} and \texttt{ICC_HPPIR1_EL1} provide equivalent functionality.

If the highest priority pending interrupt is in Group 0, a Non-secure read of this register returns the special INTID 1023.
For Secure reads when `GICD_CTLR.DS==0`, or for Secure and Non-secure reads when `GICD_CTLR.DS==1`, returns the special INTID 1022 if the highest priority pending interrupt is in Group 1.

If no interrupts are in the pending state, a read of this register returns the special INTID 1023.

Interrupt identifiers corresponding to an interrupt group that is not enabled are ignored.

If the highest priority pending interrupt is a direct interrupt that is both individually enabled in the Distributor and part of an interrupt group that is enabled in the Distributor, and the interrupt group is disabled in the CPU interface for this PE, this register returns the special INTID 1023.

For more information about pending interrupts that are not considered when determining the highest priority pending interrupt, see 'Preemption' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

**GICC_HPPIR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC CPU interface</td>
<td>0x0018</td>
<td>GICC_HPPIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `GICD_CTLR.DS == 0` accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.
The GICC_IAR characteristics are:

**Purpose**

Provides the INTID of the signaled interrupt. A read of this register by the PE acts as an acknowledge for the interrupt.

**Configuration**

This register is available in all configurations of the GIC. If GICD_CTLR.DS==0:

- This register is Common.
- GICC_AIAR is an alias of the Non-secure view of this register.

The format of the INTID is governed by whether affinity routing is enabled for a Security state.

**Attributes**

GICC_IAR is a 32-bit register.

**Field descriptions**

The GICC_IAR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | INTID |

**Bits [31:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID of the signaled interrupt.

**Note**

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGI, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

A read of this register returns the INTID of the highest priority pending interrupt for the CPU interface. The read returns a spurious INTID of 1023 if any of the following apply:

- Forwarding of interrupts by the Distributor to the CPU interface is disabled.
- Signaling of interrupts by the CPU interface to the connected PE is disabled.
- There are no pending interrupts on the CPU interface with sufficient priority for the interface to signal it to the PE.
When the GIC returns a valid INTID to a read of this register it treats the read as an acknowledge of that interrupt. In addition, it changes the interrupt status from pending to active, or to active and pending if the pending state of the interrupt persists. Normally, the pending state of an interrupt persists only if the interrupt is level-sensitive and remains asserted.

For every read of a valid INTID from GICC_IAR, the connected PE must perform a matching write to **GICC_EOIR**.

---

**Note**

- Arm recommends that software preserves the entire register value read from this register, and writes that value back to **GICC_EOIR** on completion of interrupt processing.
- For SPIs, although multiple target PEs might attempt to read this register at any time, only one PE can obtain a valid INTID. For more information, see 'Activation' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

### Accessing the GICC_IAR

When **GICD_CTLR**.DS==1, if the highest priority pending interrupt is in Group 1, the special INTID 1022 is returned. In GIC implementations that support two Security states, if the highest priority pending interrupt is in Group 0, Non-secure reads return the special INTID 1023.

In GIC implementations that support two Security states, if the highest priority pending interrupt is in Group 1, Secure reads return the special INTID 1022.

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, **ICC_IAR0** and **ICC_IAR1** provide equivalent functionality.
- For AArch64 implementations, **ICC_IAR0_EL1** and **ICC_IAR1_EL1** provide equivalent functionality.

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

**GICC_IAR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC CPU interface</td>
<td>0x000C</td>
<td>GICC_IAR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.
The GICC_IIDR characteristics are:

**Purpose**

Provides information about the implementer and revision of the CPU interface.

**Configuration**

**Attributes**

GICC_IIDR is a 32-bit register.

**Field descriptions**

The GICC_IIDR bit assignments are:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>PRODUCTID DEFINED</td>
<td>IMPLEMENTATION DEFINED</td>
<td>IMPLEMENTATION DEFINED</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
<tr>
<td>30</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>29</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**ProductID, bits [31:20]**

An implementation defined product identifier.

**Architecture_version, bits [19:16]**

The version of the GIC architecture that is implemented.

<table>
<thead>
<tr>
<th>Architecture_version</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>GICv1.</td>
</tr>
<tr>
<td>0b0010</td>
<td>GICv2.</td>
</tr>
<tr>
<td>0b0011</td>
<td>FEAT_GICv3 memory-mapped interface supported. Support for the System register interface is discoverable from PE registers ID_PFR1 and ID_A64PFR0_EL1.</td>
</tr>
<tr>
<td>0b0100</td>
<td>FEAT_GICv4 memory-mapped interface supported. Support for the System register interface is discoverable from PE registers ID_PFR1 and ID_A64PFR0_EL1.</td>
</tr>
</tbody>
</table>

Other values are reserved.

**Revision, bits [15:12]**

An implementation defined revision number for the CPU interface.

**Implementer, bits [11:0]**

Contains the JEP106 code of the company that implemented the CPU interface.

- Bits [11:8] are the JEP106 continuation code of the implementer. For an Arm implementation, this field is 0x4.
- Bit [7] is always 0.
- Bits [6:0] are the JEP106 identity code of the implementer. For an Arm implementation, bits [7:0] are therefore 0x3B.
Accessing the GICC_IIDR

GICC_IIDR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC CPU</td>
<td>0x00FC</td>
<td>GICC_IIDR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTRL.DS == 0 accesses to this register are RO.
- When an access is Secure accesses to this register are RO.
- When an access is Non-secure accesses to this register are RO.
The GICC_NSAPR<n> characteristics are:

**Purpose**

Provides information about Group 1 interrupt active priorities.

**Configuration**

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

When GICD_CTLR.DS==0, these registers are RAZ/WI to Non-secure accesses.

GICC_NSAPR1 is only implemented in implementations that support 6 or more bits of priority. GICC_NSAPR2 and GICC_NSAPR3 are only implemented in implementations that support 7 bits of priority.

**Attributes**

GICC_NSAPR<n> is a 32-bit register.

**Field descriptions**

The GICC_NSAPR<n> bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
</tbody>
</table>

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to 0.

**Accessing the GICC_NSAPR<n>**

GICC_NSAPR<n> can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC CPU interface</td>
<td>0x00E0 + (4 * n)</td>
<td>GICC_NSAPR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.
GICC_PMR, CPU Interface Priority Mask Register

The GICC_PMR characteristics are:

**Purpose**

This register provides an interrupt priority filter. Only interrupts with a higher priority than the value in this register are signaled to the PE.

**Note**

Higher interrupt priority corresponds to a lower value of the Priority field.

**Configuration**

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states this register is Common.

**Attributes**

GICC_PMR is a 32-bit register.

**Field descriptions**

The GICC_PMR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | Priority |

**Bits [31:8]**

Reserved, RES0.

**Priority, bits [7:0]**

The priority mask level for the CPU interface. If the priority of the interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

If the GIC implementation supports fewer than 256 priority levels some bits might be RAZ/WI, as follows:

- For 128 supported levels, bit [0] = 0b0.
- For 64 supported levels, bits [1:0] = 0b00.
- For 32 supported levels, bits [2:0] = 0b000.
- For 16 supported levels, bits [3:0] = 0b0000.

For more information, see 'Interrupt prioritization' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the GICC_PMR**

If the GIC implementation supports two Security states:

- Non-secure accesses to this register can only read or write values corresponding to the lower half of the priority range.
• If a Secure write has programmed the register with a value that corresponds to a value in the upper half of the priority range then:
  ◦ Any Non-secure read of the register returns 0x00, regardless of the value held in the register.
  ◦ Non-secure writes are ignored.

For more information, see 'Interrupt prioritization' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**GICC_PMR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC CPU interface</td>
<td>0x0004</td>
<td>GICC_PMR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When GICD_CTLR.DS == 0 accesses to this register are **RW**.
• When an access is Secure accesses to this register are **RW**.
• When an access is Non-secure accesses to this register are **RW**.

Copyright © 2010-2020 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.
GICC_RPR, CPU Interface Running Priority Register

The GICC_RPR characteristics are:

**Purpose**

This register indicates the running priority of the CPU interface.

**Configuration**

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states this register is Common.

**Attributes**

GICC_RPR is a 32-bit register.

**Field descriptions**

The GICC_RPR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | Priority |

**Bits [31:8]**

Reserved, RES0.

**Priority, bits [7:0]**

The current running priority on the CPU interface. This is the group priority of the current active interrupt.

If there are no active interrupts on the CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

The priority returned is the group priority as if the BPR was set to the minimum value.

**Accessing the GICC_RPR**

If there is no active interrupt on the CPU interface, the idle priority value is returned.

If the GIC implementation supports two Security states, a Non-secure read of the Priority field returns:

- 0x00 if the field value is less than 0x80.
- The Non-secure view of the Priority value if the field value is 0x80 or more.

For more information, see 'Interrupt prioritization' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Note**

Software cannot determine the number of implemented priority bits from this register.
**GICC_RPR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC CPU interface</td>
<td>0x0014</td>
<td>GICC_RPR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.
GICC_STATUSR, CPU Interface Status Register

The GICC_STATUSR characteristics are:

**Purpose**

Provides software with a mechanism to detect:

- Accesses to reserved locations.
- Writes to read-only locations.
- Reads of write-only locations.

**Configuration**

If the GIC implementation supports two Security states this register is Banked to provide Secure and Non-secure copies.

This register is used only when System register access is not enabled. If System register access is enabled, this register is not updated. Equivalent functionality might be provided by appropriate traps and exceptions.

**Attributes**

GICC_STATUSR is a 32-bit register.

**Field descriptions**

The GICC_STATUSR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:5]**

Reserved, RES0.

**ASV, bit [4]**

Attempted security violation.

<table>
<thead>
<tr>
<th>ASV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Non-secure access to a Secure register has been detected.</td>
</tr>
</tbody>
</table>

**Note**

This bit is not set to 1 for registers where any of the fields are Non-secure.

**WROD, bit [3]**

Write to an RO location.

<table>
<thead>
<tr>
<th>WROD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A write to an RO location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.
**RWOD, bit [2]**

Read of a WO location.

<table>
<thead>
<tr>
<th>RWOD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A read of a WO location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.

**WRD, bit [1]**

Write to a reserved location.

<table>
<thead>
<tr>
<th>WRD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A write to a reserved location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.

**RRD, bit [0]**

Read of a reserved location.

<table>
<thead>
<tr>
<th>RRD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A read of a reserved location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.

**Accessing the GICC_STATUSR**

This is an optional register. If the register is not implemented, the location is RAZ/WI.

If this register is implemented, **GICV_STATUSR** must also be implemented.

**GICC_STATUSR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC CPU interface</td>
<td>0x002C</td>
<td>GICC_STATUSR</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(S)</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC CPU interface</td>
<td>0x002C</td>
<td>GICC_STATUSR</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(NS)</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

Copyright © 2010-2020 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.
The GICD_CLRSPIN_SR characteristics are:

**Purpose**

Removes the pending state from a valid SPI if permitted by the Security state of the access and the GICD_NSACR<n> value for that SPI.

A write to this register changes the state of a pending SPI to inactive, and the state of an active and pending SPI to active.

**Configuration**

If GICD_TYPER.MBIS == 0, this register is reserved.

When GICD_CTLR.DS==1, this register provides functionality for all SPIs.

**Attributes**

GICD_CLRSPIN_SR is a 32-bit register.

**Field descriptions**

The GICD_CLRSPIN_SR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:13]**

Reserved, RES0.

**INTID, bits [12:0]**

The INTID of the SPI.

The function of this register depends on whether the targeted SPI is configured to be an edge-triggered or level-sensitive interrupt:

- For an edge-triggered interrupt, a write to GICD_SETSPI_NSR or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will stop being pending on activation, or if the pending state is removed by a write to GICD_CLRSPIN_SR, GICD_CLRSPIN_SR, or GICD_ICPENDR<n>.
- For a level-sensitive interrupt, a write to GICD_SETSPI_NSR or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will remain pending until it is deasserted by a write to GICD_CLRSPIN_SR or GICD_CLRSPIN_SR. If the interrupt is activated between having the pending state added and being deactivated, then the interrupt will be active and pending.

**Accessing the GICD_CLRSPIN_SR**

Writes to this register have no effect if:

- The value written specifies a Secure SPI, the value is written by a Non-secure access, and the value of the corresponding GICD_NSACR<n> register is less than 0b10.
- The value written specifies an invalid SPI.
- The SPI is not pending.
16-bit accesses to bits [15:0] of this register must be supported.

**Note**

A Secure access to this register can clear the pending state of any valid SPI.

---

**GICD_CLRSPI_NSR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0048</td>
<td>GICD_CLRSPI_NSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **W0**.
- When an access is Secure accesses to this register are **W0**.
- When an access is Non-secure accesses to this register are **W0**.
GICD_CLRSPISR, Clear Secure SPI Pending Register

The GICD_CLRSPISR characteristics are:

**Purpose**

Removes the pending state from a valid SPI.

A write to this register changes the state of a pending SPI to inactive, and the state of an active and pending SPI to active.

**Configuration**

If GICD_TYPER.MBIS == 0, this register is reserved.

When GICD_CTLR.DS==1, this register is WI.

**Attributes**

GICD_CLRSPISR is a 32-bit register.

**Field descriptions**

The GICD_CLRSPISR bit assignments are:

</tbody>
</table>

**Bits [31:13]**

Reserved, RES0.

**INTID, bits [12:0]**

The INTID of the SPI.

The function of this register depends on whether the targeted SPI is configured to be an edge-triggered or level-sensitive interrupt:

- For an edge-triggered interrupt, a write to GICD_SETSPI_NSR or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will stop being pending on activation, or if the pending state is removed by a write to GICD_CLRSPISR, GICD_CLRSPISR, or GICD_ICPENDR.<n>.
- For a level-sensitive interrupt, a write to GICD_SETSPI_NSR or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will remain pending until it is deasserted by a write to GICD_CLRSPISR or GICD_CLRSPISR. If the interrupt is activated between having the pending state added and being deactivated, then the interrupt will be active and pending.

**Accessing the GICD_CLRSPISR**

Writes to this register have no effect if:

- The value is written by a Non-secure access.
- The value written specifies an invalid SPI.
- The SPI is not pending.

16-bit accesses to bits [15:0] of this register must be supported.
GICD_CLR_SPI_SR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0058</td>
<td>GICD_CLR_SPI_SR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTRL.DS == 0 accesses to this register are **WI**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WI**.
GICD_CPENDSGIR<n>, SGI Clear-Pending Registers, n = 0 - 3

The GICD_CPENDSGIR<n> characteristics are:

**Purpose**

Removes the pending state from an SGI.

A write to this register changes the state of a pending SGI to inactive, and the state of an active and pending SGI to active.

**Configuration**

Four SGI clear-pending registers are implemented. Each register contains eight clear-pending bits for each of four SGIs, for a total of 16 possible SGIs.

In multiprocessor implementations, each PE has a copy of these registers.

**Attributes**

GICD_CPENDSGIR<n> is a 32-bit register.

**Field descriptions**

The GICD_CPENDSGIR<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| SGI_clear_pending_bits3 | SGI_clear_pending_bits2 | SGI_clear_pending_bits1 | SGI_clear_pending_bits0 |

SGI_clear_pending_bits<x>, bits [8x+7:8x], for x = 3 to 0

Removes the pending state from SGI number 4n + x for the PE corresponding to the bit number written to.

Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>SGI_clear_pending_bits&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x00</td>
<td>If read, indicates that the SGI from the corresponding PE is not pending and is not active and pending. If written, has no effect.</td>
</tr>
<tr>
<td>0x01</td>
<td>If read, indicates that the SGI from the corresponding PE is pending or is active and pending. If written, removes the pending state from the SGI for the corresponding PE.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

For SGI ID m, generated by processing element C writing to the corresponding GICD_SGIR field, where DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_CPENDSGIR<n> number is given by n = m DIV 4.
- The offset of the required register is (0xF10 + (4n)).
- The offset of the required field within the register GICD_CPENDSGIR<n> is given by m MOD 4.
- The required bit in the 8-bit SGI clear-pending field m is bit C.
Accessing the GICD_CPENDSGIR<n>

These registers are used only when affinity routing is not enabled. When affinity routing is enabled, this register is RES0. An implementation is permitted to make the register RAZ/WI in this case.

A register bit that corresponds to an unimplemented SGI is RAZ/WI.

These registers are byte-accessible.

If the GIC implementation supports two Security states:

- A register bit that corresponds to a Group 0 interrupt is RAZ/WI to Non-secure accesses.
- Register bits corresponding to unimplemented PEs are RAZ/WI.

GICD_CPENDSGIR<n> can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC</td>
<td>0x0F10 + (4 * n)</td>
<td>GICD_CPENDSGIR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RW.
- When an access is Secure accesses to this register are RW.
- When an access is Non-secure accesses to this register are RW.
GICD_CTLR, Distributor Control Register

The GICD_CTLR characteristics are:

**Purpose**

Enables interrupts and affinity routing.

**Configuration**

The format of this register depends on the Security state of the access and the number of Security states supported, which is specified by GICD_CTLR.DS.

**Attributes**

GICD_CTLR is a 32-bit register.

**Field descriptions**

The GICD_CTLR bit assignments are:

**When access is Secure, in a system that supports two Security states:**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RWP</td>
</tr>
<tr>
<td>30</td>
<td>RES0</td>
</tr>
<tr>
<td>29</td>
<td>E1NWF</td>
</tr>
<tr>
<td>28</td>
<td>DS</td>
</tr>
<tr>
<td>27</td>
<td>ARE_NS</td>
</tr>
<tr>
<td>26</td>
<td>ARE_S</td>
</tr>
<tr>
<td>25</td>
<td>RES0</td>
</tr>
<tr>
<td>24</td>
<td>EnableGrp1S</td>
</tr>
<tr>
<td>23</td>
<td>EnableGrp1NS</td>
</tr>
<tr>
<td>22</td>
<td>EnableGrp0</td>
</tr>
</tbody>
</table>

**RWP, bit [31]**

Register Write Pending. Read only. Indicates whether a register write is in progress or not:

<table>
<thead>
<tr>
<th>RWP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No register write in progress. The effects of previous register writes to the affected register fields are visible to all logical components of the GIC architecture, including the CPU interfaces.</td>
</tr>
<tr>
<td>0b1</td>
<td>Register write in progress. The effects of previous register writes to the affected register fields are not guaranteed to be visible to all logical components of the GIC architecture, including the CPU interfaces, as the effects of the changes are still being propagated.</td>
</tr>
</tbody>
</table>

This field tracks writes to:

- GICD_CTLR[2:0], the Group Enables, for transitions from 1 to 0 only.
- GICD_CTLR[7:4], the ARE bits, E1NWF bit and DS bit.
- GICD_ICENABLER<n>.

Updates to other register fields are not tracked by this field.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [30:8]**

Reserved, RES0.
E1NWF, bit [7]

Enable 1 of N Wakeup Functionality.

It is IMPLEMENTATION DEFINED whether this bit is programmable, or RAZ/WI.

If it is implemented, then it has the following behavior:

<table>
<thead>
<tr>
<th>E1NWF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A PE that is asleep cannot be picked for 1 of N interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>A PE that is asleep can be picked for 1 of N interrupts as determined by IMPLEMENTATION DEFINED controls.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

DS, bit [6]

Disable Security.

<table>
<thead>
<tr>
<th>DS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure accesses are not permitted to access and modify registers that control Group 0 interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure accesses are permitted to access and modify registers that control Group 0 interrupts.</td>
</tr>
</tbody>
</table>

If DS is written from 0 to 1 when GICD_CTLR.ARE_S == 1, then GICD_CTLR.ARE for the single Security state is RAO/WI.

If the Distributor only supports a single Security state, this bit is RAO/WI.

If the Distributor supports two Security states, it IMPLEMENTATION DEFINED whether this bit is programmable or implemented as RAZ/WI.

When this field is set to 1, all accesses to GICD_CTLR access the single Security state view, and all bits are accessible.

When set to 1, this field can only be cleared by a hardware reset.

Writing this bit from 0 to 1 is UNPREDICTABLE if any of the following is true:

- GICD_CTLR.EnableGrp0==1.
- GICD_CTLR.EnableGrp1S==1.
- GICD_CTLR.EnableGrp1NS==1.
- One or more INTID is in the Active or Active and Pending state.

On a Warm reset, this field resets to 0.

ARE_NS, bit [5]

Affinity Routing Enable, Non-secure state.

<table>
<thead>
<tr>
<th>ARE_NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Affinity routing disabled for Non-secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Affinity routing enabled for Non-secure state.</td>
</tr>
</tbody>
</table>

When affinity routing is enabled for the Secure state, this field is RAO/WI.

Changing the ARE_NS settings from 0 to 1 is UNPREDICTABLE except when GICD_CTLR.EnableGrp1 Non-secure == 0.

Changing the ARE_NS settings from 1 to 0 is UNPREDICTABLE.

If GICv2 backwards compatibility for Non-secure state is not implemented, this field is RAO/WI.

On a Warm reset, this field resets to 0.

ARE_S, bit [4]

Affinity Routing Enable, Secure state.
ARE_S | Meaning
---|---
0b0 | Affinity routing disabled for Secure state.
0b1 | Affinity routing enabled for Secure state.

Changing the ARE_S setting from 0 to 1 is **UNPREDICTABLE** except when all of the following apply:

- GICD_CTLR.EnableGrp0==0.
- GICD_CTLR.EnableGrp1S==0.
- GICD_CTLR.EnableGrp1NS==0.

Changing the ARE_S settings from 1 to 0 is **UNPREDICTABLE**.

If GICv2 backwards compatibility for Secure state is not implemented, this field is RAO/WI.

On a Warm reset, this field resets to 0.

**Bit [3]**

Reserved, RES0.

**EnableGrp1S, bit [2]**

Enable Secure Group 1 interrupts.

<table>
<thead>
<tr>
<th>EnableGrp1S</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure Group 1 interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure Group 1 interrupts are enabled.</td>
</tr>
</tbody>
</table>

If GICD_CTLR.ARE_S == 0, this field is RES0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**EnableGrp1NS, bit [1]**

Enable Non-secure Group 1 interrupts.

<table>
<thead>
<tr>
<th>EnableGrp1NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure Group 1 interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure Group 1 interrupts are enabled.</td>
</tr>
</tbody>
</table>

**Note**

This field also controls whether LPIs are forwarded to the PE.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**EnableGrp0, bit [0]**

Enable Group 0 interrupts.

<table>
<thead>
<tr>
<th>EnableGrp0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 0 interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 0 interrupts are enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**When access is Non-secure, in a system that supports two Security states:**

- **RWP**
- **RES0**
- **ARE_NS**
- **RES0**
- **EnableGrp1A**
- **EnableGrp1**
RWP, bit [31]

This bit is a read-only alias of the Secure GICD_CTLR.RWP bit.

Bits [30:5]

Reserved, RES0.

ARE_NS, bit [4]

This bit is a read-write alias of the Secure GICD_CTLR.ARE_NS bit.

If GICv2 backwards compatibility for Non-secure state is not implemented, this field is RAO/WI.

Bits [3:2]

Reserved, RES0.

EnableGrp1A, bit [1]

If ARE_NS == 1, then this bit is a read-write alias of the Secure GICD_CTLR.EnableGrp1NS bit.

If ARE_NS == 0, then this bit is RES0.

EnableGrp1, bit [0]

If ARE_NS == 0, then this bit is a read-write alias of the Secure GICD_CTLR.EnableGrp1NS bit.

If ARE_NS == 1, then this bit is RES0.

When in a system that supports only a single Security state:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No register write in progress. The effects of previous register writes to the affected register fields are visible to all logical components of the GIC architecture, including the CPU interfaces.</td>
</tr>
<tr>
<td>0b1</td>
<td>Register write in progress. The effects of previous register writes to the affected register fields are not guaranteed to be visible to all logical components of the GIC architecture, including the CPU interfaces, as the effects of the changes are still being propagated.</td>
</tr>
</tbody>
</table>

This field tracks updates to:

- GICD_CTLR[2:0], the Group Enables, for transitions from 1 to 0 only.
- GICD_CTLR[7:4], the ARE bits, E1NWF bit and DS bit.
- GICD_ICENABLER<n>, the bits that allow disabling of SPIs.

Updates to other register fields are not tracked by this field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Bits [30:9]

Reserved, RES0.

nASSGIreq, bit [8]

When FEAT_GICv4p1 is implemented:

Controls whether SGIs have an active state.

This bit is RES0 if GICD_TYPER2.GICD_TYPER2.nASSGIcap is 0.

This bit is WI when any of GICD_CTLR.{EnableGrp0,EnableGrp1} is 1.

<table>
<thead>
<tr>
<th>nASSGIreq</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>SGIs have an active state and must be deactivated.</td>
</tr>
<tr>
<td>0b1</td>
<td>SGIs do not have an active state and do not require deactivation.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

E1NWF, bit [7]

Enable 1 of N Wakeup Functionality.

It is IMPLEMENTATION DEFINED whether this bit is programmable, or RAZ/WI.

If it is implemented, then it has the following behavior:

<table>
<thead>
<tr>
<th>E1NWF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A PE that is asleep cannot be picked for 1 of N interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>A PE that is asleep can be picked for 1 of N interrupts as determined by IMPLEMENTATION DEFINED controls.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

DS, bit [6]

Disable Security. This field is RAO/WI.

Bit [5]

Reserved, RES0.

ARE, bit [4]

Affinity Routing Enable.

<table>
<thead>
<tr>
<th>ARE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Affinity routing disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Affinity routing enabled.</td>
</tr>
</tbody>
</table>

Changing the ARE settings from 0 to 1 is UNPREDICTABLE except when all of the following apply:

- GICD_CTLR.EnableGrp1==0.
- GICD_CTLR.EnableGrp0==0.

Changing ARE from 1 to 0 is UNPREDICTABLE.

If GICv2 backwards compatibility is not implemented, this field is RAO/WI.
On a Warm reset, this field resets to 0.

**Bits [3:2]**

Reserved, RES0.

**EnableGrp1, bit [1]**

Enable Group 1 interrupts.

<table>
<thead>
<tr>
<th>EnableGrp1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 1 interrupts disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 1 interrupts enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EnableGrp0, bit [0]**

Enable Group 0 interrupts.

<table>
<thead>
<tr>
<th>EnableGrp0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 0 interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 0 interrupts are enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Accessing the GICD_CTLR

If an interrupt is pending within a CPU interface when the corresponding GICD_CTLR.EnableGrpX bit is written from 1 to 0 the interrupt must be retrieved from the CPU interface.

**Note**

This might have no effect on the forwarded interrupt if it has already been activated. When a write changes the value of ARE for a Security state or the value of the DS bit, the format used for interpreting the remaining bits provided in the write data is the format that applied before the write takes effect.

**GICD_CTLR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0000</td>
<td>GICD_CTLR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.
GICD_ICACTIVER<n>, Interrupt Clear-Active Registers, n = 0 - 31

The GICD_ICACTIVER<n> characteristics are:

Purpose

Deactivates the corresponding interrupt. These registers are used when saving and restoring GIC state.

Configuration

These registers are available in all GIC configurations. If GICD_CTLR.DS==0, these registers are Common.

The number of implemented GICD_ICACTIVER<n> registers is \((GICD_TYPER.ITLinesNumber+1)\). Registers are numbered from 0.

GICD_ICACTIVER0 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_ICACTIVER0 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ICACTIVER<n> is a 32-bit register.

Field descriptions

The GICD_ICACTIVER<n> bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clear_active_bit31</td>
<td>Clear_active_bit30</td>
<td>Clear_active_bit29</td>
<td>Clear_active_bit28</td>
<td>Clear_active_bit27</td>
<td>Clear_active_bit26</td>
</tr>
</tbody>
</table>

Clear_active_bit<x>, bit [x], for x = 31 to 0

Removes the active state from interrupt number \(32n + x\). Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Clear_active_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that the corresponding interrupt is active, or is active and pending. If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICACTIVER<n> number, n, is given by \(n = m \text{ DIV 32}\).
- The offset of the required GICD_ICACTIVER is (0x380 + (4*n)).
- The bit number of the required group modifier bit in this register is \(m \text{ MOD 32}\).
Accessing the GICD_ICACTIVER<n>

When affinity routing is enabled for the Security state of an interrupt, the bits corresponding to SGIs and PPIs in that Security state are RAZ/WI, and equivalent functionality for SGIs and PPIs is provided by GICR_ICACTIVER0.

Bits corresponding to unimplemented interrupts are RAZ/WI.

If GICD_CTLR.DS==0, unless the GICD_NSACR<n> registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

GICD_ICACTIVER<n> can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0380 + (4 * n)</td>
<td>GICD_ICACTIVER&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RW.
- When an access is Secure accesses to this register are RW.
- When an access is Non-secure accesses to this register are RW.
**GICD_ICACTIVER<n>E, Interrupt Clear-Active Registers (extended SPI range), n = 0 - 31**

The GICD_ICACTIVER<n>E characteristics are:

**Purpose**

Removes the active state from the corresponding SPI in the extended SPI range.

**Configuration**

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_ICACTIVER<n>E are `RES0`.

When GICD_TYPER.ESPI==0, these registers are `RES0`.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ICACTIVER<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

**Attributes**

GICD_ICACTIVER<n>E is a 32-bit register.

**Field descriptions**

The GICD_ICACTIVER<n>E bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clear_active_bit31</td>
<td>Clear_active_bit30</td>
<td>Clear_active_bit29</td>
<td>Clear_active_bit28</td>
<td>Clear_active_bit27</td>
<td>Clear_active_bit26</td>
</tr>
</tbody>
</table>

**Clear_active_bit<x>, bit [x], for x = 31 to 0**

For the extended SPIs, removes the active state to interrupt number x. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Clear_active_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that the corresponding interrupt is active, or is active and pending. If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICACTIVER<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_ICACTIVER<n>E is (0x1C00 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

**Accessing the GICD_ICACTIVER<n>E**

When affinity routing is not enabled for the Security state of an interrupt in GICD_ICACTIVER<n>E, the corresponding bit is `RES0`. 

---

Page 3666
When \texttt{GICD\_CTRL.DS==0}, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

\textbf{GICD\_ICACTIVER\(<n>E\) can be accessed through the memory-mapped interfaces:}

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x1C00 + (4 * n)</td>
<td>GICD_ICACTIVER(&lt;n&gt;E)</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When \texttt{GICD\_CTRL.DS == 0} accesses to this register are RW.
- When an access is Secure accesses to this register are RW.
- When an access is Non-secure accesses to this register are RW.
The GICD_ICENABLER<n> characteristics are:

**Purpose**

Disables forwarding of the corresponding interrupt to the CPU interfaces.

**Configuration**

These registers are available in all GIC configurations. If \( GICD\_\text{CTLR}.\text{DS} == 0 \), these registers are Common.

The number of implemented \( \text{GICD\_ICENABLER}\_n \) registers is \( (\text{GICD\_TYPER}.\text{ITLinesNumber}+1) \). Registers are numbered from 0.

\( \text{GICD\_ICENABLER}0 \) is Banked for each connected PE with \( \text{GICR\_TYPER}.\text{Processor\_Number} < 8 \).

Accessing \( \text{GICD\_ICENABLER}0 \) from a PE with \( \text{GICR\_TYPER}.\text{Processor\_Number} > 7 \) is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

**Attributes**

\( \text{GICD\_ICENABLER}\_n \) is a 32-bit register.

**Field descriptions**

The GICD_ICENABLER<n> bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
</tr>
</thead>
</table>

Clear_enable_bit<x>, bit \([x]\), for \(x = 31\) to \(0\)

For SPIs and PPIs, controls the forwarding of interrupt number \(32n + x\) to the CPU interfaces. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Clear_enable_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that forwarding of the corresponding interrupt is enabled. If written, disables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 0.</td>
</tr>
</tbody>
</table>

For SGIs, the behavior of this bit is IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For INTID \(m\), when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICENABLER<n> number, \( n \), is given by \( n = m \div 32 \).
- The offset of the required GICD_ICENABLER is \((8 \times 180 + (4 \times n))\).
- The bit number of the required group modifier bit in this register is \( m \mod 32 \).
Note

Writing a 1 to a GICD_ICENABLER<n> bit only disables the forwarding of the corresponding interrupt from the Distributor to any CPU interface. It does not prevent the interrupt from changing state, for example becoming pending or active and pending if it is already active.

Accessing the GICD_ICENABLER<n>

For SGIs and PPIs:

- When ARE is 1 for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR_ICENABLER0.

Bits corresponding to unimplemented interrupts are RAZ/WI.

When GICD_CTLR.DS==0, bits corresponding to Group 0 and Secure Group 1 interrupts are RAZ/WI to Non-secure accesses.

It is IMPLEMENTATION DEFINED whether implemented SGIs are permanently enabled, or can be enabled and disabled by writes to GICD_ISENABLER<n> and GICD_ICENABLER<n> where n=0.

Completion of a write to this register does not guarantee that the effects of the write are visible throughout the affinity hierarchy. To ensure an enable has been cleared, software must write to the register with bits set to 1 to clear the required enables. Software must then poll GICD_CTLR.RWP until it has the value zero.

GICD_ICENABLER<n> can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0180 + (4 * n)</td>
<td>GICD_ICENABLER&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RW.
- When an access is Secure accesses to this register are RW.
- When an access is Non-secure accesses to this register are RW.
The GICD_ICENABLER\textsubscript{n}E characteristics are:

**Purpose**

Disables forwarding of the corresponding SPI in the extended SPI range to the CPU interfaces.

**Configuration**

This register is present only when FEAT\_GICv3p1 is implemented. Otherwise, direct accesses to GICD\_ICENABLER\textsubscript{n}E are \texttt{RES0}.

When \texttt{GICD\_TYPER.ESPI==0}, these registers are \texttt{RES0}.

When \texttt{GICD\_TYPER.ESPI==1}, the number of implemented GICD\_ICENABLER\textsubscript{n}E registers is (\texttt{GICD\_TYPER.ESPI\_range+1}). Registers are numbered from 0.

**Attributes**

GICD\_ICENABLER\textsubscript{n}E is a 32-bit register.

**Field descriptions**

The GICD\_ICENABLER\textsubscript{n}E bit assignments are:

|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|

**Clear_enable_bit\textsubscript{x}, bit [x], for x = 31 to 0**

For the extended SPI range, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Clear_enable_bit\textsubscript{x}</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD\_ICENABLER\textsubscript{n}E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD\_ICENABLER\textsubscript{n}E is (0x1400 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.
Accessing the \texttt{GICD\_ICENABLER\langle n\rangle\_E}

When affinity routing is not enabled for the Security state of an interrupt in \texttt{GICD\_ICENABLER\langle n\rangle\_E}, the corresponding bit is \texttt{RES}.0.

When \texttt{GICD\_CTLR.DS==0}, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

\textbf{GICD\_ICENABLER\langle n\rangle\_E can be accessed through the memory-mapped interfaces:}

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x1400 + (4 * n)</td>
<td>GICD_ICENABLER\langle n\rangle_E</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When \texttt{GICD\_CTLR.DS == 0} accesses to this register are \texttt{RW}.
- When an access is Secure accesses to this register are \texttt{RW}.
- When an access is Non-secure accesses to this register are \texttt{RW}.
GICD_ICFGR<n>, Interrupt Configuration Registers, n = 0 - 63

The GICD_ICFGR<n> characteristics are:

**Purpose**

Determines whether the corresponding interrupt is edge-triggered or level-sensitive.

**Configuration**

These registers are available in all GIC configurations. If the GIC implementation supports two Security states, these registers are Common.

GICD_ICFGR1 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_ICFGR1 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

For SGIs and PPIs:

- When ARE is 1 for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR_ICFGR<n>

For each supported PPI, it is IMPLEMENTATION DEFINED whether software can program the corresponding Int_config field.

For SGIs, Int_config fields are RO, meaning that GICD_ICFGR0 is RO.

Changing Int_config when the interrupt is individually enabled is UNPREDICTABLE.

Changing the interrupt configuration between level-sensitive and edge-triggered (in either direction) at a time when there is a pending interrupt will leave the interrupt in an UNKNOWN pending state.

Fields corresponding to unimplemented interrupts are RAZ/WI.

**Attributes**

GICD_ICFGR<n> is a 32-bit register.

**Field descriptions**

The GICD_ICFGR<n> bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
</tr>
</thead>
<tbody>
<tr>
<td>Int_config15</td>
<td>Int_config14</td>
<td>Int_config13</td>
<td>Int_config12</td>
<td>Int_config11</td>
<td>Int_config10</td>
<td>Int_config9</td>
<td>Int_config8</td>
<td>Int_config7</td>
<td>Int_config6</td>
<td>Int_config5</td>
<td>Int_config4</td>
<td>Int_config3</td>
<td>Int_config2</td>
<td>Int_config1</td>
<td>Int_config0</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Int_config<x>, bits [2x+1:2x], for x = 15 to 0**

Indicates whether the interrupt with ID 16n + x is level-sensitive or edge-triggered.

Int_config[0] (bit [2x]) is RES0.

Possible values of Int_config[1] (bit [2x+1]) are:
For SGIs, Int_config[1] is RAO/WI.

For SPIs and PPIs, Int_config[1] is programmable unless the implementation supports two Security states and the bit corresponds to a Group 0 or Secure Group 1 interrupt, in which case the bit is RAZ/WI to Non-secure accesses.

On a Warm reset, this field resets to an architecturally "UNKNOWN" value.

**Accessing the GICD_ICFGR<n>**

GICD_ICFGR<n> can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0C00 + (4 * n)</td>
<td>GICD_ICFGR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.
GICD_ICFGR<n>E, Interrupt Configuration Registers (Extended SPI Range), n = 0 - 63

The GICD_ICFGR<n>E characteristics are:

**Purpose**

Determines whether the corresponding SPI in the extended SPI range is edge-triggered or level-sensitive.

**Configuration**

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_ICFGR<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ICFGR<n>E registers is ((GICD_TYPER.ESPI_range+1)*2). Registers are numbered from 0.

**Attributes**

GICD_ICFGR<n>E is a 32-bit register.

**Field descriptions**

The GICD_ICFGR<n>E bit assignments are:

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13 |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Int_config15 | Int_config14 | Int_config13 | Int_config12 | Int_config11 | Int_config10 | Int_config9 | Int_config8 | Int_config7 | Int_config6 | Int_config5 | Int_config4 | Int_config3 | Int_config2 | Int_config1 | Int_config0 |

Int_config<x>, bits [2x+1:2x], for x = 15 to 0

Indicates whether the interrupt with ID 16n + x is level-sensitive or edge-triggered.

Int_config[0] (bit[2x]) is RES0.

Possible values of Int_config[1] (bit[2x+1]) are:

<table>
<thead>
<tr>
<th>Int_config&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Corresponding interrupt is level-sensitive.</td>
</tr>
<tr>
<td>0b01</td>
<td>Corresponding interrupt is edge-triggered.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the GICD_ICFGR<n>E**

When affinity routing is not enabled for the Security state of an interrupt in GICD_ICFGR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

**GICD_ICFGR<n>E can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
</table>
This interface is accessible as follows:

- When `GICD_CTR.DS` == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.
GICD_ICPENDR<n>, Interrupt Clear-Pending Registers, n = 0 - 31

The GICD_ICPENDR<n> characteristics are:

**Purpose**

Removes the pending state from the corresponding interrupt.

**Configuration**

These registers are available in all GIC configurations. If GICD_CTLR.DS==0, these registers are Common.

The number of implemented GICD_ICPENDR<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_ICPENDR0 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_ICPENDR0 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

**Attributes**

GICD_ICPENDR<n> is a 32-bit register.

**Field descriptions**

The GICD_ICPENDR<n> bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
</tr>
</thead>
</table>

*Clear_pending_bit<x>*, bit [x], for x = 31 to 0

For SPIs and PPIs, removes the pending state from interrupt number 32n + x. Reads and writes have the following behavior:
### Clear_pending_bit<x>

<table>
<thead>
<tr>
<th>Clear_pending_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that the corresponding interrupt is not pending on any PE. If written, has no effect.</td>
</tr>
</tbody>
</table>
| 0b1                  | If read, indicates that the corresponding interrupt is pending, or active and pending:  
  • On this PE if the interrupt is an SGI or PPI.  
  • On at least one PE if the interrupt is an SPI.  
If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active. This has no effect in the following cases:  
  • If the interrupt is an SGI. In this case, the write is ignored. The pending state of an SGI can be cleared using GICD_CPENDSGIR<n>.  
  • If the interrupt is not pending and is not active and pending.  
  • If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to GICD_ISPENDR<n>. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending. |

On a Warm reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICPENDR<n> number, n, is given by n = m DIV 32.
- The offset of the required GICD_ICPENDR is (0x200 + (4*n)).
- The bit number of the required group modifier bit in this register is m MOD 32.

### Accessing the GICD_ICPENDR<n>

Clear-pending bits for SGIs are RO/WI.

When affinity routing is enabled for the Security state of an interrupt:

- Bits corresponding to SGIs and PPIs are RAZ/WI, and equivalent functionality for SGIs and PPIs is provided by GICR_ICPENDR0.
- Bits corresponding to Group 0 and Group 1 Secure interrupts can only be cleared by Secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

If GICD_CTLR.DS==0, unless the GICD_NSACR<n> registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

**GICD_ICPENDR<n> can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0280 + (4 * n)</td>
<td>GICD_ICPENDR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RW.
- When an access is Secure accesses to this register are RW.
- When an access is Non-secure accesses to this register are RW.
The GICD_ICPENDR<n>E characteristics are:

**Purpose**

Removes the pending state to the corresponding SPI in the extended SPI range.

**Configuration**

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_ICPENDR<n>E are RES0.

When \( \text{GICD_TYPER.ESPI} == 0 \), these registers are RES0.

When \( \text{GICD_TYPER.ESPI} == 1 \), the number of implemented GICD_ICPENDR<n>E registers is \( (\text{GICD_TYPER.ESPI_range}+1) \). Registers are numbered from 0.

**Attributes**

GICD_ICPENDR<n>E is a 32-bit register.

**Field descriptions**

The GICD_ICPENDR<n>E bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Clear_pending_bit31</td>
</tr>
<tr>
<td>30</td>
<td>Clear_pending_bit30</td>
</tr>
<tr>
<td>29</td>

</tr>
<tr>
<td>26</td>
<td>Clear_pending_bit26</td>
</tr>
</tbody>
</table>

**Clear_pending_bit<x>, bit [x], for x = 31 to 0**

For the extended PPIs, removes the pending state to interrupt number \( x \). Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Clear_pending_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that the corresponding interrupt is not pending.</td>
</tr>
<tr>
<td></td>
<td>If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that the corresponding interrupt is pending, or active and pending.</td>
</tr>
<tr>
<td></td>
<td>If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active.</td>
</tr>
<tr>
<td></td>
<td>This has no effect in the following cases:</td>
</tr>
<tr>
<td></td>
<td>• If the interrupt is not pending and is not active and pending.</td>
</tr>
<tr>
<td></td>
<td>• If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to GICD_ISPENDR&lt;n&gt;E. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:
• The corresponding GICD_ICPENDR<n>E number, n, is given by \( n = (m-4096) \text{ DIV } 32 \).
• The offset of the required GICD_ICPENDR<n>E is \( (0x1800 + (4*n)) \).
• The bit number of the required group modifier bit in this register is \( (m-4096) \text{ MOD } 32 \).

**Accessing the GICD_ICPENDR<n>E**

When affinity routing is not enabled for the Security state of an interrupt in GICD_ICPENDR<n>E, the corresponding bit is \texttt{RES0}.

When \texttt{GICD_CTLR.DS==0}, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

**GICD_ICPENDR<n>E can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>( 0x1800 + (4*n) )</td>
<td>GICD_ICPENDR&lt;n&gt;E</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When \texttt{GICD_CTLR.DS == 0} accesses to this register are \texttt{RW}.
• When an access is Secure accesses to this register are \texttt{RW}.
• When an access is Non-secure accesses to this register are \texttt{RW}.

GICD_IGROUPR<n>, Interrupt Group Registers, n = 0 - 31

The GICD_IGROUPR<n> characteristics are:

**Purpose**

Controls whether the corresponding interrupt is in Group 0 or Group 1.

**Configuration**

These registers are available in all GIC configurations. If GICD_CTLR.DS==0, these registers are Secure.

The number of implemented GICD_IGROUPR<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_IGROUPR0 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_IGROUPR0 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

**Attributes**

GICD_IGROUPR<n> is a 32-bit register.

**Field descriptions**

The GICD_IGROUPR<n> bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group_status_bit31</td>
<td>Group_status_bit30</td>
<td>Group_status_bit29</td>
<td>Group_status_bit28</td>
<td>Group_status_bit27</td>
<td>Group_status_bit26</td>
</tr>
</tbody>
</table>

**Group_status_bit<x>, bit [x], for x = 31 to 0**

Group status bit.

<table>
<thead>
<tr>
<th>Group_status_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When GICD_CTLR.DS==1, the corresponding interrupt is Group 0. When GICD_CTLR.DS==0, the corresponding interrupt is Secure.</td>
</tr>
<tr>
<td>0b1</td>
<td>When GICD_CTLR.DS==1, the corresponding interrupt is Group 1. When GICD_CTLR.DS==0, the corresponding interrupt is Non-secure Group 1.</td>
</tr>
</tbody>
</table>

If affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICD_IGRPMODR<n> to form a 2-bit field that defines an interrupt group. The encoding of this field is described in GICD_IGRPMODR<n>.

If affinity routing is disabled for the Security state of an interrupt, then:

- The corresponding GICD_IGRPMODR<n> bit is RES0.
- For Secure interrupts, the interrupt is Secure Group 0.
- For Non-secure interrupts, the interrupt is Non-secure Group 1.

On a Warm reset, when n == 0, this field resets to an UNKNOWN value.
On a Warm reset, when \( n > 0 \), this field resets to 0.

For INTID \( m \), when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD\_IGROUP\(<n>\) number, \( n \), is given by \( n = m \div 32 \).
- The offset of the required GICD\_IGROUP is \( (0\times080 + (4\times n)) \).
- The bit number of the required group modifier bit in this register is \( m \mod 32 \).

### Accessing the GICD\_IGROUP\(<n>\)

For SGI\&s and PPI\&s:

- When ARE is 1 for the Security state of an interrupt, the field for that interrupt is \( \text{RES0} \) and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR\_IGROUP\(<0>\).

When \( \text{GICD\_CTRL\_DS} = 0 \), the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

---

**Note**

Accesses to GICD\_IGROUP\(<0>\) when affinity routing is not enabled for a Security state access the same state as GICR\_IGROUP\(<0>\), and must update Redistributor state associated with the PE performing the accesses. Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

---

**GICD\_IGROUP\(<n>\) can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>( 0\times080 + (4\times n) )</td>
<td>GICD_IGROUP(&lt;n&gt;)</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD\_CTRL\_DS == 0 accesses to this register are RW.
- When an access is Secure accesses to this register are RW.
The GICD_IGROUPR<n>E characteristics are:

**Purpose**

Controls whether the corresponding SPI in the extended SPI range is in Group 0 or Group 1.

**Configuration**

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_IGROUPR<n>E are RES0.

GICD_IGROUPR<n>E resets to 0x00000000.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1:

- The number of implemented GICD_IGROUPR<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.
- When GICD_CTLR.DS==0, this register is Secure.

**Attributes**

GICD_IGROUPR<n>E is a 32-bit register.

**Field descriptions**

The GICD_IGROUPR<n>E bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>

<tr>
<td>0b1</td>
<td>When GICD_CTLR.DS==1, the corresponding interrupt is Group 1. When GICD_CTLR.DS==0, the corresponding interrupt is Non-secure Group 1.</td>
</tr>
</tbody>
</table>

If affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICD_IGRPMODR<n>E to form a 2-bit field that defines an interrupt group. The encoding of this field is described in GICD_IGRPMODR<n>E.

If affinity routing is disabled for the Security state of an interrupt, the bit is RES0:

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IGROUPR<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_IGROUPR<n>E is (0x1000 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.
Accessing the GICD_IGROUPR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_IGROUPR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_IGROUPR<n>E can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x1000 + (4 * n)</td>
<td>GICD_IGROUPR&lt;n&gt;E</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RW.
- When an access is Secure accesses to this register are RW.
- When an access is Non-secure accesses to this register are RW.
GICD_IGRPMODR<n>, Interrupt Group Modifier Registers, n = 0 - 31

The GICD_IGRPMODR<n> characteristics are:

**Purpose**

When GICD_CTLR.DS==0, this register together with the GICD_IGROUPR<n> registers, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- Secure Group 1.

**Configuration**

When GICD_CTLR.DS==0, these registers are Secure.

The number of implemented GICD_IGROUPR<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

When GICD_CTLR.ARE_S==0 or GICD_CTLR.DS==1, the GICD_IGRPMODR<n> registers are RES0. An implementation can make these registers RAZ/WI in this case.

**Attributes**

GICD_IGRPMODR<n> is a 32-bit register.

**Field descriptions**

The GICD_IGRPMODR<n> bit assignments are:

<table>
<thead>
<tr>
<th>Group modifier bit</th>
<th>Group status bit</th>
<th>Definition</th>
<th>Short name</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>0b0</td>

<td>0b0</td>
<td>Secure Group 1</td>
<td>G1S</td>
</tr>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>Reserved, treated as Non-secure Group 1</td>
<td>-</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IGRPMODR<n> number, n, is given by n = m DIV 32.
- The offset of the required GICD_IGRPMODR is (0x080 + (4*n)).
- The bit number of the required group modifier bit in this register is m MOD 32.

See GICD_IGROUPR<n> for information about the GICD_IGRPMODR0 reset value.
Accessing the GICD_IGRPMODR<n>

When affinity routing is enabled for Secure state, GICD_IGRPMODR0 is RES0 and equivalent functionality is proved by GICR_IGRPMODR0.

When GICD_CTLR.DS==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

---

**Note**

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

---

**GICD_IGRPMODR<n> can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0D00 + (4 * n)</td>
<td>GICD_IGRPMODR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RW.
- When an access is Secure accesses to this register are RW.
The GICD_IGRPMODR<n>E characteristics are:

**Purpose**

When GICD_CTLR_DS==0, this register together with the GICD_IGROUPR<n>E registers, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- When System register access is enabled, Secure Group 1.

**Configuration**

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_IGRPMODR<n>E are RES0.

GICD_IGRPMODR<n>E resets to 0x00000000.

When GICD_TYPER_ESPI==0, these registers are RES0.

When GICD_TYPER_ESPI==1:

- The number of implemented GICD_IGRPMODR<n>E registers is (GICD_TYPER_ESPI_range+1). Registers are numbered from 0.
- When GICD_CTLR_DS==0, this register is Secure.

**Attributes**

GICD_IGRPMODR<n>E is a 32-bit register.

**Field descriptions**

The GICD_IGRPMODR<n>E bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group modifier bit31</td>
<td>Group modifier bit30</td>
<td>Group modifier bit29</td>
<td>Group modifier bit28</td>
<td>Group modifier bit27</td>
</tr>
</tbody>
</table>

**Group modifier bit<x>, bit [x], for x = 31 to 0**

Group modifier bit. In implementations where affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICD_IGROUPR<n>E to form a 2-bit field that defines an interrupt group:

<table>
<thead>
<tr>
<th>Group modifier bit</th>
<th>Group status bit</th>
<th>Definition</th>
<th>Short name</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>0b0</td>
<td>Secure Group 0</td>
<td>G0S</td>
</tr>
<tr>
<td>0b0</td>
<td>0b1</td>
<td>Non-secure Group 1</td>
<td>G1NS</td>
</tr>
<tr>
<td>0b1</td>
<td>0b0</td>
<td>Secure Group 1</td>
<td>G1S</td>
</tr>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>Reserved, treated as Non-secure Group 1</td>
<td>-</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IGRPMODR<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_IGRPMODR<n>E is (0x3400 + (4*n)).
The bit number of the required group modifier bit in this register is \((m-4096) \mod 32\).

### Accessing the GICD\_IGRPMODR\(<n>\)E

When affinity routing is not enabled for the Security state of an interrupt in GICD\_IGRPMODR\(<n>\)E, the corresponding bit is \texttt{RES0}.

When \texttt{GICD\_CTRL.DS==0}, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

**GICD\_IGRPMODR\(<n>\)E can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>(0x3400 + (4 * n))</td>
<td>GICD_IGRPMODR(&lt;n&gt;)E</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When \texttt{GICD\_CTRL.DS == 0} accesses to this register are \texttt{RW}.
- When an access is Secure accesses to this register are \texttt{RW}.
- When an access is Non-secure accesses to this register are \texttt{RW}.
GICD_IIDR, Distributor Implementer Identification Register

The GICD_IIDR characteristics are:

**Purpose**

Provides information about the implementer and revision of the Distributor.

**Configuration**

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states, this register is Common.

**Attributes**

GICD_IIDR is a 32-bit register.

**Field descriptions**

The GICD_IIDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>ProductID</td>
</tr>
<tr>
<td>30</td>
<td>Reserved</td>
</tr>
<tr>
<td>29</td>
<td>Variant</td>
</tr>
<tr>
<td>28</td>
<td>Revision</td>
</tr>
<tr>
<td>27</td>
<td>Implementer</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**ProductID, bits [31:24]**

An IMPLEMENTATION DEFINED product identifier.

**Bits [23:20]**

Reserved, RES0.

**Variant, bits [19:16]**

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish product variants, or major revisions of a product.

**Revision, bits [15:12]**

An IMPLEMENTATION DEFINED revision number. Typically, this field is used to distinguish minor revisions of a product.

**Implementer, bits [11:0]**

Contains the JEP106 code of the company that implemented the Distributor:

- Bits [11:8] are the JEP106 continuation code of the implementer. For an Arm implementation, this field is 0x4.
- Bit [7] is always 0.
- Bits [6:0] are the JEP106 identity code of the implementer. For an Arm implementation, bits [7:0] are therefore 0x3B.
Accessing the GICD_IIDR

GICD_IIDR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0008</td>
<td>GICD_IIDR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

Copyright © 2010-2020 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.
The GICD_IPRIORITYR<n> characteristics are:

**Purpose**

Holds the priority of the corresponding interrupt.

**Configuration**

These registers are available in all configurations of the GIC. When GICD_CTLR.DS==0, these registers are Common.

The number of implemented GICD_IPRIORITYR<n> registers is 8*(GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_IPRIORITYR0 to GICD_IPRIORITYR7 are Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_IPRIORITYR0 to GICD_IPRIORITYR7 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

**Attributes**

GICD_IPRIORITYR<n> is a 32-bit register.

**Field descriptions**

The GICD_IPRIORITYR<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Priority_offset_3B | Priority_offset_2B | Priority_offset_1B | Priority_offset_0B |

**Priority_offset_3B, bits [31:24]**

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt.

On a Warm reset, this field resets to 0.

**Priority_offset_2B, bits [23:16]**

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt.

On a Warm reset, this field resets to 0.

**Priority_offset_1B, bits [15:8]**

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt.

On a Warm reset, this field resets to 0.
Interrupt priority value from an **IMPLEMENTATION DEFINED** range, at byte offset 0. Lower priority values correspond to greater priority of the interrupt.

On a Warm reset, this field resets to 0.

For interrupt ID \( m \), when \( \text{DIV} \) and \( \text{MOD} \) are the integer division and modulo operations:

- The corresponding GICD_IPRIORITY\( \langle n \rangle \) number, \( n \), is given by \( n = m \text{ DIV} 4 \).
- The offset of the required GICD_IPRIORITY\( \langle n \rangle \) register is \( (0x400 + (4*n)) \).
- The byte offset of the required Priority field in this register is \( m \text{ MOD} 4 \), where:
  - Byte offset 0 refers to register bits [7:0].
  - Byte offset 1 refers to register bits [15:8].
  - Byte offset 2 refers to register bits [23:16].
  - Byte offset 3 refers to register bits [31:24].

### Accessing the GICD_IPRIORITY\( \langle n \rangle \)

These registers are always used when affinity routing is not enabled. When affinity routing is enabled for the Security state of an interrupt:

- GICR_IPRIORITY\( \langle n \rangle \) is used instead of GICD_IPRIORITY\( \langle n \rangle \) where \( n = 0 \) to 7 (that is, for SGIs and PPIs).
- GICD_IPRIORITY\( \langle n \rangle \) is RAZ/WI where \( n = 0 \) to 7.

These registers are byte-accessible.

A register field corresponding to an unimplemented interrupt is RAZ/WI.

A GIC might implement fewer than eight priority bits, but must implement at least bits [7:4] of each field. In each field, unimplemented bits are RAZ/WI, see 'Interrupt prioritization' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

When GICD_CTLR.DS==0:

- A register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.
- A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in 'Software accesses of interrupt priority' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

It is **IMPLEMENTATION DEFINED** whether changing the value of a priority field changes the priority of an active interrupt.

---

**Note**

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

---

**GICD_IPRIORITY\( \langle n \rangle \)** can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0400 + (4 * n)</td>
<td>GICD_IPRIORITY( \langle n \rangle )</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.
**GICD_IPRIORITYR<n>E, Holds the priority of the corresponding interrupt for each extended SPI supported by the GIC., n = 0 - 255**

The GICD_IPRIORITYR<n>E characteristics are:

**Purpose**

Holds the priority of the corresponding interrupt for each extended SPI supported by the GIC.

**Configuration**

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_IPRIORITYR<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_IPRIORITYR<n>E registers is ((GICD_TYPER.ESPI_range+1)*8). Registers are numbered from 0.

**Attributes**

GICD_IPRIORITYR<n>E is a 32-bit register.

**Field descriptions**

The GICD_IPRIORITYR<n>E bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Priority_offset_3B, bits [31:24]**

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Priority_offset_2B, bits [23:16]**

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Priority_offset_1B, bits [15:8]**

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Priority_offset_0B, bits [7:0]**

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 0. Lower priority values correspond to greater priority of the interrupt.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IPRIORITYR<n> number, n, is given by \( n = (m - 4096) \text{ DIV } 4 \).
- The offset of the required GICD_IPRIORITYR<n>E register is \( (0\times2000 + (4n)) \).
- The byte offset of the required Priority field in this register is \( m \text{ MOD } 4 \), where:
  - Byte offset 0 refers to register bits \([7:0]\).
  - Byte offset 1 refers to register bits \([15:8]\).
  - Byte offset 2 refers to register bits \([23:16]\).
  - Byte offset 3 refers to register bits \([31:24]\).

### Accessing the GICD_IPRIORITYR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD-ISACTIVER<n>E, the corresponding bit is **RES0**.

When GICD_CTLR.DS==0:

- A field that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.
- A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in Software accesses of interrupt priority.

Bits corresponding to unimplemented interrupts are RAZ/WI.

---

**Note**

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than once. The effect of the change must be visible in finite time.

---

**GICD_IPRIORITYR<n>E can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>( 0\times2000 + (4\text{ n}) )</td>
<td>GICD_IPRIORITYR&lt;n&gt;E</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.
GICD_IROUTER<n>, Interrupt Routing Registers, n = 32 - 1019

The GICD_IROUTER<n> characteristics are:

**Purpose**

When affinity routing is enabled, provides routing information for the SPI with INTID n.

**Configuration**

These registers are available in all configurations of the GIC. If the GIC implementation supports two Security states, these registers are Common.

The maximum value of n is given by \(32 \times (\text{GICD_TYPER.ITLinesNumber}+1) - 1\). GICD_IROUTER<n> registers where n=0 to 31 are reserved.

**Attributes**

GICD_IROUTER<n> is a 64-bit register.

**Field descriptions**

The GICD_IROUTER<n> bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | Aff3 | Aff1 | Aff0 | Aff1 | Aff1 | Aff1 | Aff1 | Aff1 | Aff1 | Aff1 | Aff1 | Aff1 | Aff1 | Aff1 | Aff1 | Aff1 | Aff1 | Aff1 | Aff1 | Aff1 | Aff1 | Aff1 | Aff1 | Aff1 | Aff1 |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:40]**

Reserved, RES0.

**Aff3, bits [39:32]**

Affinity level 3, the least significant affinity level field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Interrupt_Routing_Mode, bit [31]**

Interrupt Routing Mode. Defines how SPIs are routed in an affinity hierarchy:

<table>
<thead>
<tr>
<th>Interrupt_Routing_Mode</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Interrupts routed to the PE specified by a.b.c.d. In this routing, a, b, c, and d are the values of fields Aff3, Aff2, Aff1, and Aff0 respectively.</td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupts routed to any PE defined as a participating node.</td>
</tr>
</tbody>
</table>

If GICD_IROUTER<n>.IRM == 0 and the affinity path does not correspond to an implemented PE, then if the corresponding interrupt becomes pending behavior is CONSTRAINED UNPREDICTABLE:

- The interrupt is not forwarded to any PE, direct reads return the written value.
• The affinity path is treated as an unknown implemented PE, direct reads return the unknown implemented PE

• The affinity path is treated as an unknown implemented PE, direct reads return the written value

In implementations that do not require 1 of N distribution of SPIs, this bit might be RAZ/WI.

When this bit is set to 1, GICD_IROUTER<n>.{Aff3, Aff2, Aff1, Aff0} are unknown.

---

**Note**

An implementation might choose to make the Aff<n> fields RO when this field is 1.

---

On a Warm reset, this field resets to an architecturally unknown value.

**Bits [30:24]**

Reserved, RES0.

**Aff2, bits [23:16]**

Affinity level 2, an intermediate affinity level field.

On a Warm reset, this field resets to an architecturally unknown value.

**Aff1, bits [15:8]**

Affinity level 1, an intermediate affinity level field.

On a Warm reset, this field resets to an architecturally unknown value.

**Aff0, bits [7:0]**

Affinity level 0, the most significant affinity level field.

On a Warm reset, this field resets to an architecturally unknown value.

For an SPI with INTID m:

• The corresponding GICD_IROUTER<n> register number, n, is given by n = m.
• The offset of the GICD_IROUTER<n> register is 0x6000 + 8n.

---

**Accessing the GICD_IROUTER<n>**

These registers are used only when affinity routing is enabled. When affinity routing is not enabled:

• These registers are RES0. An implementation is permitted to make the register RAZ/WI in this case.
• The GICD_ITARGETSR<n> registers provide interrupt routing information.

---

**Note**

When affinity routing becomes enabled for a Security state (for example, following a reset or following a write to GICD_CTLR) the value of all writeable fields in this register is unknown for that Security state. When the group of an interrupt changes so the ARE setting for the interrupt changes to 1, the value of this register is unknown for that interrupt.

---

If GICD_CTLR.DS==0, unless the GICD_NSACR<n> registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any GICD_IROUTER<n> registers that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.
For each interrupt, a GIC implementation might support fewer than 256 values for an affinity level. In this case, some bits of the corresponding affinity level field might be RO. Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

**GICD_IROUTER<n>** can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x6000 + (8 * n)</td>
<td>GICD_IROUTER&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

Copyright © 2010-2020 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.
The GICD_IROUTER<n>E characteristics are:

### Purpose

When affinity routing is enabled, provides routing information for the corresponding SPI in the extended SPI range.

### Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_IROUTER<n>E are \texttt{RES0}.

RW fields in this register reset to architecturally \texttt{UNKNOWN} values.

When \texttt{GICD_TYPER.ESPI==0}, these registers are \texttt{RES0}.

When \texttt{GICD_TYPER.ESPI==1}, the number of implemented GICD_IROUTER<n>E registers is \(((GICD_TYPER.ESPI\_range+1)*32)-1\). Registers are numbered from 0.

### Attributes

GICD_IROUTER<n>E is a 64-bit register.

### Field descriptions

The GICD_IROUTER<n>E bit assignments are:

<table>
<thead>
<tr>
<th>Bit (Hex)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-40</td>
<td>Reserved, \texttt{RES0}.</td>
</tr>
<tr>
<td>31</td>
<td>\texttt{Aff3}</td>
</tr>
<tr>
<td>30-24</td>
<td>\texttt{RES0}</td>
</tr>
<tr>
<td>23-16</td>
<td>\texttt{Aff2}</td>
</tr>
<tr>
<td>15-8</td>
<td>\texttt{Aff1}</td>
</tr>
<tr>
<td>7-0</td>
<td>\texttt{Aff0}</td>
</tr>
</tbody>
</table>

#### Bits [63:40]

Reserved, \texttt{RES0}.

#### Aff3, bits [39:32]

Affinity level 3, the least significant affinity level field.

#### Interrupt_Routing_Mode, bit [31]

Interrupt Routing Mode. Defines how SPIs are routed in an affinity hierarchy:

<table>
<thead>
<tr>
<th>Interrupt_Routing_Mode</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Interrupts routed to the PE specified by a.b.c.d. In this routing, a, b, c, and d are the values of fields Aff3, Aff2, Aff1, and Aff0 respectively.</td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupts routed to any PE defined as a participating node.</td>
</tr>
</tbody>
</table>

If GICD_IROUTER<n>E.IRM == 0 and the affinity path does not correspond to an implemented PE, then if the corresponding interrupt becomes pending behavior is \texttt{CONSTRAINED UNPREDICTABLE}: 
• The interrupt is not forwarded to any PE, direct reads return the written value
• The affinity path is treated as an **UNKNOWN** implemented PE, direct reads return the **UNKNOWN** implemented PE
• The affinity path is treated as an **UNKNOWN** implemented PE, direct reads return the written value

In implementations that do not require 1 of N distribution of SPIs, this bit might be RAZ/WI.

When this bit is set to 1, GICD_IROUTER<n>E.{Aff3, Aff2, Aff1, Aff0} are **UNKNOWN**.

---

**Note**

An implementation might choose to make the Aff<n> fields RO when this field is 1.

---

**Bits [30:24]**

Reserved, RES0.

**Aff2, bits [23:16]**

Affinity level 2, an intermediate affinity level field.

**Aff1, bits [15:8]**

Affinity level 1, an intermediate affinity level field.

**Aff0, bits [7:0]**

Affinity level 0, the most significant affinity level field.

For an SPI with INTID m:

• The corresponding GICD_IROUTER<n>E register number, n, is given by n = m.
• The offset of the GICD_IROUTER<n>E register is 0x6000 + 8n.

---

**Accessing the GICD_IROUTER<n>E**

When affinity routing is not enabled for the Security state of an interrupt in GICD_IROUTER<n>E, the register is RES0.

When GICD_CTLR.DS==0, a register that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

**GICD_IROUTER<n>E can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x6000 + (8 * n)</td>
<td>GICD_IROUTER&lt;n&gt;E</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When GICD_CTLR.DS == 0 accesses to this register are **RW**.
• When an access is Secure accesses to this register are **RW**.
• When an access is Non-secure accesses to this register are **RW**.
The GICD_ISACTIVER\(<n>\) characteristics are:

### Purpose

Activates the corresponding interrupt. These registers are used when saving and restoring GIC state.

### Configuration

These registers are available in all GIC configurations. If \(\text{GICD_CTLR.DS} = 0\), these registers are Common.

The number of implemented GICD_ISACTIVER\(<n>\) registers is \((\text{GICD_TYPER.ITLinesNumber} + 1)\). Registers are numbered from 0.

GICD_ISACTIVER0 is Banked for each connected PE with \(\text{GICR_TYPER.Processor_Number} < 8\).

Accessing GICD_ISACTIVER0 from a PE with \(\text{GICR_TYPER.Processor_Number} > 7\) is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

### Attributes

GICD_ISACTIVER\(<n>\) is a 32-bit register.

### Field descriptions

The GICD_ISACTIVER\(<n>\) bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set_active_bit31</td>
<td>Set_active_bit30</td>
<td>Set_active_bit29</td>
<td>Set_active_bit28</td>
<td>Set_active_bit27</td>
<td>Set_active_bit26</td>
<td>Set_active_bit25</td>
</tr>
</tbody>
</table>

\[\text{Set_active_bit\(<x>\), bit } [x], \text{ for } x = 31 \text{ to } 0\]

Adds the active state to interrupt number \(32n + x\). Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Set_active_bit(&lt;x&gt;)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that the corresponding interrupt is active, or is active and pending. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

For INTID \(m\), when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISACTIVER\(<n>\) number, \(n\), is given by \(n = m \text{ DIV } 32\).
- The offset of the required GICD_ISACTIVER is \((0x300 + (4*n))\).
- The bit number of the required group modifier bit in this register is \(m \text{ MOD } 32\).
Accessing the GICD_ISACTIVER<n>

When affinity routing is enabled for the Security state of an interrupt, bits corresponding to SGIs and PPIs are RAZ/WI, and equivalent functionality for SGIs and PPIs is provided by GICR_ISACTIVER0.

Bits corresponding to unimplemented interrupts are RAZ/WI.

If GICD_CTLR.DS==0, unless the GICD_NSACR<n> registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

The bit reads as one if the status of the interrupt is active or active and pending. GICD_ISPENDR<n> and GICD_ICPENDR<n> provide the pending status of the interrupt.

GICD_ISACTIVER<n> can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0300 + (4 * n)</td>
<td>GICD_ISACTIVER&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RW.
- When an access is Secure accesses to this register are RW.
- When an access is Non-secure accesses to this register are RW.
GICD_ISACTIVER<n>E, Interrupt Set-Active Registers (extended SPI range), n = 0 - 31

The GICD_ISACTIVER<n>E characteristics are:

**Purpose**

Adds the active state to the corresponding SPI in the extended SPI range.

**Configuration**

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_ISACTIVER<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ISACTIVER<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

**Attributes**

GICD_ISACTIVER<n>E is a 32-bit register.

**Field descriptions**

The GICD_ISACTIVER<n>E bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set_active_bit31</td>
<td>Set_active_bit30</td>
<td>Set_active_bit29</td>
<td>Set_active_bit28</td>
<td>Set_active_bit27</td>
<td>Set_active_bit26</td>
<td>Set_active_bit25</td>
</tr>
</tbody>
</table>

**Set_active_bit<x>, bit [x], for x = 31 to 0**

For the extended SPIs, adds the active state to interrupt number x. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Set_active_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that the corresponding interrupt is active, or active and pending on this PE. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISACTIVER<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_ISACTIVER<n>E is (0x1A00 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

**Accessing the GICD_ISACTIVER<n>E**

When affinity routing is not enabled for the Security state of an interrupt in GICD_ISACTIVER<n>E, the corresponding bit is RES0.
When $GICD\_CTLR.DS==0$, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

**$GICD\_ISACTIVER<n>E$ can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x1A00 + (4 * n)</td>
<td>$GICD_ISACTIVER&lt;n&gt;E$</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When $GICD\_CTLR.DS == 0$ accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.
GICD_ISENABLER<n>, Interrupt Set-Enable Registers, n = 0 - 31

The GICD_ISENABLER<n> characteristics are:

**Purpose**

Enables forwarding of the corresponding interrupt to the CPU interfaces.

**Configuration**

These registers are available in all GIC configurations. If GICD_CTLR.DS==0, these registers are Common.

The number of implemented GICD_ISENABLER<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_ISENABLER0 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_ISENABLER0 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

**Attributes**

GICD_ISENABLER<n> is a 32-bit register.

**Field descriptions**

The GICD_ISENABLER<n> bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set_enable_bit31</td>
<td>Set_enable_bit30</td>
<td>Set_enable_bit29</td>
<td>Set_enable_bit28</td>
<td>Set_enable_bit27</td>
<td>Set_enable_bit26</td>
<td>Set_enable_bit25</td>
</tr>
</tbody>
</table>

**Set_enable_bit<x>, bit [x], for x = 31 to 0**

For SPIs and PPIs, controls the forwarding of interrupt number 32n + x to the CPU interfaces. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Set_enable_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 1.</td>
</tr>
</tbody>
</table>

For SGIs, the behavior of this bit is IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISENABLER<n> number, n, is given by n = m DIV 32.
- The offset of the required GICD_ISENABLER is (0x100 + (4*n)).
- The bit number of the required group modifier bit in this register is m MOD 32.
At start-up, and after a reset, a PE can use this register to discover which peripheral INTIDs the GIC supports. If \texttt{GICD\_CTLR.DS==0} in a system that supports EL3, the PE must do this for the Secure view of the available interrupts, and Non-secure software running on the PE must do this discovery after the Secure software has configured interrupts as Group 0/Secure Group 1 and Non-secure Group 1.

### Accessing the GICD\_ISENABLER\<n>\

For SGIs and PPIs:

- When ARE is 1 for the Security state of an interrupt, the field for that interrupt is \texttt{RES0} and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by \texttt{GICR\_ISENABLER0}.

Bits corresponding to unimplemented interrupts are RAZ/WI.

When \texttt{GICD\_CTLR.DS==0}, bits corresponding to Group 0 or Secure Group 1 interrupts are RAZ/WI to Non-secure accesses.

It is \texttt{IMPLEMENTATION DEFINED} whether implemented SGIs are permanently enabled, or can be enabled and disabled by writes to \texttt{GICD\_ISENABLER\<n>} and \texttt{GICD\_ICENABLER\<n>} where \(n=0\).

For SPIs and PPIs, each bit controls the forwarding of the corresponding interrupt from the Distributor to the CPU interfaces.

### GICD\_ISENABLER\<n> can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC</td>
<td>0x0100+(4*(n))</td>
<td>GICD_ISENABLER&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD\_CTRL.DS == 0 accesses to this register are \texttt{RW}.
- When an access is Secure accesses to this register are \texttt{RW}.
- When an access is Non-secure accesses to this register are \texttt{RW}.

GICD_ISENABLER<sup>n</sup>E, Interrupt Set-Enable Registers, n = 0 - 31

The GICD_ISENABLER<sup>n</sup>E characteristics are:

**Purpose**

Enables forwarding of the corresponding SPI in the extended SPI range to the CPU interfaces.

**Configuration**

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_ISENABLER<sup>n</sup>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ISENABLER<sup>n</sup>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

**Attributes**

GICD_ISENABLER<sup>n</sup>E is a 32-bit register.

**Field descriptions**

The GICD_ISENABLER<sup>n</sup>E bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set_enable_bit31</td>
<td>Set_enable_bit30</td>
<td>Set_enable_bit29</td>
<td>Set_enable_bit28</td>
<td>Set_enable_bit27</td>
<td>Set_enable_bit26</td>
<td>Set_enable_bit25</td>
</tr>
</tbody>
</table>

**Set_enable_bit<sup>x</sup>, bit [x], for x = 31 to 0**

For the extended SPI range, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Set_enable_bit&lt;sup&gt;x&lt;/sup&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISENABLER<sup>n</sup>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_ISENABLER<sup>n</sup>E is (0x1200 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.
Accessing the GICD_ISENABLER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ISENABLER<n>E, the corresponding bit is RES0.

When GICD_CTRLR.DS == 0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ISENABLER<n>E can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x1200 + (4 * n)</td>
<td>GICD_ISENABLER&lt;n&gt;E</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTRLR.DS == 0 accesses to this register are RW.
- When an access is Secure accesses to this register are RW.
- When an access is Non-secure accesses to this register are RW.
GICD_ISPENDR<n>, Interrupt Set-Pending Registers, n = 0 - 31

The GICD_ISPENDR<n> characteristics are:

**Purpose**

Adds the pending state to the corresponding interrupt.

**Configuration**

These registers are available in all GIC configurations. If GICD_CTLR.DS==0, these registers are Common.

The number of implemented GICD_ISPENDR<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_ISPENDR0 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_ISPENDR0 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

**Attributes**

GICD_ISPENDR<n> is a 32-bit register.

**Field descriptions**

The GICD_ISPENDR<n> bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set_pending_bit31</td>
<td>Set_pending_bit30</td>
<td>Set_pending_bit29</td>
<td>Set_pending_bit28</td>
<td>Set_pending_bit27</td>
<td>Set_pending_bit26</td>
</tr>
</tbody>
</table>

**Set_pending_bit<x>, bit [x], for x = 31 to 0**

For SPIs and PPIs, adds the pending state to interrupt number 32n + x. Reads and writes have the following behavior:
<table>
<thead>
<tr>
<th>Set_pending bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that the corresponding interrupt is not pending on any PE. If written, has no effect.</td>
</tr>
</tbody>
</table>
| 0b1            | If read, indicates that the corresponding interrupt is pending, or active and pending:  
  • On this PE if the interrupt is an SGI or PPI.  
  • On at least one PE if the interrupt is an SPI.  
If written, changes the state of the corresponding interrupt from inactive to pending, or from active to active and pending. This has no effect in the following cases:  
  • If the interrupt is an SGI. The pending state of an SGI can be set using GICD_SPENDSGIR<n>.  
  • If the interrupt is not inactive and is not active.  
  • If the interrupt is already pending because of a write to GICD_ISPENDR<n>.  
  • If the interrupt is already pending because the corresponding interrupt signal is asserted. In this case, the interrupt remains pending if the interrupt signal is deasserted. |

On a Warm reset, this field resets to 0.

### Accessing the GICD_ISPENDR<n>

Set-pending bits for SGIs are read-only and ignore writes. The Set-pending bits for SGIs are provided as GICD_SPENDSGIR<n>.

When affinity routing is enabled for the Security state of an interrupt:

- Bits corresponding to SGIs and PPIs are RAZ/WI, and equivalent functionality for SGIs and PPIs is provided by GICR_ISPENDR0.
- Bits corresponding to Group 0 and Group 1 Secure interrupts can only be set by Secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

If GICD_CTLR.DS==0, unless the GICD_NSACR<n> registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

**GICD_ISPENDR<n> can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0200 + (4 * n)</td>
<td>GICD_ISPENDR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RW.
- When an access is Secure accesses to this register are RW.
- When an access is Non-secure accesses to this register are RW.
**Purpose**

Adds the pending state to the corresponding SPI in the extended SPI range.

**Configuration**

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_ISPENDR<n>E are RES0.

When GICD_TYPER_ESPI==0, these registers are RES0.

When GICD_TYPER_ESPI==1, the number of implemented GICD_ISPENDR<n>E registers is (GICD_TYPER_ESPI_range+1). Registers are numbered from 0.

**Attributes**

GICD_ISPENDR<n>E is a 32-bit register.

**Field descriptions**

The GICD_ISPENDR<n>E bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Bit Assignments</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set_pending_bit31</td>
<td>31</td>
<td>If read, indicates that the corresponding interrupt is not pending. If written, has no effect.</td>
</tr>
<tr>
<td>Set_pending_bit30</td>
<td>30</td>
<td></td>
</tr>
<tr>
<td>Set_pending_bit29</td>
<td>29</td>
<td></td>
</tr>
<tr>
<td>Set_pending_bit28</td>
<td>28</td>
<td></td>
</tr>
<tr>
<td>Set_pending_bit27</td>
<td>27</td>
<td></td>
</tr>
<tr>
<td>Set_pending_bit26</td>
<td>26</td>
<td></td>
</tr>
</tbody>
</table>

For the extended SPIs, adds the pending state to interrupt number x. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Set_pending_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that the corresponding interrupt is not pending. If written, has no effect.</td>
</tr>
</tbody>
</table>
| 0b1               | If read, indicates that the corresponding interrupt is pending, or active and pending. If written, changes the state of the corresponding interrupt from inactive to pending, or from active to active and pending. This has no effect in the following cases:  
  - If the interrupt is already pending because of a write to GICD_ISPENDR<n>E.  
  - If the interrupt is already pending because the corresponding interrupt signal is asserted. In this case, the interrupt remains pending if the interrupt signal is deasserted. |

On a Warm reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISPENDR<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_ISPENDR<n>E is (0x1600 + (4*n)).
The bit number of the required group modifier bit in this register is \((m-4096) \mod 32\).

### Accessing the GICD_ISPENDR\(n\)E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ISPENDR\(n\)E, the corresponding bit is RES0.

When \texttt{GICD_CTLR.DS}==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

**GICD_ISPENDR\(n\)E can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x1600 + (4 * (n))</td>
<td>GICD_ISPENDR(n)E</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When \texttt{GICD_CTLR.DS == 0} accesses to this register are \textbf{RW}.
- When an access is Secure accesses to this register are \textbf{RW}.
- When an access is Non-secure accesses to this register are \textbf{RW}.
The GICD_ITARGETSR<\text{n}> characteristics are:

**Purpose**

When affinity routing is not enabled, holds the list of target PEs for the interrupt. That is, it holds the list of CPU interfaces to which the Distributor forwards the interrupt if it is asserted and has sufficient priority.

**Configuration**

These registers are available in all configurations of the GIC. When \text{GICD_CTRLR.DS==0}, these registers are Common.

The number of implemented GICD_ITARGETSR<n> registers is 8*(\text{GICD_TYPER.ITLinesNumber}+1). Registers are numbered from 0.

GICD_ITARGETSR0 to GICD_ITARGETSR7 are Banked for each connected PE with \text{GICR_TYPER.Processor_Number < 8}.

Accessing GICD_ITARGETSR0 to GICD_ITARGETSR7 from a PE with \text{GICR_TYPER.Processor_Number > 7} is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

**Attributes**

\text{GICD_ITARGETSR<n>} is a 32-bit register.

**Field descriptions**

The GICD_ITARGETSR<n> bit assignments are:

<table>
<thead>
<tr>
<th>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPU_targets_offset_3B</td>
</tr>
</tbody>
</table>

PEs in the system number from 0, and each bit in a PE targets field refers to the corresponding PE. For example, a value of 0x3 means that the Pending interrupt is sent to PEs 0 and 1. For GICD_ITARGETSR0-GICD_ITARGETSR7, a read of any targets field returns the number of the PE performing the read.

**CPU_targets_offset_3B**, bits [31:24]

PE targets for an interrupt, at byte offset 3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CPU_targets_offset_2B**, bits [23:16]

PE targets for an interrupt, at byte offset 2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CPU_targets_offset_1B**, bits [15:8]

PE targets for an interrupt, at byte offset 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**CPU_targets_offset_0B, bits [7:0]**

PE targets for an interrupt, at byte offset 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

The bits that are set to 1 in the PE targets field determine which PEs are targeted:

<table>
<thead>
<tr>
<th>Value of PE targets field</th>
<th>Interrupt targets</th>
</tr>
</thead>
<tbody>
<tr>
<td>0bxxxxxxx1</td>
<td>CPU interface 0</td>
</tr>
<tr>
<td>0bxxxxx1xx</td>
<td>CPU interface 1</td>
</tr>
<tr>
<td>0bxxxx1xxxx</td>
<td>CPU interface 2</td>
</tr>
<tr>
<td>0bxxxx1xxxx</td>
<td>CPU interface 3</td>
</tr>
<tr>
<td>0bx1xxxxxx</td>
<td>CPU interface 4</td>
</tr>
<tr>
<td>0bx1xxxxxx</td>
<td>CPU interface 5</td>
</tr>
<tr>
<td>0b1xxxxxxx</td>
<td>CPU interface 6</td>
</tr>
<tr>
<td>0b1xxxxxxx</td>
<td>CPU interface 7</td>
</tr>
</tbody>
</table>

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ITARGETSR<n> number, n, is given by \( n = m \text{ DIV 4} \).
- The offset of the required GICD_ITARGETSR<n> register is \((0x800 + (4*n))\).
- The byte offset of the required Priority field in this register is m MOD 4, where:
  - Byte offset 0 refers to register bits [7:0].
  - Byte offset 1 refers to register bits [15:8].
  - Byte offset 2 refers to register bits [23:16].
  - Byte offset 3 refers to register bits [31:24].

Software can write to these registers at any time. Any change to a targets field value:

- Has no effect on any active interrupt. This means that removing a CPU interface from a targets list does not cancel an active state for interrupts on that CPU interface. There is no effect on interrupts that are active and pending until the active status is cleared, at which time it is treated as a pending interrupt.
- Has an effect on any pending interrupts. This means:
  - Enables the CPU interface to be chosen as a target for the pending interrupt using an IMPLEMENTATIONDEFINED mechanism.
  - Removing a CPU interface from the target list of a pending interrupt removes the pending state of the interrupt on that CPU interface.

**Accessing the GICD_ITARGETSR<n>**

These registers are used when affinity routing is not enabled. When affinity routing is enabled for the Security state of an interrupt, the target PEs for an interrupt are defined by GICD_IROUTER<n> and the associated byte in GICD_ITARGETSR<n> is RES0. An implementation is permitted to make the byte RAZ/WI in this case.

- These registers are byte-accessible.
- A register field corresponding to an unimplemented interrupt is RAZ/WI.
- A field bit corresponding to an unimplemented CPU interface is RAZ/WI.
- GICD_ITARGETSR0-GICD_ITARGETSR7 are read-only. Each field returns a value that corresponds only to the PE reading the register.
- It is IMPLEMENTATIONDEFINED which, if any, SPIs are statically configured in hardware. The field for such an SPI is read-only, and returns a value that indicates the PE targets for the interrupt.
- If GICD_CTLR.DS==0, unless the GICD_NSACR<n> registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

In a single connected PE implementation, all interrupts target one PE, and these registers are RAZ/WI.

**Note**

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.
GICD_ITARGETSR<n> can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0800 + (4 * n)</td>
<td>GICD_ITARGETSR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.
GICD_NSACR<n>, Non-secure Access Control Registers, n = 0 - 63

The GICD_NSACR<n> characteristics are:

**Purpose**

Enables Secure software to permit Non-secure software on a particular PE to create and control Group 0 interrupts.

**Configuration**

The concept of selective enabling of Non-secure access to Group 0 and Secure Group 1 interrupts applies to SGIs and SPIs.

GICD_NSACR0 is a Banked register used for SGIs. A copy is provided for every PE that has a CPU interface and that supports this feature.

**Attributes**

GICD_NSACR<n> is a 32-bit register.

**Field descriptions**

The GICD_NSACR<n> bit assignments are:

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14
NS_access15 NS_access14 NS_access13 NS_access12 NS_access11 NS_access10 NS_access9 NS_access8 NS_access7
```

**NS_access<x>, bits [2x+1:2x], for x = 15 to 0**

Controls Non-secure access of the interrupt with ID 16n + x.

If the corresponding interrupt does not support configurable Non-secure access, the field is RAZ/WI.

Otherwise, the field is RW and determines the level of Non-secure control permitted if the interrupt is a Secure interrupt. If the interrupt is a Non-secure interrupt, this field is ignored.

The possible values of each 2-bit field are:
NS_access<x> | Meaning
---|---
0b00 | No Non-secure access is permitted to fields associated with the corresponding interrupt.
0b01 | Non-secure read and write access is permitted to setting pending bits in GICD_ISPENDR<n> associated with the corresponding interrupt. A Non-secure write access to GICD_SETSPI_NSR is permitted to set the pending state of the corresponding interrupt. A Non-secure write access to GICD_SGIR is permitted to generate a Secure SGI for the corresponding interrupt. An implementation might also provide read access to clear-pending bits in GICD_ICPENDR<n> associated with the corresponding interrupt.
0b10 | As 0b01, but adds Non-secure read and write access permission to fields associated with the corresponding interrupt in the GICD_ICPENDR<n> registers. A Non-secure write access to GICD_CLRSPI_NSR is permitted to clear the pending state of the corresponding interrupt. Also adds Non-secure read access permission to fields associated with the corresponding interrupt in the GICD_ISACTIVER<n> and GICD_ICACTIVER<n> registers.
0b11 | For GICD_NSACR0 this encoding is reserved and treated as 10. For all other GICD_NSACR<n> registers this encoding is treated as 0b10, but adds Non-secure read and write access permission to GICD_ITARGETSR<n> and GICD_IROUTER<n> fields associated with the corresponding interrupt.

On a Warm reset, this field resets to 0.

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_NSACR<n> number, n, is given by n = m DIV 16.
- The offset of the required GICD_NSACR<n> register is (0xE00 + (4*n)).

**Note**

Because each field in this register comprises two bits, GICD_NSACR0 controls access rights to SGI registers, GICD_NSACR1 controls access to PPI registers (and is always RAZ/WI), and all other GICD_NSACR<n> registers control access to SPI registers.

For compatibility with GICv2, writes to GICD_NSACR0 for a particular PE must be coordinated within the Distributor and must update GICR_NSACR for the Redistributor associated with that PE.

### Accessing the GICD_NSACR<n>

These registers are always used when affinity routing is not enabled. When affinity routing is enabled for the Secure state, GICD_NSACR0 is RES0 and GICR_NSACR provides equivalent functionality for SGIs.

These registers do not support PPIs, therefore GICD_NSACR1 is RAZ/WI.

**GICD_NSACR<n> can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x00E00 + (4 * n)</td>
<td>GICD_NSACR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 1 accesses to this register are RAZ/WI.
- When an access is Secure accesses to this register are RW.
- When an access is Non-secure accesses to this register are RAZ/WI.
The GICD_NSACR<n>E characteristics are:

**Purpose**

Enables Secure software to permit Non-secure software on a particular PE to create and control Group 0 interrupts.

**Configuration**

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_NSACR<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ICFGR<n>E registers is ((GICD_TYPER.ESPI_range+1)*2). Registers are numbered from 0.

**Attributes**

GICD_NSACR<n>E is a 32-bit register.

**Field descriptions**

The GICD_NSACR<n>E bit assignments are:

```
 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14
NS_access15 NS_access14 NS_access13 NS_access12 NS_access11 NS_access10 NS_access9 NS_access8 NS_access7
```

**NS_access<x>>, bits [2x+1:2x], for x = 15 to 0**

Controls Non-secure access of the interrupt with ID 16n + x.

If the corresponding interrupt does not support configurable Non-secure access, the field is RAZ/WI.

Otherwise, the field is RW and determines the level of Non-secure control permitted if the interrupt is a Secure interrupt. If the interrupt is a Non-secure interrupt, this field is ignored.

The possible values of each 2-bit field are:
<table>
<thead>
<tr>
<th>NS_access&lt;0x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>No Non-secure access is permitted to fields associated with the corresponding interrupt.</td>
</tr>
<tr>
<td>0b01</td>
<td>Non-secure read and write access is permitted to set-pending bits in GICD_ISPENDR&lt;n&gt;E associated with the corresponding interrupt. A Non-secure write access to GICD_SETSPI_NSR is permitted to set the pending state of the corresponding interrupt.</td>
</tr>
<tr>
<td>0b10</td>
<td>As 0b01, but adds Non-secure read and write access permission to fields associated with the corresponding interrupt in the GICD_ICPENDR&lt;n&gt;E registers. A Non-secure write access to GICD_CLRSPN_NSR is permitted to clear the pending state of the corresponding interrupt. Also adds Non-secure read access permission to fields associated with the corresponding interrupt in the GICD_ISACTIVER&lt;n&gt;E and GICD_ICACTIVER&lt;n&gt;E registers.</td>
</tr>
<tr>
<td>0b11</td>
<td>This encoding is treated as 0b10, but adds Non-secure read and write access permission to GICD_IROUTER&lt;n&gt;E fields associated with the corresponding interrupt.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_NSACR<n>E number, n, is given by \( n = (m - 4096) \text{ DIV } 16 \).
- The offset of the required GICD_NSACR<n>E register is \( \text{0x3600 + (4*n)} \).

### Accessing the GICD_NSACR<n>E

GICD_NSACR<n>E can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x3600 + (4*n)</td>
<td>GICD_NSACR&lt;n&gt;E</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 1 accesses to this register are RAZ/WI.
- When an access is Secure accesses to this register are RW.
- When an access is Non-secure accesses to this register are RAZ/WI.
The GICD_SETSPI_NSR characteristics are:

**Purpose**

Adds the pending state to a valid SPI if permitted by the Security state of the access and the GICD_NSACR<n> value for that SPI.

A write to this register changes the state of an inactive SPI to pending, and the state of an active SPI to active and pending.

**Configuration**

If GICD_TYPER.MBIS == 0, this register is reserved.

When GICD_CTLR.DS==1, this register provides functionality for all SPIs.

**Attributes**

GICD_SETSPI_NSR is a 32-bit register.

**Field descriptions**

The GICD_SETSPI_NSR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | INTID |

**Bits [31:13]**

Reserved, RES0.

**INTID, bits [12:0]**

The INTID of the SPI.

The function of this register depends on whether the targeted SPI is configured to be an edge-triggered or level-sensitive interrupt:

- For an edge-triggered interrupt, a write to GICD_SETSPI_NSR or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will stop being pending on activation, or if the pending state is removed by a write to GICD_CLRSPISR_NSR, GICD_CLRSPISR_SR, or GICD_ICPENDR<n>.
- For a level-sensitive interrupt, a write to GICD_SETSPI_NSR or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will remain pending until it is deasserted by a write to GICD_CLRSPISR_NSR or GICD_CLRSPISR_SR. If the interrupt is activated between having the pending state added and being deactivated, then the interrupt will be active and pending.

**Accessing the GICD_SETSPI_NSR**

Writes to this register have no effect if:

- The value written specifies a Secure SPI, the value is written by a Non-secure access, and the value of the corresponding GICD_NSACR<n> register is 0.
- The value written specifies an invalid SPI.
- The SPI is already pending.
16-bit accesses to bits [15:0] of this register must be supported.

Note

A Secure access to this register can set the pending state of any valid SPI.

**GICD_SETSPI_NS R can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0040</td>
<td>GICD_SETSPI_NS R</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GIC_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.
GICD_SETSPI_SR, Set Secure SPI Pending Register

The GICD_SETSPI_SR characteristics are:

Purpose

Adds the pending state to a valid SPI.

A write to this register changes the state of an inactive SPI to pending, and the state of an active SPI to active and pending.

Configuration

If GICD_TYPER.MBIS == 0, this register is reserved.

When GICD_CTLR.DS==1, this register is WI.

Attributes

GICD_SETSPI_SR is a 32-bit register.

Field descriptions

The GICD_SETSPI_SR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | INTID |

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

The INTID of the SPI.

The function of this register depends on whether the targeted SPI is configured to be an edge-triggered or level-sensitive interrupt:

- For an edge-triggered interrupt, a write to GICD_SETSPI_NSR or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will stop being pending on activation, or if the pending state is removed by a write to GICD_CLRSPI_NSR, GICD_CLRSPI_SR, or GICD_ICPNDR<n>.
- For a level-sensitive interrupt, a write to GICD_SETSPI_NSR or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will remain pending until it is deasserted by a write to GICD_CLRPI_NSR or GICD_CLRPI_SR. If the interrupt is activated between having the pending state added and being deasserted, then the interrupt will be active and pending.

Accessing the GICD_SETSPI_SR

Writes to this register have no effect if:

- The value is written by a Non-secure access.
- The value written specifies an invalid SPI.
- The SPI is already pending.

16-bit accesses to bits [15:0] of this register must be supported.
GICD_SETSPI_SR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0050</td>
<td>GICD_SETSPI_SR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WI**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WI**.
GICD_SGIR, Software Generated Interrupt Register

The GICD_SGIR characteristics are:

**Purpose**

Controls the generation of SGIs.

**Configuration**

This register is available in all configurations of the GIC. If the GIC supports two Security states this register is Common.

**Attributes**

GICD_SGIR is a 32-bit register.

**Field descriptions**

The GICD_SGIR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | TargetListFilter | CPUTargetList | NSATT | RES0 | INTID |

**Bits [31:26]**

Reserved, RES0.

**TargetListFilter, bits [25:24]**

Determines how the Distributor processes the requested SGI.

<table>
<thead>
<tr>
<th>TargetListFilter</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Forward the interrupt to the CPU interfaces specified by GICD_SGIR.CPUTargetList.</td>
</tr>
<tr>
<td>0b01</td>
<td>Forward the interrupt to all CPU interfaces except that of the PE that requested the interrupt.</td>
</tr>
<tr>
<td>0b10</td>
<td>Forward the interrupt only to the CPU interface of the PE that requested the interrupt.</td>
</tr>
<tr>
<td>0b11</td>
<td>Reserved.</td>
</tr>
</tbody>
</table>

**CPUTargetList, bits [23:16]**

When GICD_SGIR.TargetListFilter is 0b00, this field defines the CPU interfaces to which the Distributor must forward the interrupt.

Each bit of the field refers to the corresponding CPU interface. For example, CPUTargetList[0] corresponds to interface 0. Setting a bit to 1 indicates that the interrupt must be forwarded to the corresponding interface.

If this field is 0b00000000 when GICD_SGIR.TargetListFilter is 0b00, the Distributor does not forward the interrupt to any CPU interface.

**NSATT, bit [15]**

Specifies the required group of the SGI.
### NSATT

<table>
<thead>
<tr>
<th>NSATT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Forward the SGI specified in the INTID field to a specified CPU interface only if the SGI is configured as Group 0 on that interface.</td>
</tr>
<tr>
<td>0b1</td>
<td>Forward the SGI specified in the INTID field to a specified CPU interface only if the SGI is configured as Group 1 on that interface.</td>
</tr>
</tbody>
</table>

This field is writable only by a Secure access. Non-secure accesses can also generate Group 0 interrupts, if allowed to do so by GICD_NSACR0. Otherwise, Non-secure writes to GICD_SGIR generate an SGI only if the specified SGI is programmed as Group 1, regardless of the value of bit [15] of the write.

#### Bits [14:4]

Reserved, RES0.

#### INTID, bits [3:0]

The INTID of the SGI to forward to the specified CPU interfaces.

### Accessing the GICD_SGIR

This register is used only when affinity routing is not enabled. When affinity routing is enabled, this register is RES0.

It is **IMPLEMENTATION DEFINED** whether this register has any effect when the forwarding of interrupts by the Distributor is disabled by GICD_CTLR.

**GICD_SGIR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0F00</td>
<td>GICD_SGIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.
The GICD_SPENDSGIR\(n\) characteristics are:

### Purpose

Add the pending state to an SGI.

A write to this register changes the state of an inactive SGI to pending, and the state of an active SGI to active and pending.

### Configuration

Four SGI set-pending registers are implemented. Each register contains eight set-pending bits for each of four SGIs, for a total of 16 possible SGIs.

In multiprocessor implementations, each PE has a copy of these registers.

### Attributes

GICD_SPENDSGIR\(n\) is a 32-bit register.

### Field descriptions

The GICD_SPENDSGIR\(n\) bit assignments are:

<table>
<thead>
<tr>
<th></th>
<th>SGI_set_pending_bits3</th>
<th>SGI_set_pending_bits2</th>
<th>SGI_set_pending_bits1</th>
<th>SGI_set_pending_bits0</th>

</tbody>
</table>

SGI_set_pending_bits\(x\), bits \([8x+7:8x]\), for \(x = 3\) to \(0\)

Add the pending state to SGI number \(4n + x\) for the PE corresponding to the bit number written to.

Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>SGI_set_pending_bits(x)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x00</td>
<td>If read, indicates that the SGI from the corresponding PE is not pending and is not active and pending. If written, has no effect.</td>
</tr>
<tr>
<td>0x01</td>
<td>If read, indicates that the SGI from the corresponding PE is pending or is active and pending. If written, adds the pending state to the SGI for the corresponding PE.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

For SGI ID \(m\), generated by processing element C writing to the corresponding GICD_SGIR field, where DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_SPENDSGIR\(n\) number is given by \(n = m \text{ DIV} 4\).
- The offset of the required register is \((0xF20 + (4n))\).
- The offset of the required field within the register GICD_SPENDSGIR\(n\) is given by \(m \text{ MOD} 4\).
- The required bit in the 8-bit SGI set-pending field \(m\) is bit C.
Accessing the GICD_SPENDSGIR<n>

These registers are used only when affinity routing is not enabled. When affinity routing is enabled for the Security state of an interrupt then the bit associated with SGI in that Security state is RES0. An implementation is permitted to make the register RAZ/WI in this case.

A register bit that corresponds to an unimplemented SGI is RAZ/WI.

These registers are byte-accessible.

If the GIC implementation supports two Security states:

- A register bit that corresponds to a Group 0 interrupt is RAZ/WI to Non-secure accesses.
- Register bits corresponding to unimplemented PEs are RAZ/WI.

GICD_SPENDSGIR<n> can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0F20 + (4 * n)</td>
<td>GICD_SPENDSGIR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RW.
- When an access is Secure accesses to this register are RW.
- When an access is Non-secure accesses to this register are RW.
GICD_STATUSR, Error Reporting Status Register

The GICD_STATUSR characteristics are:

Purpose

Provides software with a mechanism to detect:

- Accesses to reserved locations.
- Writes to read-only locations.
- Reads of write-only locations.

Configuration

If the GIC implementation supports two Security states this register is Banked to provide Secure and Non-secure copies.

Attributes

GICD_STATUSR is a 32-bit register.

Field descriptions

The GICD_STATUSR bit assignments are:

Bits [31:4]

Reserved, RES0.

WROD, bit [3]

Write to an RO location.

<table>
<thead>
<tr>
<th>WROD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A write to an RO location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.

RWOD, bit [2]

Read of a WO location.

<table>
<thead>
<tr>
<th>RWOD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A read of a WO location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.

WRD, bit [1]

Write to a reserved location.
When a violation is detected, software must write 1 to this register to reset it.

**RRD, bit [0]**

Read of a reserved location.

<table>
<thead>
<tr>
<th>WRD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A read of a reserved location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.

**Accessing the GICD_STATUSR**

This is an optional register. If the register is not implemented, the location is RAZ/WI.

**GICD_STATUSR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0010</td>
<td>GICD_STATUSR (S)</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0010</td>
<td>GICD_STATUSR (NS)</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.
GICD_TYPER, Interrupt Controller Type Register

The GICD_TYPER characteristics are:

**Purpose**

Provides information about what features the GIC implementation supports. It indicates:

- Whether the GIC implementation supports two Security states.
- The maximum number of INTIDs that the GIC implementation supports.
- The number of PEs that can be used as interrupt targets.

**Configuration**

This register is available in all configurations of the GIC. When $\text{GICD_CTLR.DS}=0$, this register is Common.

**Attributes**

GICD_TYPER is a 32-bit register.

**Field descriptions**

The GICD_TYPER bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**ESPI_range, bits [31:27]**

*When GICD_TYPER.ESPI == 1:*

Indicates the maximum INTID in the Extended SPI range.

Maximum Extended SPI INTID is $(32 \times (\text{ESPI\_range} + 1) + 4095)$

*Otherwise:*

Reserved, RES0.

**RSS, bit [26]**

Range Selector Support.

<table>
<thead>
<tr>
<th>RSS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The IRI supports targeted SGIs with affinity level 0 values of 0 - 15.</td>
</tr>
<tr>
<td>0b1</td>
<td>The IRI supports targeted SGIs with affinity level 0 values of 0 - 255.</td>
</tr>
</tbody>
</table>

**No1N, bit [25]**

Indicates whether 1 of N SPI interrupts are supported.

<table>
<thead>
<tr>
<th>No1N</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>1 of N SPI interrupts are supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>1 of N SPI interrupts are not supported.</td>
</tr>
</tbody>
</table>
A3V, bit [24]

Affinity 3 valid. Indicates whether the Distributor supports nonzero values of Affinity level 3.

<table>
<thead>
<tr>
<th>A3V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Distributor only supports zero values of Affinity level 3.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Distributor supports nonzero values of Affinity level 3.</td>
</tr>
</tbody>
</table>

IDbits, bits [23:19]

The number of interrupt identifier bits supported, minus one.

DVIS, bit [18]

When FEAT_GICv4 is implemented:

Indicates whether the implementation supports Direct Virtual LPI injection.

<table>
<thead>
<tr>
<th>DVIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The implementation does not support Direct Virtual LPI injection.</td>
</tr>
<tr>
<td>0b1</td>
<td>The implementation supports Direct Virtual LPI injection.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

LPIS, bit [17]

Indicates whether the implementation supports LPIs.

<table>
<thead>
<tr>
<th>LPIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The implementation does not support LPIs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The implementation supports LPIs.</td>
</tr>
</tbody>
</table>

MBIS, bit [16]

Indicates whether the implementation supports message-based interrupts by writing to Distributor registers.

<table>
<thead>
<tr>
<th>MBIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The implementation does not support message-based interrupts by writing to Distributor registers. The GICD_CLRSPI_NSR, GICD_SETSPI_NSR, GICD_CLRSPI_SR, and GICD_SETSPI_SR registers are reserved.</td>
</tr>
<tr>
<td>0b1</td>
<td>The implementation supports message-based interrupts by writing to the GICD_CLRSPI_NSR, GICD_SETSPI_NSR, GICD_CLRSPI_SR, or GICD_SETSPI_SR registers.</td>
</tr>
</tbody>
</table>

num_LPIs, bits [15:11]

Number of supported LPIs.

- 0b000000 Number of LPIs as indicated by GICD_TYPER.IDbits.
- All other values Number of LPIs supported is $2^{(\text{num}_\text{LPIs}+1)}$.
  - Available LPI INTIDs are $8192..(8192 + 2^{(\text{num}_\text{LPIs}+1)} - 1)$.
  - This field cannot indicate a maximum LPI INTID greater than that indicated by GICD_TYPER.IDbits.

When the supported INTID width is less than 14 bits, this field is RES0 and no LPIs are supported.
SecurityExtn, bit [10]

Indicates whether the GIC implementation supports two Security states:

When `GICD_CTLR.DS == 1`, this field is RAZ.

<table>
<thead>
<tr>
<th>SecurityExtn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The GIC implementation supports only a single Security state.</td>
</tr>
<tr>
<td>0b1</td>
<td>The GIC implementation supports two Security states.</td>
</tr>
</tbody>
</table>

Bit [9]

Reserved, RES0.

ESPI, bit [8]

Extended SPI

<table>
<thead>
<tr>
<th>ESPI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Extended SPI range not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Extended SPI range implemented.</td>
</tr>
</tbody>
</table>

CPUNumber, bits [7:5]

Reports the number of PEs that can be used when affinity routing is not enabled, minus 1.

These PEs must be numbered contiguously from zero, but the relationship between this number and the affinity hierarchy from MPIDR is IMPLEMENTATION DEFINED. If the implementation does not support ARE being zero, this field is 000.

ITLinesNumber, bits [4:0]

For the INTID range 32 to 1019, indicates the maximum SPI supported.

If the value of this field is N, the maximum SPI INTID is 32(N+1) minus 1. For example, 00011 specifies that the maximum SPI INTID in is 127.

Regardless of the range of INTIDs defined by this field, interrupt IDs 1020-1023 are reserved for special purposes.

A value of 0 indicates no SPIs are support.

The ITLinesNumber field only indicates the maximum number of SPIs that the GIC implementation might support. This value determines the number of instances of the following interrupt registers:

- `GICD_IGROUPR<n>`.
- `GICD_ISENABLER<n>`.
- `GICD_ICENABLER<n>`.
- `GICD_ISPENDR<n>`.
- `GICD_ICPENDR<n>`.
- `GICD_ICACTIVER<n>`.
- `GICD_ICFGR<n>`.
- `GICD_ITARGETSR<n>`.

The GIC architecture does not require a GIC implementation to support a continuous range of SPI interrupt IDs. Software must check which SPI INTIDs are supported, up to the maximum value indicated by `GICD_TYPER.ITLinesNumber`. 
Accessing the GICD_TYPER

GICD_TYPER can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0004</td>
<td>GICD_TYPER</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.
The GICD_TYPER2 characteristics are:

**Purpose**

Provides information about which features the GIC implementation supports.

**Configuration**

This register is present only when FEAT_GICv4p1 is implemented. Otherwise, direct accesses to GICD_TYPER2 are RES0.

When GICD_CTLR.DS == 0, this register is Common.

**Attributes**

GICD_TYPER2 is a 32-bit register.

**Field descriptions**

The GICD_TYPER2 bit assignments are:

<table>
<thead>
<tr>
<th></th>
<th>RES0</th>
<th>nASSGICap</th>
<th>VIL</th>
<th>RES0</th>
<th>VID</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>30</td>
<td>29</td>
<td>28</td>
<td>27</td>
<td>26</td>
</tr>
<tr>
<td></td>
<td>25</td>
<td>24</td>

<td>22</td>
<td>21</td>
</tr>
<tr>
<td></td>
<td>20</td>
<td>19</td>
<td>18</td>
<td>17</td>
<td>16</td>
</tr>
<tr>
<td></td>
<td>15</td>
<td>14</td>
<td>13</td>
<td>12</td>
<td>11</td>
</tr>
<tr>
<td></td>
<td>10</td>
<td>9</td>
<td>8</td>
<td>7</td>
<td>6</td>
</tr>
<tr>
<td></td>
<td>5</td>
<td>4</td>
<td>3</td>
<td>2</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>0</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:9]**

Reserved, RES0.

**nASSGICap, bit [8]**

Indicates whether SGIs can be configured to not have an active state.

<table>
<thead>
<tr>
<th>nASSGICap</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>SGIs have an active state.</td>
</tr>
<tr>
<td>0b1</td>
<td>SGIs can be globally configured not to have an active state.</td>
</tr>
</tbody>
</table>

This bit is RES0 on implementations that support two Security states.

**VIL, bit [7]**

Indicates whether 16 bits of vPEID are implemented.

<table>
<thead>
<tr>
<th>VIL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>GIC supports 16-bit vPEID.</td>
</tr>
<tr>
<td>0b1</td>
<td>GIC supports GICD_TYPER2.VID + 1 bits of vPEID.</td>
</tr>
</tbody>
</table>

**Bits [6:5]**

Reserved, RES0.

**VID, bits [4:0]**

When GICD_TYPER2.VIL == 1, the number of bits is equal to the bits of vPEID minus one.
When GICD_TYPER2.VIL == 0, this field is RES0.

**Accessing the GICD_TYPER2**

**GICD_TYPER2 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x000C</td>
<td>GICD_TYPER2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.
The GICH_APR<n> characteristics are:

**Purpose**

These registers track which preemption levels are active in the virtual CPU interface, and indicate the current active priority. Corresponding bits are set to 1 in this register when an interrupt is acknowledged, based on GICH_LR<n>.Priority, and the least significant bit set is cleared on EOI.

**Configuration**

This register is available when the GIC implementation supports interrupt virtualization.

The number of registers required depends on how many bits are implemented in GICH_LR<n>.Priority:

- When 5 priority bits are implemented, 1 register is required (GICH_APR0).
- When 6 priority bits are implemented, 2 registers are required (GICH_APR0, GICH_APR1).
- When 7 priority bits are implemented, 4 registers are required (GICH_APR0, GICH_APR1, GICH_APR2, GICH_APR3).

Unimplemented registers are RAZ/WI.

**Attributes**

GICH_APR<n> is a 32-bit register.

**Field descriptions**

The GICH_APR<n> bit assignments are:

<table>
<thead>
<tr>
<th>P&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>There is no interrupt active at the priority corresponding to that bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>There is an interrupt active at the priority corresponding to that bit.</td>
</tr>
</tbody>
</table>

The correspondence between priorities and bits depends on the number of bits of priority that are implemented.

If 5 bits of priority are implemented (bits [7:3] of priority), then there are 32 priority groups, and the active state of these priorities are held in GICH_APR0 in the bits corresponding to Priority[7:3].

If 6 bits of priority are implemented (bits [7:2] of priority), then there are 64 priority groups, and:

- The active state of priorities 0 - 124 are held in GICH_APR0 in the bits corresponding to 0:Priority[6:2].
- The active state of priorities 128 - 252 are held in GICH_APR1 in the bits corresponding to 1:Priority[6:2].

If 7 bits of priority are implemented (bits [7:1] of priority), then there are 128 priority groups, and:

- The active state of priorities 0 - 62 are held in GICH_APR0 in the bits corresponding to 00:Priority[5:1].
- The active state of priorities 64 - 126 are held in GICH_APR1 in the bits corresponding to 01:Priority[5:1].
- The active state of priorities 128 - 190 are held in GICH_APR2 in the bits corresponding to 10:Priority[5:1].
- The active state of priorities 192 - 254 are held in GICH_APR3 in the bits corresponding to 11:Priority[5:1].
On a Warm reset, this field resets to 0.

**Accessing the GICH_APR<n>**

These registers are used only when System register access is not enabled. When System register access is enabled the following registers provide equivalent functionality:

- **In AArch64:**
  - For Group 0, **ICH_AP0R<n>_EL2**.
  - For Group 1, **ICH_AP1R<n>_EL2**.

- **In AArch32:**
  - For Group 0, **ICH_AP0R<n>**.
  - For Group 1, **ICH_AP1R<n>**.

**GICH_APR<n>** can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual interface control</td>
<td>0x00F0 + (4 * n)</td>
<td>GICH_APR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.
GICH_EISR, End Interrupt Status Register

The GICH_EISR characteristics are:

**Purpose**

Indicates which List registers have outstanding EOI maintenance interrupts.

**Configuration**

This register is available when the GIC implementation supports interrupt virtualization.

**Attributes**

GICH_EISR is a 32-bit register.

**Field descriptions**

The GICH_EISR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-16</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>15-0</td>
<td>Status&lt;n&gt;, bit [n], for n = 15 to 0</td>
</tr>
</tbody>
</table>

EOI maintenance interrupt status for List register <n>:

<table>
<thead>
<tr>
<th>Status&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>GICH_LR&lt;n&gt; does not have an EOI maintenance interrupt.</td>
</tr>
<tr>
<td>0b1</td>
<td>GICH_LR&lt;n&gt; has an EOI maintenance interrupt that has not been handled.</td>
</tr>
</tbody>
</table>

For any GICH_LR<n> register, the corresponding status bit is set to 1 if all of the following are true:

- GICH_LR<n>.State is 0b00.
- GICH_LR<n>.HW == 0.
- GICH_LR<n>.EOI == 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the GICH_EISR**

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICH_EISR provides equivalent functionality.
- For AArch64 implementations, ICH_EISR_EL2 provides equivalent functionality.

Bits corresponding to unimplemented List registers are RAZ.

GICH_EISR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual interface control</td>
<td>0x0020</td>
<td>GICH_EISR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RO.
- When an access is Secure accesses to this register are RO.
- When an access is Non-secure accesses to this register are RO.
The GICH_ELRSR characteristics are:

**Purpose**

Indicates which List registers contain valid interrupts.

**Configuration**

This register is available when the GIC implementation supports interrupt virtualization.

**Attributes**

GICH_ELRSR is a 32-bit register.

**Field descriptions**

The GICH_ELRSR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | Status15 | Status14 | Status13 | Status12 | Status11 | Status10 | Status9 | Status8 | Status7 | Status6 | Status5 | Status4 | Status3 | Status2 | Status1 | Status0 |

**Bits [31:16]**

Reserved, RES0.

**Status<n>, bit [n], for n = 15 to 0**

Status bit for List register <n>:

<table>
<thead>
<tr>
<th>Status&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>GICH_LR&lt;n&gt;, if implemented, contains a valid interrupt. Using this List register can result in overwriting a valid interrupt.</td>
</tr>
<tr>
<td>0b1</td>
<td>GICH_LR&lt;n&gt; does not contain a valid interrupt. The List register is empty and can be used without overwriting a valid interrupt or losing an EOI maintenance interrupt.</td>
</tr>
</tbody>
</table>

For any GICH_LR<n> register, the corresponding status bit is set to 1 if GICH_LR<n>.State is 0b00 and either:

- GICH_LR<n>.HW == 1.
- GICH_LR<n>.EOI == 0.

On a Warm reset, this field resets to 1.

**Accessing the GICH_ELRSR**

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICH_ELRSR provides equivalent functionality.
- For AArch64 implementations, ICH_ELRSR_EL2 provides equivalent functionality.

Bits corresponding to unimplemented List registers are RES0.
GICH_ELRSR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual interface control</td>
<td>0x0030</td>
<td>GICH_ELRSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.
GICH_HCR, Hypervisor Control Register

The GICH_HCR characteristics are:

**Purpose**

Controls the virtual CPU interface.

**Configuration**

This register is available when the GIC implementation supports interrupt virtualization.

**Attributes**

GICH_HCR is a 32-bit register.

**Field descriptions**

The GICH_HCR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>EOICount</td>
<td>Counts the number of EOIs received that do not have a corresponding entry in the List registers. The virtual CPU interface increments this field automatically when a matching EOI is received. EOIs that do not clear a bit in GICH_APR&lt;n&gt; do not cause an increment. If an EOI occurs when the value of this field is 31, then the field wraps to 0. The maintenance interrupt is asserted whenever this field is nonzero and GICH_HCR.LRENPIE == 1. On a Warm reset, this field resets to an architecturally UNKNOWN value.</td>
</tr>
<tr>
<td>6</td>
<td>VGrp1DIE</td>
<td>VM Group 1 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected virtual machine is disabled:</td>
</tr>
<tr>
<td>5</td>
<td>VGrp1EIE</td>
<td>VM Group 1 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected virtual machine is enabled:</td>
</tr>
<tr>

<td>VM Group 0 Disabled Interrupt Enable.</td>
</tr>
<tr>
<td>3</td>
<td>VGrp0EIE</td>
<td>VM Group 0 Enabled Interrupt Enable.</td>
</tr>
<tr>
<td>2</td>
<td>NPIE</td>
<td>No Pass Interrupt Enable.</td>
</tr>
<tr>
<td>1</td>
<td>LRENPIE</td>
<td>Local Resources Enabled Pass Interrupt Enable.</td>
</tr>
<tr>
<td>0</td>
<td>En</td>
<td>Enable.</td>
</tr>
</tbody>
</table>

Reserved, RES0.
### VGrp1EIE, bit [0]

**Meaning**
- **0b0**: Maintenance interrupt disabled.
- **0b1**: Maintenance interrupt signaled when GICV_CTLR.EnableGrp1 == 1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### VGrp0DIE, bit [5]

**Meaning**
- **0b0**: Maintenance interrupt disabled.
- **0b1**: Maintenance interrupt signaled when GICV_CTLR.EnableGrp0 == 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### VGrp0EIE, bit [4]

**Meaning**
- **0b0**: Maintenance interrupt disabled.
- **0b1**: Maintenance interrupt signaled when GICV_CTLR.EnableGrp0 == 1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### NPIE, bit [3]

**Meaning**
- **0b0**: Maintenance interrupt disabled.
- **0b1**: Maintenance interrupt signaled while the List registers contain no interrupts in the pending state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### LRENPIE, bit [2]

**Meaning**
- **0b0**: Maintenance interrupt disabled.
- **0b1**: Maintenance interrupt signaled while GICH_HCR.EOICount is not 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### UIE, bit [1]

**Meaning**
- **0b0**: Maintenance interrupt disabled.
- **0b1**: Underflow Interrupt Enable.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**GICH_HCR, Hypervisor Control Register**

[Page 3744]
Enables the signaling of a maintenance interrupt when the List registers are either empty or hold only one valid entry.

<table>
<thead>
<tr>
<th>UIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>

<tr>
<td>0b1</td>
<td>A maintenance interrupt is signaled if zero or one of the List register entries are marked as a valid interrupt.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**En, bit [0]**

Enable.

Global enable bit for the virtual CPU interface.

<table>
<thead>
<tr>
<th>En</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Virtual CPU interface operation is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Virtual CPU interface operation is enabled.</td>
</tr>
</tbody>
</table>

When this field is 0:

- The virtual CPU interface does not signal any maintenance interrupts.
- The virtual CPU interface does not signal any virtual interrupts.
- A read of `GICV_IAR` or `GICV_AIAR` returns a spurious interrupt ID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The VGrp1DIE, VGrp1EIE, VGrp0DIE, and VGrp0EIE fields permit the hypervisor to track the virtual CPU interfaces that are enabled. The hypervisor can then route interrupts that have multiple targets correctly and efficiently, without having to read the virtual CPU interface status.

See 'Maintenance interrupts' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069) and GIC_MISR for more information.

**Accessing the GICH_HCR**

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, `ICH_HCR` provides equivalent functionality.
- For AArch64 implementations, `ICH_HCR_EL2` provides equivalent functionality.

GICH_HCR.En must be set to 1 for any virtual or maintenance interrupt to be asserted.

**GICH_HCR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual interface control</td>
<td>0x0000</td>
<td>GICH_HCR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RW.
- When an access is Secure accesses to this register are RW.
- When an access is Non-secure accesses to this register are RW.
The GICH_LR<n> characteristics are:

**Purpose**

These registers provide context information for the virtual CPU interface.

**Configuration**

This register is available when the GIC implementation supports interrupt virtualization.

A maximum of 16 List registers can be provided. GICH_VTR.ListRegs defines the number implemented. Unimplemented List registers are RAZ/WI.

**Attributes**

GICH_LR<n> is a 32-bit register.

**Field descriptions**

The GICH_LR<n> bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>HW</th>
<th>State</th>
<th>Priority</th>
<th>RES0</th>
<th>pINTID</th>
<th>vINTID</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>30 – 29</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>28 – 24</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>23 – 16</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>15 – 11</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>10 – 0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**HW, bit [31]**

Indicates whether this virtual interrupt is a hardware interrupt, meaning that it corresponds to a physical interrupt. Deactivation of the virtual interrupt also causes the deactivation of the physical interrupt corresponding to the INTID:

<table>
<thead>
<tr>
<th>HW Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This interrupt is triggered entirely in software. No notification is sent to the Distributor when the virtual interrupt is deactivated.</td>
</tr>
<tr>
<td>0b1</td>
<td>A hardware interrupt. A deactivate interrupt request is sent to the Distributor when the virtual interrupt is deactivated, using GICH_LR&lt;n&gt;.pINTID to indicate the physical interrupt identifier. If GICV_CTLR.EOImode == 0, this request corresponds to a write to GICV_EOIR or GICV_AEOIR, otherwise it corresponds to a write to GICV_DIR.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Group, bit [30]**

Indicates whether the interrupt is Group 0 or Group 1:

<table>
<thead>
<tr>
<th>Group Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 0 virtual interrupt. GICV_CTLR.FIQEn determines whether it is signaled as a virtual IRQ or as a virtual FIQ, and GICV_CTLR.EnableGrp0 enables signaling of this interrupt to the virtual machine.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 1 virtual interrupt, signaled as a virtual IRQ. GICV_CTLR.EnableGrp1 enables signaling of this interrupt to the virtual machine.</td>
</tr>
</tbody>
</table>

**Note**
GICV_CTLR. CBPR controls whether GICV_BPR or GICV_ABPR determines if a pending Group 1 interrupt has sufficient priority to preempt current execution.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

State, bits [29:28]

The state of the interrupt. This field has one of the following values:

<table>
<thead>
<tr>
<th>State</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Inactive</td>
</tr>
<tr>
<td>0b01</td>
<td>Pending</td>
</tr>
<tr>
<td>0b10</td>
<td>Active</td>
</tr>
<tr>
<td>0b11</td>
<td>Active and pending</td>
</tr>
</tbody>
</table>

The GIC updates these state bits as virtual interrupts proceed through the interrupt life cycle. Entries in the inactive state are ignored, except for the purpose of generating virtual maintenance interrupts.

Note

For hardware interrupts, the active and pending state is held in the Distributor rather than the virtual CPU interface. A hypervisor must only use the active and pending state for software originated interrupts, which are typically associated with virtual devices, or for SGIs.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Priority, bits [27:23]

The priority of this interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [22:20]

Reserved, RES0.

pINTID, bits [19:10]

The function of this field depends on the value of GICH_LR<n>.HW.

When GICH_LR<n>.HW == 0:

- Bit [19] indicates whether the interrupt triggers an EOI maintenance interrupt. If this bit is 1, then when the interrupt identified by vINTID is deactivated, an EOI maintenance interrupt is asserted.
- Bits [18:13] are reserved, SBZ.
- If the vINTID field value corresponds to an SGI (that is, 0-15), bits [12:10] contain the number of the requesting PE. This appears in the corresponding field of GICV_IAR or GICV_AIAR. If the vINTID field value is not 0-15, this field must be cleared to 0.

When GICH_LR<n>.HW == 1:

- This field indicates the pINTID that the hypervisor forwards to the Distributor. This field is only required to implement enough bits to hold a valid value for the ID configuration. Any unused higher order bits are RAZ/WI.
- If the value of pINTID is 0-15 or 1020-1023, behavior is UNPREDICTABLE. If the value of pINTID is 16-31, this field applies to the PPI associated with this same PE as the virtual CPU interface requesting the deactivation.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
\textbf{vINTID, bits [9:0]}

This INTID is returned to the VM when the interrupt is acknowledged through \texttt{GICV_IAR}. Each valid interrupt stored in the List registers must have a unique vINTID for that virtual CPU interface. If the value of vINTID is 1020-1023, behavior is \texttt{UNPREDICTABLE}.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

\section*{Accessing the GICH\_LR<\texttt{n}>}

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, \texttt{ICH\_LR<\texttt{n}>} provides equivalent functionality.
- For AArch64 implementations, \texttt{ICH\_LR<\texttt{n>>\_EL2} provides equivalent functionality.

\texttt{GICH\_LR<\texttt{n}> can be accessed through the memory-mapped interfaces:}

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual interface control</td>
<td>0x0100 + (4 * \texttt{n})</td>
<td>GICH_LR&lt;\texttt{n}&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD\_CTRL.DS == 0 accesses to this register are \texttt{RW}.
- When an access is Secure accesses to this register are \texttt{RW}.
- When an access is Non-secure accesses to this register are \texttt{RW}.
GICH_MISR, Maintenance Interrupt Status Register

The GICH_MISR characteristics are:

**Purpose**

Indicates which maintenance interrupts are asserted.

**Configuration**

This register is available when the GIC implementation supports interrupt virtualization.

**Attributes**

GICH_MISR is a 32-bit register.

**Field descriptions**

The GICH_MISR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Bit Description</th>
<th>Byte Location</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>Reserved, RES0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>VGrp1D</td>
<td></td>
<td></td>
</tr>
<tr>
<td>6</td>
<td>VGrp1E</td>
<td></td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>VGrp0D</td>
<td></td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>VGrp0E</td>
<td></td>
<td></td>
</tr>
<tr>

<td>NP</td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>LREN</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>U</td>
<td></td>
<td></td>
</tr>
<tr>
<td>0</td>
<td>EOI</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**VGrp1D, bit [7]**

vPE Group 1 Disabled.

<table>
<thead>
<tr>
<th>VGrp1D</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>vPE Group 1 Disabled maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>vPE Group 1 Disabled maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when GICH_HCR.VGrp1DIE == 1 and GICH_VMCR.VENG1 == 0.

On a Warm reset, this field resets to 0.

**VGrp1E, bit [6]**

vPE Group 1 Enabled.

<table>
<thead>
<tr>
<th>VGrp1E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>vPE Group 1 Enabled maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>vPE Group 1 Enabled maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when GICH_HCR.VGrp1EIE == 1 and GICH_VMCR.VENG1 == 1.

On a Warm reset, this field resets to 0.

**VGrp0D, bit [5]**

vPE Group 0 Disabled.
VGrp0D

<table>
<thead>
<tr>
<th>VGrp0D</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>vPE Group 0 Disabled maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>vPE Group 0 Disabled maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when \texttt{GICH\_HCR.VGrp0DIE} == 1 and \texttt{GICH\_VMCR.VENG0} == 0.

On a Warm reset, this field resets to 0.

**VGrp0E, bit [4]**

vPE Group 0 Enabled.

<table>
<thead>
<tr>
<th>VGrp0E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>vPE Group 0 Enabled maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>vPE Group 0 Enabled maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when \texttt{GICH\_HCR.VGrp0EIE} == 1 and \texttt{GICH\_VMCR.VENG0} == 1.

On a Warm reset, this field resets to 0.

**NP, bit [3]**

No Pending.

<table>
<thead>
<tr>
<th>NP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No Pending maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>No Pending maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when \texttt{GICH\_HCR.NPIE} == 1 and no List register is in the pending state.

On a Warm reset, this field resets to 0.

**LRENP, bit [2]**

List Register Entry Not Present.

<table>
<thead>
<tr>
<th>LRENP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>List Register Entry Not Present maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>List Register Entry Not Present maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when \texttt{GICH\_HCR.LRENPIE} == 1 and \texttt{GICH\_HCR.EOICount} is nonzero.

On a Warm reset, this field resets to 0.

**U, bit [1]**

Underflow.

<table>
<thead>
<tr>
<th>U</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Underflow maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Underflow maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when \texttt{GICH\_HCR.UIE} == 1 and zero or one of the List register entries are marked as a valid interrupt.

On a Warm reset, this field resets to 0.

**EOI, bit [0]**

End Of Interrupt.
This maintenance interrupt is asserted when at least one bit in \texttt{GICH\_EISR} == 1.

On a Warm reset, this field resets to 0.

\textbf{Note}

A List register is in the pending state only if the corresponding \texttt{GICH\_LR<n>} value is \texttt{0b01}, that is, pending. The active and pending state is not included.

**Accessing the GICH\_MISR**

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, \texttt{ICH\_MISR} provides equivalent functionality.
- For AArch64 implementations, \texttt{ICH\_MISR\_EL2} provides equivalent functionality.

A maintenance interrupt is asserted only if at least one bit is set to 1 in this register and if \texttt{GICH\_HCR.En} == 1.

**GICH\_MISR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual</td>
<td>0x0010</td>
<td>GICH_MISR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When \texttt{GICD\_CTLR.DS} == 0 accesses to this register are \texttt{RO}.
- When an access is Secure accesses to this register are \texttt{RO}.
- When an access is Non-secure accesses to this register are \texttt{RO}.
**GICH_VMCR, Virtual Machine Control Register**

The GICH_VMCR characteristics are:

**Purpose**

Enables the hypervisor to save and restore the virtual machine view of the GIC state. This register is updated when a virtual machine updates the virtual CPU interface registers.

**Configuration**

This register is available when the GIC implementation supports interrupt virtualization.

**Attributes**

GICH_VMCR is a 32-bit register.

**Field descriptions**

The GICH_VMCR bit assignments are:

| Bit 31 | Bit 30 | Bit 29 | Bit 28 | Bit 27 | Bit 26 | Bit 25 | Bit 24 | Bit 23 | Bit 22 | Bit 21 | Bit 20 | Bit 19 | Bit 18 | Bit 17 | Bit 16 | Bit 15 | Bit 14 | Bit 13 | Bit 12 | Bit 11 | Bit 10 | Bit 9 | Bit 8 | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|        |
| VPMR   | VBPR0  | VBPR1  | RES0   | VEOIM  | RES0   | VCBPR  | VFIQEn | VAckCtl | VENG1  | VENG0  |        |        |        |        |        |        |        |        |        |        |        |        |        |        |

**VPMR, bits [31:24]**

Virtual priority mask. The priority mask level for the CPU interface. If the priority of an interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

This alias field is updated when a VM updates `GICV_PMR.Priority`.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**VBPR0, bits [23:21]**

Virtual Binary Point Register, Group 0. Defines the point at which the priority value fields split into two parts, the Group priority field and the subpriority field. The Group priority field determines Group 0 interrupt preemption, and also determines Group 1 interrupt preemption if GICH_VMCR.VCBPR == 1.

This alias field is updated when a VM updates `GICV_BPR.Binary_Point`.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**VBPR1, bits [20:18]**

Virtual Binary Point Register, Group 1. Defines the point at which the priority value fields split into two parts, the Group priority field and the subpriority field. The Group priority field determines Group 1 interrupt preemption if GICH_VMCR.VCBPR == 0.

This alias field is updated when a VM updates `GICV_ABPR.Binary_Point`.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [17:10]**

Reserved, RES0.
VEOIM, bit [9]

Virtual EOI mode. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VEOIM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A write of an INTID to <code>GICV_EOIR</code> or <code>GICV_AEOIR</code> drops the priority of the interrupt with that INTID, and also deactivates that interrupt.</td>
</tr>
<tr>
<td>0b1</td>
<td>A write of an INTID to <code>GICV_EOIR</code> or <code>GICV_AEOIR</code> only drops the priority of the interrupt with that INTID. Software must write to <code>GICV_DIR</code> to deactivate the interrupt.</td>
</tr>
</tbody>
</table>

This alias field is updated when a VM updates `GICV_CTLR`.EOI mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:5]

Reserved, RES0.

VCBPR, bit [4]

Virtual Common Binary Point Register. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VCBPR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><code>GICV_ABPR</code> determines the preemption group for Group 1 interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td><code>GICV_BPR</code> determines the preemption group for Group 1 interrupts.</td>
</tr>
</tbody>
</table>

This alias field is updated when a VM updates `GICV_CTLR`.CBPR.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

VFIQEn, bit [3]

Virtual FIQ enable. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VFIQEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 0 virtual interrupts are presented as virtual IRQs.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 0 virtual interrupts are presented as virtual FIQs.</td>
</tr>
</tbody>
</table>

This alias field is updated when a VM updates `GICV_CTLR`.FIQEn.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

VAckCtl, bit [2]

Virtual AckCtl. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VAckCtl</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If the highest priority pending interrupt is Group 1, a read of <code>GICV_IAR</code> or <code>GICV_HPPIR</code> returns an INTID of 1022.</td>
</tr>
<tr>
<td>0b1</td>
<td>If the highest priority pending interrupt is Group 1, a read of <code>GICV_IAR</code> or <code>GICV_HPPIR</code> returns the INTID of the corresponding interrupt.</td>
</tr>
</tbody>
</table>

This alias field is updated when a VM updates `GICV_CTLR`.AckCtl.

This field is supported for backwards compatibility with GICv2. Arm deprecates the use of this field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
VENG1, bit [1]

Virtual interrupt enable, Group 1. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VENG1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 1 virtual interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 1 virtual interrupts are enabled.</td>
</tr>
</tbody>
</table>

This alias field is updated when a VM updates `GICV_CTLR.EnableGrp1`.

On a Warm reset, this field resets to an architecturally `UNKNOWN` value.

VENG0, bit [0]

Virtual interrupt enable, Group 0. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VENG0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 0 virtual interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 0 virtual interrupts are enabled.</td>
</tr>
</tbody>
</table>

This alias field is updated when a VM updates `GICV_CTLR.EnableGrp0`.

On a Warm reset, this field resets to an architecturally `UNKNOWN` value.

**Note**

A List register is in the pending state only if the corresponding `GICH_LR<n>` value is `0b01`, that is, pending. The active and pending state is not included.

**Accessing the GICH_VMCR**

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, `ICH_VMCR` provides equivalent functionality.
- For AArch64 implementations, `ICH_VMCR_EL2` provides equivalent functionality.

**GICH_VMCR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual interface control</td>
<td>0x0008</td>
<td>GICH_VMCR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are `RW`.
- When an access is Secure accesses to this register are `RW`.
- When an access is Non-secure accesses to this register are `RW`.
GICH_VTR, Virtual Type Register

The GICH_VTR characteristics are:

**Purpose**

Indicates the number of implemented virtual priority bits and List registers.

**Configuration**

This register is available when the GIC implementation supports interrupt virtualization.

**Attributes**

GICH_VTR is a 32-bit register.

**Field descriptions**

The GICH_VTR bit assignments are:

<table>
<thead>
<tr>
<th>PRIbits</th>
<th>PREbits</th>
<th>IDbits</th>
<th>SEIS</th>
<th>A3V</th>
<th>RES0</th>
<th>ListRegs</th>
</tr>
</thead>
</table>

**PRIbits, bits [31:29]**

The number of virtual priority bits implemented, minus one.

An implementation must implement at least 32 levels of virtual priority (5 priority bits).

**PREbits, bits [28:26]**

The number of virtual preemption bits implemented, minus one.

An implementation must implement at least 32 levels of virtual preemption priority (5 preemption bits).

The value of this field must be less than or equal to the value of GICH_VTR.PRIbits.

**IDbits, bits [25:23]**

The number of virtual interrupt identifier bits supported:

<table>
<thead>
<tr>
<th>IDbits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>16 bits.</td>
</tr>
<tr>
<td>0b001</td>
<td>24 bits.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**SEIS, bit [22]**

SEI support. Indicates whether the virtual CPU interface supports generation of SEIs:

<table>
<thead>
<tr>
<th>SEIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The virtual CPU interface logic does not support generation of SEIs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The virtual CPU interface logic supports generation of SEIs.</td>
</tr>
</tbody>
</table>
A3V, bit [21]

Affinity 3 valid. Possible values are:

<table>
<thead>
<tr>
<th>A3V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The virtual CPU interface logic only supports zero values of the Aff3 field in ICC_SGI0R_EL1, ICC_SGI1R_EL1, and ICC_ASGI1R_EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The virtual CPU interface logic supports nonzero values of the Aff3 field in ICC_SGI0R_EL1, ICC_SGI1R_EL1, and ICC_ASGI1R_EL1.</td>
</tr>
</tbody>
</table>

Bits [20:5]

Reserved, RES0.

ListRegs, bits [4:0]

The number of implemented List registers, minus one.

Accessing the GICH_VTR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICH_VTR provides equivalent functionality.
- For AArch64 implementations, ICH_VTR_EL2 provides equivalent functionality.

GICH_VTR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual interface control</td>
<td>0x0004</td>
<td>GICH_VTR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RO.
- When an access is Secure accesses to this register are RO.
- When an access is Non-secure accesses to this register are RO.
**GICR_CLRLPIR, Clear LPI Pending Register**

The GICR_CLRLPIR characteristics are:

**Purpose**

Clears the pending state of the specified LPI.

**Configuration**

This register is present only when FEAT_GICv4p1 is implemented. Otherwise, direct accesses to GICR_CLRLPIR are RES0.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_CLRLPIR is a 64-bit register.

**Field descriptions**

The GICR_CLRLPIR bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 | RES0 | RES0 |

**Bits [63:32]**

Reserved, RES0.

**pINTID, bits [31:0]**

The INTID of the physical LPI.

---

**Note**

The size of this field is IMPLEMENTATION DEFINED, and is specified by the GICD_TYPER.IDbits field. Unimplemented bits are RES0.

---

**Accessing the GICR_CLRLPIR**

When written with a 32-bit write the data is zero-extended to 64 bits.

This register is mandatory in an implementation that supports LPIs and does not include an ITS. The functionality of this register is IMPLEMENTATION DEFINED in an implementation that does include an ITS.

Writes to this register have no effect if any of the following apply:

- **GICR_CTLR.EnableLPIs == 0.**
- The pINTID value specifies an unimplemented LPI.
- The pINTID value specifies an LPI that is not pending.
GICR_CLRLPIR, Clear LPI Pending Register

**GICR_CLRLPIR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>RD_base</td>
<td>0x0048</td>
<td>GICR_CLRLPIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.
The GICR_CTLR characteristics are:

**Purpose**

Controls the operation of a Redistributor, and enables the signaling of LPIs by the Redistributor to the connected PE.

**Configuration**

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_CTLR is a 32-bit register.

**Field descriptions**

The GICR_CTLR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 30 29 28 27</td>
<td>UWP RES0 DPG1S DPG1NS DPG0</td>
</tr>
<tr>
<td>26 25 24 23 22</td>
<td>RES0</td>
</tr>
<tr>
<td>21 20 19 18 17</td>
<td></td>
</tr>
<tr>
<td>16 15 14 13 12</td>
<td></td>
</tr>
<tr>
<td>11 10 9 8 7 6 5</td>
<td></td>
</tr>
<tr>
<td>4 3 2 1 0</td>
<td>RWP RCE EnableLPIs</td>
</tr>
</tbody>
</table>

**UWP, bit [31]**

Upstream Write Pending. Read-only. Indicates whether all upstream writes have been communicated to the Distributor:

<table>
<thead>
<tr>
<th>UWP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The effects of all upstream writes have been communicated to the Distributor, including any Generate SGI packets. For more information, see ‘Generate SGI (ICC)’ in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).</td>
</tr>
<tr>
<td>0b1</td>
<td>Not all the effects of upstream writes, including any Generate SGI packets, have been communicated to the Distributor. For more information, see 'Generate SGI (ICC)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).</td>
</tr>
</tbody>
</table>

**Bits [30:27]**

Reserved, RES0.

**DPG1S, bit [26]**

Disable Processor selection for Group 1 Secure interrupts. When GICR_TYPER.DPGS == 1:

<table>
<thead>
<tr>
<th>DPG1S</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A Group 1 Secure SPI configured to use the 1 of N distribution model can select this PE, if the PE is not asleep and if Secure Group 1 interrupts are enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Group 1 Secure SPI configured to use the 1 of N distribution model cannot select this PE.</td>
</tr>
</tbody>
</table>

When GICR_TYPER.DPGS == 0 this bit is RAZ/WI.
When `GICD_CTLR.DS==1`, this field is RAZ/WI. In GIC implementations that support two Security states, this field is only accessible by Secure accesses, and is RAZ/WI to Non-secure accesses.

It is IMPLEMENTATION DEFINED whether these bits affect the selection of PEs for interrupts using the 1 of N distribution model when `GICD_CTLR.ARE_S==0`.

On a Warm reset, this field resets to 0.

**DPG1NS, bit [25]**

Disable Processor selection for Group 1 Non-secure interrupts. When `GICR_TYPER.DPGS == 1`:

<table>
<thead>
<tr>
<th>DPG1NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A Group 1 Non-secure SPI configured to use the 1 of N distribution model can select this PE, if the PE is not asleep and if Non-secure Group 1 interrupts are enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Group 1 Non-secure SPI configured to use the 1 of N distribution model cannot select this PE.</td>
</tr>
</tbody>
</table>

When `GICR_TYPER.DPGS == 0` this bit is RAZ/WI.

It is IMPLEMENTATION DEFINED whether these bits affect the selection of PEs for interrupts using the 1 of N distribution model when `GICD_CTLR.ARE_NS==0`.

On a Warm reset, this field resets to 0.

**DPG0, bit [24]**

Disable Processor selection for Group 0 interrupts. When `GICR_TYPER.DPGS == 1`:

<table>
<thead>
<tr>
<th>DPG0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A Group 0 SPI configured to use the 1 of N distribution model can select this PE, if the PE is not asleep and if Group 0 interrupts are enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Group 0 SPI configured to use the 1 of N distribution model cannot select this PE.</td>
</tr>
</tbody>
</table>

When `GICR_TYPER.DPGS == 0` this bit is RAZ/WI.

When `GICD_CTLR.DS == 1`, this field is always accessible. In GIC implementations that support two Security states, this field is RAZ/WI to Non-secure accesses.

It is IMPLEMENTATION DEFINED whether these bits affect the selection of PEs for interrupts using the 1 of N distribution model when `GICD_CTLR.ARE_S == 0`.

On a Warm reset, this field resets to 0.

**Bits [23:4]**

Reserved, RES0.

**RWP, bit [3]**

Register Write Pending. This bit indicates whether a register write for the current Security state is in progress or not.
Meaning

0b0  The effect of all previous writes to the following registers are visible to all agents in the system:
• GICR_ICENABLER0
• GICR_CTLR DPG1S
• GICR_CTLR DPG1NS
• GICR_CTLR DPG0
• GICR_CTLR, which clears EnableLPIs from 1 to 0.
• In FEAT_GICv4p1, GICR_VPROPBASER, which clears Valid from 1 to 0.

0b1  The effect of all previous writes to the following registers are not guaranteed by the architecture to be visible to all agents in the system while the changes are still being propagated:
• GICR_ICENABLER0
• GICR_CTLR DPG1S
• GICR_CTLR DPG1NS
• GICR_CTLR DPG0
• GICR_CTLR, which clears EnableLPIs from 1 to 0.
• In FEAT_GICv4p1, GICR_VPROPBASER, which clears Valid from 1 to 0.

IR, bit [2]

LPI invalidate registers supported.

This bit is read-only.

Meaning

IR  Meaning

0b0  This bit does not indicate whether the GICR_INVLPIR, GICR_INVALLR and GICR_SYNCR are implemented or not.

0b1  GICR_INVLPIR, GICR_INVALLR and GICR_SYNCR are implemented.

If GICR_TYPER.DirectLPI is 1 or GICR_TYPER.RVPEI is 1, GICR_INVLPIR, GICR_INVALLR, and GICR_SYNCR are always implemented.

Arm recommends that implementations report GICR_CTLR.IR as 1 in these cases.

CES, bit [1]

Clear Enable Supported.

This bit is read-only.

Meaning

CES  Meaning

0b0  The IRI does not indicate whether GICR_CTLR.EnableLPIs is RES1 once set.

0b1  GICR_CTLR.EnableLPIs is not RES1 once set.

Implementing GICR_CTLR.EnableLPIs as programmable and not reporting GICR_CTLR.CES == 1 is deprecated.

Implementing GICR_CTLR.EnableLPIs as RES1 once set is deprecated.

When GICR_CTLR.CES == 0, software cannot assume that GICR_CTLR.EnableLPIs is programmable without observing the bit being cleared.

EnableLPIs, bit [0]

In implementations where affinity routing is enabled for the Security state:

Meaning

EnableLPIs  Meaning

0b0  LPI support is disabled. Any doorbell interrupt generated as a result of a write to a virtual LPI register must be discarded, and any ITS translation requests or commands involving LPIs in this Redistributor are ignored.

0b1  LPI support is enabled.
Note

If $\text{GICR}_\text{TYPER}.\text{PLPIS} == 0$, this field is RES0. If $\text{GICD}_\text{CTLR}.\text{ARE}_\text{NS}$ is written from 1 to 0 when this bit is 1, behavior is an IMPLEMENTATION DEFINED choice between clearing $\text{GICR}_\text{CTLR}.\text{EnableLPIs}$ to 0 or maintaining its current value.

When affinity routing is not enabled for the Non-secure state, this bit is RES0.

When written from 0 to 1, the Redistributor loads the LPI Pending table from memory to check for any pending interrupts.

After it has been written to 1, it is IMPLEMENTATION DEFINED whether the bit becomes RES1 or can be cleared by to 0.

Where the bit remains programmable:

- Software must observe $\text{GICR}_\text{CTLR}.\text{RWP} == 0$ after clearing $\text{GICR}_\text{CTLR}.\text{EnableLPIs}$ from 1 to 0 before writing $\text{GICR}_\text{PENDBASER}$ or $\text{GICR}_\text{PROPBASER}$, otherwise behavior is UNPREDICTABLE.
- Software must observe $\text{GICR}_\text{CTLR}.\text{RWP} == 0$ after clearing $\text{GICR}_\text{CTLR}.\text{EnableLPIs}$ from 1 to 0 before setting $\text{GICR}_\text{CTLR}.\text{EnableLPIs}$ to 1, otherwise behavior is UNPREDICTABLE.

Note

If one or more ITS is implemented, Arm strongly recommends that all LPIs are mapped to another Redistributor before $\text{GICR}_\text{CTLR}.\text{EnableLPIs}$ is cleared to 0.

On a Warm reset, this field resets to 0.

The participation of a PE in the 1 of N distribution model for a given interrupt group is governed by the concatenation of $\text{GICR}_\text{WAKER}_\text{ProcessorSleep}$, the appropriate $\text{GICR}_\text{CTLR}.\text{DPG} \{1, 0\}$ bit, and the PE interrupt group enable. The behavior options are:

<table>
<thead>
<tr>
<th>$\text{PS}$</th>
<th>$\text{DPG} {1S, 1NS, 0}$</th>
<th>Enable</th>
<th>PE Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>0b0</td>
<td>0b0</td>
<td>The PE cannot be selected.</td>
</tr>
<tr>
<td>0b0</td>
<td>0b0</td>
<td>0b1</td>
<td>The PE can be selected.</td>
</tr>
<tr>
<td>0b0</td>
<td>0b1</td>
<td>*</td>
<td>The PE cannot be selected.</td>
</tr>
<tr>
<td>0b1</td>
<td>*</td>
<td>*</td>
<td>The PE cannot be selected when $\text{GICD}<em>\text{CTLR}.\text{E1NWF} == 0$. When $\text{GICD}</em>\text{CTLR}.\text{E1NWF} == 1$, the mechanism by which PEs are selected is IMPLEMENTATION DEFINED.</td>
</tr>
</tbody>
</table>

If an SPI using the 1 of N distribution model has been forwarded to the PE, and a write to $\text{GICR}_\text{CTLR}$ occurs that changes the DPG bit for the interrupt group of the SPI, the IRI must attempt to select a different target PE for the SPI. This might have no effect on the forwarded SPI if it has already been activated.

### Accessing the GICR_CTLR

$\text{GICR}_\text{CTLR}$ can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC</td>
<td>RD_base</td>
<td>0x0000</td>
<td>GICR_CTLR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When $\text{GICD}_\text{CTLR}.\text{DS} == 0$ accesses to this register are RW.
- When an access is Secure accesses to this register are RW.
- When an access is Non-secure accesses to this register are RW.
GICR_ICACTIVER0, Interrupt Clear-Active Register 0

The GICR_ICACTIVER0 characteristics are:

**Purpose**

Deactivates the corresponding SGI or PPI. These registers are used when saving and restoring GIC state.

**Configuration**

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_ICACTIVER0 is a 32-bit register.

**Field descriptions**

The GICR_ICACTIVER0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Clear_active_bit31</td>
</tr>
<tr>
<td>30</td>
<td>Clear_active_bit30</td>
</tr>
<tr>
<td>29</td>
<td>Clear_active_bit29</td>
</tr>
<tr>
<td>28</td>
<td>Clear_active_bit28</td>
</tr>
<tr>
<td>27</td>
<td>Clear_active_bit27</td>
</tr>
<tr>
<td>26</td>
<td>Clear_active_bit26</td>

<tr>
<td>2</td>
<td>Clear_active_bit2</td>
</tr>
<tr>
<td>1</td>
<td>Clear_active_bit1</td>
</tr>
<tr>
<td>0</td>
<td>Clear_active_bit0</td>
</tr>
</tbody>
</table>

Clear_active_bit<x>, bit [x], for x = 31 to 0

Removes the active state from interrupt number x. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Clear_active_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that the corresponding interrupt is active, or is active and pending. If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally unknown value.

**Accessing the GICR_ICACTIVER0**

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICACTIVER0, the corresponding bit is RAZ/WI and equivalent functionality is provided by GICD_ICACTIVER<n>, with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by GICD_ICACTIVER<n>.

When GICD_CTLR.DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

**GICR_ICACTIVER0 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>SGI_base</td>
<td>0x8380</td>
<td>GICR_ICACTIVER0</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RW.
- When an access is Secure accesses to this register are RW.
- When an access is Non-secure accesses to this register are RW.
The GICR_ICACTIVER<n>E characteristics are:

**Purpose**

Removes the active state from the corresponding PPI.

**Configuration**

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_ICACTIVER<n>E are `RES0`.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_ICACTIVER<n>E is a 32-bit register.

**Field descriptions**

The GICR_ICACTIVER<n>E bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Clear_active_bit31</td>
</tr>
<tr>
<td>30</td>

<tr>
<td>3</td>
<td>Clear_active_bit3</td>
</tr>
<tr>
<td>2</td>
<td>Clear_active_bit2</td>
</tr>
<tr>
<td>1</td>
<td>Clear_active_bit1</td>
</tr>
<tr>
<td>0</td>
<td>Clear_active_bit0</td>
</tr>
</tbody>
</table>

For the extended PPIs, removes the active state to interrupt number x. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Clear_active_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0                 | If read, indicates that the corresponding interrupt is not active, and is not active and pending.
|                     | If written, has no effect. |
| 0b1                 | If read, indicates that the corresponding interrupt is active, or is active and pending.
|                     | If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect. |

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ICACTIVER<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_ICACTIVER<n>E is \((0x200 + (4*n))\).
- The bit number of the required group modifier bit in this register is \((m-1024) \text{ MOD } 32\).

**Accessing the GICR_ICACTIVER<n>E**

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICACTIVER<n>E, the corresponding bit is `RES0`.

When `GICD_CTRLR.DS==0`, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.
Bits corresponding to unimplemented interrupts are RAZ/WI.

**GICR\_ICACTIVER\(<n>E\)** can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>SGI_base</td>
<td>0x0380 + (4 * n)</td>
<td>GICR_ICACTIVER(&lt;n&gt;E)</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD\_CTRL\_DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.
GICR_ICENABLER0, Interrupt Clear-Enable Register 0

The GICR_ICENABLER0 characteristics are:

**Purpose**

Disables forwarding of the corresponding SGI or PPI to the CPU interfaces.

**Configuration**

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_ICENABLER0 is a 32-bit register.

**Field descriptions**

The GICR_ICENABLER0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that forwarding of the corresponding interrupt is enabled. If written, disables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the GICR_ICENABLER0**

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICENABLER0, the corresponding bit is RAZ/WI and equivalent functionality is provided by **GICD_ICENABLER<n>** with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by **GICD_ICENABLER<n>**.

When **GICD_CTLR.DS == 0**, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

**GICR_ICENABLER0 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC</td>
<td>SGI_base</td>
<td>0x0180</td>
<td>GICR_ICENABLER0</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When GICD_CTLR_DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.
The GICR_ICENABLER\(n\)E characteristics are:

**Purpose**

Disables forwarding of the corresponding PPI to the CPU interfaces.

**Configuration**

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_ICENABLER\(n\)E are RES0.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_ICENABLER\(n\)E is a 32-bit register.

**Field descriptions**

The GICR_ICENABLER\(n\)E bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
</tr>
</thead>
</table>

**Clear_enable_bit\(x\), bit \(x\), for \(x = 31\) to \(0\)**

For the extended PPI range, controls the forwarding of interrupt number \(x\) to the CPU interface. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Clear_enable_bit(x)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that forwarding of the corresponding interrupt is disabled.</td>
</tr>
<tr>
<td></td>
<td>If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that forwarding of the corresponding interrupt is enabled.</td>
</tr>
<tr>
<td></td>
<td>If written, disables forwarding of the corresponding interrupt.</td>
</tr>
<tr>
<td></td>
<td>After a write of 1 to this bit, a subsequent read of this bit returns 0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

For INTID \(m\), when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ICENABLER\(n\)E number, \(n\), is given by \(n = (m-1024) \div 32\).
- The offset of the required GICR_ICENABLER\(n\)E is \((0\times180 + (4 \times n))\).
- The bit number of the required group modifier bit in this register is \((m-1024) \mod 32\).

**Accessing the GICR_ICENABLER\(n\)E**

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICENABLER\(n\)E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.
Bits corresponding to unimplemented interrupts are RAZ/WI.

**GICR_ICENABLER\(<n>E \text{ can be accessed through the memory-mapped interfaces:}**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>SGI_base</td>
<td>0x0180 + (4 * n)</td>
<td>GICR_ICENABLER(&lt;n&gt;E</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.
The GICR_ICFGR0 characteristics are:

**Purpose**

Determines whether the corresponding SGI is edge-triggered or level-sensitive.

**Configuration**

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_ICFGR0 is a 32-bit register.

**Field descriptions**

The GICR_ICFGR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Int_config15</td>
</tr>
<tr>
<td>30</td>
<td>Int_config14</td>
</tr>
<tr>
<td>29</td>
<td>Int_config13</td>
</tr>
<tr>
<td>28</td>
<td>Int_config12</td>
</tr>
<tr>
<td>27</td>
<td>Int_config11</td>
</tr>
<tr>
<td>26</td>
<td>Int_config10</td>
</tr>
<tr>
<td>25</td>
<td>Int_config9</td>
</tr>
<tr>
<td>24</td>
<td>Int_config8</td>
</tr>
<tr>
<td>23</td>
<td>Int_config7</td>
</tr>
<tr>
<td>22</td>
<td>Int_config6</td>
</tr>
<tr>
<td>21</td>
<td>Int_config5</td>
</tr>
<tr>
<td>20</td>
<td>Int_config4</td>
</tr>
<tr>
<td>19</td>
<td>Int_config3</td>
</tr>
<tr>
<td>18</td>
<td>Int_config2</td>
</tr>
<tr>
<td>17</td>
<td>Int_config1</td>
</tr>
<tr>
<td>16</td>
<td>Int_config0</td>
</tr>
</tbody>
</table>

Int_config<x>, bits [2x+1:2x], for x = 15 to 0

Indicates whether the interrupt with ID 16n + x is level-sensitive or edge-triggered.

Int_config[0] (bit [2x]) is RES0.

Possible values of Int_config[1] (bit [2x+1]) are:

<table>
<thead>
<tr>
<th>Int_config&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Corresponding interrupt is level-sensitive.</td>
</tr>
<tr>
<td>0b01</td>
<td>Corresponding interrupt is edge-triggered.</td>
</tr>
</tbody>
</table>

For SGIs, Int_config[1] is RAO/WI.

A read of this bit always returns the correct value to indicate the interrupt triggering method.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the GICR_ICFGR0**

This register is used when affinity routing is enabled.

When affinity routing is disabled for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case. Equivalent functionality is provided by GICD_ICFGR<n> with n=0.

When GICD_CTLR.DS==0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

GICR_ICFGR0 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC</td>
<td>SGI_base</td>
<td>0x0C00</td>
<td>GICR_ICFGR0</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RW.
- When an access is Secure accesses to this register are RW.
- When an access is Non-secure accesses to this register are RW.
GICR_ICFGR1,Interrupt Configuration Register 1

The GICR_ICFGR1 characteristics are:

**Purpose**
Determined whether the corresponding PPI is edge-triggered or level-sensitive.

**Configuration**

A copy of this register is provided for each Redistributor.

For each supported PPI, it is IMPLEMENTATION DEFINED whether software can program the corresponding Int_config field.

Changing Int_config when the interrupt is individually enabled is UNPREDICTABLE.

Changing the interrupt configuration between level-sensitive and edge-triggered (in either direction) at a time when there is a pending interrupt will leave the interrupt in an UNKNOWN pending state.

**Attributes**

GICR_ICFGR1 is a 32-bit register.

**Field descriptions**

The GICR_ICFGR1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>30</td>
<td>Int_config15</td>
</tr>
<tr>
<td>29</td>
<td>Int_config14</td>
</tr>
<tr>
<td>28</td>
<td>Int_config13</td>
</tr>
<tr>
<td>27</td>
<td>Int_config12</td>
</tr>
<tr>
<td>26</td>
<td>Int_config11</td>
</tr>
<tr>
<td>25</td>
<td>Int_config10</td>
</tr>
<tr>
<td>24</td>
<td>Int_config9</td>
</tr>
<tr>
<td>23</td>
<td>Int_config8</td>
</tr>
<tr>
<td>22</td>
<td>Int_config7</td>
</tr>
<tr>
<td>21</td>
<td>Int_config6</td>
</tr>
<tr>
<td>20</td>
<td>Int_config5</td>
</tr>
<tr>
<td>19</td>
<td>Int_config4</td>
</tr>
<tr>
<td>18</td>
<td>Int_config3</td>
</tr>
<tr>
<td>17</td>
<td>Int_config2</td>
</tr>
<tr>
<td>16</td>
<td>Int_config1</td>
</tr>
<tr>
<td>15</td>
<td>Int_config0</td>
</tr>
</tbody>
</table>

Int_config<x>, bits [2x+1:2x], for x = 15 to 0
Indicates whether the interrupt with ID 16n + x is level-sensitive or edge-triggered.

Int_config[0] (bit [2x]) is RES0.

Possible values of Int_config[1] (bit [2x+1]) are:

<table>
<thead>
<tr>
<th>Int_config&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Corresponding interrupt is level-sensitive.</td>
</tr>
<tr>
<td>0b01</td>
<td>Corresponding interrupt is edge-triggered.</td>
</tr>
</tbody>
</table>

A read of this bit always returns the correct value to indicate the interrupt triggering method.

For PPIs, Int_config[1] is programmable unless the implementation supports two Security states and the bit corresponds to a Group 0 or Secure Group 1 interrupt, in which case the bit is RAZ/WI to Non-secure accesses.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the GICR_ICFGR1**

This register is used when affinity routing is enabled.

When affinity routing is disabled for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case. Equivalent functionality is provided by GICD_ICFGR<n> with n=1.
GICR_ICFGR1 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>SGI_base</td>
<td>0x0C04</td>
<td>GICR_ICFGR1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.
GICR_ICFGR<n>E, Interrupt configuration registers, n = 2 - 5

The GICR_ICFGR<n>E characteristics are:

**Purpose**

Determines whether the corresponding PPI in the extended PPI range is edge-triggered or level-sensitive.

**Configuration**

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_ICFGR<n>E are RES0.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_ICFGR<n>E is a 32-bit register.

**Field descriptions**

The GICR_ICFGR<n>E bit assignments are:

```
<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
</tr>
</thead>
<tbody>
<tr>
<td>Int_config31</td>
<td>Int_config30</td>
<td>Int_config29</td>
<td>Int_config28</td>
<td>Int_config27</td>
<td>Int_config26</td>
<td>Int_config25</td>
<td>Int_config24</td>
<td>Int_config23</td>
</tr>
</tbody>
</table>
```

**Int_config<x>, bit [x], for x = 31 to 0**

Indicates whether the interrupt with ID 16n + x is level-sensitive or edge-triggered.

Int_config[0] (bit [2x]) is RES0.

Possible values of Int_config[1] (bit [2x+1]) are:

<table>
<thead>
<tr>
<th>Int_config&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The corresponding interrupt is level-sensitive.</td>
</tr>
<tr>
<td>0b1</td>
<td>The corresponding interrupt is edge-triggered.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For each supported extended PPI, it is IMPLEMENTATION DEFINED whether software can program the corresponding Int_config field.

**Accessing the GICR_ICFGR<n>E**

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICFGR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

**GICR_ICFGR<n>E can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
</table>

---
<table>
<thead>
<tr>
<th>GIC Redistributor</th>
<th>SGI_base</th>
<th>$0x0C00 + (4 * n)$</th>
<th>GICR_ICFGR&lt;n&gt;E</th>
</tr>
</thead>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.
GICR_ICPENDR0, Interrupt Clear-Pending Register 0

The GICR_ICPENDR0 characteristics are:

**Purpose**

Removes the pending state from the corresponding SGI or PPI.

**Configuration**

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_ICPENDR0 is a 32-bit register.

**Field descriptions**

The GICR_ICPENDR0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
</tr>
</thead>
</table>

**Clear_pending_bit<x>, bit [x], for x = 31 to 0**

Removes the pending state from interrupt number x. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Clear_pending_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that the corresponding interrupt is not pending. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that the corresponding interrupt is pending, or active and pending. If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active. This has no effect in the following cases:</td>
</tr>
<tr>
<td></td>
<td>• If the interrupt is not pending and is not active and pending.</td>
</tr>
<tr>
<td></td>
<td>• If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to GICD_ISPENDR&lt;n&gt;. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally unknown value.

**Accessing the GICR_ICPENDR0**

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICPENDR0, the corresponding bit is RAZ/WI and equivalent functionality is provided by GICD_ICPENDR<n> with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by GICD_ICENABLER<n>.

When GICD_CTLR_DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.
GICR_ICPENDR0 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>SGI_base</td>
<td>0x0280</td>
<td>GICR_ICPENDR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.
The GICR_ICPENDR<n>E characteristics are:

**Purpose**

Removes the pending state from the corresponding PPI.

**Configuration**

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_ICPENDR<n>E are RES0.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_ICPENDR<n>E is a 32-bit register.

**Field descriptions**

The GICR_ICPENDR<n>E bit assignments are:

|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|

For the extended PPIs, removes the pending state to interrupt number x. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Clear_pending_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that the corresponding interrupt is not pending on this PE. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that the corresponding interrupt is pending, or active and pending on this PE. If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active. This has no effect in the following cases:</td>
</tr>
<tr>
<td></td>
<td>• If the interrupt is not pending and is not active and pending.</td>
</tr>
<tr>
<td></td>
<td>• If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to GICR_ISPENDR&lt;n&gt;E. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ICPENDR<n>E number, n, is given by \( n = (m-1024) \div 32 \).
- The offset of the required GICR_ICPENDR<n>E is \((0x200 + (4*n))\).
The bit number of the required group modifier bit in this register is \((m-1024) \mod 32\).

**Accessing the GICR_ICPENDR\(n\)E**

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICPENDR\(n\)E, the corresponding bit is RES0.

When \texttt{GICD_CTLR.DS==0}, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

**GICR_ICPENDR\(n\)E can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>SGI_base</td>
<td>0x0280 + (4 * (n))</td>
<td>GICR_ICPENDR(n)E</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RW.
- When an access is Secure accesses to this register are RW.
- When an access is Non-secure accesses to this register are RW.
The GICR_IGROUPR0 characteristics are:

**Purpose**

Controls whether the corresponding SGI or PPI is in Group 0 or Group 1.

**Configuration**

This register is available in all GIC configurations. If the GIC implementation supports two Security states, this register is Secure.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_IGROUPR0 is a 32-bit register.

**Field descriptions**

The GICR_IGROUPR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Index</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Redistributor_group_status_bit31</td>
</tr>

<td>Redistributor_group_status_bit12</td>
</tr>
<tr>
<td>11</td>
<td>Redistributor_group_status_bit11</td>
</tr>
<tr>
<td>10</td>
<td>Redistributor_group_status_bit10</td>
</tr>
<tr>
<td>9</td>
<td>Redistributor_group_status_bit9</td>
</tr>
<tr>
<td>8</td>
<td>Redistributor_group_status_bit8</td>
</tr>
<tr>
<td>7</td>
<td>Redistributor_group_status_bit7</td>
</tr>
<tr>
<td>6</td>
<td>Redistributor_group_status_bit6</td>
</tr>
<tr>
<td>5</td>
<td>Redistributor_group_status_bit5</td>
</tr>
<tr>
<td>4</td>
<td>Redistributor_group_status_bit4</td>
</tr>
<tr>
<td>3</td>
<td>Redistributor_group_status_bit3</td>
</tr>
<tr>
<td>2</td>
<td>Redistributor_group_status_bit2</td>
</tr>
<tr>
<td>1</td>
<td>Redistributor_group_status_bit1</td>
</tr>
<tr>
<td>0</td>
<td>Redistributor_group_status_bit0</td>
</tr>
</tbody>
</table>

**Redistributor_group_status_bit<x>, bit [x], for x = 31 to 0**

Group status bit. In this register:

- Bits [31:16] are group status bits for PPIs.
- Bits [15:0] are group status bits for SGIs.

<table>
<thead>
<tr>
<th>Redistributor_group_status_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When GICD_CTLR.DS==1, the corresponding interrupt is Group 0. When GICD_CTLR.DS==0, the corresponding interrupt is Secure.</td>
</tr>
<tr>
<td>0b1</td>
<td>When GICD_CTLR.DS==1, the corresponding interrupt is Group 1. When GICD_CTLR.DS==0, the corresponding interrupt is Non-secure Group 1.</td>
</tr>
</tbody>
</table>

When GICD_CTLR.DS == 0, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICR_IGRPMODR0 to form a 2-bit field that defines an interrupt group. The encoding of this field is at GICR_IGRPMODR0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The considerations for the reset value of this register are the same as those for GICD_IGROUPR<n> with n=0.

**Accessing the GICR_IGROUPR0**

When affinity routing is not enabled for the Security state of an interrupt in GICR_IGROUPR0, the corresponding bit is RES0 and equivalent functionality is provided by GICD_IGROUPR<n> with n=0.
When `GICD_CTLR.DS == 0`, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

### Note
Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

**GICR_IGROUPR0 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>SGI_base</td>
<td>0x0080</td>
<td>GICR_IGROUPR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `GICD_CTLR.DS == 0` accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.
The GICR_IGROUPR<n>E characteristics are:

**Purpose**

Controls whether the corresponding PPI is in Group 0 or Group 1.

**Configuration**

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_IGROUPR<n>E are RES0.

When GICD_CTLR.DS==0, this register is Secure.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_IGROUPR<n>E is a 32-bit register.

**Field descriptions**

The GICR_IGROUPR<n>E bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group_status_bit31</td>
<td>Group_status_bit30</td>
<td>Group_status_bit29</td>
<td>Group_status_bit28</td>
<td>Group_status_bit27</td>
<td>Group_status_bit26</td>
</tr>
</tbody>
</table>

**Group_status_bit<x>, bit [x], for x = 31 to 0**

Group status bit.

<table>
<thead>
<tr>
<th>Group_status_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When GICD_CTLR.DS==1, the corresponding interrupt is Group 0. When GICD_CTLR.DS==0, the corresponding interrupt is Secure.</td>
</tr>
<tr>
<td>0b1</td>
<td>When GICD_CTLR.DS==1, the corresponding interrupt is Group 1. When GICD_CTLR.DS==0, the corresponding interrupt is Non-secure Group 1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

If affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICR_IGRMODR<n>E to form a 2-bit field that defines an interrupt group. The encoding of this field is described in GICR_IGRMODR<n>E.

If affinity routing is disabled for the Security state of an interrupt, the bit is RES0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_IGROUPR<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_IGROUPR<n>E is (0x80 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-1024) MOD 32.
Accessing the GICR_IGROUPR\(n\)E

When affinity routing is not enabled for the Security state of an interrupt in GICR_IGROUPR\(n\)E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_IGROUPR\(n\)E can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>SGI_base</td>
<td>0x0080 + (4 * (n))</td>
<td>GICR_IGROUPR(n)E</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RW.
- When an access is Secure accesses to this register are RW.
- When an access is Non-secure accesses to this register are RW.
GICR_IGRPMODR0, Interrupt Group Modifier Register 0

The GICR_IGRPMODR0 characteristics are:

**Purpose**

When `GICD_CTLR.DS==0`, this register together with the `GICR_IGROUPR0` register, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- When System register access is enabled, Secure Group 1.

**Configuration**

When `GICD_CTLR.DS==0`, this register is Secure.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_IGRPMODR0 is a 32-bit register.

**Field descriptions**

The GICR_IGRPMODR0 bit assignments are:

<table>
<thead>
<tr>
<th>Group modifier bit&lt;31&gt;, bit [x], for x = 31 to 0</th>
</tr>
</thead>
</table>

**Group modifier_bit<x>, bit [x], for x = 31 to 0**

Group modifier bit. In implementations where affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in `GICR_IGROUPR0` to form a 2-bit field that defines an interrupt group:

<table>
<thead>
<tr>
<th>Group modifier bit</th>
<th>Group status bit</th>
<th>Definition</th>
<th>Short name</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>0b0</td>
<td>Secure Group 0</td>
<td>G0S</td>
</tr>
<tr>
<td>0b0</td>
<td>0b1</td>
<td>Non-secure Group 1</td>
<td>G1NS</td>
</tr>
<tr>
<td>0b1</td>
<td>0b0</td>
<td>Secure Group 1</td>
<td>G1S</td>
</tr>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>Reserved, treated as Non-secure Group 1</td>
<td>-</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the GICR_IGRPMODR0**

When affinity routing is not enabled for the Security state of an interrupt in GICR_IGRPMODR0, the corresponding bit is **RES0** and equivalent functionality is provided by `GICD_IGRPMODR<n>` with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by `GICD_IGRPMODR<n>`.

When `GICD_CTLR.ARE_S == 0` or `GICD_CTLR.DS == 1`, GICR_IGRPMODR0 is **RES0**. An implementation can make this register RAZ/WI in this case.

When `GICD_CTLR.DS==0`, the register is RAZ/WI to Non-secure accesses.
Bits corresponding to unimplemented interrupts are RAZ/WI.

**Note**

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

**GICR_IGRPMODR0 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>SGI_base</td>
<td>0x0000</td>
<td>GICR_IGRPMODR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.
GICR_IGRPMODR\(n\)E, Interrupt Group Modifier Registers, \(n = 1 - 2\)

The GICR_IGRPMODR\(n\)E characteristics are:

**Purpose**

When GIC_D_CTLR.DS\(==0\), this register together with the GICR_IGROUPR\(n\)E registers, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- When System register access is enabled, Secure Group 1.

**Configuration**

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_IGRPMODR\(n\)E are \texttt{RES0}.

When GIC_D_CTLR.DS\(==0\), this register is Secure.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_IGRPMODR\(n\)E is a 32-bit register.

**Field descriptions**

The GICR_IGRPMODR\(n\)E bit assignments are:

<table>
<thead>
<tr>
<th>Group modifier bit</th>
<th>Group status bit</th>
<th>Definition</th>
<th>Short name</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>0b0</td>
<td>Secure Group 0</td>
<td>G0S</td>
</tr>
<tr>
<td>0b0</td>
<td>0b1</td>
<td>Non-secure Group 1</td>
<td>G1NS</td>
</tr>
<tr>
<td>0b1</td>
<td>0b0</td>
<td>Secure Group 1</td>
<td>G1S</td>
</tr>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>Reserved, treated as Non-secure Group 1</td>
<td>-</td>
</tr>
</tbody>
</table>

Group modifier bit. In implementations where affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICR_IGROUPR\(n\)E to form a 2-bit field that defines an interrupt group:

- On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

For INTID \(m\), when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_IGRPMODR\(n\)E number, \(n\), is given by \(n = (m-1024) \text{ DIV} \ 32\).
- The offset of the required GICR_IGRPMODR\(n\)E is \((0x000 + (4*n))\).
- The bit number of the required group modifier bit in this register is \((m-1024) \text{ MOD} \ 32\).
Accessing the GICR_IGRPMODR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_IGRPMODR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

**GICR_IGRPMODR<n>E can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>SGI_base</td>
<td>0x0000 + (4 * n)</td>
<td>GICR_IGRPMODR&lt;n&gt;E</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RW.
- When an access is Secure accesses to this register are RW.
- When an access is Non-secure accesses to this register are RW.
The GICR_IIDR characteristics are:

**Purpose**

Provides information about the implementer and revision of the Redistributor.

**Configuration**

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states, this register is Common.

**Attributes**

GICR_IIDR is a 32-bit register.

**Field descriptions**

The GICR_IIDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Range</th>
<th>Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-24</td>
<td>ProductID</td>
</tr>
<tr>
<td>23-20</td>
<td>RES0</td>
</tr>
<tr>
<td>19-16</td>
<td>Variant</td>
</tr>
<tr>
<td>15-12</td>
<td>Revision</td>
</tr>
<tr>
<td>11-0</td>
<td>Implementer</td>
</tr>
</tbody>
</table>

**ProductID, bits [31:24]**

An IMPLEMENTATION DEFINED product identifier.

**Bits [23:20]**

Reserved, RES0.

**Variant, bits [19:16]**

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish product variants, or major revisions of a product.

**Revision, bits [15:12]**

An IMPLEMENTATION DEFINED revision number. Typically, this field is used to distinguish minor revisions of a product.

**Implementer, bits [11:0]**

Contains the JEP106 code of the company that implemented the Redistributor:

- Bits [11:8] are the JEP106 continuation code of the implementer. For an Arm implementation, this field is 0x4.
- Bit [7] is always 0.
- Bits [6:0] are the JEP106 identity code of the implementer. For an Arm implementation, bits [7:0] are therefore 0x3B.
Accessing the GICR_IIDR

GICR_IIDR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC RDistributor</td>
<td>RD_base</td>
<td>0x0004</td>
<td>GICR_IIDR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTRLR.DS == 0 accesses to this register are RO.
- When an access is Secure accesses to this register are RO.
- When an access is Non-secure accesses to this register are RO.
The GIC characteristics are:

**Purpose**

Invalidates any cached configuration data of all physical LPIs, causing the GIC to reload the interrupt configuration from the physical LPI Configuration table at the address specified by GICR_PROPBASER.

**Configuration**

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_INVALLR is a 64-bit register.

**Field descriptions**

The GICR_INVALLR bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| V  | RES0 | vPEID | RES0 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

**V, bit [63]**

When FEAT_GICv4p1 is implemented:

Indicates whether the INTID is virtual or physical.

<table>
<thead>
<tr>
<th>V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Invalidate is for a physical INTID.</td>
</tr>
<tr>
<td>0b1</td>
<td>Invalidate is for a virtual INTID.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

**Bits [62:48]**

Reserved, RES0.

**vPEID, bits [47:32]**

When FEAT_GICv4p1 is implemented:

When GICR_INVLPIR.V == 0, this field is RES0

When GICR_INVLPIR.V == 1, this field is the target vPEID of the invalidate.

**Note**
The size of this field is IMPLEMENTATION DEFINED, and is specified by the
GICD_TYPER2.VIL and GICD_TYPER2.VID fields. Unimplemented bits are
RES0.

Otherwise:
Reserved, RES0.

Bits [31:0]
Reserved, RES0.

Note
If any LPI has been forwarded to the PE and a valid write to GICR_INVALLR is
received, the Redistributor must ensure it reloads its properties from memory.
This has no effect on the forwarded LPI if it has already been activated.

Accessing the GICR_INVALLR

This register is mandatory when any of the following are true:

- GICR_TYPER.Direct is 1.
- GICR_CTLR.IR is 1.
- GICv4.1 is implemented.

Otherwise, the functionality is IMPLEMENTATION DEFINED.

Writes to this register have no effect if no physical LPIs are currently stored in the local Redistributor cache.

GICR_INVALLR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC</td>
<td>RD_base</td>
<td>0x0080</td>
<td>GICR_INVALLR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are WO.
- When an access is Secure accesses to this register are WO.
- When an access is Non-secure accesses to this register are WO.
GICR_INVLPiR, Redistributor Invalidate LPI Register

The GICR_INVLPiR characteristics are:

**Purpose**

Invalidates the cached configuration data of a specified LPI, causing the GIC to reload the interrupt configuration from the physical LPI Configuration table at the address specified by GICR_PROPBASER.

**Configuration**

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_INVLPiR is a 64-bit register.

**Field descriptions**

The GICR_INVLPiR bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| V | RES0 | INTID | vPEID |

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

**V, bit [63]**

When FEAT_GICv4p1 is implemented:

Indicates whether the INTID is virtual or physical.

<table>
<thead>
<tr>
<th>V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Invalidate is for a physical INTID.</td>
</tr>
<tr>
<td>0b1</td>
<td>Invalidate is for a virtual INTID.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

**Bits [62:48]**

Reserved, RES0.

**vPEID, bits [47:32]**

When FEAT_GICv4p1 is implemented:

When GICR_INVLPiR.V == 0, this field is RES0

When GICR_INVLPiR.V == 1, this field is the target vPEID of the invalidate.

**Note**
The size of this field is IMPLEMENTATION DEFINED, and is specified by the
GICD_TYPER2.VIL and GICD_TYPER2.VID fields. Unimplemented bits are
RES0.

Otherwise:

Reserved, RES0.

**INTID, bits [31:0]**

The INTID of the physical LPI to be cleaned.

**Note**

The size of this field is IMPLEMENTATION DEFINED, and is specified by the
GICD_TYPER.IDbits field. Unimplemented bits are RES0.

**Note**

If any LPI has been forwarded to the PE and a valid write to GICR_INVLPIR is
received, the Redistributor must ensure it reloads its properties from memory
and apply any changes by retrieving and reforwarding the LPI as required.
This has no effect on the forwarded LPI if it has already been activated.

**Accessing the GICR_INVLPIR**

When written with a 32-bit write the data is zero-extended to 64 bits.

This register is mandatory when any of the following are true:

- GICR_TYPER.Direct is 1.
- GICR_CTLR.IR is 1.
- GICv4.1 is implemented.

Otherwise, the functionality is IMPLEMENTATION DEFINED.

Writes to this register have no effect if either:

- The specified LPI is not currently stored in the local Redistributor.
- The pINTID field corresponds to an unimplemented LPI.

**GICR_INVLPIR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>RD_base</td>
<td>0x00A0</td>
<td>GICR_INVLPIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are WO.
- When an access is Secure accesses to this register are WO.
- When an access is Non-secure accesses to this register are WO.
GICR_IPRIORITYR\(n\), Interrupt Priority Registers, \(n = 0 - 7\)

The GICR_IPRIORITYR\(n\) characteristics are:

**Purpose**

Holds the priority of the corresponding interrupt for each SGI and PPI supported by the GIC.

**Configuration**

A copy of these registers is provided for each Redistributor.

These registers are configured as follows:

- GICR_IPRIORITYR0-GICR_IPRIORITYR3 store the priority of SGIs.
- GICR_IPRIORITYR4-GICR_IPRIORITYR7 store the priority of PPIs.

**Attributes**

GICR_IPRIORITYR\(n\) is a 32-bit register.

**Field descriptions**

The GICR_IPRIORITYR\(n\) bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>

</tbody>
</table>

*Priority_offset_3B*, bits [31:24]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

*Priority_offset_2B*, bits [23:16]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

*Priority_offset_1B*, bits [15:8]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

*Priority_offset_0B*, bits [7:0]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 0. Lower priority values correspond to greater priority of the interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing the GICR_IPRIORITYR<n>

These registers are used when affinity routing is enabled for the Security state of the interrupt. When affinity routing is not enabled the bits corresponding to the interrupt are RAZ/WI and GICD_IPRIORITYR<n> provides equivalent functionality.

These registers are used for SGIs and PPIs only. Equivalent functionality for SPIs is provided by GICD_IPRIORITYR<n>.

These registers are byte-accessible.

When GICD_CTLR.DS == 0:

- A field that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.
- A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in 'Software accesses of interrupt priority' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Note**

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

**GICR_IPRIORITYR<n> can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>SGI_base</td>
<td>0x0400 + (4 * n)</td>
<td>GICR_IPRIORITYR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.
The GICR_IPRIORITYR<n>E characteristics are:

**Purpose**

Holds the priority of the corresponding interrupt for each extended PPI supported by the GIC.

**Configuration**

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_IPRIORITYR<n>E are RES0.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_IPRIORITYR<n>E is a 32-bit register.

**Field descriptions**

The GICR_IPRIORITYR<n>E bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | Priority_offset_3B |
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | Priority_offset_2B |
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | Priority_offset_1B |
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | Priority_offset_0B |

**Priority_offset_3B, bits [31:24]**

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Priority_offset_2B, bits [23:16]**

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Priority_offset_1B, bits [15:8]**

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Priority_offset_0B, bits [7:0]**

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 0. Lower priority values correspond to greater priority of the interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:
• The corresponding GICR_IPRIORITYR<n> number, n, is given by \( n = (m-1024) \div 4 \).
• The offset of the required GICR_IPRIORITYR<n>E register is \((0x400 + (4*n))\).
• The byte offset of the required Priority field in this register is \( m \mod 4 \), where:
  ◦ Byte offset 0 refers to register bits [7:0].
  ◦ Byte offset 1 refers to register bits [15:8].
  ◦ Byte offset 2 refers to register bits [23:16].
  ◦ Byte offset 3 refers to register bits [31:24].

### Accessing the GICR_IPRIORITYR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISACTIVER<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS == 0:

• A field that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.
• A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in Software accesses of interrupt priority.

Bits corresponding to unimplemented interrupts are RAZ/WI.

---

**Note**

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than once. The effect of the change must be visible in finite time.

---

**GICR_IPRIORITYR<n>E can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>SGI_base</td>
<td>0x0400 + (4*n)</td>
<td>GICR_IPRIORITYR&lt;n&gt;E</td>

</tbody>
</table>

This interface is accessible as follows:

• When GICD_CTLR.DS == 0 accesses to this register are **RW**.
• When an access is Secure accesses to this register are **RW**.
• When an access is Non-secure accesses to this register are **RW**.
The GICR_ISACTIVER0 characteristics are:

**Purpose**

Activates the corresponding SGI or PPI. These registers are used when saving and restoring GIC state.

**Configuration**

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_ISACTIVER0 is a 32-bit register.

**Field descriptions**

The GICR_ISACTIVER0 bit assignments are:

<table>

<td>Set_active_bit1</td>
</tr>
<tr>
<td>0</td>
<td>Set_active_bit0</td>
</tr>
</tbody>
</table>

**Set_active_bit<x>, bit [x], for x = 31 to 0**

Adds the active state to interrupt number x. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Set_active_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that the corresponding interrupt is active, or is active and pending. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the GICR_ISACTIVER0**

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISACTIVER0, the corresponding bit is RAZ/WI and equivalent functionality is provided by GICD_ISACTIVER<n> with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by GICD_ISACTIVER<n>.

When GICD_CTLR.DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

**GICR_ISACTIVER0 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>SGI_base</td>
<td>0x0300</td>
<td>GICR_ISACTIVER0</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICR_ISACTIVER\(<n>E\), Interrupt Set-Active Registers, \(n = 1 - 2\)

The GICR_ISACTIVER\(<n>E\) characteristics are:

**Purpose**

Adds the active state to the corresponding PPI.

**Configuration**

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_ISACTIVER\(<n>E\) are RES0.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_ISACTIVER\(<n>E\) is a 32-bit register.

**Field descriptions**

The GICR_ISACTIVER\(<n>E\) bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set_active_bit31</td>
<td>Set_active_bit30</td>
<td>Set_active_bit29</td>
<td>Set_active_bit28</td>
<td>Set_active_bit27</td>
<td>Set_active_bit26</td>
<td>Set_active_bit25</td>
</tr>
</tbody>
</table>

**Set_active_bit\(<x>\), bit \([x]\), for \(x = 31\) to \(0\)**

For the extended PPIs, adds the active state to interrupt number \(x\). Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Set_active_bit(&lt;x&gt;)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that the corresponding interrupt is active, or active and pending on this PE. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

For INTID \(m\), when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ISACTIVER\(<n>E\) number, \(n\), is given by \(n = (m-1024) \text{ DIV } 32\).
- The offset of the required GICR_ISACTIVER\(<n>E\) is \((0x200 + (4*n))\).
- The bit number of the required group modifier bit in this register is \((m-1024) \text{ MOD } 32\).

**Accessing the GICR_ISACTIVER\(<n>E\)**

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISACTIVER\(<n>E\), the corresponding bit is RES0.

When GICD_CTRLR.DS==0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.
Bits corresponding to unimplemented interrupts are RAZ/WI.

**GICR_ISACTIVER<n>E can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>

</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RO.
- When an access is Secure accesses to this register are RO.
- When an access is Non-secure accesses to this register are RO.
GICR_NSACR, Non-secure Access Control Register

The GICR_NSACR characteristics are:

**Purpose**

Enables Secure software to permit Non-secure software to create SGIs targeting the PE connected to this Redistributor by writing to ICC_SGI1R_EL1, ICC_ASGI1R_EL1 or ICC_SGI0R_EL1.

For more information, see 'Forwarding an SGI to a target PE' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Configuration**

For a description on when a write to ICC_SGI0R_EL1, ICC_SGI1R_EL1 or ICC_ASGI1R_EL1 is permitted to generate an interrupt, see 'Use of control registers for SGI forwarding' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Attributes**

GICR_NSACR is a 32-bit register.

**Field descriptions**

The GICR_NSACR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| NS_access15 | NS_access14 | NS_access13 | NS_access12 | NS_access11 | NS_access10 | NS_access9 | NS_access8 | NS_access7 |

**NS_access<x>, bits [2x+1:2x], for x = 15 to 0**

Configures the level of Non-secure access permitted when the SGI is in Secure Group 0 or Secure Group 1, as defined from GICR_IGROUPR0 and GICR_IGRPMODR0. A field is provided for each SGI. The possible values of each 2-bit field are:

<table>
<thead>
<tr>
<th>NS_access&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-secure writes are not permitted to generate Secure Group 0 SGIs or Secure Group 1 SGIs.</td>
</tr>
<tr>
<td>0b01</td>
<td>Non-secure writes are permitted to generate a Secure Group 0 SGI.</td>
</tr>
<tr>
<td>0b10</td>
<td>As 0b01, but additionally Non-secure writes to are permitted to generate a Secure Group 1 SGI.</td>
</tr>
<tr>
<td>0b11</td>
<td>Reserved. If the field is programmed to the reserved value, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the valid values. However, to maintain the principle that as the value increases additional accesses are permitted Arm strongly recommends that implementations treat this value as 0b10. It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the valid value chosen.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the GICR_NSACR**

When GICD_CTRLR.DS == 1, this register is RAZ/WI.
When `GICD_CTLR.DS == 0`, this register is Secure, and is RAZ/WI to Non-secure accesses.

This register is used when affinity routing is enabled. When affinity routing is not enabled for the Security state of the interrupt, `GICD_NSACR<n>` with n=0 provides equivalent functionality.

This register does not support PPIs.

**GICR_NSACR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>SGI_base</td>
<td>0x0E00</td>
<td>GICR_NSACR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICR_PARTIDR, Set PARTID and PMG Register

The GICR_PARTIDR characteristics are:

Purpose

Sets the PARTID and PMG values used for memory accesses by the Redistributor.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_PARTIDR are RES0.

A copy of this register is provided for each Redistributor.

When GICR_TYPER.MPAM==0, this register is RES0.

Attributes

GICR_PARTIDR is a 32-bit register.

Field descriptions

The GICR_PARTIDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:24</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>23:16</td>
<td>PMG value used when Redistributor accesses memory. It is IMPLEMENTATION DEFINED whether bits not needed to represent PMG values in the range 0 to PMG_MAX are stateful or RES0. On a Warm reset, this field resets to 0.</td>
</tr>
<tr>
<td>15:0</td>
<td>PARTID value used when Redistributor accesses memory. It is IMPLEMENTATION DEFINED whether bits not needed to represent PARTID values in the range 0 to PARTID_MAX are stateful or RES0. On a Warm reset, this field resets to 0.</td>
</tr>
</tbody>
</table>

Accessing the GICR_PARTIDR

GICR_PARTIDR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
</table>

Page 3816
This interface is accessible as follows:

- When \( \text{GICD_CTLR.DS} == 0 \) accesses to this register are \text{RW}.
- When an access is Secure accesses to this register are \text{RW}.
- When an access is Non-secure accesses to this register are \text{RW}.
The GICR_PENDBASER characteristics are:

**Purpose**

Specifies the base address of the LPI Pending table, and the Shareability and Cacheability of accesses to the LPI Pending table.

**Configuration**

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_PENDBASER is a 64-bit register.

**Field descriptions**

The GICR_PENDBASER bit assignments are:

<table>
<thead>
<tr>
<th>Bit [63]</th>
<th>Reserved, RE0.</th>
</tr>
</thead>
<tbody>
<tr>
<td>PTZ, bit [62]</td>
<td>Pending Table Zero. Indicates to the Redistributor whether the LPI Pending table is zero when GICR_CTLR.EnableLPi == 1. This field is WO, and reads as 0.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>PTZ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The LPI Pending table is not zero, and contains live data.</td>
</tr>
<tr>
<td>0b1</td>
<td>The LPI Pending table is zero. Software must ensure the LPI Pending table is zero before this value is written.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Bits [61:59]</th>
<th>Reserved, RE0.</th>
</tr>
</thead>
<tbody>
<tr>
<td>OuterCache, bits [58:56]</td>
<td>Indicates the Outer Cacheability attributes of accesses to the LPI Pending table. The possible values of this field are:</td>
</tr>
</tbody>
</table>
OuterCache

| 0b000 | Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability. |
| 0b001 | Normal Outer Non-cacheable. |
| 0b010 | Normal Outer Cacheable Read-allocate, Write-through. |
| 0b011 | Normal Outer Cacheable Read-allocate, Write-back. |
| 0b100 | Normal Outer Cacheable Write-allocate, Write-through. |
| 0b101 | Normal Outer Cacheable Write-allocate, Write-back. |
| 0b110 | Normal Outer Cacheable Read-allocate, Write-allocate, Write-through. |
| 0b111 | Normal Outer Cacheable Read-allocate, Write-allocate, Write-back. |

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [55:52]**

Reserved, RES0.

**Physical Address, bits [51:16]**

Bits [51:16] of the physical address containing the LPI Pending table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [15:12]**

Reserved, RES0.

**Shareability, bits [11:10]**

Indicates the Shareability attributes of accesses to the LPI Pending table. The possible values of this field are:

<table>
<thead>
<tr>
<th>Shareability</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Inner Shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Reserved. Treated as 0b00.</td>
</tr>
</tbody>
</table>

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**InnerCache, bits [9:7]**

Indicates the Inner Cacheability attributes of accesses to the LPI Pending table. The possible values of this field are:

<table>
<thead>
<tr>
<th>InnerCache</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Device-nGnRnE.</td>
</tr>
<tr>
<td>0b001</td>
<td>Normal Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b010</td>
<td>Normal Inner Cacheable Read-allocate, Write-through.</td>
</tr>
<tr>
<td>0b011</td>
<td>Normal Inner Cacheable Read-allocate, Write-back.</td>
</tr>
<tr>
<td>0b100</td>
<td>Normal Inner Cacheable Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b101</td>
<td>Normal Inner Cacheable Write-allocate, Write-back.</td>
</tr>
<tr>
<td>0b110</td>
<td>Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b111</td>
<td>Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.</td>
</tr>
</tbody>
</table>
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [6:0]**

Reserved, RES0.

**Accessing the GICR_PENDBASER**

Having the GICR_PENDBASER OuterCache, Shareability or InnerCache fields programmed to different values on different Redistributors with **GICR_CTLR**.EnableLPi == 1 in the system is UNPREDICTABLE.

Changing GICR_PENDBASER with **GICR_CTLR**.EnableLPi == 1 is UNPREDICTABLE.

**GICR_PENDBASER** can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>RD_base</td>
<td>0x0078</td>
<td>GICR_PENDBASER</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

Copyright © 2010-2020 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.
The GICR_PROPBASER characteristics are:

**Purpose**

Specifies the base address of the LPI Configuration table, and the Shareability and Cacheability of accesses to the LPI Configuration table.

**Configuration**

A copy of this register is provided for each Redistributor.

An implementation might make this register RO, for example to correspond to an LPI Configuration table in read-only memory.

**Attributes**

GICR_PROPBASER is a 64-bit register.

**Field descriptions**

The GICR_PROPBASER bit assignments are:

<table>
<thead>
<tr>
<th>Bit Positions</th>
<th>Bit Assignments</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:59</td>
<td>RES0 OuterCache RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>31:0</td>
<td>Physical Address Shareability InnerCache RES0 IDbits</td>
<td>Physical Address, InnerCache, RES0, IDbits.</td>
</tr>
</tbody>
</table>

**Bits [63:59]**

Reserved, RES0.

**OuterCache, bits [58:56]**

Indicates the Outer Cacheability attributes of accesses to the LPI Configuration table. The possible values of this field are:

<table>
<thead>
<tr>
<th>OuterCache</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.</td>
</tr>
<tr>
<td>0b001</td>
<td>Normal Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b010</td>
<td>Normal Outer Cacheable Read-allocate, Write-through.</td>
</tr>
<tr>
<td>0b011</td>
<td>Normal Outer Cacheable Read-allocate, Write-back.</td>
</tr>
<tr>
<td>0b100</td>
<td>Normal Outer Cacheable Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b101</td>
<td>Normal Outer Cacheable Write-allocate, Write-back.</td>
</tr>
<tr>
<td>0b110</td>
<td>Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b111</td>
<td>Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.</td>
</tr>
</tbody>
</table>

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Bits [55:52]

Reserved, RES0.

Physical_Address, bits [51:12]

Bits [51:12] of the physical address containing the LPI Configuration table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the LPI Configuration table. The possible values of this field are:

<table>
<thead>
<tr>
<th>Shareability</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Inner Shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Reserved. Treated as 0b00.</td>
</tr>
</tbody>
</table>

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the LPI Configuration table. The possible values of this field are:

<table>
<thead>
<tr>
<th>InnerCache</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Device-nGnRnE.</td>
</tr>
<tr>
<td>0b001</td>
<td>Normal Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b010</td>
<td>Normal Inner Cacheable Read-allocate, Write-through.</td>
</tr>
<tr>
<td>0b011</td>
<td>Normal Inner Cacheable Read-allocate, Write-back.</td>
</tr>
<tr>
<td>0b100</td>
<td>Normal Inner Cacheable Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b101</td>
<td>Normal Inner Cacheable Write-allocate, Write-back.</td>
</tr>
<tr>
<td>0b110</td>
<td>Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b111</td>
<td>Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IDbits, bits [4:0]

The number of bits of LPI INTID supported, minus one, by the LPI Configuration table starting at Physical_Address.

If the value of this field is larger than the value of GICD_TYPER.IDbits, the GICD_TYPER.IDbits value applies.

If the value of this field is less than 0b1101, indicating that the largest INTID is less than 8192 (the smallest LPI interrupt ID), the GIC will behave as if all physical LPis are out of range.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing the GICR_PROPBASER

It is IMPLEMENTATION DEFINED whether GICR_PROPBASER can be set to different values on different Redistributors. GICR_TYPER.CommonLPIAff identifies the Redistributors that must have GICR_PROPBASER set to the same values whenever GICR_CTLR.EnableLPIs == 1.

Setting different values in different copies of GICR_PROPBASER on Redistributors that are required to use a common LPI Configuration table when GICR_CTLR.EnableLPIs == 1 leads to UNPREDICTABLE behavior.

Other restrictions apply when a Redistributor caches information from GICR_PROPBASER. For more information, see 'LPI Configuration tables' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

GICR_PROPBASER can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>RD_base</td>
<td>0x0070</td>
<td>GICR_PROPBASER</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RW.
- When an access is Secure accesses to this register are RW.
- When an access is Non-secure accesses to this register are RW.
The GICR_SETLPIR characteristics are:

**Purpose**

Generates an LPI by setting the pending state of the specified LPI.

**Configuration**

This register is present only when FEAT_GICv4p1 is implemented. Otherwise, direct accesses to GICR_SETLPIR are RES0.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_SETLPIR is a 64-bit register.

**Field descriptions**

The GICR_SETLPIR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:32</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>31:0</td>
<td>pINTID, bits [31:0]</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**pINTID, bits [31:0]**

The INTID of the physical LPI to be generated.

---

**Note**

The size of this field is IMPLEMENTATION DEFINED, and is specified by the GICD_TYPER.IDbits field. Unimplemented bits are RES0.

**Accessing the GICR_SETLPIR**

When written with a 32-bit write the data is zero-extended to 64 bits.

This register is mandatory in an implementation that supports LPIS and does not include an ITS. The functionality is IMPLEMENTATION DEFINED in an implementation that does include an ITS.

Writes to this register have no effect if either:

- The pINTID field corresponds to an LPI that is already pending.
- The pINTID field corresponds to an unimplemented LPI.
- GICR_CTLR_EnableLPIS == 0.
**GICR_SETLPIR** can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>RD_base</td>
<td>0x0040</td>
<td>GICR_SETLPIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.
GICR_STATUSR, Error Reporting Status Register

The GICR_STATUSR characteristics are:

**Purpose**

Provides software with a mechanism to detect:

- Accesses to reserved locations.
- Writes to read-only locations.
- Reads of write-only locations.

**Configuration**

A copy of this register is provided for each Redistributor.

If the GIC implementation supports two Security states this register is Banked to provide Secure and Non-secure copies.

**Attributes**

GICR_STATUSR is a 32-bit register.

**Field descriptions**

The GICR_STATUSR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:4]**

Reserved, RES0.

**WROD, bit [3]**

Write to an RO location.

<table>
<thead>
<tr>
<th>WROD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A write to an RO location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.

**RWOD, bit [2]**

Read of a WO location.

<table>
<thead>
<tr>
<th>RWOD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A read of a WO location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.

**WRD, bit [1]**

Write to a reserved location.
When a violation is detected, software must write 1 to this register to reset it.

**RRD, bit [0]**

Read of a reserved location.

<table>
<thead>
<tr>
<th>RRD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A read of a reserved location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.

**Accessing the GICR_STATUSR**

This is an optional register. If the register is not implemented, the location is RAZ/WI.

**GICR_STATUSR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>RD_base</td>
<td>0x0010</td>
<td>GICR_STATUSR(S)</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>RD_base</td>
<td>0x0010</td>
<td>GICR_STATUSR(NS)</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.
GICR_SYNCR, Redistributor Synchronize Register

The GICR_SYNCR characteristics are:

**Purpose**

Indicates completion of register based invalidate operations.

**Configuration**

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_SYNCR is a 32-bit register.

**Field descriptions**

The GICR_SYNCR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Bit Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-1</td>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>0</td>
<td>Busy</td>
<td>Indicates completion of invalidation operations</td>
</tr>
</tbody>
</table>

**Busy, bit [0]**

Indicates completion of invalidation operations

<table>
<thead>
<tr>
<th>Busy</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No operations are in progress.</td>
</tr>
<tr>
<td>0b1</td>
<td>A write is in progress to one or more of the following registers:</td>
</tr>
<tr>
<td></td>
<td>• GICR_INVLPIR.</td>
</tr>
<tr>
<td></td>
<td>• GICR_INVALLR.</td>
</tr>
<tr>
<td></td>
<td>• GICv3, GICR_CLRLPIR.</td>
</tr>
</tbody>
</table>

This field tracks operations initiated on the same Redistributor.

**Accessing the GICR_SYNCR**

When this register is accessed, it is optional that an implementation might wait until all operations are complete before returning a value, in which case GICR_SYNCR.Busy is always 0.

This register is mandatory when any of the following are true:

- GICR_TYPER.Direct is 1.
- GICR_CTLR.IR is 1.
- GICv4.1 is implemented.

Otherwise, the functionality is IMPLEMENTATION DEFINED.

**GICR_SYNCR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
</table>
This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RO.
- When an access is Secure accesses to this register are RO.
- When an access is Non-secure accesses to this register are RO.
The GICR_TYPER characteristics are:

**Purpose**

Provides information about the configuration of this Redistributor.

**Configuration**

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_TYPER is a 64-bit register.

**Field descriptions**

The GICR_TYPER bit assignments are:

<table>
<thead>
<tr>
<th>Affinity Value</th>
<th>VLPIS</th>
<th>PLPIS</th>
<th>Last</th>
<th>DirectLP</th>
<th>Dirty</th>
<th>MPAM</th>
<th>DPGS</th>
<th>RVPEID</th>
<th>Processor_Number</th>
<th>CommonLP</th>
<th>VSGI</th>
<th>PPInum</th>
</tr>
</thead>
<tbody>
<tr>
<td>6362616059</td>
<td>58</td>
<td>57</td>
<td>56</td>
<td>55545352515049484746454443424140</td>
<td>39</td>
<td>38</td>
<td>37</td>
<td>36</td>
<td>35</td>
<td>34</td>
<td>33</td>
<td>32</td>
</tr>
</tbody>
</table>

**Affinity_Value, bits [63:32]**

The identity of the PE associated with this Redistributor.

Bits [63:56] provide Aff3, the Affinity level 3 value for the Redistributor.

Bits [55:48] provide Aff2, the Affinity level 2 value for the Redistributor.

Bits [47:40] provide Aff1, the Affinity level 1 value for the Redistributor.

Bits [39:32] provide Aff0, the Affinity level 0 value for the Redistributor.

**PPInum, bits [31:27]**

When FEAT_GICv3p1 is implemented:

The value derived from this field specifies the maximum PPI INTID that a GIC implementation can support. An implementation might not implement all PPIs up to this maximum.

<table>
<thead>
<tr>
<th>PPInum</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00000</td>
<td>Maximum PPI INTID is 31.</td>
</tr>
<tr>
<td>0b00001</td>
<td>Maximum PPI INTID is 1087.</td>
</tr>
<tr>
<td>0b00010</td>
<td>Maximum PPI INTID is 1119.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Otherwise:**

Reserved, RES0.
**VSGI, bit [26]**

When **FEAT_GICv4p1** is implemented:

Indicates whether vSGIs are supported.

<table>
<thead>
<tr>
<th>VSGI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Direct injection of SGIs not supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>Direct injection of SGIs supported.</td>
</tr>
</tbody>
</table>

**Otherwise:**

Reserved, RES0.

**CommonLPIAff, bits [25:24]**

The affinity level at which Redistributors share an LPI Configuration table.

<table>
<thead>
<tr>
<th>CommonLPIAff</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>All Redistributors must share an LPI Configuration table.</td>
</tr>
<tr>
<td>0b01</td>
<td>All Redistributors with the same Aff3 value must share an LPI Configuration table.</td>
</tr>
<tr>
<td>0b10</td>
<td>All Redistributors with the same Aff3.Aff2 value must share an LPI Configuration table.</td>
</tr>
<tr>
<td>0b11</td>
<td>All Redistributors with the same Aff3.Aff2.Aff1 value must share an LPI Configuration table.</td>
</tr>
</tbody>
</table>

**Processor_Number, bits [23:8]**

A unique identifier for the PE. When **GITS_TYPER.PTA == 0**, an ITS uses this field to identify the interrupt target.

When affinity routing is disabled for a Security state, this field indicates which **GICD_ITARGETSR<n>** corresponds to this Redistributor.

**RVPEID, bit [7]**

When **FEAT_GICv4p1** is implemented:

Indicates how the resident vPE is specified.

<table>
<thead>
<tr>
<th>RVPEID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><strong>GICR_VPENDBASER</strong> records the address of the vPE's Virtual Pending Table.</td>
</tr>
<tr>
<td>0b1</td>
<td><strong>GICR_VPENDBASER</strong> records vPEID.</td>
</tr>
</tbody>
</table>

**Otherwise:**

Reserved, RES0.

**MPAM, bit [6]**

When **FEAT_GICv3p1** is implemented:

<table>
<thead>
<tr>
<th>MPAM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MPAM not supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAM supported.</td>
</tr>
</tbody>
</table>
Otherwise:

Reserved, RES0.

**DPGS, bit [5]**

Sets support for GICR_CTLR.DPG* bits.

<table>
<thead>
<tr>
<th>DPGS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>GICR_CTLR.DPG* bits are not supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>GICR_CTLR.DPG* bits are supported.</td>
</tr>
</tbody>
</table>

**Last, bit [4]**

Indicates whether this Redistributor is the highest-numbered Redistributor in a series of contiguous Redistributor pages.

<table>
<thead>
<tr>
<th>Last</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This Redistributor is not the highest-numbered Redistributor in a series of contiguous Redistributor pages.</td>
</tr>
<tr>
<td>0b1</td>
<td>This Redistributor is the highest-numbered Redistributor in a series of contiguous Redistributor pages.</td>
</tr>
</tbody>
</table>

**DirectLPI, bit [3]**

Indicates whether this Redistributor supports direct injection of LPIs.

<table>
<thead>
<tr>
<th>DirectLPI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This Redistributor does not support direct injection of LPIs. The GICR_SETLPIR, GICR_CLRLPIR, GICR_INVLPIR, GICR_INVALLR, and GICR_SYNCR registers are either not implemented, or have an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>This Redistributor supports direct injection of LPIs. The GICR_SETLPIR, GICR_CLRLPIR, GICR_INVLPIR, GICR_INVALLR, and GICR_SYNCR registers are implemented.</td>
</tr>
</tbody>
</table>

**Dirty, bit [2]**

Controls the functionality of GICR_VPENDBASER.Dirty.

<table>
<thead>
<tr>
<th>Dirty</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>GICR_VPENDBASER.Dirty is UNKNOWN when GICR_VPENDBASER.Valid == 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>GICR_VPENDBASER.Dirty indicates when the Virtual Pending Table has been parsed when GICR_VPENDBASER.Valid is written from 0 to 1.</td>
</tr>
</tbody>
</table>

When GICR_TYPER.VLPIS == 0, this field is RES0.

**Note**

In GICv4p1 implementations this field is RES1.

**VLPIS, bit [1]**

Indicates whether the GIC implementation supports virtual LPIs and the direct injection of virtual LPIs.
<table>
<thead>
<tr>
<th>VLPIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The implementation does not support virtual LPIs or the direct injection of virtual LPIs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The implementation supports virtual LPIs and the direct injection of virtual LPIs.</td>
</tr>
</tbody>
</table>

**Note**

In GICv3 implementations this field is res0.

---

### PLPIS, bit [0]

Indicates whether the GIC implementation supports physical LPIs.

<table>
<thead>
<tr>
<th>PLPIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The implementation does not support physical LPIs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The implementation supports physical LPIs.</td>
</tr>
</tbody>
</table>

---

**Accessing the GICR_TYPER**

**GICR_TYPER can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>RD_base</td>
<td>0x0008</td>
<td>GICR_TYPER</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.
GICR_VPENDBASER, Virtual Redistributor LPI Pending Table Base Address Register

The GICR_VPENDBASER characteristics are:

### Purpose

Specifies the base address of the memory that holds the virtual LPI Pending table for the currently scheduled virtual machine.

### Configuration

#### Attributes

GICR_VPENDBASER is a 64-bit register.

#### Field descriptions

The GICR_VPENDBASER bit assignments are:

### When FEAT_GICv4 is implemented:

<table>
<thead>
<tr>
<th>Field</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Valid</td>
<td>bit [63]</td>
</tr>
<tr>
<td>0b0</td>
<td>The virtual LPI Pending table is not valid. No vPE is scheduled.</td>
</tr>
<tr>
<td>0b1</td>
<td>The virtual LPI Pending table is valid. A vPE is scheduled.</td>
</tr>
</tbody>
</table>

Setting GICR_VPENDBASER.Valid == 1 when the associated CPU interface does not implement FEAT_GICv4 is UNPREDICTABLE.

#### Note

Software can determine whether a PE supports FEAT_GICv3 or FEAT_GICv4 by reading ID_AA64PFR0_EL1.

Writing a new value to any bit of GICR_VPENDBASER, other than GICR_VPENDBASER.Valid, when GICR_VPENDBASER.Valid==1 is UNPREDICTABLE.

On a Warm reset, this field resets to 0.

#### IDAI, bit [62]

Implementation Defined Area Invalid. Indicates whether the IMPLEMENTATION DEFINED area in the virtual LPI Pending table is valid.
For more information, see 'LPI Pending tables' and 'Virtual LPI Configuration tables and virtual LPI Pending tables' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**PendingLast, bit [61]**

Indicates whether there are pending and enabled interrupts for the last scheduled vPE.

This value is set by the implementation when GICR_VPENDBASER.Valid has been written from 1 to 0 and is otherwise **UNKNOWN**.

<table>
<thead>
<tr>
<th>PendingLast</th>
<th>Meaning</th>
<th>IDAI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>There are no pending and enabled interrupts for the last scheduled vPE.</td>
<td>The IMPLEMENTATION DEFINED area is valid.</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>There is at least one pending interrupt for the last scheduled vPE. It is IMPLEMENTATION DEFINED whether this bit is set when the only pending interrupts for the last scheduled vPE are not enabled. Arm deprecates setting PendingLast to 1 when the only pending interrupts for the last scheduled virtual machine are not enabled.</td>
<td>The IMPLEMENTATION DEFINED area is invalid and all pending interrupt information is held in the architecturally defined part of the virtual LPI Pending table.</td>
<td></td>
</tr>
</tbody>
</table>

When the GICR_VPENDBASER.Valid bit is written from 0 to 1, this bit is RES1.

On a Warm reset, this field resets to 0.

**Dirty, bit [60]**

- **When GICR_VPENDBASER.Valid == 0:**
  Indicates whether a de-scheduling operation is in progress.
  This field is read-only.

<table>
<thead>
<tr>
<th>Dirty</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No de-scheduling operation in process.</td>
</tr>
<tr>
<td>0b1</td>
<td>De-scheduling operation in process.</td>
</tr>
</tbody>
</table>

Writing 1 to GICR_VPENDBASER.Valid is **UNPREDICTABLE** while GICR_VPENDBASER.Dirty==1.

On a Warm reset, this field resets to 0.

- **When GICR_VPENDBASER.Valid == 1 and GICR_TYPER.Dirty == 1:**
  This field is read-only. Reports whether the Virtual Pending table has been parsed.

<table>
<thead>
<tr>
<th>Dirty</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Parsing of the Virtual Pending Table has completed.</td>
</tr>
<tr>
<td>0b1</td>
<td>Parsing of the Virtual Pending Table has not completed.</td>
</tr>
</tbody>
</table>

Writing 1 to GICR_VPENDBASER.Valid is **UNPREDICTABLE** while GICR_VPENDBASER.Dirty == 1.

On a Warm reset, this field resets to 0.

**Otherwise:**

This field is read-only. This fields is **UNKNOWN**.
On a Warm reset, this field resets to 0.

**Bit [59]**

Reserved, RES0.

**OuterCache, bits [58:56]**

Indicates the Outer Cacheability attributes of accesses to virtual LPI Pending tables of vPEs targeting this Redistributor.

<table>
<thead>
<tr>
<th>OuterCache</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.</td>
</tr>
<tr>
<td>0b001</td>
<td>Normal Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b010</td>
<td>Normal Outer Cacheable Read-allocate, Write-through.</td>
</tr>
<tr>
<td>0b011</td>
<td>Normal Outer Cacheable Read-allocate, Write-back.</td>
</tr>
<tr>
<td>0b100</td>
<td>Normal Outer Cacheable Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b101</td>
<td>Normal Outer Cacheable Write-allocate, Write-back.</td>
</tr>
<tr>
<td>0b110</td>
<td>Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b111</td>
<td>Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.</td>
</tr>
</tbody>
</table>

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The Cacheability, Outer Cacheability and Shareability fields are used for accesses to the virtual LPI Pending table of resident and non-resident vPEs.

If the OuterCacheability attribute of the virtual LPI Pending tables that are associated with vPEs targeting the same Redistributor are different, behavior is UNPREDICTABLE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [55:52]**

Reserved, RES0.

**Physical_Address, bits [51:16]**

Bits [51:16] of the physical address containing the virtual LPI Pending table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [15:12]**

Reserved, RES0.

**Shareability, bits [11:10]**

Indicates the Shareability attributes of accesses to the virtual LPI Pending table.

<table>
<thead>
<tr>
<th>Shareability</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Inner Shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Reserved. Treated as 0b00.</td>
</tr>
</tbody>
</table>

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.
The Cacheability, Outer Cacheability and Shareability fields are used for accesses to the virtual LPI Pending table of resident and non-resident vPEs.

If the Shareability attribute of the virtual LPI Pending tables that are associated with vPEs targeting the same Redistributor are different, behavior is **UNPREDICTABLE**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the virtual LPI Pending table.

<table>
<thead>
<tr>
<th>InnerCache</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Device-nGnRnE.</td>
</tr>
<tr>
<td>0b001</td>
<td>Normal Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b010</td>
<td>Normal Inner Cacheable Read-allocate, Write-through.</td>
</tr>
<tr>
<td>0b011</td>
<td>Normal Inner Cacheable Read-allocate, Write-back.</td>
</tr>
<tr>
<td>0b100</td>
<td>Normal Inner Cacheable Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b101</td>
<td>Normal Inner Cacheable Write-allocate, Write-back.</td>
</tr>
<tr>
<td>0b110</td>
<td>Normal Inner Cacheable Write-allocate, Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b111</td>
<td>Normal Inner Cacheable Write-allocate, Write-allocate, Write-back.</td>
</tr>
</tbody>
</table>

The Cacheability, Outer Cacheability and Shareability fields are used for accesses to the virtual LPI Pending table of resident and non-resident vPEs.

If the InnerCacheability attribute of the virtual LPI Pending tables that are associated with vPEs targeting the same Redistributor are different, behavior is **UNPREDICTABLE**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Bits [6:0]

Reserved, RES0.

### When FEAT_GICv4p1 is implemented:

<table>
<thead>
<tr>
<th>63</th>
<th>62</th>
<th>61</th>
<th>60</th>
<th>59</th>
<th>58</th>
<th>57</th>
<th>56</th>
<th>55</th>
<th>54</th>
<th>53</th>
<th>52</th>
<th>51</th>
<th>50</th>
<th>49</th>
<th>48</th>
<th>47</th>
<th>46</th>
<th>45</th>
<th>44</th>
<th>43</th>
<th>42</th>
<th>41</th>
<th>40</th>
<th>39</th>
<th>38</th>
<th>37</th>
<th>36</th>
<th>35</th>
<th>34</th>
<th>33</th>
<th>32</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>30</td>
<td>29</td>
<td>28</td>
<td>27</td>
<td>26</td>
<td>25</td>
<td>24</td>
<td>23</td>
<td>22</td>
<td>21</td>
<td>20</td>
<td>19</td>
<td>18</td>
<td>17</td>
<td>16</td>
<td>15</td>
<td>14</td>
<td>13</td>
<td>12</td>
<td>11</td>
<td>10</td>
<td>9</td>
<td>8</td>
<td>7</td>
<td>6</td>
<td>5</td>
<td>4</td>
<td>3</td>
<td>2</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Valid</th>
<th>Doorbell</th>
<th>PendingLast</th>
<th>Dirty</th>
<th>VGrp0En</th>
<th>VGrp1En</th>
<th>RES0</th>
<th>vPEID</th>
</tr>
</thead>
</table>

### Valid, bit [63]

This bit controls whether a vPE is scheduled:

<table>
<thead>
<tr>
<th>Valid</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The virtual LPI Pending table is not valid. No vPE is scheduled.</td>
</tr>
<tr>
<td>0b1</td>
<td>The virtual LPI Pending table is valid. A vPE is scheduled.</td>
</tr>
</tbody>
</table>

Setting GICR_VPENDBASER.Valid == 1 when the associated CPU interface does not implement FEAT_GICv4 is **UNPREDICTABLE**.

### Note

Software can determine whether a PE supports FEAT_GICv3 or FEAT_GICv4 by reading ID_AA64PFR0_EL1.

Writing a new value to any bit of GICR_VPENDBASER, other than GICR_VPENDBASER.Valid, when GICR_VPENDBASER.Valid==1 is **UNPREDICTABLE**.

Setting GICR_VPENDBASER.Valid to 1 is **UNPREDICTABLE** if GICR_VPRPBASER.Valid == 0.

On a Warm reset, this field resets to 0.
Doorbell, bit [62]

When GICR_VPENDBASER.Valid is written from 1 to 0, this bit controls whether a default doorbell interrupt is requested for the descheduled vPE.

<table>
<thead>
<tr>
<th>Doorbell</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No default doorbell requested.</td>
</tr>
<tr>
<td>0b1</td>
<td>Default doorbell requested.</td>
</tr>
</tbody>
</table>

When GICR_VPENDBASER.Valid is written from 1 to 0, if there are outstanding enabled pending interrupts then this bit is treated as 0.

When GICR_VPENDBASER.Valid is written from 1 to 0, if GICR_VPENDBASER.PendingLast is written as 1 then this bit is treated as 0.

When GICR_VPENDBASER.Valid == 1, reads return an **UNKNOWN** value.

On a Warm reset, this field resets to an **UNKNOWN** value.

PendingLast, bit [61]

Indicates whether there are pending and enabled interrupts for the last scheduled vPE.

This value is set by the implementation when GICR_VPENDBASER.Valid is written from 1 to 0 and is otherwise **UNKNOWN**.

<table>
<thead>
<tr>
<th>PendingLast</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>There are no pending and enabled interrupts for the last scheduled vPE.</td>
</tr>
<tr>
<td>0b1</td>
<td>There is at least one pending and enabled interrupt for the last scheduled vPE.</td>
</tr>
</tbody>
</table>

When the GICR_VPENDBASER.Valid bit is written from 0 to 1, this bit is **RES1**.

When GICR_VPENDBASER.Valid is written from 1 to 0, if GICR_VPENDBASER.PendingLast is written as 1, then this bit is set to an **UNKNOWN** value.

On a Warm reset, this field resets to an **UNKNOWN** value.

Dirty, bit [60]

**When GICR_VPENDBASER.Valid == 0:**

Read-only. Indicates whether a de-scheduling operation is in progress.

<table>
<thead>
<tr>
<th>Dirty</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No de-scheduling operation in progress.</td>
</tr>
<tr>
<td>0b1</td>
<td>De-scheduling operation in progress.</td>
</tr>
</tbody>
</table>

Writing 1 to GICR_VPENDBASER.Valid is **UNPREDICTABLE** while GICR_VPENDBASER.Dirty == 1.

On a Warm reset, this field resets to 0.

**Otherwise:**

Read-only. Reports whether the Virtual Pending table has been parsed.

<table>
<thead>
<tr>
<th>Dirty</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Parsing of the Virtual Pending Table is complete.</td>
</tr>
<tr>
<td>0b1</td>
<td>Parsing of the Virtual Pending Table has not completed.</td>
</tr>
</tbody>
</table>

Writing 1 to GICR_VPENDBASER.Valid is **UNPREDICTABLE** while GICR_VPENDBASER.Dirty == 1.

On a Warm reset, this field resets to 0.
Enable virtual Group 0 interrupts.

<table>
<thead>
<tr>
<th>VGrp0En</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Forwarding of virtual Group 0 interrupts disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Forwarding of virtual Group 0 interrupts enabled.</td>
</tr>
</tbody>
</table>

Writing a new value to VGrp0En while GICR_VPENDBASER.Valid==1 is CONSTRAINED UNPREDICTABLE:

- The update is ignored.
- The update is ignored for all purposes other than a direct read of the register.
- The virtual group enable is updated.

On a Warm reset, this field resets to an UNKNOWN value.

Enable virtual Group 1 interrupts.

<table>
<thead>
<tr>
<th>VGrp1En</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Forwarding of virtual Group 1 interrupts disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Forwarding of virtual Group 1 interrupts enabled.</td>
</tr>
</tbody>
</table>

Writing a new value to VGrp1En while GICR_VPENDBASER.Valid==1 is CONSTRAINED UNPREDICTABLE:

- The update is ignored.
- The update is ignored for all purposes other than a direct read of the register.
- The virtual group enable is updated.

On a Warm reset, this field resets to an UNKNOWN value.

Reserved, RES0.

When GICR_VPENDBASER.Valid == 1, ID of scheduled vPE.

When GICR_VPENDBASER.Valid == 1, if GICR_VPENDBASER.vPEID is set to a value greater than the configured vPEID width, the behavior of this field is CONSTRAINED UNPREDICTABLE:

- GICR_VPENDBASER.vPEID is treated as having an UNKNOWN valid value for all purposes other than a direct read of the register.
- GICR_VPENDBASER.Valid is treated as being set to 0 for all purposes other than a direct read of the register.

The size of this field is IMPLEMENTATION DEFINED, and is specified by the GICD_TYPER2.VIL and GICD_TYPER2.VID fields, unimplemented bits are RES0.

Accessing the GICR_VPENDBASER

The effect of a write to this register is not guaranteed to be visible throughout the affinity hierarchy, as indicated by GICR_CTLR.RWP == 0.

GICR_VPENDBASER can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
</table>

Page 3839
This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RW.
- When an access is Secure accesses to this register are RW.
- When an access is Non-secure accesses to this register are RW.
The GICR_VPROPBASER characteristics are:

**Purpose**

Specifies the base address of the memory that holds the virtual LPI Configuration table for the currently scheduled virtual machine.

**Configuration**

This register is provided in FEAT_GICv4 implementations only.

**Attributes**

GICR_VPROPBASER is a 64-bit register.

**Field descriptions**

The GICR_VPROPBASER bit assignments are:

**When FEAT_GICv4 is implemented:**

<table>
<thead>
<tr>
<th>Bits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-59</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

**OuterCache, bits [58:56]**

Indicates the Outer Cacheability attributes of accesses to the LPI Configuration table. The possible values of this field are:

<table>
<thead>
<tr>
<th>OuterCache</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000b</td>
<td>Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.</td>
</tr>
<tr>
<td>0001b</td>
<td>Normal Outer Non-cacheable.</td>
</tr>
<tr>
<td>0010b</td>
<td>Normal Outer Cacheable Read-allocate, Write-through.</td>
</tr>
<tr>
<td>0011b</td>
<td>Normal Outer Cacheable Read-allocate, Write-back.</td>
</tr>
<tr>
<td>0100b</td>
<td>Normal Outer Cacheable Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0101b</td>
<td>Normal Outer Cacheable Write-allocate, Write-back.</td>
</tr>
<tr>
<td>0110b</td>
<td>Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0111b</td>
<td>Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.</td>
</tr>
</tbody>
</table>

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Bits [55:52]
Reserved, RES0.

Physical Address, bits [51:12]
Bits [51:12] of the physical address containing the virtual LPI Configuration table.
In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Shareability, bits [11:10]
Indicates the Shareability attributes of accesses to the LPI Configuration table. The possible values of this field are:

<table>
<thead>
<tr>
<th>Shareability</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Inner Shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Reserved. Treated as 0b00.</td>
</tr>
</tbody>
</table>

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

InnerCache, bits [9:7]
Indicates the Inner Cacheability attributes of accesses to the LPI Configuration table. The possible values of this field are:

<table>
<thead>
<tr>
<th>InnerCache</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Device-nGnRnE.</td>
</tr>
<tr>
<td>0b001</td>
<td>Normal Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b010</td>
<td>Normal Inner Cacheable Read-allocate, Write-through.</td>
</tr>
<tr>
<td>0b011</td>
<td>Normal Inner Cacheable Read-allocate, Write-back.</td>
</tr>
<tr>
<td>0b100</td>
<td>Normal Inner Cacheable Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b101</td>
<td>Normal Inner Cacheable Write-allocate, Write-back.</td>
</tr>
<tr>
<td>0b110</td>
<td>Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b111</td>
<td>Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]
Reserved, RES0.

IDbits, bits [4:0]
The number of bits of virtual LPI INTID supported, minus one.
If the value of this field is less than 0b1101, indicating that the largest INTID is less than 8192 (the smallest LPI interrupt ID), the GIC will behave as if all virtual LPIs are out of range.
On a Warm reset, this field resets to an architecturally UNKNOWN value.
When FEAT_GICv4p1 is implemented:

<table>
<thead>
<tr>
<th>Valid</th>
<th>RES0</th>
<th>Entry_Size</th>
<th>OuterCache</th>
<th>Indirect</th>
<th>Page_Size</th>
<th>Z</th>
<th>Physical_Address</th>
<th>Shareability</th>
<th>InnerCache</th>
<th>Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>30</td>
<td>29</td>

<td>7</td>
<td>6</td>
<td>5</td>
<td>4</td>
<td>3</td>
<td>2</td>
<td>1</td>
</tr>
</tbody>
</table>

Valid, bit [63]

This bit controls whether the vPE Configuration Table is valid:

<table>
<thead>
<tr>
<th>Valid</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The vPE Configuration table is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The vPE Configuration table is valid.</td>
</tr>
</tbody>
</table>

TBC

On a Warm reset, this field resets to 0.

Bit [62]

Reserved, RES0.

Entry_Size, bits [61:59]

Specifies the number of bytes per table entry, minus one.

This bit is read-only.

OuterCache, bits [58:56]

Indicates the Outer Cacheability attributes of accesses to the table. The possible values of this field are:

<table>
<thead>
<tr>
<th>OuterCache</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.</td>
</tr>
<tr>
<td>0b001</td>
<td>Normal Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b010</td>
<td>Normal Outer Cacheable Read-allocate, Write-through.</td>
</tr>
<tr>
<td>0b011</td>
<td>Normal Outer Cacheable Read-allocate, Write-back.</td>
</tr>
<tr>
<td>0b100</td>
<td>Normal Outer Cacheable Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b101</td>
<td>Normal Outer Cacheable Write-allocate, Write-back.</td>
</tr>
<tr>
<td>0b110</td>
<td>Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b111</td>
<td>Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.</td>
</tr>
</tbody>
</table>

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

On a Warm reset, this field resets to an UNKNOWN value.

Indirect, bit [55]

This field indicates whether GICR_VPROPBASER specifies a single, flat table or a two-level table where the first level contains a list of descriptors.

<table>
<thead>
<tr>
<th>Indirect</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Single Level. The Size field indicates the number of pages used to store data associated with each table entry.</td>
</tr>
<tr>
<td>0b1</td>
<td>Two Level. The Size field indicates the number of pages that contain an array of 64-bit descriptors to pages that are used to store the data associated with each table entry. A little endian memory order model is used.</td>
</tr>
</tbody>
</table>
This field is \texttt{RES0} for GIC implementations that only support flat tables.

On a Warm reset, this field resets to an \texttt{UNKNOWN} value.

**Page_Size, bits [54:53]**

The following values indicate the size of page that the translation table uses:

<table>
<thead>
<tr>
<th>Page Size</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>4KB.</td>
</tr>
<tr>
<td>0b01</td>
<td>16KB.</td>
</tr>
<tr>
<td>0b10</td>
<td>64KB.</td>
</tr>
<tr>
<td>0b11</td>
<td>Reserved. Treated as 0b10.</td>
</tr>
</tbody>
</table>

\textbf{Note}

If the GIC implementation supports only a single, fixed page size, this field might be RO.

On a Warm reset, this field resets to an \texttt{UNKNOWN} value.

**Z, bit [52]**

When GICR\_VPROPBASER\_Valid is written from 0 to 1, GICR\_VPROPBASER\_Z indicates whether the vPE Configuration table is known to contain all zeros.

<table>
<thead>
<tr>
<th>Z</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The vPE Configuration table is not zero, and contains live data.</td>
</tr>
<tr>
<td>0b1</td>
<td>The vPE Configuration table is zero.</td>
</tr>
</tbody>
</table>

Setting GICR\_VPROPBASER\_Z to 0 causes the IRI to reload configuration from memory.

When GICR\_VPROPBASER\_Valid is written from 0 to 1, if GICR\_VPROPBASER\_Z==1 behavior is \texttt{UNPREDICTABLE} if the allocated memory does not contain all zeros.

This field is WO, and reads as 0.

**Physical_Address, bits [51:12]**

Bits [51:12] of the physical address containing the LPI Configuration table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are \texttt{RES0}.

On a Warm reset, this field resets to an \texttt{UNKNOWN} value.

**Shareability, bits [11:10]**

Indicates the Shareability attributes of accesses to the LPI Configuration table. The possible values of this field are:

<table>
<thead>
<tr>
<th>Shareability</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Inner Shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Reserved. Treated as 0b00.</td>
</tr>
</tbody>
</table>

It is \texttt{IMPLEMENTATION DEFINED} whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

On a Warm reset, this field resets to an \texttt{UNKNOWN} value.

**InnerCache, bits [9:7]**

Indicates the Inner Cacheability attributes of accesses to the LPI Configuration table. The possible values of this field are:
### InnerCache

<table>
<thead>
<tr>
<th>InnerCache</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Device-nGnRnE.</td>
</tr>
<tr>
<td>0b001</td>
<td>Normal Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b010</td>
<td>Normal Inner Cacheable Read-allocate, Write-through.</td>
</tr>
<tr>
<td>0b011</td>
<td>Normal Inner Cacheable Read-allocate, Write-back.</td>
</tr>
<tr>
<td>0b100</td>
<td>Normal Inner Cacheable Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b101</td>
<td>Normal Inner Cacheable Write-allocate, Write-back.</td>
</tr>
<tr>
<td>0b110</td>
<td>Normal Inner Cacheable Read-allocate, Write-allocate,</td>
</tr>
<tr>
<td></td>
<td>Write-through.</td>
</tr>
<tr>
<td>0b111</td>
<td>Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to a **UNKNOWN** value.

### Size, bits [6:0]

The number of pages of physical memory allocated to the table, minus one.

**GICR_VPROPBASER.** Page Size specifies the size of each page.

On a Warm reset, this field resets to a **UNKNOWN** value.

### Accessing the GICR_VPROPBASER

**GICR_VPROPBASER** can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>VLPI_base</td>
<td>0x0070</td>
<td>GICR_VPROPBASER</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `GICD_CTLR.DS == 0` accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.
The GICR_VSGIPENDR characteristics are:

**Purpose**

Requests the pending state of virtual SGIs for a specified vPE.

**Configuration**

This register is present only when FEAT_GICv4p1 is implemented. Otherwise, direct accesses to GICR_VSGIPENDR are RES0.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_VSGIPENDR is a 32-bit register.

**Field descriptions**

The GICR_VSGIPENDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Busy</td>
<td>0b0: Query of virtual SGI state not in progress. 0b1: Query of virtual SGI state in progress.</td>
</tr>
<tr>
<td>30:16</td>
<td>Reserved</td>
<td>RES0</td>
</tr>
<tr>
<td>15:0</td>
<td>Pending</td>
<td>0b0: Query of virtual SGI state not in progress. 0b1: Query of virtual SGI state in progress.</td>
</tr>
</tbody>
</table>

**Bits [30:16]**

Reserved, RES0.

**Pending, bits [15:0]**

Pending state of virtual SGIs for requested vPEID.

This field is **UNKNOWN** when GICR_VSGIPENDR.Busy == 1

**Accessing the GICR_VSGIPENDR**

64-bit access only.

**GICR_VSGIPENDR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>VLPI_base</td>
<td>0x0088</td>
<td>GICR_VSGIPENDR</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When GICD_CTRLS.DS == 0 accesses to this register are RO.
- When an access is Secure accesses to this register are RO.
- When an access is Non-secure accesses to this register are RO.
The GICR_VSGIR characteristics are:

**Purpose**

Requests the pending state of virtual SGIs for a specified vPE.

**Configuration**

This register is present only when FEAT_GICv4p1 is implemented. Otherwise, direct accesses to GICR_VSGIR are RES0.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_VSGIR is a 32-bit register.

**Field descriptions**

The GICR_VSGIR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>vPEID</td>

</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**vPEID, bits [15:0]**

ID of target vPE

Writing this field is **CONSTRAINED UNPREDICTABLE** when GICR_VSGIPENDR.Busy == 1, with either the write ignored or a new query started.

Writing a value greater than the configured vPEID width behaviour is **CONSTRAINED UNPREDICTABLE**:

- GICR_VPENDBASER.vPEID is treated as having an **UNKNOWN** valid value for all purposes other than a direct read of the register.
- GICR_VPENDBASER.Valid is treated as being set to 0 for all purposes other than a direct read of the register.

The size of this field is **IMPLEMENTATION DEFINED**, and is specified by the GICD_TYPER2.VIL and GICD_TYPER2.VID fields. Unimplemented bits are RES0.

**Accessing the GICR_VSGIR**

64-bit access only.

**GICR_VSGIR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
</table>

Page 3848
This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.
The GICR_WAKER characteristics are:

**Purpose**

Permits software to control the behavior of the WakeRequest power management signal corresponding to the Redistributor. Power management operations follow the rules in 'Power management' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Configuration**

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_WAKER is a 32-bit register.

**Field descriptions**

The GICR_WAKER bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>IMPLEMENTATION DEFINED</td>
<td></td>
</tr>
<tr>
<td>30</td>
<td>RES0</td>
<td>Reserved. Reserved, RES0.</td>
</tr>
<tr>
<td>2</td>
<td>ChildrenAsleep</td>
<td>Read-only. Indicates whether the connected PE is quiescent:</td>
</tr>
<tr>
<td>1</td>
<td>ProcessorSleep</td>
<td>Indicates whether the Redistributor can assert the WakeRequest signal:</td>
</tr>
<tr>
<td>0</td>
<td>IMPLEMENTATION DEFINED</td>
<td></td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 1.
<table>
<thead>
<tr>
<th>ProcessorSleep</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This PE is not in, and is not entering, a low power state.</td>
</tr>
</tbody>
</table>
| 0b1           | The PE is either in, or is in the process of entering, a low power state. All interrupts that arrive at the Redistributor:  
  • Assert a **WakeRequest** signal.  
  • Are held in the pending state at the Redistributor, and are not communicated to the CPU interface. |

**Note**
When ProcessorSleep == 1, the Redistributor must ensure that any interrupts that are pending on the CPU interface are released.

For an implementation that is using the GIC Stream Protocol Interface:
• A Quiesce command puts the interface between the Redistributor and the CPU interface in a quiescent state. For more information, see ‘Quiesce (IRI)’ in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).
• A Release command releases any interrupts that are pending on the CPU interface. For more information, see ‘Release (ICC)’ in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Note**
Before powering down a PE, software must set this bit to 1 and wait until ChildrenAsleep == 1. After powering up a PE, or following a failed powerdown, software must set this bit to 0 and wait until ChildrenAsleep == 0.

Changing ProcessorSleep from 1 to 0 when ChildrenAsleep is not 1 results in **UNPREDICTABLE** behavior.

Changing ProcessorSleep from 0 to 1 when the Enable for each interrupt group in the associated CPU interface is not 0 results in **UNPREDICTABLE** behavior.

On a Warm reset, this field resets to 1.

**IMPLEMENTATION DEFINED, bit [0]**

IMPLEMENTATION DEFINED.

**Accessing the GICR_WAKER**

When **GICD_CTLR**.DS==1, this register is always accessible.

When **GICD_CTLR**.DS==0, this is a Secure register. This register is RAZ/WI to Non-secure accesses.

To ensure a Redistributor is quiescent, software must write to GICR_WAKER with ProcessorSleep == 1, then poll the register until ChildrenAsleep == 1.

Resetting the connected PE when GICR_WAKER.ProcessorSleep==0 or GICR_WAKER.ChildrenAsleep==0, can lead to **UNPREDICTABLE** behaviour in the IRI.

Resetting the IRI when GICR_WAKER.ProcessorSleep==0 or GICR_WAKER.ChildrenAsleep==0 can lead to **UNPREDICTABLE** behaviour in the connected PE.
GICR_WAKER can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>RD_base</td>
<td>0x0014</td>
<td>GICR_WAKER</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
GICV_ABPR, Virtual Machine Aliased Binary Point Register

The GICV_ABPR characteristics are:

**Purpose**

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption.

This register corresponds to **GICC_ABPR** in the physical CPU interface.

**Note**

**GICH_LR<n>** Group determines whether a virtual interrupt is Group 0 or Group 1.

**Configuration**

This register is available when the GIC implementation supports interrupt virtualization.

**Attributes**

GICV_ABPR is a 32-bit register.

**Field descriptions**

The GICV_ABPR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|
| RES0 | Binary_Point |

**Bits [31:3]**

Reserved, RES0.

**Binary_Point, bits [2:0]**

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field.

For information about how this field determines the interrupt priority bits assigned to the group priority field, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this field resets to 0.

The Binary_Point field of this register is aliased to **GICH_VMCR.VBPR1**.

**Accessing the GICV_ABPR**

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, **ICC_BPR1** provides equivalent functionality.
- For AArch64 implementations, **ICC_BPR1_EL1** provides equivalent functionality.
The value contained in this register is one greater than the actual applied binary point value, as described in 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This register is used for Group 1 interrupts when \texttt{GIC\_CTLR.CBPR} == 0. \texttt{GIC\_BPR} provides equivalent functionality for Group 0 interrupts, and for Group 1 interrupts when \texttt{GIC\_CTLR.CBPR} == 1.

\textbf{GICV\_ABPR can be accessed through the memory-mapped interfaces:}

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual CPU interface</td>
<td>0x001C</td>
<td>GIC_ABPR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When \texttt{GIC\_D\_DS} == 0 accesses to this register are \textbf{RW}.
- When an access is Secure accesses to this register are \textbf{RW}.
- When an access is Non-secure accesses to this register are \textbf{RW}.
GICV_AEOIR, Virtual Machine Aliased End Of Interrupt Register

The GICV_AEOIR characteristics are:

**Purpose**

A write to this register performs a priority drop for the specified Group 1 virtual interrupt and, if GICV_CTLR.EOImode == 0, also deactivates the interrupt.

**Configuration**

This register is available when the GIC implementation supports interrupt virtualization.

**Attributes**

GICV_AEOIR is a 32-bit register.

**Field descriptions**

The GICV_AEOIR bit assignments are:

| Bit 31 | Bit 30 | Bit 29 | Bit 28 | Bit 27 | Bit 26 | Bit 25 | Bit 24 | Bit 23 | Bit 22 | Bit 21 | Bit 20 | Bit 19 | Bit 18 | Bit 17 | Bit 16 | Bit 15 | Bit 14 | Bit 13 | Bit 12 | Bit 11 | Bit 10 | Bit 9 | Bit 8 | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| RES0   | INTID  |

**Bits [31:25]**

Reserved, RES0.

**INTID, bits [24:0]**

The INTID of the signaled interrupt.

---

**Note**

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

A successful EOI request means that:

- The highest priority bit in GICV_APR<\text{n}> is cleared, causing the running priority to drop.
- If the appropriate GICV_CTLR EOImode bit == 0, the interrupt is deactivated in the corresponding List register. If the INTID corresponds to a hardware interrupt, the interrupt is also deactivated in the Distributor.

---

**Note**

Only Group 1 interrupts can target the hypervisor, and therefore only Group 1 interrupts are deactivated in the Distributor.
A write to this register is **UNPREDICTABLE** if the INTID corresponds to a Group 0 interrupt. In addition, the following GICv2 **UNPREDICTABLE** cases require specific actions:

- If highest active priority is Group 0 and the identified interrupt is in the List Registers and it matches the highest active priority. When EL2 is using System registers and `ICH_VTR_EL2.SEIS` is 1, an **IMPLEMENTATION DEFINED** SEI might be generated, otherwise GICv3 implementations must ignore such writes.
- If the identified interrupt is in the List Registers, and the HW bit is 1, and the interrupt to be deactivated is an SGI (that is, the value of Physical ID is between 0 and 15). GICv3 implementations must perform the deactivate operation. This means that a GICv3 implementation in legacy operation must ensure only a single SGI is active for a PE.
- If the identified interrupt is in the List Registers, and the HW bit is 1, and the corresponding pINTID field value is between 1020 and 1023, indicating a special purpose INTID. GICv3 implementations must not perform a deactivate operation but must still change the state of the List register as appropriate. When EL2 is using System registers and `ICH_VTR_EL2.SEIS` is 1, an implementation might generate a system error.

### Accessing the GICV_AEOIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, `ICC_EOIR1` provides equivalent functionality.
- For AArch64 implementations, `ICC_EOIR1_EL1` provides equivalent functionality.

This register is used for Group 1 interrupts only. `GICV_EOIR` provides equivalent functionality for Group 0 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

### GICV_AEOIR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual CPU</td>
<td>0x0024</td>
<td>GICV_AEOIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `GICD_CTLR.DS == 0` accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.
The GICV_AHPPIR characteristics are:

**Purpose**

Provides the INTID of the highest priority pending Group 1 virtual interrupt in the List registers.

This register corresponds to the physical CPU interface register GICC_AHPPIR.

**Configuration**

This register is available when the GIC implementation supports interrupt virtualization.

**Attributes**

GICV_AHPPIR is a 32-bit register.

**Field descriptions**

The GICV_AHPPIR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 |       |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | INTID |

**Bits [31:25]**

Reserved, RES0.

**INTID, bits [24:0]**

The INTID of the signaled interrupt.

**Note**

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

A read of this register returns the spurious INTID 1023 if any of the following are true:

- There are no pending interrupts of sufficiently high priority value to be signaled to the PE.
- The highest priority pending interrupt is in Group 0.

**Accessing the GICV_AHPPIR**

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_HPPIR1 provides equivalent functionality.
- For AArch64 implementations, ICC_HPPIR1_EL1 provides equivalent functionality.
This register is used for Group 1 interrupts only. **GICV_HPPIR** provides equivalent functionality for Group 0 interrupts.

The register does not return the INTID of an interrupt that is active and pending.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

**GICV_AHPPIR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual CPU</td>
<td>0x0028</td>
<td>GICV_AHPPIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.
GICV_AIAR, Virtual Machine Aliased Interrupt Acknowledge Register

The GICV_AIAR characteristics are:

**Purpose**

Provides the INTID of the signaled Group 1 virtual interrupt. A read of this register by the PE acts as an acknowledge for the interrupt.

This register corresponds to the physical CPU interface register **GICC_AIAR**.

**Configuration**

This register is available when the GIC implementation supports interrupt virtualization.

**Attributes**

GICV_AIAR is a 32-bit register.

**Field descriptions**

The GICV_AIAR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>INTID</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:25]**

Reserved, RES0.

**INTID, bits [24:0]**

The INTID of the signaled interrupt.

**Note**

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

The operation of this register is similar to the operation of **GICV_IAR**. When a vPE reads this register, the corresponding **GICH_LR<n>**.Group field is checked to determine whether the interrupt is in Group 0 or Group 1:

- If the interrupt is Group 0, the spurious INTID 1023 is returned and the interrupt is not acknowledged.
- If the interrupt is Group 1, the INTID is returned. The List register entry is updated to active state, and the appropriate bit in **GICH_APR<n>** is set to 1.

A read of this register returns the spurious INTID 1023 if any of the following are true:

- When the virtual CPU interface is enabled and **GICH_HCR.En == 1**:
  - There are no pending interrupts of sufficiently high priority value to be signaled to the PE.
The highest priority pending interrupt is in Group 0.

- Interrupt signaling by the virtual CPU interface is disabled.

**Accessing the GICV_AIAR**

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_IAR1 provides equivalent functionality.
- For AArch64 implementations, ICC_IAR1_EL1 provides equivalent functionality.

This register is used for Group 1 interrupts only. GICV_IAR provides equivalent functionality for Group 0 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

**GICV_AIAR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual CPU interface</td>
<td>0x0020</td>
<td>GICV_AIAR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.
GICV_APR<n>, Virtual Machine Active Priorities Registers, n = 0 - 3

The GICV_APR<n> characteristics are:

**Purpose**

Provides information about interrupt active priorities.

These registers correspond to the physical CPU interface registers GICC_APR<n>.

**Configuration**

When System register access is disabled for EL2, these registers access GICH_APR<n>, and all active priorities for virtual machines are held in GICH_APR<n> regardless of interrupt group.

When System register access is enabled for EL2, these registers access ICH_AP1R<n>_EL2, and all active priorities for virtual machines are held in ICH_AP1R<n>_EL2 regardless of interrupt group.

**Attributes**

GICV_APR<n> is a 32-bit register.

**Field descriptions**

The GICV_APR<n> bit assignments are:

<table>
<thead>

P<x>, bit [x], for x = 31 to 0

Provides information about active priorities for the virtual machine.

See GICH_APR<n> and ICH_AP1R<n>_EL2 for the correspondence between priorities and bits.

**Accessing the GICV_APR<n>**

If System register access is not enabled for EL2, these registers access GICH_APR<n>. If System register access is enabled for EL2, these registers access ICH_AP1R<n>_EL2. All active priority mapped guests are held in the accessed registers, regardless of interrupt group.

GICV_APR<n> can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual CPU</td>
<td>0x00D0 + (4 * n)</td>
<td>GICV_APR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RW.
- When an access is Secure accesses to this register are RW.
- When an access is Non-secure accesses to this register are RW.
The GICV_BPR characteristics are:

**Purpose**

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption.

This register corresponds to **GICC_BPR** in the physical CPU interface.

**Note**

**GICH_LR<<n>>** Group determines whether a virtual interrupt is Group 0 or Group 1.

**Configuration**

This register is available when the GIC implementation supports interrupt virtualization.

When **GICV_CTLR**.CBPR == 1, this register determines interrupt preemption for both Group 0 and Group 1 interrupts.

**Attributes**

GICV_BPR is a 32-bit register.

**Field descriptions**

The GICV_BPR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | Binary_Point |

**Bits [31:3]**

Reserved, RES0.

**Binary_Point, bits [2:0]**

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field.

For information about how this field determines the interrupt priority bits assigned to the group priority field, see 'ICC_BPR0_EL1 Binary Point for Group 1 interrupts when CBPR == 1, or for Group 0 interrupts' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The Binary_Point field of this register is aliased to **GICH_VMCR**.VBPR0.

**Accessing the GICV_BPR**

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, **ICC_BPR0** provides equivalent functionality.
- For AArch64 implementations, **ICC_BPR0_EL1** provides equivalent functionality.
**GICV_BPR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual CPU</td>
<td>0x0008</td>
<td>GICV_BPR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICV_CTLR, Virtual Machine Control Register

The GICV_CTLR characteristics are:

**Purpose**

Controls the behavior of virtual interrupts.

This register corresponds to the physical CPU interface register `GICC_CTLR`.

**Configuration**

This register is available when a GIC implementation supports interrupt virtualization.

**Attributes**

GICV_CTLR is a 32-bit register.

**Field descriptions**

The GICV_CTLR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-10</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>9</td>
<td>EOImode</td>
</tr>
<tr>
<td>8-5</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>4</td>
<td>CBPR</td>
</tr>
<tr>
<td>3</td>
<td>FIQEn</td>
</tr>
<tr>
<td>2</td>
<td>AckCtl</td>
</tr>
<tr>
<td>1</td>
<td>EnableGrp1</td>
</tr>
<tr>
<td>0</td>
<td>EnableGrp0</td>
</tr>
</tbody>
</table>

**Bits [31:10]**

Reserved, RES0.

**EOImode, bit [9]**

Controls the behavior associated with the `GICV_EOIR`, `GICV_AEOIR`, and `GICV_DIR` registers:

<table>
<thead>
<tr>
<th>EOImode</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Writes to <code>GICV_EOIR</code> and <code>GICV_AEOIR</code> perform priority drop and deactivate interrupt operations simultaneously. Behavior on a write to <code>GICV_DIR</code> is unpredictable. When it has completed processing the interrupt, the virtual machine writes to <code>GICV_EOIR</code> or <code>GICV_AEOIR</code> to deactivate the interrupt. The write updates the List registers and causes the virtual CPU interface to signal the interrupt completion to the physical Distributor.</td>
</tr>
<tr>
<td>0b1</td>
<td>Writes to <code>GICV_EOIR</code> and <code>GICV_AEOIR</code> perform priority drop operation only. Writes to <code>GICV_DIR</code> perform deactivate interrupt operation only. When it has completed processing the interrupt, the virtual machine writes to <code>GICV_DIR</code> to deactivate the interrupt. The write updates the List registers and causes the virtual CPU interface to signal the interrupt completion to the Distributor.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [8:5]**

Reserved, RES0.
CBPR, bit [4]

Controls whether GICV_BPR affects both Group 0 and Group 1 interrupts:

<table>
<thead>
<tr>
<th>CBPR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>GICV_BPR affects Group 0 virtual interrupts only.</td>
</tr>
<tr>
<td>0b1</td>
<td>GICV_BPR affects both Group 0 and Group 1 virtual interrupts.</td>
</tr>
</tbody>
</table>

For more information, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

FIQEn, bit [3]

FIQ Enable. Controls whether Group 0 virtual interrupts are presented as virtual FIQs:

<table>
<thead>
<tr>
<th>FIQEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 0 virtual interrupts are presented as virtual IRQs.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 0 virtual interrupts are presented as virtual FIQs.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

AckCtl, bit [2]

Arm deprecates use of this bit. Arm strongly recommends that software is written to operate with this bit always cleared to 0.

Acknowledge control. When the highest priority interrupt is Group 1, determines whether GICV_IAR causes the CPU interface to acknowledge the interrupt or returns the spurious identifier 1022, and whether GICV_HPPIR returns the interrupt ID or the special identifier 1022.

<table>
<thead>
<tr>
<th>AckCtl</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns an interrupt ID of 1022.</td>
</tr>
<tr>
<td>0b1</td>
<td>If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns the interrupt ID of the corresponding interrupt.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EnableGrp1, bit [1]

Enables the signaling of Group 1 virtual interrupts by the virtual CPU interface to the virtual machine:

<table>
<thead>
<tr>
<th>EnableGrp1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Signaling of Group 1 interrupts is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Signaling of Group 1 interrupts is enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EnableGrp0, bit [0]

Enables the signaling of Group 0 virtual interrupts by the virtual CPU interface to the virtual machine:

<table>
<thead>
<tr>
<th>EnableGrp0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Signaling of Group 0 interrupts is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Signaling of Group 0 interrupts is enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing the GICV_CTLR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_CTLR provides equivalent functionality.
- For AArch64 implementations, ICC_CTLR_EL1 provides equivalent functionality.

**GICV_CTLR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual CPU</td>
<td>0x0000</td>
<td>GICV_CTLR</td>
</tr>
<tr>
<td>interface</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.
The GICV_DIR characteristics are:

**Purpose**

Deactivates a specified virtual interrupt in the \texttt{GICH\_LR<n>} List registers.

This register corresponds to the physical CPU interface register \texttt{GICC\_DIR}.

**Configuration**

This register is available when the GIC implementation supports interrupt virtualization.

**Attributes**

GICV_DIR is a 32-bit register.

**Field descriptions**

The GICV_DIR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | INTID |

**Bits [31:25]**

Reserved, RES0.

**INTID, bits [24:0]**

The INTID of the signaled interrupt.

**Note**

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

When the virtual machine writes to this register, the specified interrupt in the List registers is changed from active to inactive, or from active and pending to pending. If the specified interrupt is present in the List registers but is not in either the active or active and pending states, the effect is \texttt{UNPREDICTABLE}. If the specified interrupt is not present in the List registers, \texttt{GICH\_HCR} EOICount is incremented, potentially generating a maintenance interrupt.

**Note**

If the specified interrupt is not present in the List registers, the virtual machine cannot recover the INTID. Therefore, the hypervisor must ensure that, when \texttt{GICV\_CTLR} EOImode == 1, no more than one active interrupt is transferred from the List registers into a software list. If more than one active
interrupt that is not stored in the List registers exists, the hypervisor must handle accesses to GICV_DIR in software, typically by trapping these accesses.

If the corresponding GICH_LR<n>.HW == 1, indicating a hardware interrupt, then a deactivate request is sent to the physical Distributor, identifying the physical INTID from the corresponding field in the List register. This effect is identical to a Non-secure write to GICC_DIR from the PE having that physical INTID. This means that if the corresponding physical interrupt is marked as Group 0, the request is ignored.

**Note**

Interrupt deactivation using this register is based on the provided INTID, with no requirement to deactivate interrupts in any particular order. A single register is therefore used to deactivate both Group 0 and Group 1 interrupts.

**Accessing the GICV_DIR**

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_DIR provides equivalent functionality.
- For AArch64 implementations, ICC_DIR_EL1 provides equivalent functionality.

Writes to this register are valid only when GICV_CTLR.EOImode == 1. Writes to this register are otherwise UNPREDICTABLE.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

**GICV_DIR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual CPU</td>
<td>0x1000</td>
<td>GICV_DIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.
GICV_EOIR, Virtual Machine End Of Interrupt Register

The GICV_EOIR characteristics are:

**Purpose**

A write to this register performs a priority drop for the specified Group 0 virtual interrupt and, if GICV_CTLR.EOImode == 0, also deactivates the interrupt.

This register corresponds to the physical CPU interface register GICC_EOIR.

**Configuration**

This register is available when the GIC implementation supports interrupt virtualization.

**Attributes**

GICV_EOIR is a 32-bit register.

**Field descriptions**

The GICV_EOIR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>INTID</td>
</tr>
</tbody>
</table>

- **Bits [31:25]**
  - Reserved, RES0.

- **INTID, bits [24:0]**
  - The INTID of the signaled interrupt.

**Note**

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

The behavior of this register depends on the setting of GICV_CTLR.EOImode:

<table>
<thead>
<tr>
<th>GICV_CTLR.EOImode</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Both the priority drop and the deactivate interrupt effects occur</td>
</tr>
<tr>
<td>0b1</td>
<td>Only the priority drop effect occurs.</td>
</tr>
</tbody>
</table>

A successful EOI request means that:

- The highest priority bit in GICH_APR<n> is cleared, causing the running priority to drop.
- If the appropriate GICV_CTLR.EOImode bit == 0, the interrupt is deactivated in the corresponding List register GICH_LR<n>. If GICH_LR<n>.HW == 1, indicating the INTID corresponds to a hardware interrupt, a deactivate request is also sent to the physical Distributor, identifying the physical INTID from the
corresponding field in the List register. This effect is identical to a Non-secure write to GICC_DIR from the PE having that physical INTID. This means that if the corresponding physical interrupt is marked as Group 0, and GICD_CTLR.DS == 0, the deactivation request is ignored. See GICC_EOIR for more information.

Note

Only Group 1 interrupts can target the hypervisor, and therefore only Group 1 interrupts are deactivated in the Distributor.

Accessing the GICV_EOIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_EOIR0 provides equivalent functionality.
- For AArch64 implementations, ICC_EOIR0_EL1 provides equivalent functionality.

This register is used for Group 0 interrupts only. GICV_AEOIR provides equivalent functionality for Group 1 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_EOIR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual CPU</td>
<td>0x0010</td>
<td>GICV_EOIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are WO.
- When an access is Secure accesses to this register are WO.
- When an access is Non-secure accesses to this register are WO.
GICV_HPPIR, Virtual Machine Highest Priority Pending Interrupt Register

The GICV_HPPIR characteristics are:

**Purpose**

Provides the INTID of the highest priority pending Group 0 virtual interrupt in the List registers.

This register corresponds to the physical CPU interface register GICC_HPPIR.

**Configuration**

This register is available when the GIC implementation supports interrupt virtualization.

**Attributes**

GICV_HPPIR is a 32-bit register.

**Field descriptions**

The GICV_HPPIR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | INTID |

**Bits [31:25]**

Reserved, RES0.

**INTID, bits [24:0]**

The INTID of the signaled interrupt.

**Note**

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Reads of the GICC_HPPIR that do not return a valid INTID return a spurious INTID, 1022 or 1023. See 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).
<table>
<thead>
<tr>
<th>Highest priority pending interrupt Group</th>
<th>GICV_HPPIR read</th>
<th>GICV_CTLR.AckCtl</th>
<th>Returned INTID</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Non-secure</td>
<td>x</td>
<td>ID of Group 1 interrupt 1022</td>
</tr>
<tr>
<td>1</td>
<td>Secure</td>
<td>0</td>
<td>ID of Group 1 interrupt 1022</td>
</tr>
<tr>
<td>1</td>
<td>Secure</td>
<td>1</td>
<td>ID of Group 1 interrupt 1022</td>
</tr>
<tr>
<td>0</td>
<td>Non-secure</td>
<td>x</td>
<td>ID of Group 0 interrupt 1023</td>
</tr>
<tr>
<td>0</td>
<td>Secure</td>
<td>x</td>
<td>ID of Group 0 interrupt 1023</td>
</tr>
<tr>
<td>No pending interrupts</td>
<td>x</td>
<td>x</td>
<td>1023</td>
</tr>
</tbody>
</table>

If the CPU interface supports only a single Security state, the entries that apply to Secure reads describe the behavior.

## Accessing the GICV_HPPIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_HPPIR0 provides equivalent functionality.
- For AArch64 implementations, ICC_HPPIR0_EL1 provides equivalent functionality.

This register is used for Group 0 interrupts only. GICV_AHPPIR provides equivalent functionality for Group 1 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

### GICV_HPPIR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual CPU interface</td>
<td>0x0018</td>
<td>GICV_HPPIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RO.
- When an access is Secure accesses to this register are RO.
- When an access is Non-secure accesses to this register are RO.
GICV_IAR, Virtual Machine Interrupt Acknowledge Register

The GICV_IAR characteristics are:

**Purpose**

Provides the INTID of the signaled Group 0 virtual interrupt. A read of this register by the PE acts as an acknowledge for the interrupt.

This register corresponds to the physical CPU interface register GICC_IAR.

**Configuration**

This register is available when the GIC implementation supports interrupt virtualization.

**Attributes**

GICV_IAR is a 32-bit register.

**Field descriptions**

The GICV_IAR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-25</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>24-0</td>
<td>INTID</td>
</tr>
</tbody>
</table>

**Bits [31:25]**

Reserved, RES0.

**INTID, bits [24:0]**

The INTID of the signaled interrupt.

**Note**

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

When the virtual machine writes to this register, the virtual CPU interface acknowledges the highest priority pending virtual interrupt and sets the state in the corresponding List register to active. The appropriate bit in the active priorities register GICH_APR<n> is set to 1.

If GICV_LR<n>.HW == 0, indicating that the interrupt is software-triggered, then bits [12:10] of GICV_LR<n> are returned in bits [12:10] of GICV_IAR. Otherwise bits [12:10] are RES0.

A read of this register returns the spurious INTID 1023 if either of the following is true:

- There are no pending interrupts of sufficiently high priority value to be signaled to the PE with the virtual CPU interface enabled and GICH_HCR.En == 1.
Interrupt signaling by the virtual CPU interface is disabled.

A read of this register returns the spurious INTID 1022 if the highest priority pending interrupt is Group 1 and `GICV_CTLR.AckCtl == 0`.

### Accessing the GICV_IAR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, `ICC_IAR0` provides equivalent functionality.
- For AArch64 implementations, `ICC_IAR0_EL1` provides equivalent functionality.

This register is used for Group 0 interrupts only. `GICV_AIAR` provides equivalent functionality for Group 1 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

#### GICV_IAR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual CPU interface</td>
<td>0x000C</td>
<td>GICV_IAR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `GICD_CTLR.DS == 0` accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

GICV_IIDR, Virtual Machine CPU Interface Identification Register

The GICV_IIDR characteristics are:

**Purpose**

Provides information about the implementer and revision of the virtual CPU interface.

**Configuration**

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states this register is Common.

**Attributes**

GICV_IIDR is a 32-bit register.

**Field descriptions**

The GICV_IIDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Bit assignments</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-20</td>
<td>ProductID</td>
<td>An IMPLEMENTATION DEFINED product identifier.</td>
</tr>
<tr>
<td>19-16</td>
<td>Architecture_version</td>
<td>The version of the GIC architecture that is implemented.</td>
</tr>
<tr>
<td>15-12</td>
<td>Revision</td>
<td>An IMPLEMENTATION DEFINED revision number for the CPU interface.</td>
</tr>
<tr>
<td>11-0</td>
<td>Implementer</td>
<td>Contains the JEP106 code of the company that implemented the CPU interface.</td>
</tr>
</tbody>
</table>

- **ProductID**, bits [31:20]
  - An IMPLEMENTATION DEFINED product identifier.

- **Architecture_version**, bits [19:16]
  - The version of the GIC architecture that is implemented.
    - **0b0001**: GICv1.
    - **0b0010**: GICv2.
    - **0b0011**: GICv3 memory-mapped interface supported. Support for the System register interface is discoverable from PE registers ID_PFR1 and ID_AA64PFR0_EL1.
    - **0b0100**: GICv4 memory-mapped interface supported. Support for the System register interface is discoverable from PE registers ID_PFR1 and ID_AA64PFR0_EL1.
    - Other values are reserved.

- **Revision**, bits [15:12]
  - An IMPLEMENTATION DEFINED revision number for the CPU interface.

- **Implementer**, bits [11:0]
  - Contains the JEP106 code of the company that implemented the CPU interface.
    - Bits [11:8] are the JEP106 continuation code of the implementer. For an Arm implementation, this field is 0x4.
- Bit [7] is always 0.
- Bits [6:0] are the JEP106 identity code of the implementer. For an Arm implementation, bits [7:0] are therefore 0x3B.

## Accessing the GICV_IIDR

**GICV_IIDR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual CPU interface</td>
<td>0x00FC</td>
<td>GICV_IIDR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

---

GICV_PMR, Virtual Machine Priority Mask Register

The GICV_PMR characteristics are:

**Purpose**

This register provides a virtual interrupt priority filter. Only virtual interrupts with a higher priority than the value in this register are signaled to the PE.

**Note**

Higher interrupt priority corresponds to a lower value of the Priority field.

This register corresponds to the physical CPU interface register GICC_PMR.

**Configuration**

This register is available when the GIC implementation supports interrupt virtualization.

The Priority field of this register is aliased to GICH_VMCR.VMPR, to enable state to be switched easily between virtual machines during context-switching.

**Attributes**

GICV_PMR is a 32-bit register.

**Field descriptions**

The GICV_PMR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | Priority |

**Bits [31:8]**

Reserved, RES0.

**Priority, bits [7:0]**

The priority mask level for the virtual CPU interface. If the priority of the interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

If the GIC implementation supports fewer than 256 priority levels some bits might be RAZ/WI, as follows:

- For 128 supported levels, bit [0] = 0b0.
- For 64 supported levels, bits [1:0] = 0b00.
- For 32 supported levels, bits [2:0] = 0b000.
- For 16 supported levels, bits [3:0] = 0b0000.

For more information, see 'Interrupt prioritization' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the GICV_PMR**

This register is used only when System register access is not enabled. When System register access is enabled:
For AArch32 implementations, ICC_PMR provides equivalent functionality.
For AArch64 implementations, ICC_PMR_EL1 provides equivalent functionality.

**GICV_PMR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual CPU interface</td>
<td>0x0004</td>
<td>GICV_PMR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.
GICV_RPR, Virtual Machine Running Priority Register

The GICV_RPR characteristics are:

**Purpose**

This register indicates the running priority of the virtual CPU interface.

This register corresponds to the physical CPU interface register GICC_RPR.

**Configuration**

This register is available when the GIC implementation supports interrupt virtualization.

**Attributes**

GICV_RPR is a 32-bit register.

**Field descriptions**

The GICV_RPR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td></td>

<td></td>
</tr>
<tr>
<td>2</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td>Priority</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**Priority, bits [7:0]**

The current running priority on the virtual CPU interface. This is the group priority of the current active interrupt.

If there are no active interrupts on the CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

The priority returned is the group priority as if the BPR was set to the minimum value.

**Accessing the GICV_RPR**

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_RPR provides equivalent functionality.
- For AArch64 implementations, ICC_RPR_EL1 provides equivalent functionality.

Depending on the implementation, if no bits are set to 1 in GICH_APR<n>, indicating no active virtual interrupts in the virtual CPU interface, the priority reads as 0xFF or 0xF8 to reflect the number of supported interrupt priority bits defined by GICH_VTR_PRIbits.

**GICV_RPR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual CPU</td>
<td>0x0014</td>
<td>GICV_RPR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
• When GICD_CTLR.DS == 0 accesses to this register are **RO**.
• When an access is Secure accesses to this register are **RO**.
• When an access is Non-secure accesses to this register are **RO**.
GICV_STATUSR, Virtual Machine Error Reporting Status Register

The GICV_STATUSR characteristics are:

**Purpose**

Provides software with a mechanism to detect:

- Accesses to reserved locations.
- Writes to read-only locations.
- Reads of write-only locations.

**Configuration**

In systems where this register is implemented, Arm expects that when a virtual machine is scheduled, the hypervisor ensures that this register is cleared to 0. The hypervisor might check for illegal accesses when the virtual machine is unscheduled.

**Attributes**

GICV_STATUSR is a 32-bit register.

**Field descriptions**

The GICV_STATUSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>WROD</td>
</tr>
<tr>
<td>29</td>
<td>RWOD</td>
</tr>
<tr>
<td>28</td>
<td>WRD</td>
</tr>
<tr>
<td>27</td>
<td>RRD</td>
</tr>
</tbody>
</table>

**Bits [31:4]**

Reserved, RES0.

**WROD, bit [3]**

Write to an RO location.

<table>
<thead>
<tr>
<th>WROD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A write to an RO location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.

**RWOD, bit [2]**

Read of a WO location.

<table>
<thead>
<tr>
<th>RWOD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A read of a WO location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.
WRD, bit [1]

Write to a reserved location.

<table>
<thead>
<tr>
<th>WRD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A write to a reserved location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.

RRD, bit [0]

Read of a reserved location.

<table>
<thead>
<tr>
<th>RRD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A read of a reserved location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.

**Accessing the GICV_STATUSR**

This is an optional register. If the register is implemented, GICC_STATUSR must also be implemented. If the register is not implemented, the location is RAZ/WI.

This register is used only when System register access is not enabled. If System register access is enabled, this register is not updated. Equivalent function might be provided by appropriate traps and exceptions.

**GICV_STATUSR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual CPU interface</td>
<td>0x002C</td>
<td>GICV_STATUSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.
The GITS_BASER<n> characteristics are:

**Purpose**

Specifies the base address and size of the ITS translation tables.

**Configuration**

A copy of this register is provided for each ITS translation table.

Bits [63:32] and bits [31:0] are accessible independently.

A maximum of 8 GITS_BASER<n> registers can be provided. Unimplemented registers are RES0.

When GITS_CTLR.Enabled == 1 or GITS_CTLR.Quiescent == 0, writing this register is UNPREDICTABLE.

**Attributes**

GITS_BASER<n> is a 64-bit register.

**Field descriptions**

The GITS_BASER<n> bit assignments are:

<table>
<thead>
<tr>
<th>Valid</th>
<th>Indirect</th>
<th>InnerCache</th>
<th>Type</th>
<th>OuterCache</th>
<th>Entry_Size</th>
<th>Physical_Address</th>
<th>Shareability</th>
<th>Page_Size</th>
<th>Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>62</td>
<td>61</td>
<td>60</td>
<td>59</td>
<td>58</td>
<td>57</td>
<td>56</td>
<td>55</td>
<td>54</td>
</tr>
<tr>
<td>53</td>
<td>52</td>
<td>51</td>
<td>50</td>
<td>49</td>
<td>48</td>
<td>47</td>
<td>46</td>
<td>45</td>
<td>44</td>
</tr>
<tr>

</tr>
<tr>
<td>3</td>
<td>2</td>
<td>1</td>
<td>0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Valid, bit [63]**

Indicates whether software has allocated memory for the translation table:

<table>
<thead>
<tr>
<th>Valid</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No memory is allocated for the translation table. The ITS discards any writes to the interrupt translation page when either:</td>
</tr>
<tr>
<td></td>
<td>• GITS_BASER&lt;n&gt;.Type specifies any valid table entry type other than interrupt collections, that is, any value other than 0b100.</td>
</tr>
<tr>
<td></td>
<td>• GITS_BASER&lt;n&gt;.Type specifies an interrupt collection and GITS_TYPER.HCC == 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Memory is allocated to the translation table.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**Indirect, bit [62]**

This field indicates whether an implemented register specifies a single, flat table or a two-level table where the first level contains a list of descriptors.
**Indirect**

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Single Level. The Size field indicates the number of pages used by the ITS to store data associated with each table entry.</td>
</tr>
<tr>
<td>0b1</td>
<td>Two Level. The Size field indicates the number of pages which contain an array of 64-bit descriptors to pages that are used to store the data associated with each table entry. A little endian memory order model is used.</td>
</tr>
</tbody>
</table>

For more information, see ‘The ITS tables’ in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field is RAZ/WI for GIC implementations that only support flat tables. If the maximum width of the scaling factor that is identified by GITS_BASER<n>.Type and the smallest page size that is supported result in a single level table that requires multiple pages, then implementing this bit as RAZ/WI is DEPRECATED.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**InnerCache, bits [61:59]**

Indicates the Inner Cacheability attributes of accesses to the table. The possible values of this field are:

<table>
<thead>
<tr>
<th>InnerCache</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Device-nGnRnE.</td>
</tr>
<tr>
<td>0b001</td>
<td>Normal Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b010</td>
<td>Normal Inner Cacheable Read-allocate, Write-through.</td>
</tr>
<tr>
<td>0b011</td>
<td>Normal Inner Cacheable Read-allocate, Write-back.</td>
</tr>
<tr>
<td>0b100</td>
<td>Normal Inner Cacheable Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b101</td>
<td>Normal Inner Cacheable Write-allocate, Write-back.</td>
</tr>
<tr>
<td>0b110</td>
<td>Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b111</td>
<td>Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Type, bits [58:56]**

Read only. Specifies the type of entity that requires entries in the corresponding translation table. The possible values of the field are:

<table>
<thead>
<tr>
<th>Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Unimplemented. This register does not correspond to a translation table.</td>
</tr>
<tr>
<td>0b01</td>
<td>Devices. This register corresponds to a translation table that scales with the width of the DeviceID. Only a single GITS_BASER&lt;n&gt; register reports this type.</td>
</tr>
<tr>
<td>0b10</td>
<td>vPEs. FEAT_GICv4 only. This register corresponds to a translation table that scales with the number of vPEs in the system. The translation table requires (ENTRY_SIZE * N) bytes of memory, where N is the number of vPEs in the system. Only a single GITS_BASER&lt;n&gt; register reports this type.</td>
</tr>
<tr>
<td>0b100</td>
<td>Interrupt collections. This register corresponds to a translation table that scales with the number of interrupt collections in the system. The translation table requires (ENTRY_SIZE * N) bytes of memory, where N is the number of interrupt collections. Not more than one GITS_BASER&lt;n&gt; register will report this type.</td>
</tr>
</tbody>
</table>

Other values are reserved.

For FEAT_GICv4p1, the registers are allocated as follows:

- GITS_BASER0.Type is 0b001 (Device).
- GITS_BASER1.Type is either 0b100 (Collection Table) or 0b000 (Unimplemented).
- GITS_BASER2.Type is either 0b010 (vPE) or 0b000 (Unimplemented).
- GITS_BASER<n>.Type, where 'n' is in the range 3 to 7, is 0b000 (Unimplemented).
For FEAT_GICv3, FEAT_GICv3p1, and FEAT_GICv4, Arm recommends that the GITS_BASER<n> use the same allocations.

Other allocations of Type values are deprecated.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**OuterCache, bits [55:53]**

Indicates the Outer Cacheability attributes of accesses to the table. The possible values of this field are:

<table>
<thead>
<tr>
<th>OuterCache</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.</td>
</tr>
<tr>
<td>0b001</td>
<td>Normal Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b010</td>
<td>Normal Outer Cacheable Read-allocate, Write-through.</td>
</tr>
<tr>
<td>0b011</td>
<td>Normal Outer Cacheable Read-allocate, Write-back.</td>
</tr>
<tr>
<td>0b100</td>
<td>Normal Outer Cacheable Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b101</td>
<td>Normal Outer Cacheable Write-allocate, Write-back.</td>
</tr>
<tr>
<td>0b110</td>
<td>Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b111</td>
<td>Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.</td>
</tr>
</tbody>
</table>

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Entry_Size, bits [52:48]**

Read-only. Specifies the number of bytes per translation table entry, minus one.

**Physical_Address, bits [47:12]**

Physical Address. When Page_Size is 4KB or 16KB:

- Bits [51:48] of the base physical address are zero.
- This field provides bits[47:12] of the base physical address of the table.
- Bits[11:0] of the base physical address are zero.
- The address must be aligned to the size specified in the Page Size field. Otherwise the effect is CONSTRAINED UNPREDICTABLE, and can be one of the following:
  - Bits[X:12], where X is derived from the page size, are treated as zero.
  - The value of bits[X:12] are used when calculating the address of a table access.

When Page_Size is 64KB:

- Bits[15:0] of the base physical address are 0.

In implementations that support fewer than 52 bits of physical address, any unimplemented upper bits might be RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Shareability, bits [11:10]**

Indicates the Shareability attributes of accesses to the table. The possible values of this field are:

<table>
<thead>
<tr>
<th>Shareability</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Inner Shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Reserved. Treated as 0b00.</td>
</tr>
</tbody>
</table>
It is **IMPLEMENTATION DEFINED** whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Page Size, bits [9:8]**

The size of page that the translation table uses:

<table>
<thead>
<tr>
<th>Page Size</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>4KB.</td>
</tr>
<tr>
<td>0b01</td>
<td>16KB.</td>
</tr>
<tr>
<td>0b10</td>
<td>64KB.</td>
</tr>
<tr>
<td>0b11</td>
<td>Reserved. Treated as 0b10.</td>
</tr>
</tbody>
</table>

**Note**

If the GIC implementation supports only a single, fixed page size, this field might be RO.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Size, bits [7:0]**

The number of pages of physical memory allocated to the table, minus one. GITS_BASER<n>.Page_Size specifies the size of each page.

If GITS_BASER<n>.Type == 0, this field is RAZ/WI.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the GITS_BASER<n>**

**GITS_BASER<n>** can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC ITS control</td>
<td>0x0100  + (8 * n)</td>
<td>GITS_BASER&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.
GITS_CBASER, ITS Command Queue Descriptor

The GITS_CBASER characteristics are:

Purpose

Specifies the base address and size of the ITS command queue.

Configuration

Bits [63:32] and bits [31:0] are accessible separately.

Attributes

GITS_CBASER is a 64-bit register.

Field descriptions

The GITS_CBASER bit assignments are:

<table>
<thead>
<tr>
<th>Valid</th>
<th>RES0</th>
<th>InnerCache</th>
<th>RES0</th>
<th>OuterCache</th>
<th>RES0</th>
<th>Physical_Address</th>
<th>Shareability</th>
<th>RES0</th>

<td></td>
</tr>
</tbody>
</table>

Valid, bit [63]

Indicates whether software has allocated memory for the command queue:

<table>
<thead>
<tr>
<th>Valid</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No memory is allocated for the command queue.</td>
</tr>
<tr>
<td>1</td>
<td>Memory is allocated to the command queue.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

Bit [62]

Reserved, RES0.

InnerCache, bits [61:59]

Indicates the Inner Cacheability attributes of accesses to the command queue. The possible values of this field are:

<table>
<thead>
<tr>
<th>InnerCache</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>

</tr>
<tr>
<td>0b101</td>
<td>Normal Inner Cacheable Write-allocate, Write-back.</td>
</tr>
<tr>
<td>0b110</td>
<td>Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b111</td>
<td>Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Bits [58:56]

Reserved, RES0.

OuterCache, bits [55:53]

Indicates the Outer Cacheability attributes of accesses to the command queue. The possible values of this field are:

<table>
<thead>
<tr>
<th>OuterCache</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal Outer Cacheable Read-allocate, Write-through.</td>
</tr>
<tr>

<td>Normal Outer Cacheable Read-allocate, Write-back.</td>
</tr>
<tr>
<td>0b100</td>
<td>Normal Outer Cacheable Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b101</td>
<td>Normal Outer Cacheable Write-allocate, Write-back.</td>
</tr>
<tr>
<td>0b110</td>
<td>Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b111</td>
<td>Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.</td>
</tr>
</tbody>
</table>

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [52]

Reserved, RES0.

Physical_Address, bits [51:12]

Bits [51:12] of the base physical address of the command queue. Bits [11:0] of the base address are 0.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

If bits [15:12] are not all zeros, behavior is a CONSTRAINED UNPREDICTABLE choice:

- Bits [15:12] are treated as if all the bits are zero. The value read back from those bits is either the value written or zero.
- The result of the calculation of an address for a command queue read can be corrupted.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the command queue. The possible values of this field are:

<table>
<thead>
<tr>
<th>Shareability</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Inner Shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Reserved. Treated as 0b00.</td>
</tr>
</tbody>
</table>

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [9:8]

Reserved, RES0.
Size, bits [7:0]

The number of 4KB pages of physical memory allocated to the command queue, minus one.

On a Warm reset, this field resets to an architecturally unknown value.

The command queue is a circular buffer and wraps at Physical Address [47:0] + (4096 * (Size + 1)).

Note

When this register is successfully written, the value of GITS_CREADR is set to zero.

Accessing the GITS_CBASER

When GITS_CTLR.Enabled == 1 or GITS_CTLR.Quiescent == 0, writing this register is unpredictable.

GITS_CBASER can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC ITS control</td>
<td>0x0080</td>
<td>GITS_CBASER</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RW.
- When an access is Secure accesses to this register are RW.
- When an access is Non-secure accesses to this register are RW.
GITS_CREADR, ITS Read Register

The GITS_CREADR characteristics are:

**Purpose**

Specifies the offset from GITS_CBASER where the ITS reads the next ITS command.

**Configuration**

This register is cleared to 0 when a value is written to GITS_CBASER.

Bits [63:32] and bits [31:0] are accessible separately.

**Attributes**

GITS_CREADR is a 64-bit register.

**Field descriptions**

The GITS_CREADR bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | Offset | RES0 | Stalled |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:20]**

Reserved, RES0.

**Offset, bits [19:5]**

**Bits [4:1]**

Reserved, RES0.

**Stalled, bit [0]**

Reports whether the processing of commands is stalled because of a command error.

<table>
<thead>
<tr>
<th>Stalled</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ITS command queue is not stalled because of a command error.</td>
</tr>
<tr>
<td>0b1</td>
<td>ITS command queue is stalled because of a command error.</td>
</tr>
</tbody>
</table>

For more information, see ‘The ITS command interface’ in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).
Accessing the GITS_CREADR

GITS_CREADR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC ITS control</td>
<td>0x0090</td>
<td>GITS_CREADR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.
The GITS_CTLR characteristics are:

**Purpose**

Controls the operation of an ITS.

**Configuration**

The ITS_Number (bits [7:4]) and bit [1] fields apply only in FEAT_GICv4 implementations, and are RES0 in FEAT_GICv3 implementations.

**Attributes**

GITS_CTLR is a 32-bit register.

**Field descriptions**

The GITS_CTLR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Quiescent</td>
</tr>
<tr>

</tr>
<tr>
<td>8</td>
<td>UMSlirq</td>
</tr>
<tr>
<td>7</td>
<td>ITS_Number, RES0</td>
</tr>
<tr>
<td>6</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>5</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>4</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>3</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>2</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>1</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>0</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

**Quiescent, bit [31]**

Read-only. Indicates completion of all ITS operations when GITS_CTLR.Enabled == 0.

<table>
<thead>
<tr>
<th>Quiescent</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The ITS is not quiescent and cannot be powered down.</td>
</tr>
<tr>
<td>0b1</td>
<td>The ITS is quiescent and can be powered down.</td>
</tr>
</tbody>
</table>

For the ITS to be considered inactive, there must be no transactions in progress. In addition, all operations required to ensure that mapping data is consistent with external memory must be complete.

**Note**

In distributed GIC implementations, this bit is set to 1 only after the ITS forwards any operations that have not yet been completed to the Redistributors and receives confirmation that all such operations have reached the appropriate Redistributor.

In FEAT_GICv3, FEAT_GICv3p1, and FEAT_GICv4, when GITS_CTLR.Enabled == 1, the value of GITS_CTLR.Quiiescent is UNKNOWN.

In FEAT_GICv4p1, when GITS_CTLR.Enabled == 1, the value of GITS_CTLR.Quiiescent reads as 1 until the write to Enabled has taken effect and then reads as 0.

On a Warm reset, this field resets to 1.

**Bits [30:9]**

Reserved, RES0.

**UMSlirq, bit [8]**

Unmapped MSI reporting interrupt enable.
UMSIirq | Meaning
--- | ---
0b0 | The ITS does not assert an interrupt signal when GITS_STATUSR.UMSI is 1.
0b1 | The ITS asserts an interrupt signal when GITS_STATUSR.UMSI is 1.

If GITS_TYPER.UMSIirq is 0, this field is RES0.

On a Warm reset, this field resets to 0.

**ITS_Number, bits [7:4]**

In FEAT_GICv3 implementations this field is RES0.

In FEAT_GICv4 implementations with more than one ITS instance, this field indicates the ITS number for use with 'VMOVPE GICv4.0' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

It is IMPLEMENTATION DEFINED whether this field is programmable or RO.

If this field is programmable, changing this field when GITS_CTLR.Quiescent == 0 or GITS_CTLR.Enabled == 1 is UNPREDICTABLE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [3:2]**

Reserved, RES0.

**ImDe, bit [1]**

In GICv3 implementations, this bit is RES0.

In GICv4 implementations, this bit is IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to 0.

**Enabled, bit [0]**

Controls whether the ITS is enabled:

<table>
<thead>
<tr>
<th>Enabled</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The ITS is not enabled. Writes to GITS_TRANSLATER are ignored and no further command queue entries are processed.</td>
</tr>
<tr>
<td>0b1</td>
<td>The ITS is enabled. Writes to GITS_TRANSLATER result in interrupt translations and the command queue is processed.</td>
</tr>
</tbody>
</table>

If a write to this register changes this field from 1 to 0, the ITS must ensure that both:

- Any caches containing mapping data are made consistent with external memory.
- GITS_CTLR.Quiescent == 0 until all caches are consistent with external memory.

Changing GITS_CTLR.Enabled from 0 to 1 when GITS_CTLR.Quiescent is 0 results in UNPREDICTABLE behavior.

On a Warm reset, this field resets to 0.

**Accessing the GITS_CTLR**

GITS_CTLR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC ITS control</td>
<td>0x0000</td>
<td>GITS_CTLR</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.
GITS_CWRITER, ITS Write Register

The GITS_CWRITER characteristics are:

Purpose

Specifies the offset from GITS_CBASER where software writes the next ITS command.

Configuration

Bits [63:32] and bits [31:0] are accessible separately.

Attributes

GITS_CWRITER is a 64-bit register.

Field descriptions

The GITS_CWRITER bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field Name</th>

</tbody>
</table>

Bits [63:20]

Reserved, RES0.

Offset, bits [19:5]

Bits [19:5] of the offset from GITS_CBASER. Bits [4:0] of the offset are zero. On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:1]

Reserved, RES0.

Retry, bit [0]

Writing this bit has the following effects:

<table>
<thead>
<tr>
<th>Retry</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No effect on the processing commands by the ITS.</td>
</tr>
<tr>
<td>0b1</td>
<td>Restarts the processing of commands by the ITS if it stalled because of a command error.</td>
</tr>
</tbody>
</table>

Note

If the processing of commands is not stalled because of a command error, writing 1 to this bit has no effect.

When read, this bit is RES0.

For more information, see 'The ITS command interface' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).
If GITS_CWRITER is written with a value outside of the valid range specified by GITS_CBASER.Physical_Address and GITS_CBASER.Size, behavior is a CONSTRAINED UNPREDICTABLE choice, as follows:

- The command queue is considered invalid, and no further commands are processed until GITS_CWRITER is written with a value that is in the valid range.
- The value is treated as a valid UNKNOWN value.

An implementation might choose to report a system error in an IMPLEMENTATION DEFINED manner.

Accessing the GITS_CWRITER

GITS_CWRITER can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC ITS control</td>
<td>0x0088</td>
<td>GITS_CWRITER</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RW.
- When an access is Secure accesses to this register are RW.
- When an access is Non-secure accesses to this register are RW.
The GITS_IIDR characteristics are:

**Purpose**

Provides information about the implementer and revision of the ITS.

**Configuration**

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states, this register is Common.

**Attributes**

GITS_IIDR is a 32-bit register.

**Field descriptions**

The GITS_IIDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>ProductID</td>
</tr>
<tr>
<td>30</td>
<td>RES0</td>
</tr>
<tr>
<td>29</td>
<td>Variant</td>
</tr>
<tr>
<td>28</td>
<td>Revision</td>
</tr>
<tr>
<td>27</td>
<td>Implementer</td>
</tr>
</tbody>
</table>

**ProductID, bits [31:24]**

An IMPLEMENTATION DEFINED product identifier.

**Bits [23:20]**

Reserved, RES0.

**Variant, bits [19:16]**

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish product variants, or major revisions of a product.

**Revision, bits [15:12]**

An IMPLEMENTATION DEFINED revision number. Typically, this field is used to distinguish minor revisions of a product.

**Implementer, bits [11:0]**

Contains the JEP106 code of the company that implemented the ITS:

- Bits [11:8] are the JEP106 continuation code of the implementer. For an Arm implementation, this field is 0x4.
- Bit [7] is always 0.
- Bits [6:0] are the JEP106 identity code of the implementer. For an Arm implementation, bits [7:0] are therefore 0x3B.
Accessing the GITS_IIDR

GITS_IIDR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC ITS control</td>
<td>0x0004</td>
<td>GITS_IIDR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RO.
- When an access is Secure accesses to this register are RO.
- When an access is Non-secure accesses to this register are RO.
GITS_MPAMIDR, Report maximum PARTID and PMG Register

The GITS_MPAMIDR characteristics are:

**Purpose**

Reports the maximum support PARTID and PMG values.

**Configuration**

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GITS_MPAMIDR are RES0.

A copy of this register is provided for each ITS.

When GITS_TYPER.MPAM==0, this register is RES0.

**Attributes**

GITS_MPAMIDR is a 32-bit register.

**Field descriptions**

The GITS_MPAMIDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>PMGmax</td>
</tr>
<tr>
<td>24</td>
<td>PARTIDmax</td>
</tr>
</tbody>
</table>

**Bits [31:24]**

Reserved, RES0.

**PMGmax, bits [23:16]**

Maximum PMG value supported.

**PARTIDmax, bits [15:0]**

Maximum PARTID value supported.

**Accessing the GITS_MPAMIDR**

GITS_MPAMIDR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC ITS control</td>
<td>0x0010</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are RO.
- When an access is Secure accesses to this register are RO.
- When an access is Non-secure accesses to this register are RO.
GITS_MPIDR, Report ITS's affinity.

The GITS_MPIDR characteristics are:

**Purpose**

Reports ITS's affinity when the vPE Table is shared with Redistributors.

**Configuration**

This register is present only when FEAT_GICv4p1 is implemented. Otherwise, direct accesses to GITS_MPIDR are RES0.

A copy of this register is provided for each ITS.

When GITS_TYPER.SVPET==0, this register is RES0.

**Attributes**

GITS_MPIDR is a 32-bit register.

**Field descriptions**

The GITS_MPIDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-24</td>
<td>Aff3, Affinity level 3 value for the ITS.</td>
</tr>
<tr>
<td>23-16</td>
<td>Aff2, Affinity level 2 value for the ITS.</td>
</tr>
<tr>
<td>15-8</td>
<td>Aff1, Affinity level 1 value for the ITS.</td>
</tr>
<tr>
<td>7-0</td>
<td>RES0, Reserved.</td>
</tr>
</tbody>
</table>

**Accessing the GITS_MPIDR**

GITS_MPIDR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC ITS control</td>
<td>0x0018</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTRLR.DS == 0 accesses to this register are RO.
- When an access is Secure accesses to this register are RO.
• When an access is Non-secure accesses to this register are RO.
The GITS_PARTIDR characteristics are:

**Purpose**

Sets the PARTID and PMG values used for memory accesses by the ITS.

**Configuration**

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GITS_PARTIDR are RES0.

A copy of this register is provided for each ITS.

When GITS_TYPER.MPAM==0, this register is RES0.

**Attributes**

GITS_PARTIDR is a 32-bit register.

**Field descriptions**

The GITS_PARTIDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>PMG</td>
</tr>
<tr>
<td>29</td>
<td>PARTID</td>
</tr>
</tbody>
</table>

**Bits [31:24]**

Reserved, RES0.

**PMG, bits [23:16]**

PMG value used when ITS accesses memory.

It is IMPLEMENTATION DEFINED whether bits not needed to represent PMG values in the range 0 to PMG_MAX are stateful or RES0.

On a Warm reset, this field resets to 0.

**PARTID, bits [15:0]**

PARTID value used when ITS accesses memory.

It is IMPLEMENTATION DEFINED whether bits not needed to represent PARTID values in the range 0 to PARTID_MAX are stateful or RES0.

On a Warm reset, this field resets to 0.

**Accessing the GITS_PARTIDR**

GITS_PARTIDR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC ITS control</td>
<td>0x0014</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are \textbf{RW}.
- When an access is Secure accesses to this register are \textbf{RW}.
- When an access is Non-secure accesses to this register are \textbf{RW}.
GITS_SGIR, ITS SGI Register

The GITS_SGIR characteristics are:

Purpose

Written by software to signal a virtual SGI for translation by the ITS.

Configuration

This register is present only when FEAT_GICv4p1 is implemented. Otherwise, direct accesses to GITS_SGIR are RES0. This register is provided only in FEAT_GICv4p1 implementations.

Attributes

GITS_SGIR is a 64-bit register.

Field descriptions

The GITS_SGIR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:48]</td>
<td>Reserved, RES0.</td>
<td></td>
</tr>
<tr>
<td>[47:32]</td>
<td>vPEID, ID of target vPEID.</td>
<td></td>
</tr>
<tr>
<td>[31:4]</td>
<td>Reserved, RES0.</td>
<td></td>
</tr>
<tr>
<td>[3:0]</td>
<td>vINTID, INTID of virtual SGI.</td>
<td></td>
</tr>
</tbody>
</table>

Bits [63:48]

Reserved, RES0.

vPEID, bits [47:32]

ID of target vPEID.

The size of this field is IMPLEMENTATION DEFINED, and is specified by the GICD_TYPER2.VIL and GICD_TYPER2.VID fields. Unimplemented bits are RES0.

Bits [31:4]

Reserved, RES0.

Accessing the GITS_SGIR

64-bit access only.

GITS_SGIR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC ITS control</td>
<td>0x20020</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When GICD_CTRL_DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.
GITS_STATUSR, ITS Error Reporting Status Register

The GITS_STATUSR characteristics are:

Purpose

Provides software with a mechanism to detect:

• Accesses to reserved locations.
• Writes to read-only locations.
• Reads of write-only locations.
• Unmapped MSIs.

Configuration

Attributes

GITS_STATUSR is a 32-bit register.

Field descriptions

The GITS_STATUSR bit assignments are:

| Bit 31 | Bit 30 | Bit 29 | Bit 28 | Bit 27 | Bit 26 | Bit 25 | Bit 24 | Bit 23 | Bit 22 | Bit 21 | Bit 20 | Bit 19 | Bit 18 | Bit 17 | Bit 16 | Bit 15 | Bit 14 | Bit 13 | Bit 12 | Bit 11 | Bit 10 | Bit 9 | Bit 8 | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| \[31:10\] | \[9:6\] | Syndrome | Overflow | UMSI | WROD | RWOD | WRD | RRD |

Bits \[31:10\]

Reserved, RES0.

Syndrome, bits \[9:6\]

Syndrome for the MSI that set GITS_STATUSR.UMSI to 1.

<table>
<thead>
<tr>
<th>Syndrome</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Unknown reason.</td>
</tr>
<tr>
<td>0b0010</td>
<td>DeviceID out of range.</td>
</tr>
<tr>
<td>0b0011</td>
<td>DeviceID unmapped.</td>
</tr>
<tr>
<td>0b0100</td>
<td>EventID out of range.</td>
</tr>
<tr>
<td>0b0101</td>
<td>EventID unmapped.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Collection unmapped.</td>
</tr>
<tr>
<td>0b1001</td>
<td>vPEID unmapped.</td>
</tr>
</tbody>
</table>

An implementation might not support reporting all syndromes, and might report 0b0000 for any cause.

This field is UNKNOWN when GITS_STATUSR.UMSI is 0.

Overflow, bit \[5\]

Reports whether an unmapped MSI has been received while GITS_STATUSR.UMSI is 1.

<table>
<thead>
<tr>
<th>Overflow</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No unmapped MSIs have been received since GITS_STATUSR.UMSI set to 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>At least one unmapped MSIs have been received since GITS_STATUSR.UMSI set to 1.</td>
</tr>
</tbody>
</table>

A software write of 1 to the bit clears it. A write of any other value is ignored.
If \texttt{GITS\_TYPER\_UMSI} is 0, this field is \texttt{RES0}.

**UMSI, bit [4]**

Reports whether an unmapped MSI has been received

<table>
<thead>
<tr>
<th>UMSI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No unmapped MSIs have been received.</td>
</tr>
<tr>
<td>0b1</td>
<td>Unmapped MSI received.</td>
</tr>
</tbody>
</table>

A software write of 1 to the bit clears it. A write of any other value is ignored.

If \texttt{GITS\_TYPER\_UMSI} is 0, this field is \texttt{RES0}.

**WROD, bit [3]**

Write to an RO location.

<table>
<thead>
<tr>
<th>WROD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A write to an RO location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.

**RWOD, bit [2]**

Read of a WO location.

<table>
<thead>
<tr>
<th>RWOD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A read of a WO location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.

**WRD, bit [1]**

Write to a reserved location.

<table>
<thead>
<tr>
<th>WRD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A write to a reserved location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.

**RRD, bit [0]**

Read of a reserved location.

<table>
<thead>
<tr>
<th>RRD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A read of a reserved location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.

**Accessing the GITS\_STATUSR**

This is an optional register. If the register is not implemented, the location is RAZ/WI.

\texttt{GITS\_STATUSR} can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC ITS control</td>
<td>0x0020</td>
<td>GITS_STATUSR</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.
GITS_TRANSLATER, ITS Translation Register

The GITS_TRANSLATER characteristics are:

**Purpose**

Written by a requesting Device to signal an interrupt for translation by the ITS.

**Configuration**

This register is at the same offset as GICD_SETSPI_NSR in the Distributor, and is at the same offset as GICR_SETLPIR in the Redistributor.

**Attributes**

GITS_TRANSLATER is a 32-bit register.

**Field descriptions**

The GITS_TRANSLATER bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>EventID</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**EventID, bits [31:0]**

An identifier corresponding to the interrupt to be translated.

**Note**

The size of the EventID is DeviceID specific, and set when the DeviceID is mapped to an ITT (using MAPD).

The number of EventID bits implemented is reported by GITS_TYPER.ID_bits. If a write specifies non-zero identifiers bits outside this range behavior is a CONSTRAINED UNPREDICTABLE choice between:

- Non-zero identifier bits outside the supported range are ignored.
- The write is ignored.

The DeviceID presented to an ITS is used to index a device table. The device table maps the DeviceID to an interrupt translation table for that device.

**Accessing the GITS_TRANSLATER**

16-bit access to bits [15:0] of this register must be supported. When this register is written by a 16-bit transaction, bits [31:16] are written as zero.

Implementations must ensure that:

- A unique DeviceID is provided for each requesting device, and the DeviceID is presented to the ITS when a write to this register occurs in a manner that cannot be spoofed by any agent capable of performing writes.
- The DeviceID presented corresponds to the DeviceID field in the ITS commands.

Writes to this register are ignored if any of the following are true:

- GITS_CTLR. Enabled == 0.
- The presented DeviceID is not mapped to an Interrupt Translation Table.
- The DeviceID is larger than the supported size.
• The DeviceID is mapped to an Interrupt Translation Table, but the EventID is outside the range specified by MAPD.
• The EventID is mapped to an Interrupt Translation Table and the EventID is within the range specified by MAPD, but the EventID is unmapped.

Translation requests that result from writes to this register are subject to certain ordering rules. For more information, see 'Ordering of translations with the output to ITS commands' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**GITS_TRANSLATER can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC ITS translation</td>
<td>0x0040</td>
<td>GITS_TRANSLATER</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When GICD_CTLR.DS == 0 accesses to this register are **WO**.
• When an access is Secure accesses to this register are **WO**.
• When an access is Non-secure accesses to this register are **WO**.
# GITS_TYPER, ITS Type Register

The GITS_TYPER characteristics are:

## Purpose

Specifies the features that an ITS supports.

## Configuration

## Attributes

GITS_TYPER is a 64-bit register.

## Field descriptions

The GITS_TYPER bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:46</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>45</td>
<td><strong>UMSI_irq</strong>, bit 45**</td>
</tr>
<tr>
<td><strong>Meaning</strong></td>
<td></td>
</tr>
<tr>
<td>0b0</td>
<td>Interrupt on unmapped MSI not supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupt on unmapped MSI is supported.</td>
</tr>
<tr>
<td>44</td>
<td><strong>UMSI</strong>, bit 44**</td>
</tr>
<tr>
<td><strong>Meaning</strong></td>
<td></td>
</tr>
<tr>
<td>0b0</td>
<td>Reporting of unmapped MSIs is not supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reporting of unmapped MSIs is supported.</td>
</tr>
<tr>
<td>43</td>
<td><strong>nID</strong>, bit 43**</td>
</tr>
<tr>
<td><strong>Meaning</strong></td>
<td></td>
</tr>
<tr>
<td>0b0</td>
<td>Individual doorbell interrupt supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>Individual doorbell interrupt not supported.</td>
</tr>
</tbody>
</table>

## Bits [63:46]

Reserved, RES0.

## UMSI_irq, bit [45]

Indicates support for generating an interrupt on receiving unmapped MSI.

## UMSI, bit [44]

Indicates support for reporting receipt of unmapped MSIs.

## nID, bit [43]

When FEAT_GICv4p1 is implemented:

### nID

<table>
<thead>
<tr>
<th>Bits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Individual doorbell interrupt supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>Individual doorbell interrupt not supported.</td>
</tr>
</tbody>
</table>
Otherwise:
Reserved, RES0.

**SVPET, bits [42:41]**

**When FEAT_GICv4p1 is implemented:**

<table>
<thead>
<tr>
<th>SVPET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>vPE Table is not shared with Redistributors.</td>
</tr>
<tr>
<td>0b01</td>
<td>vPE Table is shared with the groups of Redistributors indicated by GITS_MPIDR.Aff3.</td>
</tr>
<tr>
<td>0b10</td>
<td>vPE Table is shared with the groups of Redistributors indicated by GITS_MPIDR fields Aff3 and Aff2.</td>
</tr>
<tr>
<td>0b11</td>
<td>vPE Table is shared with the groups of Redistributors indicated by GITS_MPIDR fields Aff3, Aff2 and Aff1.</td>
</tr>
</tbody>
</table>

Otherwise:
Reserved, RES0.

**VMAPP, bit [40]**

**When FEAT_GICv4p1 is implemented:**

<table>
<thead>
<tr>
<th>VMAPP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FEAT_GICv4 VMAPP command layout.</td>
</tr>
<tr>
<td>0b1</td>
<td>FEAT_GICv4p1 VMAPP command layout.</td>
</tr>
</tbody>
</table>

Otherwise:
Reserved, RES0.

**VSGI, bit [39]**

**When FEAT_GICv4p1 is implemented:**

<table>
<thead>
<tr>
<th>VSGI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Direct injection of SGIs is not supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>Direct injection of SGIs is supported.</td>
</tr>
</tbody>
</table>

Otherwise:
Reserved, RES0.

**MPAM, bit [38]**

**When FEAT_GICv3p1 is implemented:**

<table>
<thead>
<tr>
<th>MPAM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MPAM is not supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAM is supported.</td>
</tr>
</tbody>
</table>
Otherwise:

Reserved, RES0.

### VMOVP, bit [37]

Indicates the form of the VMOVP command.

<table>
<thead>
<tr>
<th>VMOVP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When moving a vPE, software must issue a VMOVP on all ITSs that have mappings for that vPE. The ITSList and Sequence Number fields in the VMOVP command must ensure synchronization, otherwise behavior is UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b1</td>
<td>When moving a vPE, software must only issue a VMOVP on one of the ITSs that has a mapping for that vPE. The ITSList and Sequence Number fields in the VMOVP command are RES0.</td>
</tr>
</tbody>
</table>

### CIL, bit [36]

Collection ID Limit.

<table>
<thead>
<tr>
<th>CIL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>GITS_TYPER.CIDbits is RES0. ITS supports 16-bit Collection ID, GITS_TYPER.CIDbits is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>GITS_TYPER.CIDbits indicates supported Collection ID size</td>
</tr>
</tbody>
</table>

In implementations that do not support Collections in external memory, this bit is RES0 and the number of Collections supported is reported by GITS_TYPER.HCC.

### CIDbits, bits [35:32]

Number of Collection ID bits.

- The number of bits of Collection ID minus one.
- When GITS_TYPER.CIL == 0, this field is RES0.

### HCC, bits [31:24]

Hardware Collection Count. The number of interrupt collections supported by the ITS without provisioning of external memory.

**Note**

Collections held in hardware are unmapped at reset.

### Bits [23:20]

Reserved, RES0.

### PTA, bit [19]

Physical Target Addresses. Indicates the format of the target address:

<table>
<thead>
<tr>
<th>PTA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The target address corresponds to the PE number specified by GICR_TYPER.Processor_Number.</td>
</tr>
<tr>
<td>0b1</td>
<td>The target address corresponds to the base physical address of the required Redistributor.</td>
</tr>
</tbody>
</table>

For more information, see 'RDbase' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).
SEIS, bit [18]

SEI support. Indicates whether the virtual CPU interface supports generation of SEIs:

<table>
<thead>
<tr>
<th>SEIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The ITS does not support local generation of SEIs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The ITS supports local generation of SEIs.</td>
</tr>
</tbody>
</table>

Devbits, bits [17:13]

The number of DeviceID bits implemented, minus one.

ID_bits, bits [12:8]

The number of EventID bits implemented, minus one.

ITT_entry_size, bits [7:4]

Read-only. Indicates the number of bytes per translation table entry, minus one.

For more information about the ITS command 'MAPD', see MAPD.

IMPLEMENTATION DEFINED, bit [3]

IMPLEMENTATION DEFINED.

CCT, bit [2]

Cumulative Collection Tables.

<table>
<thead>
<tr>
<th>CCT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The total number of supported collections is determined by the number</td>
</tr>
<tr>
<td></td>
<td>of collections held in memory only.</td>
</tr>
<tr>
<td>0b1</td>
<td>The total number of supported collections is determined by the number</td>
</tr>
<tr>
<td></td>
<td>of collections that are held in memory and the number that is indicated</td>
</tr>
<tr>
<td></td>
<td>by the GITS_TYPER.HCC.</td>
</tr>
</tbody>
</table>

If GITS_TYPER.HCC == 0, or if memory backed collections are not supported (all GITS_BASER<n>.Type != 100), this bit is RES0.

Virtual, bit [1]

When FEAT_GICv4 is implemented:

Indicates whether the ITS supports virtual LPIs and direct injection of virtual LPIs:

<table>
<thead>
<tr>
<th>Virtual</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The ITS does not support virtual LPIs or direct injection of virtual LPIs</td>
</tr>
<tr>
<td>0b1</td>
<td>The ITS supports virtual LPIs and direct injection of virtual LPIs</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

Physical, bit [0]

Indicates whether the ITS supports physical LPIs:
### Physical Meaning

<table>
<thead>
<tr>
<th>Physical</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The ITS does not support physical LPIS.</td>
</tr>
<tr>
<td>0b1</td>
<td>The ITS supports physical LPIS.</td>
</tr>
</tbody>
</table>

This field is RES1, indicating that the ITS supports physical LPIS.

## Accessing the GITS_TYPER

**GITS_TYPER can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC ITS control</td>
<td>0x0008</td>
<td>GITS_TYPER</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

GITS_UMSIR, ITS Unmapped MSI register

The GITS_UMSIR characteristics are:

**Purpose**

Provides the DeviceID and EventID of the unmapped MSI that set GITS_STATUSR.UMSI.

**Configuration**

This register is present only when GITS_TYPER.UMSI == 1. Otherwise, direct accesses to GITS_UMSIR are RES0.

**Attributes**

GITS_UMSIR is a 64-bit register.

**Field descriptions**

The GITS_UMSIR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>DeviceID</th>
<th>EventID</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>62</td>
<td>61</td>

<td></td>
</tr>
</tbody>
</table>

**DeviceID, bits [63:32]**

DeviceID of MSI that set GITS_STATUSR.UMSI to 1.

If GITS_STATUSR.UMSI is 0, this field is UNKNOWN.

**EventID, bits [31:0]**

EventID of MSI that set GITS_STATUSR.UMSI to 1.

If GITS_STATUSR.UMSI is 0, this field is UNKNOWN.

**Accessing the GITS_UMSIR**

GITS_UMSIR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC ITS control</td>
<td>0x0028</td>
<td>GITS_UMSIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.
The MIDR_EL1 characteristics are:

**Purpose**

Provides identification information for the PE, including an implementer code for the device and a device ID number.

**Configuration**

External register MIDR_EL1 bits [31:0] are architecturally mapped to AArch64 System register MIDR_EL1[31:0].

External register MIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register MIDR[31:0].

It is IMPLEMENTATION DEFINED whether MIDR_EL1 is implemented in the Core power domain or in the Debug power domain.

**Attributes**

MIDR_EL1 is a 32-bit register.

**Field descriptions**

The MIDR_EL1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Implementer | Variant | Architecture | PartNum | Revision |

**Implementer, bits [31:24]**

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

<table>
<thead>
<tr>
<th>Hex representation</th>
<th>Implementer</th>
</tr>

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

**Variant, bits [23:20]**

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.
Architecture, bits [19:16]

Architecture version. Defined values are:

<table>
<thead>
<tr>
<th>Architecture</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>Armv4.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Armv4T.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Armv5 (obsolete).</td>
</tr>
<tr>
<td>0b0100</td>
<td>Armv5T.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Armv5TE.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Armv5TEJ.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Armv6.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Architectural features are individually identified in the ID_* registers, see 'ID registers'.</td>
</tr>
</tbody>
</table>

All other values are reserved.

PartNum, bits [15:4]

An implementation defined primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

Revision, bits [3:0]

An implementation defined revision number for the device.

Accessing the MIDR_EL1

MIDR_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xD00</td>
<td>MIDR_EL1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

The MPAMCFG_CMAX characteristics are:

**Purpose**

The MPAMCFG_CMAX is a 32-bit read-write register that controls the maximum fraction of the cache capacity that the PARTID selected by MPAMCFG_PART_SEL is permitted to allocate. MPAMCFG_CMAX_s controls cache maximum capacity for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_CMAX_ns controls the cache maximum capacity for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

If MPAMF_IDR.HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

**Configuration**

The power domain of MPAMCFG_CMAX is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_CCAP_PART == 1. Otherwise, direct accesses to MPAMCFG_CMAX are RES0.

**Attributes**

MPAMCFG_CMAX is a 32-bit register.

**Field descriptions**

The MPAMCFG_CMAX bit assignments are:

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

**Bits [31:16]**

Reserved, RES0.

**CMAX, bits [15:0]**

Maximum cache capacity usage in fixed-point fraction format by the partition selected by MPAMCFG_PART_SEL. The fraction represents the portion of the total cache capacity that the PARTID is permitted to allocate.

The implemented width of the fixed-point fraction is given in MPAMF_CCAP_IDR.CMAX_WD. Unimplemented bits within the field are RAZ/WI. The implemented bits of the CMAX field are always the most-significant bits of the field.

The fixed-point fraction CMAX is less than 1. The implied binary point is between bits 15 and 16. This representation has as the largest fraction of the cache that can be represented in an implementation with w implemented bits is 1 - 1/ w.

**Accessing the MPAMCFG_CMAX**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_CMAX_s must be accessible from the Secure MPAM feature page. MPAMCFG_CMAX_ns must be accessible from the Non-secure MPAM feature page.
MPAMCFG_CMAX_s and MPAMCFG_CMAX_ns must be separate registers. The Secure instance (MPAMCFG_CMAX_s) accesses the cache capacity partitioning used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_CMAX_ns) accesses the cache capacity partitioning used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_CMAX access the cache maximum capacity partitioning configuration settings for the cache resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_CMAX access the cache maximum capacity partitioning configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_CMAX access the cache maximum capacity partitioning configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_CMAX access the cache maximum capacity partitioning configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

**MPAMCFG_CMAX can be accessed through the memory-mapped interfaces:**

<table>

<td>0x0108</td>
<td>MPAMCFG_CMAX_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
MPAMCFG_CPBM<n>, MPAM Cache Portion Bitmap Partition Configuration Register, n = 0 - 1023

The MPAMCFG_CPBM<n> characteristics are:

**Purpose**

The MPAMCFG_CPBM<n> register array gives access to the cache portion bitmap. Each register in the array is a read-write register that configures the cache portions numbered from \(<n \times 32>\) to \(<31 + (n \times 32)>\) that a PARTID is allowed to allocate.

After setting MPAMCFG_PART_SEL with a PARTID, software writes to the MPAMCFG_CPBM<n> register to configure which cache portions the PARTID is allowed to allocate.

The MPAMCFG_CPBM<n> register that contains the bitmap bit corresponding to cache portion \(p\) has \(n\) equal to \(p[15:5]\). The field, \(P<x>\), of that MPAMCFG_CPBM<n> register that contain the bitmap bit corresponding to cache portion \(p\) has \(x\) equal to \(p[4:0]\).

MPAMCFG_CPBM<n>_s controls cache portions for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_CPBM<n>_ns controls the cache portions for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

If MPAMF_IDR.HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

**Configuration**

The power domain of MPAMCFG_CPBM<n> is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_CPOR_Part == 1. Otherwise, direct accesses to MPAMCFG_CPBM<n> are res0.

**Attributes**

MPAMCFG_CPBM<n> is a 32-bit register.

**Field descriptions**

The MPAMCFG_CPBM<n> bit assignments are:

\[
P<x + (n \times 32)>, \text{bit } [x] , \text{for } x = 31 \text{ to } 0
\]

Portion allocation control bit. Each cache portion allocation control bit, MPAMCFG_CPBM<n>.P<x>, grants permission to the PARTID selected by MPAMCFG_PART_SEL to allocate cache lines within cache portion \(<x + (n \times 32)>\).

<table>
<thead>
<tr>
<th>(P&lt;x + (n \times 32)&gt;)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The PARTID is not permitted to allocate into cache portion (&lt;x + (n \times 32)&gt;).</td>
</tr>
<tr>
<td>0b1</td>
<td>The PARTID is permitted to allocate within cache portion (&lt;x + (n \times 32)&gt;).</td>
</tr>
</tbody>
</table>

The number of bits in the cache portion partitioning bit map of this component is given in MPAMF_CPOR_IDR.CPBM_WD. CPBM_WD contains a value from 1 to \(2^{15}\), inclusive. Values of CPBM_WD greater than 32 require an array of 32-bit MPAMCFG_CPBM<n> registers to access the cache portion bitmap, up to 1024 registers.
Bits MPAMCFG_CPBM<n>.P<<x + (n * 32)>>, where <x + (n * 32)> is greater than or equal to CPBM_WD, are RES0:

- If n > MPAMF_CPOR_IDR.CPBM_WD[15:5], the entire 32 P<x> are RES0.
- If n == MPAMF_CPOR_IDR.CPBM_WD[15:5], bits [31: CPBM_WD[4:0]] are RES0 and the remaining bits are valid.
- If n < MPAMF_CPOR_IDR.CPBM_WD[15:5], the entire 32 P<x> are valid.

**Accessing the MPAMCFG_CPBM<n>**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_CPBM<n>_s must be accessible from the Secure MPAM feature page. MPAMCFG_CPBM<n>_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_CPBM<n>_s and MPAMCFG_CPBM<n>_ns must be separate registers. The Secure instance (MPAMCFG_CPBM<n>_s) accesses the cache portion bitmap used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_CPBM<n>_ns) accesses the cache portion bitmap used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_CPBM<n> access the cache portion bitmap configuration settings for the cache resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_CPBM<n> access the cache portion bitmap configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_CPBM<n> access the cache portion bitmap configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_CPBM<n> access the cache portion bitmap configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

**MPAMCFG_CPBM<n> can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x1000 + (4 * n)</td>
<td>MPAMCFG_CPBM&lt;n&gt;_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>

</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x1000 + (4 * n)</td>
<td>MPAMCFG_CPBM&lt;n&gt;_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
The MPAMCFG_INTPARTID characteristics are:

**Purpose**

MPAMCFG_INTPARTID is a 32-bit read-write register that controls the mapping of the PARTID selected by MPAMCFG_PART_SEL into a narrower internal PARTID (intPARTID).

MPAMCFG_INTPARTID_s controls the mapping for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_INTPARTID_ns controls the mapping for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

The MPAMCFG_INTPARTID register associates the request PARTID (reqPARTID) in the MPAMCFG_PART_SEL register with an internal PARTID (intPARTID) in this register. To set that association, store reqPARTID into the MPAMCFG_PART_SEL register and then store the intPARTID into the MPAMCFG_INTPARTID register. To read the association, store reqPARTID into the MPAMCFG_PART_SEL register and then read MPAMCFG_INTPARTID.

If the intPARTID stored into MPAMCFG_INTPARTID is out-of-range or does not have the INTERNAL bit set, the association of reqPARTID to intPARTID is not written and MPAMF_ESR is set to indicate an intPARTID_Range error.

If MPAMCFG_PART_SEL.INTERNAL is 1 when MPAMCFG_INTPARTID is read or written, MPAMF_ESR is set to indicate an Unexpected_INTERNAL error.

**Configuration**

The power domain of MPAMCFG_INTPARTID is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_PARTID_NRW == 1. Otherwise, direct accesses to MPAMCFG_INTPARTID are RES0.

**Attributes**

MPAMCFG_INTPARTID is a 32-bit register.

**Field descriptions**

The MPAMCFG_INTPARTID bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | INTERNAL | INTPARTID |

**Bits [31:17]**

Reserved, RES0.

**INTERNAL, bit [16]**

Internal PARTID flag.

This bit must be 1 when written to the register. If written as 0, the write will not update the reqPARTID to intPARTID association.

On a read of this register, the bit will always read the value last written.
INTPARTID, bits [15:0]

This field contains the intPARTID mapped to the reqPARTID in MPAMCFG_PART_SEL.
The maximum intPARTID supported is MPAMF_PARTID_NRW_IDR.INTPARTID_MAX.

Accessing the MPAMCFG_INTPARTID

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_INTPARTID_s must be accessible from the Secure MPAM feature page. MPAMCFG_INTPARTID_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_INTPARTID_s and MPAMCFG_INTPARTID_ns must be separate registers. The Secure instance (MPAMCFG_INTPARTID_s) accesses the PARTID narrowing used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_INTPARTID_ns) accesses the PARTID narrowing used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_INTPARTID access the PARTID narrowing configuration settings without being affected by MPAMCFG_PART_SEL.RIS.

Loads and stores to MPAMCFG_INTPARTID access the PARTID narrowing configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_INTPARTID can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0600</td>
<td>MPAMCFG_INTPARTID_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0600</td>
<td>MPAMCFG_INTPARTID_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
MPAMCFG_MBW_MAX, MPAM Memory Bandwidth Maximum Partition Configuration Register

The MPAMCFG_MBW_MAX characteristics are:

**Purpose**

MPAMCFG_MBW_MAX is a 32-bit read-write register that controls the maximum fraction of memory bandwidth that the PARTID selected by MPAMCFG_PART_SEL is permitted to use. MPAMCFG_MBW_MAX controls maximum bandwidth for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_MBW_MAX ns controls the maximum bandwidth for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

A PARTID that has used more than MAX is given no access to additional bandwidth if HARDLIM == 1 or is given additional bandwidth only if there are no requests from PARTIDs that have not exceeded their MAX if HARDLIM == 0.

If MPAMF_IDR.HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

**Configuration**

The power domain of MPAMCFG_MBW_MAX is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MBW_PART == 1 and MPAMF_MBW_IDR.HAS_MAX == 1. Otherwise, direct accesses to MPAMCFG_MBW_MAX are RES0.

**Attributes**

MPAMCFG_MBW_MAX is a 32-bit register.

**Field descriptions**

The MPAMCFG_MBW_MAX bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| HARDLIM | RES0 | MAX |

**HARDLIM, bit [31]**

Hard bandwidth limiting.

<table>
<thead>
<tr>
<th>HARDLIM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When MAX bandwidth is exceeded, the partition contends with a low preference for downstream bandwidth beyond MAX.</td>
</tr>
<tr>
<td>0b1</td>
<td>When MAX bandwidth is exceeded, the partition does not be use any more bandwidth until the memory bandwidth measurement for the partition falls below MAX.</td>
</tr>
</tbody>
</table>

**Bits [30:16]**

Reserved, RES0.
MAX, bits [15:0]

Memory maximum bandwidth allocated to the partition selected by MPAMCFG_PART_SEL. MAX is in fixed-point fraction format. The fraction represents the portion of the total memory bandwidth capacity through the controlled component that the PARTID is permitted to allocate.

The implemented width of the fixed-point fraction is given in MPAMF_MBW_IDR.BWA_WD. Unimplemented bits are RAZ/WI. The implemented bits of the MAX field are always to the left of the field. For example, if BWA_WD = 3, the implemented bits are MPAMCFG_MBW_MAX[15:13] and MPAMCFG_MBW_MAX[12:0] are unimplemented.

The fixed-point fraction MAX is less than 1. The implied binary point is between bits 15 and 16. This representation has as the largest fraction of the bandwidth that can be represented in an implementation with w implemented bits is 1 - 1/w.

Accessing the MPAMCFG_MBW_MAX

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_MBW_MAX_s must be accessible from the Secure MPAM feature page. MPAMCFG_MBW_MAX_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_MBW_MAX_s and MPAMCFG_MBW_MAX_ns must be separate registers. The Secure instance (MPAMCFG_MBW_MAX_s) accesses the memory maximum bandwidth partitioning used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_MBW_MAX_ns) accesses the memory maximum bandwidth partitioning used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_MBW_MAX access the memory maximum bandwidth partitioning configuration settings for the bandwidth resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_MBW_MAX access the memory maximum bandwidth partitioning configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_MBW_MAX access the memory maximum bandwidth partitioning configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_MBW_MAX access the memory maximum bandwidth partitioning configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_MBW_MAX can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0208</td>
<td>MPAMCFG_MBW_MAX_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0208</td>
<td>MPAMCFG_MBW_MAX_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
The MPAMCFG_MBW_MIN characteristics are:

**Purpose**

MPAMCFG_MBW_MIN is a 32-bit read-write register that controls the minimum fraction of memory bandwidth that the PARTID selected by MPAMCFG_PART_SEL is permitted to use. MPAMCFG_MBW_MIN_s controls the minimum bandwidth for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_MBW_MIN_ns controls the minimum bandwidth for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

A PARTID that has used less than MIN is given preferential access to bandwidth.

If MPAMF_IDR.HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

**Configuration**

The power domain of MPAMCFG_MBW_MIN is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MBW_PART == 1 and MPAMF_MBW_IDR.HAS_MIN == 1. Otherwise, direct accesses to MPAMCFG_MBW_MIN are RES0.

**Attributes**

MPAMCFG_MBW_MIN is a 32-bit register.

**Field descriptions**

The MPAMCFG_MBW_MIN bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | MIN |

**Bits [31:16]**

Reserved, RES0.

**MIN, bits [15:0]**

Memory minimum bandwidth allocated to the partition selected by MPAMCFG_PART_SEL. MIN is in fixed-point fraction format. The fraction represents the portion of the total memory bandwidth capacity through the controlled component that the PARTID is permitted to allocate.

The implemented width of the fixed-point fraction is given in MPAMF_MBW_IDR.BWA WD. Unimplemented bits are RAZ/WI. The implemented bits of the MIN field are always to the left of the field. For example, if BWA WD = 4, the implemented bits are MPAMCFG_MBW_MIN[15:12] and MPAMCFG_MBW_MIN[11:0] are unimplemented.

The fixed-point fraction MIN is less than 1. The implied binary point is between bits 15 and 16. This representation has as the largest fraction of the bandwidth that can be represented in an implementation with w implemented bits is 1 - 1/w.
Accessing the MPAMCFG_MBW_MIN

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_MBW_MIN_s must be accessible from the Secure MPAM feature page. MPAMCFG_MBW_MIN_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_MBW_MIN_s and MPAMCFG_MBW_MIN_ns must be separate registers. The Secure instance (MPAMCFG_MBW_MIN_s) accesses the memory minimum bandwidth partitioning used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_MBW_MIN_ns) accesses the memory minimum bandwidth partitioning used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_MBW_MIN access the memory minimum bandwidth partitioning configuration settings for the bandwidth resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_MBW_MIN access the memory minimum bandwidth partitioning configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_MBW_MIN access the memory minimum bandwidth partitioning configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_MBW_MIN access the memory minimum bandwidth partitioning configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_MBW_MIN can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0200</td>
<td>MPAMCFG_MBW_MIN_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0200</td>
<td>MPAMCFG_MBW_MIN_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
The MPAMCFG_MBW_PBM<n> characteristics are:

**Purpose**

The MPAMCFG_MBW_PBM<n> register array gives access to the memory bandwidth portion bitmap. Each register in the array is a read-write register that configures the bandwidth portions \(32 \times n\) to \((32 \times n) + 31\) that a PARTID is allowed to allocate.

After setting MPAMCFG_PART_SEL with a PARTID, software writes to one or more of the MPAMCFG_MBW_PBM<n> registers to configure which bandwidth portions the PARTID is allowed to allocate.

The MPAMCFG_MBW_PBM<n> register that contains the bitmap bit corresponding to memory bandwidth portion \(p\) has \(n\) equal to \(p[11:5]\). The field, \(P<\times + (32 \times n)>\) of that MPAMCFG_MBW_PBM<n> register that contain the bitmap bit corresponding to memory bandwidth portion \(p\) has \(x\) equal to \(p[4:0]\).

The MPAMCFG_MBW_PBM<n>_s registers control the bandwidth portion bitmap for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. The MPAMCFG_MBW_PBM<n>_ns registers control the bandwidth portion bitmap for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

If MPAMF_IDR.HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

**Configuration**

The power domain of MPAMCFG_MBW_PBM<n> is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MBW_PART == 1 and MPAMF_MBW_IDR.HAS_PBM == 1. Otherwise, direct accesses to MPAMCFG_MBW_PBM<n> are RES0.

**Attributes**

MPAMCFG_MBW_PBM<n> is a 32-bit register.

**Field descriptions**

The MPAMCFG_MBW_PBM<n> bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
</tr>
</thead>
<tbody>
<tr>
<td>(P&lt;32 \times n + 31&gt;)</td>
<td>(P&lt;32 \times n + 30&gt;)</td>
<td>(P&lt;32 \times n + 29&gt;)</td>
<td>(P&lt;32 \times n + 28&gt;)</td>
<td>(P&lt;32 \times n + 27&gt;)</td>
<td>(P&lt;32 \times n + 26&gt;)</td>
<td>(P&lt;32 \times n + 25&gt;)</td>
</tr>
</tbody>
</table>

\(P<\times + (32 \times n)>, \text{ bit } [x]\), for \(x = 31 \text{ to } 0\)

Portion allocation control bit. Each bandwidth portion allocation control bit MPAMCFG_MBW_PBM<n>.P<<\(\times + (32 \times n)\)> grants permission to the PARTID selected by MPAMCFG_PART_SEL to allocate bandwidth within bandwidth portion \(\times + (32 \times n)\).

<table>
<thead>
<tr>
<th>(P&lt;\times + (32 \times n)&gt;)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The PARTID is not permitted to allocate into bandwidth portion (\times + (32 \times n)).</td>
</tr>
<tr>
<td>0b1</td>
<td>The PARTID is permitted to allocate within bandwidth portion (\times + (32 \times n)).</td>
</tr>
</tbody>
</table>

The number of bits in the bandwidth portion partitioning bit map of this component is given in MPAMF_MBW_IDR.BWPBM_WD. BWPBM_WD contains a value from 1 to \(2^{12}\), inclusive. Values of BWPBM_WD greater than 32 require a group of 32-bit registers to access the bandwidth portion bitmap, up to 128 32-bit registers.
Bits MPAMCFG_MBW_PBM<n>.P<x + (32 * n)>, where <x + (32 * n)> is greater than or equal to BWPBM_WD are RES0:

- If n > MPAMF_MBW_IDR.BWPBM_WD[11:5], the entire 32 P<x> are RES0.
- If n == MPAMF_MBW_IDR.BWPBM_WD[11:5], bits [31: BWPBM_WD[4:0]] are RES0 and the remaining bits are valid.
- If n < MPAMF_MBW_IDR.BWPBM_WD[11:5], the entire 32 P<x> are valid.

**Accessing the MPAMCFG_MBW_PBM<n>**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_MBW_PBM<n>_s must be accessible from the Secure MPAM feature page. MPAMCFG_MBW_PBM<n>_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_MBW_PBM<n>_s and MPAMCFG_MBW_PBM<n>_ns must be separate registers. The Secure instance (MPAMCFG_MBW_PBM<n>_s) accesses the memory bandwidth portion bitmap used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_MBW_PBM<n>_ns) accesses the memory bandwidth portion bitmap used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_MBW_PBM<n> access the memory bandwidth portion bitmap configuration settings for the bandwidth resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_MBW_PBM<n> access the memory bandwidth portion bitmap configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_MBW_PBM<n> access the memory bandwidth portion bitmap configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_MBW_PBM<n> access the memory bandwidth portion bitmap configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

**MPAMCFG_MBW_PBM<n> can be accessed through the memory-mapped interfaces:**

The MPAMCFG_MBW_PROP characteristics are:

**Purpose**

Controls the proportional stride of memory bandwidth that the PARTID selected by MPAMCFG_PART_SEL uses. MPAMCFG_MBW_PROP selects the bandwidth proportional stride for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_MBW_PROP ns selects the bandwidth proportional stride for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

Proportional stride is a relative cost of bandwidth requested by one PARTID in relation to the costs of the bandwidths requested by each other PARTID also competing to use the bandwidth.

If MPAMF_IDR.HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

**Configuration**

The power domain of MPAMCFG_MBW_PROP is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MBW_PART == 1 and MPAMF_MBW_IDR.HAS_PROP == 1. Otherwise, direct accesses to MPAMCFG_MBW_PROP are RES0.

**Attributes**

MPAMCFG_MBW_PROP is a 32-bit register.

**Field descriptions**

<td>The selected partition is not regulated by proportional stride bandwidth partitioning.</td>
</tr>
<tr>
<td>0b1</td>
<td>The selected partition has bandwidth usage regulated by proportional stride bandwidth partitioning as controlled by STRIDEM1.</td>
</tr>
</tbody>
</table>

**Bits [30:16]**

Reserved, RES0.

**STRIDEM1, bits [15:0]**

Memory bandwidth stride minus 1 allocated to the partition selected by MPAMCFG_PART_SEL. STRIDEM1 represents the normalized cost of bandwidth consumption by the partition.
The proportional stride partitioning control parameter is an unsigned integer representing the normalized cost to a partition for consuming bandwidth. Larger values have a larger cost and correspond to a lesser allocation of bandwidth while smaller values indicate a lesser cost and therefore a higher allocation of bandwidth.

The implemented width of STRIDEM1 is given in MPAMF_MBW_IDR.BWA_WD.

**Accessing the MPAMCFG_MBW_PROP**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_MBW_PROP_s must be accessible from the Secure MPAM feature page. MPAMCFG_MBW_PROP_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_MBW_PROP_s and MPAMCFG_MBW_PROP_ns must be separate registers. The Secure instance (MPAMCFG_MBW_PROP_s) accesses the memory proportional stride bandwidth partitioning used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_MBW_PROP_ns) accesses the memory proportional stride bandwidth partitioning used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_MBW_PROP access the memory proportional stride bandwidth partitioning configuration settings for the bandwidth resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_MBW_PROP access the memory proportional stride bandwidth partitioning configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_MBW_PROP access the memory proportional stride bandwidth partitioning configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_MBW_PROP access the memory proportional stride bandwidth partitioning configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

**MPAMCFG_MBW_PROP can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0500</td>
<td>MPAMCFG_MBW_PROP_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

<table>

</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0500</td>
<td>MPAMCFG_MBW_PROP_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
The MPAMCFG_MBW_WINWD characteristics are:

**Purpose**

MPAMCFG_MBW_WINWD is a 32-bit register that shows and sets the value of the window width for the PARTID in MPAMCFG_PART_SEL. MPAMCFG_MBW_WINWD reads and controls the bandwidth control window width for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_MBW_WINWD ns reads and controls the bandwidth control window for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

MPAMCFG_MBW_WINWD is read-only if MPAMF_MBW_IDR.WINDWR == 0, and the window width is set by the hardware, even if variable.

MPAMCFG_MBW_WINWD is read-write if MPAMF_MBW_IDR.WINDWR == 1, permitting configuration of the window width for each PARTID independently on hardware that supports this functionality.

If MPAMF_IDR.HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

**Configuration**

The power domain of MPAMCFG_MBW_WINWD is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_MBW_PART == 1. Otherwise, direct accesses to MPAMCFG_MBW_WINWD are RES0.

**Attributes**

MPAMCFG_MBW_WINWD is a 32-bit register.

**Field descriptions**

The MPAMCFG_MBW_WINWD bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | US_INT | US_FRAC |

**Bits [31:24]**

Reserved, RES0.

**US_INT, bits [23:8]**

Window width, integer microseconds.

This field reads (and sets) the integer part of the window width in microseconds for the PARTID selected by MPAMCFG_PART_SEL.

**US_FRAC, bits [7:0]**

Window width, fractional microseconds.

This field reads (and sets) the fractional part of the window width in microseconds for the PARTID selected by MPAMCFG_PART_SEL.
**Accessing the MPAMCFG_MBW_WINWD**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_MBW_WINWD_s must be accessible from the Secure MPAM feature page. MPAMCFG_MBW_WINWD_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_MBW_WINWD_s and MPAMCFG_MBW_WINWD_ns must be separate registers. The Secure instance (MPAMCFG_MBW_WINWD_s) accesses the window width used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_MBW_WINWD_ns) accesses the window width used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_MBW_WINWD access the window width configuration settings for the bandwidth resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_MBW_WINWD access the window width configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_MBW_WINWD access the window width configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_MBW_WINWD access the window width configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

**MPAMCFG_MBW_WINWD can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0220</td>
<td>MPAMCFG_MBW_WINWD_s</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When MPAMF_MBW_IDR.WINDWR == 0 accesses to this register are **RO**.
- Otherwise accesses to this register are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0220</td>
<td>MPAMCFG_MBW_WINWD_ns</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When MPAMF_MBW_IDR.WINDWR == 0 accesses to this register are **RO**.
- Otherwise accesses to this register are **RW**.
The MPAMCFG_PART_SEL characteristics are:

**Purpose**

Selects a partition ID to configure. MPAMCFG_PART_SEL_s selects a Secure PARTID to configure. MPAMCFG_PART_SEL_ns selects a Non-secure PARTID to configure.

After setting this register with a PARTID, software (usually a hypervisor) can perform a series of accesses to MPAMCFG registers to configure parameters for MPAM resource controls to use when requests have that PARTID.

**Configuration**

The power domain of MPAMCFG_PART_SEL is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and (MPAMF_IDR.HAS_CCAP_PART == 1, or MPAMF_IDR.HAS_CPOR_PART == 1, or MPAMF_IDR.HAS_MBW_PART == 1, or MPAMF_IDR.HAS_PRI_PART == 1, or MPAMF_IDR.HAS_PARTID_NRW == 1, or (MPAMF_IDR.EXT == 0 and MPAMF_IDR.HAS_IMPL_IDR == 1) or (MPAMF_IDR.EXT == 1, MPAMF_IDR.HAS_IMPL_IDR == 1 and MPAMF_IDR.NO_IMPL_PART == 0)). Otherwise, direct accesses to MPAMCFG_PART_SEL are RES0.

**Attributes**

MPAMCFG_PART_SEL is a 32-bit register.

**Field descriptions**

The MPAMCFG_PART_SEL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RIS | RES0 | INTERNAL | PARTID_SEL |

**Bits [31:28]**

Reserved, RES0.

**RIS, bits [27:24]**

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented), MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_RIS == 1:

Resource Instance Selector. RIS selects one resource to configure through MPAMCFG registers and describe with MPAMF ID registers.

Otherwise:

Reserved, RES0.

**Bits [23:17]**

Reserved, RES0.
INTERNAL, bit [16]

Internal PARTID.

If `MPAMF_IDR.HAS_PARTID_NRW = 0`, this field is RAZ/WI.

If `MPAMF_IDR.HAS_PARTID_NRW = 1`:

<table>
<thead>
<tr>
<th>INTERNAL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PARTID_SEL is interpreted as a request PARTID and ignored except for use with <code>MPAMCFG_INTPARTID</code> register access.</td>
</tr>
<tr>
<td>0b1</td>
<td>PARTID_SEL is interpreted as an internal PARTID and used for access to MPAMCFG control settings except for <code>MPAMCFG_INTPARTID</code>.</td>
</tr>
</tbody>
</table>

If PARTID narrowing is implemented as indicated by `MPAMF_IDR.HAS_PARTID_NRW = 1`, when accessing other MPAMCFG registers the value of the `MPAMCFG_PART_SEL.INTERNAL` bit is checked for these conditions:

- When the `MPAMCFG_INTPARTID` register is read or written, if the value of `MPAMCFG_PART_SEL.INTERNAL` is not 0, an Unexpected_INTERNAL error is set in `MPAMF_ESR`.
- When an MPAMCFG register other than `MPAMCFG_INTPARTID` is read or written, if the value of `MPAMCFG_PART_SEL.INTERNAL` is not 1, `MPAMF_ESR` is set to indicate an intPARTID_Range error.

In either error case listed here, the value returned by a read operation is UNPREDICTABLE, and the control settings are not affected by a write.

PARTID_SEL, bits [15:0]

Selects the partition ID to configure.

Reads and writes to other MPAMCFG registers are indexed by PARTID_SEL and by the NS bit used to access `MPAMCFG_PART_SEL` to access the configuration for a single partition.

Accessing the MPAMCFG_PART_SEL

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

`MPAMCFG_PART_SEL_s` must be accessible from the Secure MPAM feature page. `MPAMCFG_PART_SEL_ns` must be accessible from the Non-secure MPAM feature page.

`MPAMCFG_PART_SEL_s` and `MPAMCFG_PART_SEL_ns` must be separate registers. The Secure instance (`MPAMCFG_PART_SEL_s`) accesses the PARTID selector used for Secure PARTIDs, and the Non-secure instance (`MPAMCFG_PART_SEL_ns`) accesses the PARTID selector used for Non-secure PARTIDs.

**MPAMCFG_PART_SEL can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0100</td>
<td>MPAMCFG_PART_SEL_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0100</td>
<td>MPAMCFG_PART_SEL_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
MPAMCFG_PRI, MPAM Priority Partition Configuration Register

The MPAMCFG_PRI characteristics are:

**Purpose**

Controls the internal and downstream priority of requests attributed to the PARTID selected by MPAMCFG_PART_SEL. MPAMCFG_PRI controls the priorities for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_PRI_ns controls the priorities for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

If MPAMF_IDR.HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

**Configuration**

The power domain of MPAMCFG_PRI is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_PRI_PART == 1. Otherwise, direct accesses to MPAMCFG_PRI are RES0.

**Attributes**

MPAMCFG_PRI is a 32-bit register.

**Field descriptions**

The MPAMCFG_PRI bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|   | DSPRI | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|   | INTPRI | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

**DSPRI, bits [31:16]**

Downstream priority.

If MPAMF_PRI_IDR.HAS_DSPRI == 0, bits of this field are RES0 as this field is not used.

If MPAMF_PRI_IDR.HAS_DSPRI == 1, this field is a priority value applied to downstream communications from this MSC for transactions of the partition selected by MPAMCFG_PART_SEL.

The implemented width of this field is MPAMF_PRI_IDR_DSPRI_WD bits. If the implemented width is less than the width of this field, the least significant bits are used.

The encoding of priority is 0-as-lowest or 0-as-highest priority according to the value of MPAMF_PRI_IDR_DSPRI_0_IS_LOW.

**INTPRI, bits [15:0]**

Internal priority.

If MPAMF_PRI_IDR.HAS_INTPRI == 0, bits of this field are RES0 as this field is not used.

If MPAMF_PRI_IDR.HAS_INTPRI == 1, this field is a priority value applied internally inside this MSC for transactions of the partition selected by MPAMCFG_PART_SEL.

The implemented width of this field is MPAMF_PRI_IDR_INTPRI_WD bits. If the implemented width is less than the width of this field, the least significant bits are used.
The encoding of priority is 0-as-lowest or 0-as-highest priority according to the value of MPAMF_PRI_IDR.INTPRI_0 IS_LOW.

Accessing the MPAMCFG_PRI

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_PRI_s must be accessible from the Secure MPAM feature page. MPAMCFG_PRI_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_PRI_s and MPAMCFG_PRI_ns must be separate registers. The Secure instance (MPAMCFG_PRI_s) accesses the priority partitioning used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_PRI_ns) accesses the priority partitioning used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_PRI access the priority partitioning configuration settings for the priority resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_PRI access the priority partitioning configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_PRI access the priority partitioning configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_PRI access the priority partitioning configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_PRI can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>

</tbody>
</table>

Accesses on this interface are RW.
MPAMF_AIDR, MPAM Architecture Identification Register

The MPAMF_AIDR characteristics are:

**Purpose**

Identifies the version of the MPAM architecture that this MSC implements.

Note: The following values are defined for bits [7:0]:

- $0x01 == MPAM architecture v0.1$
- $0x10 == MPAM architecture v1.0$
- $0x11 == MPAM architecture v1.1$

**Configuration**

The power domain of MPAMF_AIDR is **IMPLEMENTATION DEFINED**.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMF_AIDR are **RES0**.

**Attributes**

MPAMF_AIDR is a 32-bit register.

**Field descriptions**

The MPAMF_AIDR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    | RES0 |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | ArchMajorRev | ArchMinorRev |

**Bits [31:8]**

Reserved, RES0.

**ArchMajorRev, bits [7:4]**

Major revision of the MPAM architecture implemented by the MSC.

This table shows the only valid combinations of MPAM version numbers in an MSC. FORCE_NS functionality is only available in MPAM v0.1.

<table>
<thead>
<tr>
<th>ArchMajorRev</th>
<th>ArchMinorRev</th>

<td>v1.1</td>
<td>MPAMv1.0 + MPAMv1.1</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- FORCE_NS</td>
</tr>
</tbody>
</table>

Use of MPAMv0.1 in MSCs is restricted to limited circumstances. The MSC must be able to initiate requests in the secure address space which have MPAM PARTID forced to the Non-secure space with that forcing not controllable or observable by the software that configures the the device for Secure requests. Please contact Arm before setting MPAMF_AIDR to report MPAMv0.1.
**ArchMinorRev, bits [3:0]**

Minor revision of the MPAM architecture implemented by the MSC.

See the table in the description of the ArchMajorRev field in this register.

**Accessing the MPAMF_AIDR**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_AIDR is read-only.

MPAMF_AIDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_AIDR must have the same contents in the Secure and Non-secure MPAM feature pages.

**MPAMF_AIDR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>

</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
The MPAMF_CCAP_IDR characteristics are:

**Purpose**

Indicates the number of fractional bits in MPAMCFG_CMAX.CMAX. MPAMF_CCAP_IDR_s indicates the number of fractional bits in the Secure instance of MPAMCFG_CMAX. MPAMF_CCAP_IDR_ns indicates the number of fractional bits in the Non-secure instance of MPAMCFG_CMAX.

When MPAMF_IDR.HAS_RIS is 1, some fields in this register give information for the resource instance selected by MPAMCFG_PART_SEL.RIS. The description of every field that is affected by MPAMCFG_PART_SEL.RIS has information within the field description.

**Configuration**

The power domain of MPAMF_CCAP_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_CCAP_PART == 1. Otherwise, direct accesses to MPAMF_CCAP_IDR are RES0.

**Attributes**

MPAMF_CCAP_IDR is a 32-bit register.

**Field descriptions**

The MPAMF_CCAP_IDR bit assignments are:

<table>

</tbody>
</table>

**Bits [31:6]**

Reserved, RES0.

**CMAX_WD, bits [5:0]**

Number of fractional bits implemented in the cache capacity partitioning control, MPAMCFG_CMAX.CMAX, of this device. See MPAMCFG_CMAX.

This field must contain a value from 1 to 16, inclusive.

If RIS is implemented, this field indicates the number of fractional bits in the cache capacity partitioning control for the resource instance selected by MPAMCFG_PART_SEL.RIS.

**Accessing the MPAMF_CCAP_IDR**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_CCAP_IDR is read-only.

MPAMF_CCAP_IDR must be readable from the Non-secure and Secure MPAM feature pages.
MPAMF_CCAP_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF_CCAP_IDR_s) and Non-secure (MPAMF_CCAP_IDR_ns) MPAM feature pages.

When MPAMF_IDR.HAS_RIS is 1, MPAMF_CCAP_IDR shows the configuration of cache capacity partitioning for the cache resource instance selected by MPAMCFG_PART_SEL.RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

**MPAMF_CCAP_IDR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>

<td>MPAMF_CCAP_IDR_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
MPAMF_CPOR_IDR, MPAM Features Cache Portion Partitioning ID register

The MPAMF_CPOR_IDR characteristics are:

**Purpose**

Indicates the number of bits in MPAMCFG_CPB<n>. MPAMF_CPOR_IDRs indicates the number of bits in the Secure instance of MPAMCFG_CPB<n>. MPAMF_CPOR_IDRns indicates the number of bits in the Non-secure instance of MPAMCFG_CPB<n>.

When MPAMF_IDR.HAS_RIS is 1, some fields in this register give information for the resource instance selector, MPAMCFG_PART_SEL.RIS. The description of every field that is affected by MPAMCFG_PART_SEL.RIS has information within the field description.

**Configuration**

The power domain of MPAMF_CPOR_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_CPOR_PART == 1. Otherwise, direct accesses to MPAMF_CPOR_IDR are RES0.

**Attributes**

MPAMF_CPOR_IDR is a 32-bit register.

**Field descriptions**

The MPAMF_CPOR_IDR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| CPBM WD | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

**Bits [31:16]**

Reserved, RES0.

**CPBM WD, bits [15:0]**

Number of bits in the cache portion partitioning bit map of this device. See MPAMCFG_CPB<n>.

This field must contain a value from 1 to 32768, inclusive. Values greater than 32 require a group of 32-bit registers to access the CPBM, up to 1024 if CPBM WD is the largest value.

If RIS is implemented, this field indicates the number bits in the cache portion bitmap for the resource instance selected by MPAMCFG_PART_SEL.RIS.

**Accessing the MPAMF_CPOR_IDR**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_CPOR_IDR is read-only.

MPAMF_CPOR_IDR must be readable from the Non-secure and Secure MPAM feature pages.
MPAMF_CPOR_IDR, MPAM Features Cache Portion Partitioning ID register

MPAMF_CPOR_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF_CPOR_IDR_s) and Non-secure (MPAMF_CPOR_IDR_ns) MPAM feature pages.

When MPAMF_IDR.HAS_RIS is 1, MPAMF_CPOR_IDR shows the configuration of cache portion partitioning for the cache resource instance selected by MPAMCFG_PART_SEL.RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

**MPAMF_CPOR_IDR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0030</td>
<td>MPAMF_CPOR_IDR_s</td>

</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0030</td>
<td>MPAMF_CPOR_IDR_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
MPAMF_CSUMON_IDR, MPAM Features Cache Storage Usage Monitoring ID register

The MPAMF_CSUMON_IDR characteristics are:

Purpose

Indicates the number of cache storage usage monitor instances and other properties of the CSU monitoring. MPAMF_CSUMON_IDR_s indicates the number and properties of Secure cache storage usage monitoring. MPAMF_CSUMON_IDR_ns indicates the number and properties of Non-secure cache storage usage monitoring.

If MPAMF_IDR.HAS_RIS is 1, fields that mention RIS must reflect the properties of the resource instance currently selected by MPAMCFG_PART_SEL.RIS. Fields that do not mention RIS are constant across all resource instances.

Configuration

The power domain of MPAMF_CSUMON_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_CSU == 1. Otherwise, direct accesses to MPAMF_CSUMON_IDR are RES0.

Attributes

MPAMF_CSUMON_IDR is a 32-bit register.

Field descriptions

The MPAMF_CSUMON_IDR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| HAS_CAPTURE | CSU_RO | RES0 | NUM_MON |

HAS_CAPTURE, bit [31]

The implementation supports copying an MSMON_CSU to the corresponding MSMON_CSU_CAPTURE on a capture event.

<table>
<thead>
<tr>
<th>HAS_CAPTURE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MSMON_CSU_CAPTURE is not implemented and there is no support for capture events in the CSU monitor.</td>
</tr>
<tr>
<td>0b1</td>
<td>The MSMON_CSU_CAPTURE register is implemented and the CSU monitor supports the capture event behavior.</td>
</tr>
</tbody>
</table>

If RIS is implemented, this field indicates that CSU monitor capture is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

CSU_RO, bit [30]

The implementation of MSMON_CSU is read-only.

<table>
<thead>
<tr>
<th>CSU_RO</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MSMON_CSU is read-write.</td>
</tr>
<tr>
<td>0b1</td>
<td>MSMON_CSU is read-only.</td>
</tr>
</tbody>
</table>

If RIS is implemented, this field indicates that the MSMON_CSU monitor register is read-only for the resource instance selected by MPAMCFG_PART_SEL.RIS.
Bits [29:16]

Reserved, RES0.

**NUM_MON, bits [15:0]**

The number of cache storage usage monitor instances implemented.

The largest **MSMON_CFG_MON_SEL**.MON_SEL value is NUM_MON minus 1.

If RIS is implemented, this field indicates the number of CSU monitor instances implemented for the resource instance selected by **MPAMCFG_PART_SEL**.RIS.

**Accessing the MPAMF_CSUMON_IDR**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_CSUMON_IDR is read-only.

MPAMF_CSUMON_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_CSUMON_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF_CSUMON_IDR_s) and Non-secure (MPAMF_CSUMON_IDR_ns) MPAM feature pages.

When **MPAMF_IDR**.HAS_RIS is 1, MPAMF_CSUMON_IDR shows the configuration of cache storage usage monitoring for the cache resource instance selected by **MPAMCFG_PART_SEL**.RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

Access to MPAMF_CSUMON_IDR is not affected by **MSMON_CFG_MON_SEL**.RIS.

**MPAMF_CSUMON_IDR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0088</td>
<td>MPAMF_CSUMON_IDR_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.

<table>
<thead>

<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0088</td>
<td>MPAMF_CSUMON_IDR_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
MPAMF_ECR, MPAM Error Control Register

The MPAMF_ECR characteristics are:

**Purpose**

MPAMF_ECR is a 32-bit read-write register that controls MPAM error interrupts for this MSC. MPAMF_ECR_s controls Secure MPAM error handling. MPAMF_ECR_ns controls Non-secure MPAM error handling.

**Configuration**

The power domain of MPAMF_ECR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMF_ECR are RES0.

If a MSC cannot encounter any of the error conditions listed in section 15.1, both the MPAMF_ESR and MPAMF_ECR must be RAZ/WI.

**Attributes**

MPAMF_ECR is a 32-bit register.

**Field descriptions**

The MPAMF_ECR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>30</td>
<td>RES0</td>
</tr>
<tr>
<td>29</td>
<td>INTEN</td>
</tr>
<tr>
<td>28</td>
<td>Interrupt Enable.</td>
</tr>
<tr>
<td>27</td>
<td>MPAM error interrupts are not generated.</td>
</tr>
<tr>
<td>26</td>
<td>MPAM error interrupts are generated.</td>
</tr>
</tbody>
</table>

**Accessing the MPAMF_ECR**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_ECR_s must be accessible from the Secure MPAM feature page. MPAMF_ECR_ns must be accessible from the Non-secure MPAM feature page.

MPAMF_ECR_s and MPAMF_ECR_ns must be separate registers. The Secure instance (MPAMF_ECR_s) accesses the error interrupt controls used for Secure PARTIDs, and the Non-secure instance (MPAMF_ECR_ns) accesses the error interrupt controls used for Non-secure PARTIDs.

**MPAMF_ECR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
</table>
Accesses on this interface are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x00F0</td>
<td>MPAMF_ECR_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
The MPAMF_ESR characteristics are:

**Purpose**

Indicates MPAM error status for this MSC. MPAMF_ESR_s reports Secure MPAM errors. MPAMF_ESR_ns reports Non-secure MPAM errors.

Software should write this register after reading the status of an error to reset ERRCODE to 0x0000 and OVRWR to 0 so that future errors are not reported with OVRWR set.

**Configuration**

The power domain of MPAMF_ESR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMF_ESR are RES0.

MAMPF_ESR is 64-bit register when MPAM v0.1 or v1.1 is implemented and MPAMF_IDR.HAS_EXTD_ESR == 1.

Otherwise, MAMPF_ESR is a 32-bit register.

If a MSC cannot encounter any of the error conditions listed in 'Errors in MSCs' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598), both the MPAMF_ESR and MPAMF_ECR must be RAZ/WI.

**Attributes**

MPAMF_ESR is a:

- 64-bit register when (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_IDR.HAS_EXTD_ESR == 1
- 32-bit register otherwise

**Field descriptions**

The MPAMF_ESR bit assignments are:

**When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_IDR.HAS_EXTD_ESR == 1:**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>35</td>
<td>Resource Instance Selector. Where applicable to the ERRCODE, captures the RIS value for the error.</td>
</tr>
</tbody>
</table>

**Bits [63:36]**

Reserved, RES0.

**RIS, bits [35:32]**

When MPAMF_IDR.HAS_RIS == 1:

Resource Instance Selector. Where applicable to the ERRCODE, captures the RIS value for the error.
Otherwise:

Reserved, RES0.

OVRWR, bit [31]

Overwritten.

If 0 and ERRCODE == 0b0000, no errors have occurred.

If 0 and ERRCODE is non-zero, a single error has occurred and is recorded in this register.

If 1 and ERRCODE is non-zero, multiple errors have occurred and this register records the most recent error.

The state where this bit is 1 and ERRCODE is zero must not be produced by hardware and is only reached when software writes this combination into this register.

Bits [30:28]

Reserved, RES0.

ERRCODE, bits [27:24]

Error code.

<table>
<thead>
<tr>
<th>ERRCODE</th>

</tbody>
</table>

PMG, bits [23:16]

Program monitoring group.

Set to the PMG on an error that captures PMG. Otherwise, set to 0x00 on an error that does not capture PMG.

PARTID_MON, bits [15:0]

PARTID or monitor.

Set to the PARTID on an error that captures PARTID.

Set to the monitor index on an error that captures MON.

On an error that captures neither PARTID nor MON, this field is set to 0.

Otherwise:
MPAMF_ESR, MPAM Error Status Register

OVRWR, bit [31]

Overwritten.

If 0 and ERRCODE == 0b0000, no errors have occurred.

If 0 and ERRCODE is non-zero, a single error has occurred and is recorded in this register.

If 1 and ERRCODE is non-zero, multiple errors have occurred and this register records the most recent error.

The state where this bit is 1 and ERRCODE is 0 must not be produced by hardware and is only reached when software writes this combination into this register.

Bits [30:28]

Reserved, RES0.

ERRCODE, bits [27:24]

Error code.

<table>
<thead>
<tr>
<th>ERRCODE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No error.</td>
</tr>
<tr>
<td>0b0001</td>

<td>Reserved.</td>
</tr>
</tbody>
</table>

PMG, bits [23:16]

Program monitoring group.

Set to the PMG on an error that captures PMG. Otherwise, set to 0x00 on an error that does not capture PMG.

PARTID_MON, bits [15:0]

PARTID or monitor.

Set to the PARTID on an error that captures PARTID.

Set to the monitor index on an error that captures MON.

On an error that captures neither PARTID nor MON, this field is set to 0x0000.

Accessing the MPAMF_ESR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_ESR_s must be accessible from the Secure MPAM feature page. MPAMF_ESR_ns must be accessible from the Non-secure MPAM feature page.
MPAMF_ESR_s and MPAMF_ESR_ns must be separate registers. The Secure instance (MPAMF_ESR_s) accesses the error status used for Secure PARTIDs, and the Non-secure instance (MPAMF_ESR_ns) accesses the error status used for Non-secure PARTIDs.

**MPAMF_ESR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x00F8</td>
<td>MPAMF_ESR_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x00F8</td>
<td>MPAMF_ESR_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
MPAMF_IDR, MPAM Features Identification Register

The MPAMF_IDR characteristics are:

**Purpose**

Indicates which memory partitioning and monitoring features are present on this MSC. MPAMF_IDR_s indicates the MPAM features accessed from the Secure MPAM feature page. MPAMF_IDR_ns indicates the MPAM features accessed from the Non-secure MPAM feature page.

When MPAMF_IDR.HAS_RIS is 1, some fields in this register give information for the resource instance selected by MPAMCFG_PART_SEL.RIS. The description of every field that is affected by MPAMCFG_PART_SEL.RIS has that information within the field description.

**Configuration**

The power domain of MPAMF_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMF_IDR are RES0.

MAMPF_IDR is 64-bit register when MPAM v0.1 or v1.1 is implemented.

Otherwise, MAMPF_IDR is a 32-bit register.

**Attributes**

MPAMF_IDR is a:

- 64-bit register when FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented
- 32-bit register otherwise

**Field descriptions**

The MPAMF_IDR bit assignments are:

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

<table>
<thead>
<tr>

</tbody>
</table>

Bits [63:60]

Reserved, RES0.

**RIS_MAX, bits [59:56]**

When MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_RIS == 1:

Maximum RIS value supported in MPAMCFG_PART_SEL. Must be 0b0000 if MPAMF_IDR.HAS_RIS == 0.

Otherwise:

Reserved, RES0.
Bits [55:40]
Reserved, RES0.

HAS_ESR, bit [39]

When MPAMF_IDR.EXT == 1:

**MPAMF_ESR** is implemented.

<table>
<thead>
<tr>
<th>HAS_ESR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><strong>MPAMF_ESR, MPAMF_ECR</strong>, and MPAM error handling are not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td><strong>MPAMF_ESR, MPAMF_ECR</strong>, and MPAM error handling are implemented.</td>
</tr>
</tbody>
</table>

Otherwise:
Reserved, RES0.

HAS_EXTD_ESR, bit [38]

When MPAMF_IDR.EXT == 1:

**MPAMF_ESR** is 64 bits.

<table>
<thead>
<tr>
<th>HAS_EXTD_ESR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><strong>MPAMF_ESR</strong> is 32 bits.</td>
</tr>
<tr>
<td>0b1</td>
<td><strong>MPAMF_ESR</strong> is 64 bits.</td>
</tr>
</tbody>
</table>

When **MPAMF_IDR.HAS_RIS** and **MPAMF_IDR.HAS_ESR**, this field must be 1.

Otherwise:
Reserved, RES0.

NO_IMPL_MSMON, bit [37]

When MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_IMPL_IDR == 1:

**MPAMF_IMPL_IDR** defines no **IMPLEMENTATION DEFINED** resource monitors.

<table>
<thead>
<tr>
<th>NO_IMPL_MSMON</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><strong>MPAMF_IMPL_IDR</strong> defines at least one <strong>IMPLEMENTATION DEFINED</strong> resource monitor.</td>
</tr>
<tr>
<td>0b1</td>
<td><strong>MPAMF_IMPL_IDR</strong> does not define any <strong>IMPLEMENTATION DEFINED</strong> resource monitors.</td>
</tr>
</tbody>
</table>

If RIS is implemented, this field indicates the presence of **IMPLEMENTATION DEFINED** resource monitors described in **MPAMF_IMPL_IDR** for the selected resource instance.

Otherwise:
Reserved, RES0.

NO_IMPL_PART, bit [36]

When MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_IMPL_IDR == 1:

**MPAMF_IMPL_IDR** defines no **IMPLEMENTATION DEFINED** resource controls.
MPAMF_IDR, MPAM Features Identification Register

<table>
<thead>
<tr>
<th>NO_IMPL_PART</th>

</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MPAMF_IMPL_IDR defines at least one IMPLEMENTATION DEFINED resource control.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAMF_IMPL_IDR does not define any IMPLEMENTATION DEFINED resource controls.</td>
</tr>
</tbody>
</table>

If RIS is implemented, this field indicates the presence of IMPLEMENTATION DEFINED resource controls described in MPAMF_IMPL_IDR for the selected resource instance.

Otherwise:

Reserved, RES0.

**Bits [35:33]**

Reserved, RES0.

**HAS_RIS, bit [32]**

When MPAMF_IDR.EXT == 1:

Has resource instance selector. Indicates that MPAMCFG_PART_SEL contains the RIS field that selects a resource instance to control.

<table>
<thead>
<tr>
<th>HAS_RIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MPAMCFG_PART_SEL does not implement the MPAMCFG_PART_SEL.RIS field or multiple resource instance support.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAMCFG_PART_SEL implements the MPAMCFG_PART_SEL.RIS field and MPAM resource instance numbers up to and including MPAMF_IDR.RIS_MAX.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

**HAS_PARTID_NRW, bit [31]**

Has PARTID narrowing.

<table>
<thead>
<tr>
<th>HAS_PARTID_NRW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not have MPAMF_PARTID_NRW_IDR, MPAMCFG_INTPARTID or intPARTID mapping support.</td>
</tr>
<tr>
<td>0b1</td>
<td>Supports the MPAMF_PARTID_NRW_IDR, MPAMCFG_INTPARTID registers.</td>
</tr>
</tbody>
</table>

**HAS_MSMON, bit [30]**

Has resource monitors. Indicates whether this MSC has MPAM resource monitors.

<table>
<thead>
<tr>
<th>HAS_MSMON</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not support MPAM resource monitoring by groups or MPAMF_MSMON_IDR.</td>
</tr>
<tr>
<td>0b1</td>
<td>Supports resource monitoring by matching a combination of PARTID and PMG. See MPAMF_MSMON_IDR.</td>
</tr>
</tbody>
</table>
HAS_IMPL_IDR, bit [29]

Has MPAM_IMPL_IDR. Indicates whether this MSC has the implementation-specific MPAM features register, MPAM_IMPL_IDR.

<table>
<thead>
<tr>
<th>HAS_IMPL_IDR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not have MPAM_IMPL_IDR.</td>
</tr>
<tr>
<td>0b1</td>
<td>Has MPAM_IMPL_IDR.</td>
</tr>
</tbody>
</table>

EXT, bit [28]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Extended MPAM_IDR.

<table>
<thead>
<tr>
<th>EXT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MPAM_IDR has no defined bits in [63:32]. The register is</td>
</tr>
<tr>
<td></td>
<td>effectively 32 bits.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAM_IDR has bits defined in [63:32]. The register is 64-bits.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

HAS_PRI_PART, bit [27]

Has priority partitioning. Indicates that MPAM priority partitioning is implemented and MPAM_PRI_IDR exists.

<table>
<thead>
<tr>
<th>HAS_PRI_PART</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not support priority partitioning or have</td>
</tr>
<tr>
<td></td>
<td>MPAM_PRI_IDR.</td>
</tr>
<tr>
<td>0b1</td>
<td>Has priority partitioning and MPAM_PRI_IDR.</td>
</tr>
</tbody>
</table>

If RIS is implemented, this field indicates the presence of priority partitioning resource controls as described in MPAM_PRI_IDR for the selected resource instance.

HAS_MBW_PART, bit [26]

Has memory bandwidth partitioning. Indicates whether this MSC implements MPAM memory bandwidth partitioning and MPAM_MBW_IDR.

<table>
<thead>
<tr>
<th>HAS_MBW_PART</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not support memory bandwidth partitioning or have</td>
</tr>
<tr>
<td></td>
<td>MPAM_MBW_IDR.</td>
</tr>
<tr>
<td>0b1</td>
<td>Has MPAM_MBW_IDR.</td>
</tr>
</tbody>
</table>

If RIS is implemented, this field indicates the presence of memory bandwidth partitioning resource controls as described in MPAM_MBW_IDR for the selected resource instance.

HAS_CPOR_PART, bit [25]

Has cache portion partitioning. Indicates whether this MSC implements MPAM cache portion partitioning and MPAM_CPOR_IDR.

<table>
<thead>
<tr>
<th>HAS_CPOR_PART</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not support cache portion partitioning or have</td>
</tr>
<tr>
<td></td>
<td>MPAM_CPOR_IDR or MPAMCFG_CPBM&lt;n&gt; registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>Has MPAM_CPOR_IDR and MPAMCFG_CPBM&lt;n&gt; registers.</td>
</tr>
</tbody>
</table>

If RIS is implemented, this field indicates the presence of cache portion partitioning resource controls as described in MPAM_CPOR_IDR for the selected resource instance.
HAS_CCAP_PART, bit [24]

Has cache capacity partitioning. Indicates whether this MSC implements MPAM cache capacity partitioning and the
MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.

<table>
<thead>
<tr>
<th>HAS_CCAP_PART</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not support cache capacity partitioning or have MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>Has MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.</td>
</tr>
</tbody>
</table>

If RIS is implemented, this field indicates the presence of cache capacity partitioning resource controls as described in
MPAMF_CPOR_IDR for the selected resource instance.

PMG_MAX, bits [23:16]

Maximum value of Non-secure PMG supported by this component.

PARTID_MAX, bits [15:0]

Maximum value of Non-secure PARTID supported by this component.

Otherwise:

31 30 29 28 27 26 25 24 23
HAS_PARTID_NRW HAS_MSMON HAS_IMPL_IDR EXT HAS_PRI_PART HAS_MBW_PART HAS_CPOR_PART HAS_CCAP_PART

HAS_PARTID_NRW, bit [31]

Has PARTID narrowing.

<table>
<thead>
<tr>
<th>HAS_PARTID_NRW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not have MPAMF_PARTID_NRW_IDR, MPAMCFG_INTPARTID or intPARTID mapping support.</td>
</tr>
<tr>
<td>0b1</td>
<td>Supports the MPAMF_PARTID_NRW_IDR, MPAMCFG_INTPARTID registers.</td>
</tr>
</tbody>
</table>

HAS_MSMON, bit [30]

Has resource monitors. Indicates whether this MSC has MPAM resource monitors.

<table>
<thead>
<tr>
<th>HAS_MSMON</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not support MPAM resource monitoring by groups or MPAMF_MSMON_IDR.</td>
</tr>
<tr>
<td>0b1</td>
<td>Supports resource monitoring by matching a combination of PARTID and PMG. See MPAMF_MSMON_IDR.</td>
</tr>
</tbody>
</table>

HAS_IMPL_IDR, bit [29]

Has MPAMF_IMPL_IDR. Indicates whether this MSC has the implementation-specific MPAM features register, MPAMF_IMPL_IDR.

<table>
<thead>
<tr>
<th>HAS_IMPL_IDR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not have MPAMF_IMPL_IDR.</td>
</tr>
<tr>
<td>0b1</td>
<td>Has MPAMF_IMPL_IDR.</td>
</tr>
</tbody>
</table>
EXT, bit [28]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Extended MPAMF_IDR.

<table>
<thead>
<tr>
<th>EXT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MPAMF_IDR has no defined bits in [63:32]. The register is effectively 32 bits.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAMF_IDR has bits defined in [63:32]. The register is 64-bits.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

HAS_PRI_PART, bit [27]

Has priority partitioning. Indicates whether this MSC implements MPAM priority partitioning and MPAMF_PRI_IDR.

<table>
<thead>
<tr>
<th>HAS_PRI_PART</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not support priority partitioning or have MPAMF_PRI_IDR.</td>
</tr>
<tr>
<td>0b1</td>
<td>Has MPAMF_PRI_IDR.</td>
</tr>
</tbody>
</table>

HAS_MBW_PART, bit [26]

Has memory bandwidth partitioning. Indicates whether this MSC implements MPAM memory bandwidth partitioning and MPAMF_MBW_IDR.

<table>
<thead>
<tr>
<th>HAS_MBW_PART</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not support memory bandwidth partitioning or have MPAMF_MBW_IDR register.</td>
</tr>
<tr>
<td>0b1</td>
<td>Has MPAMF_MBW_IDR register.</td>
</tr>
</tbody>
</table>

HAS_CPOR_PART, bit [25]

Has cache portion partitioning. Indicates whether this MSC implements MPAM cache portion partitioning and MPAMF_CPOR_IDR.

<table>
<thead>
<tr>
<th>HAS_CPOR_PART</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not support cache portion partitioning or have MPAMF_CPOR_IDR or MPAMCFG_CPBM&lt;n&gt; registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>Has MPAMF_CPOR_IDR and MPAMCFG_CPBM&lt;n&gt; registers.</td>
</tr>
</tbody>
</table>

HAS_CCAP_PART, bit [24]

Has cache capacity partitioning. Indicates whether this MSC implements MPAM cache capacity partitioning and the MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.

<table>
<thead>
<tr>
<th>HAS_CCAP_PART</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not support cache capacity partitioning or have MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>Has MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.</td>
</tr>
</tbody>
</table>

PMG_MAX, bits [23:16]

Maximum value of Non-secure PMG supported by this component.

MPAMF_IDR, MPAM Features Identification Register
**PARTID_MAX, bits [15:0]**

Maximum value of Non-secure PARTID supported by this component.

**Accessing the MPAMF_IDR**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_IDR is read-only.

MPAMF_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF_IDR_s) and Non-secure (MPAMF_IDR_ns) MPAM feature pages.

When MPAMF_IDR.HAS_RIS is 1, MPAMF_IDR shows the configuration of MSC MPAM for the resource instance selected by MPAMCFG_PART_SEL.RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

**MPAMF_IDR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0000</td>
<td>MPAMF_IDR_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0000</td>
<td>MPAMF_IDR_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
MPAMF_IIDR, MPAM Implementation Identification Register

The MPAMF_IIDR characteristics are:

**Purpose**

Uniquely identifies the MSC implementation by the combination of implementer, product ID, variant and revision.

**Configuration**

The power domain of MPAMF_IIDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMF_IIDR are RES0.

**Attributes**

MPAMF_IIDR is a 32-bit register.

**Field descriptions**

The MPAMF_IIDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit positions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-20</td>
<td>ProductID</td>
</tr>
<tr>
<td>19-16</td>
<td>Variant</td>
</tr>
<tr>
<td>15-12</td>
<td>Revision</td>
</tr>
<tr>
<td>11-0</td>
<td>Implementer</td>
</tr>
</tbody>
</table>

**ProductID, bits [31:20]**

IMPLEMENTATION DEFINED value identifying the MPAM MSC.

The MSC implementer as identified in the MPAMF_IIDR.Implementer field must assure each product has a unique ProductID from any other with the same Implementer value.

**Variant, bits [19:16]**

IMPLEMENTATION DEFINED value used to distinguish product variants, or major revisions of the product.

*Note*

Implementations of ProductID with differing software interfaces are expected to have different values in the MPAMF_IIDR.Variant field.

**Revision, bits [15:12]**

IMPLEMENTATION DEFINED value used to distinguish minor revisions of the product.

*Note*

This field is intended to differentiate product revisions that are minor changes and are largely software compatible with previous revisions.

**Implementer, bits [11:0]**

Contains the JEP106 code of the company that implemented the MPAM MSC.
(11:8) must contain the JEP106 continuation code of the implementer.

(7) must always be 0.

(6:0) must contain the JEP106 identity code of the implementer.

For an Arm implementation, bits(11:0) are 0x43B.

**Accessing the MPAMF_IIDR**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_IIDR is read-only.

MPAMF_IIDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_IIDR must have the same contents in the Secure and Non-secure MPAM feature pages.

**MPAMF_IIDR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>

</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
**MPAMF_IMPL_IDR, MPAM Implementation-Specific Partitioning Feature Identification Register**

The MPAMF_IMPL_IDR characteristics are:

**Purpose**

Indicates the implementation-defined partitioning and monitoring features and parameters of the MSC. MPAMF_IMPL_IDR_s indicates implementation-defined partitioning and monitoring features accessed from the Secure MPAM feature page. MPAMF_IMPL_IDR_ns indicates those accessed from the Non-secure MPAM feature page.

If MPAMF_IDR.HAS_RIS is 1, this register gives the implementation-specific features and parameters of the resource instance selected by MPAMCFG_PART_SEL.RIS for any features that are specific to the resource.

**Configuration**

The power domain of MPAMF_IMPL_IDR is implementation defined.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_IMPL_IDR == 1. Otherwise, direct accesses to MPAMF_IMPL_IDR are RES0.

**Attributes**

MPAMF_IMPL_IDR is a 32-bit register.

**Field descriptions**

The MPAMF_IMPL_IDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Bit Assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>

</tr>
<tr>
<td>1</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**IMPLFEAT, bits [31:0]**

All 32 bits of this register are available to be used as the implementer sees fit to indicate the presence of implementation-defined MPAM features in this MSC and to give additional implementation-specific read-only information about the parameters of implementation-specific MPAM features to software.

If RIS is implemented, this register indicates the implementation-specific features and parameters of the resource instance selected by MPAMCFG_PART_SEL.RIS.

**Accessing the MPAMF_IMPL_IDR**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_IMPL_IDR is read-only.

MPAMF_IMPL_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_IMPL_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF_IMPL_IDR_s) and Non-secure (MPAMF_IMPL_IDR_ns) MPAM feature pages.

When MPAMF_IDR.HAS_RIS is 1, MPAMF_IMPL_IDR shows the configuration of implementation-specific features for the resource instance selected by MPAMCFG_PART_SEL.RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.
**MPAMF_IMPL_IDR** can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0028</td>
<td>MPAMF_IMPL_IDR_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0028</td>
<td>MPAMF_IMPL_IDR_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
The MPAM_F_BW_IDR characteristics are:

Purpose

Indicates which MPAM bandwidth partitioning features are present on this MSC. MPAM_F_BW_IDR_s indicates bandwidth partitioning features accessed from the Secure MPAM feature page. MPAM_F_BW_IDR_ns indicates bandwidth partitioning features accessed from the Non-secure MPAM feature page.

When MPAM_IDR.HAS_RIS is 1, some fields in this register give information for the resource instance selected by MPAMCFG_PART_SEL.RIS. The description of every field that is affected by MPAMCFG_PART_SEL.RIS has that information within the field description.

Configuration

The power domain of MPAM_F_BW_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPM is implemented and MPAM_IDR.HAS_MBW_PART == 1. Otherwise, direct accesses to MPAM_F_BW_IDR are RES0.

Attributes

MPAM_F_BW_IDR is a 32-bit register.

Field descriptions

The MPAM_F_BW_IDR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | BWPBM_WD | RES0 | WINDWR | HAS_PROP | HAS_PBM | HAS_MAX | HAS_MIN | RES0 | BWA_WD |

Bits [31:29]

Reserved, RES0.

BWPBM_WD, bits [28:16]

Bandwidth portion bitmap width.

The number of bandwidth portion bits in the MPAMCFG_MBW_PBM<n> register array.

If MPAM_F_BW_IDR.HAS_PBM is 1, this field must contain a value from 1 to 4096, inclusive. Values greater than 32 require a group of 32-bit registers to access the BWPBM, up to 128 if BWPBM_WD is the largest value.

If MPAM_F_BW_IDR.HAS_PBM is 0, this field must be ignored by software.

If RIS is implemented, this field indicates the width of the memory bandwidth portion bitmap partitioning control for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Bit [15]

Reserved, RES0.
**WINDWR, bit [14]**

Indicates the bandwidth accounting period register is writable.

<table>
<thead>
<tr>
<th>WINDWR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The bandwidth accounting period is readable from <code>MPAMCFG_MBW_WINWD</code> which might be fixed or vary due to clock rate reconfiguration of the memory channel or memory controller.</td>
</tr>
<tr>
<td>0b1</td>
<td>The bandwidth accounting width is readable and writable per partition in <code>MPAMCFG_MBW_WINWD</code>.</td>
</tr>
</tbody>
</table>

**HAS_PROP, bit [13]**

Indicates that this MSC implements proportional stride bandwidth partitioning and the `MPAMCFG_MBW_PROP` register can be accessed.

<table>
<thead>
<tr>
<th>HAS_PROP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>There is no memory bandwidth proportional stride control and the <code>MPAMCFG_MBW_PROP</code> register is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>The proportional stride memory bandwidth partitioning scheme is supported and the <code>MPAMCFG_MBW_PROP</code> register can be accessed.</td>
</tr>
</tbody>
</table>

If RIS is implemented, this field indicates the presence of the memory bandwidth proportional stride partitioning control for the resource instance selected by `MPAMCFG_PART_SEL.RIS`.

**HAS_PBM, bit [12]**

Indicates that bandwidth portion partitioning is implemented and the `MPAMCFG_MBW_PBM<n>` register array can be accessed.

<table>
<thead>
<tr>
<th>HAS_PBM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>There is no memory bandwidth portion control and the <code>MPAMCFG_MBW_PBM</code> is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>The memory bandwidth portion allocation scheme exists and the <code>MPAMCFG_MBW_PBM</code> register can be accessed.</td>
</tr>
</tbody>
</table>

If RIS is implemented, this field indicates the presence of the memory bandwidth portion partitioning control for the resource instance selected by `MPAMCFG_PART_SEL.RIS`.

**HAS_MAX, bit [11]**

Indicates that this MSC implements maximum bandwidth partitioning and the `MPAMCFG_MBW_MAX` register can be accessed.

<table>
<thead>
<tr>
<th>HAS_MAX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>There is no maximum memory bandwidth control and the <code>MPAMCFG_MBW_MAX</code> register is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>The maximum memory bandwidth allocation scheme is supported and the <code>MPAMCFG_MBW_MAX</code> register can be accessed.</td>
</tr>
</tbody>
</table>

If RIS is implemented, this field indicates the presence of the maximum bandwidth partitioning control for the resource instance selected by `MPAMCFG_PART_SEL.RIS`.

**HAS_MIN, bit [10]**

Indicates that this MSC implements minimum bandwidth partitioning and the `MPAMCFG_MBW_MIN` register can be accessed.
Meaning

<table>
<thead>
<tr>
<th>HAS_MIN</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>There is no minimum memory bandwidth control and the $	ext{MPAMCFG_MBW_MIN}$ register is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>The minimum memory bandwidth allocation scheme is supported and the $	ext{MPAMCFG_MBW_MIN}$ register can be accessed.</td>
</tr>
</tbody>
</table>

If RIS is implemented, this field indicates the presence of the minimum bandwidth partitioning control for the resource instance selected by $	ext{MPAMCFG_PART_SEL.RIS}$.

**Bits [9:6]**

Reserved, RES0.

**BWA_WD, bits [5:0]**

Number of implemented bits in the bandwidth allocation fields: MIN, MAX and STRIDE. See $	ext{MPAMCFG_MBW_MIN}$, $	ext{MPAMCFG_MBW_MAX}$ and $	ext{MPAMCFG_MBW_PROP}$.

In any of these bandwidth allocation fields exist, this field must have a value from 1 to 16, inclusive. Otherwise, it is permitted to be 0.

If RIS is implemented, this field indicates the number of implemented bits in the bandwidth allocation control fields for the resource instance selected by $	ext{MPAMCFG_PART_SEL.RIS}$.

**Accessing the MPAMF_MBW_IDR**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_MBW_IDR is read-only.

MPAMF_MBW_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_MBW_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF_MBW_IDR_s) and Non-secure (MPAMF_MBW_IDR_ns) MPAM feature pages.

When MPAMF_IDR HAS_RIS is 1, MPAMF_MBW_IDR shows the configuration of memory bandwidth partitioning for the bandwidth resource instance selected by $	ext{MPAMCFG_PART_SEL.RIS}$. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

**MPAMF_MBW_IDR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0040</td>
<td>MPAMF_MBW_IDR_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0040</td>
<td>MPAMF_MBW_IDR_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
**Purpose**

Indicates the number of memory bandwidth usage monitor instances implemented. This register also indicates several properties of MBWU monitoring, including whether the implementation supports capture, scaling or long counters.

MPAMF_MBWUMON_IDR indicates the number of Secure memory bandwidth usage monitor instances.

MPAMF_MBWUMON_IDR_ns indicates the number of Non-secure memory bandwidth usage monitor instances.

If MPAMF_IDR.HAS_RIS is 1, fields that mention RIS must reflect the properties of the resource instance currently selected by MPAMCFG_PART_SEL.RIS. Fields that do not mention RIS are constant across all resource instances.

**Configuration**

The power domain of MPAMF_MBWUMON_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_MBWU == 1. Otherwise, direct accesses to MPAMF_MBWUMON_IDR are RES0.

**Attributes**

MPAMF_MBWUMON_IDR is a 32-bit register.

**Field descriptions**

The MPAMF_MBWUMON_IDR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>272625242322212019181716151413121110 9 8 7 6 5 4 3 2 1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>HAS_CAPTURE</td>
<td>HAS_LONG</td>
<td>LWD</td>
<td>HAS_RWBW</td>
<td>RES0</td>
</tr>
</tbody>
</table>

**HAS_CAPTURE, bit [31]**

The implementation supports copying an MSMON_MBWU to the corresponding MSMON_MBWU_CAPTURE on a capture event.

<table>
<thead>
<tr>
<th>HAS_CAPTURE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MSMON_MBWU_CAPTURE is not implemented and there is no support for capture events in the MBWU monitor.</td>
</tr>
<tr>
<td>0b1</td>
<td>The MSMON_MBWU_CAPTURE register is implemented and the MBWU monitor supports the capture event behavior.</td>
</tr>
</tbody>
</table>

If RIS is implemented, this field indicates that MBWU monitor capture is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

If MPAMF_MBWUMON_IDR.HAS_LONG is 1, this also indicates that MSMON_MBWU_L_CAPTURE is implemented.

**HAS_LONG, bit [30]**

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Indicates whether MSMON_MBWU_L is implemented.

If HAS_CAPTURE is 1, indicates whether MSMON_MBWU_L_CAPTURE is implemented.
HAS_LONG

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

If RIS is implemented, this field indicates that the long MBWU monitor is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

If MPAMF_MBWUMON_IDR.HAS_CAPTURE is 1, this also indicates that MSMON_MBWU_L_CAPTURE is implemented.

Otherwise:

Reserved, RES0.

LWD, bit [29]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Long register VALUE width.

If MPAMF_MBWUMON_IDR.HAS_LONG is 0, MPAMF_MBWUMON_IDR.LWD must also be 0.

<table>
<thead>
<tr>
<th>LWD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If MPAMF_MBWUMON_IDR.HAS_LONG is 1, MSMON_MBWU_L has 44-bit VALUE field in bits [43:0]. Bits [62:44] are RES0. If HAS_LONG is 1 and MPAMF_MBWUMON_IDR.HAS_CAPTURE is 1, MSMON_MBWU_L_CAPTURE also has 44-bit VALUE field in bits [43:0].</td>
</tr>
<tr>
<td>0b1</td>
<td>MSMON_MBWU_L has 63-bit VALUE field in bits [62:0]. If MPAMF_MBWUMON_IDR.HAS_CAPTURE == 1, MSMON_MBWU_L_CAPTURE also has 63-bit VALUE field in bits [62:0].</td>
</tr>
</tbody>
</table>

If RIS is implemented, this field indicates the length of the MSMON_MBWU_L.VALUE field implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Otherwise:

Reserved, RES0.

HAS_RWBW, bit [28]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Read/write bandwidth selection is implemented in MSMON_CFG_MBWU_FLT.

<table>
<thead>
<tr>
<th>HAS_RWBW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Read/write bandwidth selection is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read/write bandwidth selection is implemented.</td>
</tr>
</tbody>
</table>

If RIS is implemented, this field indicates whether read/write bandwidth collection selection is available in MSMON_CFG_MBWU_FLT for resource instance selected by MPAMCFG_PART_SEL.RIS.

Otherwise:

Reserved, RES0.

Bits [27:21]

Reserved, RES0.
SCALE, bits [20:16]

Scaling of MSMON_MBWU.VALUE in bits. If scaling is enabled by MSMON_CFG_MBWU_CTL.SCLEN, the byte count in the VALUE field has been shifted by SCALE bits to the right.

<table>
<thead>
<tr>
<th>SCALE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00000</td>
<td>Scaling is not implemented.</td>
</tr>
<tr>
<td>0bxxxxx</td>
<td>Other values are right shift count when scaling is enabled.</td>
</tr>
</tbody>
</table>

If RIS is implemented, this field indicates the scale value for MSMON_MBWU.VALUE field for the resource instance selected by MPAMCFG_PART_SEL.RIS.

NUM_MON, bits [15:0]

The number of memory bandwidth usage monitor instances implemented. The largest monitor instance selector, MSMON_CFG_MON_SEL.MON_SEL, is NUM_MON minus 1.

If RIS is implemented, this field indicates the number of MBWU monitor instances for MSMON_MBWU.VALUE field for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Accessing the MPAMF_MBWUMON_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_MBWUMON_IDR is read-only.

MPAMF_MBWUMON_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_MBWUMON_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF_MBWUMON_IDR_s) and Non-secure (MPAMF_MBWUMON_IDR_ns) MPAM feature pages.

When MPAMF_IDR.HAS_RIS is 1, MPAMF_MBWUMON_IDR shows the configuration of memory bandwidth monitoring for the bandwidth resource instance selected by MPAMCFG_PART_SEL.RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

Access to MPAMF_MBWUMON_IDR is not affected by MSMON_CFG_MON_SEL.RIS.

MPAMF_MBWUMON_IDR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE</td>
<td>0x0090</td>
<td>MPAMF_MBWUMON_IDR</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.

MPAMF_PRI_IDR, MPAM Priority Partitioning Identification Register

The MPAMF_PRI_IDR characteristics are:

**Purpose**

Indicates which MPAM priority partitioning features are present on this MSC. MPAMF_PRI_IDR_s indicates priority partitioning features accessed from the Secure MPAM feature page. MPAMF_PRI_IDR_ns indicates priority partitioning features accessed from the Non-secure MPAM feature page.

When MPAMF_IDR.HAS_RIS is 1, some fields in this register give information for the resource instance selected by MPAMCFG_PART_SEL.RIS. The description of every field that is affected by MPAMCFG_PART_SEL.RIS has that information within the field description.

**Configuration**

The power domain of MPAMF_PRI_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_PRI_PART == 1. Otherwise, direct accesses to MPAMF_PRI_IDR are RES0.

**Attributes**

MPAMF_PRI_IDR is a 32-bit register.

**Field descriptions**

The MPAMF_PRI_IDR bit assignments are:

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
RES0 DSPRI_WD RES0 DSPRI_0_IS_LOW HAS_DSPRI RES0 INTPRI_WD RES0 INTPRI_0_IS_LOW HAS_INTPRI
```

**Bits [31:26]**

Reserved, RES0.

**DSPRI_WD, bits [25:20]**

Number of implemented bits in the downstream priority field (DSPRI) of MPAMCFG_PRI.

If HAS_DSPRI == 1, this field must contain a value from 1 to 16, inclusive.

If HAS_DSPRI == 0, this field must be 0.

If RIS is implemented, this field indicates the number of downstream priority bits for the resource instance selected by MPAMCFG_PART_SEL.RIS.

**Bits [19:18]**

Reserved, RES0.

**DSPRI_0_IS_LOW, bit [17]**

Indicates whether 0 in MPAMCFG_PRI DSPRI is the lowest or the highest downstream priority.
**DSPRI_0_IS_LOW**

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>In the <code>MPAMCFG_PRI</code>.DSPRI field, a value of 0 means the highest priority.</td>
</tr>
<tr>
<td>0b1</td>
<td>In the <code>MPAMCFG_PRI</code>.DSPRI field, a value of 0 means the lowest priority.</td>
</tr>
</tbody>
</table>

If RIS is implemented, this field indicates that 0 is the lowest downstream priority for the resource instance selected by `MPAMCFG_PART_SEL`.RIS.

**HAS_DSPRI, bit [16]**

Indicates that the `MPAMCFG_PRI` register implements the DSPRI field.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This MSC supports priority partitioning, but does not implement a downstream priority (DSPRI) field in the <code>MPAMCFG_PRI</code> register.</td>
</tr>
<tr>
<td>0b1</td>
<td>This MSC supports downstream priority partitioning and implements the downstream priority (DSPRI) field in the <code>MPAMCFG_PRI</code> register.</td>
</tr>
</tbody>
</table>

If RIS is implemented, this field indicates that downstream priority is implemented for the resource instance selected by `MPAMCFG_PART_SEL`.RIS.

**Bits [15:10]**

Reserved, RES0.

**INTPRI_WD, bits [9:4]**

Number of implemented bits in the internal priority field (INTPRI) in the `MPAMCFG_PRI` register.

If HAS_INTPRI == 1, this field must contain a value from 1 to 16, inclusive.

If HAS_INTPRI == 0, this field must be 0.

If RIS is implemented, this field indicates the number of internal priority bits for the resource instance selected by `MPAMCFG_PART_SEL`.RIS.

**Bits [3:2]**

Reserved, RES0.

**INTPRI_0_IS_LOW, bit [1]**

Indicates whether 0 in `MPAMCFG_PRI`.INTPRI is the lowest or the highest internal priority.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>In the <code>MPAMCFG_PRI</code>.INTPRI field, a value of 0 means the highest priority.</td>
</tr>
<tr>
<td>0b1</td>
<td>In the <code>MPAMCFG_PRI</code>.INTPRI field, a value of 0 means the lowest priority.</td>
</tr>
</tbody>
</table>

If RIS is implemented, this field indicates that 0 is the lowest internal priority for the resource instance selected by `MPAMCFG_PART_SEL`.RIS.

**HAS_INTPRI, bit [0]**

Indicates that this MSC implements the INTPRI field in the `MPAMCFG_PRI` register.
The MSC supports priority partitioning, but does not implement the internal priority (INTPRI) field in the MPAMCFG_PRI register.

This MSC supports internal priority partitioning and implements the internal priority (INTPRI) field in the MPAMCFG_PRI register.

If RIS is implemented, this field indicates that internal priority is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

### Accessing the MPAMF_PRI_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_PRI_IDR is read-only.

MPAMF_PRI_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_PRI_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF_PRI_IDR_s) and Non-secure (MPAMF_PRI_IDR_ns) MPAM feature pages.

When MPAMF_IDR.HAS_RIS is 1, MPAMF_PRI_IDR shows the configuration of priority partitioning for the resource instance selected by MPAMCFG_PART_SEL.RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

**MPAMF_PRI_IDR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0048</td>
<td>MPAMF_PRI_IDR_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0048</td>
<td>MPAMF_PRI_IDR_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
MPAMF_SIDR, MPAM Features Secure Identification Register

The MPAMF_SIDR characteristics are:

**Purpose**

The MPAMF_SIDR is a 32-bit read-only register that indicates the maximum Secure PARTID and Secure PMG on this MSC.

**Configuration**

The power domain of MPAMF_SIDR is **IMPLEMENTATION DEFINED**.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMF_SIDR are **RES0**.

**Attributes**

MPAMF_SIDR is a 32-bit register.

**Field descriptions**

The MPAMF_SIDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>24</td>
<td>S_PMG_MAX</td>
</tr>
<tr>
<td>15</td>
<td>S_PARTID_MAX</td>
</tr>
</tbody>
</table>

**Bits [31:24]**

Reserved, RES0.

**S_PMG_MAX, bits [23:16]**

Maximum value of Secure PMG supported by this component.

**S_PARTID_MAX, bits [15:0]**

Maximum value of Secure PARTID supported by this component.

**Accessing the MPAMF_SIDR**

This register is only within the Secure MPAM feature page memory frame.

MPAMF_SIDR is read-only.

MPAMF_SIDR must only be readable from the Secure MPAM feature page. If the system or the MSC does not support the Secure address map, this register must not be accessible.

**MPAMF_SIDR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0008</td>
<td>MPAMF_SIDR_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
**MSMON\_CAPT\_EVNT, MPAM Capture Event Generation Register**

The MSMON\_CAPT\_EVNT characteristics are:

**Purpose**

Generates a local capture event when written with bit[0] as 1. MSMON\_CAPT\_EVNT_s generates local capture events for Secure monitors only or for Secure and Non-secure monitors. MSMON\_CAPT\_EVNT_ns generates local capture events for Non-secure monitors only.

**Configuration**

The power domain of MSMON\_CAPT\_EVNT is IMPLEMENTATION DEFINED.

This register is present only when FEAT\_MPAM is implemented, MPAMF\_IDR.HAS\_MSMON == 1 and MPAMF\_MSMON\_IDR.HAS\_LOCAL\_CAPT\_EVNT == 1. Otherwise, direct accesses to MSMON\_CAPT\_EVNT are RES0.

**Attributes**

MSMON\_CAPT\_EVNT is a 32-bit register.

**Field descriptions**

The MSMON\_CAPT\_EVNT bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | ALL | NOW |

**Bits [31:2]**

Reserved, RES0.

**ALL, bit [1]**

In the Secure instance of this register, if ALL written as 1 and NOW is also written as 1, signal a capture event to Secure and Non-secure monitor instances in this MSC that are configured with CAPT\_EVNT = 7.

If written as 0 and NOW is written as 1, signal a capture event to Secure monitor instances in this MSC that are configured with CAPT\_EVNT = 7.

In the Non-secure instance of this register, this bit is RAZ/WI.

This bit always reads as zero.

<table>
<thead>
<tr>
<th>ALL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Send capture event to Secure monitors only.</td>
</tr>
<tr>
<td>0b1</td>
<td>Send capture event to both Secure and Non-secure monitors.</td>
</tr>
</tbody>
</table>

**NOW, bit [0]**

When written as 1, this bit causes an event to all monitors in this MSC with CAPT\_EVNT set to the value of 7.

When this bit is written as 0, no event is signaled.

This bit always reads as zero.
**Accessing the MSMON_CAPT_EVNT**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_CAPT_EVNT_s must be accessible from the Secure MPAM feature page. MSMON_CAPT_EVENT_ns must be accessible from the Non-secure MPAM feature page.

The two instances of MSMON_CAPT_EVNT must be separate registers. The Secure instance (MSMON_CAPT_EVNT_s) can generate capture events for both Secure and Non-secure PARTID monitors, and the Non-secure instance (MSMON_CAPT_EVNT_ns) can generate capture events for Non-secure PARTID monitors only.

**MSMON_CAPT_EVNT can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0808</td>
<td>MSMON_CAPT_EVNT_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0808</td>
<td>MSMON_CAPT_EVNT_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
**MSMON_CFG_CSU_CTL, MPAM Memory System Monitor Configure Cache Storage Usage Monitor Control Register**

The MSMON_CFG_CSU_CTL characteristics are:

**Purpose**

Controls the CSU monitor selected by `MSMON_CFG_MON_SEL`. MSMON_CFG_CSU_CTL_s controls the Secure cache storage usage monitor instance selected by the Secure instance of `MSMON_CFG_MON_SEL`. MSMON_CFG_CSU_CTL_ns controls Non-secure cache storage usage monitor instance selected by the Non-secure instance of `MSMON_CFG_MON_SEL`.

If `MPAMF_IDR.HAS_RIS` is 1, the monitor instance configuration accessed is for the resource instance currently selected by `MSMON_CFG_MON_SEL.RIS` and the monitor instance of that resource instance selected by `MSMON_CFG_MON_SEL.MON_SEL`.

**Configuration**

The power domain of MSMON_CFG_CSU_CTL is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_CSU == 1. Otherwise, direct accesses to MSMON_CFG_CSU_CTL are RES0.

**Attributes**

MSMON_CFG_CSU_CTL is a 32-bit register.

**Field descriptions**

The MSMON_CFG_CSU_CTL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>EN</th>
<th>CAPT_EVNT</th>
<th>CAPT_RESET</th>
<th>OFLOW_STATUS</th>
<th>OFLOW_INTR</th>
<th>OFLOW_FRZ</th>
<th>SUBTYPE</th>
<th>RES0</th>
<th>MATCH_PMG</th>
<th>MATCH_PARTID</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>EN</td>
<td>CAPT_EVNT</td>
<td>CAPT_RESET</td>
<td>OFLOW_STATUS</td>
<td>OFLOW_INTR</td>
<td>OFLOW_FRZ</td>
<td>SUBTYPE</td>
<td>RES0</td>
<td>MATCH_PMG</td>
<td>MATCH_PARTID</td>
</tr>
</tbody>
</table>

**EN, bit [31]**

Enabled.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The monitor instance is disabled and must not collect any information.</td>
</tr>
<tr>
<td>0b1</td>
<td>The monitor instance is enabled to collect information according to the configuration of the instance.</td>
</tr>
</tbody>
</table>

**CAPT_EVNT, bits [30:28]**

Capture event selector.

Select the event that triggers capture from the following:
<table>
<thead>
<tr>
<th>CAPT_EVNT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>No capture event is triggered.</td>
</tr>
<tr>
<td>0b001</td>
<td>External capture event 1 (optional but recommended)</td>
</tr>
<tr>
<td>0b010</td>
<td>External capture event 2 (optional)</td>
</tr>
<tr>
<td>0b011</td>
<td>External capture event 3 (optional)</td>
</tr>
<tr>
<td>0b100</td>
<td>External capture event 4 (optional)</td>
</tr>
<tr>
<td>0b101</td>
<td>External capture event 5 (optional)</td>
</tr>
<tr>
<td>0b110</td>
<td>External capture event 6 (optional)</td>
</tr>
<tr>
<td>0b111</td>
<td>Capture occurs when a MSMON_CAPT_EVNT register in this MSC is written and causes a capture event for the security state of this monitor. (optional)</td>
</tr>
</tbody>
</table>

The values marked as optional indicate capture event sources that can be omitted in an implementation. Those values representing non-implemented event sources must not trigger a capture event.

If capture is not implemented for the CSU monitor type as indicated by MPAMF_CSUMON_IDR.HAS_CAPTURE = 0, this field is RAZ/WI.

**CAPT_RESET, bit [27]**

Reset after capture.

Controls whether the value of MSMON_CSU is reset to zero immediately after being copied to MSMON_CSU_CAPTURE.

<table>
<thead>
<tr>
<th>CAPT_RESET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Monitor is not reset on capture.</td>
</tr>
<tr>
<td>0b1</td>
<td>Monitor is reset on capture.</td>
</tr>
</tbody>
</table>

If capture is not implemented for the CSU monitor type as indicated by MPAMF_CSUMON_IDR.HAS_CAPTURE = 0, this field is RAZ/WI.

Because the CSU monitor type produces a measurement rather than a count, it might not make sense to ever reset the value after a capture. If there is no reason to ever reset a CSU monitor, this field is RAZ/WI.

**OFLOW_STATUS, bit [26]**

Overflow status.

Indicates whether the value of MSMON_CSU has overflowed.

<table>
<thead>
<tr>
<th>OFLOW_STATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No overflow has occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>At least one overflow has occurred since this bit was last written to zero.</td>
</tr>
</tbody>
</table>

If overflow is not possible for a CSU monitor in the implementation, this field is RAZ/WI.

**OFLOW_INTR, bit [25]**

Overflow Interrupt.

Controls whether an overflow interrupt is generated when the value of MSMON_CSU has overflowed.

<table>
<thead>
<tr>
<th>OFLOW_INTR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No interrupt is signaled on an overflow of MSMON_CSU.</td>
</tr>
<tr>
<td>0b1</td>
<td>On overflow, an implementation-specific interrupt is signaled.</td>
</tr>
</tbody>
</table>

If OFLOW_INTR is not supported by the implementation, this field is RAZ/WI.

**OFLOW_FRZ, bit [24]**

Freeze Monitor on Overflow.
Controls whether the value of **MSMON_CSU** freezes on an overflow.

<table>
<thead>
<tr>
<th>OFLOW_FRZ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Monitor count wraps on overflow.</td>
</tr>
<tr>
<td>0b1</td>
<td>Monitor count freezes on overflow. The frozen value might be 0 or another value if the monitor overflowed with an increment larger than 1.</td>
</tr>
</tbody>
</table>

If overflow is not possible for a CSU monitor in the implementation, this field is RAZ/WI.

**SUBTYPE, bits [23:20]**

Subtype. Type of cache storage usage counted by this monitor.

This field is not currently used for CSU monitors, but reserved for future use.

This field is RAZ/WI.

**Bits [19:18]**

Reserved, RES0.

**MATCH_PMG, bit [17]**

Match PMG.

Controls whether the monitor measures only storage used with PMG matching **MSMON_CFG_CSU_FLT**.PMG.

<table>
<thead>
<tr>
<th>MATCH_PMG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The monitor measures storage used with any PMG value.</td>
</tr>
<tr>
<td>0b1</td>
<td>The monitor only measures storage used with the PMG value matching <strong>MSMON_CFG_CSU_FLT</strong>.PMG.</td>
</tr>
</tbody>
</table>

If MATCH_PMG == 1 and MATCH_PARTID == 0, it is CONSTRAINED UNPREDICTABLE whether the monitor instance:

- Measures the storage used with matching PMG and with any PARTID.
- Measures no storage usage, that is, **MSMON_CSU**.VALUE is zero.
- Measures the storage used with matching PMG and PARTID, that is, treats MATCH_PARTID as == 1.

**MATCH_PARTID, bit [16]**

Match PARTID.

Controls whether the monitor measures only storage used with PARTID matching **MSMON_CFG_CSU_FLT**.PARTID.

<table>
<thead>
<tr>
<th>MATCH_PARTID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The monitor measures storage used with any PARTID value.</td>
</tr>
<tr>
<td>0b1</td>
<td>The monitor only measures storage used with the PARTID value matching <strong>MSMON_CFG_CSU_FLT</strong>.PARTID.</td>
</tr>
</tbody>
</table>

**Bits [15:8]**

Reserved, RES0.

**TYPE, bits [7:0]**

Monitor Type Code. The CSU monitor is TYPE = 0x43.

TYPE is a read-only constant indicating the type of the monitor.

Reads as 0x43.
Accessing the MSMON_CFG_CSU_CTL

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_CFG_CSU_CTL_s must be accessible from the Secure MPAM feature page. MSMON_CFG_CSU_CTL_ns must be accessible from the Non-secure MPAM feature page.

MSMON_CFG_CSU_CTL_s and MSMON_CFG_CSU_CTL_ns must be separate registers. The Secure instance (MSMON_CFG_CSU_CTL_s) accesses the cache storage usage monitor controls used for Secure PARTIDs, and the Non-secure instance (MSMON_CFG_CSU_CTL_ns) accesses the cache storage usage monitor controls used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MSMON_CFG_CSU_CTL access the cache storage usage monitor configuration settings for the cache resource instance selected by MSMON_CFG_MON_SEL.RIS and the cache storage usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

When RIS is not implemented, loads and stores to MSMON_CFG_CSU_CTL access the cache storage usage monitor configuration settings for the cache storage usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

MSMON_CFG_CSU_CTL can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0818</td>
<td>MSMON_CFG_CSU_CTL_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0818</td>
<td>MSMON_CFG_CSU_CTL_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
MSMON_CFG_CSU_FLT, MPAM Memory System Monitor Configure Cache Storage Usage Monitor Filter Register

The MSMON_CFG_CSU_FLT characteristics are:

**Purpose**

Configures PARTID and PMG to measure or count in the CSU monitor selected by MSMON_CFG_MON_SEL. MSMON_CFG_CSU_FLT sets filter conditions for the Secure cache storage usage monitor instance selected by the Secure instance of MSMON_CFG_MON_SEL. MSMON_CFG_CSU_CTL sets filter conditions for the Non-secure cache storage usage monitor instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.

If MPAMF_IDR.HAS_RIS is 1, the monitor instance filter configuration accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

**Configuration**

The power domain of MSMON_CFG_CSU_FLT is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_CSU == 1. Otherwise, direct accesses to MSMON_CFG_CSU_FLT are RES0.

**Attributes**

MSMON_CFG_CSU_FLT is a 32-bit register.

**Field descriptions**

The MSMON_CFG_CSU_FLT bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>PMG</td>
</tr>
<tr>
<td>29</td>
<td>PARTID</td>
</tr>
</tbody>
</table>

**Bits [31:24]**

Reserved, RES0.

**PMG, bits [23:16]**

Performance monitoring group to filter cache storage usage monitoring.

If MSMON_CFG_CSU_CTL.MATCH PMG == 0, this field is not used to match cache storage to a PMG and the contents of this field is ignored.

If MSMON_CFG_CSU_CTL.MATCH PMG == 1 and MSMON_CFG_CSU_CTL.MATCH PARTID == 1, the monitor instance selected by MSMON_CFG_MON_SEL measures or counts cache storage labeled with PMG equal to this field and PARTID equal to the PARTID field.

If MSMON_CFG_CSU_CTL.MATCH PMG == 1 and MSMON_CFG_CSU_CTL.MATCH PARTID == 0, the behavior of the monitor instance selected by MSMON_CFG_MON_SEL is CONSTRAINED UNPREDICTABLE. See MSMON_CFG_CSU_CTL.MATCH_PMG for more information.

**PARTID, bits [15:0]**

Partition ID to filter cache storage usage monitoring.
If `MSMON_CFG_CSU_CTL.MATCH_PARTID` == 0 and `MSMON_CFG_CSU_CTL.MATCH_PMG` == 0, the monitor measures all allocated cache storage.

If `MSMON_CFG_CSU_CTL.MATCH_PARTID` == 0 and `MSMON_CFG_CSU_CTL.MATCH_PMG` == 1, the behavior of the monitor is CONSTRAINED UNPREDICTABLE. See the description of `MSMON_CFG_CSU_CTL.MATCH_PMG`.

If `MSMON_CFG_CSU_CTL.MATCH_PARTID` == 1 and `MSMON_CFG_CSU_CTL.MATCH_PMG` == 0, the monitor selected by `MSMON_CFG_MON_SEL` measures or counts cache storage labeled with PARTID equal to this field.

If `MSMON_CFG_CSU_CTL.MATCH_PARTID` == 1 and `MSMON_CFG_CSU_CTL.MATCH_PMG` == 1, the monitor selected by `MSMON_CFG_MON_SEL` measures or counts cache storage labeled with PARTID equal to this field and PMG equal to the PMG field.

**Accessing the MSMON_CFG_CSU_FLT**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

`MSMON_CFG_CSU_FLT_s` must be accessible from the Secure MPAM feature page. `MSMON_CFG_CSU_FLT_ns` must be accessible from the Non-secure MPAM feature page.

`MSMON_CFG_CSU_FLT_s` and `MSMON_CFG_CSU_FLT_ns` must be separate registers. The Secure instance (`MSMON_CFG_CSU_FLT_s`) accesses the PARTID and PMG matching for a cache storage usage monitor used for Secure PARTIDs, and the Non-secure instance (`MSMON_CFG_CSU_FLT_ns`) accesses the PARTID and PMG matching for a cache storage usage monitor used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to `MSMON_CFG_CSU_FLT` access the monitor configuration settings for the resource instance selected by `MSMON_CFG_MON_SEL.RIS` and the cache storage usage monitor instance selected by `MSMON_CFG_MON_SEL.MON_SEL`.

When RIS is not implemented, loads and stores to `MSMON_CFG_CSU_FLT` access the monitor configuration settings for the cache storage usage monitor instance selected by `MSMON_CFG_MON_SEL.MON_SEL`.

`MSMON_CFG_CSU_FLT` can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0810</td>
<td>MSMON_CFG_CSU_FLT_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0810</td>
<td>MSMON_CFG_CSU_FLT_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
The MSMON_CFG_MBWU_CTL characteristics are:

**Purpose**

Controls the MBWU monitor selected by `MSMON_CFG_MON_SEL`. MSMON_CFG_MBWU_CTL controls the Secure memory bandwidth usage monitor instance selected by the Secure instance of `MSMON_CFG_MON_SEL`. MSMON_CFG_MBWU_CTL ns controls Non-secure memory bandwidth usage monitor instance selected by the Non-secure instance of `MSMON_CFG_MON_SEL`.

If `MPAMF_IDR.HAS_RIS` is 1, the monitor instance configuration accessed is for the resource instance currently selected by `MSMON_CFG_MON_SEL.RIS` and the monitor instance of that resource instance selected by `MSMON_CFG_MON_SEL.MON_SEL`.

**Configuration**

The power domain of MSMON_CFG_MBWU_CTL is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_MBWU == 1. Otherwise, direct accesses to MSMON_CFG_MBWU_CTL are RES0.

**Attributes**

MSMON_CFG_MBWU_CTL is a 32-bit register.

**Field descriptions**

The MSMON_CFG_MBWU_CTL bit assignments are:

```
<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
</tr>
</thead>
<tbody>
<tr>
<td>EN</td>
<td>CAPT_EVNT</td>
<td>CAPT_RESET</td>
<td>OFLOW_STATUS</td>
<td>OFLOW_INTR</td>
<td>OFLOW_FRZ</td>
<td>SUBTYPE</td>
<td>SCLEN</td>
<td>RES0</td>
<td>MATCH_PMG</td>
<td>MATCH_PARTID</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

**EN, bit [31]**

Enabled.

<table>
<thead>
<tr>
<th>EN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The monitor instance is disabled and must not collect any information.</td>
</tr>
<tr>
<td>0b1</td>
<td>The monitor instance is enabled to collect information according to the configuration of the instance.</td>
</tr>
</tbody>
</table>

**CAPT_EVNT, bits [30:28]**

Capture event selector.

When the selected capture event occurs, `MSMON_MBWU` of the monitor instance is copied to `MSMON_MBWU_CAPTURE` of the same instance. If the long counter is also implemented, `MSMON_MBWU_L` is also copied to `MSMON_MBWU_L_CAPTURE`.

Select the event that triggers capture from the following:
Meaning

<table>
<thead>
<tr>
<th>CAPT_EVNT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>No capture event is triggered.</td>
</tr>
<tr>
<td>0b001</td>
<td>External capture event 1 (optional but recommended)</td>
</tr>
<tr>
<td>0b010</td>
<td>External capture event 2 (optional)</td>
</tr>
<tr>
<td>0b011</td>
<td>External capture event 3 (optional)</td>
</tr>
<tr>
<td>0b100</td>
<td>External capture event 4 (optional)</td>
</tr>
<tr>
<td>0b101</td>
<td>External capture event 5 (optional)</td>
</tr>
<tr>
<td>0b110</td>
<td>External capture event 6 (optional)</td>
</tr>
<tr>
<td>0b111</td>
<td>Capture occurs when a MSMON_CAPT_EVNT register in this MSC is written and causes a capture event for the security state of this monitor. (optional)</td>
</tr>
</tbody>
</table>

The values marked as optional indicate capture event sources that can be omitted in an implementation. Those values representing non-implemented event sources must not trigger a capture event.

If capture is not implemented for the MBWU monitor type as indicated by MPAMF_MBWUMON_IDR.HAS_CAPTURE = 0, this field is RAZ/WI.

CAPT_RESET, bit [27]

Reset MSMON_MBWU.VALUE after capture.

Controls whether the VALUE field of the monitor instance is reset to zero immediately after being copied to the corresponding capture register.

<table>
<thead>
<tr>
<th>CAPT_RESET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MSMON_MBWU.VALUE field of the monitor instance is not reset on capture.</td>
</tr>
<tr>
<td>0b1</td>
<td>MSMON_MBWU.VALUE field of the monitor instance is reset on capture.</td>
</tr>
</tbody>
</table>

If capture is not implemented for the MBWU monitor type as indicated by MPAMF_MBWUMON_IDR.HAS_CAPTURE = 0, this field is RAZ/WI.

This control bit affects both MSMON_MBWU and MSMON_MBWU_L in implementations that include MSMON_MBWU_L.

OFLOW_STATUS, bit [26]

Overflow status.

Indicates whether the value of MSMON_MBWU has overflowed.

<table>
<thead>
<tr>
<th>OFLOW_STATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MSMON_MBWU.VALUE has not overflowed.</td>
</tr>
<tr>
<td>0b1</td>
<td>MSMON_MBWU.VALUE has overflowed at least once since this bit was last written to zero.</td>
</tr>
</tbody>
</table>

If overflow is not possible for an MBWU monitor in the MSC implementation, this field is RAZ/WI.

Overflow status for MSMON_MBWU_L.VALUE is reported in MSMON_CFG_MBWU_CTL.OFLOW_STATUS_L.

OFLOW_INTR, bit [25]

Enable interrupt on overflow of MSMON_MBWU.VALUE.

<table>
<thead>
<tr>
<th>OFLOW_INTR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No interrupt is signaled on an overflow of MSMON_MBWU.VALUE.</td>
</tr>
<tr>
<td>0b1</td>
<td>An implementation-specific interrupt is signaled on an overflow of MSMON_MBWU.VALUE.</td>
</tr>
</tbody>
</table>

If overflow is not possible for an MBWU monitor in the MSC implementation, this field is RAZ/WI.

If overflow interrupt is not supported by the MSC implementation, this field is RAZ/WI.
Interrupt enable for overflow of `MSMON_MBWU.VALUE` is controlled by `MSMON_CFG_MBWU_CTL.OFLOW_INTR_L`.

**OFLOW_FRZ, bit [24]**

Freeze monitor instance on overflow.

Controls whether `MSMON_MBWU.VALUE` field of the monitor instance freezes on an overflow.

<table>
<thead>
<tr>
<th>OFLOW_FRZ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><code>MSMON_MBWU.VALUE</code> field of the monitor instance wraps on overflow.</td>
</tr>
<tr>
<td>0b1</td>
<td><code>MSMON_MBWU.VALUE</code> field of the monitor instance freezes on overflow. If the increment that caused the overflow was 1, the frozen value is the post-increment value of 0. If the increment that caused the overflow was larger than 1, the frozen value of the monitor might be 0 or a larger value less than the final increment.</td>
</tr>
</tbody>
</table>

If overflow is not possible for the instance of the MBWU monitor in the implementation, this field is RAZ/WI.

This control bit affects both `MSMON_MBWU` and `MSMON_MBWU_L` in implementations that include `MSMON_MBWU_L`.

**SUBTYPE, bits [23:20]**

Subtype. Type of bandwidth counted by this monitor.

This field is not currently used for MBWU monitors, but reserved for future use.

This field is RAZ/WI.

**SCLEN, bit [19]**

`MSMON_MBWU.VALUE` Scaling Enable.

Enables scaling of `MSMON_MBWU.VALUE` by `MPAMF_MBWUMON_IDR.SCALE`.

<table>
<thead>
<tr>
<th>SCLEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><code>MSMON_MBWU.VALUE</code> has bytes counted by the monitor instance.</td>
</tr>
<tr>
<td>0b1</td>
<td><code>MSMON_MBWU.VALUE</code> has bytes counted by the monitor instance, shifted right by <code>MPAMF_MBWUMON_IDR.SCALE</code>.</td>
</tr>
</tbody>
</table>

**Bit [18]**

Reserved, RES0.

**MATCH_PMG, bit [17]**

Match PMG.

Controls whether the monitor instance only counts data transferred with PMG matching `MSMON_CFG_MBWU_FLT.PMG`.

<table>
<thead>
<tr>
<th>MATCH_PMG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The monitor instance counts data transferred with any PMG value.</td>
</tr>
<tr>
<td>0b1</td>
<td>The monitor instance only counts data transferred with the PMG value matching <code>MSMON_CFG_MBWU_FLT.PMG</code>.</td>
</tr>
</tbody>
</table>
MATCH_PARTID, bit [16]

Match PARTID.

Controls whether the monitor instance counts only data transferred with PARTID matching
MSMON_CFG_MBWU_FLT.PARTID.

<table>
<thead>
<tr>
<th>MATCH_PARTID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The monitor instance counts data transferred with any PARTID value.</td>
</tr>
<tr>
<td>0b1</td>
<td>The monitor instance only counts data transferred with the PARTID value matching MSMON_CFG_MBWU_FLT.PARTID.</td>
</tr>
</tbody>
</table>

OFLOW_STATUS_L, bit [15]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Overflow Status of MSMON_MBWU_L.VALUE of the monitor instance.

Indicates whether MSMON_MBWU_L.VALUE has overflowed.

<table>
<thead>
<tr>
<th>OFLOW_STATUS_L</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MSMON_MBWU_L.VALUE has not overflowed.</td>
</tr>
<tr>
<td>0b1</td>
<td>MSMON_MBWU_L.VALUE has overflowed at least once since this bit was last written to zero.</td>
</tr>
</tbody>
</table>

If MPAMF_MBWUMON_IDR.HAS_LONG == 0, this bit is RES0.

Overflow status of MSMON_MBWU.VALUE is reported in MSMON_CFG_MBWU_CTL.OFLOW_STATUS.

Otherwise:

Reserved, RES0.

OFLOW_INTR_L, bit [14]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Overflow Interrupt for MSMON_MBWU.L.

Controls whether an MPAM overflow interrupt is generated when MSMON_MBWU.L.VALUE overflows.

<table>
<thead>
<tr>
<th>OFLOW_INTR_L</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No interrupt is signaled on an overflow of MSMON_MBWU.L.VALUE.</td>
</tr>
<tr>
<td>0b1</td>
<td>An implementation-specific interrupt is signalled on overflow of MSMON_MBWU.L.VALUE.</td>
</tr>
</tbody>
</table>

If overflow is not possible for an MBWU monitor in the MSC implementation, this field is RAZ/WI.

If the overflow interrupt is not supported by the MSC implementation, this field is RAZ/WI.

If MPAMF_MBWUMON_IDR.HAS_LONG == 0, this bit is RES0.

Otherwise:

Reserved, RES0.

Bits [13:8]

Reserved, RES0.
**TYPE, bits [7:0]**

Monitor Type Code. The MBWU monitor is TYPE = 0x42.

TYPE is a read-only constant indicating the type of the monitor.

Reads as 0x42.

**Accessing the MSMON_CONFIG_MBWU_CTL**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_CONFIG_MBWU_CTL_s must be accessible from the Secure MPAM feature page. MSMON_CONFIG_MBWU_CTL_ns must be accessible from the Non-secure MPAM feature page.

MSMON_CONFIG_MBWU_CTL_s and MSMON_CONFIG_MBWU_CTL_ns must be separate registers. The Secure instance (MSMON_CONFIG_MBWU_CTL_s) accesses the memory bandwidth usage monitor controls used for Secure PARTIDs, and the Non-secure instance (MSMON_CONFIG_MBWU_CTL_ns) accesses the memory bandwidth usage monitor controls used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MSMON_CONFIG_MBWU_CTL access the monitor configuration settings for the bandwidth resource instance selected by MSMON_CONFIG_MON_SEL.RIS and the memory bandwidth usage monitor instance selected by MSMON_CONFIG_MON_SEL.MON_SEL.

When RIS is not implemented, loads and stores to MSMON_CONFIG_MBWU_CTL access the monitor configuration settings for the memory bandwidth usage monitor instance selected by MSMON_CONFIG_MON_SEL.MON_SEL.

**MSMON_CONFIG_MBWU_CTL can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0828</td>
<td>MSMON_CONFIG_MBWU_CTL_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0828</td>
<td>MSMON_CONFIG_MBWU_CTL_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

MSMON_CFG_MBWU_FLT, MPAM Memory System Monitor Configure Memory Bandwidth Usage Monitor Filter Register

The MSMON_CFG_MBWU_FLT characteristics are:

**Purpose**

Controls PARTID and PMG to measure or count in the MBWU monitor selected by MSMON_CFG_MON_SEL. MSMON_CFG_MBWU_FLT sets filter conditions for the Secure memory bandwidth usage monitor instance selected by the Secure instance of MSMON_CFG_MON_SEL. MSMON_CFG_MBWU_CTL sets filter conditions for the Non-secure memory bandwidth usage monitor instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.

If MPAMF_IDR.HAS_RIS is 1, the monitor instance filter configuration accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

**Configuration**

The power domain of MSMON_CFG_MBWU_FLT is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_MBWU == 1. Otherwise, direct accesses to MSMON_CFG_MBWU_FLT are RES0.

**Attributes**

MSMON_CFG_MBWU_FLT is a 32-bit register.

**Field descriptions**

The MSMON_CFG_MBWU_FLT bit assignments are:

**When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:**

<table>
<thead>
<tr>
<th>RWBW</th>
<th>RES0</th>
<th>PMG</th>
<th>PARTID</th>
</tr>
</thead>
<tbody>

<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

RW filtering.

**RWBW, bits [31:30]**

When MPAMF_MBWUMON_IDR.HAS_RWBW == 1:

Read/write bandwidth filter. Configures the selected monitor instance to count all bandwidth, only read bandwidth or only write bandwidth.

<table>
<thead>
<tr>
<th>RWBW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Monitor instance counts read bandwidth and write bandwidth.</td>
</tr>
<tr>
<td>0b01</td>
<td>Monitor instance counts write bandwidth only.</td>
</tr>
<tr>
<td>0b10</td>
<td>Monitor instance counts read bandwidth only.</td>
</tr>
<tr>
<td>0b11</td>
<td>Reserved.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.
Bits [29:24]

Reserved, RES0.

PMG, bits [23:16]

Performance monitoring group to filter memory bandwidth usage monitoring.

If `MSMON_CFG_MBWU_CTL.MATCH_PMG == 0`, this field is not used to match memory bandwidth to a PMG and the contents of this field is ignored.

If `MSMON_CFG_MBWU_CTL.MATCH_PMG == 1`, the monitor selected by `MSMON_CFG_MON_SEL` measures or counts memory bandwidth labeled with PMG equal to this field.

PARTID, bits [15:0]

Partition ID to filter memory bandwidth usage monitoring.

If `MSMON_CFG_MBWU_CTL.MATCH_PARTID == 0`, this field is not used to match memory bandwidth to a PARTID and the contents of this field is ignored.

If `MSMON_CFG_MBWU_CTL.MATCH_PARTID == 1`, the monitor selected by `MSMON_CFG_MON_SEL` measures or counts memory bandwidth labeled with PARTID equal to this field.

Otherwise:

<table>
<thead>
<tr>
<th>31</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:24]

Reserved, RES0.

PMG, bits [23:16]

Performance monitoring group to filter memory bandwidth usage monitoring.

If `MSMON_CFG_MBWU_CTL.MATCH_PMG == 0`, this field is not used to match memory bandwidth to a PMG and the contents of this field is ignored.

If `MSMON_CFG_MBWU_CTL.MATCH_PMG == 1`, the monitor selected by `MSMON_CFG_MON_SEL` measures or counts memory bandwidth labeled with PMG equal to this field.

PARTID, bits [15:0]

Partition ID to filter memory bandwidth usage monitoring.

If `MSMON_CFG_MBWU_CTL.MATCH_PARTID == 0`, this field is not used to match memory bandwidth to a PARTID and the contents of this field is ignored.

If `MSMON_CFG_MBWU_CTL.MATCH_PARTID == 1`, the monitor selected by `MSMON_CFG_MON_SEL` measures or counts memory bandwidth labeled with PARTID equal to this field.

Accessing the `MSMON_CFG_MBWUFLT`

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

`MSMON_CFG_MBWUFLT_s` must be accessible from the Secure MPAM feature page. `MSMON_CFG_MBWUFLT_ns` must be accessible from the Non-secure MPAM feature page.

`MSMON_CFG_MBWUFLT_s` and `MSMON_CFG_MBWUFLT_ns` must be separate registers. The Secure instance (`MSMON_CFG_MBWUFLT_s`) accesses the PARTID and PMG matching for a memory bandwidth usage monitor used
for Secure PARTIDs, and the Non-secure instance (MSMON_CFG_MBWU_FLT_ns) accesses the PARTID and PMG matching for a memory bandwidth usage monitor used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MSMON_CFG_MBWU_FLT access the monitor configuration settings for the bandwidth resource instance selected by MSMON_CFG_MON_SEL, RIS and the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL_MON_SEL.

When RIS is not implemented, loads and stores to MSMON_CFG_MBWU_FLT access the monitor configuration settings for the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL_MON_SEL.

**MSMON_CFG_MBWU_FLT can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0820</td>
<td>MSMON_CFG_MBWU_FLT_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

<table>
<thead>
<tr>

<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0820</td>
<td>MSMON_CFG_MBWU_FLT_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
MSMON_CFG_MON_SEL, MPAM Monitor Instance Selection Register

The MSMON_CFG_MON_SEL characteristics are:

**Purpose**

Selects a monitor instance to access through the MSMON configuration and counter registers. MSMON_CFG_MON_SEL selects a Secure monitor instance to access via the Secure MPAM feature page. MSMON_CFG_MON_SEL_ns selects a Non-secure monitor instance to access via the Non-secure MPAM feature page.

**Note**

Different performance monitoring features within a MSC could have different numbers of monitor instances. See the NUM_MON field in the corresponding ID register. This means that a monitor out-of-bounds error might be signaled when an MSMON_CFG register is accessed because the value in MSMON_CFG_MON_SEL.MON_SEL is too large for the particular monitoring feature.

To configure a monitor, set MON_SEL in this register to the index of the monitor instance to configure, then write to the MSMON_CFG_x register to set the configuration of the monitor. At a later time, read the monitor register (for example MSMON_MBWU) to get the value of the monitor.

**Configuration**

The power domain of MSMON_CFG_MON_SEL is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and (MPAMF_IDR.HAS_MSMON == 1, or (MPAMF_IDR.HAS_IMPL_IDR == 1 and MPAMF_IDR.EXT == 0) or (MPAMF_IDR.HAS_IMPL_IDR == 1, MPAMF_IDR.EXT == 1 and MPAMF_IDR.NO_IMPL_MSMON == 0)). Otherwise, direct accesses to MSMON_CFG_MON_SEL are RES0.

**Attributes**

MSMON_CFG_MON_SEL is a 32-bit register.

**Field descriptions**

The MSMON_CFG_MON_SEL bit assignments are:

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0| RIS | RES0| MON_SEL

**Bits [31:28]**

Reserved, RES0.

**RIS, bits [27:24]**

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented), MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_RIS == 1:

Resource Instance Selector. RIS selects one resource to configure through MSMON_CFG registers.
Otherwise:

Reserved, RES0.

**Bits [23:16]**

Reserved, RES0.

**MON_SEL, bits [15:0]**

Selects the monitor instance to configure or read.

Reads and writes to other MSMON registers are indexed by MON_SEL and by the NS bit used to access
MSMON_CFG_MON_SEL to access the configuration for a single monitor.

**Accessing the MSMON_CFG_MON_SEL**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_CFG_MON_SEL_s must be accessible from the Secure MPAM feature page. MSMON_CFG_MON_SEL_ns must be accessible from the Non-secure MPAM feature page.

MSMON_CFG_MON_SEL_s and MSMON_CFG_MON_SEL_ns must be separate registers. The Secure instance (MSMON_CFG_MON_SEL_s) accesses the monitor instance selector used for Secure PARTIDs, and the Non-secure instance (MSMON_CFG_MON_SEL_ns) accesses the monitor instance selector used for Non-secure PARTIDs.

**MSMON_CFG_MON_SEL can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0800</td>
<td>MSMON_CFG_MON_SEL_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0800</td>
<td>MSMON_CFG_MON_SEL_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
The MSMON_CSU characteristics are:

**Purpose**

Accesses the CSU monitor instance selected by `MSMON_CFG_MON_SEL`. MSMON_CSU_s is a Secure cache storage usage monitor instance selected by the Secure instance of `MSMON_CFG_MON_SEL`, MSMON_CSU_ns is a Non-secure cache storage usage monitor instance selected by the Non-secure instance of `MSMON_CFG_MON_SEL`.

If `MPAMF_IDR.HAS_RIS` is 1, the monitor instance accessed is for the resource instance currently selected by `MSMON_CFG_MON_SEL.RIS` and the monitor instance of that resource instance selected by `MSMON_CFG_MON_SEL.MON_SEL`.

**Configuration**

The power domain of MSMON_CSU is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, `MPAMF_IDR.HAS_MSMON` == 1 and `MPAMF_MSMON_IDR.MSMON_CSU` == 1. Otherwise, direct accesses to MSMON_CSU are RES0.

**Attributes**

MSMON_CSU is a 32-bit register.

**Field descriptions**

The MSMON_CSU bit assignments are:

**NRDY, bit [31]**

Not Ready. Indicates whether the monitor instance has possibly inaccurate data.

<table>
<thead>
<tr>
<th>NRDY</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The monitor instance is ready and the MSMON_CSU.VALUE field is accurate.</td>
</tr>
<tr>
<td>0b1</td>
<td>The monitor instance is not ready and the contents of the MSMON_CSU.VALUE field might be inaccurate or otherwise not represent the actual cache storage usage.</td>
</tr>
</tbody>
</table>

**VALUE, bits [30:0]**

Cache storage usage measurement value if MSMON_CSU.NRDY is 0. Invalid if MSMON_CSU.NRDY is 1.

VALUE is the cache storage usage measured in bytes meeting the criteria set in `MSMON_CFG_CSUFLT` and `MSMON_CFG_CSU_CTL` for the monitor instance selected by `MSMON_CFG_MON_SEL`.

**Accessing the MSMON_CSU**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.
MSMON_CSU_s must be accessible from the Secure MPAM feature page. MSMON_CSU_ns must be accessible from the Non-secure MPAM feature page.

MSMON_CSU_s and MSMON_CSU_ns must be separate registers. The Secure instance (MSMON_CSU_s) accesses the cache storage usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_CSU_ns) accesses the cache storage usage monitor used for Non-secure PARTIDs.

When RIS is implemented, reads and writes to MSMON_CSU access the cache storage usage monitor monitor instance for the cache resource instance selected by MSMON_CFG_MON_SEL.RIS and the cache storage usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

When RIS is not implemented, reads and writes to MSMON_CSU access the cache storage usage monitor monitor instance for the cache storage usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

**MSMON_CSU can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0840</td>
<td>MSMON_CSU_s</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When MPAMF_CSUMON_IDR.CSU_RO == 0 accesses to this register are RW.
- When MPAMF_CSUMON_IDR.CSU_RO == 1 accesses to this register are RO.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0840</td>
<td>MSMON_CSU_ns</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When MPAMF_CSUMON_IDR.CSU_RO == 0 accesses to this register are RW.
- When MPAMF_CSUMON_IDR.CSU_RO == 1 accesses to this register are RO.
MSMON_CSU_CAPTURE, MPAM Cache Storage Usage Monitor Capture Register

The MSMON_CSU_CAPTURE characteristics are:

**Purpose**

MSMON_CSU_CAPTURE is a 32-bit read-write register that accesses the captured MSMON_CSU monitor instance selected by MSMON_CFG_MON_SEL. MSMON_CSU_CAPTURE_s is the Secure cache storage usage monitor capture instance selected by the Secure instance of MSMON_CFG_MON_SEL. MSMON_CSU_CAPTURE_ns is the Non-secure cache storage usage monitor capture instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.

If MPAMF_IDR.HAS_RIS is 1, the monitor instance capture register accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

**Configuration**

The power domain of MSMON_CSU_CAPTURE is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1, MPAMF_MSMON_IDR.MSMON_CSU == 1 and MPAMF_CSUMON_IDR.HAS_CAPTURE == 1. Otherwise, direct accesses to MSMON_CSU_CAPTURE are RES0.

**Attributes**

MSMON_CSU_CAPTURE is a 32-bit register.

**Field descriptions**

The MSMON_CSU_CAPTURE bit assignments are:

<tr>
<td>0b1</td>
<td>The captured monitor instance was not ready and the contents of the MSMON_CSU_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual cache storage usage.</td>
</tr>
</tbody>
</table>

**VALUE, bits [30:0]**

Captured cache storage usage measurement if MSMON_CSU_CAPTURE.NRDY is 0. Invalid if MSMON_CSU_CAPTURE.NRDY is 1.

VALUE is the captured cache storage usage measurement in bytes meeting the criteria set in MSMON_CFG_CSU_FLT and MSMON_CFG_CSU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.
Accessing the MSMON_CSU_CAPTURE

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_CSU_CAPTURE_s must be accessible from the Secure MPAM feature page. MSMON_CSU_CAPTURE_ns must be accessible from the Non-secure MPAM feature page.

MSMON_CSU_CAPTURE_s and MSMON_CSU_CAPTURE_ns must be separate registers. The Secure instance (MSMON_CSU_CAPTURE_s) accesses the captured cache storage usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_CSU_CAPTURE_ns) accesses the captured cache storage usage monitor used for Non-secure PARTIDs.

When RIS is implemented, reads and writes to MSMON_CSU_CAPTURE access the monitor instance for the cache resource instance selected by MSMON_CFG_MON_SEL.RIS and the cache storage usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

When RIS is not implemented, reads and writes to MSMON_CSU_CAPTURE access the monitor instance for the cache storage usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

MSMON_CSU_CAPTURE can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0848</td>
<td>MSMON_CSU_CAPTURE_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
MSMON_MBWU, MPAM Memory Bandwidth Usage Monitor Register

The MSMON_MBWU characteristics are:

**Purpose**

Accesses the monitor instance selected by MSMON_CFG_MON_SEL. MSMON_MBWU_s is the Secure memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL_s. MSMON_MBWU_ns is the Non-secure memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL_ns.

If MPAMF_IDR.HAS_RIS is 1, the monitor instance register accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

**Configuration**

The power domain of MSMON_MBWU is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_MBWU == 1. Otherwise, direct accesses to MSMON_MBWU are RES0.

**Attributes**

MSMON_MBWU is a 32-bit register.

**Field descriptions**

The MSMON_MBWU bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>

</tbody>
</table>

**NRDY, bit [31]**

Not Ready. Indicates whether the monitor has possibly inaccurate data.

<table>
<thead>
<tr>
<th>NRDY</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The monitor instance is ready and the MSMON_MBWU.VALUE field is accurate.</td>
</tr>
<tr>
<td>0b1</td>
<td>The monitor instance is not ready and the contents of the MSMON_MBWU.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.</td>
</tr>
</tbody>
</table>

**VALUE, bits [30:0]**

Memory bandwidth usage counter value if MSMON_MBWU.NRDY is 0. Invalid if MSMON_MBWU.NRDY is 1.

VALUE is the scaled count of bytes transferred since the monitor was last reset that meet the criteria set in MSMON_CFG_MBWU_FLT and MSMON_CFG_MBWU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

If MSMON_CFG_MBWU_CTL.SCLEN enables scaling, the count in VALUE is the number of bytes shifted right by MPAMF_MBWUMON_IDR.SCALE bit positions and rounded.
**Accessing the MSMON_MBWU**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_MBWU_s must be accessible from the Secure MPAM feature page. MSMON_MBWU_ns must be accessible from the Non-secure MPAM feature page.

MSMON_MBWU_s and MSMON_MBWU_ns must be separate registers. The Secure instance (MSMON_MBWU_s) accesses the memory bandwidth usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_MBWU_ns) accesses the memory bandwidth usage monitor used for Non-secure PARTIDs.

When RIS is implemented, reads and writes to MSMON_MBWU access the memory bandwidth usage monitor instance for the resource instance selected by MSMON_CFG_MON_SEL.RIS and the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

When RIS is not implemented, reads and writes to MSMON_MBWU access the memory bandwidth usage monitor instance for the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

**MSMON_MBWU can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0860</td>
<td>MSMON_MBWU_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0860</td>
<td>MSMON_MBWU_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
MSMON_MBWU_CAPTURE, MPAM Memory Bandwidth Usage Monitor Capture Register

The MSMON_MBWU_CAPTURE characteristics are:

**Purpose**

Accesses the captured MSMON_MBWU monitor instance selected by `MSMON_CFG_MON_SEL`. MSMON_MBWU_CAPTURE_s is the Secure memory bandwidth usage monitor capture instance selected by the Secure instance of `MSMON_CFG_MON_SEL`. MSMON_MBWU_CAPTURE_ns is the Non-secure memory bandwidth usage monitor capture instance selected by the Non-secure instance of `MSMON_CFG_MON_SEL`.

If `MPAMF_IDR.HAS_RIS` is 1, the monitor instance capture register accessed is for the resource instance currently selected by `MSMON_CFG_MON_SEL.RIS` and the monitor instance of that resource instance selected by `MSMON_CFG_MON_SEL.MON_SEL`.

**Configuration**

The power domain of MSMON_MBWU_CAPTURE is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1, MPAMF_MSMON_IDR.MSMON_MBWU == 1 and MPAMF_MBWUMON_IDR.HAS_CAPTURE == 1. Otherwise, direct accesses to MSMON_MBWU_CAPTURE are RES0.

**Attributes**

MSMON_MBWU_CAPTURE is a 32-bit register.

**Field descriptions**

The MSMON_MBWU_CAPTURE bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>NRDY Not Ready. The captured NRDY bit from the corresponding instance of MSMON_MBWU. This bit indicates whether the captured monitor value has possibly inaccurate data.</td>
</tr>
<tr>
<td>30-0</td>
<td>VALUE Captured memory bandwidth usage counter value if MSMON_MBWU_CAPTURE.NRDY is 0. Invalid if MSMON_MBWU_CAPTURE.NRDY is 1.</td>
</tr>
</tbody>
</table>

**NRDY, bit [31]**

Not Ready. The captured NRDY bit from the corresponding instance of MSMON_MBWU. This bit indicates whether the captured monitor value has possibly inaccurate data.

<table>
<thead>
<tr>
<th>NRDY</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The captured monitor instance was ready and the MSMON_MBWU_CAPTURE.VALUE field is accurate.</td>
</tr>
<tr>
<td>0b1</td>
<td>The captured monitor instance was not ready and the contents of the MSMON_MBWU_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.</td>
</tr>
</tbody>
</table>

**VALUE, bits [30:0]**

Captured memory bandwidth usage counter value if MSMON_MBWU_CAPTURE.NRDY is 0. Invalid if MSMON_MBWU_CAPTURE.NRDY is 1.

VALUE is the captured VALUE field from the corresponding instance of MSMON_MBWU, the count of bytes transferred since the monitor was last reset that meet the criteria set in MSMON_CFG_MBWU_FLT and MSMON_CFG_MBWU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.
VALUE captures the **MSMON_MBWU(VALUE)** and preserves any scaling that had been performed on the VALUE field in that register.

### Accessing the MSMON_MBWU_CAPTURE

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

**MSMON_MBWU_CAPTURE_s** must be accessible from the Secure MPAM feature page. **MSMON_MBWU_CAPTURE_ns** must be accessible from the Non-secure MPAM feature page.

**MSMON_MBWU_CAPTURE_s** and **MSMON_MBWU_CAPTURE_ns** must be separate registers. The Secure instance (**MSMON_MBWU_CAPTURE_s**) accesses the captured memory bandwidth usage monitor used for Secure PARTIDs, and the Non-secure instance (**MSMON_MBWU_CAPTURE_ns**) accesses the captured memory bandwidth usage monitor used for Non-secure PARTIDs.

When RIS is implemented, reads and writes to **MSMON_MBWU_CAPTURE** access the monitor instance for the bandwidth resource instance selected by **MSMON_CFG_MON_SEL.RIS** and the memory bandwidth usage monitor instance selected by **MSMON_CFG_MON_SEL.MON_SEL**.

When RIS is not implemented, reads and writes to **MSMON_MBWU_CAPTURE** access the monitor instance for the memory bandwidth usage monitor instance selected by **MSMON_CFG_MON_SEL.MON_SEL**.

**MSMON_MBWU_CAPTURE** can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0868</td>
<td>MSMON_MBWU_CAPTURE_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0868</td>
<td>MSMON_MBWU_CAPTURE_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
MSMON_MBWU_L, MPAM Long Memory Bandwidth Usage Monitor Register

The MSMON_MBWU_L characteristics are:

**Purpose**

Accesses the monitor instance selected by MSMON_CFG_MON_SEL. MSMON_MBWU_L is the Secure memory bandwidth usage monitor instance selected by the Secure instance of MSMON_CFG_MON_SEL. MSMON_MBWU_L_ns is the Non-secure memory bandwidth usage monitor instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.

If MPAMF_IDR.HAS_RIS is 1, the monitor instance long monitor register accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

**Configuration**

The power domain of MSMON_MBWU_L is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1, MPAMF_MSMON_IDR.MSMON_MBWU == 1 and MPAMF_MBWUMON_IDR.HAS_LONG == 1. Otherwise, direct accesses to MSMON_MBWU_L are RES0.

**Attributes**

MSMON_MBWU_L is a 64-bit register.

**Field descriptions**

The MSMON_MBWU_L bit assignments are:

When MPAMF_MBWUMON_IDR.LWD == 0:

<table>
<thead>
<tr>

NRDY, bit [63]

Not Ready. Indicates whether the monitor instance has possibly inaccurate data.

<table>
<thead>
<tr>
<th>NRDY</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The monitor instance is ready and the MSMON_MBWU_L.VALUE field is accurate.</td>
</tr>
<tr>
<td>0b1</td>
<td>The monitor instance is not ready and the contents of the MSMON_MBWU_L.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.</td>
</tr>
</tbody>
</table>

VALUE, bits [62:0]

Long (63-bit) memory bandwidth usage counter value if MSMON_MBWU_L.NRDY is 0. Invalid if MSMON_MBWU_L.NRDY is 1.

VALUE is the long count of bytes transferred since the monitor instance was last reset that meet the criteria set in MSMON_CFG_MBWU_FLT and MSMON_CFG_MBWU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

Accessing the MSMON_MBWU_L

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_MBWU_L_s must be accessible from the Secure MPAM feature page. MSMON_MBWU_L_ns must be accessible from the Non-secure MPAM feature page.

MSMON_MBWU_L_s and MSMON_MBWU_L_ns must be separate registers. The Secure instance (MSMON_MBWU_L_s) accesses the long memory bandwidth usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_MBWU_L_ns) accesses the long memory bandwidth usage monitor used for Non-secure PARTIDs.

When RIS is implemented, reads and writes to MSMON_MBWU_L access the long memory bandwidth usage monitor instance for the bandwidth resource instance selected by MSMON_CFG_MON_SEL.RIS and the monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

When RIS is not implemented, reads and writes to MSMON_MBWU_L access the long memory bandwidth usage monitor instance for the monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

MSMON_MBWU_L can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0880</td>
<td>MSMON_MBWU_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
Accesses on this interface are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0080</td>
<td>MSMON_MBWU_ns</td>
</tr>
</tbody>
</table>
The MSMON_MBWU_L_CAPTURE characteristics are:

**Purpose**

Accesses the captured MSMON_MBWU_L monitor instance selected by MSMON_CFG_MON_SEL.

MSMON_MBWU_L_CAPTURE_s is the Secure memory bandwidth usage monitor capture instance selected by the Secure instance of MSMON_CFG_MON_SEL.

MSMON_MBWU_L_CAPTURE_ns is the Non-secure memory bandwidth usage monitor capture instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.

If MPAMF_IDR.HAS_RIS is 1, the monitor instance long capture register accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

**Configuration**

The power domain of MSMON_MBWU_L_CAPTURE is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1, MPAMF_MSMON_IDR.MSMON_MBWU == 1, MPAMF_MBWUMON_IDR.HAS_CAPTURE == 1 and MPAMF_MBWUMON_IDR.HAS_LONG == 1. Otherwise, direct accesses to MSMON_MBWU_L_CAPTURE are RES0.

**Attributes**

MSMON_MBWU_L_CAPTURE is a 64-bit register.

**Field descriptions**

The MSMON_MBWU_L_CAPTURE bit assignments are:

**When MPAMF_MBWUMON_IDR.LWD == 0:**

<table>

</tr>
</tbody>
</table>

**Bits [62:44]**

Reserved, RES0.
VALUE, bits [43:0]

Captured long memory bandwidth usage counter value if MSMON_MBWU_L_CAPTURE.NRDY is 0. Invalid if MSMON_MBWU_L_CAPTURE.NRDY is 1.

VALUE is the captured 44-bit count of bytes transferred since the monitor instance was last reset that meet the criteria set in MSMON_CFG_MBWU_FLT and MSMON_CFG_MBWU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

When MPAMF_MBWUMON_IDR.LWD == 1:

<td>The captured monitor instance was not ready and the contents of the MSMON_MBWU_L_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.</td>
</tr>
</tbody>
</table>

VALUE, bits [62:0]

The captured long memory bandwidth usage counter value if MSMON_MBWU_L_CAPTURE.NRDY is 0. Invalid if MSMON_MBWU_L_CAPTURE.NRDY is 1.

VALUE is the captured 63-bit count of bytes transferred since the monitor instance was last reset that meet the criteria set in MSMON_CFG_MBWU_FLT and MSMON_CFG_MBWU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

Accessing the MSMON_MBWU_L_CAPTURE

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_MBWU_L_CAPTURE_s must be accessible from the Secure MPAM feature page.

MSMON_MBWU_L_CAPTURE_ns must be accessible from the Non-secure MPAM feature page.

MSMON_MBWU_L_CAPTURE_s and MSMON_MBWU_L_CAPTURE_ns must be separate registers. The Secure instance (MSMON_MBWU_L_CAPTURE_s) accesses the captured long memory bandwidth usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_MBWU_L_CAPTURE_ns) accesses the captured long memory bandwidth usage monitor used for Non-secure PARTIDs.

When RIS is implemented, reads and writes to MSMON_MBWU_L_CAPTURE access the monitor instance for the bandwidth resource instance selected by MSMON_CFG_MON_SEL.RIS and the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

When RIS is not implemented, reads and writes to MSMON_MBWU_L_CAPTURE access the monitor instance for the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

MSMON_MBWU_L_CAPTURE can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0890</td>
<td>MSMON_MBWU_CAPTURE_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>

<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0890</td>
<td>MSMON_MBWU_CAPTURE_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
OSLAR_EL1, OS Lock Access Register

The OSLAR_EL1 characteristics are:

**Purpose**

Used to lock or unlock the OS lock.

**Configuration**

External register OSLAR_EL1 bits [31:0] are architecturally mapped to AArch64 System register OSLAR_EL1[31:0].

External register OSLAR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGOSLAR[31:0].

OSLAR_EL1 is in the Core power domain.

If FEAT_Debugv8p2 is not implemented, it is IMPLEMENTATION DEFINED whether external debug accesses to OSLAR_EL1 are ignored and return an error when AllowExternalDebugAccess() returns FALSE for the access.

If FEAT_Debugv8p2 is implemented, external debug accesses to OSLAR_EL1 are ignored and return an error when AllowExternalDebugAccess() returns FALSE for the access.

**Attributes**

OSLAR_EL1 is a 32-bit register.

**Field descriptions**

The OSLAR_EL1 bit assignments are:

<table>

**Bits [31:1]**

Reserved, RES0.

**OSLK, bit [0]**

On writes to OSLAR_EL1, bit[0] is copied to the OS lock.

Use EDPRSR. OSLK to check the current status of the lock.

**Accessing the OSLAR_EL1**

**Note**

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

OSLAR_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x300</td>
<td>OSLAR_EL1</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When \texttt{IsCorePowered()}, \texttt{!DoubleLockStatus()}, \texttt{AllowExternalDebugAccess()} and \texttt{SoftwareLockStatus()} accesses to this register are \texttt{WI}.
- When \texttt{IsCorePowered()}, \texttt{!DoubleLockStatus()}, \texttt{AllowExternalDebugAccess()} and \texttt{!SoftwareLockStatus()} accesses to this register are \texttt{WO}.
- When \texttt{IsCorePowered()}, \texttt{!DoubleLockStatus()}, \texttt{!AllowExternalDebugAccess()} and \texttt{FEAT_Debugv8p2} is not implemented accesses to this register are \texttt{IMPDEF}.
- Otherwise accesses to this register generate an error response.
PMAUTHSTATUS, Performance Monitors Authentication Status register

The PMAUTHSTATUS characteristics are:

**Purpose**

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for Performance Monitors.

**Configuration**

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is OPTIONAL, and is required for CoreSight compliance. Arm recommends that this register is implemented.

**Attributes**

PMAUTHSTATUS is a 32-bit register.

**Field descriptions**

The PMAUTHSTATUS bit assignments are:

<table>
<thead>
<tr>
<th>Bit assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-8</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>7-6</td>
<td>SNID, holds the same value as DBGAUTHSTATUS_EL1.SNID.</td>
</tr>
<tr>
<td>5-4</td>
<td>SID, secure invasive debug. Possible values:</td>
</tr>
<tr>
<td>3-2</td>
<td>NSNID, holds the same value as DBGAUTHSTATUS_EL1.NSNID.</td>
</tr>
<tr>
<td>1-0</td>
<td>NSID, non-secure invasive debug. Possible values:</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SNID, bits [7:6]**

Holds the same value as DBGAUTHSTATUS_EL1.SNID.

**SID, bits [5:4]**

Secure invasive debug. Possible values:

<table>
<thead>
<tr>
<th>SID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Not implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**NSNID, bits [3:2]**

Holds the same value as DBGAUTHSTATUS_EL1.NSNID.

**NSID, bits [1:0]**

Non-secure invasive debug. Possible values:
All other values are reserved.

Accessing the PMAUTHSTATUS

PMAUTHSTATUS can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFB8</td>
<td>PMAUTHSTATUS</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
PMCCFILTR_EL0, Performance Monitors Cycle Counter Filter Register

The PMCCFILTR_EL0 characteristics are:

**Purpose**

Determines the modes in which the Cycle Counter, PMCCNTR_EL0, increments.

**Configuration**

External register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMCCFILTR_EL0[31:0].

External register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCCFILTR[31:0].

PMCCFILTR_EL0 is in the Core power domain.

On a Warm or Cold reset, RW fields in this register reset:

- To architecturally **UNKNOWN** values if the reset is to an Exception level that is using AArch64.
- To 0 if the reset is to an Exception level that is using AArch32.

The register is not affected by an External debug reset.

**Attributes**

PMCCFILTR_EL0 is a 32-bit register.

**Field descriptions**

The PMCCFILTR_EL0 bit assignments are:

```
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| P  | U  | NSK | NSU | NSH | M  | RES0 | SH | RES0 |
```

**P, bit [31]**

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR_EL0.NSK bit.

<table>
<thead>
<tr>
<th>P</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count cycles in EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count cycles in EL1.</td>
</tr>
</tbody>
</table>

**U, bit [30]**

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR_EL0.NSU bit.

<table>
<thead>
<tr>
<th>U</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count cycles in EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count cycles in EL0.</td>
</tr>
</tbody>
</table>
NSK, bit [29]

When EL3 is implemented:

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Non-secure EL1 are counted.
Otherwise, cycles in Non-secure EL1 are not counted.

Otherwise:

Reserved, RES0.

NSU, bit [28]

When EL3 is implemented:

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Non-secure EL0 are counted.
Otherwise, cycles in Non-secure EL0 are not counted.

Otherwise:

Reserved, RES0.

NSH, bit [27]

When EL2 is implemented:

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If FEAT_SEL2 and EL3 are implemented, counting in Secure EL2 is further controlled by the PMCCFILTR_EL0.SH bit.

<table>
<thead>
<tr>
<th>NSH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not count cycles in EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Count cycles in EL2.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

M, bit [26]

When EL3 is implemented:

Secure EL3 filtering bit.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Secure EL3 are counted.
Otherwise, cycles in Secure EL3 are not counted.

Most applications can ignore this field and set its value to 0.

Note

This field is not visible in the AArch32 PMCCFILTR System register.
Otherwise:

Reserved, RES0.

**Bit [25]**

Reserved, RES0.

**SH, bit [24]**

*When FEAT_SEL2 is implemented and EL3 is implemented:*

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Secure EL2 are counted.

Otherwise, cycles in Secure EL2 are not counted.

If Secure EL2 is disabled, this field is RES0.

**Note**

This field is not visible in the AArch32 PMCCFILTR System register.

Otherwise:

Reserved, RES0.

**Bits [23:0]**

Reserved, RES0.

**Accessing the PMCCFILTR_EL0**

**Note**

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

**PMCCFILTR_EL0 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x47C</td>
<td>PMCCFILTR_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.
PMCCNTR_EL0, Performance Monitors Cycle Counter

The PMCCNTR_EL0 characteristics are:

Purpose

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. For more information, see 'Time as measured by the Performance Monitors cycle counter'.

PMCCFILTR_EL0 determines the modes and states in which the PMCCNTR_EL0 can increment.

Configuration

External register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch64 System register PMCCNTR_EL0[63:0].

External register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch32 System register PMCCNTR[63:0].

PMCCNTR_EL0 is in the Core power domain.

Attributes

PMCCNTR_EL0 is a 64-bit register.

Field descriptions

The PMCCNTR_EL0 bit assignments are:

<table>
<thead>
<tr>

</tbody>
</table>

CCNT, bits [63:0]

Cycle count. Depending on the values of PMCR_EL0.{LC,D}, the cycle count increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to PMCR_EL0.C sets this field to 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMCCNTR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCCNTR_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x0F8</td>
<td>PMCCNTR_EL0</td>
<td>31:0</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x0FC</td>
<td>PMCCNTR_EL0</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.
PMCEID0, Performance Monitors Common Event Identification register 0

The PMCEID0 characteristics are:

**Purpose**

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x0000 to 0x001F

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

For more information about the common events and the use of the PMCEIDn registers, see ‘The PMU event number space and common events’.

**Note**

- Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.
- This view of the register was previously called PMCEID0_EL0.

**Configuration**

External register PMCEID0 bits [31:0] are architecturally mapped to AArch64 System register PMCEID0_EL0[31:0].

External register PMCEID0 bits [31:0] are architecturally mapped to AArch32 System register PMCEID0[31:0].

PMCEID0 is in the Core power domain.

**Attributes**

PMCEID0 is a 32-bit register.

**Field descriptions**

The PMCEID0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| D31 | D30 | D29 | D28 | D27 | D26 | D25 | D24 | D23 | D22 | D21 | D20 | D19 | D18 | D17 | D16 | D15 | D14 | D13 | D12 | D11 | D10 | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to common event n.

For each bit:

<table>
<thead>
<tr>
<th>ID&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The common event is not implemented, or not counted.</td>
</tr>
<tr>
<td>0b1</td>
<td>The common event is implemented.</td>
</tr>
</tbody>
</table>

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

**Note**

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.
Accessing the PMCEID0

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCEID0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE20</td>
<td>PMCEID0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
PMCEID1, Performance Monitors Common Event Identification register 1

The PMCEID1 characteristics are:

**Purpose**

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x020 to 0x03F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

For more information about the common events and the use of the PMCEIDn registers, see ‘The PMU event number space and common events’.

**Note**

- Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.
- This view of the register was previously called PMCEID1_EL0.

**Configuration**

External register PMCEID1 bits [31:0] are architecturally mapped to AArch64 System register PMCEID1_EL0[31:0].

External register PMCEID1 bits [31:0] are architecturally mapped to AArch32 System register PMCEID1[31:0].

PMCEID1 is in the Core power domain.

**Attributes**

PMCEID1 is a 32-bit register.

**Field descriptions**

The PMCEID1 bit assignments are:

<table>
<thead>
<tr>
<th>ID&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The common event is not implemented, or not counted.</td>
</tr>
<tr>
<td>0b1</td>
<td>The common event is implemented.</td>
</tr>
</tbody>
</table>

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

**Note**

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.
Accessing the PMCEID1

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCEID1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE24</td>
<td>PMCEID1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
PMCEID2, Performance Monitors Common Event Identification register 2

The PMCEID2 characteristics are:

**Purpose**

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x4000 to 0x401F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

---

**Note**

Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

**Configuration**

External register PMCEID2 bits [31:0] are architecturally mapped to AArch64 System register PMCEID0_EL0[63:32].

External register PMCEID2 bits [63:32] are architecturally mapped to AArch32 System register PMCEID2[31:0].

PMCEID2 is in the Core power domain.

This register is present only when FEAT_PMUv3p1 is implemented. Otherwise, direct accesses to PMCEID2 are RES0.

**Attributes**

PMCEID2 is a 32-bit register.

**Field descriptions**

The PMCEID2 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dhi31</td>
<td>Dhi30</td>
<td>Dhi29</td>
<td>Dhi28</td>
<td>Dhi27</td>
<td>Dhi26</td>
<td>Dhi25</td>
<td>Dhi24</td>
<td>Dhi23</td>
<td>Dhi22</td>
<td>Dhi21</td>
<td>Dhi20</td>
<td>Dhi19</td>
<td>Dhi18</td>
<td>Dhi17</td>
<td>Dhi16</td>
<td>Dhi15</td>
</tr>
</tbody>
</table>

DHi<n>, bit [n], for n = 31 to 0

DHi[n] corresponds to common event (0x4000 + n).

For each bit:

<table>
<thead>
<tr>
<th>IDHi&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The common event is not implemented, or not counted.</td>
</tr>
<tr>
<td>0b1</td>
<td>The common event is implemented.</td>
</tr>
</tbody>
</table>

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

---

**Note**
Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

## Accessing the PMCEID2

**Note**

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

### PMCEID2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE28</td>
<td>PMCEID2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
PMCEID3, Performance Monitors Common Event Identification register 3

The PMCEID3 characteristics are:

**Purpose**

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x4020 to 0x403F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

**Note**

Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEIDn registers, see ‘The PMU event number space and common events’.

**Configuration**

External register PMCEID3 bits [31:0] are architecturally mapped to AArch64 System register PMCEID1_EL0[63:32].

External register PMCEID3 bits [63:32] are architecturally mapped to AArch32 System register PMCEID3[31:0].

PMCEID3 is in the Core power domain.

This register is present only when FEAT_PMUv3p1 is implemented. Otherwise, direct accesses to PMCEID3 are RES0.

**Attributes**

PMCEID3 is a 32-bit register.

**Field descriptions**

The PMCEID3 bit assignments are:

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15
IDhi31|IDhi30|IDhi29|IDhi28|IDhi27|IDhi26|IDhi25|IDhi24|IDhi23|IDhi22|IDhi21|IDhi20|IDhi19|IDhi18|IDhi17|IDhi16|IDhi15|D
```

IDhi\[n\], bit [n], for n = 31 to 0

IDhi[n] corresponds to common event (0x4020 + n).

For each bit:

```
<table>
<thead>
<tr>
<th>IDhi[n]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The common event is not implemented, or not counted.</td>
</tr>
<tr>
<td>0b1</td>
<td>The common event is implemented.</td>
</tr>
</tbody>
</table>
```

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

**Note**
Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

### Accessing the PMCEID3

**Note**

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

**PMCEID3 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE2C</td>
<td>PMCEID3</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
PMCFGR, Performance Monitors Configuration Register

The PMCFGR characteristics are:

**Purpose**

Contains PMU-specific configuration data.

**Configuration**

PMCFGR is in the Core power domain.

**Attributes**

PMCFGR is a 32-bit register.

**Field descriptions**

The PMCFGR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| NCG | RES0 | FZO | RES0 | UEN | WT | NA | EXC | CCD | CC | SIZE | N |

**NCG, bits [31:28]**

This feature is not supported, so this field is RAZ.

**Bits [27:22]**

Reserved, RES0.

**FZO, bit [21]**

Freeze-on-overflow supported. Defined values are:

<table>
<thead>
<tr>
<th>FZO</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Freeze-on-overflow mechanism not supported. PMCR_EL0.FZO is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Freeze-on-overflow mechanism supported. PMCR_EL0.FZO is RW.</td>
</tr>
</tbody>
</table>

Accessing this field has the following behavior:

- When FEAT_PMUv3p7 is implemented, access to this field is RAO/WI.
- When FEAT_PMUv3p7 is not implemented, access to this field is RAZ/WI.

**Bit [20]**

Reserved, RES0.

**UEN, bit [19]**

User-mode Enable Register supported. PMUSERENR_EL0 is not visible in the external debug interface, so this bit is RAZ.
WT, bit [18]

This feature is not supported, so this bit is RAZ.

NA, bit [17]

This feature is not supported, so this bit is RAZ.

EX, bit [16]

Export supported. Value is IMPLEMENTATION DEFINED.

<table>
<thead>
<tr>
<th>EX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PMCR_EL0.X is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>PMCR_EL0.X is read/write.</td>
</tr>
</tbody>
</table>

CCD, bit [15]

Cycle counter has prescale.

This is RES1 if AArch32 is supported at any Exception level, and RAZ otherwise.

<table>
<thead>
<tr>
<th>CCD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PMCR_EL0.D is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>PMCR_EL0.D is read/write.</td>
</tr>
</tbody>
</table>

CC, bit [14]

Dedicated cycle counter (counter 31) supported. This bit is RAO.

SIZE, bits [13:8]

Size of counters, minus one. This field defines the size of the largest counter implemented by the Performance Monitors Unit.

From Armv8, the largest counter is 64-bits, so the value of this field is 0b111111.

This field is used by software to determine the spacing of the counters in the memory-map. From Armv8, the counters are a doubleword-aligned addresses.

N, bits [7:0]

Number of counters implemented in addition to the cycle counter, PMCCNTR_EL0. The maximum number of event counters is 31.

<table>
<thead>
<tr>
<th>N</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x00</td>
<td>Only PMCCNTR_EL0 implemented.</td>
</tr>
<tr>
<td>0x01</td>
<td>PMCCNTR_EL0 plus one event counter implemented.</td>
</tr>
</tbody>
</table>

and so on up to 0b00011111, which indicates PMCCNTR_EL0 and 31 event counters implemented.

Accessing the PMCFGR

**Note**

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.
**PMCFGR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE00</td>
<td>PMCFGR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()` and `AllowExternalPMUAccess()` accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
**PMCID1SR, CONTEXTIDR_EL1 Sample Register**

The PMCID1SR characteristics are:

**Purpose**

Contains the sampled value of `CONTEXTIDR_EL1`, captured on reading `PMPCSR[31:0]`.

**Configuration**

PMCID1SR is in the Core power domain.

This register is present only when FEAT_PCSRv8p2 is implemented. Otherwise, direct accesses to PMCID1SR are RES0.

---

**Note**

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of `EDDEVID.PCSample`.

---

**Attributes**

PMCID1SR is a 32-bit register.

**Field descriptions**

The PMCID1SR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

`CONTEXTIDR_EL1`, bits [31:0]

Context ID. The value of CONTEXTIDR that is associated with the most recent `PMPCSR` sample. When the most recent `PMPCSR` sample was generated:

- If EL1 is using AArch64, then the Context ID is sampled from `CONTEXTIDR_EL1`.
- If EL1 is using AArch32, then the Context ID is sampled from `CONTEXTIDR`.
- If EL3 is implemented and is using AArch32, then `CONTEXTIDR` is a banked register and PMCID1SR samples the current banked copy of `CONTEXTIDR` for the Security state that is associated with the most recent `PMPCSR` sample.

Because the value written to PMCID1SR is an indirect read of CONTEXTIDR, it is constrained unpredictable whether PMCID1SR is set to the original or new value if `PMPCSR` samples:

- An instruction that writes to CONTEXTIDR.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMCID1SR**

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.
PMCID1SR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x208</td>
<td>PMCID1SR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x228</td>
<td>PMCID1SR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
The PMCID2SR characteristics are:

**Purpose**

Contains the sampled value of CONTEXTIDR_EL2, captured on reading PMPCSR[31:0].

**Configuration**

PMCID2SR is in the Core power domain.

This register is present only when FEAT_PCSRv8p2 is implemented and EL2 is implemented. Otherwise, direct accesses to PMCID2SR are RES0.

---

**Note**

If FEAT_PCSRv8p2 is not implemented, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of EDDEVID.PCSample.

---

**Attributes**

PMCID2SR is a 32-bit register.

**Field descriptions**

The PMCID2SR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

CONTEXTIDR_EL2, bits [31:0]

Context ID. The value of CONTEXTIDR_EL2 that is associated with the most recent PMPCSR sample. When the most recent PMPCSR sample was generated:

- If EL2 is using AArch64, then this field is set to the Context ID sampled from CONTEXTIDR_EL2.
- If EL2 is using AArch32, then this field is set to an UNKNOWN value.

Because the value written to PMCID2SR is an indirect read of CONTEXTIDR_EL2, it is CONSTRAINED UNPREDICTABLE whether PMCID2SR is set to the original or new value if PMPCSR samples:

- An instruction that writes to CONTEXTIDR_EL2.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMCID2SR**

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.
PMCID2SR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x22C</td>
<td>PMCID2SR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
PMCIDR0, Performance Monitors Component Identification Register 0

The PMCIDR0 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

For more information, see 'About the Component Identification scheme'.

**Configuration**

Implementation of this register is **OPTIONAL**.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMCIDR0 is a 32-bit register.

**Field descriptions**

The PMCIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>29</td>
<td>PRMBL_0</td>

<td>PRMBL_0, bits [7:0]</td>
</tr>
<tr>
<td>27</td>
<td>Preamble</td>
</tr>
<tr>
<td>26</td>
<td>Reads as 0x0D</td>
</tr>
</tbody>
</table>

**Accessing the PMCIDR0**

**PMCIDR0 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFF0</td>
<td>PMCIDR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
The PMCIDR1 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

For more information, see 'About the Component Identification scheme'.

**Configuration**

Implementation of this register is **OPTIONAL**.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMCIDR1 is a 32-bit register.

**Field descriptions**

The PMCIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>

**Bits [31:8]**

Reserved, RES0.

**CLASS, bits [7:4]**

Component class.

<table>
<thead>
<tr>
<th>CLASS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1001</td>
<td>CoreSight component.</td>
</tr>
</tbody>
</table>

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

**PRMBL_1, bits [3:0]**

Preamble. RAZ.

Reads as 0b0000.
Accessing the PMCIDR1

PMCIDR1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFF4</td>
<td>PMCIDR1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
The PMCIDR2 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

For more information, see 'About the Component Identification scheme'.

**Configuration**

Implementation of this register is **OPTIONAL**.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMCIDR2 is a 32-bit register.

**Field descriptions**

The PMCIDR2 bit assignments are:

<table>
<thead>

</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_2, bits [7:0]**

Preamble.

Reads as 0x05.

**Accessing the PMCIDR2**

PMCIDR2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFF8</td>
<td>PMCIDR2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
PMCIDR3, Performance Monitors Component Identification Register 3

The PMCIDR3 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

For more information, see 'About the Component Identification scheme'.

**Configuration**

Implementation of this register is **OPTIONAL**.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMCIDR3 is a 32-bit register.

**Field descriptions**

The PMCIDR3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td></td>
</tr>
<tr>
<td>29</td>
<td>PRMBL_3</td>
<td></td>
</tr>
</tbody>
</table>

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble.

Reads as 0xB1.

**Accessing the PMCIDR3**

PMCIDR3 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFFC</td>
<td>PMCIDR3</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
PMCNTENCLR_EL0, Performance Monitors Count Enable Clear register

The PMCNTENCLR_EL0 characteristics are:

Purpose

Disables the Cycle Count Register, PMCCNTR_EL0, and any implemented event counters PMEVCNTR<n>. Reading this register shows which counters are enabled.

Configuration

External register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMCNTENCLR_EL0[31:0].

External register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCNTENCLR[31:0].

PMCNTENCLR_EL0 is in the Core power domain.

Attributes

PMCNTENCLR_EL0 is a 32-bit register.

Field descriptions

The PMCNTENCLR_EL0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

C, bit [31]

PMCCNTR_EL0 disable bit. Disables the cycle counter register. Possible values are:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter is enabled. When written, disables the cycle counter.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter disable bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that PMEVCNTR&lt;n&gt;_EL0 is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that PMEVCNTR&lt;n&gt;_EL0 is enabled. When written, disables PMEVCNTR&lt;n&gt;_EL0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing the PMCNTENCLR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCNTENCLR_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xC20</td>
<td>PMCNTENCLR_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.
PMCNTENSET_EL0, Performance Monitors Count Enable Set register

The PMCNTENSET_EL0 characteristics are:

**Purpose**

Enables the Cycle Count Register, PMCCNTR_EL0, and any implemented event counters PMEVCNTR<n>. Reading this register shows which counters are enabled.

**Configuration**

External register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMCNTENSET_EL0[31:0].

External register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCNTENSET[31:0].

PMCNTENSET_EL0 is in the Core power domain.

**Attributes**

PMCNTENSET_EL0 is a 32-bit register.

**Field descriptions**

The PMCNTENSET_EL0 bit assignments are:

```
<table>
<thead>
<tr>
<th>C</th>
<th>PMCCNTR_EL0 enable bit. Enables the cycle counter register. Possible values are:</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter is enabled. When written, enables the cycle counter.</td>
</tr>
</tbody>
</table>
```

On a Warm reset, this field resets to an architecturally UNKNOWN value.

```
P<n>, bit [n], for n = 30 to 0
```

Event counter enable bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

```
P<n>                      Meaning
0b0                       When read, means that PMEVCNTR<n>_EL0 is disabled. When written, has no effect.
0b1                       When read, means that PMEVCNTR<n>_EL0 event counter is enabled. When written, enables PMEVCNTR<n>_EL0.
```

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing the PMCNTENSEL_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCNTENSEL_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xC00</td>
<td>PMCNTENSEL_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

**Purpose**

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

**Configuration**

External register PMCR_EL0 bits [7:0] are architecturally mapped to AArch32 System register PMCR[7:0].

External register PMCR_EL0 bits [7:0] are architecturally mapped to AArch64 System register PMCR_EL0[7:0].

PMCR_EL0 is in the Core power domain.

This register is only partially mapped to the internal PMCR System register. An external agent must use other means to discover the information held in PMCR[31:11], such as accessing PMCFGR and the ID registers.

**Attributes**

PMCR_EL0 is a 32-bit register.

**Field descriptions**

The PMCR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RAZ/WI</td>
</tr>
<tr>
<td>30</td>
<td>RES0</td>
</tr>
<tr>
<td>29</td>
<td>FZO</td>
</tr>
<tr>
<td>28</td>
<td>RES0</td>
</tr>
<tr>
<td>27</td>
<td>LP</td>
</tr>
<tr>
<td>26</td>
<td>LC</td>
</tr>
<tr>
<td>25</td>
<td>DP</td>
</tr>
<tr>
<td>24</td>
<td>X</td>
</tr>
<tr>
<td>23</td>
<td>D</td>
</tr>
<tr>
<td>22</td>
<td>C</td>
</tr>
<tr>
<td>21</td>
<td>P</td>
</tr>
<tr>
<td>20</td>
<td>E</td>
</tr>
</tbody>
</table>

Bits [31:11]

Reserved, RAZ/WI.

Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.

Bit [10]

Reserved, RES0.

**FZO, bit [9]**

When FEAT_PMUv3p7 is implemented:

Freeze-on-overflow. Stop event counters on overflow.

<table>
<thead>
<tr>
<th>FZO</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not freeze on overflow.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counters do not count when PMOVSVCLR_EL0[(N-1):0] is nonzero, where N is the value of MDCR_EL2.HPMN if EL2 is implemented, and PMCR_EL0.N otherwise.</td>
</tr>
</tbody>
</table>

If EL2 is implemented, then:

- This bit affects the operation of event counters in the range [0 .. (MDCR_EL2.HPMN-1)].
- If MDCR_EL2.HPMN is less than PMCR_EL0.N:
This bit does not affect the operation of event counters in the range [MDCR_EL2.HPMN .. (PMCR_EL0.N-1)].

The operation of this bit ignores the values of PMOVCLR_EL0[(PMCR_EL0.N-1):MDCR_EL2.HPMN].

- This applies even when EL2 is disabled in the current Security state.

This bit does not affect the operation of PMCCNTR_EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bit [8]**

Reserved, RES0.

**LP, bit [7]**

*When FEAT_PMUv3p5 is implemented:*

Long event counter enable. Determines when unsigned overflow is recorded by a counter overflow bit.

<table>
<thead>
<tr>
<th>LP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counter overflow on increment that causes unsigned overflow of PMEVCNTR&lt;n&gt;_EL0[31:0].</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counter overflow on increment that causes unsigned overflow of PMEVCNTR&lt;n&gt;_EL0[63:0].</td>
</tr>
</tbody>
</table>

If EL2 is implemented and MDCR_EL2.HPMN is less than PMCR_EL0.N, this bit does not affect the operation of event counters in the range [MDCR_EL2.HPMN:(PMCR_EL0.N-1)].

If EL2 is implemented and HDCR.HPMN is less than PMCR_EL0.N, this bit does not affect the operation of event counters in the range [HDCR.HPMN:(PMCR_EL0.N-1)].

**Note**

The effect of MDCR_EL2.HPMN or HDCR.HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state. For more information, see the description of MDCR_EL2.HPMN or HDCR.HPMN.

If the highest implemented Exception level is using AArch32, it is IMPLEMENTATION DEFINED whether this bit is RW or RAZ/WI.

**Otherwise:**

Reserved, RES0.

**LC, bit [6]**

*When AArch32 is supported at any Exception level:*

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

<table>
<thead>
<tr>
<th>LC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0[31:0].</td>
</tr>
<tr>
<td>0b1</td>
<td>Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0[63:0].</td>
</tr>
</tbody>
</table>
Arm deprecates use of `PMCR_EL0.LC = 0`.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES1**.

**DP, bit [5]**

When EL3 is implemented or (FEAT_PMUv3p1 is implemented and EL2 is implemented):

Disable cycle counter when event counting is prohibited. The possible values of this bit are:

<table>
<thead>
<tr>
<th>DP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counting by <code>PMCCNTR_EL0</code> is not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>When event counting for counters in the range [0..(MDCR_EL2.HPMN-1)] is prohibited, cycle counting by <code>PMCCNTR_EL0</code> is disabled.</td>
</tr>
</tbody>
</table>

For more information, see 'Prohibiting event counting'.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally **UNKNOWN** if the reset is into an Exception level that is using AArch64.
- 0 if the reset is into an Exception level that is using AArch32.

**Otherwise:**

Reserved, **RES0**.

**X, bit [4]**

When the implementation includes a PMU event export bus:

Enable export of events in an **IMPLEMENTATION DEFINED** PMU event export bus.

<table>
<thead>
<tr>
<th>X</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not export events.</td>
</tr>
<tr>
<td>0b1</td>
<td>Export events where not prohibited.</td>
</tr>
</tbody>
</table>

This field enables the exporting of events over an **IMPLEMENTATION DEFINED** PMU event export bus to another device, for example to an **OPTIONAL** PE trace unit.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally **UNKNOWN** if the reset is into an Exception level that is using AArch64.
- 0 if the reset is into an Exception level that is using AArch32.

**Otherwise:**

Reserved, RAZ/WI.

**D, bit [3]**

When AArch32 is supported at any Exception level:

Clock divider.
### D

<table>
<thead>
<tr>
<th>Meaning</th>
<th>0b0</th>
<th>When enabled, <code>PMCCNTR_EL0</code> counts every clock cycle.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0b1</td>
<td>When enabled, <code>PMCCNTR_EL0</code> counts once every 64 clock cycles.</td>
</tr>
</tbody>
</table>

If `PMCR_EL0.LC` == 1, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of `PMCR_EL0.D = 1`.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally `UNKNOWN` if the reset is into an Exception level that is using AArch64.
- 0 if the reset is into an Exception level that is using AArch32.

**Otherwise:**

Reserved, `RES0`.

### C, bit [2]

Cycle counter reset. The effects of writing to this bit are:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reset <code>PMCCNTR_EL0</code> to zero.</td>
</tr>
</tbody>
</table>

**Note**

Resetting `PMCCNTR_EL0` does not change the cycle counter overflow bit.

Access to this field is `WO/RAZ`.

### P, bit [1]

Event counter reset. The effects of writing to this bit are:

<table>
<thead>
<tr>
<th>P</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reset all event counters, not including <code>PMCCNTR_EL0</code>, to zero.</td>
</tr>
</tbody>
</table>

**Note**

Resetting the event counters does not change the event counter overflow bits.

If `FEAT_PMUv3p5` is implemented, the value of `MDCR_EL2.HLP`, or `PMCR_EL0.LP` is ignored and bits [63:0] of all event counters are reset.

Access to this field is `WO/RAZ`.

### E, bit [0]

Enable.

<table>
<thead>
<tr>
<th>E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All event counters in the range [0..(PMN-1)] and <code>PMCCNTR_EL0</code> are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>All event counters in the range [0..(PMN-1)] and <code>PMCCNTR_EL0</code> are enabled by <code>PMCNTENSET_EL0</code>.</td>
</tr>
</tbody>
</table>

If EL2 is implemented then:

- If EL2 is using AArch32, PMN is `HDCR.HPMN`.
- If EL2 is using AArch64, PMN is `MDCR_EL2.HPMN`.
- If PMN is less than `PMCR_EL0.N`, this bit does not affect the operation of event counters in the range `[PMN..(PMCR_EL0.N-1)]`. 

Page 4053
If EL2 is not implemented, PMN is PMCR_EL0.N.

---

**Note**

The effect of the following fields on the operation of this bit applies if EL2 is implemented regardless of whether EL2 is enabled in the current Security state:

- **HDCR.**HPMN. See the description of **HDCR.**HPMN for more information.
- **MDCR_EL2.**HPMN. See the description of **MDCR_EL2.**HPMN for more information.

---

On a Warm reset, this field resets to 0.

## Accessing the PMCR_EL0

---

**Note**

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

---

**PMCR_EL0 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE04</td>
<td>PMCR_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
PMDEVAFF0, Performance Monitors Device Affinity register 0

The PMDEVAFF0 characteristics are:

**Purpose**

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

**Configuration**

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required if the external interface to the PMU is implemented.

**Attributes**

PMDEVAFF0 is a 32-bit register.

**Field descriptions**

The PMDEVAFF0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**MPIDR_EL1lo, bits [31:0]**

MPIDR_EL1 low half. Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented Exception level.

**Accessing the PMDEVAFF0**

PMDEVAFF0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFA8</td>
<td>PMDEVAFF0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
PMDEVAFF1, Performance Monitors Device Affinity register 1

The PMDEVAFF1 characteristics are:

**Purpose**

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

**Configuration**

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required if the external interface to the PMU is implemented.

**Attributes**

PMDEVAFF1 is a 32-bit register.

**Field descriptions**

The PMDEVAFF1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | MPIDR_EL1hi |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**MPIDR_EL1hi, bits [31:0]**

MPIDR_EL1 high half. Read-only copy of the high half of MPIDR_EL1, as seen from the highest implemented Exception level.

**Accessing the PMDEVAFF1**

PMDEVAFF1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFAC</td>
<td>PMDEVAFF1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
PMDEVARCH, Performance Monitors Device Architecture register

The PMDEVARCH characteristics are:

**Purpose**

Identifies the programmers' model architecture of the Performance Monitor component.

**Configuration**

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

PMDEVARCH is a 32-bit register.

**Field descriptions**

The PMDEVARCH bit assignments are:

```
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ARCHITECT | PRESENT | REVISION | ARCHID |
```

**ARCHITECT, bits [31:21]**

Defines the architecture of the component. For Performance Monitors, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

**PRESENT, bit [20]**

When set to 1, indicates that the DEVARCH is present.

This field is 1 in Armv8.

**REVISION, bits [19:16]**

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

For Performance Monitors, the revision defined by Armv8 is 0x0.

All other values are reserved.

**ARCHID, bits [15:0]**

Defines this part to be an Armv8 debug component. For architectures defined by Arm this is further subdivided.

For Performance Monitors:

- Bits [15:12] are the architecture version, 0x2.
- Bits [11:0] are the architecture part number, 0xA16.

This corresponds to Performance Monitors architecture version PMUv3.
Note

The PMUv3 memory-mapped programmers' model can be used by devices other than Armv8 processors. Software must determine whether the PMU is attached to an Armv8 processor by using the PMDEVAFF0 and PMDEVAFF1 registers to discover the affinity of the PMU to any Armv8 processors.

Accessing the PMDEVARCH

PMDEVARCH can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFB0</td>
<td>PMDEVARCH</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
PMDEVID, Performance Monitors Device ID register

The PMDEVID characteristics are:

**Purpose**

Provides information about features of the Performance Monitors implementation.

**Configuration**

If FEAT_DoPD is implemented, this register is in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required from Armv8.2 and in any implementation that includes FEAT_PCSRv8p2. Otherwise, its location is RES0.

**Note**

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of EDDEVID.PCSample.

**Attributes**

PMDEVID is a 32-bit register.

**Field descriptions**

The PMDEVID bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>

</table>

**Bits [31:4]**

Reserved, RES0.

**PCSample, bits [3:0]**

Indicates the level of PC Sample-based Profiling support using Performance Monitors registers.

<table>
<thead>
<tr>
<th>PCSample</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>PC Sample-based Profiling Extension is not implemented in the Performance Monitors register space.</td>
</tr>
<tr>
<td>0b0001</td>
<td>PC Sample-based Profiling Extension is implemented in the Performance Monitors register space.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_PCSRv8p2 implements the functionality identified by the value 0b0001.
Accessing the PMDEVID

PMDEVID can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFC8</td>
<td>PMDEVID</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
PMDEVTYPE, Performance Monitors Device Type register

The PMDEVTYPE characteristics are:

**Purpose**

Indicates to a debugger that this component is part of a PE's performance monitor interface.

**Configuration**

Implementation of this register is **OPTIONAL**.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

PMDEVTYPE is a 32-bit register.

**Field descriptions**

The PMDEVTYPE bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:8</td>
<td>RES0</td>
<td>Reserved</td>
</tr>
<tr>
<td>7:4</td>
<td>SUB</td>
<td>Subtype. Must read as 0x1 to indicate this is a component within a PE.</td>
</tr>
<tr>
<td>3:0</td>
<td>MAJOR</td>
<td>Major type. Must read as 0x6 to indicate this is a performance monitor component.</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SUB, bits [7:4]**

Subtype. Must read as 0x1 to indicate this is a component within a PE.

**MAJOR, bits [3:0]**

Major type. Must read as 0x6 to indicate this is a performance monitor component.

**Accessing the PMDEVTYPE**

PMDEVTYPE can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFCC</td>
<td>PMDEVTYPE</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
PMEVCNTR\text{n}_EL0, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR\text{n}_EL0 characteristics are:

**Purpose**

Holds event counter \( n \), which counts events, where \( n \) is 0 to 30.

**Configuration**

External register PMEVCNTR\text{n}_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMEVCNTR\text{n}_EL0[31:0].

External register PMEVCNTR\text{n}_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMEVCNTR\text{n}[31:0].

PMEVCNTR\text{n}_EL0 is in the Core power domain.

**Attributes**

PMEVCNTR\text{n}_EL0 is a:

- 64-bit register when FEAT_PMUv3p5 is implemented
- 32-bit register otherwise

**Field descriptions**

The PMEVCNTR\text{n}_EL0 bit assignments are:

**When FEAT_PMUv3p5 is implemented:**

<table>
<thead>
<tr>
<th>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</th>
</tr>
</thead>
<tbody>
<tr>
<td>Event counter ( n )</td>
</tr>
<tr>
<td>Event counter ( n )</td>
</tr>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
</tr>
</tbody>
</table>

**Bits [63:0]**

Event counter \( n \). Value of event counter \( n \), where \( n \) is the number of this register and is a number from 0 to 30.

If the highest implemented Exception level is using AArch32, the optional external interface to the performance monitors is implemented, and the PMCR LP and HDCR HLP bits are RAZ/WI, then locations in the external interface to the performance monitors that map to PMEVCNTR\text{n}_EL0[63:32] return UNKNOWN values on reads.

If the implementation does not support AArch64 at any Exception level, bits [63:32] of the event counters are not required to be implemented.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

<table>
<thead>
<tr>
<th>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Event counter ( n )</td>
</tr>
</tbody>
</table>
Bits [31:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMEVCNTR<n>_EL0

External accesses to the performance monitors ignore PMUSERENR_EL0 and, if implemented, MDCR_EL2 {TPM, TPMCR, HPMN} and MDCR_EL3.TPM. This means that all counters are accessible regardless of the current Exception level or privilege of the access.

If FEAT_PMUv3p5 is not implemented, when IsCorePowered(), DoubleLockStatus(), OSLockStatus() or !AllowExternalPMUAccess(), 32-bit accesses to 0x004+8×n have a CONSTRAINED UNPREDICTABLE behavior.

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMEVCNTR<n>_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x000 + (8 * n)</td>
<td>PMEVCNTR&lt;n&gt;_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
PMEVTYPER\textsubscript{n} \_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER\textsubscript{n} \_EL0 characteristics are:

**Purpose**

Configures event counter \( n \), where \( n \) is 0 to 30.

**Configuration**

External register PMEVTYPER\textsubscript{n} \_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMEVTYPER\textsubscript{n} \_EL0[31:0].

External register PMEVTYPER\textsubscript{n} \_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMEVTYPER\textsubscript{n}[31:0].

PMEVTYPER\textsubscript{n} \_EL0 is in the Core power domain.

If event counter \( n \) is not implemented:

- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalPMUAccess(), accesses are RES0.
- Otherwise, it is CONSTRAINED UNPREDICTABLE whether accesses to this register are RES0 or generate an error response.

**Attributes**

PMEVTYPER\textsubscript{n} \_EL0 is a 32-bit register.

**Field descriptions**

The PMEVTYPER\textsubscript{n} \_EL0 bit assignments are:

\[
\begin{array}{ccccccccccccccccccccccc}
\hline
\end{array}
\]

**P, bit [31]**

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER\textsubscript{n} \_EL0.NSK bit.

<table>
<thead>
<tr>
<th>P</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count events in EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count events in EL1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**U, bit [30]**

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER\textsubscript{n} \_EL0.NSU bit.

<table>
<thead>
<tr>
<th>U</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count events in EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count events in EL0.</td>
</tr>
</tbody>
</table>
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**NSK, bit [29]**

*When EL3 is implemented:*

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in Non-secure EL1 are counted. Otherwise, events in Non-secure EL1 are not counted.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**NSU, bit [28]**

*When EL3 is implemented:*

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.U bit, events in Non-secure EL0 are counted. Otherwise, events in Non-secure EL0 are not counted.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**NSH, bit [27]**

*When EL2 is implemented:*

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If FEAT_SEL2 and EL3 are implemented, counting in Secure EL2 is further controlled by the PMEVTYPER<n>_EL0.SH bit.

<table>
<thead>
<tr>
<th>NSH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not count events in EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Count events in EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**M, bit [26]**

*When EL3 is implemented:*

Secure EL3 filtering bit.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in Secure EL3 are counted. Otherwise, events in Secure EL3 are not counted.
Most applications can ignore this field and set its value to 0b0.

**Note**

This field is not visible in the AArch32 PMEVTYPEPER<n> System register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**MT, bit [25]**

When (FEAT_MTPMU is implemented and enabled) or an IMPLEMENTATION DEFINED multi-threaded PMU Extension is implemented:

Multithreading.

<table>
<thead>
<tr>
<th>MT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count events only on controlling PE.</td>
</tr>
<tr>
<td>0b1</td>
<td>Count events from any PE with the same affinity at level 1 and above as this PE.</td>
</tr>
</tbody>
</table>

**Note**

- When the lowest level of affinity consists of logical PEs that are implemented using a multi-threading type approach, an implementation is described as multi-threaded. That is, the performance of PEs at the lowest affinity level is highly interdependent.
- Events from a different thread of a multithreaded implementation are not Attributable to the thread counting the event.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SH, bit [24]**

When FEAT_SEL2 is implemented and EL3 is implemented:

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMEVTYPEPER<n>_EL0.NSH bit, events in Secure EL2 are counted.

Otherwise, events in Secure EL2 are not counted.

**Note**

This field is not visible in the AArch32 PMEVTYPEPER<n> System register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.
**Bits [23:16]**

Reserved, RES0.

**evtCount[15:10], bits [15:10]**

*When FEAT_PMUV3p1 is implemented:*

Extension to evtCount[9:0]. See evtCount[9:0] for more details.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

**evtCount[9:0], bits [9:0]**

Event to count. The event number of the event that is counted by event counter PMEVCNTR<n>_EL0.

Software must program this field with an event that is supported by the PE being programmed.

The ranges of event numbers allocated to each type of event are shown in ‘Allocation of the PMU event number space’.

If evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range 0x0000 to 0x003F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- If 16-bit evtCount is implemented, for the range 0x4000 to 0x403F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED events, it is UNPREDICTABLE what event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

**Note**

UNPREDICTABLE means the event must not expose privileged information.

Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include an event from a set of common IMPLEMENTATION DEFINED events, then no event is counted and the value read back on evtCount is the value written.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMEVTYPER<n>_EL0**

**Note**

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

**PMEVTYPER<n>_EL0 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x400 + (4 * n)</td>
<td>PMEVTYPER&lt;n&gt;_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
• When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and
  !SoftwareLockStatus() accesses to this register are RW.
• Otherwise accesses to this register generate an error response.
PMINTENCLR_EL1, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR_EL1 characteristics are:

**Purpose**

Disables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR_EL0, and the event counters PMEVCNTR<n>_EL0. Reading the register shows which overflow interrupt requests are enabled.

**Configuration**

External register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch64 System register PMINTENCLR_EL1[31:0].

External register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMINTENCLR[31:0].

PMINTENCLR_EL1 is in the Core power domain.

**Attributes**

PMINTENCLR_EL1 is a 32-bit register.

**Field descriptions**

The PMINTENCLR_EL1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

**C, bit [31]**

PMCCNTR_EL0 overflow interrupt request disable bit. Possible values are:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P<n>, bit [n], for n = 30 to 0**

Event counter overflow interrupt request disable bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that the PMEVCNTR&lt;n&gt;_EL0 event counter interrupt request is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that the PMEVCNTR&lt;n&gt;_EL0 event counter interrupt request is enabled. When written, disables the PMEVCNTR&lt;n&gt;_EL0 interrupt request.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing the PMINTENCLR_EL1

Note
SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMINTENCLR_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xC60</td>
<td>PMINTENCLR_EL1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
PMINTENSET_EL1, Performance Monitors Interrupt Enable Set register

The PMINTENSET_EL1 characteristics are:

**Purpose**

Enables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR_EL0, and the event counters PMEVCNTR<n>_EL0. Reading the register shows which overflow interrupt requests are enabled.

**Configuration**

External register PMINTENSET_EL1 bits [31:0] are architecturally mapped to AArch64 System register PMINTENSET_EL1[31:0].

External register PMINTENSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMINTENSET[31:0].

PMINTENSET_EL1 is in the Core power domain.

**Attributes**

PMINTENSET_EL1 is a 32-bit register.

**Field descriptions**

The PMINTENSET_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Bit Assignment</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>[31]</td>
<td>PMCCNTR_EL0 overflow interrupt request enable bit. Possible values are:</td>
</tr>
<tr>
<td>P&lt;n&gt;</td>
<td>[n] (n = 30 to 0)</td>
<td>PMEVCNTR&lt;n&gt;_EL0 event counter overflow interrupt request enable bit. Possible values are:</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**PMCCNTR_EL0** overflow interrupt request enable bit. Possible values are:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**PMEVCNTR<n>_EL0** event counter overflow interrupt request enable bit. Possible values are:

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that the PMEVCNTR&lt;n&gt;_EL0 event counter interrupt request is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that the PMEVCNTR&lt;n&gt;_EL0 event counter interrupt request is enabled. When written, enables the PMEVCNTR&lt;n&gt;_EL0 interrupt request.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing the PMINTENSET_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMINTENSET_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xC40</td>
<td>PMINTENSET_EL1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
PMITCTRL, Performance Monitors Integration mode Control register

The PMITCTRL characteristics are:

**Purpose**

Enables the Performance Monitors to switch from default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

**Configuration**

It is IMPLEMENTATION DEFINED whether PMITCTRL is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

**Attributes**

PMITCTRL is a 32-bit register.

**Field descriptions**

The PMITCTRL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>IME</td>

<tr>
<td>3</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:1]**

Reserved, RES0.

**IME, bit [0]**

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

<table>
<thead>
<tr>
<th>IME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Integration mode enabled.</td>
</tr>
</tbody>
</table>

The following resets apply:

- If the register is implemented in the Core power domain:
  - On a Cold reset, this field resets to 0.
  - On an External debug reset, the value of this field is unchanged.
  - On a Warm reset, the value of this field is unchanged.

- If the register is implemented in the External debug power domain:
  - On a Cold reset, the value of this field is unchanged.
  - On an External debug reset, this field resets to 0.
  - On a Warm reset, the value of this field is unchanged.
Accessing the PMITCTRL

PMITCTRL can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xF00</td>
<td>PMITCTRL</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register are **IMPDEF**.
PMLAR, Performance Monitors Lock Access Register

The PMLAR characteristics are:

**Purpose**

Allows or disallows access to the Performance Monitors registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

**Configuration**

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Software uses PMLAR to set or clear the lock, and PMLSR to check the current status of the lock.

**Attributes**

PMLAR is a 32-bit register.

**Field descriptions**

The PMLAR bit assignments are:

**When Software Lock is implemented:**

<table>
<thead>
<tr>

</tbody>
</table>

**KEY**

**KEY, bits [31:0]**

Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory-mapped interface.

**Otherwise:**

<table>

</tbody>
</table>

**RES0**

Otherwise

**Bits [31:0]**

Reserved, RES0.
Accessing the PMLAR

PMLAR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFB0</td>
<td>PMLAR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **WO**.
- Otherwise accesses to this register generate an error response.
PMLSR, Performance Monitors Lock Status Register

The PMLSR characteristics are:

Purpose

Indicates the current status of the software lock for Performance Monitors registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Software uses PMLAR to set or clear the lock, and PMLSR to check the current status of the lock.

Attributes

PMLSR is a 32-bit register.

Field descriptions

The PMLSR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>

<td>nTT</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required. RAZ.

SLK, bit [1]

When Software Lock is implemented and FEAT_DoPD is not implemented:

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when Software Lock is implemented, possible values of this field are:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Lock clear. Writes are permitted to this component's registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>Lock set. Writes to this component's registers are ignored, and reads have no side effects.</td>
</tr>
</tbody>
</table>

On an External debug reset, this field resets to 1.
Otherwise:

Reserved, RAZ.

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

<table>
<thead>
<tr>
<th>SLI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Software Lock not implemented or not memory-mapped access.</td>
</tr>
<tr>
<td>0b1</td>
<td>Software Lock implemented and memory-mapped access.</td>
</tr>
</tbody>
</table>

Accessing the PMLSR

PMLSR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFB4</td>
<td>PMLSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
PMMIR, Performance Monitors Machine Identification Register

The PMMIR characteristics are:

**Purpose**

Describes Performance Monitors parameters specific to the implementation.

**Configuration**

PMMIR is in the Core power domain.

This register is present only when FEAT_PMUv3p4 is implemented. Otherwise, direct accesses to PMMIR are RES0.

**Attributes**

PMMIR is a 32-bit register.

**Field descriptions**

The PMMIR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>SLOTS</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SLOTS, bits [7:0]**

Operation width. The largest value by which the STALL SLOT event might increment by in a single cycle. If the STALL SLOT event is implemented, this field must not be zero.

**Accessing the PMMIR**

If the Core power domain is off or in a low-power state, access on this interface returns an Error.

**PMMIR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE40</td>
<td>PMMIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsCorePowered(), or DoubleLockStatus(), or OSLockStatus() or !AllowExternalPMUAccess() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
PMOVSCLR_EL0, Performance Monitors Overflow Flag Status Clear register

The PMOVSCLR_EL0 characteristics are:

**Purpose**

Contains the state of the overflow bit for the Cycle Count Register, PMCCNTR_EL0, and each of the implemented event counters PMEVCNTR<n>. Writing to this register clears these bits.

**Configuration**

External register PMOVSCLR_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMOVSCLR_EL0[31:0].

External register PMOVSCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMOVR[31:0].

PMOVSCLR_EL0 is in the Core power domain.

**Attributes**

PMOVSCLR_EL0 is a 32-bit register.

**Field descriptions**

The PMOVSCLR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
</table>

**C, bit [31]**

Cycle counter overflow clear bit.

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter has overflowed since this bit was last cleared. When written, clears the cycle counter overflow bit to 0.</td>
</tr>
</tbody>
</table>

PMCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P<n>, bit [n], for n = 30 to 0**

Event counter overflow clear bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.
### PMOVSCLR_EL0, Performance Monitors Overflow Flag Status Clear register

<table>
<thead>
<tr>
<th>$P&lt;n&gt;$</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that PMEVCNTR&lt;$n&gt;_EL0 has not overflowed since this bit was last cleared. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that PMEVCNTR&lt;$n&gt;_EL0 has overflowed since this bit was last cleared. When written, clears the PMEVCNTR&lt;$n&gt;_EL0 overflow bit to 0.</td>
</tr>
</tbody>
</table>

If FEAT_PMUV3p5 is implemented, MDCR_EL2.HLP and PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<$n>_EL0[31:0] or unsigned overflow of PMEVCNTR<$n>_EL0[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Accessing the PMOVSCLR_EL0

**Note**

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMOVSCLR_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xC80</td>
<td>PMOVSCLR_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.
PMOVSSET_EL0, Performance Monitors Overflow Flag Status Set register

The PMOVSSET_EL0 characteristics are:

**Purpose**

Sets the state of the overflow bit for the Cycle Count Register, PMCCNTR_EL0, and each of the implemented event counters PMEVCNTR<n>.

**Configuration**

External register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMOVSSET_EL0[31:0].

External register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMOVSSET[31:0].

PMOVSSET_EL0 is in the Core power domain.

**Attributes**

PMOVSSET_EL0 is a 32-bit register.

**Field descriptions**

The PMOVSSET_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>Cycle counter overflow set bit.</td>
</tr>
</tbody>
</table>

- **C, bit [31]**
  - 0b0: When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.
  - 0b1: When read, means the cycle counter has overflowed since this bit was last cleared. When written, sets the cycle counter overflow bit to 1.

PMCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P<n>, bit [n], for n = 30 to 0**

Event counter overflow set bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.
When read, means that $\text{PMEVCNTR}_{n, \text{EL0}}$ has not overflowed since this bit was last cleared. When written, has no effect.

When read, means that $\text{PMEVCNTR}_{n, \text{EL0}}$ has overflowed since this bit was last cleared. When written, sets the $\text{PMEVCNTR}_{n, \text{EL0}}$ overflow bit to 1.

If FEAT_PMUv3p5 is implemented, $\text{MDCR}_{\text{EL2}}$.HLP and $\text{PMCR}_{\text{EL0}}$.LP control whether an overflow is detected from unsigned overflow of $\text{PMEVCNTR}_{n, \text{EL0}}[31:0]$ or unsigned overflow of $\text{PMEVCNTR}_{n, \text{EL0}}[63:0]$.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the PMOVSSET_EL0

**Note**

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

### PMOVSSET_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xCC0</td>
<td>PMOVSSET_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
PMPCSR, Program Counter Sample Register

The PMPCSR characteristics are:

**Purpose**

Holds a sampled instruction address value.

**Configuration**

PMPCSR is in the Core power domain.

This register is present only when FEAT_PCSRv8p2 is implemented. Otherwise, direct accesses to PMPCSR are RES0.

**Note**

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of EDDEVID.PCSample.

Support for 64-bit atomic reads is IMPLEMENTATION DEFINED. If 64-bit atomic reads are implemented, a 64-bit read of PMPCSR has the same side-effect as a 32-bit read of PMCSR[31:0] followed by a 32-bit read of PMPCSR[63:32], returning the combined value. For example, if the PE is in Debug state then a 64-bit atomic read returns bits[31:0] == 0xFFFFFFFF and bits[63:32] UNKNOWN.

**Attributes**

PMPCSR is a 64-bit register.

**Field descriptions**

The PMPCSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>NS</th>
<th>EL</th>
<th>RES0</th>
<th>PCSample[55:32]</th>
<th>PCSample[31:0]</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>62</td>
<td>61</td>
<td>60</td>
<td>59</td>
<td>58</td>
</tr>
<tr>
<td>31</td>
<td>30</td>
<td>29</td>
<td>28</td>
<td>27</td>
<td>26</td>
</tr>
</tbody>
</table>

**NS, bit [63]**

Non-secure state sample. Indicates the Security state that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sample is from Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Sample is from Non-secure state.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**EL, bits [62:61]**

Exception level status sample. Indicates the Exception level that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.
On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [60:56]**

Reserved, RES0.

**PCSample[55:32], bits [55:32]**

Bits[55:32] of the sampled instruction address value. The translation regime that PMPCSR samples can be determined from PMPCSR.(NS,EL).

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**PCSample[31:0], bits [31:0]**

Bits[31:0] of the sampled instruction address value.

PMPCSR[31:0] reads as **0xFFFFFFFF** when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If an instruction has retired since the PE left Reset state, then the first read of PMPCSR[31:0] is permitted but not required to return **0xFFFFFFFF**.

PMPCSR[31:0] reads as an **UNKNOWN** value when any of the following are true:

- The PE is in Reset state.
- No instruction has retired since the PE left Reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No instruction has retired since the last read of PMPCSR[31:0].

For the cases where a read of PMPCSR[31:0] returns **0xFFFFFFFF** or an **UNKNOWN** value, the read has the side-effect of setting PMPCSR[63:32], **PMCID1SR**, **PMCID2SR**, and **PMVIDSR** to **UNKNOWN** values.

Otherwise, a read of PMPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to PMPCSR[63:32], **PMCID1SR**, **PMCID2SR**, and **PMVIDSR**. The translation regime that PMPCSR samples can be determined from PMPCSR.(NS,EL).

For a read of PMPCSR[31:0] from the memory-mapped interface, if PMLSR.SLK == 1, meaning the **OPTIONAL** Software Lock is locked, then the side-effect of the access does not occur and PMPCSR[63:32], **PMCID1SR**, **PMCID2SR**, and **PMVIDSR** are unchanged.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the PMPCSR**

**IMPLEMENTATION DEFINED** extensions to external debug might make the value of this register **UNKNOWN**, see 'Permitted behavior that might make the PC Sample-based profiling registers **UNKNOWN**'.

**PMPCSR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x200</td>
<td>PMPCSR</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
PMPCSR, Program Counter Sample Register

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x204</td>
<td>PMPCSR</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x220</td>
<td>PMPCSR</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x224</td>
<td>PMPCSR</td>
<td>63:32</td>
</tr>
</tbody>
</table>
The PMPIDR0 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

For more information, see 'About the Peripheral identification scheme'.

**Configuration**

Implementation of this register is **OPTIONAL**.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMPIDR0 is a 32-bit register.

**Field descriptions**

The PMPIDR0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Res0 | Part_0 |

**Bits [31:8]**

Reserved, RES0.

**Part_0, bits [7:0]**

Part number, least significant byte.

**Accessing the PMPIDR0**

PMPIDR0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFE0</td>
<td>PMPIDR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
The PMPIDR1 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

For more information, see 'About the Peripheral identification scheme'.

**Configuration**

Implementation of this register is **OPTIONAL**.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMPIDR1 is a 32-bit register.

**Field descriptions**

The PMPIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>

</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**DES_0, bits [7:4]**

Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is 0b1011.

**PART_1, bits [3:0]**

Part number, most significant nibble.

**Accessing the PMPIDR1**

**PMPIDR1 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFE4</td>
<td>PMPIDR1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
The PMPIDR2 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

For more information, see 'About the Peripheral identification scheme'.

**Configuration**

Implementation of this register is **OPTIONAL**.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMPIDR2 is a 32-bit register.

**Field descriptions**

The PMPIDR2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td>Reserved, unused</td>
</tr>
<tr>
<td>30</td>
<td>REVISION</td>
<td>Part major revision. Parts can also use this field to extend Part number to 16-bits.</td>
</tr>
<tr>
<td>29</td>
<td>JEDEC</td>
<td>RA0. Indicates a JEP106 identity code is used.</td>
</tr>
<tr>
<td>28</td>
<td>DES_1</td>
<td>Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is 0b011.</td>
</tr>
</tbody>
</table>

**Accessing the PMPIDR2**

PMPIDR2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFE8</td>
<td>PMPIDR2</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
The PMPIDR3 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

For more information, see 'About the Peripheral identification scheme'.

**Configuration**

Implementation of this register is **OPTIONAL**.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMPIDR3 is a 32-bit register.

**Field descriptions**

The PMPIDR3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>Reserved, reserved (RES0)</td>
</tr>
<tr>
<td>REVAND</td>
<td>Part minor revision. Parts using PMPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.</td>
</tr>
<tr>
<td>CMOD</td>
<td>Customer modified. Indicates someone other than the Designer has modified the component.</td>
</tr>
</tbody>
</table>

**Accessing the PMPIDR3**

PMPIDR3 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFEC</td>
<td>PMPIDR3</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
The PMPIDR4 characteristics are:

### Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Peripheral identification scheme'.

### Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

### Attributes

PMPIDR4 is a 32-bit register.

### Field descriptions

The PMPIDR4 bit assignments are:

<table>
<thead>
<tr>
<th>Bit assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-8</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>7-4</td>
<td>SIZE, bits [7:4]. Size of the component. RAZ. Log₂ of the number of 4KB pages from the start of the component to the end of the component ID registers.</td>
</tr>
<tr>
<td>3-0</td>
<td>DES_2, bits [3:0]. Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is 0b0100.</td>
</tr>
</tbody>
</table>

### Accessing the PMPIDR4

PMPIDR4 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFD0</td>
<td>PMPIDR4</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
PMSWINC_EL0, Performance Monitors Software Increment register

The PMSWINC_EL0 characteristics are:

**Purpose**

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see SW_INCR.

**Configuration**

External register PMSWINC_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMSWINC_EL0[31:0].

External register PMSWINC_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMSWINC[31:0].

PMSWINC_EL0 is in the Core power domain.

Implementation of this register is **OPTIONAL**.

If this register is implemented, use of it is deprecated.

If 1 is written to bit [n] from the external debug interface, it is **CONSTRAINED UNPREDICTABLE** whether or not a SW_INCR event is created for counter n. This is consistent with not implementing the register in the external debug interface.

**Attributes**

PMSWINC_EL0 is a 32-bit register.

**Field descriptions**

The PMSWINC_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
</table>

**Bit [31]**

Reserved, RES0.

**P<n>, bit [n], for n = 30 to 0**

Event counter software increment bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are WI.

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action. The write to this bit is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>It is <strong>CONSTRAINED UNPREDICTABLE</strong> whether a SW_INCR event is generated for event counter n.</td>
</tr>
</tbody>
</table>

**Accessing the PMSWINC_EL0**

**Note**
SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

**PMSWINC_EL0 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xCA0</td>
<td>PMSWINC_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **WI**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **WO**.
- Otherwise accesses to this register generate an error response.
PMVIDSR, VMID Sample Register

The PMVIDSR characteristics are:

**Purpose**

Contains the sampled VMID value that is captured on reading PMPCSR[31:0].

**Configuration**

PMVIDSR is in the Core power domain.

This register is present only when FEAT_PCSRv8p2 is implemented and EL2 is implemented. Otherwise, direct accesses to PMVIDSR are RES0.

---

**Note**

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of EDDEVID.PCSample.

---

**Attributes**

PMVIDSR is a 32-bit register.

**Field descriptions**

The PMVIDSR bit assignments are:

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0| VMID[15:8] | VMID |

**Bits [31:16]**

Reserved, RES0.

**VMID[15:8], bits [15:8]**

When FEAT_Vomid16 is implemented:

Extension to VMID[7:0]. See VMID[7:0] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**VMID, bits [7:0]**

VMID sample. The VMID associated with the most recent PMPCSR sample. When the most recent PMPCSR sample was generated:

- This field is set to an UNKNOWN value if any of the following apply:
  - EL2 is disabled in the current Security state.
  - The PE is executing at EL2.
EL2 is enabled in the current Security state, the PE is executing at EL0, EL2 is using AArch64, HCR_EL2.E2H == 1, and HCR_EL2.TGE == 1.

- Otherwise:
  - If EL2 is using AArch64 and either FEAT_VMID16 is not implemented or VTCR_EL2.VS is 1, this field is set to VTTBR_EL2.VMID.
  - If EL2 is using AArch64, FEAT_VMID16 is implemented, and VTCR_EL2.VS is 0, PMVIDSR.VMID[7:0] is set to VTTBR_EL2.VMID[7:0] and PMVIDSR.VMID[15:8] is RES0.
  - If EL2 is using AArch32, this field is set to VTTBR.VMID.

Because the value written to PMVIDR is an indirect read of the VMID value, it is CONSTRAINED UNPREDICTABLE whether PMVIDSR is set to the original or new value if PMPCSR samples:

- An instruction that writes to the VMID value.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## Accessing the PMVIDSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

**PMVIDSR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x20C</td>
<td>PMVIDSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
