The ID_ISAR2_EL1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch64 System register ID_ISAR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR2[31:0].

**Attributes**

ID_ISAR2_EL1 is a 64-bit register.

**Field descriptions**

The ID_ISAR2_EL1 bit assignments are:

**When AArch32 is supported at any Exception level:**

</table>

**Bits [63:32]**

Reserved, RES0.

**Reversal, bits [31:28]**

Indicates the implemented Reversal instructions. Defined values are:

<table>
<thead>
<tr>
<th>Reversal</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the REV, REV16, and REVSH instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the RBIT instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

**PSR_AR, bits [27:24]**

Indicates the implemented A and R profile instructions to manipulate the PSR. Defined values are:
PSR_AR | Meaning
---|---
0b0000 | None implemented.
0b0001 | Adds the MRS and MSR instructions, and the exception return forms of data-processing instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

The exception return forms of the data-processing instructions are:

- In the A32 instruction set, data-processing instructions with the PC as the destination and the S bit set. These instructions might be affected by the WithShifts attribute.
- In the T32 instruction set, the SUBS PC,LR,#N instruction.

**MultU, bits [23:20]**

Indicates the implemented advanced unsigned Multiply instructions. Defined values are:

<table>
<thead>
<tr>
<th>MultU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the UMULL and UMLAL instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the UMAAL instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

**MultS, bits [19:16]**

Indicates the implemented advanced signed Multiply instructions. Defined values are:

<table>
<thead>
<tr>
<th>MultS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SMULL and SMLAL instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the SMLABB, SMLABT, SMLALBB, SMLALBT, SMLALT, SMLATB, SMLATT, SMLAWB, SMLAWT, SMULBB, SMULBT, SMULTB, SMULTT, SMULWB, and SMULWT instructions. Also adds the Q bit in the PSRs.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0010, and adds the SMLAD, SMLADX, SMLALD, SMLALDX, SMLS, SMLSD, SMLSDX, SMLS, SMML, SMLAR, SMMLS, SMMLSR, SMMUL, SMMULR, SMUAD, SMUADX, SMUSD, and SMUSDX instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

**Mult, bits [15:12]**

Indicates the implemented additional Multiply instructions. Defined values are:

<table>
<thead>
<tr>
<th>Mult</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No additional instructions implemented. This means only MUL is implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the MLA instruction.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the MLS instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

**MultiAccessInt, bits [11:8]**

Indicates the support for interruptible multi-access instructions. Defined values are:
### MultiAccessInt

<table>
<thead>
<tr>
<th>MultiAccessInt</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No support. This means the LDM and STM instructions are not interruptible.</td>
</tr>
<tr>
<td>0b0001</td>
<td>LDM and STM instructions are restartable.</td>
</tr>
<tr>
<td>0b0010</td>
<td>LDM and STM instructions are continuable.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

### MemHint, bits [7:4]

Indicates the implemented Memory Hint instructions. Defined values are:

<table>
<thead>
<tr>
<th>MemHint</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the PLD instruction.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Adds the PLD instruction. (0b0001 and 0b0010 have identical effects.)</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0001 (or 0b0010), and adds the PLI instruction.</td>
</tr>
<tr>
<td>0b0100</td>
<td>As for 0b0011, and adds the PLDW instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0100.

### LoadStore, bits [3:0]

Indicates the implemented additional load/store instructions. Defined values are:

<table>
<thead>
<tr>
<th>LoadStore</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No additional load/store instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the LDRD and STRD instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the Load Acquire (LDAB, LDAH, LDA, LDAEXB, LDAEXH, LDAEX, LDAEXD) and Store Release (STLB, STLH, STL, STLEXB, STLEXH, STLEX, STLEXD) instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

### Otherwise:

<table>
<thead>
<tr>
<th></th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>

**Bits [63:32]**

Reserved, RES0.

**T32EE, bits [31:28]**

Indicates the implemented T32EE instructions. Defined values are:

<table>
<thead>
<tr>
<th>T32EE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>000000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>000001</td>
<td>Adds the ENTERX and LEAVEX instructions, and modifies the load behavior to include null checking.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**TrueNOP, bits [27:24]**

Indicates the implemented true NOP instructions. Defined values are:
TrueNOP, bits [47:44]

Indicates the meaning of TrueNOP. Defined values are:

<table>
<thead>
<tr>
<th>TrueNOP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented. This means there are no NOP instructions that do not have any register dependencies.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds true NOP instructions in both the T32 and A32 instruction sets. This also permits additional NOP-compatible hints.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

T32Copy, bits [23:20]

Indicates the support for T32 non flag-setting MOV instructions. Defined values are:

<table>
<thead>
<tr>
<th>T32Copy</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported. This means that in the T32 instruction set, encoding T1 of the MOV (register) instruction does not support a copy from a low register to a low register.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds support for T32 instruction set encoding T1 of the MOV (register) instruction, copying from a low register to a low register.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

TabBranch, bits [19:16]

Indicates the implemented Table Branch instructions in the T32 instruction set. Defined values are:

<table>
<thead>
<tr>
<th>TabBranch</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the TBB and TBH instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

SynchPrim, bits [15:12]

Used in conjunction with ID_ISAR4.SynchPrim_frac to indicate the implemented Synchronization Primitive instructions. Defined values are:

<table>
<thead>
<tr>
<th>SynchPrim</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>If SynchPrim_frac == 0b0000, no Synchronization Primitives implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>If SynchPrim_frac == 0b0000, adds the LDREX and STREX instructions.</td>
</tr>
<tr>
<td></td>
<td>If SynchPrim_frac == 0b0011, also adds the CLREX, LDREXB, STREXB, and STREXH instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>If SynchPrim_frac == 0b0000, as for [0b0001, 0b0011] and also adds the LDREXD and STREXD instructions.</td>
</tr>
</tbody>
</table>

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is 0b0010.

SVC, bits [11:8]

Indicates the implemented SVC instructions. Defined values are:

<table>
<thead>
<tr>
<th>SVC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SVC instruction.</td>
</tr>
</tbody>
</table>
All other values are reserved.

In Armv8-A, the only permitted value is **0b0001**.

**SIMD, bits [7:4]**

Indicates the implemented SIMD instructions. Defined values are:

<table>
<thead>
<tr>
<th>SIMD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SSAT and USAT instructions, and the Q bit in the PSRs.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0001, and adds the PKHBT, PKHTB, QADD16, QADD8, QASX, QSUB16, QSUB8, QAX, SADD16, SADD8, SASX, SEL, SHADD16, SHADD8, SHASX, SHSUB16, SHSUB8, SHAX, SSAT16, SSUB16, SSUB8, SSAX, SXTAB16, SXTB16, UADD16, UADD8, USAX, UHADD16, UHADD8, UHASX, UHSUB16, UHSUB8, UHASX, UQADD16, UQADD8, UQASX, UQSUB16, UQSUB8, UQASX, USAD8, USADA8, USAT16, USUB16, USUB8, USAX, UXTAB16, and UXTB16 instructions. Also adds support for the GE[3:0] bits in the PSRs.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is **0b0001**.

The SIMD field relates only to implemented instructions that perform SIMD operations on the general-purpose registers. In an implementation that supports floating-point and Advanced SIMD instructions, MVFR0, MVFR1, and MVFR2 give information about the implemented Advanced SIMD instructions.

**Saturate, bits [3:0]**

Indicates the implemented Saturate instructions. Defined values are:

<table>
<thead>
<tr>
<th>Saturate</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented. This means no non-Advanced SIMD saturate instructions are implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the QADD, QDADD, QDSUB, and QSUB instructions, and the Q bit in the PSRs.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is **0b0001**.

** Otherwise:**

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</td>
</tr>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is **0b0001**.

**Accessing the ID_ISAR3_EL1**

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>MRS &lt;Xt&gt;, ID_ISAR3_EL1</th>
</tr>
</thead>
<tbody>
<tr>
<td>op0</td>
</tr>
<tr>
<td>0b11</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        end if
    else
        UNDEFINED;
    end if
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_ISAR3_EL1;
    end if
elsif PSTATE.EL == EL2 then
    return ID_ISAR3_EL1;
elsif PSTATE.EL == EL3 then
    return ID_ISAR3_EL1;
The ID_ISAR4_EL1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch64 System register ID_ISAR4_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR4[31:0].

**Attributes**

ID_ISAR4_EL1 is a 64-bit register.

**Field descriptions**

The ID_ISAR4_EL1 bit assignments are:

**When AArch32 is supported at any Exception level:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| SWP_frac | PSR_M | SynchPrim_frac | Barrier | SMC | Writeback | WithShifts | Unpriv |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:32]**

Reserved, RES0.

**SWP_frac, bits [31:28]**

Indicates support for the memory system locking the bus for SWP or SWPB instructions. Defined values are:

<table>
<thead>
<tr>
<th>SWP_frac</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SWP or SWPB instructions not implemented. SWP or SWPB implemented but only in a uniprocessor context. SWP and SWPB do not guarantee whether memory accesses from other Requesters can come between the load memory access and the store memory access of the SWP or SWPB.</td>
</tr>
<tr>
<td>0b0001</td>
<td></td>
</tr>
</tbody>
</table>

All other values are reserved. This field is valid only if ID_ISAR0.Swap is 0b0000.

In Armv8-A, the only permitted value is 0b0000.
**PSR_M, bits [27:24]**

Indicates the implemented M profile instructions to modify the PSRs. Defined values are:

<table>
<thead>
<tr>
<th>PSR_M</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the M profile forms of the CPS, MRS, and MSR instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**SynchPrim_frac, bits [23:20]**

Used in conjunction with ID_ISAR3, SynchPrim to indicate the implemented Synchronization Primitive instructions. Possible values are:

<table>
<thead>
<tr>
<th>SynchPrim_frac</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>If SynchPrim == 0b0000, no Synchronization Primitives implemented. If SynchPrim == 0b0001, adds the LDREX and STREX instructions. If SynchPrim == 0b0010, also adds the CLREX, LDREXB, LDREXH, STREXB, STREXH, LDREXD, and STREXD instructions.</td>
</tr>
<tr>
<td>0b0011</td>
<td>If SynchPrim == 0b0001, adds the LDREX, STREX, CLREX, LDREXB, LDREXH, STREXB, and STREXH instructions.</td>
</tr>
</tbody>
</table>

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is 0b0000.

**Barrier, bits [19:16]**

Indicates the implemented Barrier instructions in the A32 and T32 instruction sets. Defined values are:

<table>
<thead>
<tr>
<th>Barrier</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented. Barrier operations are provided only as System instructions in the (coproc==0b1111) encoding space.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the DMB, DSB, and ISB barrier instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**SMC, bits [15:12]**

Indicates the implemented SMC instructions. Defined values are:

<table>
<thead>
<tr>
<th>SMC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SMC instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0001 and 0b0000.

If EL1 cannot use AArch32, then this field has the value 0b0000.

**Writeback, bits [11:8]**

Indicates the support for Writeback addressing modes. Defined values are:
### Writeback

<table>
<thead>
<tr>
<th>Writeback</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Basic support. Only the LDM, STM, PUSH, POP, SRS, and RFE instructions support writeback addressing modes. These instructions support all of their writeback addressing modes.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds support for all of the writeback addressing modes.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### WithShifts, bits [7:4]

Indicates the support for instructions with shifts. Defined values are:

<table>
<thead>
<tr>
<th>WithShifts</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Nonzero shifts supported only in MOV and shift instructions.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds support for shifts of loads and stores over the range LSL 0-3.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0001, and adds support for other constant shift options, both on load/store and other instructions.</td>
</tr>
<tr>
<td>0b0100</td>
<td>As for 0b0011, and adds support for register-controlled shift options.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0100.

### Unpriv, bits [3:0]

Indicates the implemented unprivileged instructions. Defined values are:

<table>
<thead>
<tr>
<th>Unpriv</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented. No T variant instructions are implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the LDRBT, LDRT, STRBT, and STRT instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the LDRHT, LDRSBT, LDRSHT, and STRHT instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

### Otherwise:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</td>
<td>UNKNOWN</td>
</tr>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
<td>UNKNOWN</td>
</tr>
</tbody>
</table>

### Bits [63:0]

Reserved, UNKNOWN.

### Accessing the ID_ISAR4_EL1

Accesses to this register use the following encodings:

\[
\text{MRS <Xt>, ID_ISAR4_EL1}
\]

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>

elsif PSTATE.EL == EL2 then
  return ID_ISAR4_EL1;
elsif PSTATE.EL == EL3 then
  return ID_ISAR4_EL1;
The ID_ISAR5_EL1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, and ID_ISAR4_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch64 System register ID_ISAR5_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR5[31:0].

**Attributes**

ID_ISAR5_EL1 is a 64-bit register.

**Field descriptions**

The ID_ISAR5_EL1 bit assignments are:

**When AArch32 is supported at any Exception level:**

<p>| | | | | | | | | | | | |</p>
<table>
<thead>
<tr>

<td>22</td>
<td>21</td>
<td>20</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**VCMA, bits [31:28]**

Indicates AArch32 support for complex number addition and multiplication where numbers are stored in vectors. Defined values are:

<table>
<thead>
<tr>
<th>VCMA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The VCMLA and VCADD instructions are not implemented in AArch32.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The VCMLA and VCADD instructions are implemented in AArch32.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_FCMA implements the functionality identified by 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, the only permitted value is 0b0001.
RDM, bits [27:24]
Indicates whether the VQRDMLAH and VQRDMLSH instructions are implemented in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>RDM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No VQRDMLAH and VQRDMLSH instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>VQRDMLAH and VQRDMLSH instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_RDM implements the functionality identified by the value 0b0001.

In Armv8.0, the only permitted value is 0b0000.
From Armv8.1, the only permitted value is 0b0001.

Bits [23:20]
Reserved, RES0.

CRC32, bits [19:16]
Indicates whether the CRC32 instructions are implemented in AArch32 state.

<table>
<thead>
<tr>
<th>CRC32</th>

**ID_ISAR6_EL1, AArch32 Instruction Set Attribute Register 6**

The ID_ISAR6_EL1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1 and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch64 System register ID_ISAR6_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR6[31:0].

**Note**

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

**Attributes**

ID_ISAR6_EL1 is a 64-bit register.

**Field descriptions**

The ID_ISAR6_EL1 bit assignments are:

**When AArch32 is supported at any Exception level:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | I8MM | BF16 | SPECRES | SB | FHM | DP | JSCVT |

**Bits [63:28]**

Reserved, RES0.

**I8MM, bits [27:24]**

Indicates support for Advanced SIMD and floating-point Int8 matrix multiplication instructions in AArch32 state. Defined values of this field are:

<table>
<thead>
<tr>
<th>I8MM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Int8 matrix multiplication instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>VSMMLA, VSUDOT, VUMMLA, VUSMMLA, and VUSDOT instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.
FEAT AA32I8MM implements the functionality identified by 0b0001.

**BF16, bits [23:20]**

Indicates support for Advanced SIMD and floating-point BF16 instructions in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>BF16</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>BF16 instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>VCVT, VCVTB, VCVTT, VDOT, VFMAB, VFMAT, and VMMLA instructions with BF16 operand or result types are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_AA32BF16 implements the functionality identified by 0b0001.

**SPECRES, bits [19:16]**

Indicates support for Speculation invalidation instructions in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>SPECRES</th>
<th>Meaning</th>

</tr>
<tr>
<td>0b0001</td>
<td>CFPRCTX, DVPRCTX, and CPRPRCTX instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_SPECRES implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

**SB, bits [15:12]**

Indicates support for the SB instruction in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>SB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SB instruction is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SB instruction is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_SB implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

**FHM, bits [11:8]**

Indicates support for Advanced SIMD and floating-point VFMAL and VFMSL instructions in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>FHM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>VFMAL and VMFSL instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>VFMAL and VMFSL instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_FHM implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

**DP, bits [7:4]**

Indicates support for Advanced SIMD and floating-point VFMAL and VFMSL instructions in AArch32 state. Defined values are:
<table>
<thead>
<tr>
<th>DP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Dot product instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>UDOT and VSDOT instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_DotProd implements the functionality identified by 0b0001.

In Armv8.2, the permitted values are 0b0000 and 0b0001.

From Armv8.4, the only permitted value is 0b0001.

**JSCVT, bits [3:0]**

Indicates support for the VJCVT instruction in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>JSCVT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The VJCVT instruction is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The VJCVT instruction is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_JSCVT implements the functionality identified by 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

**Otherwise:**

</table>
if PSTATE.EL == EL0 then
  if IsFeatureImplemented(FEAT_IDST) then
    if EL2Enabled() && HCR_EL2.TGE == '1' then
      AArch64.SystemAccessTrap(EL2, 0x18);
    else
      AArch64.SystemAccessTrap(EL1, 0x18);
  else
    UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && (!IsZero(ID_ISAR6_EL1) || boolean IMPLEMENTATION_DEFINED "ID_ISAR6_EL1
trapped by HCR_EL2.TID3") && HCR_EL2.TID3 == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    return ID_ISAR6_EL1;
elsif PSTATE.EL == EL2 then
  return ID_ISAR6_EL1;
elsif PSTATE.EL == EL3 then
  return ID_ISAR6_EL1;
The ID_MMFR0_EL1 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with ID_MMFR1_EL1, ID_MMFR2_EL1, ID_MMFR3_EL1, and ID_MMFR4_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch64 System register ID_MMFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR0[31:0].

**Attributes**

ID_MMFR0_EL1 is a 64-bit register.

**Field descriptions**

The ID_MMFR0_EL1 bit assignments are:

**When AArch32 is supported at any Exception level:**

<table>
<thead>
<tr>
<th>Bits [63:32]</th>
<th>Reserved, RES0</th>
</tr>
</thead>
<tbody>
<tr>
<td>InnerShr</td>
<td>FCSE</td>
</tr>
<tr>
<td>31 30 29</td>
<td>28 27 26 25</td>
</tr>
</tbody>
</table>

**InnerShr, bits [31:28]**

Innermost Shareability. Indicates the innermost shareability domain implemented. Defined values are:

<table>
<thead>
<tr>
<th>InnerShr</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Implemented as Non-cacheable.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Implemented with hardware coherency support.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Shareability ignored.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the permitted values are 0b0000, 0b0001, and 0b1111.

This field is valid only if the implementation supports two levels of shareability, as indicated by ID_MMFR0_EL1.ShareLvl having the value 0b0001.

When ID_MMFR0_EL1.ShareLvl is zero, this field is UNKNOWN.
FCSE, bits [27:24]

Indicates whether the implementation includes the FCSE. Defined values are:

<table>
<thead>
<tr>
<th>FCSE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for FCSE.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the only permitted value is 0b0000.

AuxReg, bits [23:20]

Auxiliary Registers. Indicates support for Auxiliary registers. Defined values are:

<table>
<thead>
<tr>
<th>AuxReg</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for Auxiliary Control Register only.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Support for Auxiliary Fault Status Registers (AIFSR and ADFSR)</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the only permitted value is 0b0010.

Note

Accesses to unimplemented Auxiliary registers are UNDEFINED.

TCM, bits [19:16]

Indicates support for TCMs and associated DMAs. Defined values are:

<table>
<thead>
<tr>
<th>TCM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support is IMPLEMENTATION DEFINED. Armv7 requires this setting.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Support for TCM only. Armv6 implementation.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Support for TCM and DMA, Armv6 implementation.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

ShareLvl, bits [15:12]

Shareability Levels. Indicates the number of shareability levels implemented. Defined values are:

<table>
<thead>
<tr>
<th>ShareLvl</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>One level of shareability implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Two levels of shareability implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the only permitted value is 0b0001.

OuterShr, bits [11:8]

Outermost Shareability. Indicates the outermost shareability domain implemented. Defined values are:
OuterShr | Meaning
--- | ---
0b0000 | Implemented as Non-cacheable.
0b0001 | Implemented with hardware coherency support.
0b1111 | Shareability ignored.

All other values are reserved.

From Armv8 the permitted values are 0b0000, 0b0001, and 0b1111.

**PMSA, bits [7:4]**

Indicates support for a PMSA. Defined values are:

<table>
<thead>
<tr>
<th>PMSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for IMPLEMENTATION DEFINED PMSA.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Support for PMSAv6, with a Cache Type Register implemented.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Support for PMSAv7, with support for memory subsections. Armv7-R profile.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

**VMSA, bits [3:0]**

Indicates support for a VMSA. Defined values are:

<table>
<thead>
<tr>
<th>VMSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for IMPLEMENTATION DEFINED VMSA.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Support for VMSAv6, with Cache and TLB Type Registers implemented.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Support for VMSAv7, with support for remapping and the Access flag. Armv7-A profile.</td>
</tr>
<tr>
<td>0b0100</td>
<td>As for 0b0011, and adds support for the PXN bit in the Short-descriptor translation table format descriptors.</td>
</tr>
<tr>
<td>0b0101</td>
<td>As for 0b0100, and adds support for the Long-descriptor translation table format.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0101.

**Otherwise:**

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</td>
<td>UNKNOWN</td>

**Bits [63:32]**

Reserved, RES0.

**BPred, bits [31:28]**

Branch Predictor. Indicates branch predictor management requirements. Defined values are:
### BPred

<table>
<thead>
<tr>
<th>BPred</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No branch predictor, or no MMU present. Implies a fixed MPU configuration.</td>
</tr>
</tbody>
</table>
| 0b0001 | Branch predictor requires flushing on:  
  - Enabling or disabling a stage of address translation.  
  - Writing new data to instruction locations.  
  - Writing new mappings to the translation tables.  
  - Changes to the TTBR0, TTBR1, or TTBCR registers.  
  - Changes to the ContextID or ASID, or to the FCSE ProcessID if this is supported. |
| 0b0010 | Branch predictor requires flushing on:  
  - Enabling or disabling a stage of address translation.  
  - Writing new data to instruction locations.  
  - Writing new mappings to the translation tables.  
  - Any change to the TTBR0, TTBR1, or TTBCR registers without a change to the corresponding ContextID or ASID, or FCSE ProcessID if this is supported. |
| 0b0011 | Branch predictor requires flushing only on writing new data to instruction locations. |
| 0b0100 | For execution correctness, branch predictor requires no flushing at any time. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0010, 0b0011, and 0b0100. For values other than 0b0000 and 0b0100 the Arm Architecture Reference Manual, or the product documentation, might give more information about the required maintenance.

### L1TstCln, bits [27:24]

Level 1 cache Test and Clean. Indicates the supported Level 1 data cache test and clean operations, for Harvard or unified cache implementations. Defined values are:

<table>
<thead>
<tr>
<th>L1TstCln</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
</tbody>
</table>
| 0b0001   | Supported Level 1 data cache test and clean operations are:  
  - Test and clean data cache. |
| 0b0010   | As for 0b0001, and adds:  
  - Test, clean, and invalidate data cache. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

### L1Uni, bits [23:20]

Level 1 Unified cache. Indicates the supported entire Level 1 cache maintenance operations for a unified cache implementation. Defined values are:

<table>
<thead>
<tr>
<th>L1Uni</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
</tbody>
</table>
| 0b0001  | Supported entire Level 1 cache operations are:  
  - Invalidate cache, including branch predictor if appropriate.  
  - Invalidate branch predictor, if appropriate. |
| 0b0010  | As for 0b0001, and adds:  
  - Clean cache, using a recursive model that uses the cache dirty status bit.  
  - Clean and invalidate cache, using a recursive model that uses the cache dirty status bit. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.
L1Hvd, bits [19:16]

Level 1 Harvard cache. Indicates the supported entire Level 1 cache maintenance operations for a Harvard cache implementation. Defined values are:

<table>
<thead>
<tr>
<th>L1Hvd</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>

<tr>
<td></td>
<td>• Clean data cache, using a recursive model that uses the cache dirty status bit.</td>
</tr>
<tr>
<td></td>
<td>• Clean and invalidate data cache, using a recursive model that uses the cache dirty status bit.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1UniSW, bits [15:12]

Level 1 Unified cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a unified cache implementation. Defined values are:

<table>
<thead>
<tr>
<th>L1UniSW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported Level 1 unified cache line maintenance operations by set/way are:</td>
</tr>
<tr>
<td></td>
<td>• Clean cache line by set/way.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Clean and invalidate cache line by set/way.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0010, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate cache line by set/way.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1HvdSW, bits [11:8]

Level 1 Harvard cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a Harvard cache implementation. Defined values are:

<table>
<thead>
<tr>
<th>L1HvdSW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported Level 1 Harvard cache line maintenance operations by set/way are:</td>
</tr>
<tr>
<td></td>
<td>• Clean data cache line by set/way.</td>
</tr>
<tr>
<td></td>
<td>• Clean and invalidate data cache line by set/way.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds:</td>

elsif PSTATE.EL == EL3 then
  return ID_MMFR1_EL1;
The ID_MMFR2_EL1 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with ID_MMFR0_EL1, ID_MMFR1_EL1, ID_MMFR3_EL1, and ID_MMFR4_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch64 System register ID_MMFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR2[31:0].

**Attributes**

ID_MMFR2_EL1 is a 64-bit register.

**Field descriptions**

The ID_MMFR2_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | HWAccFlg | WFIStall | MemBarr | UniTLB | HvdTLB | L1HvdRng | L1HvdBG | L1HvdFG |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

**HWAccFlg, bits [31:28]**

Hardware Access Flag. In earlier versions of the Arm Architecture, this field indicates support for a Hardware Access flag, as part of the VMSAv7 implementation. Defined values are:

<table>
<thead>
<tr>
<th>HWAccFlg</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for VMSAv7 Access flag, updated in hardware.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8, the only permitted value is 0b0000.

**WFIStall, bits [27:24]**

Wait For Interrupt Stall. Indicates the support for Wait For Interrupt (WFI) stalling. Defined values are:
### WFIStall

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for WFI stalling.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8, the permitted values are 0b0000 and 0b0001.

### MemBarr, bits [23:20]

Memory Barrier. Indicates the supported memory barrier System instructions in the (coproc==0b1111) encoding space:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported memory barrier System instructions are:</td>
</tr>
<tr>
<td></td>
<td>• Data Synchronization Barrier (DSB).</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Instruction Synchronization Barrier (ISB).</td>
</tr>
<tr>
<td></td>
<td>• Data Memory Barrier (DMB).</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8, the only permitted value is 0b0010.

Arm deprecates the use of these operations. ID_ISAR4.Barrier_intrs indicates the level of support for the preferred barrier instructions.

### UniTLB, bits [19:16]

Unified TLB. Indicates the supported TLB maintenance operations, for a unified TLB implementation. Defined values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported unified TLB maintenance operations are:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate all entries in the TLB.</td>
</tr>
<tr>
<td></td>
<td>• Invalidate TLB entry by VA.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate TLB entries by ASID match.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0010, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate instruction TLB and data TLB entries by VA All ASID. This is a shared unified TLB operation.</td>
</tr>
<tr>
<td>0b0100</td>
<td>As for 0b0011, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate Hyp mode unified TLB entry by VA.</td>
</tr>
<tr>
<td></td>
<td>• Invalidate entire Non-secure PL1&amp;0 unified TLB.</td>
</tr>
<tr>
<td></td>
<td>• Invalidate entire Hyp mode unified TLB.</td>
</tr>
<tr>
<td>0b0101</td>
<td>As for 0b0100, and adds the following operations:</td>
</tr>
<tr>
<td></td>
<td>TLBIMVALIS, TLBIMVAALIS, TLBIMVALHIS, TLBIMVAL, TLBIMVAAL, TLBIMVALH.</td>
</tr>
<tr>
<td>0b0110</td>
<td>As for 0b0101, and adds the following operations:</td>
</tr>
<tr>
<td></td>
<td>TLBIIIPAS2IS, TLBIIIPAS2LIS, TLBIIIPAS2, TLBIIIPAS2L.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0110.

### HvdTLB, bits [15:12]

If the Unified TLB field (UniTLB, bits [19:16]) is not 0000, then the meaning of this field is IMPLEMENTATION DEFINED. Arm deprecates the use of this field by software.

### L1HvdRng, bits [11:8]

Level 1 Harvard cache Range. Indicates the supported Level 1 cache maintenance range operations, for a Harvard cache implementation. Defined values are:
Meaning

<table>
<thead>
<tr>
<th>L1HvdRng</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported Level 1 Harvard cache maintenance range operations are:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate data cache range by VA.</td>
</tr>
<tr>
<td></td>
<td>• Invalidate instruction cache range by VA.</td>
</tr>
<tr>
<td></td>
<td>• Clean data cache range by VA.</td>
</tr>
<tr>
<td></td>
<td>• Clean and invalidate data cache range by VA.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8, the only permitted value is 0b0000.

L1HvdBG, bits [7:4]

Level 1 Harvard cache Background fetch. Indicates the supported Level 1 cache background fetch operations, for a Harvard cache implementation. When supported, background fetch operations are non-blocking operations. Defined values are:

Meaning

<table>
<thead>
<tr>
<th>L1HvdBG</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported Level 1 Harvard cache background fetch operations are:</td>
</tr>
<tr>
<td></td>
<td>• Fetch instruction cache range by VA.</td>
</tr>
<tr>
<td></td>
<td>• Fetch data cache range by VA.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8, the only permitted value is 0b0000.

L1HvdFG, bits [3:0]

Level 1 Harvard cache Foreground fetch. Indicates the supported Level 1 cache foreground fetch operations, for a Harvard cache implementation. When supported, foreground fetch operations are blocking operations. Defined values are:

Meaning

<table>
<thead>
<tr>
<th>L1HvdFG</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported Level 1 Harvard cache foreground fetch operations are:</td>
</tr>
<tr>
<td></td>
<td>• Fetch instruction cache range by VA.</td>
</tr>
<tr>
<td></td>
<td>• Fetch data cache range by VA.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8, the only permitted value is 0b0000.

Otherwise:

63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32

        return ID.MMFR2_EL1;
    end
elsif PSTATE.EL == EL2 then
    return ID.MMFR2_EL1;
else PSTATE.EL == EL3 then
    return ID.MMFR2_EL1;
```
The ID_MMFR3_EL1 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32 state. Must be interpreted with ID_MMFR0_EL1, ID_MMFR1_EL1, ID_MMFR2_EL1, and ID_MMFR4_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch64 System register ID_MMFR3_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR3[31:0].

**Attributes**

ID_MMFR3_EL1 is a 64-bit register.

**Field descriptions**

The ID_MMFR3_EL1 bit assignments are:

When AArch32 is supported at any Exception level:

<table>
<thead>
<tr>
<th></th>
<th>RES0</th>
<th>Supersec</th>
<th>CMemSz</th>
<th>CohWalk</th>
<th>PAN</th>
<th>MaintBcst</th>
<th>BPMaint</th>
<th>CMaintSW</th>
<th>CMaintVA</th>

</thead>
<tbody>
<tr>
<td>63:32</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [63:32]

Reserved, RES0.

**Supersec, bits [31:28]**

Supersections. On a VMSA implementation, indicates whether Supersections are supported. Defined values are:

<table>
<thead>
<tr>
<th>Supersec</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Supersections supported.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Supersections not supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b1111.

**CMemSz, bits [27:24]**

Cached Memory Size. Indicates the physical memory size supported by the caches. Defined values are:
<table>
<thead>
<tr>
<th>CMemSz</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>4GB, corresponding to a 32-bit physical address range.</td>
</tr>
<tr>
<td>0b0001</td>
<td>64GB, corresponding to a 36-bit physical address range.</td>
</tr>
<tr>
<td>0b0010</td>
<td>1TB or more, corresponding to a 40-bit or larger physical address range.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000, 0b0001, and 0b0010.

**CohWalk, bits [23:20]**

Coherent Walk. Indicates whether Translation table updates require a clean to the Point of Unification. Defined values are:

<table>
<thead>
<tr>
<th>CohWalk</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Updates to the translation tables require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Updates to the translation tables do not require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**PAN, bits [19:16]**

Privileged Access Never. Indicates support for the PAN bit in CPSR, SPSR, and DSPSR in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>PAN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>PAN not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>PAN supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>PAN supported and ATS1CPRP and ATS1CPWP instructions supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_PAN implements the functionality identified by the value 0b0001.

FEAT_PAN2 implements the functionality added by the value 0b0010.

In Armv8.1, the value 0b0000 is not permitted.

From Armv8.2, the only permitted value is 0b0010.

**MaintBcst, bits [15:12]**

Maintenance Broadcast. Indicates whether Cache, TLB, and branch predictor operations are broadcast. Defined values are:

<table>
<thead>
<tr>
<th>MaintBcst</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Cache, TLB, and branch predictor operations only affect local structures.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Cache and branch predictor operations affect structures according to shareability and defined behavior of instructions. TLB operations only affect local structures.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Cache, TLB, and branch predictor operations affect structures according to shareability and defined behavior of instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.
BPMaint, bits [11:8]

Branch Predictor Maintenance. Indicates the supported branch predictor maintenance operations in an implementation with hierarchical cache maintenance operations. Defined values are:

<table>
<thead>
<tr>
<th>BPMaint</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported branch predictor maintenance operations are:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate all branch predictors.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate branch predictors by VA.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

CMaintSW, bits [7:4]

Cache Maintenance by Set/Way. Indicates the supported cache maintenance operations by set/way, in an implementation with hierarchical caches. Defined values are:

<table>
<thead>
<tr>
<th>CMaintSW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported hierarchical cache maintenance instructions by set/way are:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate data cache by set/way.</td>
</tr>
<tr>
<td></td>
<td>• Clean data cache by set/way.</td>
</tr>
<tr>
<td></td>
<td>• Clean and invalidate data cache by set/way.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

In a unified cache implementation, the data cache maintenance operations apply to the unified caches.

CMaintVA, bits [3:0]

Cache Maintenance by Virtual Address. Indicates the supported cache maintenance operations by VA, in an implementation with hierarchical caches. Defined values are:

<table>
<thead>
<tr>
<th>CMaintVA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported hierarchical cache maintenance operations by VA are:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate data cache by VA.</td>
</tr>
<tr>
<td></td>
<td>• Clean data cache by VA.</td>
</tr>
<tr>
<td></td>
<td>• Clean and invalidate data cache by VA.</td>
</tr>
<tr>
<td></td>
<td>• Invalidate instruction cache by VA.</td>
</tr>
<tr>
<td></td>
<td>• Invalidate all instruction cache entries.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

In a unified cache implementation, data cache maintenance operations apply to the unified caches, and the instruction cache maintenance instructions are not implemented.

Otherwise:

<table>
<thead>
<tr>
<th>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</th>

</table>

Bits [63:32]

Reserved, RES0.

**EVT, bits [31:28]**

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the HCR2\{TTLBIS, TOCU, TICAB, TID4\} traps. Defined values are:

<table>
<thead>
<tr>
<th>EVT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>HCR2{TTLBIS, TOCU, TICAB, TID4} traps are not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>HCR2{TOCU, TICAB, TID4} traps are supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>HCR2{TTLBIS, TOCU, TICAB, TID4} trap is not supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT EVT implements the functionality identified by the values 0b0001 and 0b0010.

If EL2 is not implemented supporting AArch32, the only permitted value is 0b0000.

In Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.
From Armv8.5, the permitted values are:
- 0b0000 when EL2 is not implemented.
- 0b0010 when EL2 is implemented.

**CCIDX, bits [27:24]**

Support for use of the revised CCSIDR format and the presence of the CCSIDR2 is indicated. Defined values are:

<table>
<thead>
<tr>
<th>CCIDX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>32-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>64-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_CCIDX implements the functionality identified by 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

**LSM, bits [23:20]**

Indicates support for LSMAOE and nTLSMD bits in HSCTL.R and SCTLR. Defined values are:

<table>
<thead>
<tr>
<th>LSM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>LSMAOE and nTLSMD bits not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>LSMAOE and nTLSMD bits supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_LSMAOC implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

**HPDS, bits [19:16]**

Hierarchical permission disables bits in translation tables. Defined values are:

<table>
<thead>
<tr>
<th>HPDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Disabling of hierarchical controls not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supports disabling of hierarchical controls using the TTBCR2,HPD0, TTBCR2,HPD1, and HTCR,HPD bits.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for value 0b0001, and adds possible hardware allocation of bits[62:59] of the translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_AA32HPD implements the functionality identified by the value 0b0001.

FEAT_HPDS2 implements the functionality added by the value 0b0010.

**Note**

The value 0b0000 implies that the encoding for TTBCR2 is UNDEFINED.

**CnP, bits [15:12]**

Common not Private translations. Defined values are:

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Common not Private translations not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Common not Private translations supported.</td>
</tr>
</tbody>
</table>
All other values are reserved.

FEAT_TTCNP implements the functionality identified by the value 0b0001.

From Armv8.2 the only permitted value is 0b0001.

**XNX, bits [11:8]**

Support for execute-never control distinction by Exception level at stage 2. Defined values are:

<table>
<thead>
<tr>
<th>XNX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Distinction between EL0 and EL1 execute-never control at stage 2 not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Distinction between EL0 and EL1 execute-never control at stage 2 supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_XNX implements the functionality identified by the value 0b0001.

When FEAT_XNX is implemented:

- If all of the following conditions are true, it is IMPLEMENTATION DEFINED whether the value of ID_MMFR4_EL1.XNX is 0b0000 or 0b0001:
  - ID_AA64MMFR1_EL1.XNX ==1.
  - EL2 cannot use AArch32.
  - EL1 can use AArch32.
- If EL2 can use AArch32 then the only permitted value is 0b0001.

**AC2, bits [7:4]**

Indicates the extension of the ACTLR and HACTLR registers using ACTLR2 and HACTLR2. Defined values are:

<table>
<thead>
<tr>
<th>AC2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>ACTLR2 and HACTLR2 are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>ACTLR2 and HACTLR2 are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8.0 and Armv8.1 the permitted values are 0b0000 and 0b0001.

From Armv8.2, the only permitted value is 0b0001.

**SpecSEI, bits [3:0]**

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:

<table>
<thead>
<tr>
<th>SpecSEI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The PE never generates an SError interrupt due to an External abort on a speculative read.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The PE might generate an SError interrupt due to an External abort on a speculative read.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Otherwise:**

<table>
<thead>
<tr>
<th>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</th>
<th>UNKNOWN</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
<td>UNKNOWN</td>
</tr>
</tbody>
</table>
Bits [63:0]

Reserved, UNKNOWN.

Accessing the ID_MMFR4_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ID_MMFR4_EL1

<table>
<thead>
<tr>

  return ID_MMFR4_EL1;
The ID_MMFR5_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_MMFR5_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR5[31:0].

Attributes

ID_MMFR5_EL1 is a 64-bit register.

Field descriptions

The ID_MMFR5_EL1 bit assignments are:

When AArch32 is supported at any Exception level:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

    elsif PSTATE.EL == EL3 then
        return ID_MMFR5_EL1;
The ID_PFR0_EL1 characteristics are:

**Purpose**

Gives top-level information about the instruction sets supported by the PE in AArch32 state.

Must be interpreted with ID_PFR1_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch64 System register ID_PFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_PFR0[31:0].

**Attributes**

ID_PFR0_EL1 is a 64-bit register.

**Field descriptions**

The ID_PFR0_EL1 bit assignments are:

**When AArch32 is supported at any Exception level:**

<table>
<thead>
<tr>
<th>Bits [63:32]</th>
<th>Reserved, RES0</th>
</tr>
</thead>
</table>

**RAS, bits [31:28]**

RAS Extension version. Defined values are:

<table>
<thead>
<tr>
<th>RAS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No RAS Extension.</td>
</tr>
<tr>
<td>0b0001</td>
<td>RAS Extension present.</td>
</tr>
<tr>
<td>0b0010</td>
<td>FEAT_RASv1p1 present. As 0b0001, and adds support for additional ERXMISC&lt;m&gt; System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR&lt;n&gt;STATUS and support for the optional RAS Timestamp Extension.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_RAS implements the functionality identified by the value 0b0001.

FEAT_RASv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0 and Armv8.1, the permitted values are 0b0000 and 0b0001.
In Armv8.2, the only permitted value is 0b0001.

From Armv8.4, if FEAT_DoubleFault is implemented, the only permitted value is 0b0010.

From Armv8.4, when FEAT_DoubleFault is not implemented, and ERRIDR_EL1.NUM is 0, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010.

---

**Note**

When the value of this field is 0b0001, ID_PFR2_EL1.RAS_frac indicates whether FEAT_RASv1p1 is implemented.

---

**DIT, bits [27:24]**

Data Independent Timing. Defined values are:

<table>
<thead>
<tr>
<th>DIT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>AArch32 does not guarantee constant execution time of any instructions.</td>
</tr>
<tr>
<td>0b0001</td>
<td>AArch32 provides the PSTATE.DIT mechanism to guarantee constant execution time of certain instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_DIT implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

**AMU, bits [23:20]**

Indicates support for Activity Monitors Extension. Defined values are:

<table>
<thead>
<tr>
<th>AMU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Activity Monitors Extension is not implemented.</td>

<tr>
<td>0b0010</td>
<td>FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_AMUv1 implements the functionality identified by the value 0b0001.

FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

**CSV2, bits [19:16]**

Speculative use of out of context branch targets. Defined values are:

<table>
<thead>
<tr>
<th>CSV2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>This Device does not disclose whether branch targets trained in one hardware described context can affect speculative execution in a different hardware described context.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Branch targets trained in one hardware described context can only affect speculative execution in a different hardware described context in a hard-to-determine way.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_CSV2 implements the functionality identified by 0b0001.
From Armv8.5, the only permitted value is \texttt{0b0001}.

**State3, bits [15:12]**

T32EE instruction set support. Defined values are:

<table>
<thead>
<tr>
<th>State3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>T32EE instruction set implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is \texttt{0b0000}.

**State2, bits [11:8]**

Jazelle extension support. Defined values are:

<table>
<thead>
<tr>
<th>State2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>0b0001</td>

ID_PFR1_EL1, AArch32 Processor Feature Register 1

The ID_PFR1_EL1 characteristics are:

**Purpose**

Gives information about the AArch32 programmers' model.

Must be interpreted with ID_PFR0_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch64 System register ID_PFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_PFR1[31:0].

**Attributes**

ID_PFR1_EL1 is a 64-bit register.

**Field descriptions**

The ID_PFR1_EL1 bit assignments are:

**When AArch32 is supported at any Exception level:**

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
</tr>
<tr>

</tr>
<tr>
<td>0b0011</td>
<td>System register interface to version 4.1 of the GIC CPU interface is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Virt_frac, bits [27:24]

Virtualization fractional field. When the Virtualization field is 0b0000, determines the support for features from the ARMv7 Virtualization Extensions. Defined values are:
**Virt_frac**

<table>
<thead>
<tr>
<th>Virt_frac</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No features from the ARMv7 Virtualization Extensions are implemented.</td>
</tr>
</tbody>
</table>
| 0b0001    | The following features of the ARMv7 Virtualization Extensions are implemented:  
          | • The SCR.SIF bit, if EL3 is implemented.  
          | • The modifications to the SCR.AW and SCR.FW bits described in the Virtualization Extensions, if EL3 is implemented.  
          | • The MSR (banked register) and MRS (banked register) instructions.  
          | • The ERET instruction. |

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL2 is implemented.
- 0b0001 when EL2 is not implemented.

This field is only valid when the value of ID_PFR1_EL1.Virtualization is 0, otherwise it holds the value 0b0000.

**Note**

The ID_ISAR registers do not identify whether the instructions added by the ARMv7 Virtualization Extensions are implemented.

---

**Sec_frac, bits [23:20]**

Security fractional field. When the Security field is 0b0000, determines the support for features from the ARMv7 Security Extensions. Defined values are:

<table>
<thead>
<tr>
<th>Sec_frac</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No features from the ARMv7 Security Extensions are implemented.</td>
</tr>
</tbody>
</table>
| 0b0001   | The following features from the ARMv7 Security Extensions are implemented:  
          | • The VBAR register.  
          | • The TTBCR.PD0 and TTBCR.PD1 bits. |
| 0b0010   | As for 0b0001, plus the ability to access Secure or Non-secure physical memory is supported. |

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL3 is implemented.
- 0b0001 or 0b0010 when EL3 is not implemented.

This field is only valid when the value of ID_PFR1_EL1.Security is 0, otherwise it holds the value 0b0000.

**GenTimer, bits [19:16]**

Generic Timer support. Defined values are:

<table>
<thead>
<tr>
<th>GenTimer</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Generic Timer is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Generic Timer is implemented.</td>

<tr>
<td>0b0010</td>
<td>Generic Timer is implemented, and also includes support for CNTHCTL.EVNTIS and CNTKCTL.EVNTIS fields, and CNTPTCSS and CNTVCTSS counter views.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_ECV implements the functionality identified by the value 0b0010.

In Armv8.0, Armv8.1, Armv8.2, Armv8.3, Armv8.4, and Armv8.5, the only permitted value is 0b0001.
From Armv8.6, the only permitted value is 0b0010.

**Virtualization, bits [15:12]**

Virtualization support. Defined values are:

<table>
<thead>
<tr>
<th>Virtualization</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL2, Hyp mode, and the HVC instruction not</td>
</tr>
<tr>
<td></td>
<td>implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EL2, Hyp mode, the HVC instruction, and all the</td>
</tr>
<tr>
<td></td>
<td>features described by Virt_frac == 0b0001</td>
</tr>
<tr>
<td></td>
<td>implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0001 when EL2 is implemented.

In an implementation that includes EL2, if EL2 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

If EL1 cannot use AArch32 then this field has the value 0b0000.

**Note**

The ID-ISARs do not identify whether the HVC instruction is implemented.

**MProgMod, bits [11:8]**

M profile programmers' model support. Defined values are:

<table>
<thead>
<tr>
<th>MProgMod</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Support for two-stack programmers' model.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

**Security, bits [7:4]**

Security support. Defined values are:

<table>
<thead>
<tr>
<th>Security</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL3, Monitor mode, and the SMC instruction not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EL3, Monitor mode, the SMC instruction, and all the features</td>
</tr>
<tr>
<td></td>
<td>described by Sec_frac == 0b0001 implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the ability to set the NSACR.RFR bit.</td>
</tr>
<tr>
<td></td>
<td>Not permitted in Armv8 as the NSACR.RFR bit is RES0.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL3 is not implemented.
- 0b0001 when EL3 is implemented.

In an implementation that includes EL3, if EL3 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

If EL1 cannot use AArch32 then this field has the value 0b0000.
ProgMod, bits [3:0]

Support for the standard programmers' model for Armv4 and later. Model must support User, FIQ, IRQ, Supervisor, Abort, Undefined, and System modes. Defined values are:

<table>
<thead>
<tr>
<th>ProgMod</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0001 and 0b0000.

If EL1 cannot use AArch32 then this field has the value 0b0000.

Otherwise:

<table>
<thead>
<tr>
<th>63</th>
<th>62</th>
<th>61</th>
<th>60</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

Bits [63:0]

Reserved, UNKNOWN.

Accessing the ID_PFR1_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ID_PFR1_EL1

```
if PSTATE_EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
    elsif PSTATE_EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_PFR1_EL1;
    elsif PSTATE_EL == EL2 then
        return ID_PFR1_EL1;
    elsif PSTATE_EL == EL3 then
        return ID_PFR1_EL1;
```
The ID_PFR2_EL1 characteristics are:

**Purpose**

Gives information about the AArch32 programmers' model.

Must be interpreted with ID_PFR0_EL1 and ID_PFR1_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch64 System register ID_PFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_PFR2[31:0].

**Attributes**

ID_PFR2_EL1 is a 64-bit register.

**Field descriptions**

The ID_PFR2_EL1 bit assignments are:

**When AArch32 is supported at any Exception level:**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
</tr>
<tr>
<td>62</td>
<td>RAS_frac</td>
</tr>
<tr>
<td>61</td>
<td>SSBS</td>
</tr>
<tr>
<td>60</td>
<td>CSV3</td>
</tr>
</tbody>
</table>

**Bits [63:12]**

Reserved, RES0.

**RAS_frac, bits [11:8]**

RAS Extension fractional field. Defined values are:

<table>
<thead>
<tr>
<th>RAS_frac</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>If ID_PFR0_EL1.RAS == 0b0001, RAS Extension implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>If ID_PFR0_EL1.RAS == 0b0001, as 0b0000 and adds support for additional ERXMISC&lt;m&gt; System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR&lt;n&gt;STATUS and support for the optional RAS Timestamp Extension.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field is valid only if ID_PFR0_EL1.RAS == 0b0001.
**SSBS, bits [7:4]**

Speculative Store Bypassing controls in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>SSBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>AArch32 provides no mechanism to control the use of Speculative Store Bypassing.</td>
</tr>
<tr>
<td>0b0001</td>
<td>AArch32 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe.</td>
</tr>
</tbody>
</table>

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

All other values are reserved.

**CSV3, bits [3:0]**

Speculative use of faulting data. Defined values are:

<table>
<thead>
<tr>
<th>CSV3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>This Device does not disclose whether data loaded under speculation with a permission or domain fault can be used to form an address or generate condition codes or SVE predicate values to be used by instructions newer than the load in the speculative sequence</td>
</tr>
<tr>
<td>0b0001</td>
<td>Data loaded under speculation with a permission or domain fault cannot be used to form an address or generate condition codes or SVE predicate values to be used by instructions newer than the load in the speculative sequence</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_CSV3 implements the functionality identified by the value 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If FEAT_E0PD is implemented, FEAT_CSV3 must be implemented.

**Otherwise:**

    return ID_PFR2_EL1;
elsif PSTATE.EL == EL3 then
    return ID_PFR2_EL1;
**IFSR32_EL2, Instruction Fault Status Register (EL2)**

The IFSR32_EL2 characteristics are:

**Purpose**

Allows access to the AArch32 IFSR register from AArch64 state only. Its value has no effect on execution in AArch64 state.

**Configuration**

AArch64 System register IFSR32_EL2 bits [31:0] are architecturally mapped to AArch32 System register IFSR[31:0].

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to IFSR32_EL2 are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

**Attributes**

IFSR32_EL2 is a 64-bit register.

**Field descriptions**

The IFSR32_EL2 bit assignments are:

**When TTBCR.EAE == 0:**

|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

**Bits [63:17]**

Reserved, RES0.

**FnV, bit [16]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<table>
<thead>
<tr>
<th>FnV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IFAR is valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>IFAR is not valid, and holds an UNKNOWN value.</td>
</tr>
</tbody>
</table>

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [15:13]**

Reserved, RES0.
External abort type. This bit can be used to provide an **IMPLEMENTATION DEFINED** classification of External aborts. In an implementation that does not provide any classification of External aborts, this bit is **RES0**. For aborts other than External aborts this bit always returns 0. On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Bit [11]

Reserved, **RES0**.

<table>
<thead>
<tr>

<tr>
<td>0b11110</td>
<td>Synchronous parity or ECC error on translation table walk, level 2.</td>
<td>When FEAT_RAS is not implemented</td>
</tr>
</tbody>
</table>

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Short-descriptor translation table lookup'.

The FS field is split as follows:

- FS[4] is IFSR32_EL2[10].
- FS[3:0] is IFSR32_EL2[3:0].

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Data Abort exception, this bit is set as follows:

<table>
<thead>
<tr>
<th>LPAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Using the Short-descriptor translation table formats.</td>
</tr>
<tr>
<td>0b1</td>
<td>Using the Long-descriptor translation table formats.</td>
</tr>
</tbody>
</table>
Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [8:4]**

Reserved, **RES0**.

**When TTBCR.EAE == 1:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

**Bits [63:17]**

Reserved, **RES0**.

**FnV, bit [16]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<table>
<thead>
<tr>
<th>FnV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><strong>IFAR</strong> is valid.</td>
</tr>
<tr>
<td>0b1</td>
<td><strong>IFAR</strong> is not valid, and holds a <strong>UNKNOWN</strong> value.</td>
</tr>
</tbody>
</table>

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is **RES0** for all other Prefetch Abort exceptions.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [15:13]**

Reserved, **RES0**.

**ExT, bit [12]**

External abort type. This bit can be used to provide an **IMPLEMENTATION DEFINED** classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is **RES0**.

For aborts other than External aborts this bit always returns 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [11:10]**

Reserved, **RES0**.

**LPAE, bit [9]**

On taking a Data Abort exception, this bit is set as follows:

<table>
<thead>
<tr>
<th>LPAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Using the Short-descriptor translation table formats.</td>
</tr>
<tr>
<td>0b1</td>
<td>Using the Long-descriptor translation table formats.</td>
</tr>
</tbody>
</table>

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [8:6]**

Reserved, RES0.

**STATUS, bits [5:0]**

Fault status bits. Possible values of this field are:

<table>
<thead>
<tr>

elseif PSTATE.EL == EL2 then
    IFSR32_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    IFSR32_EL2 = X[t];
The ISR_EL1 characteristics are:

### Purpose

Shows the pending status of the IRQ, FIQ, or SError interrupt.

When executing at EL2, EL3 or Secure EL1 when SCR_EL3.EEL2 == 0b0, this shows the pending status of the physical IRQ, FIQ, or SError interrupts.

When executing at either Non-secure EL1 or at Secure EL1 when SCR_EL3.EEL2 == 0b1:

- If the HCR_EL2.{IMO,FMO,AMO} bit has a value of 1, the corresponding ISR_EL1.{I,F,A} bit shows the pending status of the virtual IRQ, FIQ, or SError.
- If the HCR_EL2.{IMO,FMO,AMO} bit has a value of 0, the corresponding ISR_EL1.{I,F,A} bit shows the pending status of the physical IRQ, FIQ, or SError.

### Configuration

AArch64 System register ISR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ISR[31:0].

### Attributes

ISR_EL1 is a 64-bit register.

### Field descriptions

The ISR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-9</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>8</td>
<td>SError interrupt pending bit</td>
</tr>
<tr>
<td>7</td>
<td>IRQ pending bit</td>
</tr>
</tbody>
</table>

#### Bits [63:9]

- Reserved, RES0.

#### A, bit [8]

- SError interrupt pending bit.

<table>
<thead>
<tr>
<th>A</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No pending SError</td>
</tr>
<tr>
<td>0b1</td>
<td>An SError interrupt is pending</td>
</tr>
</tbody>
</table>

If the SError interrupt is edge-triggered, this field is cleared to zero when the physical SError interrupt is taken.

#### I, bit [7]

- IRQ pending bit. Indicates whether an IRQ interrupt is pending.

<table>
<thead>
<tr>
<th>I</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No pending IRQ</td>
</tr>
<tr>
<td>0b1</td>
<td>An IRQ interrupt is pending</td>
</tr>
</tbody>
</table>
F, bit [6]

FIQ pending bit. Indicates whether an FIQ interrupt is pending.

<table>
<thead>
<tr>
<th>F</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No pending FIQ.</td>
</tr>
<tr>
<td>0b1</td>
<td>An FIQ interrupt is pending.</td>
</tr>
</tbody>
</table>

Bits [5:0]

Reserved, RES0.

Accessing the ISR_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ISR_EL1

LORC_EL1, LORegion Control (EL1)

The LORC_EL1 characteristics are:

**Purpose**

Enables and disables LORegions, and selects the current LORegion descriptor.

**Configuration**

This register is present only when FEAT_LOR is implemented. Otherwise, direct accesses to LORC_EL1 are UNDEFINED.

If no LORegion descriptors are supported by the PE, then this register is RES0.

**Attributes**

LORC_EL1 is a 64-bit register.

**Field descriptions**

The LORC_EL1 bit assignments are:

<table>

Reserved, RES0.

**DS, bits [9:2]**

Descriptor Select. Selects the current LORegion descriptor accessed by LORSA_EL1, LOREA_EL1, and LORN_EL1.

The number of LORegion descriptors in IMPLEMENTATION DEFINED. The maximum number of LORegion descriptors supported is 256. If the number is less than 256, then bits[63:M+2] are RES0, where M is Log2(Number of LORegion descriptors supported by the implementation).

If this field points to an LORegion descriptor that is not supported by an implementation, then the registers LORN_EL1, LOREA_EL1, and LORSA_EL1 are RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [1]**

Reserved, RES0.

**EN, bit [0]**

Enable. Indicates whether LORegions are enabled.

<table>
<thead>
<tr>
<th>EN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disabled. Memory accesses do not match any LORegions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Enabled. Memory accesses may match a LORegion.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.
On a Warm reset, this field resets to 0.

LOREA_EL1, LORegion End Address (EL1)

The LOREA_EL1 characteristics are:

**Purpose**

Holds the physical address of the end of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

**Configuration**

This register is present only when FEAT_LOR is implemented. Otherwise, direct accesses to LOREA_EL1 are UNDEFINED.

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- LORC_EL1.DS points to a LORegion that is not supported by the PE.

**Attributes**

LOREA_EL1 is a 64-bit register.

**Field descriptions**

The LOREA_EL1 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |

Any of the fields in this register are permitted to be cached in a TLB.

**Bits [63:52]**

Reserved, RES0.

**EA[51:48], bits [51:48]**

When FEAT_LPA is implemented:

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EA[47:16], bits [47:16]**

Bits [47:16] of the end physical address of an LORegion described in the current LORegion descriptor selected by LORC_EL1.DS. Bits[15:0] of this address are defined to be 0xFFFF. For implementations with fewer than 48 bits, the upper bits of this field are RES0.
When FEAT_LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, EA[51:48] form the upper part of the address value. Otherwise, for implementations with fewer than 52 physical address bits, EA[51:48] are RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [15:0]**

Reserved, RES0.

The LORID_EL1 characteristics are:

**Purpose**

Indicates the number of LORegions and LORegion descriptors supported by the PE.

**Configuration**

This register is present only when FEAT_LOR is implemented. Otherwise, direct accesses to LORID_EL1 are UNDEFINED.

If no LORegion descriptors are implemented, then the registers LORC_EL1, LORN_EL1, LOREA_EL1, and LORSA_EL1 are RES0.

**Attributes**

LORID_EL1 is a 64-bit register.

**Field descriptions**

The LORID_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>62</td>
<td>Reserved, RES0</td>

</tr>
<tr>
<td>60</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>59</td>
<td>LR</td>
</tr>
</tbody>
</table>

**Bits [63:24]**

Reserved, RES0.

**LD, bits [23:16]**

Number of LORegion descriptors supported by the PE. This is an 8-bit binary number.

**Bits [15:8]**

Reserved, RES0.

**LR, bits [7:0]**

Number of LORegions supported by the PE. This is an 8-bit binary number.

---

**Note**

If LORID_EL1 indicates that no LORegions are implemented, then LoadLOAcquire and StoreLORelease will behave as LoadAcquire and StoreRelease.

---

**Accessing the LORID_EL1**

Accesses to this register use the following encodings:

LORN_EL1, LORegion Number (EL1)

The LORN_EL1 characteristics are:

**Purpose**

Holds the number of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

**Configuration**

This register is present only when FEAT_LOR is implemented. Otherwise, direct accesses to LORN_EL1 are UNDEFINED.

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- LORC_EL1.DS points to a LORegion that is not supported by the PE.

**Attributes**

LORN_EL1 is a 64-bit register.

</tbody>
</table>

Any of the fields in this register are permitted to be cached in a TLB.

**Bits [63:8]**

Reserved, RES0.

**Num, bits [7:0]**

Number of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

The maximum number of LORegions supported by the PE is 256. If the maximum number is less than 256, then bits[8:N] are RES0, where N is (Log₂(Number of LORegions supported by the PE)).

If this field points to a LORegion that is not supported by the PE, then the current LORegion descriptor does not match any LORegion.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the LORN_EL1**

Accesses to this register use the following encodings:

```
MRS <Xt>, LORN_EL1
```

The MAIR_EL1 characteristics are:

**Purpose**

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL1.

**Configuration**

AArch64 System register MAIR_EL1 bits [31:0] are architecturally mapped to AArch32 System register PRRR[31:0] when TTBCR.EAE == 0.

AArch64 System register MAIR_EL1 bits [31:0] are architecturally mapped to AArch32 System register MAIR0[31:0] when TTBCR.EAE == 1.

AArch64 System register MAIR_EL1 bits [63:32] are architecturally mapped to AArch32 System register NMRR[31:0] when TTBCR.EAE == 0.

AArch64 System register MAIR_EL1 bits [63:32] are architecturally mapped to AArch32 System register MAIR1[31:0] when TTBCR.EAE == 1.

**Attributes**

MAIR_EL1 is a 64-bit register.

**Field descriptions**

The MAIR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Attr7 |     | Attr6 |     | Attr5 |     | Attr4 |     | Attr3 |     | Attr2 |     | Attr1 |     | Attr0 |     |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |

MAIR_EL1 is permitted to be cached in a TLB.

**Attr<n>, bits [8n+7:8n], for n = 7 to 0**

Attr is encoded as follows:
### Attr | Meaning
--- | ---
0b0000dd00 | Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01 | If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise, UNPREDICTABLE.
0b0000dd1x | UNPREDICTABLE.
0b00000000, (oooo != 0000 and iiii != 0000) | Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal Memory.
0b01000000 | If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b10100000 | If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b11110000 | If FEAT_MTE is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise, UNPREDICTABLE.
0bxxxx0000, (xxxx != 0000, xxxx != 0100, xxxx != 1010, xxxx != 1111) | UNPREDICTABLE.

'dd' is encoded as follows:

| dd | Meaning |
--- | ---|
0b00 | Device-nGnRnE memory |
0b01 | Device-nGnRE memory |
0b10 | Device-nGRE memory |
0b11 | Device-GRE memory |

'oooo' is encoded as follows:

| 'oooo' | Meaning |
--- | ---|
0b0000 | See encoding of Attr |
0b00RW, RW | Normal memory, Outer Write-Through Transient |
not0b0 | |
0b0100 | Normal memory, Outer Non-cacheable |
0b01RW, RW | Normal memory, Outer Write-Back Transient |
not0b0 | |
0b10RW | Normal memory, Outer Write-Through Non-transient |
0b11RW | Normal memory, Outer Write-Back Non-transient |

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

'iiii' is encoded as follows:

| 'iiii' | Meaning |
--- | ---|
0b0000 | See encoding of Attr |
0b00RW, RW | Normal memory, Inner Write-Through Transient |
not0b0 | |
0b0100 | Normal memory, Inner Non-cacheable |
0b01RW, RW | Normal memory, Inner Write-Back Transient |
not0b0 | |
0b10RW | Normal memory, Inner Write-Through Non-transient |
0b11RW | Normal memory, Inner Write-Back Non-transient |

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'oooo' and 'iiii' fields have the following meanings:
<table>
<thead>
<tr>
<th>R or W</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No Allocate</td>
</tr>
<tr>
<td>0b1</td>
<td>Allocate</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally \textit{UNKNOWN} value.

**Accessing the MAIR\_EL1**

When \texttt{HCR\_EL2.E2H} is 1, without explicit synchronization, access from EL3 using the mnemonic MAIR\_EL1 or MAIR\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

\[
\text{MRS} <Xt>, \text{MAIR\_EL1}
\]

\[
\begin{array}{|c|c|c|c|c|}
\hline
\text{op0} & \text{op1} & \text{CRn} & \text{CRm} & \text{op2} \\
\hline
0b11 & 0b000 & 0b1010 & 0b0010 & 0b000 \\
\hline
\end{array}
\]

\[
\text{if PSTATE.EL == EL0 then} \\
\quad \text{UNDEFINED;}
\]

\[
\text{elsif PSTATE.EL == EL1 then} \\
\quad \text{if EL2Enabled()} \&\& \text{HCR\_EL2.TVM} == '1' then \\
\quad \quad \text{AArch64.SystemAccessTrap(EL2, 0x18);} \\
\quad \text{elsif EL2Enabled()} \&\& (!HaveEL(EL3) || SCR\_EL3.FGTEn == '1') \&\& \text{HFGWTR\_EL2.MAIR\_EL1} == '1' then \\
\quad \quad \text{AArch64.SystemAccessTrap(EL2, 0x18);} \\
\quad \text{elsif EL2Enabled()} \&\& \text{HCR\_EL2.<NV2,NV1,NV>} == '111' then \\
\quad \quad \text{return NVMem[0x140];} \\
\quad \text{else} \\
\quad \quad \text{return MAIR\_EL1;} \\
\text{elsif PSTATE.EL == EL2 then} \\
\quad \text{if HCR\_EL2.E2H} == '1' then \\
\quad \quad \text{return MAIR\_EL2;} \\
\quad \text{else} \\
\quad \quad \text{return MAIR\_EL1;} \\
\text{elsif PSTATE.EL == EL3 then} \\
\quad \text{return MAIR\_EL1;} \\
\]

\[
\text{MSR MAIR\_EL1, <Xt>}
\]

\[
\begin{array}{|c|c|c|c|c|}

The MAIR_EL2 characteristics are:

**Purpose**

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL2.

**Configuration**

AArch64 System register MAIR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HMAIR0[31:0].

AArch64 System register MAIR_EL2 bits [63:32] are architecturally mapped to AArch32 System register HMAIR1[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

MAIR_EL2 is a 64-bit register.

**Field descriptions**

The MAIR_EL2 bit assignments are:

'R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'oooo' and 'iiii' fields have the following meanings:

MAIR_EL3, Memory Attribute Indirection Register (EL3)
<table>
<thead>
<tr>
<th>R or W</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No Allocate</td>
</tr>
<tr>
<td>0b1</td>
<td>Allocate</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

## Accessing the MAIR_EL3

Accesses to this register use the following encodings:

**MRS <Xt>, MAIR_EL3**

```c
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return MAIR_EL3;
```

**MSR MAIR_EL3, <Xt>**

```c
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    MAIR_EL3 = X[t];
```
**MDCCINT_EL1, Monitor DCC Interrupt Enable Register**

The MDCCINT_EL1 characteristics are:

**Purpose**

Enables interrupt requests to be signaled based on the DCC status flags.

**Configuration**

AArch64 System register MDCCINT_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGDCCINT[31:0].

**Attributes**

MDCCINT_EL1 is a 64-bit register.

**Field descriptions**

The MDCCINT_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>60</td>
<td>RX, bit [30] DCC interrupt request enable control for DTRRX. Enables a common COMMIRQ interrupt request to be signaled based on the DCC status flags.</td>
</tr>
<tr>
<td>59</td>
<td>Meaning</td>
</tr>
<tr>
<td>58</td>
<td>No interrupt request generated by DTRRX.</td>
</tr>
<tr>
<td>57</td>
<td>Interrupt request will be generated on RXfull == 1.</td>
</tr>
<tr>
<td>28</td>
<td>TX, bit [29] DCC interrupt request enable control for DTRTX. Enables a common COMMIRQ interrupt request to be signaled based on the DCC status flags.</td>
</tr>
<tr>
<td>27</td>

MDCCSR_EL0, Monitor DCC Status Register

The MDCCSR_EL0 characteristics are:

**Purpose**

Read-only register containing control status flags for the DCC.

**Configuration**

AArch64 System register MDCCSR_EL0 bits [30:29] are architecturally mapped to External register [EDSCR][30:29].

AArch64 System register MDCCSR_EL0 bits [30:29] are architecturally mapped to AArch32 System register [DBGDSCR][30:29].

**Attributes**

MDCCSR_EL0 is a 64-bit register.

**Field descriptions**

The MDCCSR_EL0 bit assignments are:

| Bit 63 | Bit 62 | Bit 61 | Bit 60 | Bit 59 | Bit 58 | Bit 57 | Bit 56 | Bit 55 | Bit 54 | Bit 53 | Bit 52 | Bit 51 | Bit 50 | Bit 49 | Bit 48 | Bit 47 | Bit 46 | Bit 45 | Bit 44 | Bit 43 | Bit 42 | Bit 41 | Bit 40 | Bit 39 | Bit 38 | Bit 37 | Bit 36 | Bit 35 | Bit 34 | Bit 33 | Bit 32 |

The MDCR_EL2 characteristics are:

**Purpose**
Provides EL2 configuration options for self-hosted debug and the Performance Monitors Extension.

**Configuration**
AArch64 System register MDCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HDCR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**
MDCR_EL2 is a 64-bit register.

**Field descriptions**
The MDCR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>62</th>
<th>61</th>
<th>60</th>
<th>59</th>
<th>58</th>
<th>57</th>
<th>56</th>

<td>HPMD</td>
<td>RES0</td>
<td>TPM</td>
<td>E2PB</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:37]**
Reserved, RES0.

**HPMFZS, bit [36]**
When FEAT_SPEv1p2 is implemented:

Hyp Performance Monitors Freeze-on-SPE event. Stop counters when PMBLIMITER_EL1.(PMFZ, E) == {1, 1} and PMBSR_EL1.S == 0b1.

<table>
<thead>
<tr>
<th>HPMFZS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not freeze on Statistical Profiling Buffer Management event.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counters do not count following a Statistical Profiling Buffer Management event.</td>
</tr>
</tbody>
</table>

If MDCR_EL2.HPMN is less than PMCR_EL0.N, this bit affects the operation of event counters in the range [MDCR_EL2.HPMN .. (PMCR_EL0.N-1)].

If MDCR_EL2.HPMN is equal to PMCR_EL0.N, this bit has no effect.

This bit does not affect the operation of event counters in the range [0 .. (MDCR_EL2.HPMN-1)] and PMCCNTR_EL0.

The operation of this bit applies even when EL2 is disabled in the current Security state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

**Bits [35:30]**
Reserved, RES0.

**HPMFZO, bit [29]**

When FEAT_PMUv3p7 is implemented:

Hyp Performance Monitors Freeze-on-overflow. Stop event counters on overflow.

<table>
<thead>
<tr>
<th>HPMFZO</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not freeze on overflow. Event counters do not count when PMOVSCLR_EL0((PMCR_EL0.N-1):MDCR_EL2.HPMN) is nonzero.</td>
</tr>
<tr>
<td>0b1</td>
<td></td>
</tr>
</tbody>
</table>

If MDCR_EL2.HPMN is less than PMCR_EL0.N, this bit affects the operation of event counters in the range [MDCR_EL2.HPMN .. (PMCR_EL0.N-1)].

If MDCR_EL2.HPMN is equal to PMCR_EL0.N, this bit has no effect.

This bit does not affect the operation of event counters in the range [0 .. (MDCR_EL2.HPMN-1)] and PMCCNTR_EL0.

The operation of this bit ignores the values of PMOVSCLR_EL0((MDCR_EL2.HPMN-1):0].

The operation of this bit applies even when EL2 is disabled in the current Security state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

**MTPME, bit [28]**

When FEAT_MTPMU is implemented and EL3 is not implemented:

Multi-threaded PMU Enable. Enables use of the PMEVTYPER<n>_EL0.MT bits.

<table>
<thead>
<tr>
<th>MTPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FEAT_MTPMU is disabled. The Effective value of PMEVTYPER&lt;n&gt;_EL0.MT is zero.</td>
</tr>
<tr>
<td>0b1</td>
<td>PMEVTYPER&lt;n&gt;_EL0.MT bits not affected by this bit.</td>
</tr>
</tbody>
</table>

If FEAT_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this bit is 0b0.

On a Cold reset, this field resets to 1.

Otherwise:
Reserved, RES0.

**TDCC, bit [27]**

When FEAT_FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel at EL1 and EL0 to EL2.
The DCC registers trapped by this control are:

AArch64: OSDTRRX_EL1, OSDTRTX_EL1, MDCCSR_EL0, MDCCINT_EL1, and, when the PE is in Non-debug state, DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0.

AArch32: DBGDTRRXext, DBGDTRTXext, DBGDSCRint, DBGDCCINT, and, when the PE is in Non-debug state, DBGDTRRXint and DBGDTRTXint.

The traps are reported with EC syndrome value:

- 0x05 for trapped AArch32 MRC and MCR accesses with coproc == 0b1110.
- 0x06 for trapped AArch32 LDC to DBGDTRTXint and STC from DBGDTRRXint.
- 0x18 for trapped AArch64 MRS and MSR accesses.

When the PE is in Debug state, MDCR_EL2.TDCC does not trap any accesses to:

AArch64: DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0.

AArch32: DBGDTRRXint and DBGDTRTXint.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HLP, bit [26]

When FEAT_PMUv3p5 is implemented:

Hypervisor Long event counter enable. Determines when unsigned overflow is recorded by a counter overflow bit.

<table>
<thead>
<tr>
<th>HLP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counter overflow on increment that causes unsigned overflow of PMEVCNTR&lt;np&gt; EL0[31:0].</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counter overflow on increment that causes unsigned overflow of PMEVCNTR&lt;np&gt; EL0[63:0].</td>
</tr>
</tbody>
</table>

If MDCR_EL2.HPMN is less than PMCR_EL0.N or PMCR_N, this bit affects the operation of event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)] or [MDCR_EL2.HPMN..(PMCR_N-1)]. Otherwise this bit has no effect on the operation of the event counters.

Note

The effect of MDCR_EL2.HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state.

For more information see the description of the MDCR_EL2.HPMN field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
Bits [25:24]

Reserved, RES0.

**HCCD, bit [23]**

*When FEAT_PMUv3p5 is implemented:*

Hypervisor Cycle Counter Disable. Prohibits PMCCNTR_EL0 from counting at EL2.

<table>
<thead>
<tr>
<th>HCCD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counting by PMCCNTR_EL0 is not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Cycle counting by PMCCNTR_EL0 is prohibited at EL2.</td>
</tr>
</tbody>
</table>

This bit does not affect the CPU_CYCLES event or any other event that counts cycles.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

**Bits [22:20]**

Reserved, RES0.

**TTRF, bit [19]**

*When FEAT_TRF is implemented:*

Traps use of the Trace Filter Control registers at EL1 to EL2, as follows:

- Access to TRFCR_EL1 is trapped to EL2, reported using EC syndrome value 0x18.
- Access to TRFCR is trapped to EL2, reported using EC syndrome value 0x03.

<table>
<thead>
<tr>
<th>TTRF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to TRFCR_EL1 and TRFCR at EL1 are not affected by this control.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to TRFCR_EL1 and TRFCR at EL1 generate a trap exception to EL2 when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

**Bit [18]**

Reserved, RES0.

**HPMD, bit [17]**

*When FEAT_PMUv3p1 is implemented:*

Guest Performance Monitors Disable. This control prohibits event counting at EL2.
### HPMD

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counting allowed at EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counting prohibited at EL2. If FEAT_Debugv8p2 is not implemented, event counting is prohibited unless enabled by the IMPLEMENTATION DEFINED authentication interface <code>ExternalSecureNoninvasiveDebugEnabled()</code>.</td>
</tr>
</tbody>
</table>

This control applies only to:

- The event counters in the range [0..(MDCR_EL2.HPMN-1)].
- If `PMCR_EL0.DP` is set to 1, `PMCCNTR_EL0`.

The other event counters are unaffected, and when `PMCR_EL0.DP` is set to 0, `PMCCNTR_EL0` is unaffected.

On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

### Bits [16:15]

Reserved, RES0.

### TPMS, bit [14]

**When FEAT_SPE is implemented:**

Trap Performance Monitor Sampling. If EL2 is implemented and enabled in the current Security state, controls access to Statistical Profiling control registers from EL1.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not trap Statistical Profiling controls to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state, accesses to Statistical Profiling control registers at EL1 generate a Trap exception to EL2.</td>
</tr>
</tbody>
</table>

The Statistical Profiling control registers trapped by this control are:

- `PMSCR_EL1`, `PMSEVFR_EL1`, `PMSFCR_EL1`, `PMSICR_EL1`, `PMSIDR_EL1`, `PMSIRR_EL1`, and `PMSLATFR_EL1`.
- If FEAT_SPEv1p2 is implemented, `PMSNEVFR_EL1`.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

### E2PB, bits [13:12]

**When FEAT_SPE is implemented:**

EL2 Profiling Buffer. If EL2 is implemented and enabled in the Profiling Buffer owning Security state, this field controls the owning translation regime. If EL2 is implemented and enabled in the current Security state, this field controls access to Profiling Buffer control registers from EL1.
Meaning

0b00 If EL2 is implemented and enabled in the Profiling Buffer owning Security state, the Profiling Buffer uses the EL2 or EL2&0 stage 1 translation regime. Otherwise the Profiling Buffer uses the EL1&0 stage 1 translation regime. If EL2 is implemented and enabled in the current Security state, accesses to Profiling Buffer control registers at EL1 generate a Trap exception to EL2.

0b10 Profiling Buffer uses the EL1&0 stage 1 translation regime. If EL2 is implemented and enabled in the current Security state, accesses to Profiling Buffer control registers at EL1 generate a Trap exception to EL2.

0b11 Profiling Buffer uses the EL1&0 stage 1 translation regime. Accesses to Profiling Buffer control registers at EL1 are not trapped to EL2.

All other values are reserved.

The Profiling Buffer control registers trapped by this control are: PMBLIMITR_EL1, PMBPTR_EL1, and PMBSR_EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TDRA, bit [11]

Trap Debug ROM Address register access. Traps System register accesses to the Debug ROM registers to EL2 when EL2 is enabled in the current Security state as follows:

- If EL1 is using AArch64 state, accesses to MDRAR_EL1 are trapped to EL2, reported using EC syndrome value 0x18.
- If EL0 or EL1 is using AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05 and MRRC or MCRR accesses are trapped to EL2, reported using EC syndrome value 0x0C:
  - DBGDRAR, DBGDSAR.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- MDCR_EL2.TDE == 1.
- HCR_EL2.TGE == 1.

Note

EL2 does not provide traps on debug register accesses through the optional memory-mapped external debug interfaces.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDOSA, bit [10]

When FEAT_DoubleLock is implemented:

Trap debug OS-related register access. Traps EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states as follows:
In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value \(0x18\):

- OSLAR_EL1, OSLSR_EL1, OSDLR_EL1, and DBGPRCR_EL1.
- Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

In AArch32 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value \(0x05\):

- DBGOSLSR, DBGOSLAR, DBGOSDLR, and DBGPRCR.
- Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

<table>
<thead>
<tr>
<th>TDOSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 System register accesses to the powerdown debug registers are trapped to EL2 when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

**Note**

These registers are not accessible at EL0.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- **MDCR_EL2.TDE == 1.**
- **HCR_EL2.TGE == 1.**

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Trap debug OS-related register access. Traps EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states as follows:

In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value \(0x18\):

- OSLAR_EL1, OSLSR_EL1, and DBGPRCR_EL1.
- Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

In AArch32 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value \(0x05\):

- DBGOSLSR, DBGOSLAR, and DBGPRCR.
- Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

It is IMPLEMENTATION DEFINED whether accesses to OSDLR_EL1 are trapped.

It is IMPLEMENTATION DEFINED whether accesses to DBGOSDLR are trapped.

<table>
<thead>
<tr>
<th>TDOSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 System register accesses to the powerdown debug registers are trapped to EL2 when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

**Note**

These registers are not accessible at EL0.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:
Note

EL2 does not provide traps on debug register accesses through the optional memory-mapped external debug interfaces.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**TDA, bit [9]**

Trap Debug Access. Traps EL0 and EL1 System register accesses to debug System registers that are not trapped by MDCR_EL2.TDRA or MDCR_EL2.TDOSA, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2 reported using EC syndrome value 0x18:
  - MDCCSR_EL0, MDCCINT_EL1, OSDTRRX_EL1, MDSCR_EL1, OSDTRTX_EL1, OSECCR_EL1, DBGVR<n>_EL1, DBGCR<n>_EL1, DBGWVR<n>_EL1, DBGWCR<n>_EL1, DBGCLAIMCLR_EL1, DBGAUTHSTATUS_EL1,
  - When not in Debug state, DBGDTR_EL0, DBGDTRRX_EL0, DBGDTRTX_EL0.
- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05:
  - DBGDIDR, DBGDCINT, DBGWFAR, DBGVCR, DBGDCRext, DBGDTRXext, DBGDTRRXext, DBGVR<n>, DBGCR<n>, DBGXVR<n>, DBGWCR<n>, DBGWVR<n>, DBGCLAIMCLR, DBGAUTHSTATUS, DBGDEVID, DBGDEVID1, DBGDEVID2, DBGSECCR,
  - When not in Debug state, DBGDTRRXint and DBGDTRTXint.
- In AArch32 state, STC accesses to DBGDTRRXint and LDC accesses to DBGDTRTXint are trapped to EL2, reported using EC syndrome value 0x06.

<table>
<thead>
<tr>
<th>TDA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 or EL1 System register accesses to the debug registers are trapped from both Execution states to EL2 when EL2 is enabled in the current Security state, unless the access generates a higher priority exception.</td>
</tr>
</tbody>
</table>

Traps of AArch32 accesses to DBGDTRRXint and DBGDTRTXint are ignored in Debug state.

Traps of AArch64 accesses to DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0 are ignored in Debug state.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- **MDCR_EL2.TDE == 1**
- **HCR_EL2.TGE == 1**

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**TDE, bit [8]**

Trap Debug Exceptions. Controls routing of Debug exceptions, and defines the debug target Exception level, EL_D.

<table>
<thead>
<tr>
<th>TDE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The debug target Exception level is EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is enabled for the current Effective value of <strong>SCR_EL3.NS</strong>, the debug target Exception level is EL2, otherwise the debug target Exception level is EL1.</td>
</tr>
</tbody>
</table>

The MDCR_EL2.(TDRA, TDOSA, TDA) fields are treated as being 1 for all purposes other than returning the result of a direct read of the register.

For more information, see 'Routing debug exceptions'.

This field is treated as being 1 for all purposes other than a direct read when **HCR_EL2.TGE == 1**.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**HPME, bit [7]**  
When FEAT_PMUv3 is implemented:

[MDCR_EL2.HPMN..(N-1)] event counters enable.

<table>
<thead>
<tr>
<th>HPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)] are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)] are enabled by PMCNTENSET_EL0.</td>
</tr>
</tbody>
</table>

If MDCR_EL2.HPMN is less than PMCR_EL0.N or PMCR.N, the event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)] or [HDCR.HPMN..(PMCR.N-1)], are enabled and disabled by this bit. Otherwise this bit has no effect on the operation of the event counters.

**Note**

The effect of MDCR_EL2.HPMN on the operation of this bit applies regardless of whether EL2 is enabled in the current Security state.

For more information see the description of the HPMN field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TPM, bit [6]**  
When FEAT_PMUv3 is implemented:

Trap Performance Monitors accesses. Traps EL0 and EL1 accesses to all Performance Monitor registers to EL2 when EL2 is enabled in the current Security state, from both Execution states, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - PMCR_EL0, PMCNTENSET_EL0, PMCNTENCLR_EL0, PMOVSCLR_EL0, PMSWINC_EL0, PMSEL0_EL0, PMCEID0_EL0, PMCEID1_EL0, PMCCNTR_EL0, PMXEVTYPER_EL0, PMXEVNCTR_EL0, PMUSERENR_EL0, PMINTENSET_EL1, PMINTENCLR_EL1, PMOVSET_EL0, PMEVCNTR<->_EL0, PMEVTYPER<n>_EL0, PMCCFILTR_EL0.
  - If FEAT_PMUv3p4 is implemented, PMMIR_EL1

- In AArch32 state, MRCC or MCR accesses to the following registers are trapped to EL2 and reported using EC syndrome value 0x03, MRRC or MCRR accesses are trapped to EL2 and reported using EC syndrome value 0x04:
  - PMCR, PMCNTENSET, PMCNTENCLR, PMOVS, PMSWINC, PMSEL, PMCEID0, PMCEID1, PMCCNTR, PMXEVTYPER, PMXEVCNTR, PMUSERENR, PMINTENSET, PMINTENCLR, PMOVSET, PMEVCNTR<n>, PMEVTYPER<n>, PMCCFILTR.
  - If FEAT_PMUv3p4 is implemented, PMMIR.
  - If FEAT_PMUv3p1 is implemented, PMCEID2, and PMCEID3.

<table>
<thead>
<tr>
<th>TPM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 and EL1 accesses to all Performance Monitor registers are trapped to EL2 when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>
Note

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TPMCR, bit [5]

When FEAT_PMUv3 is implemented:

Trap PMCR_EL0 or PMCR accesses. Traps EL0 and EL1 accesses to EL2, when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to PMCR_EL0 are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, accesses to PMCR are trapped to EL2, reported using EC syndrome value 0x03.

<table>
<thead>
<tr>
<th>TPMCR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 and EL1 accesses to the PMCR_EL0 or PMCR are trapped to EL2 when EL2 is enabled in the current Security state, unless it is trapped by PMUSERENR.EN or PMUSERENR_EL0.EN.</td>
</tr>
</tbody>
</table>

Note

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPMN, bits [4:0]

When FEAT_PMUv3 is implemented:

Defines the number of event counters that are accessible from EL3, EL2, EL1, and from EL0 if permitted.

If HPMN is less than PMCR_EL0.N, HPMN divides the Performance Monitors into two ranges: [0..(HPMN-1)] and [HPMN..(PMCR_EL0.N-1)].

For an event counter in the range [0..(HPMN-1)]:

- The counter is accessible from EL3, EL2, and EL1, and from EL0 if permitted by PMUSERENR_EL0 or PMUSERENR.
- If FEAT_PMUv3p5 is implemented, PMCR_EL0.LP or PMCR LP determines whether the counter overflow flag is set on unsigned overflow of PMEVCNTR<n>_EL0[31:0] or PMEVCNTR<n>_EL0[63:0].
- The counter is enabled by PMCR_EL0.E or PMCR.E and bit <n> of PMCNTENSET_EL0.

Note

If HPMN is equal to PMCR_EL0.N, this applies to all event counters.

If HPMN is less than PMCR_EL0.N, for an event counter in the range [HPMN..(PMCR_EL0.N-1)]:

The counter is accessible from EL2 and EL3.
If FEAT_SEL2 is disabled or is not implemented, the counter is also accessible from Secure EL1, and from Secure EL0 if permitted by PMUSERENR_EL0.
If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP or HDCR.HLP determines whether the counter overflow flag is set on unsigned overflow of PMEVCNTR<n>_EL0[31:0] or PMEVCNTR<n>_EL0[63:0].
The counter is enabled by MDCR_EL2.HPME or HDCR.HPME and bit <n> of PMCNTENSEL_EL0.

If this field is set to 0, or to a value larger than PMCR_EL0.N, then the following CONSTRAINED UNPREDICTABLE behaviors apply:

- The value returned by a direct read of MDCR_EL2.HPMN is UNKNOWN.
- Either:
  - An UNKNOWN number of counters are reserved for EL2 and EL3 use. That is, the PE behaves as if MDCR_EL2.HPMN is set to an UNKNOWN non-zero value less than or equal to PMCR_EL0.N.
  - All counters are reserved for EL2 and EL3 use, meaning no counters are accessible from EL1 and EL0.

On a Warm reset, this field resets to the value in PMCR_EL0.N.

Otherwise:

Reserved, RES0.

**Accessing the MDCR_EL2**

Accesses to this register use the following encodings:

**MRS <Xt>, MDCR_EL2**

<table>

    MDCR_EL2 = X[t];
MDCR_EL3, Monitor Debug Configuration Register (EL3)

The MDCR_EL3 characteristics are:

**Purpose**

Provides EL3 configuration options for self-hosted debug and the Performance Monitors Extension.

**Configuration**

AArch64 System register MDCR_EL3 bits [31:0] can be mapped to AArch32 System register $SDCR[31:0]$, but this is not architecturally mandated.

This register is present only when EL3 is implemented. Otherwise, direct accesses to MDCR_EL3 are UNDEFINED.

**Attributes**

MDCR_EL3 is a 64-bit register.

**Field descriptions**

The MDCR_EL3 bit assignments are:

| Bits   | 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  |
|--------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|

**Bits [63:37]**

Reserved, RES0.

**EnPMSN, bit [36]**

When FEAT_SPEv1p2 is implemented:

Trap accesses to $PMSNEVFR_EL1$. Controls access to Statistical Profiling $PMSNEVFR_EL1$ System register from EL2 and EL1.

<table>
<thead>
<tr>
<th>EnPMSN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to $PMSNEVFR_EL1$ at EL2 and EL1 generate a Trap exception to EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not trap $PMSNEVFR_EL1$ to EL3.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.
MPMX, bit [35]

When FEAT_PMUv3p7 is implemented:

Monitor Performance Monitors Extended control. In conjunction with MDCR_EL3.SPME, controls when event counters are disabled at EL3 and in other Secure Exception levels.

<table>
<thead>
<tr>
<th>MPMX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counting is not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counting by some or all event counters is prohibited at EL3.</td>
</tr>
</tbody>
</table>

If EL2 is implemented, MDCR_EL3.SPME == 0b1, and MDCR_EL2.HPMN is less than PMCR_EL0.N then all the following are true:

- This bit affects the operation of event counters in the range [0 .. (MDCR_EL2.HPMN-1)].
- This bit does not affect the operation of event counters in the range [MDCR_EL2.HPMN .. (PMCR_EL0.N-1)].
- This applies even when EL2 is disabled in Secure state.

If EL2 is not implemented, MDCR_EL3.SPME == 0b0, or MDCR_EL2.HPMN is equal to PMCR_EL0.N then this bit affects the operation of all event counters.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

MCCD, bit [34]

When FEAT_PMUv3p7 is implemented:

Monitor Cycle Counter Disable. Prohibits the Cycle Counter, PMCCNTR_EL0, from counting at EL3.

<table>
<thead>
<tr>
<th>MCCD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counting by PMCCNTR_EL0 is not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Cycle counting by PMCCNTR_EL0 is prohibited at EL3.</td>
</tr>
</tbody>
</table>

This bit does not affect the CPU_CYCLES event or any other event that counts cycles.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [33:29]

Reserved, RES0.

MTPME, bit [28]

When FEAT_MTPMU is implemented:

Multi-threaded PMU Enable. Enables use of the PMEVTYPER<n>_EL0.MT bits.

<table>
<thead>
<tr>
<th>MTPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FEAT_MTPMU is disabled. The Effective value of PMEVTYPER&lt;n&gt;_EL0.MT is zero.</td>
</tr>
<tr>
<td>0b1</td>
<td>PMEVTYPER&lt;n&gt;_EL0.MT bits not affected by this bit.</td>
</tr>
</tbody>
</table>

If FEAT_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this bit is 0b0.

On a Cold reset, this field resets to 1.
**TDCC, bit [27]**

When FEAT_FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel at EL2, EL1, and EL0 to EL3.

<table>
<thead>
<tr>
<th>TDCC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any register accesses to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to the DCC registers at EL2, EL1, and EL0 generate a Trap exception to EL3, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.</td>
</tr>
</tbody>
</table>

The DCC registers trapped by this control are:

- **AArch64**: OSDTRRX_EL1, OSDTRTX_EL1, MDCCSR_EL0, MDCCINT_EL1, and, when the PE is in Non-debug state, DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0.
- **AArch32**: DBGDTRRXext, DBGDTRTXext, DBGDSCRint, DBGDCCINT, and, when the PE is in Non-debug state, DBGDTRRXint and DBGDTRTXint.

The traps are reported with EC syndrome value:

- 0x05 for trapped AArch32 MRC and MCR accesses with coproc == 0b1110.
- 0x06 for trapped AArch32 LDC to DBGDTRRXint and STC from DBGDTRRXint.
- 0x18 for trapped AArch64 MRS and MSR accesses.

When the PE is in Debug state, MDCR_EL3.TDCC does not trap any accesses to:

- **AArch64**: DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0.
- **AArch32**: DBGDTRRXint and DBGDTRTXint.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SCCD, bit [23]**

When FEAT_PMUv3p5 is implemented:

Secure Cycle Counter Disable. Prohibits PMCCNTR_EL0 from counting in Secure state.

<table>
<thead>
<tr>
<th>SCCD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counting by PMCCNTR_EL0 is not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Cycle counting by PMCCNTR_EL0 is prohibited in Secure state.</td>
</tr>
</tbody>
</table>

This bit does not affect the CPU_CYCLES event or any other event that counts cycles.

On a Warm reset, this field resets to 0.
Otherwise:
Reserved, RES0.

Bit [22]
Reserved, RES0.

**EPMAD, bit [21]**

*When FEAT_Debugv8p4 is implemented and FEAT_PMUv3 is implemented:*

External Performance Monitors Non-secure Access Disable. Controls Non-secure access to Performance Monitor registers by an external debugger.

<table>
<thead>
<tr>
<th>EPMAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure access to Performance Monitor registers from external debugger is permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure access to Performance Monitor registers from external debugger is not permitted.</td>
</tr>
</tbody>
</table>

If the Performance Monitors Extension does not support external debug interface accesses this bit is RES0.

Otherwise, if EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

*When FEAT_PMUv3 is implemented:*

External Performance Monitors Access Disable. Controls access to Performance Monitor registers by an external debugger.

<table>
<thead>
<tr>
<th>EPMAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to Performance Monitor registers from external debugger is permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access to Performance Monitor registers from external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.</td>
</tr>
</tbody>
</table>

If the Performance Monitors Extension does not support external debug interface accesses this bit is RES0.

Otherwise, if EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

*Otherwise:*

Reserved, RES0.

**EDAD, bit [20]**

*When FEAT_Debugv8p4 is implemented:*

External Debug Non-secure Access Disable. Controls Non-secure access to breakpoint, watchpoint, and OSLAR_EL1 registers by an external debugger.

<table>
<thead>
<tr>
<th>EDAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure access to debug registers from external debugger is permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure access to breakpoint and watchpoint registers, and OSLAR_EL1 from external debugger is not permitted.</td>
</tr>
</tbody>
</table>
If EL3 is not implemented and the Effective value of `SCR_EL3.NS` is \(0b0\), then the Effective value of this field is \(0b1\).

On a Warm reset, this field resets to \(0\).

### When FEAT_Debugv8p2 is implemented:

External Debug Access Disable. Controls access to breakpoint, watchpoint, and `OSLAR_EL1` registers by an external debugger.

<table>
<thead>
<tr>
<th>EDAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>(0b0)</td>
<td>Access to debug registers, and to <code>OSLAR_EL1</code> from external debugger is permitted.</td>
</tr>
<tr>
<td>(0b1)</td>
<td>Access to breakpoint and watchpoint registers, and to <code>OSLAR_EL1</code> from external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the Effective value of `SCR_EL3.NS` is \(0b0\), then the Effective value of this field is \(0b1\).

On a Warm reset, this field resets to \(0\).

Otherwise:

External Debug Access disable. Controls access to breakpoint, watchpoint, and optionally `OSLAR_EL1` registers by an external debugger.

<table>
<thead>
<tr>
<th>EDAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>(0b0)</td>
<td>Access to debug registers from external debugger is permitted.</td>
</tr>
<tr>
<td>(0b1)</td>
<td>Access to breakpoint and watchpoint registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface. It is IMPLEMENTATION DEFINED whether access to the <code>OSLAR_EL1</code> register from an external debugger is permitted or not permitted.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the Effective value of `SCR_EL3.NS` is \(0b0\), then the Effective value of this field is \(0b1\).

On a Warm reset, this field resets to \(0\).

### TTRF, bit [19]

#### When FEAT_TRF is implemented:

Trap Trace Filter controls. Traps use of the Trace Filter control registers at EL2 and EL1 to EL3.

The Trace Filter registers trapped by this control are:

- `TRFCR_EL2`, `TRFCR_EL12`, `TRFCR_EL1`, reported using EC syndrome value \(0x18\).
- `HTRFCR` and `TRFCR`, reported using EC syndrome value \(0x03\).

<table>
<thead>
<tr>
<th>TTRF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>(0b0)</td>
<td>Accesses to Trace Filter registers at EL2 and EL1 are not affected by this bit.</td>
</tr>
<tr>
<td>(0b1)</td>
<td>Accesses to Trace Filter registers at EL2 and EL1 generate a Trap exception to EL3, unless the access generates a higher priority exception.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, \(RES0\).

### STE, bit [18]
When FEAT_TRF is implemented:

Secure Trace enable. Enables tracing in Secure state.

<table>
<thead>
<tr>
<th>STE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Trace prohibited in Secure state unless overridden by the IMPLEMENTATION DEFINED authentication interface.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trace in Secure state is not affected by this bit.</td>
</tr>
</tbody>
</table>

This bit also controls the level of authentication required by an external debugger to enable external tracing. See 'Register controls to enable self-hosted trace'.

If EL3 is not implemented and the Effective value of SCR_EL3_NS is 0b0, the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SPME, bit [17]

When FEAT_PMUv3 is implemented and FEAT_PMUv3p7 is implemented:

Secure Performance Monitors Enable.

Controls event counting in Secure state and EL3.

When MDCR_EL3.MPMX == 0b1, this bit affects the operation of event counters at EL3 only. See MDCR_EL3.MPMX for more information.

<table>
<thead>
<tr>
<th>SPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When MDCR_EL3.MPMX == 0b0: Event counting prohibited in Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>When MDCR_EL3.MPMX == 0b0: Event counting in Secure state not affected by this bit.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the Effective value of SCR_EL3_NS is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

When FEAT_PMUv3 is implemented and FEAT_Debugv8p2 is implemented:

Secure Performance Monitors Enable. Controls event counting in Secure state.

<table>
<thead>
<tr>
<th>SPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counting prohibited in Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counting in Secure state not affected by this bit.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the Effective value of SCR_EL3_NS is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

When FEAT_PMUv3 is implemented:

Secure Performance Monitors Enable. Controls event counting in Secure state.

<table>
<thead>
<tr>
<th>SPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counting prohibited in Secure state, unless ExternalSecureNoninvasiveDebugEnabled() is TRUE.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counting in Secure state not affected by this bit.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the Effective value of SCR_EL3_NS is 0b0, then the Effective value of this bit is 0b1.
On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

**SDD, bit [16]**

AArch64 Secure Self-hosted invasive debug disable. Disables Software debug exceptions in Secure state, other than Breakpoint Instruction exceptions.

<table>
<thead>
<tr>
<th>SDD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Debug exceptions in Secure state are not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Debug exceptions, other than Breakpoint Instruction exceptions, are disabled from all Exception levels in Secure state.</td>
</tr>
</tbody>
</table>

The SDD bit is ignored unless both of the following are true:

- The PE is in Secure state.
- The Effective value of **SCR_EL3**.RW is 0b1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**SPD32, bits [15:14]**

When EL1 is capable of using AArch32:

AArch32 Secure self-hosted privileged debug. Enables or disables debug exceptions from Secure EL1 using AArch32, other than Breakpoint Instruction exceptions.

<table>
<thead>
<tr>
<th>SPD32</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Legacy mode. Debug exceptions from Secure EL1 are enabled by the IMPLEMENTATION DEFINED authentication interface.</td>
</tr>
<tr>
<td>0b10</td>
<td>Secure privileged debug disabled. Debug exceptions from Secure EL1 are disabled.</td>
</tr>
<tr>
<td>0b11</td>
<td>Secure privileged debug enabled. Debug exceptions from Secure EL1 are enabled.</td>
</tr>
</tbody>
</table>

Other values are reserved, and have the CONstrained UNPredictable behavior that they must have the same behavior as 0b00. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field has no effect on Breakpoint Instruction exceptions. These are always enabled.

This field is ignored if the PE is either:

- In Non-secure state.
- In Secure state and Secure EL1 is using AArch64.

If Secure EL1 is using AArch32 then:

- If debug exceptions from Secure EL1 are enabled, then debug exceptions from Secure EL0 are also enabled.
- Otherwise, debug exceptions from Secure EL0 are enabled only if the value of **SDER32_EL3**.SUIDEN is 0b1.

If EL3 is not implemented and the Effective value of **SCR_EL3**.NS is 0b0, then the Effective value of this field is 0b11.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.
When FEAT_SPE is implemented:

Non-secure Profiling Buffer. Controls the owning translation regime and accesses to Statistical Profiling and Profiling Buffer control registers.

<table>
<thead>
<tr>
<th>NSPB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in both Security states generate Trap exceptions to EL3.</td>
</tr>
<tr>
<td>0b01</td>
<td>Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Non-secure state generate Trap exceptions to EL3.</td>
</tr>
<tr>
<td>0b10</td>
<td>Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in both Security states generate Trap exceptions to EL3.</td>
</tr>
<tr>
<td>0b11</td>
<td>Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Secure state generate Trap exceptions to EL3.</td>
</tr>
</tbody>
</table>

The Statistical Profiling and Profiling Buffer control registers trapped by this control are:

- PMBLIMITR_EL1, PMBPTR_EL1, PMBSR_EL1, PMSCR_EL1, PMSCR_EL2, PMSEVFR_EL1, PMSFCSR_EL1, PMSICR_EL1, PMSIDR_EL1, PMBSR_EL1, and PMSLATFR_EL1.
- If FEAT_SPEv1p2 is implemented, PMSNEVFR_EL1.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b1, the Effective value of this field is 0b11.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, the Effective value of this field is 0b01.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [11]

Reserved, RES0.

TDOSA, bit [10]

When FEAT_DoubleLock is implemented:

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

Accesses to the registers are trapped as follows:

- Accesses from AArch64 state, OSLAR_EL1, OSLSR_EL1, OSDLR_EL1, DBGOSLAR, DBGOSLHR, DBGOSDLR, and DBGOSLHR, are trapped to EL3 and reported using EC syndrome value 0x18.
- Accesses using MCR or MRC to DBGOSLAR, DBGOSLHR, DBGOSDLR, and DBGOSLHR, are trapped to EL3 and reported using EC syndrome value 0x05.
- Accesses to any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
## TDOSA

<table>
<thead>
<tr>
<th>TDOSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by \texttt{HDCR.TDOSA} or \texttt{MDCR.EL2.TDOSA}.</td>
</tr>
</tbody>
</table>

### Note

The powerdown debug registers are not accessible at EL0.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

### Otherwise:

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

The following registers are affected by this trap:

- AArch64: \texttt{Oslar_EL1}, \texttt{Oslsr_EL1}, and \texttt{Dbgpocr_EL1}.
- AArch32: \texttt{Dbgoslar}, \texttt{Dbgoslslr}, and \texttt{Dbgpocr}.
- AArch64 and AArch32: Any \texttt{IMPLEMENTATION DEFINED} register with similar functionality that the implementation specifies as trapped by this bit.
- It is \texttt{IMPLEMENTATION DEFINED} whether accesses to \texttt{Osdler_EL1} and \texttt{Dbgosdlr} are trapped.

<table>
<thead>
<tr>
<th>TDOSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by \texttt{HDCR.TDOSA} or \texttt{MDCR.EL2.TDOSA}.</td>
</tr>
</tbody>
</table>

### Note

The powerdown debug registers are not accessible at EL0.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

### TDA, bit [9]

Trap Debug Access. Traps EL2, EL1, and EL0 System register accesses to those debug System registers that cannot be trapped using the MDCR.EL3.TDOSA field.

Accesses to the debug registers are trapped as follows:

- In AArch64 state, the following registers are trapped to EL3 and reported using EC syndrome value \texttt{0x18}:
  - \texttt{DBGVR<n> EL1}, \texttt{DBGBCR<n> EL1}, \texttt{DBGWVR<n> EL1}, \texttt{DBGWCR<n> EL1}, \texttt{DBGCLAIMSET_EL1}, \texttt{DBGCLAIMCLR_EL1}, \texttt{DBGAUTHSTATUS_EL1}, \texttt{DBGVCR<n> EL2}.
  - AArch64: \texttt{MDCR_EL2}, \texttt{MDRAR_EL1}, \texttt{MDCCSR_EL0}, \texttt{MDCCINT_EL1}, \texttt{MDSRCR_EL1}, \texttt{OSDTRRX_EL1}, \texttt{OSDTRTX_EL1}, \texttt{OSECRR_EL1}.
- In AArch32 state, \texttt{SDER} is trapped to EL3 and reported using EC syndrome value \texttt{0x03}.
- In AArch32 state, accesses using MCR or MRC to the following registers are reported using EC syndrome value \texttt{0x05}, accesses using MCRR or MRRC are reported using EC syndrome value \texttt{0x0C}:
  - \texttt{HDCR}, \texttt{DBGDRAR}, \texttt{DBGDSAR}, \texttt{DBGDIDR}, \texttt{DBGDCCINT}, \texttt{DBGWFR}, \texttt{DBGVCR}, \texttt{DBGVCR<n>}, \texttt{DBGBCR<n>}, \texttt{DBGWVR<n>}, \texttt{DBGWVR<n>}, \texttt{DBGVCR<n>}, \texttt{DBGCINT}, \texttt{DBGAUTHSTATUS}, \texttt{DBGDEVID}, \texttt{DBGDEVID1}, \texttt{DBGDEVID2}, \texttt{DBGOSECCR}.
- In AArch32 state, STC accesses to \texttt{DBGDTRRXint} and LDC accesses to \texttt{DBGDTRTXint} are reported using EC syndrome value \texttt{0x06}.
- When not in Debug state, the following registers are also trapped to EL3:
  - AArch64 accesses to \texttt{DBGDTR_E0}, \texttt{DBGDTRRX_E0}, and \texttt{DBGDTRTX_E0}, reported using EC syndrome value \texttt{0x18}.
  - AArch32 accesses using MCR or MRC to \texttt{DBGDTRRXint} and \texttt{DBGDTRTXint}, reported using EC syndrome value \texttt{0x05}. 

---

**Page 1129**
TDA | Meaning
--- | ---
0b0 | This control does not cause any instructions to be trapped.
0b1 | EL0, EL1, and EL2 accesses to the debug registers, other than the registers that can be trapped by MDCR_EL3.TDOSA, are trapped to EL3, from both Security states and both Execution states, unless it is trapped by DBGDSCR EXT, UDCCdis, MDSCR_EL1.TDCC, HDCR.TDA or MDCR_EL2.TDA.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [8:7]**

Reserved, RES0.

TPM, bit [6]

**When FEAT_PMUv3 is implemented:**

Trap Performance Monitor register accesses. Accesses to all Performance Monitor registers from EL0, EL1 and EL2 to EL3, from both Security states and both Execution states are trapped as follows:

- In AArch64 state, accesses to the following registers are trapped to EL3 and are reported using EC syndrome value 0x18:
  - PMCR_EL0, PMCNTENSET_EL0, PMCNTENCLR_EL0, PMOVSCLR_EL0, PMSWINC_EL0, PMSELR_EL0, PMCEID0_EL0, PMCEID1_EL0, PMCCNTR_EL0, PMXEVTYPE0_EL0, PMXEVCTR_EL0, PMUSERENR_EL0, PMINTENSET_EL1, PMINTENCLR_EL1, PMOVSSET_EL0, PMEVCTR<n>_EL0, PMEVTYPE<n>_EL0, EL0, PMCCFILTR_EL0.
  - If FEAT_PMUv3p4 is implemented, PMMIR_EL1.
- In AArch32 state, accesses using MCR or MRC to the following registers are reported using EC syndrome value 0x03, accesses using MCRR or MRRC are reported using EC syndrome value 0x04:
  - PMCR, PMCNTENSET, PMCNTENCLR, PMOVS, PMSWINC, PMSELR, PMCEID0, PMCEID1, PMCCNTR, PMXEVTYPE, PMXEVCTR, PMUSERENR, PMINTENSET, PMINTENCLR, PMOVSSET, PMFVCNTR<n>, PMFVTYPE<n>, PMCCFILTR.
  - If FEAT_PMUv3p1 is implemented, PMCEID2, and PMCEID3.
  - If FEAT_PMUv3p4 is implemented, PMMIR.

TPM | Meaning
--- | ---
0b0 | This control does not cause any instructions to be trapped.
0b1 | EL2, EL1, and EL0 System register accesses to all Performance Monitor registers are trapped to EL3, unless it is trapped by HDCR.TPM or MDCR_EL2.TPM.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Bits [5:0]**

Reserved, RES0.

**Accessing the MDCR_EL3**

Accesses to this register use the following encodings:

The MDRAR_EL1 characteristics are:

Purpose

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system. Armv8 deprecates any use of this register.

Configuration

AArch64 System register MDRAR_EL1 bits [63:0] are architecturally mapped to AArch32 System register DBGDRAR[63:0].

Attributes

MDRAR_EL1 is a 64-bit register.

Field descriptions

The MDRAR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | ROMADDR |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:52]

Reserved, RES0.

ROMADDR, bits [51:12]

**ROMADDR encoding when FEAT_LPA is implemented**

| 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ROMADDR |

ROMADDR, bits [39:0]

The ROM table physical address.

Bits [11:0] of the ROM table physical address are defined to be zero.

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.

If MDRAR_EL1.Valid == 0b00, then this field is UNKNOWN.

The upper part of the address value.

If the physical address size in bits (PAsize) is less than 52, then the register bits corresponding to ROMADDR [39:PAsize] are RES0.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**ROMADDR encoding when FEAT_LPA is not implemented or AArch32 is supported at any Exception level**

| 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:32]**

- Reserved, RES0.

**TFO, bit [31]**

When FEAT_TRF is implemented:

- Trace Filter override. Used for save/restore of EDSCR.TFO.
- When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.
- When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.TFO. Reads and writes of this bit are indirect accesses to EDSCR.TFO.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is RW.
- When OSLSR_EL1.OSLK == 0, access to this field is RO.

**Otherwise:**

- Reserved, RES0.

**RXfull, bit [30]**

Used for save/restore of EDSCR.RXfull.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.
When `OSLSR_EL1.OSLK == 1`, this bit holds the value of `EDSCR.RXfull`. Reads and writes of this bit are indirect accesses to `EDSCR.RXfull`.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When `OSLSR_EL1.OSLK == 1`, access to this field is **RW**.
- When `OSLSR_EL1.OSLK == 0`, access to this field is **RO**.

**TXfull, bit [29]**

Used for save/restore of `EDSCR.TXfull`.

When `OSLSR_EL1.OSLK == 0`, software must treat this bit as UNK/SBZP.

When `OSLSR_EL1.OSLK == 1`, this bit holds the value of `EDSCR.TXfull`. Reads and writes of this bit are indirect accesses to `EDSCR.TXfull`.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When `OSLSR_EL1.OSLK == 1`, access to this field is **RW**.
- When `OSLSR_EL1.OSLK == 0`, access to this field is **RO**.

**Bit [28]**

Reserved, RES0.

**RXO, bit [27]**

Used for save/restore of `EDSCR.RXO`.

When `OSLSR_EL1.OSLK == 0`, software must treat this bit as UNK/SBZP.

When `OSLSR_EL1.OSLK == 1`, this bit holds the value of `EDSCR.RXO`. Reads and writes of this bit are indirect accesses to `EDSCR.RXO`.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When `OSLSR_EL1.OSLK == 1`, access to this field is **RW**.
- When `OSLSR_EL1.OSLK == 0`, access to this field is **RO**.

**TXU, bit [26]**

Used for save/restore of `EDSCR.TXU`.

When `OSLSR_EL1.OSLK == 0`, software must treat this bit as UNK/SBZP.

When `OSLSR_EL1.OSLK == 1`, this bit holds the value of `EDSCR.TXU`. Reads and writes of this bit are indirect accesses to `EDSCR.TXU`.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When `OSLSR_EL1.OSLK == 1`, access to this field is **RW**.
- When `OSLSR_EL1.OSLK == 0`, access to this field is **RO**.

**Bits [25:24]**

Reserved, RES0.
INTdis, bits [23:22]

Used for save/restore of \texttt{EDSCR}.INTdis.

When \texttt{OSLSR_EL1.OSLK} == 0, and software must treat this bit as UNK/SBZP.

When \texttt{OSLSR_EL1.OSLK} == 1, this field holds the value of \texttt{EDSCR}.INTdis. Reads and writes of this field are indirect accesses to \texttt{EDSCR}.INTdis.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When \texttt{OSLSR_EL1.OSLK} == 1, access to this field is \texttt{RW}.
- When \texttt{OSLSR_EL1.OSLK} == 0, access to this field is \texttt{RO}.

TDA, bit [21]

Used for save/restore of \texttt{EDSCR}.TDA.

When \texttt{OSLSR_EL1.OSLK} == 0, software must treat this bit as UNK/SBZP.

When \texttt{OSLSR_EL1.OSLK} == 1, this bit holds the value of \texttt{EDSCR}.TDA. Reads and writes of this bit are indirect accesses to \texttt{EDSCR}.TDA.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When \texttt{OSLSR_EL1.OSLK} == 1, access to this field is \texttt{RW}.
- When \texttt{OSLSR_EL1.OSLK} == 0, access to this field is \texttt{RO}.

Bit [20]

Reserved, \texttt{RES0}.

SC2, bit [19]

When \texttt{FEAT_PCSRv8} is implemented, \texttt{FEAT_VHE} is implemented and \texttt{FEAT_PCSRv8p2} is not implemented:

Used for save/restore of \texttt{EDSCR}.SC2.

When \texttt{OSLSR_EL1.OSLK} == 0, software must treat this bit as UNK/SBZP.

When \texttt{OSLSR_EL1.OSLK} == 1, this bit holds the value of \texttt{EDSCR}.SC2. Reads and writes of this bit are indirect accesses to \texttt{EDSCR}.SC2.

Accessing this field has the following behavior:

- When \texttt{OSLSR_EL1.OSLK} == 1, access to this field is \texttt{RW}.
- When \texttt{OSLSR_EL1.OSLK} == 0, access to this field is \texttt{RO}.

Otherwise:

Reserved, \texttt{RES0}.

Bits [18:16]

Reserved, \texttt{RAZ/WI}.

Hardware must implement this field as \texttt{RAZ/WI}. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.
MDE, bit [15]

Monitor debug events. Enable Breakpoint, Watchpoint, and Vector Catch exceptions.

<table>
<thead>
<tr>
<th>MDE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Breakpoint, Watchpoint, and Vector Catch exceptions disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Breakpoint, Watchpoint, and Vector Catch exceptions enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

HDE, bit [14]

Used for save/restore of **EDSCR.HDE**.

When **OSLSR_EL1.OSLK == 0**, software must treat this bit as UNK/ SBZP.

When **OSLSR_EL1.OSLK == 1**, this bit holds the value of **EDSCR.HDE**. Reads and writes of this bit are indirect accesses to **EDSCR.HDE**.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When **OSLSR_EL1.OSLK == 1**, access to this field is **RW**.
- When **OSLSR_EL1.OSLK == 0**, access to this field is **RO**.

KDE, bit [13]

Local (kernel) debug enable. If **ELD** is using AArch64, enable debug exceptions within **ELD**. Permitted values are:

<table>
<thead>
<tr>
<th>KDE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Debug exceptions, other than Breakpoint Instruction exceptions, enabled within <strong>ELD</strong>.</td>
</tr>
<tr>
<td>0b1</td>
<td>All debug exceptions enabled within <strong>ELD</strong>.</td>
</tr>
</tbody>
</table>

RES0 if **ELD** is using AArch32.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

TDCC, bit [12]

Traps EL0 accesses to the Debug Communication Channel (DCC) registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and **HCR_EL2.TGE** is 1, from both Execution states, as follows:

- In AArch64 state, MRS or MSR accesses to the following DCC registers are trapped, reported using EC syndrome value 0x18:
  - MDCCSR_EL0.
  - If not in Debug state, DBGDTR_EL0, DBGDTRTX_EL0, and DBGDTRRX_EL0.
- In AArch32 state, MRC or MCR accesses to the following registers are trapped, reported using EC syndrome value 0x05:
  - DBGDSCRint, DBGDIDR, DBGDSAR, DBGDRAR.
  - If not in Debug state, DBGDTRRXint, and DBGDTRTXint.
- In AArch32 state, LDC access to DBGDTRRXint and STC access to DBGDTRTXint are trapped, reported using EC syndrome value 0x06.
- In AArch32 state, MRRC accesses to DBGDSAR and DBGDRAR are trapped, reported using EC syndrome value 0x0C.

<table>
<thead>
<tr>
<th>TDCC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 using AArch64: EL0 accesses to the AArch64 DCC registers are trapped.</td>
</tr>
<tr>
<td></td>
<td>EL0 using AArch32: EL0 accesses to the AArch32 DCC registers are trapped.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Bits [11:7]

Reserved, RES0.

ERR, bit [6]

Used for save/restore of EDSCR.ERR.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.ERR. Reads and writes of this bit are indirect accesses to EDSCR.ERR.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is RW.
- When OSLSR_EL1.OSLK == 0, access to this field is RO.

Bits [5:1]

Reserved, RES0.

SS, bit [0]

Software step control bit. If EL1 is using AArch64, enable Software step. Permitted values are:

<table>
<thead>
<tr>
<th>SS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Software step disabled</td>
</tr>
<tr>
<td>0b1</td>
<td>Software step enabled.</td>
</tr>
</tbody>
</table>

RES0 if EL1 is using AArch32.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the MDSCR_EL1**

Individual fields within this register might have restricted accessibility when OSLSR_EL1.OSLK == 0 (the OS lock is unlocked). See the field descriptions for more detail.

Accesses to this register use the following encodings:

\[
MRS \langle Xt\rangle, \text{MDSCR_EL1}
\]

<table>

The MIDR_EL1 characteristics are:

**Purpose**

Provides identification information for the PE, including an implementer code for the device and a device ID number.

**Configuration**

AArch64 System register MIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register `.MIDR[31:0]`. AArch64 System register MIDR_EL1 bits [31:0] are architecturally mapped to External register `.MIDR_EL1[31:0]`.

**Attributes**

MIDR_EL1 is a 64-bit register.

**Field descriptions**

The MIDR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | Implementer | Variant | Architecture | PartNum | Revision |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:32]**

Reserved, `RES0`.

**Implementer, bits [31:24]**

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

<table>
<thead>
<tr>
<th>Hex representation</th>
<th>Implementer</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x00</td>
<td>Reserved for software use</td>
</tr>
<tr>
<td>0xC0</td>
<td>Ampere Computing</td>
</tr>
<tr>
<td>0x41</td>
<td>Arm Limited</td>
</tr>
<tr>
<td>0x42</td>
<td>Broadcom Corporation</td>
</tr>
<tr>
<td>0x43</td>
<td>Cavium Inc.</td>
</tr>
<tr>
<td>0x44</td>
<td>Digital Equipment Corporation</td>
</tr>
<tr>
<td>0x46</td>
<td>Fujitsu Ltd.</td>
</tr>
<tr>
<td>0x49</td>
<td>Infineon Technologies AG</td>
</tr>
<tr>
<td>0x4D</td>
<td>Motorola or Freescale Semiconductor Inc.</td>
</tr>
<tr>
<td>0x4E</td>
<td>NVIDIA Corporation</td>
</tr>
<tr>
<td>0x50</td>
<td>Applied Micro Circuits Corporation</td>
</tr>
<tr>
<td>0x51</td>
<td>Qualcomm Inc.</td>
</tr>
<tr>
<td>0x56</td>
<td>Marvell International Ltd.</td>
</tr>
<tr>
<td>0x69</td>
<td>Intel Corporation</td>
</tr>
</tbody>
</table>

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.
**Variant, bits [23:20]**

An implementation defined variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

**Architecture, bits [19:16]**

Architecture version. For A-profile, the defined values are:

<table>
<thead>
<tr>
<th>Architecture</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>Armv4.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Armv4T.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Armv5 (obsolete).</td>
</tr>
<tr>
<td>0b0100</td>
<td>Armv5T.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Armv5TE.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Armv5TEJ.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Armv6.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Architectural features are individually identified in the ID * registers, see 'ID registers'.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**PartNum, bits [15:4]**

An implementation defined primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

**Revision, bits [3:0]**

An implementation defined revision number for the device.

**Accessing the MIDR_EL1**

Accesses to this register use the following encodings:

**MRS <Xt>, MIDR_EL1**

```
<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>
<td>0b0000</td>
<td>0b0000</td>
<td>0b000</td>
</tr>
</tbody>
</table>
```

```c
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
else if PSTATE.EL == EL1 then
    if EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGRTR_EL2.MIDR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return VPIDR_EL2;
    else
        return MIDR_EL1;
else if PSTATE.EL == EL2 then
    return MIDR_EL1;
else if PSTATE.EL == EL3 then
    return MIDR_EL1;
else
    return MIDR_EL1;
```
MPAM0_EL1, MPAM0 Register (EL1)

The MPAM0_EL1 characteristics are:

**Purpose**

Holds information to generate MPAM labels for memory requests when executing at EL0. When EL2 is present and enabled, the MPAM virtualization option is present, MPAMHCR_EL2.GSTAPP_PLK == 1 and HCR_EL2.TGE == 0, MPAM1_EL1 is used instead of MPAM0_EL1 to generate MPAM information to label memory requests.

If EL2 is present and enabled, and HCR_EL2.E2H == 0 or HCR_EL2.TGE == 0, the MPAM virtualization option is present and MPAMHCR_EL2.EL0_VPMEN == 1, then MPAM PARTIDs in MPAM0_EL1 are virtual and mapped into physical PARTIDs for the current Security state.

**Configuration**

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAM0_EL1 are UNDEFINED.

**Attributes**

MPAM0_EL1 is a 64-bit register.

**Field descriptions**

The MPAM0_EL1 bit assignments are:

| Bits [63:48] | Reserved, RES0. |
| PMG_D, bits [47:40] | Performance monitoring group property for PARTID_D. On a Warm reset, this field resets to an architecturally UNKNOWN value. |
| PMG_I, bits [39:32] | Performance monitoring group property for PARTID_I. On a Warm reset, this field resets to an architecturally UNKNOWN value. |
| PARTID_D, bits [31:16] | Partition ID for data accesses, including load and store accesses, made from EL0. On a Warm reset, this field resets to an architecturally UNKNOWN value. |
| PARTID_I, bits [15:0] | Partition ID for instruction accesses made from EL0. |
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

## Accessing the MPAM0_EL1

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings:

**MRS <Xt>, MPAM0_EL1**

<table>

elsif PSTATE.EL == EL3 then
  MPAM0_EL1 = X[t];
```
MPAM1_EL1, MPAM1 Register (EL1)

The MPAM1_EL1 characteristics are:

**Purpose**

Holds information to generate MPAM labels for memory requests when executing at EL1.

When EL2 is present and enabled, the MPAM virtualization option is present, MPAMHCR_EL2.GSTAPP_PLK == 1 and HCR_EL2.TGE == 0, MPAM1_EL1 is used instead of MPAM0_EL1 to generate MPAM labels for memory requests when executing at EL0.

MPAM1_EL1 is an alias for MPAM2_EL2 when executing at EL2 with HCR_EL2.E2H == 1.

MPAM1_EL12 is an alias for MPAM1_EL1 when executing at EL2 or EL3 with HCR_EL2.E2H == 1.

If EL2 is present and enabled, the MPAM virtualization option is present and MPAMHCR_EL2.EL1_VPMEN == 1, MPAM PARTIDs in MPAM1_EL1 are virtual and mapped into physical PARTIDs for the current Security state. This mapping of MPAM1_EL1 virtual PARTIDs to physical PARTIDs when EL1_VPMEN is 1 also applies when MPAM1_EL1 is used at EL0 due to MPAMHCR_EL2.GSTAPP_PLK.

**Configuration**

AArch64 System register MPAM1_EL1 bit [63] is architecturally mapped to AArch64 System register MPAM3_EL3[63] when EL3 is implemented.

AArch64 System register MPAM1_EL1 bit [63] is architecturally mapped to AArch64 System register MPAM2_EL2[63] when EL3 is not implemented and EL2 is implemented.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAM1_EL1 are UNDEFINED.

**Attributes**

MPAM1_EL1 is a 64-bit register.

**Field descriptions**

The MPAM1_EL1 bit assignments are:

<table>

**MPAMEN, bit [63]**

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

<table>
<thead>
<tr>
<th>MPAMEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The default PARTID and default PMG are output in MPAM information.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAM information is output based on the MPAMn_ELx register for ELn according the MPAM configuration.</td>
</tr>
</tbody>
</table>

If neither EL3 nor EL2 is implemented, this field is read/write.

If EL3 is implemented, this field is read-only and reads the current value of the read/write bit MPAM3_EL3.MPAMEN.
If EL3 is not implemented and EL2 is implemented, this field is read-only and reads the current value of the read/write bit MPAM2_EL2.MPAMEN.

On a Warm reset, this field resets to 0.

Accessing this field has the following behavior:

- When EL3 is not implemented and EL2 is not implemented, access to this field is RW.
- Otherwise, access to this field is RO.

### Bits [62:61]

Reserved, RES0.

### FORCED_NS, bit [60]

When FEAT_MPAMv0p1 is implemented:

In the Secure state, FORCED_NS indicates the state of MPAM3_EL3.FORCE_NS.

<table>
<thead>
<tr>
<th>FORCED_NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>In the Non-secure state, always reads as 0. In the Secure state, indicates that MPAM3_EL3.FORCE_NS == 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>In the Secure state, indicates that MPAM3_EL3.FORCE_NS == 1.</td>
</tr>
</tbody>
</table>

Always reads as 0 in the Non-secure state.

Writes are ignored.

Access to this field is RO.

### Otherwise:

Reserved, RES0.

### Bits [59:48]

Reserved, RES0.

### PMG_D, bits [47:40]

Performance monitoring group property for PARTID_D.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### PMG_I, bits [39:32]

Performance monitoring group property for PARTID_I.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### PARTID_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### PARTID_I, bits [15:0]

Partition ID for instruction accesses made from EL1.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Accessing the MPAM1_EL1

When `HCR_EL2.E2H` is 1, without explicit synchronization, accesses from EL3 using the mnemonic MPAM1_EL1 or MPAM1_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings:

MPAM2_EL2, MPAM2 Register (EL2)

The MPAM2_EL2 characteristics are:

**Purpose**

Holds information to generate MPAM labels for memory requests when executing at EL2.

**Configuration**

AArch64 System register MPAM2_EL2 bit [63] is architecturally mapped to AArch64 System register MPAM3_EL3[63] when EL3 is implemented.

AArch64 System register MPAM2_EL2 bit [63] is architecturally mapped to AArch64 System register MPAM1_EL1[63].

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAM2_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

MPAM2_EL2 is a 64-bit register.

**Field descriptions**

The MPAM2_EL2 bit assignments are:

<table>

<td>MPAM information is output based on the MPAMn_ELx register for ELn according the MPAM configuration.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented, this field is read/write.

If EL3 is implemented, this field is read-only and reads the current value of the read/write MPAM3_EL3.MPAMEN bit.

On a Warm reset, this field resets to 0.

Accessing this field has the following behavior:

- When EL3 is not implemented, access to this field is RW.
- Otherwise, access to this field is RO.

**Bits [62:59]**

Reserved, RES0.
**TIDR, bit [58]**

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMIDR_EL1.HAS_TIDR == 1:

TIDR traps accesses to MPAMIDR_EL1 from EL1 to EL2.

<table>
<thead>
<tr>
<th>TIDR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trap accesses to MPAMIDR_EL1 from EL1 to EL2.</td>
</tr>
</tbody>
</table>

MPAMHCR_EL2.TRAP_MPAMIDR_EL1 == 1 also traps MPAMIDR_EL1 accesses from EL1 to EL2. If either TIDR or TRAP_MPAMIDR_EL1 are 1, accesses are trapped.

Otherwise:

Reserved, RES0.

**Bits [57:50]**

Reserved, RES0.

**TRAPMPAM0EL1, bit [49]**

TRAPMPAM0EL1: Trap accesses from EL1 to the MPAM0_EL1 register trap to EL2.

<table>

MPAM3_EL3, MPAM3 Register (EL3)

The MPAM3_EL3 characteristics are:

**Purpose**

Holds information to generate MPAM labels for memory requests when executing at EL3.

**Configuration**

AArch64 System register MPAM3_EL3 bit [63] is architecturally mapped to AArch64 System register MPAM2_EL2[63] when EL2 is implemented.

AArch64 System register MPAM3_EL3 bit [63] is architecturally mapped to AArch64 System register MPAM1_EL1[63].

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAM3_EL3 are UNDEFINED.

**Attributes**

MPAM3_EL3 is a 64-bit register.

**Field descriptions**

The MPAM3_EL3 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| MPAMEN | TRAPLOWER | SDEFLT | FORCE_NS | RES0 | PMG_D | PMG_I | PARTID_D | PARTID_I |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**MPAMEN, bit [63]**

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

Values of this field are:

<table>
<thead>
<tr>
<th>MPAMEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The default PARTID and default PMG are output in MPAM information when executing at any ELn.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAM information is output based on the MPAMn_ELx register for ELn according the MPAM configuration.</td>
</tr>
</tbody>
</table>

This field is always read/write in MPAM3_EL3.

On a Warm reset, this field resets to 0.

**TRAPLOWER, bit [62]**

Trap direct accesses to any MPAM system registers that are not UNDEFINED from all ELn lower than EL3.

<table>
<thead>
<tr>
<th>TRAPLOWER</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not force trapping of direct accesses of MPAM system registers to EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>Force all direct accesses of MPAM system registers to trap to EL3.</td>
</tr>
</tbody>
</table>
On a Cold reset, this field resets to 1.

**SDEFLT, bit [61]**

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMIDR_EL1.HAS_SDEFLT == 1:

SDEFLT overrides the PARTID with the default PARTID when executing in the Secure state.

<table>
<thead>
<tr>
<th>SDEFLT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>The PARTID is determined normally in the Secure state.</td>
</tr>
<tr>
<td>01</td>
<td>The PARTID is always PARTID 0 when executing in the Secure state.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**FORCE_NS, bit [60]**

When FEAT_MPAMv0p1 is implemented and MPAMIDR_EL1.HAS_FORCE_NS == 1:

FORCE_NS forces MPAM_NS to always be 1 in the Secure state.

<table>
<thead>
<tr>
<th>FORCE_NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>MPAM_NS is 0 when executing in the Secure state.</td>
</tr>
<tr>
<td>01</td>
<td>MPAM_NS is 1 when executing in the Secure state.</td>
</tr>
</tbody>
</table>

An implementation is permitted to have this field as RAO if the implementation does not support generating MPAM_NS as 0.

On a Warm reset, this field resets to an **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Bits [59:48]**

Reserved, RES0.

**PMG_D, bits [47:40]**

Performance monitoring group for data accesses.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**PMG_I, bits [39:32]**

Performance monitoring group for instruction accesses.

**PARTID_D, bits [31:16]**

Partition ID for data accesses, including load and store accesses, made from EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**PARTID_I, bits [15:0]**

Partition ID for instruction accesses made from EL3.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the MPAM3_EL3**

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings:

```c
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return MPAM3_EL3;
```
The MPAMHCR_EL2 characteristics are:

**Purpose**

Controls the PARTID virtualization features of MPAM. It controls the mapping of virtual PARTIDs into physical PARTIDs in MPAM0_EL1 when EL0_VPMEN == 1 and in MPAM1_EL1 when EL1_VPMEN == 1.

**Configuration**

This register is present only when FEAT_MPAM is implemented and MPAMIDR_EL1.HAS_HCR == 1. Otherwise, direct accesses to MPAMHCR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

MPAMHCR_EL2 is a 64-bit register.

**Field descriptions**

The MPAMHCR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-32</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>31</td>
<td>TRAP_MPAMIDR_EL1, bit [31]</td>

<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**TRAP_MPAMIDR_EL1, bit [31]**

Trap accesses from EL1 to MPAMIDR_EL1 to EL2.

<table>
<thead>
<tr>
<th>TRAP_MPAMIDR_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Direct accesses to MPAMIDR_EL1 from EL1 are trapped to EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, when EL3 is not implemented, this field resets to 1.

On a Warm reset, when EL3 is implemented, this field resets to an architecturally UNKNOWN value.

**Bits [30:9]**

Reserved, RES0.

**GSTAPP_PLK, bit [8]**

Make the PARTIDs at EL0 the same as the PARTIDs at EL1. When executing at EL0, EL2 is enabled, HCR_EL2.TGE == 0 and GSTAPP_PLK = 1, MPAM1_EL1 is used instead of MPAM0_EL1 to generate MPAM labels for memory requests.
Meaning

<table>
<thead>
<tr>
<th>GSTAPP_PLK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><strong>MPAM0_EL1</strong> is used to generate MPAM labels when executing at EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td><strong>MPAM0_EL1</strong> is used to generate MPAM labels when executing at EL0 with EL2 enabled and HCR_EL2.TGE == 0. Otherwise <strong>MPAM0_EL1</strong> is used.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [7:2]**

Reserved, RES0.

**EL1_VPMEN, bit [1]**

Enable the virtual PARTID mapping of the PARTID fields in MPAM1_EL1 when executing at EL1. This bit also enables virtual PARTID mapping when **MPAM1_EL1** is used to generate MPAM labels for memory requests at EL0 due to GSTAPP_PLK == 1.

<table>
<thead>
<tr>
<th>EL1_VPMEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><strong>MPAM1_EL1</strong>.PARTID_I and <strong>MPAM1_EL1</strong>.PARTID_D are physical PARTIDs that are used to label memory system requests.</td>
</tr>
<tr>
<td>0b1</td>
<td><strong>MPAM1_EL1</strong>.PARTID_I and <strong>MPAM1_EL1</strong>.PARTID_D are virtual PARTIDs that are used to index the PhyPARTID fields of <strong>MPAMVPM0_EL2</strong> to <strong>MPAMVPM7_EL2</strong> registers to map the virtual PARTID into a physical PARTID to label memory system requests.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**EL0_VPMEN, bit [0]**

Enable the virtual PARTID mapping of the PARTID fields of **MPAM0_EL1** unless HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1.

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1, EL0_VPMEN is ignored and MPAM0_EL1 PARTID fields are not mapped.

When **MPAMHCR_EL2**.GSTAPP_PLK == 1 and HCR_EL2.TGE == 0, **MPAM1_EL1** is used as the source of PARTIDs and the virtual PARTID mapping of **MPAM1_EL1** PARTIDs is controlled by **MPAMHCR_EL2**.EL1_VPMEN.

<table>
<thead>
<tr>
<th>EL0_VPMEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>

MPAMIDR_EL1, MPAM ID Register (EL1)

The MPAMIDR_EL1 characteristics are:

**Purpose**

Indicates the presence and maximum PARTID and PMG values supported in the implementation. It also indicates whether the implementation supports MPAM virtualization.

**Configuration**

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMIDR_EL1 are UNDEFINED.

**Attributes**

MPAMIDR_EL1 is a 64-bit register.

**Field descriptions**

The MPAMIDR_EL1 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0| HAS_SDEFLT| HAS_FORCE_NS| RES0| HAS_TIDR| RES0| VPMR_MAX| RES0| HAS_HCR| RES0| PMG_MAX| RES0| PARTID_MAX|
| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   |

MPAMIDR_EL1 indicates the MPAM implementation parameters of the PE.

**Bits [63:62]**

Reserved, RES0.

**HAS_SDEFLT, bit [61]**

HAS_SDEFLT indicates support for MPAM3_EL3.SDEFLT bit. Defined values are:

<table>
<thead>
<tr>
<th>HAS_SDEFLT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The SDEFLT bit is not implemented in MPAM3_EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>The SDEFLT bit is implemented in MPAM3_EL3.</td>
</tr>
</tbody>
</table>

When MPAM3_EL3.SDEFLT == 1, accesses from the Secure execution state use the default PARTID, PARTID == 0.

**HAS_FORCE_NS, bit [60]**

HAS_FORCE_NS indicates support for MPAM3_EL3.FORCE_NS bit. Defined values are:

<table>
<thead>
<tr>
<th>HAS_FORCE_NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The FORCE_NS bit is not implemented in MPAM3_EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>The FORCE_NS bit is implemented in MPAM3_EL3.</td>
</tr>
</tbody>
</table>

When MPAM3_EL3.FORCE_NS == 1, accesses from the Secure execution state have MPAM_NS == 1.

**Bit [59]**

Reserved, RES0.
HAS_TIDR, bit [58]

HAS_TIDR indicates support for MPAM2_EL2.TIDR bit. Defined values are:

<table>
<thead>
<tr>
<th>HAS_TIDR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The TIDR bit is not implemented in MPAM2_EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>The TIDR bit is implemented in MPAM2_EL2.</td>
</tr>
</tbody>
</table>

Bits [57:40]

Reserved, RES0.

PMG_MAX, bits [39:32]

The largest value of PMG that the implementation can generate. The PMG_I and PMG_D fields of every MPAMn_ELx must implement at least enough bits to represent PMG_MAX.

Bits [31:21]

Reserved, RES0.

VPMR_MAX, bits [20:18]

When MPAMIDR_EL1.HAS_HCR == 1:

Indicates the maximum register index n for the MPAMVPM<n>_EL2 registers.

Otherwise:

Reserved, RAZ.

HAS_HCR, bit [17]

HAS_HCR indicates that the PE implementation supports MPAM virtualization, including MPAMHCR_EL2, MPAMVPMV_EL2 and MPAMVPM<n>_EL2 with n in the range 0 to VPMR_MAX. Must be 0 if EL2 is not implemented in either security state.

<table>
<thead>
<tr>
<th>HAS_HCR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MPAM virtualization is not supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAM virtualization is supported.</td>
</tr>
</tbody>
</table>

Bit [16]

Reserved, RES0.

PARTID_MAX, bits [15:0]

The largest value of PARTID that the implementation can generate. The PARTID_I and PARTID_D fields of every MPAMn_ELx must implement at least enough bits to represent PARTID_MAX.

Accessing the MPAMIDR_EL1

Accesses to this register use the following encodings:

<table>

elsif PSTATE_EL == EL3 then
    return MPAMIDR_EL1;
end if
MPAMVPM0_EL2, MPAM Virtual PARTID Mapping Register 0

The MPAMVPM0_EL2 characteristics are:

**Purpose**

MPAMVPM0_EL2 provides mappings from virtual PARTIDs 0 - 3 to physical PARTIDs.

- **MPAMIDR_EL1.VPMR_MAX** field gives the index of the highest implemented MPAMVPM<n>_EL2 register. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If **MPAMIDR_EL1.VPMR_MAX** == 0, there is only a single MPAMVPM<n>_EL2 register, **MPAMVPM0_EL2**.

- Virtual PARTID mapping is enabled by **MPAMHCR_EL2.EL1_VPMEN** for PARTIDs in **MPAM1_EL1** and by **MPAMHCR_EL2.EL0_VPMEN** for PARTIDs in **MPAM0_EL1**.

- A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is only valid when the **MPAMVPMV_EL2.VPM_V** bit in bit position n is set to 1.

**Configuration**

This register is present only when FEAT_MPAM is implemented and MPAMIDR_EL1.HAS_HCR == 1. Otherwise, direct accesses to MPAMVPM0_EL2 are **UNDEFINED**.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

MPAMVPM0_EL2 is a 64-bit register.

**Field descriptions**

The MPAMVPM0_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Positions</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 - 48</td>
<td>PhyPARTID3</td>
<td>Virtual PARTID Mapping Entry for virtual PARTID 3. PhyPARTID3 gives the mapping of virtual PARTID 3 to a physical PARTID. On a Warm reset, this field resets to an architecturally UNKNOWN value.</td>
</tr>

The MPAMVPM1_EL2 characteristics are:

### Purpose

MPAMVPM1_EL2 provides mappings from virtual PARTIDs 4 - 7 to physical PARTIDs.

**MPAMIDR_EL1**.VPMR_MAX field gives the index of the highest implemented MPAMVPM0_EL2 to MPAMVPM7_EL2 registers. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If **MPAMIDR_EL1**.VPMR_MAX == 0, there is only a single MPAMVPM<n>_EL2 register, MPAMVPM0_EL2.

Virtual PARTID mapping is enabled by **MPAMHCR_EL2.EL1_VPMEN** for PARTIDs in MPAM1_EL1 and by **MPAMHCR_EL2.EL0_VPMEN** for PARTIDs in MPAM0_EL1.

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is only valid when the MPAMVPMV_EL2.VPM_V bit in bit position n is set to 1.

### Configuration

This register is present only when FEAT_MPAM is implemented, **MPAMIDR_EL1**.HAS_HCR == 1 and **MPAMIDR_EL1**.VPMR_MAX > 0. Otherwise, direct accesses to MPAMVPM1_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

### Attributes

MPAMVPM1_EL2 is a 64-bit register.

### Field descriptions

The MPAMVPM1_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| PhyPARTID7 | PhyPARTID5 | PhyPARTID6 | PhyPARTID4 |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**PhyPARTID7**, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 7. PhyPARTID7 gives the mapping of virtual PARTID 7 to a physical PARTID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**PhyPARTID6**, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 6. PhyPARTID6 gives the mapping of virtual PARTID 6 to a physical PARTID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**PhyPARTID5**, bits [31:16]

Virtual PARTID Mapping Entry for virtual PARTID 5. PhyPARTID5 gives the mapping of virtual PARTID 5 to a physical PARTID.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**PhyPARTID4, bits [15:0]**

Virtual PARTID Mapping Entry for virtual PARTID 4. PhyPARTID4 gives the mapping of virtual PARTID 4 to a physical PARTID.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

MPAMVPM2_EL2, MPAM Virtual PARTID Mapping Register 2

The MPAMVPM2_EL2 characteristics are:

**Purpose**

MPAMVPM2_EL2 provides mappings from virtual PARTIDs 8 - 11 to physical PARTIDs.

**MPAMIDR_EL1**.VPMR_MAX field gives the index of the highest implemented MPAMVPM0_EL2 to MPAMVPM7_EL2 registers. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If MPAMIDR_EL1.VPMR_MAX == 0, there is only a single MPAMVPM<n>_EL2 register, MPAMVPM0_EL2.

Virtual PARTID mapping is enabled by MPAMHCR_EL2.EL1.VPMEN for PARTIDs in MPAM1_EL1 and by MPAMHCR_EL2.EL0.VPMEN for PARTIDs in MPAM0_EL1.

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is only valid when the MPAMVPMV_EL2.VPM_V bit in bit position n is set to 1.

**Configuration**

This register is present only when FEAT_MPAM is implemented, MPAMIDR_EL1.HAS_HCR == 1 and MPAMIDR_EL1.VPMR_MAX > 1. Otherwise, direct accesses to MPAMVPM2_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

MPAMVPM2_EL2 is a 64-bit register.

The MPAMVPM4_EL2 characteristics are:

**Purpose**

MPAMVPM4_EL2 provides mappings from virtual PARTIDs 16 - 19 to physical PARTIDs.

**MPAMIDR_EL1**.VPMR_MAX field gives the index of the highest implemented MPAMVPM<n>_EL2 registers. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If **MPAMIDR_EL1**.VPMR_MAX == 0, there is only a single MPAMVPM<n>_EL2 register, **MPAMVPM0_EL2**.

Virtual PARTID mapping is enabled by **MPAMHCR_EL2**.EL1_VPMEN for PARTIDs in **MPAM1_EL1** and by **MPAMHCR_EL2**.EL0_VPMEN for PARTIDs in **MPAM0_EL1**.

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is only valid when the **MPAMVPMV_EL2**.VPM_V bit in bit position n is set to 1.

**Configuration**

This register is present only when FEAT_MPAM is implemented, MPAMIDR_EL1.HAS_HCR == 1 and MPAMIDR_EL1.VPMR_MAX > 3. Otherwise, direct accesses to MPAMVPM4_EL2 are **UNDEFINED**.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

MPAMVPM4_EL2 is a 64-bit register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID29, bits [31:16]

Virtual PARTID Mapping Entry for virtual PARTID 29. PhyPARTID29 gives the mapping of virtual PARTID 29 to a physical PARTID.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**PhyPARTID28, bits [15:0]**

Virtual PARTID Mapping Entry for virtual PARTID 28. PhyPARTID28 gives the mapping of virtual PARTID 28 to a physical PARTID.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the MPAMVPM7_EL2**

Accesses to this register use the following encodings:

```plaintext
MRS <Xt>, MPAMVPM7_EL2
```

MPAMVMV_EL2, MPAM Virtual Partition Mapping Valid Register

The MPAMVMV_EL2 characteristics are:

**Purpose**

Valid bits for virtual PARTID mapping entries. Each bit \( m \) corresponds to virtual PARTID mapping entry \( m \) in the MPAMVMV\(<n>\)_EL2 registers where \( n = m \gg 2 \).

**Configuration**

This register is present only when FEAT_MPAM is implemented and MPAMIDR_EL1.HAS_HCR == 1. Otherwise, direct accesses to MPAMVMV_EL2 are undefined.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

MPAMVMV_EL2 is a 64-bit register.

**Field descriptions**

The MPAMVMV_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>62</th>
<th>61</th>
<th>60</th>
<th>59</th>
<th>58</th>
<th>57</th>
<th>56</th>
<th>55</th>
<th>54</th>
<th>53</th>
<th>52</th>
</tr>
</thead>
</table>

**Bits [63:32]**

Reserved, RES0.

**VPM_V<m>, bit [m], for m = 31 to 0**

Contains valid bit for virtual PARTID mapping entry corresponding to virtual PARTID\(<m>\).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the MPAMVMV_EL2**

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>

**MPIDR_EL1, Multiprocessor Affinity Register**

The MPIDR_EL1 characteristics are:

**Purpose**

In a multiprocessor system, provides an additional PE identification mechanism for scheduling purposes.

**Configuration**

AArch64 System register MPIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register `MPIDR[31:0]`.

In a uniprocessor system Arm recommends that each Aff<n> field of this register returns a value of 0.

**Attributes**

MPIDR_EL1 is a 64-bit register.

**Field descriptions**

The MPIDR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | U | RES0 | MT | Aff2 | Aff1 | Aff0 | Aff3 |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:40]**

Reserved, RES0.

**Aff3, bits [39:32]**

Affinity level 3. See the description of Aff0 for more information.

Aff3 is not supported in AArch32 state.

**Bit [31]**

Reserved, RES1.

**U, bit [30]**

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. The possible values of this bit are:

<table>
<thead>
<tr>
<th><code>U</code></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Processor is part of a multiprocessor system.</td>
</tr>
<tr>
<td>0b1</td>
<td>Processor is part of a uniprocessor system.</td>
</tr>
</tbody>
</table>

**Bits [29:25]**

Reserved, RES0.
Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of Aff0 for more information about affinity levels. The possible values of this bit are:

<table>
<thead>
<tr>
<th>MT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Performance of PEs at the lowest affinity level, or PEs with MPIDR_EL1.MT set to 1, different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent.</td>
</tr>
<tr>
<td>0b1</td>
<td>Performance of PEs at the lowest affinity level, or PEs with MPIDR_EL1.MT set to 1, different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.</td>
</tr>
</tbody>
</table>

Aff2, bits [23:16]
Affinity level 2. See the description of Aff0 for more information.

Aff1, bits [15:8]
Affinity level 1. See the description of Aff0 for more information.

Aff0, bits [7:0]
Affinity level 0. This is the affinity level that is most significant for determining PE behavior. Higher affinity levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

Accessing the MPIDR_EL1

Accesses to this register use the following encodings:

MRS <Xt>, MPIDR_EL1

```c
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then

MVFR0_EL1, AArch32 Media and VFP Feature Register 0

The MVFR0_EL1 characteristics are:

**Purpose**

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with MVFR1_EL1 and MVFR2_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch64 System register MVFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register MVFR0[31:0].

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

**Attributes**

MVFR0_EL1 is a 64-bit register.

**Field descriptions**

The MVFR0_EL1 bit assignments are:

**When AArch32 is supported at any Exception level:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | FPRound | FPShVec | FPSqrt | FPDivide | FPtrap | FPDP | FPS | SIMDReg |

**Bits [63:32]**

Reserved, RES0.

**FPRound, bits [31:28]**

Floating-Point Rounding modes. Indicates whether the floating-point implementation provides support for rounding modes. Defined values are:

<table>
<thead>
<tr>
<th>FPRound</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented, or only Round to Nearest mode supported, except that Round towards Zero mode is supported for VCVT instructions that always use that rounding mode regardless of the FPSCR setting.</td>
</tr>
<tr>
<td>0b0001</td>
<td>All rounding modes supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.
FPShVec, bits [27:24]

Short Vectors. Indicates whether the floating-point implementation provides support for the use of short vectors. Defined values are:

<table>
<thead>
<tr>
<th>FPShVec</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Short vectors not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Short vector operation supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

FPSqrt, bits [23:20]

Square Root. Indicates whether the floating-point implementation provides support for the ARMv6 VFP square root operations. Defined values are:

<table>
<thead>
<tr>
<th>FPSqrt</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported in hardware.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

The VSQRT.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VSQRT.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

FPDivide, bits [19:16]

Indicates whether the floating-point implementation provides support for VFP divide operations. Defined values are:

<table>
<thead>
<tr>
<th>FPDivide</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported in hardware.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

The VDIV.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VDIV.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

FPTrap, bits [15:12]

Floating Point Exception Trapping. Indicates whether the floating-point implementation provides support for exception trapping. Defined values are:

<table>
<thead>
<tr>
<th>FPTrap</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

A value of 0b0001 indicates that, when the corresponding trap is enabled, a floating-point exception generates an exception.

FPDP, bits [11:8]

Double Precision. Indicates whether the floating-point implementation provides support for double-precision operations. Defined values are:
FPDP, bits [7:4]

Single Precision. Indicates whether the floating-point implementation provides support for single-precision operations. Defined values are:

<table>
<thead>
<tr>
<th>FPDP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported in hardware.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported, VFPv2.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Supported, VFPv3, VFPv4, or Armv8. VFPv3 and Armv8 add an instruction to load a double-precision floating-point constant, and conversions between double-precision and fixed-point values.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP double-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F64 is only available if the Square root field is 0b0001.
- VDIV.F64 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the single-precision field is nonzero.

SIMDReg, bits [3:0]

Advanced SIMD registers. Indicates whether the Advanced SIMD and floating-point implementation provides support for the Advanced SIMD and floating-point register bank. Defined values are:

<table>
<thead>
<tr>
<th>SIMDReg</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The implementation has no Advanced SIMD and floating-point support.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The implementation includes floating-point support with 16 x 64-bit registers.</td>
</tr>
<tr>
<td>0b0010</td>
<td>The implementation includes Advanced SIMD and floating-point support with 32 x 64-bit registers.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

Otherwise:
Bits [63:0]

Reserved, UNKNOWN.

</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**SIMDFMAC, bits [31:28]**

Advanced SIMD Fused Multiply-Accumulate. Indicates whether the Advanced SIMD implementation provides fused multiply accumulate instructions. Defined values are:

<table>
<thead>
<tr>
<th>SIMDFMAC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

The Advanced SIMD and floating-point implementations must provide the same level of support for these instructions.
**FPHP, bits [27:24]**

Floating Point Half Precision. Indicates the level of half-precision floating-point support. Defined values are:

<table>
<thead>
<tr>
<th>FPHP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>

</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 in an implementation without SIMD floating-point support.
- 0b0010 in an implementation with SIMD floating-point support that does not include the FEAT_FP16 extension.
- 0b0011 in an implementation with SIMD floating-point support that includes the FEAT_FP16 extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the FPHP field, meaning the permitted values are:

<table>
<thead>
<tr>
<th>Half Precision instructions supported</th>
<th>FPHP</th>
<th>SIMDHP</th>
</tr>
</thead>
<tbody>
<tr>
<td>No support</td>
<td>0b0000</td>
<td>0b0000</td>
</tr>
<tr>
<td>Conversions only</td>
<td>0b0010</td>
<td>0b0001</td>
</tr>
<tr>
<td>Conversions and arithmetic</td>
<td>0b0011</td>
<td>0b0010</td>
</tr>
</tbody>
</table>

**SIMDSP, bits [19:16]**

Advanced SIMD Single Precision. Indicates whether the Advanced SIMD and floating-point implementation provides single-precision floating-point instructions. Defined values are:

<table>
<thead>
<tr>
<th>SIMDSP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Implemented. This value is permitted only if the SIMDInt field is 0b0001.</td>
</tr>
</tbody>
</table>

All other values are reserved.
In Armv8-A, the permitted values are 0b0000 and 0b0001.

**SIMDInt, bits [15:12]**

Advanced SIMD Integer. Indicates whether the Advanced SIMD and floating-point implementation provides integer instructions. Defined values are:

<table>
<thead>
<tr>
<th>SIMDInt</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

**SIMDLS, bits [11:8]**

Advanced SIMD Load/Store. Indicates whether the Advanced SIMD and floating-point implementation provides load/store instructions. Defined values are:

<table>
<thead>
<tr>
<th>SIMDLS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

**FPDNaN, bits [7:4]**

Default NaN mode. Indicates whether the floating-point implementation provides support only for the Default NaN mode. Defined values are:

<table>
<thead>
<tr>
<th>FPDNaN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented, or hardware supports only the Default NaN mode.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Hardware supports propagation of NaN values.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

**FPFtZ, bits [3:0]**

Flush to Zero mode. Indicates whether the floating-point implementation provides support only for the Flush-to-Zero mode of operation. Defined values are:

<table>
<thead>
<tr>
<th>FPFtZ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented, or hardware supports only the Flush-to-Zero mode of operation.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Hardware supports full denormalized number arithmetic.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

**Otherwise:**

```
63  62  61  60  59  58  57  56  55  54  53  52  51  50  49  48  47  46  45  44  43  42  41  40  39  38  37  36  35  34  33  32
   UNKNOWN

The MVFR2_EL1 characteristics are:

**Purpose**

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation. Must be interpreted with MVFR0_EL1 and MVFR1_EL1.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch64 System register MVFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register MVFR2[31:0].

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

**Attributes**

MVFR2_EL1 is a 64-bit register.

**Field descriptions**

The MVFR2_EL1 bit assignments are:

**When AArch32 is supported at any Exception level:**

<table>
<thead>
<tr>
<th>Bits [63:8]</th>

OSDTRTX_EL1, OS Lock Data Transfer Register, Transmit

The OSDTRTX_EL1 characteristics are:

**Purpose**

Used for save/restore of DBGDTRTX_EL0. It is a component of the Debug Communications Channel.

**Configuration**

AArch64 System register OSDTRTX_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRTXEXT[31:0].

**Attributes**

OSDTRTX_EL1 is a 64-bit register.

**Field descriptions**

The OSDTRTX_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
</tr>
<tr>
<td></td>
<td>Return DTRTX without side-effect</td>
</tr>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**Bits [31:0]**

Return DTRTX without side-effect.

Reads of this register return the value in DTRTX and do not change TXfull.

Writes of this register update the value in DTRTX and do not change TXfull.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

**Accessing the OSDTRTX_EL1**

Arm deprecates reads and writes of OSDTRTX_EL1 when the OS Lock is unlocked.

Accesses to this register use the following encodings:

```
MRS <Xt>, OSDTRTX_EL1
```

<table>

OSECCR_EL1, OS Lock Exception Catch Control Register

The OSECCR_EL1 characteristics are:

**Purpose**

Provides a mechanism for an operating system to access the contents of EDECCR that are otherwise invisible to software, so it can save/restore the contents of EDECCR over powerdown on behalf of the external debugger.

**Configuration**

AArch64 System register OSECCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGOSECCR[31:0].

AArch64 System register OSECCR_EL1 bits [31:0] are architecturally mapped to External register EDECCR[31:0].

If OSLSR_EL1.OSLK == 0, then OSECCR_EL1 returns an UNKNOWN value on reads and ignores writes.

**Attributes**

OSECCR_EL1 is a 64-bit register.

**Field descriptions**

The OSECCR_EL1 bit assignments are:

**When OSLSR_EL1.OSLK == 1:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | EDECCR |

**Bits [63:32]**

Reserved, RES0.

**EDECCR, bits [31:0]**

Used for save/restore to EDECCR over powerdown.

Reads or writes to this field are indirect accesses to EDECCR.

**Accessing the OSECCR_EL1**

Accesses to this register use the following encodings:

**MRS <Xt>, OSECCR_EL1**

OSLAR_EL1, OS Lock Access Register

The OSLAR_EL1 characteristics are:

**Purpose**

Used to lock or unlock the OS Lock.

**Configuration**

AArch64 System register OSLAR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGOSLAR[31:0].

AArch64 System register OSLAR_EL1 bits [31:0] are architecturally mapped to External register OSLAR_EL1[31:0].

**Attributes**

OSLAR_EL1 is a 64-bit register.

**Field descriptions**

The OSLAR_EL1 bit assignments are:

<table>
<thead>
<tr>

**Bits [63:4]**

Reserved, RES0.

**OSLM, bits [3, 0]**

OS lock model implemented. Identifies the form of OS save and restore mechanism implemented.

<table>
<thead>
<tr>
<th>OSLM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>OS Lock not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>OS Lock implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved. In an Armv8 implementation the value 0b0 is not permitted.

The OSLM field is split as follows:

- OSLM[1] is OSLR_EL1[3].
- OSLM[0] is OSLR_EL1[0].

**nTT, bit [2]**

Not 32-bit access. This bit is always RAZ. It indicates that a 32-bit access is needed to write the key to the OS Lock Access Register.

**OSLK, bit [1]**

OS Lock Status.

<table>
<thead>
<tr>
<th>OSLK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>OS Lock unlocked.</td>
</tr>
<tr>
<td>0b1</td>

PAR_EL1, Physical Address Register

The PAR_EL1 characteristics are:

**Purpose**

Returns the output address (OA) from an Address translation instruction that executed successfully, or fault information if the instruction did not execute successfully.

**Configuration**

AArch64 System register PAR_EL1 bits [63:0] are architecturally mapped to AArch32 System register PAR[63:0].

**Attributes**

PAR_EL1 is a 64-bit register.

**Field descriptions**

The PAR_EL1 bit assignments are:

**When PAR_EL1.F == 0:**

<table>
<thead>
<tr>
<th>ATTR</th>
<th>RES0</th>
<th>PA[51:48]</th>
<th>PA[47:12]</th>
<th>RES1</th>
<th>IMPLEMENTATION DEFINED</th>
<th>NS</th>
<th>SH</th>
<th>RES0</th>
<th>F</th>
</tr>
</thead>
</table>

This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR_EL1 can return a value that indicates the resulting attributes, rather than the values that appear in the translation table descriptors. More precisely:

- The PAR_EL1.{ATTR, SH} fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the translation table descriptors.
- See the PAR_EL1.NS bit description for constraints on the value it returns.

**ATTR, bits [63:56]**

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in MAIR_EL1, MAIR_EL2, and MAIR_EL3.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [55:52]**

Reserved, RES0.
**PA[51:48], bits [51:48]**

*When FEAT_LPA is implemented:*

Extension to PA[47:12]. See PA[47:12] for more details.

On a Warm reset, this field resets to an architecturally *UNKNOWN* value.

*Otherwise:*

Reserved, RES0.

**PA[47:12], bits [47:12]**

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[47:12].

When FEAT_LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, the PA[51:48] bits form the upper part of the address value. Otherwise the PA[51:48] bits are RES0.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

On a Warm reset, this field resets to an architecturally *UNKNOWN* value.

**Bit [11]**

Reserved, RES1.

**IMPLEMENTATION DEFINED, bit [10]**

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally *UNKNOWN* value.

**NS, bit [9]**

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, when SCR_EL3.EEL2 is 1, this bit reflects the Security state of the intermediate physical address space of the translation for the instructions:

- In AArch64 state: AT S1E1R, AT S1E1W, AT S1E1RP, AT S1E1WP, AT S1E0R, and AT S1E0W.
- In AArch32 state: ATS1CPR, ATS1CPW, ATS1CPRP, ATS1CPWP, ATS1CUR, and ATS1CUW.

Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is *UNKNOWN*.

On a Warm reset, this field resets to an architecturally *UNKNOWN* value.

**SH, bits [8:7]**

Shareability attribute, for the returned output address. Permitted values are:

<table>
<thead>
<tr>
<th>SH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

The value 0b01 is reserved.

**Note**
This field returns the value 0b10 for:

- Any type of Device memory.
- Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [6:1]**

Reserved, RES0.

**F, bit [0]**

Indicates whether the instruction performed a successful address translation.

<table>
<thead>
<tr>
<th>F</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Address translation completed successfully.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**When PAR_EL1.F == 1:**

<table>
<thead>
<tr>
<th>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40</th>
<th>39 38 37 36 35 34 33 32</th>
<th>RES0</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMPLEMENTATION DEFINED</td>
<td>IMPLEMENTATION DEFINED</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
<tr>
<td>RES0</td>
<td>RES1</td>
<td>RES0</td>
</tr>
</tbody>
</table>

This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

**IMPLEMENTATION DEFINED, bits [63:56]**

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IMPLEMENTATION DEFINED, bits [51:48]**

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [47:12]**

Reserved, RES0.

**Bit [11]**

Reserved, RES1.
**Bit [10]**

Reserved, RES0.

**S, bit [9]**

Indicates the translation stage at which the translation aborted:

<table>
<thead>
<tr>
<th>S</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Translation aborted because of a fault in the stage 1 translation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Translation aborted because of a fault in the stage 2 translation.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**PTW, bit [8]**

If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [7]**

Reserved, RES0.

**FST, bits [6:1]**

Fault status code, as shown in the Data Abort ESR encoding.

PMBIDR_EL1, Profiling Buffer ID Register

The PMBIDR_EL1 characteristics are:

**Purpose**

Provides information to software as to whether the buffer can be programmed at the current Exception level.

**Configuration**

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMBIDR_EL1 are UNDEFINED.

**Attributes**

PMBIDR_EL1 is a 64-bit register.

**Field descriptions**

The PMBIDR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
| Bits [63:6] |

Reserved, RES0.

**F, bit [5]**

Flag updates. Defines whether the address translation performed by the Profiling Buffer manages the Access Flag and dirty state.

<table>
<thead>
<tr>
<th>F</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hardware management of the Access Flag and dirty state for accesses made by the Statistical Profiling Extension is always disabled for all translation stages.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hardware management for the Access Flag and dirty state for accesses made by the Statistical Profiling Extension is controlled in the same way as explicit memory accesses in the owning translation regime.</td>
</tr>
</tbody>
</table>

If hardware management of the Access Flag is disabled for a stage of translation, an access to Page or Block with the Access flag bit not set in the descriptor will generate an Access Flag fault.

If hardware management of the dirty state is disabled for a stage of translation, an access to a Page or Block will ignore the Dirty Bit Modifier in the descriptor might generate a Permission fault, depending on the values of the access permission bits in the descriptor.

**P, bit [4]**

Programming not allowed. The Profiling Buffer is owned by a higher Exception level or the other Security state.
Meaning

0b0  Profiling Buffer is owned by the current or a lower Exception level in the current Security state.
0b1  Profiling Buffer is owned by a higher Exception level or the other Security state.

The value read from this field depends on the current Exception level and the Effective values of MDCR_EL3.NSPB and MDCR_EL2.E2PB:

- If EL3 is implemented, and either MDCR_EL3.NSPB == 0b00 or MDCR_EL3.NSPB == 0b01, this bit reads as one from:
  - Non-secure EL1.
  - Non-secure EL2.
  - If Secure EL2 is implemented and enabled, and MDCR_EL2.E2PB == 0b00, Secure EL1.
- If EL3 is implemented, and either MDCR_EL3.NSPB == 0b10 or MDCR_EL3.NSPB == 0b11, this bit reads as one from:
  - Secure EL1.
  - If Secure EL2 is implemented, Secure EL2.
  - If EL2 is implemented and MDCR_EL2.E2PB == 0b00, Non-secure EL1.
- If EL3 is not implemented, EL2 is implemented, and MDCR_EL2.E2PB == 0b00, this bit reads as one from EL1.
- Otherwise, this bit reads as zero.

Align, bits [3:0]

Defines the minimum alignment constraint for PMBPTR_EL1. If this field is non-zero, then the PE must pad every record up to a multiple of this size.

<table>
<thead>
<tr>
<th>Align</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Byte</td>
</tr>
<tr>
<td>0b0001</td>
<td>Halfword.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Word</td>
</tr>
<tr>
<td>0b0011</td>
<td>Doubleword.</td>
</tr>
<tr>
<td>0b0100</td>
<td>16 Bytes.</td>
</tr>
<tr>
<td>0b0101</td>
<td>32 Bytes.</td>
</tr>
<tr>
<td>0b0110</td>
<td>64 Bytes.</td>
</tr>
<tr>
<td>0b0111</td>
<td>128 Bytes.</td>
</tr>
<tr>
<td>0b1000</td>
<td>256 Bytes.</td>
</tr>
<tr>
<td>0b1001</td>
<td>512 Bytes.</td>
</tr>
<tr>
<td>0b1010</td>
<td>1KB.</td>
</tr>
<tr>
<td>0b1011</td>
<td>2KB.</td>
</tr>
</tbody>
</table>

For more information, see 'Restrictions on the current write pointer'.

Accessing the PMBIDR_EL1

Accesses to this register use the following encodings:

MRS <Xt>, PMBIDR_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>

PMBLIMITR_EL1, Profiling Buffer Limit Address Register

PMBLIMITR_EL1 characteristics are:

**Purpose**

Defines the upper limit for the profiling buffer, and enables the profiling buffer

**Configuration**

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMBLIMITR_EL1 are UNDEFINED.

**Attributes**

PMBLIMITR_EL1 is a 64-bit register.

**Field descriptions**

The PMBLIMITR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | LIMIT |

**LIMIT**, bits [63:12]

Limit address. PMBLIMITR_EL1.LIMIT:Zeros(12) is the address of the first byte in memory after the last byte in the profiling buffer. If the smallest implemented translation granule is not 4KB, then bits[N-1:12] are RES0, where N is the IMPLEMENTATION DEFINED value, \( \text{Log}_2 \text{smallest implemented translation granule})

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [11:6]**

Reserved, RES0.

**PMFZ, bit [5]**

When FEAT_SPEv1p2 is implemented:

Freeze PMU on SPE event. Stop PMU event counters when PMBSR_EL1.S == 0b1.

<table>
<thead>
<tr>
<th>PMFZ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not freeze PMU event counters on Statistical Profiling Buffer Management event.</td>
</tr>
<tr>
<td>0b1</td>
<td>Freeze PMU event counters on Statistical Profiling Buffer Management event.</td>
</tr>
</tbody>
</table>

The PMU event counters affected by this control is controlled by PMCR_EL0.FZS and, if EL2 is implemented, MDCR_EL2.HPMFZS. See the descriptions of these control bits for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**Bits [4:3]**

Reserved, RES0.

**FM, bits [2:1]**

Fill mode.

<table>
<thead>
<tr>
<th>FM</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Fill mode. Stop collection and raise maintenance interrupt on buffer fill.</td>
<td>When FEAT_SPEv1p2 is implemented</td>
</tr>
<tr>
<td>0b10</td>
<td>Discard mode. All output is discarded.</td>
<td></td>
</tr>
</tbody>
</table>

All other values are reserved.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**E, bit [0]**

Profiling Buffer enable

<table>
<thead>
<tr>
<th>E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All output is discarded.</td>
</tr>
<tr>
<td>0b1</td>
<td>Profiling buffer enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**Accessing the PMBLIMITR_EL1**

PMBPTR_EL1, Profiling Buffer Write Pointer Register

The PMBPTR_EL1 characteristics are:

**Purpose**

Defines the current write pointer for the profiling buffer.

**Configuration**

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMBPTR_EL1 are UNDEFINED.

**Attributes**

PMBPTR_EL1 is a 64-bit register.

**Field descriptions**

The PMBPTR_EL1 bit assignments are:

```
63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32
| PTR | PTR |
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
```

**PTR, bits [63:0]**

Current write address. Defines the virtual address of the next entry to be written to the buffer.

The architecture places restrictions on the values software can write to the pointer. For more information see 'Restrictions on the current write pointer'.

**Note**

As a result, an implementation might treat some of bits[M:0], where M is defined by PMBIDR_EL1.Align, as RES0.

On a management interrupt, PMBPTR_EL1 is frozen.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMBPTR_EL1**

Accesses to this register use the following encodings:

```
MRS <Xt>, PMBPTR_EL1
```

```

**PMBSR_EL1, Profiling Buffer Status/syndrome Register**

The PMBSR_EL1 characteristics are:

**Purpose**

Provides syndrome information to software when the buffer is disabled because the management interrupt has been raised.

**Configuration**

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMBSR_EL1 are UNDEFINED.

**Attributes**

PMBSR_EL1 is a 64-bit register.

**Field descriptions**

The PMBSR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:32]</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
<tbody>
<tr>
<td>EC bits [31:26]</td>
<td>Exception class</td>
</tr>
<tr>
<td>Top-level description of the cause of the buffer management event</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>EC</th>
<th>Meaning</th>
<th>MSS</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>Other buffer management event. All buffer management events other than those described by other defined Exception class codes.</td>
<td><strong>MSS encoding for other buffer management events</strong></td>
</tr>
<tr>
<td>0b011111</td>
<td>Buffer management event for an IMPLEMENTATION DEFINED reason.</td>
<td><strong>MSS encoding for a buffer management event for an IMPLEMENTATION DEFINED reason</strong></td>
</tr>
<tr>
<td>0b100100</td>
<td>Stage 1 Data Abort on write to Profiling Buffer.</td>
<td><strong>MSS encoding for stage 1 or stage 2 Data Aborts on write to buffer</strong></td>
</tr>
<tr>
<td>0b100101</td>
<td>Stage 2 Data Abort on write to Profiling Buffer.</td>
<td><strong>MSS encoding for stage 1 or stage 2 Data Aborts on write to buffer</strong></td>
</tr>
</tbody>
</table>

All other values are reserved. Reserved values might be defined in a future version of the architecture.
Writing a reserved value to this field will make the value of this field **UNKNOWN**. Values that are not supported act as reserved values when writing to this register.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [25:20]**

Reserved, **RES0**.

**DL, bit [19]**

Partial record lost.

Following a buffer management event other than an asynchronous External abort, indicates whether the last record written to the Profiling Buffer is complete.

<table>
<thead>
<tr>
<th>DL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PMBPTR_EL1 points to the first byte after the last complete record written to the Profiling Buffer.</td>
</tr>
<tr>
<td>0b1</td>
<td>Part of a record was lost because of a buffer management event or synchronous External abort. PMBPTR_EL1 might not point to the first byte after the last complete record written to the buffer, and so restarting collection might result in a data record stream that software cannot parse. All records prior to the last record have been written to the buffer.</td>
</tr>
</tbody>
</table>

When the buffer management event was because of an asynchronous external abort, this bit is set to 1 and software must not assume that any valid data has been written to the Profiling Buffer.

This bit is **RES0** if the PE never sets this bit as a result of a buffer management event caused by an asynchronous External abort.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**EA, bit [18]**

External abort.

<table>
<thead>
<tr>
<th>EA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An external abort has not been asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>An external abort has been asserted and detected by the Statistical Profiling Extension.</td>
</tr>
</tbody>
</table>

This bit is **RES0** if the PE never sets this bit as the result of an External abort.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**S, bit [17]**

Service

<table>
<thead>
<tr>
<th>S</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PMBIRO is not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>PMBIRO is asserted. All profiling data has either been written to the buffer or discarded.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**COLL, bit [16]**

Collision detected.

<table>
<thead>
<tr>
<th>COLL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No collision events detected.</td>
</tr>
<tr>
<td>0b1</td>
<td>At least one collision event was recorded.</td>
</tr>
</tbody>
</table>
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**MSS, bits [15:0]**

Management Event Specific Syndrome.
Contains syndrome specific to the management event.
The syndrome contents for each management event are described in the following sections.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**MSS encoding for stage 1 or stage 2 Data Aborts on write to buffer**

**PMCCFILTR_EL0, Performance Monitors Cycle Count Filter Register**

The PMCCFILTR_EL0 characteristics are:

**Purpose**

Determines the modes in which the Cycle Counter, PMCCNTR_EL0, increments.

**Configuration**

AArch64 System register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCCFILTR[31:0].

AArch64 System register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to External register PMCCFILTR_EL0[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCCFILTR_EL0 are UNDEFINED.

**Attributes**

PMCCFILTR_EL0 is a 64-bit register.

**Field descriptions**

The PMCCFILTR_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| P  | U  | NSK| NSU| M  | RES0|     | RES0|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |

**Bits [63:32]**

Reserved, RES0.

**P, bit [31]**

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR_EL0.NSK bit.

<table>
<thead>
<tr>
<th>P</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count cycles in EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count cycles in EL1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**U, bit [30]**

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR_EL0.NSU bit.
Meaning

<table>
<thead>
<tr>
<th>U</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count cycles in EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count cycles in EL0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**NSK, bit [29]**

*When EL3 is implemented:*

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the **PMCCFILTR_EL0.P** bit, cycles in Non-secure EL1 are counted.

Otherwise, cycles in Non-secure EL1 are not counted.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**NSU, bit [28]**

*When EL3 is implemented:*

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the **PMCCFILTR_EL0.U** bit, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**NSH, bit [27]**

*When EL2 is implemented:*

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If Secure EL2 is implemented, and EL3 is implemented, counting in Secure EL2 is further controlled by the **PMCCFILTR_EL0.SH** bit.

<table>
<thead>
<tr>
<th>NSH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not count cycles in EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Count cycles in EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**M, bit [26]**

*When EL3 is implemented:*

Secure EL3 filtering bit.
If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Secure EL3 are counted.

Otherwise, cycles in Secure EL3 are not counted.

Most applications can ignore this field and set its value to 0.

**Note**

This field is not visible in the AArch32 PMCCFILTR System register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bit [25]**

Reserved, RES0.

**SH, bit [24]**

When FEAT_SEL2 is implemented and EL3 is implemented:

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Secure EL2 are counted.

Otherwise, cycles in Secure EL2 are not counted.

If Secure EL2 is disabled, this field is RES0.

**Note**

This field is not visible in the AArch32 PMCCFILTR System register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [23:0]**

Reserved, RES0.

**Accessing the PMCCFILTR_EL0**

PMCCFILTR_EL0 can also be accessed by using PMXEVTYP Hiệp with PMSER SEL set to 0b1111.

Accesses to this register use the following encodings:

**MRS <Xt>, PMCCFILTR_EL0**

PMCCNTR_EL0, Performance Monitors Cycle Count Register

The PMCCNTR_EL0 characteristics are:

**Purpose**

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See 'Time as measured by the Performance Monitors cycle counter' for more information.

PMCCFILTR_EL0 determines the modes and states in which the PMCCNTR_EL0 can increment.

**Configuration**

AArch64 System register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch32 System register PMCCNTR[63:0].

AArch64 System register PMCCNTR_EL0 bits [63:0] are architecturally mapped to External register PMCCNTR_EL0[63:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCCNTR_EL0 are UNDEFINED.

All counters are subject to any changes in clock frequency, including clock stopping caused by the WFI and WFE instructions. This means that it is **CONSTRAINED UNPREDICTABLE** whether or not PMCCNTR_EL0 continues to increment when clocks are stopped by WFI and WFE instructions.

**Attributes**

PMCCNTR_EL0 is a 64-bit register.

**Field descriptions**

The PMCCNTR_EL0 bit assignments are:

**CCNT, bits [63:0]**

Cycle count. Depending on the values of PMCR_EL0.{LC,D}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to PMCR_EL0.C sets this field to 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the PMCCNTR_EL0**

Accesses to this register use the following encodings:

The PMCEID0_EL0 characteristics are:

**Purpose**

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the ranges 0x0000 to 0x001F and 0x4000 to 0x401F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

---

**Note**

Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

---

For more information about the common events and the use of the PMCID<n>_EL0 registers see 'The PMU event number space and common events'.

**Configuration**

AArch64 System register PMCEID0_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCEID0[31:0].

AArch64 System register PMCEID0_EL0 bits [63:32] are architecturally mapped to AArch32 System register PMCEID2[31:0].

AArch64 System register PMCEID0_EL0 bits [31:0] are architecturally mapped to External register PMCEID0[31:0].

AArch64 System register PMCEID0_EL0 bits [63:32] are architecturally mapped to External register PMCEID2[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCEID0_EL0 are UNDEFINED.

**Attributes**

PMCEID0_EL0 is a 64-bit register.

**Field descriptions**

The PMCEID0_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>IDhi&lt;n&gt;, bit [n+32], for n = 31 to 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID31</td>
</tr>
<tr>
<td>31</td>
</tr>
</tbody>
</table>

When FEAT_PMUv3p1 is implemented:

IDhi[n] corresponds to common event (0x4000 + n).

For each bit:
A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

**Note**

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

### Otherwise:

Reserved, RES0.

**ID<n>, bit [n], for n = 31 to 0**

ID[n] corresponds to common event n.

For each bit:

<table>
<thead>
<tr>
<th>ID&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The common event is not implemented, or not counted.</td>
</tr>
<tr>
<td>0b1</td>
<td>The common event is implemented.</td>
</tr>
</tbody>
</table>

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

**Note**

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

</tr>
</tbody>
</table>

IDhi<n>, bit [n+32], for n = 31 to 0

When FEAT_PMUv3p1 is implemented:

IDhi[n] corresponds to common event (0x4020 + n).

For each bit:
IDhi<n> | Meaning
---|---
0b0 | The common event is not implemented, or not counted.
0b1 | The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

**Note**

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

Otherwise:

Reserved, RES0.

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to common event (0x0020 + n).

For each bit:

<table>
<thead>
<tr>
<th>ID&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The common event is not implemented, or not counted.</td>
</tr>
<tr>
<td>0b1</td>
<td>The common event is implemented.</td>
</tr>
</tbody>
</table>

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

**Note**

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

The PMCNTENCLR_EL0 characteristics are:

**Purpose**

Disables the Cycle Count Register, PMCCNTR_EL0, and any implemented event counters PMEVCNTR<n>. Reading this register shows which counters are enabled.

**Configuration**

AArch64 System register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCNTENCLR[31:0].

AArch64 System register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to External register PMCNTENCLR_EL0[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCNTENCLR_EL0 are UNDEFINED.

**Attributes**

PMCNTENCLR_EL0 is a 64-bit register.

**Field descriptions**

The PMCNTENCLR_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:32]**

Reserved, RES0.

**C, bit [31]**

**PMCCNTR_EL0** disable bit. Disables the cycle counter register. Possible values are:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter is enabled. When written, disables the cycle counter.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P<n>, bit [n], for n = 30 to 0**

Event counter disable bit for PMEVCNTR<n>_EL0.

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in MDCR_EL2.HPMN. Otherwise, N is the value in PMCR_EL0.N.
Meaning

<table>

PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

**Purpose**

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

**Configuration**

AArch64 System register PMCR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCR[31:0].

AArch64 System register PMCR_EL0 bits [7:0] are architecturally mapped to External register PMCR_EL0[7:0].

This register is present only when FEAT_PMUV3 is implemented. Otherwise, direct accesses to PMCR_EL0 are UNDEFINED.

**Attributes**

PMCR_EL0 is a 64-bit register.

**Field descriptions**

The PMCR_EL0 bit assignments are:

**Bits [63:33]**

Reserved, RES0.

**FZS, bit [32]**

**When FEAT_SPEv1p2 is implemented:**

Freeze-on-SPE event. Stop counters when PMBLIMITR_EL1.(PMFZ,E) == (1,1) and PMBSR_EL1.S == 0b1.

<table>
<thead>
<tr>
<th>FZS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not freeze on Statistical Profiling Buffer Management event.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counters do not count following a Statistical Profiling Buffer Management event.</td>
</tr>
</tbody>
</table>

If EL2 is implemented, then:

- This bit affects the operation of event counters in the range [0 .. (MDCR_EL2.HPMN-1)].
- If MDCR_EL2.HPMN is less than PMCR_EL0.N:
  - This bit does not affect the operation of event counters in the range [MDCR_EL2.HPMN .. (PMCR_EL0.N-1)].
- This applies even when EL2 is disabled in the current Security state.

This bit does not affect the operation of PMCCNTR_EL0.

On a Warm reset, when AArch32 is supported at any Exception level, this field resets to 0.

On a Warm reset, when the implementation only supports execution in AArch64 state, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**IMP, bits [31:24]**

When FEAT_PMUv3p7 is not implemented:

Implementer code.

If this field is zero, then PMCR_EL0.IDCODE is RES0 and software must use MIDR_EL1 to identify the PE.

Otherwise, this field and PMCR_EL0.IDCODE identify the PMU implementation to software. The implementer codes are allocated by Arm. A non-zero value has the same interpretation as MIDR_EL1.Implementer.

Use of this field is deprecated.

This field reads as an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

Reserved, RAZ.

**IDCODE, bits [23:16]**

When PMCR_EL0.IMP != 0x00:

Identification code. Use of this field is deprecated. This field has an IMPLEMENTATION DEFINED value.

Each implementer must maintain a list of identification codes that are specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.

Access to this field is RO.

Otherwise:

Reserved, RES0.

**N, bits [15:11]**

Indicates the number of event counters implemented. This value is in the range of 0b00000-0b11111. If the value is 0b00000 then only PMCCNTR_EL0 is implemented. If the value is 0b11111 PMCCNTR_EL0 and 31 event counters are implemented.

When EL2 is implemented and enabled for the current Security state, reads of this field from EL1 and EL0 return the value of MDCR_EL2.HPMN.

Access to this field is RO.

**Bit [10]**

Reserved, RES0.

**FZO, bit [9]**

When FEAT_PMUv3p7 is implemented:

Freeze-on-overflow. Stop event counters on overflow.
Meaning

0b0    Do not freeze on overflow.
0b1    Event counters do not count when PMOVsCLR_EL0[(N-1):0] is nonzero, where N is the value of MDCR_EL2.HPMN if EL2 is implemented, and PMCR_EL0.N otherwise.

If EL2 is implemented, then:

- This bit affects the operation of event counters in the range [0 .. (MDCR_EL2.HPMN-1)].
- If MDCR_EL2.HPMN is less than PMCR_EL0.N:
  - This bit does not affect the operation of event counters in the range [MDCR_EL2.HPMN .. (PMCR_EL0.N-1)].
  - The operation of this bit ignores the values of PMOVsCLR_EL0[(PMCR_EL0.N-1):MDCR_EL2.HPMN].
- This applies even when EL2 is disabled in the current Security state.

This bit does not affect the operation of PMCCNTR_EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [8]

Reserved, RES0.

LP, bit [7]

When FEAT_PMUv3p5 is implemented:

Long event counter enable. Determines when unsigned overflow is recorded by a counter overflow bit.

LP

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0     Event counter overflow on increment that causes unsigned overflow of PMEVCNTR&lt;n&gt;_EL0[31:0].</td>
</tr>
<tr>
<td>0b1     Event counter overflow on increment that causes unsigned overflow of PMEVCNTR&lt;n&gt;_EL0[63:0].</td>
</tr>
</tbody>
</table>

If EL2 is implemented and MDCR_EL2.HPMN or HDCR.HPMN is less than PMCR_EL0.N, this bit does not affect the operation of event counters in the range [HDCR.HPMN ..(PMCR_EL0.N-1)] or [MDCR_EL2.HPMN ..(PMCR_EL0.N-1)].

Note

The effect of MDCR_EL2.HPMN or HDCR.HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state. For more information, see the description of MDCR_EL2.HPMN or HDCR.HPMN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LC, bit [6]

When AArch32 is supported at any Exception level:

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.
<table>
<thead>
<tr>
<th>LC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0[31:0].</td>
</tr>
<tr>
<td>0b1</td>
<td>Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0[63:0].</td>
</tr>
</tbody>
</table>

Arm deprecates use of PMCR_EL0, LC = 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.

**DP, bit [5]**

*When EL3 is implemented or (FEAT_PMUv3p1 is implemented and EL2 is implemented):*

Disable cycle counter when event counting is prohibited.

<table>
<thead>
<tr>
<th>DP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counting by PMCCNTR_EL0 is not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>When event counting for counters in the range [0,(MDCR_EL2,HPMN-1)] is prohibited, cycle counting by PMCCNTR_EL0 is disabled.</td>
</tr>
</tbody>
</table>

For more information see 'Prohibiting event counting'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**X, bit [4]**

*When the implementation includes a PMU event export bus:*

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

<table>
<thead>
<tr>
<th>X</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not export events.</td>
</tr>
<tr>
<td>0b1</td>
<td>Export events where not prohibited.</td>
</tr>
</tbody>
</table>

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL PE trace unit.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RAZ/WI.

**D, bit [3]**

*When AArch32 is supported at any Exception level:*

Clock divider.
Meaning

<table>
<thead>
<tr>
<th>D</th>
<th>When enabled, PMCCNTR_EL0 counts every clock cycle.</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>When enabled, PMCCNTR_EL0 counts once every 64 clock cycles.</td>
</tr>
</tbody>
</table>

If PMCR_EL0.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR_EL0.D = 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**C, bit [2]**

Cycle counter reset. The effects of writing to this bit are:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reset PMCCNTR_EL0 to zero.</td>
</tr>
</tbody>
</table>

**Note**

Resetting PMCCNTR_EL0 does not change the cycle counter overflow bit.

The value of PMCR_EL0.LC is ignored, and bits [63:0] of all affected event counters are reset.

Access to this field is WO/RAZ.

**P, bit [1]**

Event counter reset. The effects of writing to this bit are:

<table>
<thead>
<tr>
<th>P</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reset all event counters accessible in the current Exception level, not including PMCCNTR_EL0, to zero.</td>
</tr>
</tbody>
</table>

In EL0 and EL1:

- If EL2 is implemented and enabled in the current Security state, and MDCR_EL2,HPMN is less than PMCR_EL0.N, a write of 1 to this bit does not reset event counters in the range [MDCR_EL2,HPMN..(PMCR_EL0.N-1)].
- If EL2 is not implemented, EL2 is disabled in the current Security state, or MDCR_EL2,HPMN equals PMCR_EL0.N, a write of 1 to this bit resets all the event counters.

In EL2 and EL3, a write of 1 to this bit resets all the event counters.

**Note**

Resetting the event counters does not change the event counter overflow bits.

If FEAT_PMUv3p5 is implemented, the values of MDCR_EL2,HLP and PMCR_EL0.LP are ignored, and bits [63:0] of all affected event counters are reset.

Access to this field is WO/RAZ.

**E, bit [0]**

Enable.
### PMCR_EL0, Performance Monitors Control Register

<table>
<thead>
<tr>
<th>E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All event counters in the range ([0..(PMN-1)]) and PMCCNTR_EL0 are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>All event counters in the range ([0..(PMN-1)]) and PMCCNTR_EL0 are enabled by PMCNTENSET_EL0.</td>
</tr>
</tbody>
</table>

If EL2 is implemented, then:

- If EL2 is using AArch32, PMN is `HDCR.HPMN`.
- If EL2 is using AArch64, PMN is `MDCR_EL2.HPMN`.
- If PMN is less than PMCR_EL0.N, this bit does not affect the operation of event counters in the range \([PMN..(PMCR_EL0.N-1)]\).

If EL2 is not implemented, PMN is PMCR_EL0.N.

**Note**

The effect of `MDCR_EL2.HPMN` or `HDCR.HPMN` on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state. For more information, see the description of `MDCR_EL2.HPMN` or `HDCR.HPMN`.

On a Warm reset, this field resets to 0.

PMEVCNTR<n>_EL0, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n>_EL0 characteristics are:

Purpose

Holds event counter n, which counts events, where n is 0 to 30.

Configuration

AArch64 System register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMEVCNTR<n>[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMEVCNTR<n>_EL0 are UNDEFINED.

Attributes

PMEVCNTR<n>_EL0 is a 64-bit register.

Field descriptions

The PMEVCNTR<n>_EL0 bit assignments are:

When FEAT_PMUv3p5 is implemented:

<table>
<thead>
<tr>
<th>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</th>
<th>Event counter n</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
<td>Event counter n</td>
</tr>
</tbody>
</table>

Bits [63:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

<table>
<thead>
<tr>
<th>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</th>
<th>RES0</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
<td>Event counter n</td>
</tr>
</tbody>
</table>

Bits [63:32]

Reserved, RES0.

Bits [31:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the PMEVCNTR<n>_EL0**

PMEVCNTR<n>_EL0 can also be accessed by using PMXEVCNTR_EL0 with PMSELR_EL0.SEL set to the value of <n>.

If FEAT_FGT is implemented and <n> is greater than or equal to the number of accessible counters, then the behavior of permitted reads and writes of PMEVCNTR<n>_EL0 is as follows:

- If <n> is an unimplemented event counter, the access is **UNDEFINED**.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and <n> is greater than or equal to the number of accessible counters, then reads and writes of PMEVCNTR<n>_EL0 are **CONSTRAINED UNPREDICTABLE**, and the following behaviors are permitted:

- Accesses to the register are **UNDEFINED**.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a **NOP**.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

**Note**

In EL0, an access is permitted if it is enabled by PMUSERENR_EL0.{ER,EN}.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, MDCR_EL2.HPMN identifies the number of accessible event counters. Otherwise, the number of accessible event counters is the number of implemented event counters. See MDCR_EL2.HPMN for more details.

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>

PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>_EL0 characteristics are:

**Purpose**

Configures event counter n, where n is 0 to 30.

**Configuration**

AArch64 System register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMEVTYPER<n>[31:0].

AArch64 System register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to External register PMEVTYPER<n>_EL0[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMEVTYPER<n>_EL0 are UNDEFINED.

**Attributes**

PMEVTYPER<n>_EL0 is a 64-bit register.

**Field descriptions**

The PMEVTYPER<n>_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| P   | U   | NSK | NSK | NSK | NSK | NSK | NSK | NSK | NSK | NSK | NSK | NSK | NSK | NSH | NSH | NSH | NSH | NSH | NSH | NSH | NSH | NSH | NSH | NSH | NSH | NSH | NSH | NSH | NSH | NSH | NSH | NSH |
| RES0| evtCount[15:10] | evtCount[9:0] |

**Bits [63:32]**

Reserved, RES0.

**P, bit [31]**

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER<n>_EL0.NSK bit.

<table>
<thead>
<tr>
<th>P</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Count events in EL1.</td>
</tr>
<tr>
<td>1</td>
<td>Do not count events in EL1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**U, bit [30]**

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER<n>_EL0.NSU bit.
**NSK, bit [29]**

When EL3 is implemented:

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMEVTYPER<\(n\)>_EL0.P bit, events in Non-secure EL1 are counted. Otherwise, events in Non-secure EL1 are not counted.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**NSU, bit [28]**

When EL3 is implemented:

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMEVTYPER<\(n\)>_EL0.U bit, events in Non-secure EL0 are counted. Otherwise, events in Non-secure EL0 are not counted.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**NSH, bit [27]**

When EL2 is implemented:

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If Secure EL2 is implemented, and EL3 is implemented, counting in Secure EL2 is further controlled by the PMEVTYPER<\(n\)>_EL0.SH bit.

**NSH**

<table>
<thead>
<tr>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**M, bit [26]**

When EL3 is implemented:

Secure EL3 filtering bit.
If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in Secure EL3 are counted. Otherwise, events in Secure EL3 are not counted.

Most applications can ignore this field and set its value to 0b0.

**Note**

This field is not visible in the AArch32 PMEVTYPER<n> System register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**MT, bit [25]**

When FEAT_MTPMU is implemented or an IMPLEMENTATION DEFINED multi-threaded PMU extension is implemented:

Multithreading.

<table>
<thead>
<tr>
<th>MT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count events only on controlling PE.</td>
</tr>
<tr>
<td>0b1</td>
<td>Count events from any PE with the same affinity at level 1 and above as this PE.</td>
</tr>
</tbody>
</table>

From Armv8.6, the IMPLEMENTATION DEFINED multi-threaded PMU extension is not permitted, meaning if FEAT_MTPMU is not implemented, this bit is RES0. See ID_AA64DFR0_EL1.MTPMU.

This bit is ignored by the PE and treated as zero when FEAT_MTPMU is implemented and Disabled.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SH, bit [24]**

When FEAT_SEL2 is implemented and EL3 is implemented:

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMEVTYPER<n>_EL0.NSH bit, events in Secure EL2 are counted.

Otherwise, events in Secure EL2 are not counted.

**Note**

This field is not visible in the AArch32 PMEVTYPER<n> System register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.
Bits [23:16]

Reserved, RES0.

evtCount[15:10], bits [15:10]

When FEAT_PMUv3p1 is implemented:

Extension to evtCount[9:0]. See evtCount[9:0] for more details.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count. The event number of the event that is counted by event counter PMEVCNTR<n>_EL0.

Software must program this field with an event that is supported by the PE being programmed.

The ranges of event numbers allocated to each type of event are shown in ‘Allocation of the PMU event number space’.

If evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range 0x0000 to 0x003F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- If 16-bit evtCount is implemented, for the range 0x4000 to 0x403F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED events, it is UNPREDICTABLE what event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

Note

UNPREDICTABLE means the event must not expose privileged information.

Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include an event from a set of common IMPLEMENTATION DEFINED events, then no event is counted and the value read back on evtCount is the value written.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMEVTYPER<n>_EL0

PMEVTYPER<n>_EL0 can also be accessed by using PMXVTYPER_EL0 with PMSELR_EL0 SEL set to n.

If FEAT_FGT is implemented and <n> is greater than or equal to the number of accessible counters, then the behavior of permitted reads and writes of PMEVTYPER<n>_EL0 is as follows:

- If <n> is an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and <n> is greater than or equal to the number of accessible counters, then reads and writes of PMEVTYPER<n>_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note
In EL0, an access is permitted if it is enabled by `PMUSERENR_EL0.EN`.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, `MDCR_EL2.HPMN` identifies the number of accessible event counters. Otherwise, the number of accessible event counters is the number of implemented event counters. See `MDCR_EL2.HPMN` for more details.

Accesses to this register use the following encodings:

MRS <Xt>, PMEVTYPER<n>_EL0

<table>

PMINTENCLR_EL1, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR_EL1 characteristics are:

**Purpose**

Disables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR_EL0, and the event counters PMEVCNTR<n>_EL0. Reading the register shows which overflow interrupt requests are enabled.

**Configuration**

AArch64 System register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMINTENCLR[31:0].

AArch64 System register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to External register PMINTENCLR_EL1[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMINTENCLR_EL1 are UNDEFINED.

**Attributes**

PMINTENCLR_EL1 is a 64-bit register.

**Field descriptions**

The PMINTENCLR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits 63:32</th>
<th>Meaning</th>
</tr>
</thead>
</table>

**Bits [63:32]**

Reserved, RES0.

**C, bit [31]**

PMCCNTR_EL0 overflow interrupt request disable bit. Possible values are:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.</td>
</tr>
</tbody>
</table>

**P<n>, bit [n], for n = 30 to 0**

Event counter overflow interrupt request disable bit for PMEVCNTR<n>_EL0.

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1, N is the value in MDCR_EL2.HPMN. Otherwise, N is the value in PMCR_EL0.N.
Meaning

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that the <code>PMEVCNTR&lt;n&gt;_EL0</code> event counter interrupt request is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that the <code>PMEVCNTR&lt;n&gt;_EL0</code> event counter interrupt request is enabled. When written, disables the <code>PMEVCNTR&lt;n&gt;_EL0</code> interrupt request.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

The PMMIR_EL1 characteristics are:

**Purpose**

Describes Performance Monitors parameters specific to the implementation to software.

**Configuration**

This register is present only when FEAT_PMUv3p4 is implemented. Otherwise, direct accesses to PMMIR_EL1 are UNDEFINED.

**Attributes**

PMMIR_EL1 is a 64-bit register.

**Field descriptions**

The PMMIR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:20</td>
<td>Reserved, res0.</td>
</tr>
<tr>
<td>19:16</td>
<td>BUS_WIDTH, bits</td>
</tr>
<tr>
<td>15:12</td>
<td>BUS_SLOTS</td>
</tr>
<tr>
<td>11:0</td>
<td>SLOTS</td>
</tr>
</tbody>
</table>

**Bits [63:20]**

Reserved, res0.

**BUS_WIDTH, bits [19:16]**

*From Armv8.7*

Bus width. Indicates the number of bytes each BUS_ACCESS event relates to. Encoded as \( \log_2(\text{number of bytes}) \) plus one. Defined values are:

<table>
<thead>
<tr>
<th>BUS_WIDTH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The information is not available.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Four bytes.</td>
</tr>
<tr>
<td>0b0100</td>
<td>8 bytes.</td>
</tr>
<tr>
<td>0b0101</td>
<td>16 bytes.</td>
</tr>
<tr>
<td>0b0110</td>
<td>32 bytes.</td>
</tr>
<tr>
<td>0b0111</td>
<td>64 bytes.</td>
</tr>
<tr>
<td>0b1000</td>
<td>128 bytes.</td>
</tr>
<tr>
<td>0b1001</td>
<td>256 bytes.</td>
</tr>
<tr>
<td>0b1010</td>
<td>512 bytes.</td>
</tr>
<tr>
<td>0b1011</td>
<td>1024 bytes.</td>
</tr>
<tr>
<td>0b1100</td>
<td>2048 bytes.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Each transfer is up to this number of bytes. An access might be smaller than the bus width.

When this field is nonzero, each access counted by BUS_ACCESS is at most BUS_WIDTH bytes. An implementation might treat a wide bus as multiple narrower buses, such that a wide access on the bus increments the BUS_ACCESS counter by more than one.
Otherwise:
Reserved, RAZ.

**BUS_SLOTS, bits [15:8]**

From Armv8.7:
Bus count. The largest value by which the BUS_ACCESS event might increment by in a single BUS_CYCLES cycle.
If the information is not available, this field will read as zero.

Otherwise:
Reserved, RAZ.

**SLOTS, bits [7:0]**
Operation width. The largest value by which the STALL_SLOT event might increment by in a single cycle. If the STALL_SLOT event is not implemented, this field might read as zero.

**Accessing the PMMIR_EL1**

Accesses to this register use the following encodings:

```
MRS <Xt>, PMMIR_EL1
```

</tbody>
</table>

PMCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P<n>, bit [n], for n = 30 to 0**

Event counter overflow clear bit for PMEVCNTR<n>_EL0.
If \( N \) is less than 31, then bits [30:\( N \)] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, \( N \) is the value in \texttt{MDCR\_EL2.\_HPMN}. Otherwise, \( N \) is the value in \texttt{PMCR\_EL0.N}.

<table>
<thead>
<tr>
<th>( P&lt;n&gt; )</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that \texttt{PMEVCNTR_n_EL0} has not overflowed since this bit was last cleared. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that \texttt{PMEVCNTR_n_EL0} has overflowed since this bit was last cleared. When written, clears the \texttt{PMEVCNTR_n_EL0} overflow bit to 0.</td>
</tr>
</tbody>
</table>

If \texttt{FEAT\_PMUv3p5} is implemented, \texttt{MDCR\_EL2.HLP} and \texttt{PMCR\_EL0.LP} control whether an overflow is detected from unsigned overflow of \texttt{PMEVCNTR\_n\_EL0[31:0]} or unsigned overflow of \texttt{PMEVCNTR\_n\_EL0[63:0]}.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMOVSCLR\_EL0**

Accesses to this register use the following encodings:

\[
\text{MRS} \ <Xt>, \ \text{PMOVSCLR\_EL0}
\]

PMOVSSET_EL0, Performance Monitors Overflow Flag Status Set register

The PMOVSSET_EL0 characteristics are:

**Purpose**

Sets the state of the overflow bit for the Cycle Count Register, PMCCNTR_EL0, and each of the implemented event counters PMEVCNTR<n>.

**Configuration**

AArch64 System register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMOVSSET[31:0].

AArch64 System register PMOVSSET_EL0 bits [31:0] are architecturally mapped to External register PMOVSSET_EL0[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMOVSSET_EL0 are UNDEFINED.

**Attributes**

PMOVSSET_EL0 is a 64-bit register.

**Field descriptions**

The PMOVSSET_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [63:32]**

Reserved, RES0.

**C, bit [31]**

Cycle counter overflow set bit.

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter has overflowed since this bit was last cleared. When written, sets the cycle counter overflow bit to 1.</td>
</tr>
</tbody>
</table>

PMCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P<n>, bit [n], for n = 30 to 0**

Event counter overflow set bit for PMEVCNTR<n>_EL0.
If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in MDCR_EL2.HPMN. Otherwise, N is the value in PMCR_EL0.N.

<table>
<thead>
<tr>
<th>( P^{&lt;n&gt;} )</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that \texttt{PMEVCNTR&lt;0&gt;_EL0} has not overflowed since this bit was last cleared. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that \texttt{PMEVCNTR&lt;0&gt;_EL0} has overflowed since this bit was last cleared. When written, sets the \texttt{PMEVCNTR&lt;0&gt;_EL0} overflow bit to 1.</td>
</tr>
</tbody>
</table>

If \texttt{FEAT_PMUv3p5} is implemented, MDCR_EL2.HLP and PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of \texttt{PMEVCNTR<0>_EL0}[31:0] or unsigned overflow of \texttt{PMEVCNTR<0>_EL0}[63:0].

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

PMSCR_EL1, Statistical Profiling Control Register (EL1)

The PMSCR_EL1 characteristics are:

**Purpose**

Provides EL1 controls for Statistical Profiling.

**Configuration**

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSCR_EL1 are **UNDEFINED**.

**Attributes**

PMSCR_EL1 is a 64-bit register.

**Field descriptions**

The PMSCR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>62-61</td>
<td>PCT, bits [7:6]</td>
</tr>
<tr>
<td>59-58</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>56-54</td>
<td>Bits [63:8]</td>
</tr>
</tbody>
</table>

**Bits [63:8]**

Reserved, RES0.

**PCT, bits [7:6]**

When **EL2** is implemented:

Physical Timestamp. If timestamp sampling is enabled and the Profiling Buffer is owned by EL1, requests which timestamp counter value is collected.

If FEAT_ECV is implemented, this is a two-bit field as shown. Otherwise, bit[7] is RES0.

<table>
<thead>
<tr>
<th>PCT</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Virtual timestamp. The collected timestamp is the physical counter minus the value of <strong>CNTPOFF_EL2</strong>.</td>
<td></td>
</tr>
<tr>
<td>0b01</td>
<td>Physical timestamp. The collected timestamp is the physical counter.</td>
<td></td>
</tr>
</tbody>
</table>
| 0b11 | Guest physical timestamp. The collected timestamp is the physical counter minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of **CNTPOFF_EL2**:  
• SCR_EL3.ECVEn == 0b0.  
• CNTHCTL_EL2.ECV == 0b0. |

If EL2 is enabled in the current Security state, then the value of **PMSCR_EL2**.PCT might override or modify the meaning of this field.

This field is ignored by the PE when the Profiling Buffer owning Exception level is EL2.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Physical Timestamp. Reserved. This field reads as 0b01 and ignores writes. Software should treat this field as UNK/ SBZP.

When EL2 is not implemented, the Effective values of CNTVOFF_EL2 and CNTPOFF_EL2 are zero, meaning the virtual counter and physical counter have the same value.

**TS, bit [5]**

Timestamp enable.

<table>
<thead>
<tr>
<th>TS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timestamp sampling disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timestamp sampling enabled.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE if EL2 is implemented and the Profiling Buffer is owned by EL2. For more information, see 'Controlling the data that is collected'.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**PA, bit [4]**

Physical Address sample enable.

<table>
<thead>
<tr>
<th>PA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Physical addresses are not collected.</td>
</tr>
<tr>
<td>0b1</td>
<td>Physical addresses are collected.</td>
</tr>
</tbody>
</table>

If EL2 is implemented:

- If the Profiling Buffer is owned by EL1, this bit is combined with PMSCR_EL2.PA to determine which address is collected. For more information, see 'Controlling the data that is collected'.
- If the Profiling Buffer is owned by EL2, this bit is ignored by the PE.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**CX, bit [3]**

CONTEXTIDR_EL1 sample enable.

<table>
<thead>
<tr>
<th>CX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>CONTEXTIDR_EL1 is not collected.</td>
</tr>
<tr>
<td>0b1</td>
<td>CONTEXTIDR_EL1 is collected.</td>
</tr>
</tbody>
</table>

If EL2 is implemented and enabled in the current Security state when an operation is sampled:

- If the PE is at EL2, this bit is ignored by the PE.
- If HCR_EL2.TGE == 1, this bit is ignored by the PE.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [2]**

Reserved, RES0.

**E1SPE, bit [1]**

EL1 Statistical Profiling Enable.
If EL2 is implemented and enabled in the current Security state, this bit is ignored by the PE when $HCR_{EL2}.TGE == 1$.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**E0SPE, bit [0]**

EL0 Statistical Profiling Enable. Controls sampling at EL0 when $HCR_{EL2}.TGE == 0$ or if EL2 is disabled or not implemented.

<table>
<thead>
<tr>
<th>E0SPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sampling disabled at EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Sampling enabled at EL0.</td>
</tr>
</tbody>
</table>

If EL2 is implemented and enabled in the current Security state, this bit is ignored by the PE when $HCR_{EL2}.TGE == 1$.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

PMSCR_EL2, Statistical Profiling Control Register (EL2)

The PMSCR_EL2 characteristics are:

**Purpose**

Provides EL2 controls for Statistical Profiling.

**Configuration**

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSCR_EL2 are UNDEFINED.

**Attributes**

PMSCR_EL2 is a 64-bit register.

**Field descriptions**

The PMSCR_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | RES0 | PCT | TS | PA | CX | RES0 | E2SPE | E0HSPE |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:8]**

Reserved, RES0.

**PCT, bits [7:6]**

Physical Timestamp. If timestamp sampling is enabled, determines which counter is collected. The behavior depends on the Profiling Buffer owning Exception level.

If FEAT_ECV is implemented, this is a two-bit field as shown. Otherwise, bit[7] is RES0.
PCT

<table>
<thead>
<tr>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>Virtual timestamp. The collected timestamp is the physical counter minus a virtual offset. If any of the following are true, the virtual offset is zero, otherwise the virtual offset is the value of CNTVOFF_EL2:</td>
<td></td>
</tr>
<tr>
<td>The sampled operation executed at EL2 and ( HCR_{EL2}.E2H == 0b1 ).</td>
<td></td>
</tr>
<tr>
<td>The sampled operation executed at EL0 and ( HCR_{EL2}.{E2H,TGE} == {1,1} ).</td>
<td></td>
</tr>
</tbody>
</table>

Note

If the Profiling Buffer owning Exception level is EL1, the virtual offset is always CNTVOFF_EL2.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>If the Profiling Buffer owning Exception level is EL1, then the timestamp value is selected by PMSCR_EL1.PCT. Otherwise, physical timestamp. The collected timestamp is the physical counter.</td>
<td></td>
</tr>
</tbody>
</table>

0b01

If the Profiling Buffer owning Exception level is EL1, then the timestamp value is selected by PMSCR_EL1.PCT. Otherwise, physical timestamp. The collected timestamp is the physical counter.

0b11

If the Profiling Buffer owning Exception level is EL1 and PMSCR_EL1.PCT == 0b00, then guest virtual timestamp. The collected timestamp is the physical counter minus the value of CNTVOFF_EL2. Otherwise, guest physical timestamp. The collected timestamp is the physical counter minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2:

- \( SCR_{EL3}.ECVEn == 0b0 \).
- \( CNTHCTL_{EL2}.ECV == 0b0 \).

When FEAT_ECV is implemented

All other values are reserved.

If EL2 is not implemented or EL2 is disabled in the current Security state, then the Effective value of this field is 0b01, other than for a direct read of the register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

TS, bit [5]

Timestamp Enable.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timestamp sampling disabled.</td>
<td></td>
</tr>
<tr>
<td>Timestamp sampling enabled.</td>
<td></td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when any of the following are true:

- The Profiling Buffer owning Exception level is EL1.
- In Secure state, and either FEAT_SEL2 is not implemented or Secure EL2 is disabled.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

PA, bit [4]

Physical Address Sample Enable.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>Physical addresses are not collected.</td>
<td></td>
</tr>
<tr>
<td>Physical addresses are collected.</td>
<td></td>
</tr>
</tbody>
</table>

If the Profiling Buffer owning Exception level is EL1, and EL2 is enabled in the current Security state, this bit is combined with PMSCR_EL1.PA to determine which address is collected.
If EL2 is not implemented or EL2 is disabled in the current Security state, the PE ignores the value of this bit and behaves as if this bit is set to 1, other than for a direct read of the register.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**CX, bit [3]**

<table>
<thead>
<tr>
<th>CX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><strong>CONTEXTIDR_EL2</strong> is not collected.</td>
</tr>
<tr>
<td>0b1</td>
<td><strong>CONTEXTIDR_EL2</strong> is collected.</td>
</tr>
</tbody>
</table>

If EL2 is not implemented or EL2 is disabled in the current Security state, the PE ignores the value of this bit.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [2]**

Reserved, **RES0**.

**E2SPE, bit [1]**

EL2 Statistical Profiling Enable.

<table>
<thead>
<tr>
<th>E2SPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sampling disabled at EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Sampling enabled at EL2.</td>
</tr>
</tbody>
</table>

This bit is **RES0** if **MDCR_EL2.E2PB != 0b00**.

If EL2 is disabled in the current Security state, this bit is ignored by the PE.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**E0HSPE, bit [0]**

EL0 Statistical Profiling Enable.

<table>
<thead>
<tr>
<th>E0HSPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sampling disabled at EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Sampling enabled at EL0.</td>
</tr>
</tbody>
</table>

If **MDCR_EL2.E2PB != 0b00**, this bit is **RES0**.

If EL2 is implemented and enabled in the current Security state, this bit is ignored by the PE when **HCR_EL2.TGE == 0**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

PMSELR_EL0, Performance Monitors Event Counter Selection Register

The PMSELR_EL0 characteristics are:

**Purpose**

Selects the current event counter \texttt{PMEVCNTR<n>_EL0} or the cycle counter, CCNT.

PMSELR_EL0 is used in conjunction with \texttt{PMXEVTYPER_EL0} to determine the event that increments a selected event counter, and the modes and states in which the selected counter increments.

It is also used in conjunction with \texttt{PMXEVCNTR_EL0}, to determine the value of a selected event counter.

**Configuration**

AArch64 System register PMSELR_EL0 bits [31:0] are architecturally mapped to AArch32 System register \texttt{PMSELR[31:0]}.

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMSELR_EL0 are UNDEFINED.

**Attributes**

PMSELR_EL0 is a 64-bit register.

**Field descriptions**

The PMSELR_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

**Bits [63:5]**

Reserved, RES0.

**SEL, bits [4:0]**

Selects event counter, \texttt{PMEVCNTR<n>_EL0}, where \text{n\text{}} is the value held in this field. This value identifies which event counter is accessed when a subsequent access to \texttt{PMXEVTYPER_EL0} or \texttt{PMXEVCNTR_EL0} occurs.

This field can take any value from 0 (0b00000) to (PMCR.N)-1, or 31 (0b11111).

When PMSELR_EL0.SEL is 0b11111, it selects the cycle counter and:

- A read of the \texttt{PMXEVTYPER_EL0} returns the value of \texttt{PMCCFILTR_EL0}.
- A write of the \texttt{PMXEVTYPER_EL0} writes to \texttt{PMCCFILTR_EL0}.
- A read or write of \texttt{PMXEVCNTR_EL0} has CONSTRAINED UNPREDICTABLE effects. See \texttt{PMXEVCNTR_EL0} for more details.

For details of the results of accesses to the event counters, see \texttt{PMXEVTYPER_EL0} and \texttt{PMXEVCNTR_EL0}.

For information about the number of counters accessible at each Exception level, see \texttt{MDCR_EL2.HPMN}.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing the PMSELR_EL0

Accesses to this register use the following encodings:

MRS <Xt>, PMSELR_EL0

PMSEVFR_EL1, Sampling Event Filter Register

The PMSEVFR_EL1 characteristics are:

**Purpose**

Controls sample filtering by events. The overall filter is the logical AND of these filters. For example, if E[3] and E[5] are both set to 1, only samples that have both event 3 (Level 1 unified or data cache refill) and event 5 set (TLB walk) are recorded.

**Configuration**

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSEVFR_EL1 are UNDEFINED.

**Attributes**

PMSEVFR_EL1 is a 64-bit register.

**Field descriptions**

The PMSEVFR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>62</th>
<th>61</th>
<th>60</th>
<th>59</th>
<th>58</th>
<th>57</th>
<th>56</th>
<th>55</th>
<th>54</th>
<th>53</th>
<th>52</th>
<th>51</th>
<th>50</th>
<th>49</th>
<th>48</th>
<th>47</th>
<th>46</th>
<th>45</th>
<th>44</th>
<th>43</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>30</td>
<td>29</td>
<td>28</td>
<td>27</td>
<td>26</td>
<td>25</td>
<td>24</td>
<td>23</td>
<td>22</td>
<td>21</td>
<td>20</td>
<td>19</td>
<td>18</td>
<td>17</td>
<td>16</td>
<td>15</td>
<td>14</td>
<td>13</td>
<td>12</td>
<td>11</td>
</tr>
</tbody>
</table>

E[<x>], bit [x], for x = 63 to 48, 31 to 24, 15 to 12

E[<x>] is the event filter for event <x>. If event <x> is not implemented, or filtering on event <x> is not supported, the corresponding bit is RAZ/WI.

<table>
<thead>
<tr>
<th>E[&lt;x&gt;]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event &lt;x&gt; is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have event &lt;x&gt; == 0.</td>
</tr>
</tbody>
</table>

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSCFR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [47:32]**

Reserved, RAZ/WI.

**Bits [23:19]**

Reserved, RAZ/WI.
**E[18], bit [18]**

When **FEAT_SPEv1p1** is implemented and **FEAT_SVE** is implemented:

Empty predicate.

<table>
<thead>
<tr>
<th>E[18]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Empty predicate event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Empty predicate event == 0.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when **PMSFCR_EL1.FE == 0**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RAZ/WI.

**E[17], bit [17]**

When **FEAT_SPEv1p1** is implemented and **FEAT_SVE** is implemented:

Partial predicate.

<table>
<thead>
<tr>
<th>E[17]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Partial predicate event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Partial predicate event == 0.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when **PMSFCR_EL1.FE == 0**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RAZ/WI.

**Bit [16]**

Reserved, RAZ/WI.

**E[11], bit [11]**

When **FEAT_SPEv1p1** is implemented:

Alignment.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Alignment event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Alignment event == 0.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when **PMSFCR_EL1.FE == 0**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RAZ/WI.
Bits [10:8]

Reserved, RAZ/WI.

E[7], bit [7]

Mispredicted.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Mispredicted event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Mispredicted event == 0.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[6], bit [6]

When FEAT_SPEv1p2 is implemented:

Not taken.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Not taken event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Not taken event == 0.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FE == 0b0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[5], bit [5]

TLB walk.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TLB walk event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the TLB walk event == 0.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [4]

Reserved, RAZ/WI.

E[3], bit [3]

Level 1 data or unified cache refill.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Level 1 data or unified cache refill event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Level 1 data or unified cache refill event == 0.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Bit [2]
Reserved, RAZ/WI.

E[1], bit [1]
When the PE supports sampling of speculative instructions:
Architecturally retired.

When the PE supports sampling of speculative instructions:

<table>
<thead>
<tr>
<th>E[1]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Architecturally retired event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Architecturally retired event == 0.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

If the PE does not support the sampling of speculative instructions, or always discards the sample record for speculative instructions, this bit reads as an UNKNOWN value and the PE ignores its value.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, UNKNOWN.

Bit [0]
Reserved, RAZ/WI.

PMSFCR_EL1, Sampling Filter Control Register

The PMSFCR_EL1 characteristics are:

Purpose

Controls sample filtering. The filter is the logical AND of the FL, FT and FE bits. For example, if FE == 1 and FT == 1 only samples including the selected operation types and the selected events will be recorded.

Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSFCR_EL1 are UNDEFINED.

Attributes

PMSFCR_EL1 is a 64-bit register.

Field descriptions

The PMSFCR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-19</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>18</td>
<td>ST (Store filter enable)</td>
</tr>
<tr>
<td>17</td>
<td>LD (Load filter enable)</td>
</tr>
</tbody>
</table>

ST, bit [18]

Store filter enable

<table>
<thead>
<tr>
<th>ST</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not record store operations</td>
</tr>
<tr>
<td>0b1</td>
<td>Record all store operations, including vector stores and all atomic operations</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FT == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

LD, bit [17]

Load filter enable

<table>
<thead>
<tr>
<th>LD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not record load operations</td>
</tr>
<tr>
<td>0b1</td>
<td>Record all load operations, including vector loads and atomic operations that return data</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FT == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
B, bit [16]

Branch filter enable

<table>
<thead>
<tr>
<th>B</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not record branch and exception return operations</td>
</tr>
<tr>
<td>0b1</td>
<td>Record all branch and exception return operations</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FT == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:4]

Reserved, RES0.

FnE, bit [3]

When FEAT_SPEv1p2 is implemented:

Filter by event, inverted.

<table>
<thead>
<tr>
<th>FnE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Inverted event filtering disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Inverted event filtering enabled. Samples including the events selected by PMSNEVFR_EL1 will not be recorded.</td>
</tr>
</tbody>
</table>

If any of the following are true, it is CONSTRAINED UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FnE == 0b0:

- PMSFCR_EL1.FnE == 0b1 and PMSNEVFR_EL1 is zero.
- PMSFCR_EL1.FnE == 0b1, PMSFCR_EL1.FE == 0b1, and there exists a value x such that PMSEVFR_EL1.E[x] == 0b1 and PMSNEVFR_EL1.E[x] == 0b1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FL, bit [2]

Filter by latency

<table>
<thead>
<tr>
<th>FL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Latency filtering disabled</td>
</tr>
<tr>
<td>0b1</td>
<td>Latency filtering enabled. Samples with a total latency less than PMSLATFR_EL1.MINLAT will not be recorded</td>
</tr>
</tbody>
</table>

If this field is set to 1 and PMSLATFR_EL1.MINLAT is set to zero, it is CONSTRAINED UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FL is set to 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

FT, bit [1]

Filter by operation type. The filter is the logical OR of the ST, LD and B bits. For example, if LD and ST are both set, both load and store operations are recorded

<table>
<thead>
<tr>
<th>FT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Type filtering disabled</td>
</tr>
<tr>
<td>0b1</td>
<td>Type filtering enabled. Samples not one of the selected operation types will not be recorded</td>
</tr>
</tbody>
</table>
If this field is set to 1 and the PMSFCR_EL1.{ST, LD, B} bits are all set to zero, it is **CONSTRAINED UNPREDICTABLE** whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FT is set to 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### FE, bit [0]

Filter by event.

<table>
<thead>
<tr>
<th>FE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event filtering disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event filtering enabled. Samples not including the events selected by PMSEVFR_EL1 will not be recorded.</td>
</tr>
</tbody>
</table>

If any of the following are true, it is **CONSTRAINED UNPREDICTABLE** whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FE == 0b0:

- PMSFCR_EL1.FE == 0b1 and PMSEVFR_EL1 is zero.
- FEAT_SPEv1p2 is implemented, PMSFCR_EL1.FnE == 0b1, PMSFCR_EL1.FE == 0b1, and there exists a value \(x\) such that PMSEVFR_EL1.E[\(x\)] == 0b1 and PMSNEVFR_EL1.E[\(x\)] == 0b1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

PMSICR_EL1, Sampling Interval Counter Register

The PMSICR_EL1 characteristics are:

**Purpose**

Software must write zero to PMSICR_EL1 before enabling sample profiling for a sampling session. Software must then treat PMSICR_EL1 as an opaque, 64-bit, read/write register used for context switches only.

**Configuration**

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSICR_EL1 are UNDEFINED.

The value of PMSICR_EL1 does not change whilst profiling is disabled.

**Attributes**

PMSICR_EL1 is a 64-bit register.

**Field descriptions**

The PMSICR_EL1 bit assignments are:

<table>

**ECOUNT, bits [63:56]**

When PMSIDR_EL1.ERnd == 1:

Secondary sample interval counter.

This field provides the secondary counter used after the primary counter reaches zero. Whilst the secondary counter is nonzero and profiling is enabled, the secondary counter decrements by 1 for each member of the sample population. The primary counter also continues to decrement since it is also nonzero. When the secondary counter reaches zero, a member of the sampling population is selected for sampling.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [55:32]**

Reserved, RES0.

**COUNT, bits [31:0]**

Primary sample interval counter

Provides the primary counter used for sampling.
The primary counter is reloaded when the value of this register is zero and the PE moves from a state or Exception level where profiling is disabled to a state or Exception level where profiling is enabled.

Whilst the primary counter is nonzero and sampling is enabled, the primary counter decrements by 1 for each member of the sample population.

When the counter reaches zero, the behavior depends on the values of PMSIDR_EL1.ERnd and PMSIRR_EL1.RND:

- If PMSIRR_EL1.RND == 0 or PMSIDR_EL1.ERnd == 0:
  - A member of the sampling population is selected for sampling
  - The primary counter is reloaded

- If PMSIRR_EL1.RND == 1 and PMSIDR_EL1.ERnd == 1:
  - The secondary counter is set to a random or pseudorandom value in the range 0x00 to 0xFF
  - The primary counter is reloaded

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The PMSIDR_EL1 characteristics are:

**Purpose**

Describes the Statistical Profiling implementation to software

**Configuration**

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSIDR_EL1 are UNDEFINED.

**Attributes**

PMSIDR_EL1 is a 64-bit register.

**Field descriptions**

The PMSIDR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-24</td>
<td>Reserved</td>
<td>Reserved, RES0</td>

<td>Reserved</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:24]**

Reserved, RES0.

**Format, bits [23:20]**

From Armv8.7:

Defines the format of the sample records. Defined values are:

<table>
<thead>
<tr>
<th>Format</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Format 0</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Otherwise:**

Reserved, RAZ.

**CountSize, bits [19:16]**

Defines the size of the counters. Defined values are:

<table>
<thead>
<tr>
<th>CountSize</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0010</td>
<td>12-bit saturating counters</td>
</tr>
</tbody>
</table>

All other values are reserved.

Reserved values might be defined in a future version of the architecture.
MaxSize, bits [15:12]

Defines the largest size for a single record, rounded up to a power-of-two. If this is the same as the minimum alignment (PMBIDR_EL1.Align), then each record is exactly this size. Defined values are:

<table>
<thead>
<tr>
<th>MaxSize</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0100</td>
<td>16 bytes</td>
</tr>
<tr>
<td>0b0101</td>
<td>32 bytes</td>
</tr>
<tr>
<td>0b0110</td>
<td>64 bytes</td>
</tr>
<tr>
<td>0b0111</td>
<td>128 bytes</td>
</tr>
<tr>
<td>0b1000</td>
<td>256 bytes</td>
</tr>
<tr>
<td>0b1001</td>
<td>512 bytes</td>
</tr>
<tr>
<td>0b1010</td>
<td>1024 bytes</td>
</tr>
<tr>
<td>0b1011</td>
<td>2KB</td>
</tr>
</tbody>
</table>

All other values are reserved.

Reserved values might be defined in a future version of the architecture.

Interval, bits [11:8]

Recommended minimum sampling interval. This provides guidance from the implementer to the smallest minimum sampling interval, N. Defined values are:

<table>
<thead>
<tr>
<th>Interval</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>256</td>
</tr>
<tr>
<td>0b0010</td>
<td>512</td>
</tr>
<tr>
<td>0b0011</td>
<td>768</td>
</tr>
<tr>
<td>0b0100</td>
<td>1,024</td>
</tr>
<tr>
<td>0b0101</td>
<td>1,536</td>
</tr>
<tr>
<td>0b0110</td>
<td>2,048</td>
</tr>
<tr>
<td>0b0111</td>
<td>3,072</td>
</tr>
<tr>
<td>0b1000</td>
<td>4,096</td>
</tr>
</tbody>
</table>

All other values are reserved.

Reserved values might be defined in a future version of the architecture.

Bit [7]

Reserved, RES0.

FnE, bit [6]

Filtering by events, inverted. Defined values are:

<table>
<thead>
<tr>
<th>FnE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PMSNEVFR_EL1 is not implemented and PMSFCR_EL1.FnE is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>PMSNEVFR_EL1 and PMSFCR_EL1.FnE are implemented.</td>
</tr>
</tbody>
</table>

The value 0b1 indicates support for the FEAT_SPEv1p2 feature.

ERnd, bit [5]

Defines how the random number generator is used in determining the interval between samples, when enabled by PMSIRR_EL1.RND. Defined values are:

<table>
<thead>
<tr>
<th>ERnd</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The random number is added at the start of the interval, and the sample is taken and a new interval started when the combined interval expires.</td>
</tr>
<tr>
<td>0b1</td>
<td>The random number is added and the new interval started after the interval programmed in PMSIRR_EL1.INTERVAL expires, and the sample is taken when the random interval expires.</td>
</tr>
</tbody>
</table>
LDS, bit [4]

Data source indicator for sampled load instructions. Defined values are:

<table>
<thead>
<tr>
<th>LDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Loaded data source not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Loaded data source implemented.</td>
</tr>
</tbody>
</table>

ArchInst, bit [3]

Architectural instruction profiling. Defined values are:

<table>
<thead>
<tr>
<th>ArchInst</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Micro-op sampling implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Architecture instruction sampling implemented.</td>
</tr>
</tbody>
</table>

FL, bit [2]

Filtering by latency. This bit is RAO.

FT, bit [1]

Filtering by operation type. This bit is RAO.

FE, bit [0]

Filtering by events. This bit is RAO.

Accessing the PMSIDR_EL1

Accesses to this register use the following encodings:

The PMSIRR_EL1 characteristics are:

**Purpose**

Defines the interval between samples.

**Configuration**

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSIRR_EL1 are **UNDEFINED**.

**Attributes**

PMSIRR_EL1 is a 64-bit register.

**Field descriptions**

The PMSIRR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | INTERVAL | RES0 | RND |

**Bits [63:32]**

Reserved, RES0.

**INTERVAL, bits [31:8]**

Bits [31:8] of the PMSICR_EL1 interval counter reload value. Software must set this to a non-zero value. If software sets this to zero, an **UNKNOWN** sampling interval is used. Software should set this to a value greater than the minimum indicated by PMSIDR_EL1.Interval.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [7:1]**

Reserved, RES0.

**RND, bit [0]**

Controls randomization of the sampling interval.

<table>
<thead>
<tr>
<th>RND</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disable randomization of sampling interval.</td>
</tr>
<tr>
<td>0b1</td>
<td>Add (pseudo-)random jitter to sampling interval.</td>
</tr>
</tbody>
</table>

The random number generator is not architected.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

RES0

MINLAT

Bits [63:12]

Reserved, RES0.

**MINLAT, bits [11:0]**

Minimum latency. When PMSFCR_EL1.FL == 1, defines the minimum total latency for filtered operations. Samples with a total latency less than MINLAT will not be recorded.

This field is ignored by the PE when PMSFCR_EL1.FL == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMSLATFR_EL1**

PMSNEVFR_EL1, Sampling Inverted Event Filter Register

The PMSNEVFR_EL1 characteristics are:

**Purpose**

Controls sample filtering by events. The overall filter is the logical AND of these filters. For example, if E[3] and E[5] are both set to 0b1, only samples that have both event 3 (Level 1 unified or data cache refill) and event 5 (TLB walk) clear are recorded.

**Configuration**

This register is present only when FEAT_SPEv1p2 is implemented. Otherwise, direct accesses to PMSNEVFR_EL1 are UNDEFINED.

**Attributes**

PMSNEVFR_EL1 is a 64-bit register.

**Field descriptions**

The PMSNEVFR_EL1 bit assignments are:

|   | 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 |
|---|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| E | [63] | [62] | [61] | [60] | [59] | [58] | [57] | [56] | [55] | [54] | [53] | [52] | [51] | [50] | [49] | [48] | [47] | [46] | [45] | [44] | [43] |
| E | [31] | [30] | [29] | [28] | [27] | [26] | [25] | [24] | [23] | [22] | [21] | [20] | [19] | [18] | [17] | [16] | [15] | [14] | [13] | [12] | [11] |

<table>
<thead>
<tr>
<th>E[&lt;x&gt;]</th>
<th>bit [x], for x = 63 to 48, 31 to 24, 15 to 12</th>
</tr>
</thead>
<tbody>
<tr>
<td>E[&lt;x&gt;]</td>
<td>is the event filter for IMPLEMENTATION DEFINED event &lt;x&gt;.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>E[&lt;x&gt;]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event &lt;x&gt; is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have event &lt;x&gt; == 1.</td>
</tr>
</tbody>
</table>

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This bit is ignored by the PE when PMSFCR_EL1.FnE == 0b0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

When event <x> is not implemented, or filtering on event <x> is not supported, access to this field is RAZ/WI.

**Bits [47:32]**

Reserved, RAZ/WI.

**Bits [23:19]**

Reserved, RAZ/WI.

**E[18], bit [18]**
When FEAT_SVE is implemented and FEAT_SPEv1p1 is implemented:

Not empty predicate.

<table>
<thead>
<tr>
<th>E[18]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Empty predicate event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Empty predicate event == 1.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FnE == 0b0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[17], bit [17]

When FEAT_SVE is implemented and FEAT_SPEv1p1 is implemented:

Not partial predicate.

<table>
<thead>
<tr>
<th>E[17]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Partial predicate event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Partial predicate event == 1.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FnE == 0b0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Bit [16]

Reserved, RAZ/WI.

When FEAT_SPEv1p1 is implemented:

Aligned.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Misalignment event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Misalignment event == 1.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FnE == 0b0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Bits [10:8]

Reserved, RAZ/WI.
E[7], bit [7]
Correctly predicted.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Mispredicted event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Mispredicted event == 1.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FnE == 0b0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[6], bit [6]
Taken.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Not taken event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Not taken event == 1.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FnE == 0b0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[5], bit [5]
TLB hit.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TLB walk event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the TLB walk event == 1.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FnE == 0b0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [4]
Reserved, RAZ/WI.

E[3], bit [3]
Level 1 data or unified cache hit.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Level 1 data or unified cache refill event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Level 1 data or unified cache refill event == 1.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FnE == 0b0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [2]
Reserved, RAZ/WI.

E[1], bit [1]
Speculative.
### E[1]

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0 Architecturally retired event is ignored.</td>
</tr>
<tr>
<td>0b1 Do not record samples that have the Architecturally retired event</td>
</tr>
<tr>
<td>== 1.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FnE == 0b0. This bit is RES0 if the PE does not support sampling of speculative instructions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [0]**

Reserved, RAZ/WI.

PMSNEVFR_EL1, Sampling Inverted Event Filter Register
The PMSWINC_EL0 characteristics are:

**Purpose**

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see ‘SW_INCR’.

**Configuration**

AArch64 System register PMSWINC_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMSWINC[31:0].

AArch64 System register PMSWINC_EL0 bits [31:0] are architecturally mapped to External register PMSWINC_EL0[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMSWINC_EL0 are UNDEFINED.

**Attributes**

PMSWINC_EL0 is a 64-bit register.

**Field descriptions**

The PMSWINC_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>

PMUSERENR_EL0, Performance Monitors User Enable Register

The PMUSERENR_EL0 characteristics are:

**Purpose**

Enables or disables EL0 access to the Performance Monitors.

**Configuration**

AArch64 System register PMUSERENR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMUSERENR[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMUSERENR_EL0 are UNDEFINED.

**Attributes**

PMUSERENR_EL0 is a 64-bit register.

**Field descriptions**

The PMUSERENR_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

**Bits [63:4]**

Reserved, RES0.

**ER, bit [3]**

Event counter Read. Traps EL0 access to event counters to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1.

In AArch64 state, trapped accesses are reported using EC syndrome value 0x18.

In AArch32 state, trapped accesses are reported using EC syndrome value 0x03.

<table>
<thead>
<tr>

<td>0b0</td>
<td>EL0 using AArch64: EL0 reads of the PMXEVCNTR_EL0 and PMEVCNTR&lt;n&gt;_EL0 and EL0 read/write accesses to the PMSELR_EL0, are trapped if PMUSERENR_EL0.EN is also 0. EL0 using AArch32: EL0 reads of the PMXEVCNTR and PMEVCNTR&lt;n&gt;, and EL0 read/write accesses to the PMSELR, are trapped if PMUSERENR_EL0.EN is also 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Overrides PMUSERENR_EL0.EN and enables: • RO access to PMXEVCNTR_EL0 and PMEVCNTR&lt;n&gt;_EL0 at EL0. • RW access to PMSELR_EL0 at EL0. • RW access to PMSELR at EL0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.
CR, bit [2]

Cycle counter Read. Traps EL0 access to cycle counter reads to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1.

In AArch64 state, trapped accesses are reported using EC syndrome value 0x18.

In AArch32 state, trapped MRC accesses are reported using EC syndrome value 0x03, trapped MRRC accesses are reported using EC syndrome value 0x04.

<table>
<thead>
<tr>

<td>• PMSWINC_EL0 at EL0.</td>
</tr>
<tr>
<td></td>
<td>• PMSWINC at EL0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EN, bit [0]

Traps EL0 accesses to the Performance Monitor registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from both Execution states as follows:

- In AArch64 state, MRS or MSR accesses to the following registers are reported using EC syndrome value 0x18:
  - PMCR_EL0, PMOVSCLR_EL0, PMSELR_EL0, PMCEID0_EL0, PMCEID1_EL0, PMCCNTR_EL0, PMXEVTYPEP_EL0, PMXEVCNTR_EL0, PMCNTENSET_EL0, PMCNTENCLR_EL0, PMOVSSSET_EL0, PEMVCNTR<n>_EL0, PMEVTYPER<n>_EL0, PMEVTYPER<n>_EL0, PMCCFILTR_EL0, PMSWINC_EL0.
  - If FEAT_PMUv3p4 is implemented, PMMIR_EL1.

- In AArch32 state, MRC or MCR accesses to the following registers are reported using EC syndrome value 0x03:
  - PMCR, PMOVSR, PMSELR, PMCEID0, PMCEID1, PMCCNTR, PMXEVTYPEP, PMXEVCNTR, PMCNTENSET, PMCNTENCLR, PMOVSSSET, PEMVCNTR<n>, PMEVTYPER<n>, PMCCFILTR, PMSWINC.
  - If FEAT_PMUv3p4 is implemented, PMMIR.
  - If FEAT_PMUv3p4 is implemented, in AArch32 state, PMCEID2, and PMCEID3.

- In AArch32 state, MRRC or MCRR accesses to PMCCNTR are reported using EC syndrome value 0x04.
While at EL0, accesses to the specified registers at EL0 are trapped, unless overridden by one of PMUSERENR_EL0.{ER, CR, SW}.

While at EL0, software can access all of the specified registers.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Accessing the PMUSERENR_EL0

Accesses to this register use the following encodings:

PMXEVCNTR_EL0, Performance Monitors Selected Event Count Register

The PMXEVCNTR_EL0 characteristics are:

**Purpose**

Reads or writes the value of the selected event counter, \texttt{PMEVCNTR<n>\_EL0}. \texttt{PMSELR\_EL0}.SEL determines which event counter is selected.

**Configuration**

AArch64 System register PMXEVCNTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register \texttt{PMEVCNTR[31:0]}.

This register is present only when FEAT\_PMUv3 is implemented. Otherwise, direct accesses to PMXEVCNTR_EL0 are UNDEFINED.

**Attributes**

PMXEVCNTR_EL0 is a 64-bit register.

**Field descriptions**

The PMXEVCNTR_EL0 bit assignments are:

When FEAT\_PMUv3p5 is implemented:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

\texttt{PMEVCNTR<n>}

\texttt{PMEVCNTR<n>}

PMXEVCNTR\(<n>\), bits [63:0]

Value of the selected event counter, \texttt{PMEVCNTR\(<n>\)\_EL0}, where \(n\) is the value stored in \texttt{PMSELR\_EL0}.SEL.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

\texttt{RES0}

\texttt{PMEVCNTR\(<n>\)\_EL0}

Bits [63:32]

Reserved, RES0.

PMXEVCNTR\(<n>\), bits [31:0]

Value of the selected event counter, \texttt{PMEVCNTR\(<n>\)\_EL0}, where \(n\) is the value stored in \texttt{PMSELR\_EL0}.SEL.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing the PMXEVCNTR_EL0

If FEAT_FGT is implemented and PMSELR_EL0.SEL is greater than or equal to the number of accessible counters, then the behavior of permitted reads and writes of PMXEVCNTR_EL0 is as follows:

- If PMSELR_EL0.SEL selects an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and PMSELR_EL0.SEL is greater than or equal to the number of accessible counters, then reads and writes of PMXEVCNTR_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if PMSELR_EL0.SEL has an UNKNOWN value less than the number of counters accessible at the current Exception level and Security state.
- If EL2 is implemented and enabled in the current Security state, and PMSELR_EL0.SEL is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR_EL0.{ER,EN}.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, MDCR_EL2.HPMN identifies the number of accessible event counters. Otherwise, the number of accessible event counters is the number of implemented event counters. See MDCR_EL2.HPMN for more details.

Accesses to this register use the following encodings:

PMXEVTYPE_EL0, Performance Monitors Selected Event Type Register

The PMXEVTYPE_EL0 characteristics are:

**Purpose**

When PMSELR_EL0 SEL selects an event counter, this accesses a PMEVTYPE<n>_EL0 register. When PMSELR_EL0 SEL selects the cycle counter, this accesses PMCCFILTR_EL0.

**Configuration**

AArch64 System register PMXEVTYPE_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMXEVTYPE_EL0[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMXEVTYPE_EL0 are UNDEFINED.

**Attributes**

PMXEVTYPE_EL0 is a 64-bit register.

**Field descriptions**

The PMXEVTYPE_EL0 bit assignments are:

<table>

</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**Bits [31:0]**

When PMSELR_EL0 SEL == 31, this register accesses PMCCFILTR_EL0.

Otherwise, this register accesses PMEVTYPE<n>_EL0 where n is the value in PMSELR_EL0 SEL.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMXEVTYPE_EL0**

If FEAT_FGT is implemented, and PMSELR_EL0 SEL is not 31 and is greater than or equal to the number of accessible counters, then the behavior of permitted reads and writes of PMXEVTYPE_EL0 is as follows:

- If PMSELR_EL0 SEL selects an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented, and PMSELR_EL0 SEL is not 31 and is greater than or equal to the number of accessible counters, then reads and writes of PMXEVTYPE_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
• Accesses to the register execute as a NOP.
• Accesses to the register behave as if PMSELR_EL0.SEL has an UNKNOWN value less than the number of event counters accessible at the current Exception level and Security state.
• Accesses to the register behave as if PMSELR_EL0.SEL is 31.
• If EL2 is implemented and enabled in the current Security state, PMSELR_EL0 is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

**Note**

In EL0, an access is permitted if it is enabled by PMUSERENR_EL0.EN.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, MDCR_EL2.HPMN identifies the number of accessible event counters. Otherwise, the number of accessible event counters is the number of implemented event counters. See MDCR_EL2.HPMN for more details.

Accesses to this register use the following encodings:

The RMR_EL1 characteristics are:

**Purpose**

When this register is implemented:

- A write to the register at EL1 can request a Warm reset.
- If EL1 can use all Execution states, this register specifies the Execution state that the PE boots into on a Warm reset.

**Configuration**

AArch64 System register RMR_EL1 bits [31:0] are architecturally mapped to AArch32 System register RMR[31:0] when the highest implemented Exception level is EL1.

This register is present only when the highest implemented Exception level is EL1. Otherwise, direct accesses to RMR_EL1 are **UNDEFINED**.

When EL1 is the highest implemented Exception level:

- If EL1 can use all Execution states then this register must be implemented.
- If EL1 cannot use AArch32 then it is **IMPLEMENTATION DEFINED** whether the register is implemented.

**Attributes**

RMR_EL1 is a 64-bit register.

**Field descriptions**

The RMR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RES0 | RR AA64 |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:2]**

Reserved, RES0.

**RR, bit [1]**

Reset Request. Setting this bit to 1 requests a Warm reset.

On a Warm reset, this field resets to 0.

**AA64, bit [0]**

When EL1 is capable of using AArch32:

When EL1 can use AArch32, determines which Execution state the PE boots into after a Warm reset:

<table>
<thead>
<tr>
<th>AA64</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>AArch32.</td>
</tr>
<tr>
<td>0b1</td>
<td>AArch64.</td>
</tr>
</tbody>
</table>
On coming out of the Warm reset, execution starts at the implementation defined reset vector address of the specified Execution state.

If EL1 can only use AArch64 state, this bit is RAO/WI.

When implemented as a RW field, this field resets to 1 on a Cold reset.

**Otherwise:**

Reserved, RAO/WI.

RMR_EL2, Reset Management Register (EL2)

The RMR_EL2 characteristics are:

**Purpose**

When this register is implemented:

- A write to the register at EL2 can request a Warm reset.
- If EL2 can use all Execution states, this register specifies the Execution state that the PE boots into on a Warm reset.

**Configuration**

AArch64 System register RMR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HRMR[31:0] when the highest implemented Exception level is EL2.

This register is present only when the highest implemented Exception level is EL2. Otherwise, direct accesses to RMR_EL2 are **UNDEFINED**.

When EL2 is the highest implemented Exception level:

- If EL2 can use all Execution states then this register must be implemented.
- If EL2 cannot use AArch32 then it is **IMPLEMENTATION DEFINED** whether the register is implemented.

**Attributes**

RMR_EL2 is a 64-bit register.

**Field descriptions**

The RMR_EL2 bit assignments are:

**Bits [63:2]**

Reserved, RES0.

**RR, bit [1]**

Reset Request. Setting this bit to 1 requests a Warm reset.

On a Warm reset, this field resets to 0.

**AA64, bit [0]**

When EL2 is capable of using AArch32:

When EL2 can use AArch32, determines which Execution state the PE boots into after a Warm reset:

<table>
<thead>
<tr>
<th>AA64</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>AArch32.</td>
</tr>
<tr>
<td>0b1</td>
<td>AArch64.</td>
</tr>
</tbody>
</table>
On coming out of the Warm reset, execution starts at the implementation defined reset vector address of the specified Execution state.

If EL2 can only use AArch64 state, this bit is RAO/WI.

When implemented as a RW field, this field resets to 1 on a Cold reset.

Otherwise:

Reserved, RAO/WI.

Accessing the RMR_EL2

Accesses to this register use the following encodings:

**AA64, bit [0]**

When EL3 is capable of using AArch32:

When EL3 can use AArch32, determines which Execution state the PE boots into after a Warm reset:
On coming out of the Warm reset, execution starts at the implementation-defined reset vector address of the specified execution state.

If EL3 can only use AArch64 state, this bit is RAO/WI.

When implemented as a RW field, this field resets to 1 on a Cold reset.

Otherwise:

Reserved, RAO/WI.

**Accessing the RMR_EL3**

Accesses to this register use the following encodings:

MRS <Xt>, RMR_EL3

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

if PSTATE.EL == EL3 && IsHighestEl(EL3) then
RMR_EL3 = X[t];
else
UNDEFINED;
The RNDR characteristics are:

**Purpose**

Random Number. Returns a 64-bit random number which is reseeded from the True Random Number source at an IMPLEMENTATION DEFINED rate.

If the hardware returns a genuine random number, PSTATE.NZCV is set to 0b0000.

If the instruction cannot return a genuine random number in a reasonable period of time, PSTATE.NZCV is set to 0b0100 and the data value returned is 0.

RNDR is a read-only register.

**Configuration**

This register is present only when FEAT_RNG is implemented. Otherwise, direct accesses to RNDR are UNDEFINED.

**Attributes**

RNDR is a 64-bit register.

**Field descriptions**

The RNDR bit assignments are:

```
   63  62  61  60  59  58  57  56  55  54  53  52  51  50  49  48  47  46  45  44  43  42  41  40  39  38  37  36  35  34  33  32  
     RNDR  
   31  30  29  28  27  26  25  24  23  22  21  20  19  18  17  16  15  14  13  12  11  10  9   8   7   6   5   4   3   2   1   0  
     RNDR  
```

**RNDR, bits [63:0]**

Random Number. Returns a 64-bit Random Number which is reseeded from the True Random Number source at an IMPLEMENTATION DEFINED rate.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the RNDR**

Accesses to this register use the following encodings:

```
MRS <Xt>, RNDR

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

<td></td>
<td></td>
</tr>
</tbody>
</table>
```

**Bits [63:0]**

Reset Address. The IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 64-bit state. Bits[1:0] of this register are 00, as this address must be aligned, and the address must be within the physical address size supported by the PE.

**Accessing the RVBAR_EL3**

Accesses to this register use the following encodings:

```
MRS <Xt>, RVBAR_EL3
```

```
<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b11</td>
<td>0b110</td>
<td>0b0000</td>
<td>0b001</td>
</tr>
</tbody>
</table>
```

```
if PSTATE.EL == EL3 && IsHighestEL(EL3) then
  return RVBAR_EL3;
else
  UNDEFINED;
```
The SYS S1_<op1>_<Cn>_<Cm>_<op2>, SYSL S1_<op1>_<Cn>_<Cm>_<op2>, IMPLEMENTATION DEFINED maintenance instructions

Purpose

This area of the System instruction encoding space is reserved for IMPLEMENTATION DEFINED System instructions.

Configuration

There are no configuration notes.

Attributes

SYS S1_<op1>_<Cn>_<Cm>_<op2>, SYSL S1_<op1>_<Cn>_<Cm>_<op2> is a 64-bit System instruction.

Field descriptions

The SYS S1_<op1>_<Cn>_<Cm>_<op2>, SYSL S1_<op1>_<Cn>_<Cm>_<op2> input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>

    IMPLEMENTATION_DEFINED "S3";
The SCR_EL3 characteristics are:

**Purpose**

Defines the configuration of the current Security state. It specifies:

- The Security state of EL0, EL1, and EL2. The Security state is either Secure or Non-secure.
- The Execution state at lower Exception levels.
- Whether IRQ, FIQ, SError interrupts, and External abort exceptions are taken to EL3.
- Whether various operations are trapped to EL3.

**Configuration**

AArch64 System register SCR_EL3 bits [31:0] can be mapped to AArch32 System register SCR[31:0], but this is not architecturally mandated.

This register is present only when EL3 is implemented. Otherwise, direct accesses to SCR_EL3 are UNDEFINED.

**Attributes**

SCR_EL3 is a 64-bit register.

**Field descriptions**

The SCR_EL3 bit assignments are:

**Bits [63:39]**

Reserved, RES0.

**HXEn, bit [38]**

When FEAT_HCX is implemented:

<table>
<thead>
<tr>
<th>HXEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL2 accesses to HCRX_EL2 are trapped to EL3. Indirect reads of HCRX_EL2 return 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.
**ADEn, bit [37]**

When FEAT_LS64 is implemented:

Enables access to the ACCDATA_EL1 register at EL1 and EL2.

<table>
<thead>
<tr>
<th>ADEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to ACCDATA_EL1 at EL1 and EL2 are trapped to EL3, unless the accesses are trapped to EL2 by the EL2 fine-grained trap.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause accesses to ACCDATA_EL1 to be trapped.</td>
</tr>
</tbody>
</table>

If the HFGWTR_EL2.nACCDATA_EL1 or HFGRTR_EL2.nACCDATA_EL1 traps are enabled, they take priority over this trap.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**EnAS0, bit [36]**

When FEAT_LS64 is implemented:

Traps execution of an ST64BV0 instruction at EL0, EL1, or EL2 to EL3.

<table>
<thead>
<tr>
<th>EnAS0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 execution of an ST64BV0 instruction is trapped to EL3, unless it is trapped to EL1 by SCTLR_EL1.EnAS0, or to EL2 by either HCRX_EL2.EnAS0 or SCTLR_EL2.EnAS0. EL1 execution of an ST64BV0 instruction is trapped to EL3, unless it is trapped to EL2 by HCRX_EL2.EnAS0. EL2 execution of an ST64BV0 instruction is trapped to EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

A trap of an ST64BV0 instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000001.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**AMVOFFEN, bit [35]**

When FEAT_AMUv1p1 is implemented:

Activity Monitors Virtual Offsets Enable.

<table>
<thead>
<tr>
<th>AMVOFFEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to AMEVCNTVOFF0&lt;n&gt;_EL2 and AMEVCNTVOFF1&lt;n&gt;_EL2 at EL2 are trapped to EL3. Indirect reads of the virtual offset registers are zero.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to AMEVCNTVOFF0&lt;n&gt;_EL2 and AMEVCNTVOFF1&lt;n&gt;_EL2 are not affected by this field.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
Bit [34]

Reserved, RES0.

TWDEL, bits [33:30]

When FEAT_TWED is implemented:

TWE Delay. A 4-bit unsigned number that, when SCR_EL3.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE* caused by SCR_EL3.TWE as \(2^{(TWDEL + 8)}\) cycles.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWDEn, bit [29]

When FEAT_TWED is implemented:

TWE Delay Enable. Enables a configurable delayed trap of the WFE* instruction caused by SCR_EL3.TWE.

<table>
<thead>
<tr>
<th>TWDEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The delay for taking the trap is IMPLEMENTATION DEFINED.</td>
</tr>
<tr>
<td>0b1</td>
<td>The delay for taking the trap is at least the number of cycles defined in SCR_EL3.TWDEL.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ECVEn, bit [28]

When FEAT_ECV is implemented:

ECV Enable. Enables access to the CNTPOFF_EL2 register.

<table>
<thead>
<tr>
<th>ECVEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL2 accesses to CNTPOFF_EL2 are trapped to EL3, and the value of CNTPOFF_EL2 is treated as 0 for all purposes other than direct reads or writes to the register from EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL2 accesses to CNTPOFF_EL2 are not trapped to EL3 by this mechanism.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FGTEn, bit [27]

When FEAT_FGT is implemented:

Fine-Grained Traps Enable. When EL2 is implemented, enables access to HAFGRTR_EL2, HDFGRTR_EL2, HDFGWTR_EL2, HFGTR_EL2, HFGITR_EL2 and HFGWTR_EL2.

Note
If EL2 is not implemented but EL3 is implemented, FEAT_FGT implements the MDCR_EL3 TDCC traps.

<table>
<thead>
<tr>
<th>FGTEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL2 accesses to HAFGRTR_EL2, HDFGRTR_EL2, HDFGWTR_EL2, HFGRTR_EL2, HFGITR_EL2, and HFGWTR_EL2 registers are trapped to EL3, and those registers behave as if all bits are set to 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL2 accesses to HAFGRTR_EL2, HDFGRTR_EL2, HDFGWTR_EL2, HFGRTR_EL2, HFGITR_EL2, and HFGWTR_EL2 registers are not trapped to EL3 by this mechanism.</td>
</tr>
</tbody>
</table>

Traps caused by accesses to the fine-grained trap registers are reported using an ESR_ELx.EC value of 0x18 and its associated ISS.

Otherwise:

Reserved, RES0.

ATA, bit [26]

When FEAT_MTE2 is implemented:

Allocation Tag Access. Controls access at EL2, EL1 and EL0 to Allocation Tags.

When access is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.
- MRS and MSR instructions at EL1 and EL2 using GCR_EL1, RGSR_EL1, TFSR_EL1, TFSR_EL2 or TFSRE0_EL1 that are not UNDEFINED or trapped to a lower Exception level are trapped to EL3.
- MRS and MSR instructions at EL2 using TFSR_EL12 that are not UNDEFINED are trapped to EL3.

<table>
<thead>
<tr>
<th>ATA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access is prevented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access is not prevented.</td>
</tr>
</tbody>
</table>

This field is permitted to be cached in a TLB.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnSCXT, bit [25]

When FEAT_CSV2 is implemented:

Enable access to the SCXTNUM_EL2, SCXTNUM_EL1, and SCXTNUM_EL0 registers. The defined values are:
EnSCXT

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [24:22]**

Reserved, RES0.

**FIEN, bit [21]**

*When FEAT_RASv1p1 is implemented:*

Fault Injection enable. Trap accesses to the registers ERXPFGCDN_EL1, ERXPFGCTL_EL1, and ERXPFGF_EL1 from EL1 and EL2 to EL3, reported using an ESR_ELx.EC value of 0x18.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

If EL3 is not implemented, the Effective value of SCR_EL3.FIEN is 0b1.

If ERRIDR_EL1.NUM is zero, meaning no error records are implemented, or no error record accessible using System registers is owned by a node that implements the RAS Common Fault Injection Model Extension, then this bit might be RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**NMEA, bit [20]**

*When FEAT_DoubleFault is implemented:*

Non-maskable External Aborts. When SCR_EL3.EA == 1, controls whether PSTATE.A masks SError interrupts at EL3.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

When SCR_EL3.EA == 0:

- Asserted SError interrupts are not taken at EL3 regardless of the value of PSTATE.A and this field.
- This field is ignored and its Effective value is 0.

On a Warm reset, this field resets to 0.
Reserved, RES0.

**EASE, bit [19]**

*When FEAT_DoubleFault is implemented:*

External aborts to SError interrupt vector.

<table>
<thead>
<tr>
<th>EASE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Synchronous External abort exceptions taken to EL3 are taken to the appropriate synchronous exception vector offset from VBAR_EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>Synchronous External abort exceptions taken to EL3 are taken to the appropriate SError interrupt vector offset from VBAR_EL3.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**EEL2, bit [18]**

*When FEAT_SEL2 is implemented:*

Secure EL2 Enable.

<table>
<thead>
<tr>
<th>EEL2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All behaviors associated with Secure EL2 are disabled. All registers, including timer registers, defined by FEAT_SEL2 are UNDEFINED, and those timers are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>All behaviors associated with Secure EL2 are enabled.</td>
</tr>
</tbody>
</table>

When the value of this bit is 1, then:

- When SCR_EL3.NS == 0, the SCR_EL3.RW bit is treated as 1 for all purposes other than reading or writing the register.

- If Secure EL1 is using AArch32, then any of the following operations, executed in Secure EL1, is trapped to Secure EL2, using the EC value of ESR_EL2.EC == 0x3:
  - A read or write of the SCR.
  - A read or write of the NSACR.
  - A read or write of the MVBAR.
  - A read or write of the SDCR.
  - Execution of an ATS12NSO** instruction.

- If Secure EL1 is using AArch32, then any of the following operations, executed in Secure EL1, is trapped to Secure EL2 using the EC value of ESR_EL2.EC == 0x0:
  - Execution of an SRS instruction that uses R13_mon.
  - Execution of an MRS (Banked register) or MSR (Banked register) instruction that would access SPSR_mon, R13_mon, or R14_mon.

**Note**

If the Effective value of SCR_EL3.EEL2 is 0, then these operations executed in Secure EL1 using AArch32 are trapped to EL3.

A Secure only implementation that does not implement EL3 but implements EL2, behaves as if SCR_EL3.EEL2 == 1. This bit is permitted to be cached in a TLB.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**API, bit [17]**

**When FEAT_SEL2 is implemented and FEAT_PAuth is implemented:**

Controls the use of the following instructions related to Pointer Authentication. Traps are reported using an ESR_ELx.EC value of 0x09:

- PACGA, which is always enabled.
- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZB, RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRBZ, ERATAA, ERETAB, LDRAA and LDRAB when:
  - In EL0, when **HCR_EL2.TGE == 0 or HCR_EL2.E2H == 0**, and the associated **SCTLR_EL1.En<N><M> == 1**.
  - In EL0, when **HCR_EL2.TGE == 1 and HCR_EL2.E2H == 1**, and the associated **SCTLR_EL2.En<N><M> == 1**.
  - In EL1, when the associated **SCTLR_EL1.En<N><M> == 1**.
  - In EL2, when the associated **SCTLR_EL2.En<N><M> == 1**.

<table>

<tr>
<td>0b0</td>
<td>The use of any instruction related to pointer authentication in any Exception level except EL3 when the instructions are enabled are trapped to EL3 unless they are trapped to EL2 as a result of the <strong>HCR_EL2.API</strong> bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

An instruction is trapped only if Pointer Authentication is enabled for that instruction, for more information, see 'System register control of pointer authentication'.

**Note**

If FEAT_PAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**When FEAT_SEL2 is not implemented and FEAT_PAuth is implemented:**

Controls the use of instructions related to Pointer Authentication:

- PACGA.
- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZB, RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRBZ, ERATAA, ERETAB, LDRAA and LDRAB when:
  - In Non-secure EL0, when **HCR_EL2.TGE == 0 or HCR_EL2.E2H == 0**, and the associated **SCTLR_EL1.En<N><M> == 1**.
  - In Non-secure EL0, when **HCR_EL2.TGE == 1 and HCR_EL2.E2H == 1**, and the associated **SCTLR_EL2.En<N><M> == 1**.
  - In Secure EL0, when the associated **SCTLR_EL2.En<N><M> == 1**.
  - In Secure or Non-secure EL1, when the associated **SCTLR_EL1.En<N><M> == 1**.
  - In EL2, when the associated **SCTLR_EL2.En<N><M> == 1**.

<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>
Note

If FEAT_PAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APK, bit [16]

When FEAT_PAuth is implemented:

Trap registers holding "key" values for Pointer Authentication. Traps accesses to the following registers, using an ESR_ELx.EC value of 0x18, from EL1 or EL2 to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.APK bit or other traps:

- APIAKeyLo_EL1, APIAKeyHi_EL1, APIBKeyLo_EL1, APIBKeyHi_EL1.
- APDAKeyLo_EL1, APDAKeyHi_EL1, APDBKeyLo_EL1, APDBKeyHi_EL1.
- APGAKeyLo_EL1, and APGAKeyHi_EL1.

<table>
<thead>
<tr>
<th>APK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to the registers holding &quot;key&quot; values for pointer authentication from EL1 or EL2 are trapped to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.APK bit or other traps.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

For more information, see 'System register control of pointer authentication'.

Note

If FEAT_PAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TERR, bit [15]

When FEAT_RAS is implemented:

Trap Error record accesses. Accesses to the RAS ERR* and RAS ERX* registers from EL1 and EL2 to EL3 are trapped as follows:

- Accesses from EL1 and EL2 using AArch64 to the following registers are trapped and reported using an ESR_ELx.EC value of 0x18:
  - ERRDR_EL1, ERRSELRL_EL1, ERXADDR_EL1, ERXCTRL_EL1, ERXFR_EL1, ERXMISC0_EL1, ERXMISC1_EL1, and ERXSTATUS_EL1.
- If FEAT_RASv1p1 is implemented, accesses from EL1 and EL2 using AArch64 to ERXMISC2_EL1, and ERXMISC3_EL1, are trapped and reported using an ESR_ELx.EC value of 0x18.
- Accesses from EL1 and EL2 using AArch32, to the following registers are trapped and reported using an ESR_ELx.EC value of 0x03:
ERRIDR, ERRSELR, ERXADDR, ERXADDR2, ERXCTLRL, ERXCTLRL2, ERXFR, ERXFR2, ERXMISC0, ERXMISC1, ERXMISC2, ERXMISC3, and ERXSTATUS.

- If FEAT_RASv1p1 is implemented, accesses from EL1 and EL2 using AArch32 to the following registers are trapped and reported using an ESR_ELx.EC value of 0x03:
  - ERXMISC4, ERXMISC5, ERXMISC6, and ERXMISC7.

<table>
<thead>
<tr>
<th>TERR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to the specified registers from EL1 and EL2 generate a Trap exception to EL3.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLOR, bit [14]

When FEAT_LOR is implemented:

Trap LOR registers. Traps accesses to the LORSA_EL1, LOREA_EL1, LORN_EL1, LORC_EL1, and LORID_EL1 registers from EL1 and EL2 to EL3, unless the access has been trapped to EL2.

<table>
<thead>
<tr>
<th>TLOR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 and EL2 accesses to the LOR registers that are not UNDEFINED are trapped to EL3, unless it is trapped HCR_EL2.TLOR.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWE, bit [13]

Traps EL2, EL1, and EL0 execution of WFE instructions to EL3, from both Security states and both Execution states, reported using an ESR_ELx.EC value of 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFET instruction.

<table>
<thead>
<tr>
<th>TWE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any attempt to execute a WFE instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWE, HCR.TWE, SCTLR_EL1.nTWE, SCTLR_EL2.nTWE, or HCR_EL2.TWE.</td>
</tr>
</tbody>
</table>

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.
For more information about when WFE instructions can cause the PE to enter a low-power state, see 'Wait for Event mechanism and Send event'.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**TWI, bit [12]**

Traps EL2, EL1, and EL0 execution of WFI instructions to EL3, from both Security states and both Execution states, reported using an ESR_ELx.EC value of 0x01.

When **FEAT_WFxT** is implemented, this trap also applies to the WFIT instruction.

<table>
<thead>
<tr>
<th>TWI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any attempt to execute a WFI instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by <strong>SCTLR.nTWI</strong>, <strong>HCR.TWI</strong>, <strong>SCTLR_EL1.nTWI</strong>, <strong>SCTLR_EL2.nTWI</strong>, or <strong>HCR_EL2.TWI</strong>.</td>
</tr>
</tbody>
</table>

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

For more information about when WFI instructions can cause the PE to enter a low-power state, see ‘Wait for Interrupt’.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**ST, bit [11]**

Traps Secure EL1 accesses to the Counter-timer Physical Secure timer registers to EL3, from AArch64 state only, reported using an ESR_ELx.EC value of 0x18.

<table>
<thead>
<tr>
<th>ST</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure EL1 using AArch64 accesses to the <strong>CNTPS.TVAL_EL1</strong>, <strong>CNTPS.CTL_EL1</strong>, and <strong>CNTPS.CVAL_EL1</strong> are trapped to EL3 when Secure EL2 is disabled. If Secure EL2 is enabled, the behavior is as if the value of this field was 0b1.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

**Note**

Accesses to the Counter-timer Physical Secure timer registers are always enabled at EL3. These registers are not accessible at EL0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**RW, bit [10]**

When AArch32 is supported at any Exception level:

Execution state control for lower Exception levels.
SCR_EL3, Secure Configuration Register

<table>
<thead>
<tr>
<th>RW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Lower levels are all AArch32.</td>
</tr>
<tr>
<td>0b1</td>
<td>The next lower level is AArch64.</td>
</tr>
<tr>
<td></td>
<td>If EL2 is present:</td>
</tr>
<tr>
<td></td>
<td>• EL2 is AArch64.</td>
</tr>
<tr>
<td></td>
<td>• EL2 controls EL1 and EL0 behaviors.</td>
</tr>
<tr>
<td></td>
<td>If EL2 is not present:</td>
</tr>
<tr>
<td></td>
<td>• EL1 is AArch64.</td>
</tr>
<tr>
<td></td>
<td>• EL0 is determined by the Execution state described in the</td>
</tr>
<tr>
<td></td>
<td>current process state when executing at EL0.</td>
</tr>
</tbody>
</table>

If AArch32 state is not supported by the implementation at EL2 and AArch32 state is not supported by the implementation at EL1, then this bit is RAO/WI.

If AArch32 state is supported by the implementation at EL1, SCR_EL3.NS == 1 and AArch32 state is not supported by the implementation at EL2, the Effective value of this bit is 1.

If AArch32 state is supported by the implementation at EL1, FEAT_SEL2 is implemented and SCR_EL3.{EEL2, NS} == {1, 0}, the Effective value of this bit is 1.

This bit is permitted to be cached in a TLB.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAO/WI.

**SIF, bit [9]**

**When FEAT_SEL2 is implemented:**

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from memory marked in the first stage of translation as being Non-secure. The possible values for this bit are:

<table>
<thead>
<tr>
<th>SIF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure state instruction fetches from memory marked in the first stage</td>
</tr>
<tr>
<td></td>
<td>of translation as being Non-secure are permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure state instruction fetches from memory marked in the first stage</td>
</tr>
<tr>
<td></td>
<td>of translation as being Non-secure are not permitted.</td>
</tr>
</tbody>
</table>

When FEAT_PAN3 is implemented, it is IMPLEMENTATION DEFINED whether SCR_EL3.SIF is also used to determine instruction access permission for the purpose of PAN.

This bit is permitted to be cached in a TLB.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from Non-secure memory.

<table>
<thead>
<tr>
<th>SIF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure state instruction fetches from Non-secure memory are permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure state instruction fetches from Non-secure memory are not</td>
</tr>
<tr>
<td></td>
<td>permitted.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
HCE, bit [8]

Hypervisor Call instruction enable. Enables HVC instructions at EL3 and, if EL2 is enabled in the current Security state, at EL2 and EL1, in both Execution states, reported using an ESR_ELx.EC value of 0x00.

<table>
<thead>
<tr>
<th>HCE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>HVC instructions are UNDEFINED.</td>
</tr>
<tr>
<td>0b1</td>
<td>HVC instructions are enabled at EL3, EL2, and EL1.</td>
</tr>
</tbody>
</table>

**Note**

HVC instructions are always UNDEFINED at EL0 and, if Secure EL2 is disabled, at Secure EL1. Any resulting exception is taken from the current Exception level to the current Exception level.

If EL2 is not implemented, this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

SMD, bit [7]

Secure Monitor Call disable. Disables SMC instructions at EL1 and above, from both Security states and both Execution states, reported using an ESR_ELx.EC value of 0x00.

<table>
<thead>
<tr>
<th>SMD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>SMC instructions are enabled at EL3, EL2 and EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>SMC instructions are UNDEFINED.</td>
</tr>
</tbody>
</table>

**Note**

SMC instructions are always UNDEFINED at EL0. Any resulting exception is taken from the current Exception level to the current Exception level.

If HCR_EL2.TSC or HCR.TSC traps attempted EL1 execution of SMC instructions to EL2, that trap has priority over this disable.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

Bits [5:4]

Reserved, RES1.

EA, bit [3]

External Abort and SError interrupt routing.

<table>
<thead>
<tr>
<th>EA</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0 | When executing at Exception levels below EL3, External aborts and SError interrupts are not taken to EL3. In addition, when executing at EL3:  
• SError interrupts are not taken.  
• External aborts are taken to EL3. |
| 0b1 | When executing at any Exception level, External aborts and SError interrupts are taken to EL3. |

For more information, see 'Asynchronous exception routing'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
FIQ, bit [2]

Physical FIQ Routing.

<table>
<thead>
<tr>
<th>FIQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When executing at Exception levels below EL3, physical FIQ interrupts are not taken to EL3. When executing at EL3, physical FIQ interrupts are not taken.</td>
</tr>
<tr>
<td>0b1</td>
<td>When executing at any Exception level, physical FIQ interrupts are taken to EL3.</td>
</tr>
</tbody>
</table>

For more information, see 'Asynchronous exception routing'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRQ, bit [1]

Physical IRQ Routing.

<table>
<thead>
<tr>
<th>IRQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When executing at Exception levels below EL3, physical IRQ interrupts are not taken to EL3. When executing at EL3, physical IRQ interrupts are not taken.</td>
</tr>
<tr>
<td>0b1</td>
<td>When executing at any Exception level, physical IRQ interrupts are taken to EL3.</td>
</tr>
</tbody>
</table>

For more information, see 'Asynchronous exception routing'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS, bit [0]

Non-secure bit.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Indicates that EL0 and EL1 are in Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Indicates that Exception levels lower than EL3 are in Non-secure state, so memory accesses from those Exception levels cannot access Secure memory.</td>
</tr>
</tbody>
</table>

When SCR_EL3.{EEL2, NS} == {1, 0}, then EL2 is using AArch64 and in Secure state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the SCR_EL3

Accesses to this register use the following encodings:

\[
\text{MRS} \, <\text{Xt}>, \, \text{SCR}_{-}\text{EL3}
\]

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>

<td>0b0001</td>
<td>0b000</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then UNDEFINED;
elsiif PSTATE.EL == EL1 then UNDEFINED;
elsiif PSTATE.EL == EL2 then UNDEFINED;
elsiif PSTATE.EL == EL3 then return SCR_EL3;
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elseif PSTATE.EL == EL3 then
    SCR_EL3 = X[t];
The SCTLR_EL1 characteristics are:

**Purpose**

Provides top level control of the system, including its memory system, at EL1 and EL0.

**Configuration**

AArch64 System register SCTLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register SCTLR[31:0].

**Attributes**

SCTLR_EL1 is a 64-bit register.

**Field descriptions**

The SCTLR_EL1 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  |

<td>0b1</td>
<td>The delay for taking the trap is at least the number of cycles defined in <code>SCTLR_EL1.TWEDEL</code>.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**DSSBS, bit [44]**

When `FEAT_SSBS` is implemented:

Default PSTATE.SSBS value on Exception Entry. The defined values are:

<table>
<thead>
<tr>
<th>DSSBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PSTATE.SSBS is set to 0 on an exception to EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>PSTATE.SSBS is set to 1 on an exception to EL1.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL1, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

**ATA, bit [43]**

When `FEAT_MTE2` is implemented:

Allocation Tag Access in EL1. When `SCR_EL3.ATA=1` and `HCR_EL2.ATA=1`, controls EL1 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.
<table>
<thead>
<tr>
<th>ATA</th>
<th>Meaning</th>

<tr>
<td>0b1</td>
<td>Access to Allocation Tags is not prevented.</td>
</tr>
</tbody>
</table>

This field is permitted to be cached in a TLB.

**Note**

Software may change this control bit on a context switch.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**TCF, bits [41:40]**

**When FEAT_MTE2 is implemented:**

Tag Check Fault in EL1. Controls the effect of Tag Check Faults due to Loads and Stores in EL1.

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.
### Reference Pages: 1407

<table>

<td>0b11</td>
<td>Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.</td>
<td>When FEAT_MTE3 is implemented</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally `UNKNOWN` value.

**Otherwise:**

Reserved, RES0.

**TCF0, bits [39:38]**

**When FEAT_MTE2 is implemented:**

Tag Check Fault in EL0. When `HCR_EL2.{E2H,TGE} != {1,1}`, controls the effect of Tag Check Faults due to Loads and Stores in EL0.

If FEAT_MTE3 is not implemented, the value `0b11` is reserved.

**Note**

Software may change this control bit on a context switch.

<table>
<thead>
<tr>

</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally `UNKNOWN` value.

**Otherwise:**

Reserved, RES0.

**ITFSB, bit [37]**

**When FEAT_MTE2 is implemented:**

When synchronous exceptions are not being generated by Tag Check Faults, this field controls whether on exception entry into EL1, all Tag Check Faults due to instructions executed before exception entry, that are reported asynchronously, are synchronized into `TFSRE0_EL1` and `TFSR_EL1` registers.

<table>
<thead>
<tr>
<th>ITFSB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Tag Check Faults are not synchronized on entry to EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Tag Check Faults are synchronized on entry to EL1.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally `UNKNOWN` value.
Otherwise:

Reserved, RES0.

**BT1, bit [36]**

*When FEAT_BT1 is implemented:*

PAC Branch Type compatibility at EL1.

<table>
<thead>
<tr>
<th>BT1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When the PE is executing at EL1, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the PE is executing at EL1, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**BT0, bit [35]**

*When FEAT_BT1 is implemented:*

PAC Branch Type compatibility at EL0.

<table>
<thead>
<tr>
<th>BT0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When the PE is executing at EL0, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the PE is executing at EL0, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.</td>
</tr>
</tbody>
</table>

When \texttt{HCR_EL2.E2H} == 1 && \texttt{HCR_EL2.TGE} == 1, the value of the SCTLR_EL1.BT0 has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**Bits [34:32]**

Reserved, RES0.

**EnIA, bit [31]**

*When FEAT_PAuth is implemented:*

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see ‘System register control of pointer authentication’.

<table>
<thead>
<tr>
<th>EnIA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.</td>
</tr>
</tbody>
</table>

**Note**
This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**EnIB, bit [30]**

When **FEAT_PAuth** is implemented:

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see ‘System register control of pointer authentication’.

<table>
<thead>
<tr>
<th><strong>EnIB</strong></th>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.</td>
</tr>
</tbody>
</table>

**Note**

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**LSMAOE, bit [29]**

When **FEAT_LSMAOC** is implemented:

Load Multiple and Store Multiple Atomicity and Ordering Enable.

<table>
<thead>
<tr>
<th><strong>LSMAOE</strong></th>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For all memory accesses at EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.</td>
</tr>
<tr>
<td>0b1</td>
<td>The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL0 is as defined for Armv8.0.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

When **FEAT_VHE** is implemented, and the value of **HCR_EL2.(E2H, TGE)** is {1,1}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES1.

nTLSMD, bit [28]

When FEAT_LSMAOC is implemented:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

<table>
<thead>
<tr>
<th>nTLSMD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.</td>
</tr>
<tr>
<td>0b1</td>
<td>All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of HCR_EL2.\{E2H, TGE\} is \{1,1\}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EnDA, bit [27]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see 'System register control of pointer authentication'.

<table>
<thead>
<tr>
<th>EnDA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
UCI, bit [26]

Traps EL0 execution of cache maintenance instructions, to EL1, or to EL2 when it is implemented and enabled for the current Security state and \( HCR\_EL2 \). TGE is 1, from AArch64 state only, reported using an ESR_ELx.EC value of 0x18.

This applies to\( DC\_CVAU\), \( DC\_CIVAC\), \( DC\_CVAC\), \( DC\_CVAP\), and \( IC\_IVAU\).

If FEAT_DPB2 is implemented, this trap also applies to \( DC\_CVADP\).

If FEAT_MTE2 is implemented, this trap also applies to \( DC\_CIGVAC\), \( DC\_CIGDVAC\), \( DC\_CGVAC\), \( DC\_CGDVAC\), \( DC\_CGVAP\), and \( DC\_CGDVAP\).

If FEAT_DPB2 and FEAT_MTE2 are implemented, this trap also applies to \( DC\_CVADP\) and \( DC\_CGDVADP\).

<table>
<thead>
<tr>
<th>UCI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Execution of the specified instructions at EL0 using AArch64 is trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

When FEAT_VHE is implemented, and the value of \( HCR\_EL2\).\( \{E2H, TGE\} \) is \( \{1, 1\} \), this bit has no effect on execution at EL0.

If the Point of Coherency is before any level of data cache, it is \( \text{IMPLEMENTATION DEFINED} \) whether the execution of any data or unified cache clean, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If the Point of Unification is before any level of data cache, it is \( \text{IMPLEMENTATION DEFINED} \) whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is \( \text{IMPLEMENTATION DEFINED} \) whether the execution of any instruction cache invalidate by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally \( \text{UNKNOWN} \) value.

EE, bit [25]

Endianness of data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime.

The possible values of this bit are:

<table>
<thead>
<tr>
<th>EE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&amp;0 translation regime are little-endian.</td>
</tr>
<tr>
<td>0b1</td>
<td>Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&amp;0 translation regime are big-endian.</td>
</tr>
</tbody>
</table>

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is \( \text{RES0} \).

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is \( \text{RES1} \).

The EE bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of \( HCR\_EL2\).\( \{E2H, TGE\} \) is \( \{1, 1\} \), this bit has no effect on the PE.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an \( \text{IMPLEMENTATION DEFINED} \) value.

E0E, bit [24]

Endianness of data accesses at EL0.

The possible values of this bit are:

<table>
<thead>
<tr>
<th>E0E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Explicit data accesses at EL0 are little-endian.</td>
</tr>
<tr>
<td>0b1</td>
<td>Explicit data accesses at EL0 are big-endian.</td>
</tr>
</tbody>
</table>
If an implementation only supports Little-endian accesses at EL0 then this bit is RES0. This option is not permitted when SCTLR_EL1.EE is RES1.

If an implementation only supports Big-endian accesses at EL0 then this bit is RES1. This option is not permitted when SCTLR_EL1.EE is RES0.

This bit has no effect on the endianness of LDTR, LDTRH, LDTRSH, LDTRSW, STTR, and STTRH instructions executed at EL1.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**SPAN, bit [23]**

When FEAT_PAN is implemented:

Set Privileged Access Never, on taking an exception to EL1.

<table>
<thead>
<tr>
<th>SPAN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PSTATE.PAN is set to 1 on taking an exception to EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The value of PSTATE.PAN is left unchanged on taking an exception to EL1.</td>
</tr>
</tbody>
</table>

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

**EIS, bit [22]**

When FEAT_ExS is implemented:

Exception Entry is Context Synchronizing. The defined values are:

<table>
<thead>
<tr>
<th>EIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The taking of an exception to EL1 is not a context synchronizing event.</td>
</tr>
<tr>
<td>0b1</td>
<td>The taking of an exception to EL1 is a context synchronizing event.</td>
</tr>
</tbody>
</table>

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

If SCTLR_EL1.EIS is set to 0b0:

- Indirect writes to ESR_EL1, FAR_EL1, SPSR_EL1, ELR_EL1 are synchronized on exception entry to EL1, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL1.EIS:

- Changes to the PSTATE information on entry to EL1.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.
**Otherwise:**

Reserved, RES1.

### IESB, bit [21]

**When FEAT_IESB is implemented:**

Implicit Error Synchronization event enable. Possible values are:

<table>
<thead>
<tr>
<th>IESB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disabled.</td>
</tr>
</tbody>
</table>
| 0b1  | An implicit error synchronization event is added:  
|      | • At each exception taken to EL1.  
|      | • Before the operational pseudocode of each ERET instruction  
|      |   executed at EL1. |

When the PE is in Debug state, the effect of this field is **CONSTRAINED UNPREDICTABLE**, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSX instruction taken to EL1 and before each DRPS instruction executed at EL1, in addition to the other cases where it is added.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

### TSCXT, bit [20]

**When FEAT_CSV2 is implemented:**

Trap EL0 Access to the $\text{SCXTNUM_{EL0}}$ register, when EL0 is using AArch64. The defined values are:

<table>
<thead>
<tr>
<th>TSCXT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 access to $\text{SCXTNUM_{EL0}}$ is not disabled by this mechanism.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 access to $\text{SCXTNUM_{EL0}}$ is disabled, causing an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and $\text{HCR_{EL2}.TGE}$ is 1. The value of $\text{SCXTNUM_{EL0}}$ is treated as 0.</td>
</tr>
</tbody>
</table>

When FEAT_VHE is implemented, and the value of $\text{HCR_{EL2}.{E2H, TGE}}$ is \{1,1\}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES1.

### WXN, bit [19]

Write permission implies XN (Execute-never). For the EL1&0 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

<table>
<thead>
<tr>
<th>WXN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on memory access permissions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any region that is writable in the EL1&amp;0 translation regime is forced to XN for accesses from software executing at EL1 or EL0.</td>
</tr>
</tbody>
</table>

This bit applies only when SCTLR_EL1.M bit is set.
The WXN bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of HCR_EL2.(E2H, TGE) is \{1, 1\}, this bit has no effect on the PE.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

### nTWE, bit [18]

Traps EL0 execution of WFE instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from both Execution states, reported using an ESR_ELx.EC value of 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFET instruction.

<table>
<thead>
<tr>
<th>nTWE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a WFE instruction at EL0 is trapped, if the instruction would otherwise have caused the PE to enter a low-power state.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When FEAT_VHE is implemented, and the value of HCR_EL2.(E2H, TGE) is \{1, 1\}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Bit [17]**

Reserved, RES0.

### nTWI, bit [16]

Traps EL0 execution of WFI instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from both Execution states, reported using an ESR_ELx.EC value of 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFIT instruction.

<table>
<thead>
<tr>
<th>nTWI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a WFI instruction at EL0 is trapped, if the instruction would otherwise have caused the PE to enter a low-power state.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When FEAT_VHE is implemented, and the value of HCR_EL2.(E2H, TGE) is \{1, 1\}, this bit has no effect on execution at EL0.
On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally \textit{UNKNOWN} value.

**UCT, bit [15]**

Traps EL0 accesses to the \texttt{CTR\_EL0} to EL1, or to EL2 when it is implemented and enabled for the current Security state and \texttt{HCR\_EL2}.TGE is 1, from AArch64 state only, reported using an ESR\_ELx.EC value of 0x18.

<table>
<thead>
<tr>
<th>UCT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to the \texttt{CTR_EL0} from EL0 using AArch64 are trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

When FEAT\_VHE is implemented, and the value of \texttt{HCR\_EL2}.E2H, TGE is \{1, 1\}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally \textit{UNKNOWN} value.

**DZE, bit [14]**

Traps EL0 execution of \texttt{DC ZVA} instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and \texttt{HCR\_EL2}.TGE is 1, from AArch64 state only, reported using an ESR\_ELx.EC value of 0x18.

If FEAT\_MTE2 is implemented, this trap also applies to \texttt{DC GVA} and \texttt{DC GZVA}.

<table>
<thead>
<tr>
<th>DZE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped. Reading \texttt{DCZID_EL0}.DZP from EL0 returns 1, indicating that the instructions this trap applies to are not supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

When FEAT\_VHE is implemented, and the value of \texttt{HCR\_EL2}.E2H, TGE is \{1, 1\}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally \textit{UNKNOWN} value.

**EnDB, bit [13]**

When FEAT\_PAuth is implemented:

Controls enabling of pointer authentication (using the APDBKey\_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see ‘System register control of pointer authentication’.

<table>
<thead>
<tr>
<th>EnDB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

**Note**

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally \textit{UNKNOWN} value.

**Otherwise:**

Reserved, RES0.
I, bit [12]

Stage 1 instruction access Cacheability control, for accesses at EL0 and EL1:

<table>
<thead>
<tr>
<th>I</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All instruction access to Stage 1 Normal memory from EL0 and EL1 are Stage 1 Non-cacheable. If the value of SCTLR_EL1.M is 0, instruction accesses from stage 1 of the EL1&amp;0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control has no effect on the Stage 1 Cacheability of instruction access to Stage 1 Normal memory from EL0 and EL1. If the value of SCTLR_EL1.M is 0, instruction accesses from stage 1 of the EL1&amp;0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.</td>
</tr>
</tbody>
</table>

When the value of the HCR_EL2 DC bit is 1, then instruction access to Normal memory from EL0 and EL1 are Cacheable regardless of the value of the SCTLR_EL1.1 bit.

When FEAT_VHE is implemented, and the value of HCR_EL2.(E2H, TGE) is \{1, 1\}, this bit has no effect on the PE.

On a Warm reset, in a system where the PE resets into EL1, this field resets to 0.

EOS, bit [11]

When FEAT_ExS is implemented:

Exception Exit is Context Synchronizing. The defined values are:

<table>
<thead>
<tr>
<th>EOS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An exception return from EL1 is not a context synchronizing event</td>
</tr>
<tr>
<td>0b1</td>
<td>An exception return from EL1 is a context synchronizing event</td>
</tr>
</tbody>
</table>

When FEAT_VHE is implemented, and the value of HCR_EL2.(E2H, TGE) is \{1,1\}, this bit has no effect on execution at EL0.

If SCTLR_EL1.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL1.EOS:

- The indirect write of the PSTATE and PC values from SPSR_EL1 and ELR_EL1 on exception return is synchronized.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EnRCTX, bit [10]

When FEAT_SPECRES is implemented:

Enable EL0 Access to the following instructions:

- AArch32 CFPRCTX, DVPRCTX and CPPRCTX instructions.
- AArch64 CFP RCTX, DVP RCT and CPP RCTX instructions.
The defined values are:

<table>
<thead>
<tr>
<th>EnRCTX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 access to these instructions is disabled, and these instructions are trapped to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 access to these instructions is enabled.</td>
</tr>
</tbody>
</table>

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1,1\}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UMA, bit [9]

User Mask Access. Traps EL0 execution of MSR and MRS instructions that access the PSTATE.(D, A, I, F) masks to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from AArch64 state only, reported using an ESR_ELx.EC value of 0x18.

<table>
<thead>
<tr>
<th>UMA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt at EL0 using AArch64 to execute an MRS, MSR(REGISTER), or MSR(IMMEDIATE) instruction that accesses the DAIF is trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1, 1\}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

SED, bit [8]

When EL0 is capable of using AArch32:

SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

<table>
<thead>
<tr>
<th>SED</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>SETEND instruction execution is enabled at EL0 using AArch32.</td>
</tr>
<tr>
<td>0b1</td>
<td>SETEND instructions are UNDEFINED at EL0 using AArch32 and any attempt at EL0 to access a SETEND instruction generates an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, reported using an ESR_ELx.EC value of 0x00.</td>
</tr>
</tbody>
</table>

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1, 1\}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

ITD, bit [7]

When EL0 is capable of using AArch32:

IT Disable. Disables some uses of IT instructions at EL0 using AArch32.
<table>
<thead>
<tr>
<th>ITD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All IT instruction functionality is enabled at EL0 using AArch32.</td>
</tr>
</tbody>
</table>
| 0b1   | Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED and generates an exception, reported using an ESR_ELx.EC value of 0x00, to EL1 or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1:  
  - All encodings of the IT instruction with hw1[3:0]!=1000.  
  - All encodings of the subsequent instruction with the following values for hw1:  
    - 0b11xxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.  
    - 0b1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section F3.2.5.  
    - 0b10100xxxxxxxxxxx: ADD Rd, PC, #imm  
    - 0b01001xxxxxxxxxxx: LDR Rd, [PC, #imm]  
    - 0b10101xxxxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.  
    - 0b010001xx1xxxx1111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn.  
These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.  
It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:  
  - A 16-bit instruction, that can only be followed by another 16-bit instruction.  
  - The first half of a 32-bit instruction.  
This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.  
An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.  

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see 'Changes to an ITD control by an instruction in an IT block'.  
ITD is optional, but if it is implemented in the SCTLR then it must also be implemented in the SCTLR_EL1. If it is not implemented then this bit is RAZ/WI.  

When FEAT_VHE is implemented, and the value of HCR_EL2. {E2H, TGE} is \{1, 1\}, this bit has no effect on execution at EL0.  
On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.  

Otherwise:  

Reserved, RES1.  

nAA, bit [6]  

When FEAT_LSE2 is implemented:  
Non-aligned access. This bit controls generation of Alignment faults at EL1 and EL0 under certain conditions.
nAA | Meaning
---|---
0b0 | LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.
0b1 | This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**CP15BEN, bit [5]**

**When EL0 is capable of using AArch32:**

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL0:

<table>
<thead>
<tr>
<th>CP15BEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is UNDEFINED and generates an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1. The exception is reported using an ESR_ELx.EC value of 0x80.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.</td>
</tr>
</tbody>
</table>

CP15BEN is optional, but if it is implemented in the SCTLR then it must also be implemented in the SCTLR_EL1. If it is not implemented then this bit is RAO/WI.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SA0, bit [4]**

SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see ‘SP alignment checking’.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.
SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL1 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see ‘SP alignment checking’.

When FEAT_VHE is implemented, and the value of HCR_EL2.(E2H, TGE) is \{1, 1\}, this bit has no effect on the PE.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally \textit{UNKNOWN} value.

C, bit [2]

Stage 1 Cacheability control, for data accesses.

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All data access to Stage 1 Normal memory from EL0 and EL1, and all Normal memory accesses from unified cache to the EL1&amp;0 Stage 1 translation tables, are treated as Stage 1 Non-cacheable.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control has no effect on the Stage 1 Cacheability of:</td>
</tr>
<tr>
<td></td>
<td>• Data access to Normal memory from EL0 and EL1.</td>
</tr>
<tr>
<td></td>
<td>• Normal memory accesses to the EL1&amp;0 Stage 1 translation tables.</td>
</tr>
</tbody>
</table>

When the value of the HCR_EL2.DC bit is 1, the PE ignores SCTLR.C. This means that Non-secure EL0 and Non-secure EL1 data accesses to Normal memory are Cacheable.

When FEAT_VHE is implemented, and the value of HCR_EL2.(E2H, TGE) is \{1, 1\}, this bit has no effect on the PE.

On a Warm reset, in a system where the PE resets into EL1, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL1 and EL0.

<table>
<thead>
<tr>
<th>A</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Alignment fault checking disabled when executing at EL1 or EL0.</td>
</tr>
<tr>
<td></td>
<td>Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.</td>
</tr>
<tr>
<td>0b1</td>
<td>Alignment fault checking enabled when executing at EL1 or EL0.</td>
</tr>
<tr>
<td></td>
<td>All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.</td>
</tr>
</tbody>
</table>

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

When FEAT_VHE is implemented, and the value of HCR_EL2.(E2H, TGE) is \{1, 1\}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally \textit{UNKNOWN} value.

M, bit [0]

MMU enable for EL1&0 stage 1 address translation.

<table>
<thead>
<tr>
<th>M</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL1&amp;0 stage 1 address translation disabled.</td>
</tr>
<tr>
<td></td>
<td>See the SCTLR_EL1.I field for the behavior of instruction accesses to Normal memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1&amp;0 stage 1 address translation enabled.</td>
</tr>
</tbody>
</table>

If the value of HCR_EL2.(DC, TGE) is not \{0, 0\} then in Non-secure state the PE behaves as if the value of the SCTLR_EL1.M field is 0 for all purposes other than returning the value of a direct read of the field.
When FEAT_VHE is implemented, and the value of HCR_EL2.(E2H, TGE) is \(1, 1\), this bit has no effect on the PE.

On a Warm reset, in a system where the PE resets into EL1, this field resets to 0.

**Accessing the SCTLR_EL1**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic SCTLR_EL1 or SCTLR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

\[
\begin{array}{|c|c|c|c|c|}
\hline
\text{op0} & \text{op1} & \text{CRn} & \text{CRm} & \text{op2} \\
\hline
0b11 & 0b000 & 0b0001 & 0b0000 & 0b000 \\
\hline
\end{array}
\]

SCTLR_EL2, System Control Register (EL2)

The SCTLR_EL2 characteristics are:

**Purpose**

Provides top level control of the system, including its memory system, at EL2.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1, 1\}, these controls apply also to execution at EL0.

**Configuration**

AArch64 System register SCTLR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HSCTLR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

SCTLR_EL2 is a 64-bit register.

**Field descriptions**

The SCTLR_EL2 bit assignments are:

**When HCR_EL2.E2H != 1 or HCR_EL2.TGE != 1:**

<td>When the PE is executing at EL2, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [35:32]

Reserved, RES0.

EnIA, bit [31]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see ‘System register control of pointer authentication’.

<table>
<thead>
<tr>
<th>EnIA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.</td>
</tr>
</tbody>
</table>

Note

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.
On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**EnIB, bit [30]**

**When FEAT_PAuth is implemented:**

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.

<table>
<thead>
<tr>
<th>EnIB</th>

<td>Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.</td>
</tr>
</tbody>
</table>

**Note**

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Bits [29:28]**

Reserved, RES1.

**EnDA, bit [27]**

**When FEAT_PAuth is implemented:**

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.

<table>
<thead>
<tr>
<th>EnDA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

**Note**

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

Bit [26]

Reserved, RES0.

EE, bit [25]

Endianness of data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime.

<table>
<thead>
<tr>
<th>EE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Explicit data accesses at EL2, stage 1 translation table walks in the</td>
</tr>
<tr>
<td></td>
<td>EL2 or EL2&amp;0 translation regime, and stage 2 translation table walks</td>
</tr>
<tr>
<td></td>
<td>in the EL1&amp;0 translation regime are little-endian.</td>
</tr>
<tr>
<td>0b1</td>
<td>Explicit data accesses at EL2, stage 1 translation table walks in the</td>
</tr>
<tr>
<td></td>
<td>EL2 or EL2&amp;0 translation regime, and stage 2 translation table walks</td>
</tr>
<tr>
<td></td>
<td>in the EL1&amp;0 translation regime are big-endian.</td>
</tr>
</tbody>
</table>

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an IMPLEMENTATION DEFINED value.

Bit [24]

Reserved, RES0.

Bit [23]

Reserved, RES1.

EIS, bit [22]

When FEAT_ExS is implemented:

Exception entry is a context synchronization event.

<table>
<thead>
<tr>
<th>EIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The taking of an exception to EL2 is not a context synchronization</td>
</tr>
<tr>
<td></td>
<td>event.</td>
</tr>
<tr>
<td>0b1</td>
<td>The taking of an exception to EL2 is a context synchronization event.</td>
</tr>
</tbody>
</table>

If SCTLR_EL2.EIS is set to 0b0:

- Indirect writes to ESR_EL2, FAR_EL2, SPSR_EL2, ELR_EL2, and HPFAR_EL2 are synchronized on exception entry to EL2, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL2.EIS:

- Changes to the PSTATE information on entry to EL2.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores, and data processing instructions.
- Exit from Debug state.
On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally *UNKNOWN* value.

**Otherwise:**

Reserved, RES1.

### IESB, bit [21]

**When FEAT_IESB is implemented:**

Implicit Error Synchronization event enable.

<table>
<thead>
<tr>
<th>IESB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disabled.</td>
</tr>
</tbody>
</table>
| 0b1  | An implicit error synchronization event is added:  
|      | • At each exception taken to EL2.  
|      | • Before the operational pseudocode of each ERET instruction executed at EL2. |

When the PE is in Debug state, the effect of this field is *CONSTRAINED UNPREDICTABLE*, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSX instruction taken to EL2 and before each DRPS instruction executed at EL2, in addition to the other cases where it is added.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally *UNKNOWN* value.

**Otherwise:**

Reserved, RES0.

### Bit [20]

Reserved, RES0.

### WXN, bit [19]

Write permission implies XN (Execute-never). For the EL2 or EL2&0 translation regime, this bit can force all memory regions that are writable to be treated as XN.

<table>
<thead>
<tr>
<th>WXN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on memory access permissions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any region that is writable in the EL2 or EL2&amp;0 translation regime is forced to XN for accesses from software executing at EL2.</td>
</tr>
</tbody>
</table>

This bit applies only when SCTLR_EL2.M bit is set.

The WXN bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally *UNKNOWN* value.

### Bit [18]

Reserved, RES1.

### Bit [17]

Reserved, RES0.
Bit [16]
Reserved, RES1.

Bits [15:14]
Reserved, RES0.

EnDB, bit [13]
When FEAT_PAuth is implemented:
Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.

<table>
<thead>
<tr>
<th>EnDB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

Note
This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

I, bit [12]
Instruction access Cacheability control, for accesses at EL2:

<table>
<thead>
<tr>
<th>I</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All instruction accesses to Normal memory from EL2 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&amp;0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control has no effect on the Cacheability of instruction access to Normal memory from EL2. If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&amp;0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.</td>
</tr>
</tbody>
</table>

This bit has no effect on the EL1&0 or EL3 translation regimes.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

EOS, bit [11]
When FEAT_ExS is implemented:
Exception exit is a context synchronization event.
Meaning

0b0  An exception return from EL2 is not a context synchronization event.

0b1  An exception return from EL2 is a context synchronization event.

If SCTLR_EL2.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL2.EOS:

- The indirect write of the PSTATE and PC values from SPSR_EL2 and ELR_EL2 on exception return is synchronized.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores, and data processing instructions.
- Exit from Debug state.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bits [10:7]

Reserved, RES0.

nAA, bit [6]

When FEAT_LSE2 is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL2 under certain conditions.

<table>
<thead>
<tr>
<th>nAA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLL, STLURH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURSW, LDLAR, LDLARH, STLLL, STLURH, STLUR, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [5:4]

Reserved, RES1.

SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL2 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see ‘SP alignment checking’.
On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

### C, bit [2]
Cacheability control, for data accesses.

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All data accesses to Normal memory from EL2, and all Normal memory accesses to the EL2 translation tables, are Non-cacheable for all levels of data and unified cache.</td>
</tr>
</tbody>
</table>
| 0b1 | This control has no effect on the Cacheability of:  
  - Data access to Normal memory from EL2.  
  - Normal memory accesses to the EL2 translation tables. This bit has no effect on the EL1&0 or EL3 translation regimes. |

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### A, bit [1]
Alignment check enable. This is the enable bit for Alignment fault checking at EL2:

<table>
<thead>
<tr>
<th>A</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Alignment fault checking disabled when executing at EL2. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.</td>
</tr>
<tr>
<td>0b1</td>
<td>Alignment fault checking enabled when executing at EL2. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception. Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

### M, bit [0]
MMU enable for EL2 stage 1 address translation.

<table>
<thead>
<tr>
<th>M</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL2 stage 1 address translation disabled. See the SCTLR_EL2.I field for the behavior of instruction accesses to Normal memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL2 stage 1 address translation enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

This format applies only from Armv8.1 when EL2 is enabled in the current Security state and **HCR_EL2. {E2H, TGE}** == {1, 1}.

### Bits [63:58]
Reserved, RES0.
EPAN, bit [57]

When FEAT_PAN3 is implemented:

Enhanced Privileged Access Never. When PSTATE.PAN is 1, determines whether an EL2 data access to a page with EL0 instruction access permission generates a Permission fault as a result of the Privileged Access Never mechanism.

<table>
<thead>
<tr>
<th>EPAN</th>
<th>Meaning</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No additional Permission faults are generated by this mechanism.</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>An EL1 data access to a page with stage 1 EL0 data access permission or stage 1 EL0 instruction access permission generates a Permission fault. Any speculative data accesses that would generate a Permission fault if the accesses were not speculative will not cause an allocation into a cache.</td>
<td></td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnALS, bit [56]

When FEAT_LS64 is implemented:

Traps execution of an LD64B or ST64B instruction at EL0 to EL2.

<table>
<thead>
<tr>
<th>EnALS</th>
<th>Meaning</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Execution of an LD64B or ST64B instruction at EL0 is trapped to EL2.</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
<td></td>
</tr>
</tbody>
</table>

A trap of an LD64B or ST64B instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x00000002.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnAS0, bit [55]

When FEAT_LS64 is implemented:

Traps execution of an ST64BV0 instruction at EL0 to EL2.

<table>
<thead>
<tr>
<th>EnAS0</th>
<th>Meaning</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Execution of an ST64BV0 instruction at EL0 is trapped to EL2.</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
<td></td>
</tr>
</tbody>
</table>

A trap of an ST64BV0 instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x00000001.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
EnASR, bit [54]

When FEAT_LS64 is implemented:

Traps execution of an ST64BV instruction at EL0 to EL2.

<table>
<thead>
<tr>
<th>EnASR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Execution of an ST64BV instruction at EL0 is trapped to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

A trap of an ST64BV instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000000.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [53:50]

Reserved, RES0.

TWEDEL, bits [49:46]

When FEAT_TWED is implemented:

TWE Delay. A 4-bit unsigned number that, when SCTLR_EL2.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE caused by SCTLR_EL2.nTWE as $2^{(TWEDEL + 8)}$ cycles.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEn, bit [45]

When FEAT_TWED is implemented:

TWE Delay Enable. Enables a configurable delayed trap of the WFE instruction caused by SCTLR_EL2.nTWE.

<table>
<thead>
<tr>
<th>TWEDEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The delay for taking a WFE trap is IMPLEMENTATION DEFINED.</td>
</tr>
<tr>
<td>0b1</td>
<td>The delay for taking a WFE trap is at least the number of cycles defined in SCTLR_EL2.TWEDEL.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DSSBS, bit [44]

When FEAT_SSSBS is implemented:

Default PSTATE.SSBS value on Exception Entry.

<table>
<thead>
<tr>
<th>DSSBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PSTATE.SSBS is set to 0 on an exception to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>PSTATE.SSBS is set to 1 on an exception to EL2.</td>
</tr>
</tbody>
</table>
On a Warm reset, in a system where the PE resets into EL2, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

ATA, bit [43]

When FEAT_MTE2 is implemented:

Allocation Tag Access in EL2. When SCR_EL3.ATA is 1, controls EL2 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.

<table>
<thead>
<tr>
<th>ATA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to Allocation Tags is prevented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access to Allocation Tags is not prevented.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA0, bit [42]

When FEAT_MTE2 is implemented:

Allocation Tag Access in EL0. When SCR_EL3.ATA is 1, controls EL0 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.

<table>
<thead>
<tr>
<th>ATA0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to Allocation Tags is prevented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access to Allocation Tags is not prevented.</td>
</tr>
</tbody>
</table>

This field is permitted to be cached in a TLB.

Note

Software may change this control bit on a context switch.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**TCF, bits [41:40]**

*When FEAT_MTE2 is implemented:*

Tag Check Fault in EL2. Controls the effect of Tag Check Faults due to Loads and Stores in EL2.

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

<table>
<thead>
<tr>
<th>TCF</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Tag Check Faults have no effect on the PE.</td>
<td></td>
</tr>
<tr>

<td>When the PE is executing at EL0, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [34:32]

Reserved, RES0.
EnIA, bit [31]
When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.

<table>
<thead>
<tr>
<th>EnIA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.</td>
</tr>
</tbody>
</table>

Note

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]
When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.

<table>
<thead>
<tr>
<th>EnIB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.</td>
</tr>
</tbody>
</table>

Note

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LSMAOE, bit [29]
When FEAT_LSMAOC is implemented:

Load Multiple and Store Multiple Atomicity and Ordering Enable.
The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL0 is as defined for Armv8.0.

This bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**nTLSMD, bit [28]**

*When FEAT_LSMAOC is implemented:*

All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.

This bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**EnDA, bit [27]**

*When FEAT_PAuth is implemented:*

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**UCI, bit [26]**

Traps execution of cache maintenance instructions at EL0 to EL2, from AArch64 state only. This applies to DC_CVAU, DC_CIVAC, DC_CVAC, DC_CVAP, and IC_IVAU.

If FEAT_DPB2 is implemented, this trap also applies to DC_CVADP.

If FEAT_MTE2 is implemented, this trap also applies to DC_CIGVAC, DC_CIGDVAC, DC_CGVAC, DC_CGDVAC, DC_CGVP, and DC_CGDVAP.

If FEAT_DPB2 and FEAT_MTE2 are implemented, this trap also applies to DC_CGVADP and DC_CGDVADP.

<table>
<thead>
<tr>
<th>UCI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**EE, bit [25]**

Endianness of data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL2&0 translation regime.

<table>
<thead>
<tr>
<th>EE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&amp;0 translation regime, and stage 2 translation table walks in the EL2&amp;0 translation regime are little-endian.</td>
</tr>
<tr>
<td>0b1</td>
<td>Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&amp;0 translation regime, and stage 2 translation table walks in the EL2&amp;0 translation regime are big-endian.</td>
</tr>
</tbody>
</table>

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an IMPLEMENTATION DEFINED value.

**E0E, bit [24]**

Endianness of data accesses at EL0.

<table>
<thead>
<tr>
<th>E0E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Explicit data accesses at EL0 are little-endian.</td>
</tr>
<tr>
<td>0b1</td>
<td>Explicit data accesses at EL0 are big-endian.</td>
</tr>
</tbody>
</table>

If an implementation only supports Little-endian accesses at EL0 then this bit is RES0. This option is not permitted when SCTLR_EL1.EE is RES1.
If an implementation only supports Big-endian accesses at EL0 then this bit is RES1. This option is not permitted when SCTLR_EL1.EE is RES0.

This bit has no effect on the endianness of LDTR, LDTRH, LDTRSH, LDTRSW, STTR, and STTRH instructions executed at EL1.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**SPAN, bit [23]**

Set Privileged Access Never, on taking an exception to EL2.

<table>
<thead>
<tr>
<th>SPAN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PSTATE.PAN is set to 1 on taking an exception to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>The value of PSTATE.PAN is left unchanged on taking an exception to EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**EIS, bit [22]**

When FEAT_ExS is implemented:

Exception entry is a context synchronization event.

<table>
<thead>
<tr>
<th>EIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The taking of an exception to EL2 is not a context synchronization event.</td>
</tr>
<tr>
<td>0b1</td>
<td>The taking of an exception to EL2 is a context synchronization event.</td>
</tr>
</tbody>
</table>

If SCTLR_EL2.EIS is set to 0b0:

- Indirect writes to ESR_EL2, FAR_EL2, SPSR_EL2, ELR_EL2, and HPFAR_EL2 are synchronized on exception entry to EL2, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL2.EIS:

- Changes to the PSTATE information on entry to EL2.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores, and data processing instructions.
- Exit from Debug state.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.

**IESB, bit [21]**

When FEAT_IESB is implemented:

Implicit Error Synchronization event enable.

<table>
<thead>
<tr>
<th>IESB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>An implicit error synchronization event is added:</td>
</tr>
<tr>
<td></td>
<td>• At each exception taken to EL2.</td>
</tr>
<tr>
<td></td>
<td>• Before the operational pseudocode of each ERET instruction executed at EL2.</td>
</tr>
</tbody>
</table>
When the PE is in Debug state, the effect of this field is **CONSTRAINED UNPREDICTABLE**, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSX instruction taken to EL2 and before each DRPS instruction executed at EL2, in addition to the other cases where it is added.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**TSCXT, bit [20]**

When FEAT_CSV2 is implemented:

Trap EL0 access to the SCXTNUM_EL0 register, when EL0 is using AArch64.

<table>
<thead>
<tr>
<th>TSCXT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 access to SCXTNUM_EL0 is not disabled by this mechanism.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 access to SCXTNUM_EL0 is disabled, causing an exception to EL2, and the SCXTNUM_EL0 value is treated at 0.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES1.

**WXN, bit [19]**

Write permission implies XN (Execute-never). For the EL2 or EL2&0 translation regime, this bit can force all memory regions that are writable to be treated as XN.

<table>
<thead>
<tr>
<th>WXN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on memory access permissions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any region that is writable in the EL2 or EL2&amp;0 translation regime is forced to XN for accesses from software executing at EL2.</td>
</tr>
</tbody>
</table>

This bit applies only when SCTLR_EL2.M bit is set.

The WXN bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**nTWE, bit [18]**

Traps execution of WFE instructions at EL0 to EL2, from both Execution states.

<table>
<thead>
<tr>
<th>nTWE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a WFE instruction at EL0 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or
WFI is executed when there is no Wakeup event. The only guarantee is that if
the instruction does not complete in finite time in the absence of a Wakeup
event, the trap will be taken.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Bit [17]**

Reserved, RES0.

**nTWI, bit [16]**

Traps execution of WFI instructions at EL0 to EL2, from both Execution states.

<table>
<thead>
<tr>
<th>nTWI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a WFI instruction at EL0 is trapped EL2, if the instruction would otherwise have caused the PE to enter a low-power state.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**UCT, bit [15]**

Traps EL0 accesses to the CTR_EL0 to EL2, from AArch64 state only.

<table>
<thead>
<tr>
<th>UCT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to the CTR_EL0 from EL0 using AArch64 are trapped to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**DZE, bit [14]**

Traps execution of DC ZVA instructions at EL0 to EL2, from AArch64 state only.

If FEAT_MTE2 is implemented, this trap also applies to DC GVA and DC GZVA.

<table>
<thead>
<tr>
<th>DZE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped to EL2. Reading DCZID_EL0.DZP from EL0 returns 1, indicating that the instructions that this trap applies to are not supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.
When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see ‘System register control of pointer authentication’.

<table>
<thead>
<tr>
<th>EnDB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

Note

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally \textit{UNKNOWN} value.

Otherwise:

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL2 and EL0:

<table>
<thead>
<tr>
<th>I</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All instruction access to Normal memory from EL2 and EL0 are Non-cacheable for all levels of instruction and unified cache. If the value of \textit{SCTLR EL2.M} is 0, instruction accesses from stage 1 of the EL2&amp;0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control has no effect on the Cacheability of instruction access to Normal memory from EL2 and EL0. If the value of \textit{SCTLR EL2.M} is 0, instruction accesses from stage 1 of the EL2&amp;0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.</td>
</tr>
</tbody>
</table>

This bit has no effect on the EL3 translation regimes.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

EOS, bit [11]

When FEAT_ExS is implemented:

Exception exit is a context synchronization event.

<table>
<thead>
<tr>
<th>EOS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An exception return from EL2 is not a context synchronization event.</td>
</tr>
<tr>
<td>0b1</td>
<td>An exception return from EL2 is a context synchronization event.</td>
</tr>
</tbody>
</table>

If \textit{SCTLR_EL2.EOS} is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.
The following are not affected by the value of SCTLR_EL2.EOS:

- The indirect write of the PSTATE and PC values from SPSR_EL2 and ELR_EL2 on exception return is synchronized.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores, and data processing instructions.
- Exit from Debug state.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.

**EnRCTX, bit [10]**

*When FEAT_SPECRES is implemented:*

Enable EL0 Access to the following instructions:

- AArch32 CFPRCTX, DVPRCTX and CPPRCTX instructions.
- AArch64 CFP RCTX, DVP RCT and CPP RCTX instructions.

The defined values are:

<table>
<thead>
<tr>
<th>EnRCTX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 access to these instructions is disabled, and these instructions are trapped to EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 access to these instructions is enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bit [9]**

Reserved, RES0.

**SED, bit [8]**

*When EL0 is capable of using AArch32:*

SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

<table>
<thead>
<tr>
<th>SED</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>SETEND instruction execution is enabled at EL0 using AArch32.</td>
</tr>
<tr>
<td>0b1</td>
<td>SETEND instructions are UNDEFINED at EL0 using AArch32.</td>
</tr>
</tbody>
</table>

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.
ITD, bit [7]

When EL0 is capable of using AArch32:

IT Disable. Disables some uses of IT instructions at EL0 using AArch32.

<table>
<thead>
<tr>
<th>ITD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All IT instruction functionality is enabled at EL0 using AArch32. Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED:</td>
</tr>
<tr>
<td></td>
<td>• All encodings of the IT instruction with hw1[3:0]! = 1000.</td>
</tr>
<tr>
<td></td>
<td>• All encodings of the subsequent instruction with the following values for hw1:</td>
</tr>
<tr>
<td></td>
<td>◦ 0b11xxxxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.</td>
</tr>
<tr>
<td></td>
<td>◦ 0b1011xxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section F3.2.5.</td>
</tr>
<tr>
<td></td>
<td>◦ 0b10000xxxxxxx: ADD Rd, PC, #imm</td>
</tr>
<tr>
<td></td>
<td>◦ 0b10001xxxxxxx: LDR Rd, [PC, #imm]</td>
</tr>
<tr>
<td></td>
<td>◦ 0b10001xxxx1xxx11: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.</td>
</tr>
<tr>
<td></td>
<td>◦ 0b10001xx1xxxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers UNPREDICTABLE cases with BLX Rn.</td>
</tr>
<tr>
<td>0b1</td>
<td>These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block. It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:</td>
</tr>
<tr>
<td></td>
<td>• A 16-bit instruction, that can only be followed by another 16-bit instruction.</td>
</tr>
<tr>
<td></td>
<td>• The first half of a 32-bit instruction.</td>
</tr>
<tr>
<td></td>
<td>This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED. An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.</td>
</tr>
</tbody>
</table>

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see 'Changes to an ITD control by an instruction in an IT block'.

ITD is optional, but if it is implemented in the SCTLR then it must also be implemented in the SCTLR_EL1. If it is not implemented then this bit is RAZ/WI.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

nAA, bit [6]

When FEAT_LSE2 is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL2 and EL0 under certain conditions.
Meaning

0b0 LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLAR, STLARH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.

0b1 This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLAR, STLARH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**CP15BEN, bit [5]**

*When EL0 is capable of using AArch32:*

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL0:

<table>
<thead>
<tr>
<th>CP15BEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is UNDEFINED.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.</td>
</tr>
</tbody>
</table>

CP15BEN is optional, but if it is implemented in the SCTLR then it must also be implemented in the SCTLR_EL1. If it is not implemented then this bit is RAO/WI.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**SA0, bit [4]**

SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see ‘SP alignment checking’.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**SA, bit [3]**

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL2 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see ‘SP alignment checking’.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**C, bit [2]**

Cacheability control, for data accesses.
Meaning

0b0 All data access to Normal memory from EL2 and EL0, and all Normal memory accesses to the EL2&0 translation tables, are Non-cacheable for all levels of data and unified cache.

0b1 This control has no effect on the Cacheability of:
- Data access to Normal memory from EL2 and EL0.
- Normal memory accesses to the EL2&0 translation tables.

This bit has no effect on the EL3 translation regimes.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL2 and EL0.

Meaning

0b0 Alignment fault checking disabled when executing at EL2 and EL0. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.

0b1 Alignment fault checking enabled when executing at EL2 and EL0. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL2&0 stage 1 address translation.

Meaning

0b0 EL2&0 stage 1 address translation disabled.
See the SCTLR_EL2.I field for the behavior of instruction accesses to Normal memory.

0b1 EL2&0 stage 1 address translation enabled.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Accessing the SCTLR_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic SCTLR_EL2 or SCTLR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

\[
\text{MRS} \ <Xt>, \ \text{SCTLR}\_\text{EL2}
\]

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>

SCTLR_EL3, System Control Register (EL3)

The SCTLR_EL3 characteristics are:

**Purpose**

Provides top level control of the system, including its memory system, at EL3.

**Configuration**

This register is present only when EL3 is implemented. Otherwise, direct accesses to SCTLR_EL3 are **UNDEFINED**.

**Attributes**

SCTLR_EL3 is a 64-bit register.

**Field descriptions**

The SCTLR_EL3 bit assignments are:

<table>

<tr>
<td>0b1</td>
<td>PSTATE.SBS is set to 1 on an exception to EL3.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL3, this field resets to an **IMPLEMENTATION DEFINED** value.

**ATA, bit [43]**

When **FEAT_MTE2** is implemented:

Allocation Tag Access in EL3. Controls EL3 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
• Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.

• Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.

<table>
<thead>
<tr>
<th>ATA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to Allocation Tags is prevented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access to Allocation Tags is not prevented.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Bit [42]**

Reserved, RES0.

**TCF, bits [41:40]**

When FEAT_MTE2 is implemented:

Tag Check Fault in EL3. Controls the effect of Tag Check Faults due to Loads and Stores in EL3.

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

<table>
<thead>
<tr>
<th>TCF</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Tag Check Faults have no effect on the PE.</td>

</tr>
<tr>
<td>0b11</td>
<td>Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.</td>
<td>When FEAT_MTE3 is implemented</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Bits [39:38]**

Reserved, RES0.

**ITFSB, bit [37]**

When FEAT_MTE2 is implemented:

When synchronous exceptions are not being generated by Tag Check Faults, this field controls whether on exception entry into EL3, all Tag Check Faults due to instructions executed before exception entry, that are reported asynchronously, are synchronized into TFSREQ_EL1 and TFSR_ELx registers.

<table>
<thead>
<tr>
<th>ITFSB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Tag Check Faults are not synchronized on entry to EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>Tag Check Faults are synchronized on entry to EL3.</td>
</tr>
</tbody>
</table>
On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally unknown value.

Otherwise:

Reserved, RES0.

**BT, bit [36]**

When FEAT_BTI is implemented:

PAC Branch Type compatibility at EL3.

<table>
<thead>
<tr>
<th>BT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When the PE is executing at EL3, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the PE is executing at EL3, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally unknown value.

Otherwise:

Reserved, RES0.

**Bits [35:32]**

Reserved, RES0.

**EnIA, bit [31]**

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL3 translation regime.

Possible values of this bit are:

<table>
<thead>
<tr>
<th>EnIA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.</td>
</tr>
</tbody>
</table>

For more information, see ‘System register control of pointer authentication’.

**Note**

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally unknown value.

Otherwise:

Reserved, RES0.

**EnIB, bit [30]**
When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL3 translation regime.

Possible values of this bit are:

<table>
<thead>
<tr>
<th>EnIB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.</td>
</tr>
</tbody>
</table>

For more information, see 'System register control of pointer authentication'.

**Note**

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Bits [29:28]**

Reserved, RES1.

**EnDA, bit [27]**

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL3 translation regime.

<table>
<thead>
<tr>
<th>EnDA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

For more information, see 'System register control of pointer authentication'.

**Note**

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
SCTLR_EL3, System Control Register (EL3)

Bit [26]
Reserved, RES0.

EE, bit [25]
Endianness of data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime.

<table>
<thead>
<tr>
<th>EE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Explicit data accesses at EL3, and stage 1 translation table walks</td>
</tr>
<tr>
<td></td>
<td>in the EL3 translation regime are little-endian.</td>
</tr>
<tr>
<td>0b1</td>
<td>Explicit data accesses at EL3, and stage 1 translation table walks</td>
</tr>
<tr>
<td></td>
<td>in the EL3 translation regime are big-endian.</td>
</tr>
</tbody>
</table>

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.
If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.
The EE bit is permitted to be cached in a TLB.
On a Warm reset, in a system where the PE resets into EL3, this field resets to an IMPLEMENTATION DEFINED value.

Bit [24]
Reserved, RES0.

Bit [23]
Reserved, RES1.

EIS, bit [22]
When FEAT_ExS is implemented:

Exception Entry is Context Synchronizing.

<table>
<thead>
<tr>
<th>EIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The taking of an exception to EL3 is not a context synchronizing</td>
</tr>
<tr>
<td></td>
<td>event.</td>
</tr>
<tr>
<td>0b1</td>
<td>The taking of an exception to EL3 is a context synchronizing event.</td>
</tr>
</tbody>
</table>

If SCTLR_EL3.EIS is set to 0b0:
• Indirect writes to ESR_EL3, FAR_EL3, SPSR_EL3, ELR_EL3 are synchronized on exception entry to EL3, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
• Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
• Exception Catch debug events are synchronous debug events.
• DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL3.EIS:
• Changes to the PSTATE information on entry to EL3.
• Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
• Debug state exit.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES1.
IESB, bit [21]

When FEAT_IESB is implemented:

Implicit Error Synchronization event enable.

<table>
<thead>
<tr>
<th>IESB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>An implicit error synchronization event is added:</td>
</tr>
<tr>
<td></td>
<td>• At each exception taken to EL3.</td>
</tr>
<tr>
<td></td>
<td>• Before the operational pseudocode of each ERET instruction executed at EL3.</td>
</tr>
</tbody>
</table>

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each `DCPSX` instruction taken to EL3 and before each `DRPS` instruction executed at EL3, in addition to the other cases where it is added.

When FEAT_DoubleFault is implemented, and the Effective value of SCR_EL3.NMEA is 1, this field is ignored and its Effective value is 1.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [20]

Reserved, RES0.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL3 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

<table>
<thead>
<tr>
<th>WXN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on memory access permissions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any region that is writable in the EL3 translation regime is forced to XN for accesses from software executing at EL3.</td>
</tr>
</tbody>
</table>

This bit applies only when SCTLR_EL3.M bit is set.

The WXN bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Bit [18]

Reserved, RES1.

Bit [17]

Reserved, RES0.

Bit [16]

Reserved, RES1.

Bits [15:14]

Reserved, RES0.
EnDB, bit [13]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL3 translation regime.

<table>
<thead>
<tr>
<th>EnDB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

For more information, see ‘System register control of pointer authentication’.

**Note**

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally unknown value.

**Otherwise:**

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL3:

<table>
<thead>
<tr>
<th>I</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All instruction access to Normal memory from EL3 are non-cacheable for all levels of instruction and unified cache. If the value of SCTLR_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control has no effect on the Cacheability of instruction access to Normal memory from EL3. If the value of SCTLR_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.</td>
</tr>
</tbody>
</table>

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

EOS, bit [11]

When FEAT_ExS is implemented:

Exception Exit is Context Synchronizing.

<table>
<thead>
<tr>
<th>EOS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An exception return from EL3 is not a context synchronizing event</td>
</tr>
<tr>
<td>0b1</td>
<td>An exception return from EL3 is a context synchronizing event</td>
</tr>
</tbody>
</table>

If SCTLR_EL3.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL3.EOS:

- The indirect write of the PSTATE and PC values from SPSR_EL3 and ELR_EL3 on exception return is synchronized.
- If the PE enters Debug state before the first instruction after an Exception return from EL3 to Non-secure state, any pending Halting debug event completes execution.
- The GIC behavior that allocates interrupts to FIQ or IRQ changes simultaneously with leaving the EL3 Exception level.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally unknown value.

Otherwise:

Reserved, RES1.

**Bits [10:7]**

Reserved, RES0.

**nAA, bit [6]**

When FEAT_LSE2 is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL3 under certain conditions.

<table>
<thead>
<tr>
<th>nAA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSW, LDAPURSH, LDAPURSW, LDLAR, LDARH, LDLARH, STLR, STLURH, STLRH, STLRH, STLURH, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSW, LDLARH, LDARH, LDLARH, LDLARH, STLRLR, STLRLR, STLRLR, STLRLR, STLRLR, STLRLR, STLRLR, or STLRLR to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally unknown value.

Otherwise:

Reserved, RES0.

**Bits [5:4]**

Reserved, RES1.

**SA, bit [3]**

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL3 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see ‘SP alignment checking’.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally unknown value.
C, bit [2]

Cacheability control, for data accesses.

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All data access to Normal memory from EL3, and all Normal memory accesses to the EL3 translation tables, are Non-cacheable for all levels of data and unified cache.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control has no effect on the Cacheability of:</td>
</tr>
<tr>
<td></td>
<td>- Data access to Normal memory from EL3.</td>
</tr>
<tr>
<td></td>
<td>- Normal memory accesses to the EL3 translation tables.</td>
</tr>
</tbody>
</table>

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL3.

<table>
<thead>
<tr>
<th>A</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Alignment fault checking disabled when executing at EL3.</td>
</tr>
<tr>
<td></td>
<td>Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.</td>
</tr>
<tr>
<td>0b1</td>
<td>Alignment fault checking enabled when executing at EL3.</td>
</tr>
<tr>
<td></td>
<td>All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.</td>
</tr>
</tbody>
</table>

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL3 stage 1 address translation. Possible values of this bit are:

<table>
<thead>
<tr>
<th>M</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL3 stage 1 address translation disabled.</td>
</tr>
<tr>
<td></td>
<td>See the SCTLR_EL3.I field for the behavior of instruction accesses to Normal memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL3 stage 1 address translation enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Accessing the SCTLR_EL3

Accesses to this register use the following encodings:

    SCTLR_EL3 = X[t];
SCXTNUM_EL0, EL0 Read/Write Software Context Number

The SCXTNUM_EL0 characteristics are:

Purpose

Provides a number that can be used to separate out different context numbers with the EL0 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

Configuration

This register is present only when FEAT_CSV2 is implemented. Otherwise, direct accesses to SCXTNUM_EL0 are UNDEFINED.

Attributes

SCXTNUM_EL0 is a 64-bit register.

Field descriptions

The SCXTNUM_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

Software Context Number. A number to identify the context within the EL0 exception level.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

SCXTNUM_EL2, EL2 Read/Write Software Context Number

The SCXTNUM_EL2 characteristics are:

**Purpose**

Provides a number that can be used to separate out different context numbers with the EL2 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

**Configuration**

This register is present only when FEAT_CSV2 is implemented. Otherwise, direct accesses to SCXTNUM_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

SCXTNUM_EL2 is a 64-bit register.

**Field descriptions**

The SCXTNUM_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>bits [63:0]</th>
<th>Software Context Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</td>
<td></td>
</tr>
<tr>

<td></td>
</tr>
</tbody>
</table>

**Bits [63:0]**

Software Context Number. A number to identify the context within the EL2 exception level.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the SCXTNUM_EL2**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic SCXTNUM_EL2 or SCXTNUM_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>

SCXTNUM_EL3, EL3 Read/Write Software Context Number

The SCXTNUM_EL3 characteristics are:

**Purpose**

Provides a number that can be used to separate out different context numbers with the EL3 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

**Configuration**

This register is present only when EL3 is implemented and FEAT_CSV2 is implemented. Otherwise, direct accesses to SCXTNUM_EL3 are **undefined**.

**Attributes**

SCXTNUM_EL3 is a 64-bit register.

**Field descriptions**

The SCXTNUM_EL3 bit assignments are:

<table>

SDER32_EL2, AArch32 Secure Debug Enable Register

The SDER32_EL2 characteristics are:

**Purpose**

Allows access to the AArch32 register SDER from Secure EL2 and EL3 only.

**Configuration**

This register is present only when EL2 is implemented, AArch32 is supported at any Exception level, FEAT_SEL2 is implemented and EL1 supports AArch32. Otherwise, direct accesses to SDER32_EL2 are UNDEFINED.

This register is ignored by the PE when one or more of the following are true:

- The PE is in Non-secure state.
- EL1 is using AArch64.

**Attributes**

SDER32_EL2 is a 64-bit register.

**Field descriptions**

SDER32_EL3, AArch32 Secure Debug Enable Register

The SDER32_EL3 characteristics are:

**Purpose**

Allows access to the AArch32 register SDER from AArch64 state only. Its value has no effect on execution in AArch64 state.

**Configuration**

AArch64 System register SDER32_EL3 bits [31:0] are architecturally mapped to AArch32 System register SDER[31:0].

This register is present only when EL3 is implemented, AArch32 is supported at any Exception level and EL1 supports AArch32. Otherwise, direct accesses to SDER32_EL3 are **UNDEFINED**.

This register is ignored by the PE when one or more of the following are true:

- The PE is in Non-secure state.
- EL1 is using AArch64.

**Attributes**

SDER32_EL3 is a 64-bit register.

**Field descriptions**

The SDER32_EL3 bit assignments are:

<table>
<thead>
<tr>

elsif PSTATE.EL == EL3 then
    SDER32_EL3 = X[t];
```
SP_EL0, Stack Pointer (EL0)

The SP_EL0 characteristics are:

Purpose

Holds the stack pointer associated with EL0. At higher Exception levels, this is used as the current stack pointer when the value of SPsel.SP is 0.

Configuration

There are no configuration notes.

Attributes

SP_EL0 is a 64-bit register.

Field descriptions

The SP_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>

```

**Bits [63:0]**

Stack pointer.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the SP_EL1**

This accessibility information only applies to accesses using the MRS or MSR instructions.

When the value of `SPSel.SP` is 1, this register is also accessible at EL1 as the current stack pointer.

---

**Note**

When the value of `SPSel.SP` is 0, **SP_EL0** is used as the current stack pointer at all Exception levels.

Accesses to this register use the following encodings:

**MRS <Xt>, SP_EL1**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>

SP_EL2, Stack Pointer (EL2)

The SP_EL2 characteristics are:

**Purpose**

Holds the stack pointer associated with EL2. When executing at EL2, the value of **SPSel**.SP determines the current stack pointer:

<table>
<thead>
<tr>
<th>SPSel.SP</th>
<th>Current stack pointer</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>SP_EL0</td>
</tr>
<tr>
<td>0b1</td>
<td>SP_EL2</td>
</tr>
</tbody>
</table>

**Configuration**

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

SP_EL2 is a 64-bit register.

**Field descriptions**

The SP_EL2 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

Stack pointer.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the SP_EL2**

This accessibility information only applies to accesses using the MRS or MSR instructions.

When the value of **SPSel**.SP is 1, this register is also accessible at EL2 as the current stack pointer.

**Note**

When the value of **SPSel**.SP is 0, **SP_EL0** is used as the current stack pointer at all Exception levels.

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>

elsif PSTATE.EL == EL3 then
    SP_EL2 = X[t];
The SP_El3 characteristics are:

**Purpose**

Holds the stack pointer associated with EL3. When executing at EL3, the value of SPSel.SP determines the current stack pointer:

<table>
<thead>
<tr>
<th>SPSel.SP</th>
<th>Current stack pointer</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>SP_EL0</td>
</tr>
<tr>
<td>0b1</td>
<td>SP_EL3</td>
</tr>
</tbody>
</table>

**Configuration**

This register is present only when EL3 is implemented. Otherwise, direct accesses to SP_EL3 are undefined.

**Attributes**

SP_EL3 is a 64-bit register.

**Field descriptions**

The SP_EL3 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Stack pointer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stack pointer</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:0]**

Stack pointer.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the SP_EL3**

This register is not accessible using MRS and MSR instructions.

When the value of SPSel.SP is 1, this register is accessible at EL3 as the current stack pointer.

**Note**

When the value of SPSel.SP is 0, SP_EL0 is used as the current stack pointer at all Exception levels.
SPSel, Stack Pointer Select

The SPSel characteristics are:

**Purpose**

Allows the Stack Pointer to be selected between SP_EL0 and SP_ELx.

**Configuration**

There are no configuration notes.

**Attributes**

SPSel is a 64-bit register.

**Field descriptions**

The SPSel bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RES0 | SP |

**Bits [63:1]**

Reserved, RES0.

**SP, bit [0]**

Stack pointer to use. Possible values of this bit are:

<table>
<thead>
<tr>
<th>SP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Use SP_EL0 at all Exception levels.</td>
</tr>
<tr>
<td>0b1</td>
<td>Use SP_ELx for Exception level ELx.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 1.

**Accessing the SPSel**

Accesses to this register use the following encodings:

```
MRS <Xt>, SPSel
```

<table>
<thead>
<tr>

SPSR_abt, Saved Program Status Register (Abort mode)

The SPSR_abt characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Abort mode.

**Configuration**

AArch64 System register SPSR_abt bits [31:0] are architecturally mapped to AArch32 System register SPSR_abt[31:0].

If EL1 only supports execution in AArch64 state, this register is RES0 from EL2 and EL3.

**Attributes**

SPSR_abt is a 64-bit register.

**Field descriptions**

The SPSR_abt bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| N  | Z  | C  | V  | Q  | IT[1:0] | SSB | SPAN | DIT | IL | GE | IT[7:2] | E  | A  | I  | F  | T  | M[4:0] | RES0 |

**Bits [63:32]**

Reserved, RES0.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Abort mode, and copied to PSTATE.N on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Abort mode, and copied to PSTATE.Z on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Abort mode, and copied to PSTATE.C on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Abort mode, and copied to PSTATE.V on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Abort mode, and copied to PSTATE.Q on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT[1:0], bits [26:25]

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Abort mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Abort mode.

On executing an exception return operation in Abort mode SPSR_abt.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Abort mode, and copied to PSTATE.SSBS on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Abort mode, and copied to PSTATE.PAN on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
**DIT, bit [21]**

*When FEAT_DIT is implemented:*

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Abort mode, and copied to PSTATE.DIT on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Abort mode, and copied to PSTATE.IL on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Abort mode, and copied to PSTATE.GE on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Abort mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in Abort mode.

SPSR_abt.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to Abort mode, and copied to PSTATE.E on executing an exception return operation in Abort mode.

If the implementation does not support big-endian operation, SPSR_abt.E is RES0. If the implementation does not support little-endian operation, SPSR_abt.E is RES1. On executing an exception return operation in Abort mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_abt.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_abt.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Abort mode, and copied to PSTATE.A on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Abort mode, and copied to PSTATE.I on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Abort mode, and copied to PSTATE.F on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Abort mode, and copied to PSTATE.T on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Abort mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Abort mode.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10000</td>
<td>User.</td>
</tr>
<tr>
<td>0b10001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b10010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b10011</td>
<td>Supervisor.</td>
</tr>
<tr>
<td>0b10111</td>
<td>Abort.</td>
</tr>
<tr>
<td>0b11011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b11111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_abt.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Abort mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Accessing the SPSR_abt

Accesses to this register use the following encodings:

**MRS <Xt>, SPSR_abt**

<table>
<thead>
<tr>

<td>0b0011</td>
<td>0b001</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && HCR_EL2.NV == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    UNDEFINED;
elsif PSTATE.EL == EL2 then
  SPSR_abt = X[t];
elsif PSTATE.EL == EL3 then
  SPSR_abt = X[t];
SPSR_EL1, Saved Program Status Register (EL1)

The SPSR_EL1 characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to EL1.

**Configuration**

AArch64 System register SPSR_EL1 bits [31:0] are architecturally mapped to AArch32 System register SPSR_svc[31:0].

**Attributes**

SPSR_EL1 is a 64-bit register.

**Field descriptions**

The SPSR_EL1 bit assignments are:

**When AArch32 is supported at any Exception level and exception taken from AArch32 state:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

An exception return from EL1 using AArch64 makes SPSR_EL1 become UNKNOWN.

**Bits [63:32]**

Reserved, RES0.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL1, and copied to PSTATE.N on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL1, and copied to PSTATE.Z on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL1, and copied to PSTATE.C on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL1, and copied to PSTATE.V on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL1, and copied to PSTATE.Q on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT[1:0], bits [26:25]

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to EL1, and copied to PSTATE.IT[1:0] on executing an exception return operation in EL1.

On executing an exception return operation in EL1 SPSR_EL1.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIT, bit [24]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL1, and copied to PSTATE.DIT on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL1, and copied to PSTATE.SSBS on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL1, and copied to PSTATE.PAN on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE_SS on taking an exception to EL1, and conditionally copied to PSTATE_SS on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE_IL on taking an exception to EL1, and copied to PSTATE_IL on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE_GE on taking an exception to EL1, and copied to PSTATE_GE on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to EL1, and copied to PSTATE.IT[7:2] on executing an exception return operation in EL1.

SPSR_EL1.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE_E on taking an exception to EL1, and copied to PSTATE_E on executing an exception return operation in EL1.

If the implementation does not support big-endian operation, SPSR_EL1.E is RES0. If the implementation does not support little-endian operation, SPSR_EL1.E is RES1. On executing an exception return operation in EL1, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_EL1.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_EL1.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE_A on taking an exception to EL1, and copied to PSTATE_A on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE_I on taking an exception to EL1, and copied to PSTATE_I on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL1, and copied to PSTATE.F on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL1, and copied to PSTATE.T on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state. Set to \(0b1\), the value of PSTATE.nRW, on taking an exception to EL1 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL1.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>(0b1)</td>
<td>AArch32 execution state.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL1, and copied to PSTATE.M[3:0] on executing an exception return operation in EL1.

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>(0b0000)</td>
<td>User.</td>
</tr>
<tr>
<td>(0b0001)</td>
<td>FIQ.</td>
</tr>
<tr>
<td>(0b0010)</td>
<td>IRQ.</td>
</tr>
<tr>
<td>(0b0011)</td>
<td>Supervisor.</td>
</tr>
<tr>
<td>(0b0111)</td>
<td>Abort.</td>
</tr>
<tr>
<td>(0b1011)</td>
<td>Undefined.</td>
</tr>
<tr>
<td>(0b1111)</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL1 is an illegal return event, as described in ‘Illegal return events from AArch64 state’.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

When exception taken from AArch64 state:

<table>
<thead>
<tr>
<th>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
</tr>
</tbody>
</table>

An exception return from EL1 using AArch64 makes SPSR_EL1 become UNKNOWN.

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL1, and copied to PSTATE.N on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Z, bit [30]
Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL1, and copied to PSTATE.Z on executing an exception return operation in EL1.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]
Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL1, and copied to PSTATE.C on executing an exception return operation in EL1.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]
Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL1, and copied to PSTATE.V on executing an exception return operation in EL1.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:26]
Reserved, RES0.

TCO, bit [25]
When FEAT_MTE is implemented:
Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL1, and copied to PSTATE.TCO on executing an exception return operation in EL1.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

DIT, bit [24]
When FEAT_DIT is implemented:
Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL1, and copied to PSTATE.DIT on executing an exception return operation in EL1.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

UAO, bit [23]
When FEAT_UAO is implemented:
User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL1, and copied to PSTATE.UAO on executing an exception return operation in EL1.
On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

  Reserved, RES0.

**PAN, bit [22]**

*When FEAT_PAN is implemented:*

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL1, and copied to PSTATE.PAN on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

  Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE.SS on taking an exception to EL1, and conditionally copied to PSTATE.SS on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL1, and copied to PSTATE.IL on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [19:13]**

Reserved, RES0.

**SSBS, bit [12]**

*When FEAT_SSBS is implemented:*

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL1, and copied to PSTATE.SSBS on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

  Reserved, RES0.

**BTYPE, bits [11:10]**

*When FEAT_BTI is implemented:*

Branch Type Indicator. Set to the value of PSTATE.BTYPE on taking an exception to EL1, and copied to PSTATE.BTYPE on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

  Reserved, RES0.
D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL1, and copied to PSTATE.D on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL1, and copied to PSTATE.A on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL1, and copied to PSTATE.I on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL1, and copied to PSTATE.F on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

Execution state. Set to 0b0, the value of PSTATE.nRW, on taking an exception to EL1 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL1.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>AArch64 execution state.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL0t.</td>
</tr>
<tr>
<td>0b0100</td>
<td>EL1t.</td>
</tr>
<tr>
<td>0b0101</td>
<td>EL1h.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL1 is an illegal return event, as described in ‘Illegal return events from AArch64 state’.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on taking an exception to EL1 and copied to PSTATE.EL on executing an exception return operation in EL1.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on taking an exception to EL1 and copied to PSTATE.SP on executing an exception return operation in EL1

On a Warm reset, this field resets to an architecturally UNKNOWN value.
SPSR_EL1, Saved Program Status Register (EL1)

Accessing the SPSR_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic SPSR_EL1 or SPSR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, SPSR_EL1

SPSR_EL2, Saved Program Status Register (EL2)

The SPSR_EL2 characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to EL2.

**Configuration**

AArch64 System register SPSR_EL2 bits [31:0] are architecturally mapped to AArch32 System register SPSR_hyp[31:0].

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

SPSR_EL2 is a 64-bit register.

**Field descriptions**

The SPSR_EL2 bit assignments are:

**When AArch32 is supported at any Exception level and exception taken from AArch32 state:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| **N** | **Z** | **C** | **V** | **Q** | **I[1:0]** | **DIT** | **SSBS** | **PAN** | **SS** | **IL** | **GE** | **IT[7:2]** | **E** | **A** | **I** | **F** | **T** | **M[4]** | **M[3:0]** |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

An exception return from EL2 using AArch64 makes SPSR_EL2 become **UNKNOWN**.

**Bits [63:32]**

Reserved, RES0.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL2, and copied to PSTATE.N on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL2, and copied to PSTATE.Z on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL2, and copied to PSTATE.C on executing an exception return operation in EL2.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL2, and copied to PSTATE.V on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL2, and copied to PSTATE.Q on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to EL2, and copied to PSTATE.IT[1:0] on executing an exception return operation in EL2.

On executing an exception return operation in EL2 SPSR_EL2.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**DIT, bit [24]**

*When FEAT_DIT is implemented:*

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL2, and copied to PSTATE.DIT on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**SSBS, bit [23]**

*When FEAT_SSBS is implemented:*

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL2, and copied to PSTATE.SSBS on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**PAN, bit [22]**

*When FEAT_PAN is implemented:*

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL2, and copied to PSTATE.PAN on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE.SS on taking an exception to EL2, and conditionally copied to PSTATE.SS on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL2, and copied to PSTATE.IL on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL2, and copied to PSTATE.GE on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to EL2, and copied to PSTATE.IT[7:2] on executing an exception return operation in EL2.

SPSR_EL2.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to EL2, and copied to PSTATE.E on executing an exception return operation in EL2.

If the implementation does not support big-endian operation, SPSR_EL2.E is RES0. If the implementation does not support little-endian operation, SPSR_EL2.E is RES1. On executing an exception return operation in EL2, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_EL2.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_EL2.E is RES1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL2, and copied to PSTATE.A on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL2, and copied to PSTATE.I on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL2, and copied to PSTATE.F on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL2, and copied to PSTATE.T on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state. Set to 0b1, the value of PSTATE.nRW, on taking an exception to EL2 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL2.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>AArch32 execution state.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL2, and copied to PSTATE.M[3:0] on executing an exception return operation in EL2.

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>User.</td>
</tr>
<tr>
<td>0b0001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b0010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Supervisor.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Abort.</td>
</tr>
<tr>
<td>0b1010</td>
<td>Hyp.</td>
</tr>
<tr>
<td>0b1011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b1111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_EL2.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL2 is an illegal return event, as described in ‘Illegal return events from AArch64 state’.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

When exception taken from AArch64 state:

When a Soft Fault exception occurs, the exception return from EL2 using AArch64 makes SPSR_EL2 become UNKNOWN.

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL2, and copied to PSTATE.N on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL2, and copied to PSTATE.Z on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL2, and copied to PSTATE.C on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL2, and copied to PSTATE.V on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:26]

Reserved, RES0.

TCO, bit [25]

When FEAT_MTE is implemented:

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL2, and copied to PSTATE.TCO on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [24]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL2, and copied to PSTATE.DIT on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UAO, bit [23]

When FEAT_UAO is implemented:

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL2, and copied to PSTATE.UAO on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**PAN, bit [22]**

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL2, and copied to PSTATE.PAN on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE.SS on taking an exception to EL2, and conditionally copied to PSTATE.SS on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL2, and copied to PSTATE.IL on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [19:13]**

Reserved, RES0.

**SSBS, bit [12]**

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL2, and copied to PSTATE.SSBS on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**BTYPE, bits [11:10]**

When FEAT_BT is implemented:

Branch Type Indicator. Set to the value of PSTATE.BTYPE on taking an exception to EL2, and copied to PSTATE.BTYPE on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL2, and copied to PSTATE.D on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL2, and copied to PSTATE.A on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL2, and copied to PSTATE.I on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL2, and copied to PSTATE.F on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

Execution state. Set to \(0b0\), the value of PSTATE.nRW, on taking an exception to EL2 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL2.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>AArch64 execution state.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL0t.</td>
</tr>
<tr>
<td>0b0100</td>
<td>EL1t.</td>
</tr>
<tr>
<td>0b0101</td>
<td>EL1h.</td>
</tr>
<tr>
<td>0b1000</td>
<td>EL2t.</td>
</tr>
<tr>
<td>0b1001</td>
<td>EL2h.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_EL2.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL2 is an illegal return event, as described in ‘Illegal return events from AArch64 state’.

The bits in this field are interpreted as follows:

- \(M[3:2]\) is set to the value of PSTATE.EL on taking an exception to EL2 and copied to PSTATE.EL on executing an exception return operation in EL2.
- \(M[1]\) is unused and is 0 for all non-reserved values.
- \(M[0]\) is set to the value of PSTATE.SP on taking an exception to EL2 and copied to PSTATE.SP on executing an exception return operation in EL2.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the SPSR_EL2**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic SPSR_EL2 or SPSR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

**MRS <Xt>, SPSR_EL2**

<table>

SPSR_EL3, Saved Program Status Register (EL3)

The SPSR_EL3 characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to EL3.

**Configuration**

AArch64 System register SPSR_EL3 bits [31:0] can be mapped to AArch32 System register SPSR_mon[31:0], but this is not architecturally mandated.

This register is present only when EL3 is implemented. Otherwise, direct accesses to SPSR_EL3 are UNDEFINED.

**Attributes**

SPSR_EL3 is a 64-bit register.

**Field descriptions**

The SPSR_EL3 bit assignments are:

**When AArch32 is supported at any Exception level and exception taken from AArch32 state:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

An exception return from EL3 using AArch64 makes SPSR_EL1 become UNKNOWN.

**Bits [63:32]**

Reserved, RES0.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL3, and copied to PSTATE.N on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL3, and copied to PSTATE.Z on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL3, and copied to PSTATE.C on executing an exception return operation in EL3.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL3, and copied to PSTATE.V on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL3, and copied to PSTATE.Q on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to EL3, and copied to PSTATE.IT[1:0] on executing an exception return operation in EL3.

On executing an exception return operation in EL3 SPSR_EL1.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**DIT, bit [24]**

*When FEAT_DIT is implemented:*

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL3, and copied to PSTATE.DIT on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**SSBS, bit [23]**

*When FEAT_SSBS is implemented:*

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL3, and copied to PSTATE.SSBS on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**PAN, bit [22]**

*When FEAT_PAN is implemented:*

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL3, and copied to PSTATE.PAN on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
SPSR_EL3, Saved Program Status Register (EL3)

Otherwise:

Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE.SS on taking an exception to EL3, and conditionally copied to PSTATE.SS on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL3, and copied to PSTATE.IL on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL3, and copied to PSTATE.GE on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to EL3, and copied to PSTATE.IT[7:2] on executing an exception return operation in EL3.

SPSR_EL1.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to EL3, and copied to PSTATE.E on executing an exception return operation in EL3.

If the implementation does not support big-endian operation, SPSR_EL1.E is RES0. If the implementation does not support little-endian operation, SPSR_EL1.E is RES1. On executing an exception return operation in EL3, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_EL1.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_EL1.E is RES1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL3, and copied to PSTATE.A on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL3, and copied to PSTATE.I on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL3, and copied to PSTATE.F on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**T, bit [5]**

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL3, and copied to PSTATE.T on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**M[4], bit [4]**

Execution state. Set to 0b1, the value of PSTATE.nRW, on taking an exception to EL3 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL3.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>AArch32 execution state.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**M[3:0], bits [3:0]**

AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL3, and copied to PSTATE.M[3:0] on executing an exception return operation in EL3.

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL3 is an illegal return event, as described in ‘Illegal return events from AArch64 state’.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**When exception taken from AArch64 state:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| N  | Z  | C  | V  | RES0 | TCO | DI | TI | UA | AO | PA | N  | SS | IL | RES0 | SSBS | BTYPE | D | A | I | F | RES0 | M[4] | M[3:0] |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

An exception return from EL3 using AArch64 makes SPSR_EL1 become **UNKNOWN**.

**Bits [63:32]**

Reserved, RES0.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL3, and copied to PSTATE.N on executing an exception return operation in EL3.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL3, and copied to PSTATE.Z on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL3, and copied to PSTATE.C on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL3, and copied to PSTATE.V on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Bits [27:26]

Reserved, RES0.

### TCO, bit [25]

**When FEAT_MTE is implemented:**

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL3, and copied to PSTATE.TCO on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

### DIT, bit [24]

**When FEAT_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL3, and copied to PSTATE.DIT on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

### UAO, bit [23]

**When FEAT_UAO is implemented:**

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL3, and copied to PSTATE.UAO on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**PAN, bit [22]**

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL3, and copied to PSTATE.PAN on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE.SS on taking an exception to EL3, and conditionally copied to PSTATE.SS on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL3, and copied to PSTATE.IL on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [19:13]**

Reserved, RES0.

**SSBS, bit [12]**

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL3, and copied to PSTATE.SSBS on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**BTYPE, bits [11:10]**

When FEAT_BTI is implemented:

Branch Type Indicator. Set to the value of PSTATE.BTYPE on taking an exception to EL3, and copied to PSTATE.BTYPE on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
D, bit [9]
Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL3, and copied to PSTATE.D on executing an exception return operation in EL3.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]
SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL3, and copied to PSTATE.A on executing an exception return operation in EL3.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]
IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL3, and copied to PSTATE.I on executing an exception return operation in EL3.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]
FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL3, and copied to PSTATE.F on executing an exception return operation in EL3.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]
Reserved, RES0.

M[4], bit [4]
Execution state. Set to 0b0, the value of PSTATE.nRW, on taking an exception to EL3 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL3.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>AArch64 execution state.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]
AArch64 Exception level and selected Stack Pointer.

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL0t.</td>
</tr>
<tr>
<td>0b0100</td>
<td>EL1t.</td>
</tr>
<tr>
<td>0b0101</td>
<td>EL1h.</td>
</tr>
<tr>
<td>0b1000</td>
<td>EL2t.</td>
</tr>
<tr>
<td>0b1001</td>
<td>EL2h.</td>
</tr>
<tr>
<td>0b1100</td>
<td>EL3t.</td>
</tr>
<tr>
<td>0b1101</td>
<td>EL3h.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL3 is an illegal return event, as described in ‘Illegal return events from AArch64 state’.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on taking an exception to EL3 and copied to PSTATE.EL on executing an exception return operation in EL3.
- M[1] is unused and is 0 for all non-reserved values.
M[0] is set to the value of PSTATE.SP on taking an exception to EL3 and copied to PSTATE.SP on executing an exception return operation in EL3

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Accessing the SPSR_EL3

Accesses to this register use the following encodings:

**MRS <Xt>, SPSR_EL3**

```
<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>

SPSR_fiq, Saved Program Status Register (FIQ mode)

The SPSR_fiq characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to FIQ mode.

**Configuration**

AArch64 System register SPSR_fiq bits [31:0] are architecturally mapped to AArch32 System register SPSR_fiq[31:0].

If EL1 only supports execution in AArch64 state, this register is RES0 from EL2 and EL3.

**Attributes**

SPSR_fiq is a 64-bit register.

**Field descriptions**

The SPSR_fiq bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

**Bits [63:32]**

Reserved, RES0.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to FIQ mode, and copied to PSTATE.N on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to FIQ mode, and copied to PSTATE.Z on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to FIQ mode, and copied to PSTATE.C on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to FIQ mode, and copied to PSTATE.V on executing an exception return operation in FIQ mode.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to FIQ mode, and copied to PSTATE.Q on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to FIQ mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in FIQ mode.

On executing an exception return operation in FIQ mode SPSR_fiq.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**J, bit [24]**

RES0.

In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**SSBS, bit [23]**

*When FEAT_SSBS is implemented:*

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to FIQ mode, and copied to PSTATE.SSBS on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**PAN, bit [22]**

*When FEAT_PAN is implemented:*

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to FIQ mode, and copied to PSTATE.PAN on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**DIT, bit [21]**

*When FEAT_DIT is implemented:*

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to FIQ mode, and copied to PSTATE.DIT on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to FIQ mode, and copied to PSTATE.IL on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to FIQ mode, and copied to PSTATE.GE on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to FIQ mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in FIQ mode.

SPSR_fiq.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to FIQ mode, and copied to PSTATE.E on executing an exception return operation in FIQ mode.

If the implementation does not support big-endian operation, SPSR_fiq.E is RES0. If the implementation does not support little-endian operation, SPSR_fiq.E is RES1. On executing an exception return operation in FIQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_fiq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_fiq.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to FIQ mode, and copied to PSTATE.A on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to FIQ mode, and copied to PSTATE.I on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to FIQ mode, and copied to PSTATE.F on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
T[5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to FIQ mode, and copied to PSTATE.T on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to FIQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in FIQ mode.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10000</td>
<td>User.</td>
</tr>
<tr>
<td>0b10001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b10010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b10011</td>
<td>Supervisor.</td>

<td>Abort.</td>
</tr>
<tr>
<td>0b11011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b11111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_fiq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in FIQ mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the SPSR_fiq

Accesses to this register use the following encodings:

MRS <Xt>, SPSR_fiq

```assembly
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && HCR_EL2.NV == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    UNDEFINED;
elsif PSTATE.EL == EL2 then
  return SPSR_fiq;
elsif PSTATE.EL == EL3 then
  return SPSR_fiq;
end if;
```

MSR SPSR_fiq, <Xt>

```assembly
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && HCR_EL2.NV == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    UNDEFINED;
elsif PSTATE.EL == EL2 then
  return SPSR_fiq;
elsif PSTATE.EL == EL3 then
  return SPSR_fiq;
end if;
```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    SPSR_fiq = X[t];
elsif PSTATE.EL == EL3 then
    SPSR_fiq = X[t];
**SPSR_irq**, Saved Program Status Register (IRQ mode)

The SPSR_irq characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to IRQ mode.

**Configuration**

AArch64 System register SPSR_irq bits [31:0] are architecturally mapped to AArch32 System register SPSR_irq[31:0]. If EL1 only supports execution in AArch64 state, this register is RES0 from EL2 and EL3.

**Attributes**

SPSR_irq is a 64-bit register.

**Field descriptions**

The SPSR_irq bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>62</td>
<td><strong>N</strong>, bit [31] Negative Condition flag. Set to the value of PSTATE.N on taking an exception to IRQ mode, and copied to PSTATE.N on executing an exception return operation in IRQ mode.</td>

</tr>
<tr>
<td>60</td>
<td><strong>C</strong>, bit [29] Carry Condition flag. Set to the value of PSTATE.C on taking an exception to IRQ mode, and copied to PSTATE.C on executing an exception return operation in IRQ mode.</td>
</tr>
<tr>
<td>59</td>
<td><strong>V</strong>, bit [28] Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to IRQ mode, and copied to PSTATE.V on executing an exception return operation in IRQ mode.</td>
</tr>
</tbody>
</table>

Bits [63:32]

Reserved, RES0.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to IRQ mode, and copied to PSTATE.Q on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to IRQ mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in IRQ mode.

On executing an exception return operation in IRQ mode SPSR_irq.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**J, bit [24]**

RES0.

In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**SSBS, bit [23]**

**When FEAT_SSBS is implemented:**

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to IRQ mode, and copied to PSTATE.SSBS on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**PAN, bit [22]**

**When FEAT_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to IRQ mode, and copied to PSTATE.PAN on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**DIT, bit [21]**

**When FEAT_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to IRQ mode, and copied to PSTATE.DIT on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to IRQ mode, and copied to PSTATE.IL on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to IRQ mode, and copied to PSTATE.GE on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to IRQ mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in IRQ mode.

SPSR_irq.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to IRQ mode, and copied to PSTATE.E on executing an exception return operation in IRQ mode.

If the implementation does not support big-endian operation, SPSR_irq.E is RES0. If the implementation does not support little-endian operation, SPSR_irq.E is RES1. On executing an exception return operation in IRQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_irq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_irq.E is RES1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to IRQ mode, and copied to PSTATE.A on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to IRQ mode, and copied to PSTATE.I on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to IRQ mode, and copied to PSTATE.F on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to IRQ mode, and copied to PSTATE.T on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to IRQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in IRQ mode.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10000</td>
<td>User.</td>
</tr>
<tr>
<td>0b10001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b10010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b10011</td>
<td>Supervisor.</td>
</tr>
<tr>
<td>0b10111</td>
<td>Abort.</td>
</tr>
<tr>
<td>0b11011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b11111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_irq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in IRQ mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the SPSR_irq

Accesses to this register use the following encodings:

\[

\end{array}
\]

\[
\text{MSR SPSR_irq, <Xt>}
\]
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    SPSR_irq = X[t];
elsif PSTATE.EL == EL3 then
    SPSR_irq = X[t];
SPSR_und, Saved Program Status Register (Undefined mode)

The SPSR_und characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Undefined mode.

**Configuration**

AArch64 System register SPSR_und bits [31:0] are architecturally mapped to AArch32 System register SPSR_und[31:0].

If EL1 only supports execution in AArch64 state, this register is RES0 from EL2 and EL3.

**Attributes**

SPSR_und is a 64-bit register.

**Field descriptions**

The SPSR_und bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | RES0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

**Bits [63:32]**

Reserved, RES0.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Undefined mode, and copied to PSTATE.N on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Undefined mode, and copied to PSTATE.Z on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Undefined mode, and copied to PSTATE.C on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Undefined mode, and copied to PSTATE.V on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Undefined mode, and copied to PSTATE.Q on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

IT[1:0], bits [26:25]

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Undefined mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Undefined mode.

On executing an exception return operation in Undefined mode SPSR_und.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

J, bit [24]

RES0.

In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

**When FEAT_SBS is implemented:**

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Undefined mode, and copied to PSTATE.SSBS on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

PAN, bit [22]

**When FEAT_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Undefined mode, and copied to PSTATE.PAN on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.
DIT, bit [21]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Undefined mode, and copied to PSTATE.DIT on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Undefined mode, and copied to PSTATE.IL on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Undefined mode, and copied to PSTATE.GE on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Undefined mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in Undefined mode.

SPSR_und.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Undefined mode, and copied to PSTATE.E on executing an exception return operation in Undefined mode.

If the implementation does not support big-endian operation, SPSR_und.E is RES0. If the implementation does not support little-endian operation, SPSR_und.E is RES1. On executing an exception return operation in Undefined mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_und.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_und.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Undefined mode, and copied to PSTATE.A on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Undefined mode, and copied to PSTATE.I on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Undefined mode, and copied to PSTATE.F on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Undefined mode, and copied to PSTATE.T on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Undefined mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Undefined mode.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10000</td>
<td>User</td>
</tr>
<tr>
<td>0b10001</td>
<td>FIQ</td>

**Bits [63:13]**

Reserved, RES0.

**SSBS, bit [12]**

Speculative Store Bypass Safe.

Prohibits speculative loads or stores which might practically allow a cache timing side channel.

A cache timing side channel might be exploited where a load or store uses an address that is derived from a register that is being loaded from memory using a load instruction speculatively read from a memory location. If PSTATE.SSBS is enabled, the address derived from the load instruction might be from earlier in the coherence order than the latest store to that memory location with the same virtual address.

<table>
<thead>
<tr>
<th>SSBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hardware is not permitted to load or store speculatively, in a manner that could practically give rise to a cache timing side channel, using an address derived from a register value that has been loaded from memory using a load instruction (L) that speculatively reads an entry from earlier in the coherence order from that location being loaded from than the entry generated by the latest store (S) to that location using the same virtual address as L.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hardware is permitted to load or store speculatively, in a manner that could practically give rise to a cache timing side channel, using an address derived from a register value that has been loaded from memory using a load instruction (L) that speculatively reads an entry from earlier in the coherence order from that location being loaded from than the entry generated by the latest store (S) to that location using the same virtual address as L.</td>
</tr>
</tbody>
</table>

The value of this bit is set to the value in the SCTLR_ELx.DSSBS field on taking an exception to ELx.
On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

**Bits [11:0]**

Reserved, RES0.

**Accessing the SSBS**

Accesses to this register use the following encodings:

TCR_EL1, Translation Control Register (EL1)

The TCR_EL1 characteristics are:

**Purpose**

The control register for stage 1 of the EL1&0 translation regime.

**Configuration**

AArch64 System register TCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register TTBCR[31:0].

AArch64 System register TCR_EL1 bits [63:32] are architecturally mapped to AArch32 System register TTBCR2[31:0].

**Attributes**

TCR_EL1 is a 64-bit register.

**Field descriptions**

The TCR_EL1 bit assignments are:

<table>
<thead>
<tr>

</tbody>
</table>

Any of the bits in TCR_EL1, other than the A1 bit and the EPDx bits when they have the value 1, are permitted to be cached in a TLB.

**Bits [63:60]**

Reserved, RES0.

**DS, bit [59]**

When FEAT_LPA2 is implemented:

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 1 of the EL1&0 translation regime.
### DS

<table>
<thead>
<tr>
<th>Bits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bits[49:48] of translation descriptors are RES0. Bits[9:8] in block and page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware. The minimum value of the TCR_EL1.{T0SZ, T1SZ} fields is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault. Output address[51:48] is 0b0000.</td>
</tr>
</tbody>
</table>
| 0b1  | Bits[49:48] of translation descriptors hold output address[49:48]. Bits[9:8] of translation table descriptors hold output address[51:50]. The shareability information of block and page descriptors for cacheable locations is determined by:

- TCR_EL1.SH0 if the VA is translated using tables pointed to by TTBR0_EL1.
- TCR_EL1.SH1 if the VA is translated using tables pointed to by TTBR1_EL1.

The minimum value of the TCR_EL1.{T0SZ, T1SZ} fields is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault. All calculations of the stage 1 base address are modified for tables of fewer than 8 entries so that the table is aligned to 64 bytes. Bits[5:2] of TTBR0_EL1 or TTBR1_EL1 are used to hold bits[51:48] of the output address in all cases. |

**Note**
As FEAT_LVA must be implemented if TCR_EL1.DS == 1, the minimum value of the TCR_EL1.{T0SZ, T1SZ} fields is 12, as determined by that extension.

For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00.

**Note**
This forces alignment of the ranges used by the TLBI range instructions.

This field is RES0 for a 64KB translation granule.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

### TCMA1, bit [58]

**When FEAT_MTE is implemented:**

Controls the generation of Unchecked accesses at EL1, and at EL0 if HCR_EL2.{E2H, TGE}!={1,1}, when address[59:55] = 0b111111.

<table>
<thead>
<tr>
<th>TCMA1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on the generation of Unchecked accesses at EL1 or EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>All accesses at EL1 and EL0 are Unchecked.</td>
</tr>
</tbody>
</table>

**Note**
Software may change this control bit on a context switch.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**TCMA0, bit [57]**

*When FEAT_MTE is implemented:*

Controls the generation of Unchecked accesses at EL1, and at EL0 if HCR_EL2.E2H,TGE!=\{1,1\}, when address[59:55] = 0b00000.

<table>
<thead>
<tr>
<th>TCMA0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on the generation of Unchecked accesses at EL1 or EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>All accesses at EL1 and EL0 are Unchecked.</td>
</tr>
</tbody>
</table>

**Note**

Software may change this control bit on a context switch.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**E0PD1, bit [56]**

*When FEAT_E0PD is implemented:*

Faulting control for Unprivileged access to any address translated by TTBR1_EL1.

<table>
<thead>
<tr>
<th>E0PD1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Unprivileged access to any address translated by TTBR1_EL1 will not generate a fault by this mechanism.</td>
</tr>
<tr>
<td>0b1</td>
<td>Unprivileged access to any address translated by TTBR1_EL1 will generate a level 0 translation fault.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**E0PD0, bit [55]**

*When FEAT_E0PD is implemented:*

Faulting control for Unprivileged access to any address translated by TTBR0_EL1.

<table>
<thead>
<tr>
<th>E0PD0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Unprivileged access to any address translated by TTBR0_EL1 will not generate a fault by this mechanism.</td>
</tr>
<tr>
<td>0b1</td>
<td>Unprivileged access to any address translated by TTBR0_EL1 will generate a level 0 translation fault.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
NFD1, bit [54]

When FEAT_SVE is implemented:

Non-fault translation table walk disable for stage 1 translations using TTBR1_EL1.

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using TTBR1_EL1.

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

For more information, see 'The Scalable Vector Extension (SVE)'.

<table>
<thead>
<tr>
<th>NFD1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not disable stage 1 translation table walks using TTBR1_EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on a virtual address that is translated using TTBR1_EL1 due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD0, bit [53]

When FEAT_SVE is implemented:

Non-fault translation table walk disable for stage 1 translations using TTBR0_EL1.

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using TTBR0_EL1.

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

For more information, see 'The Scalable Vector Extension (SVE)'.

<table>
<thead>
<tr>
<th>NFD0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not disable stage 1 translation table walks using TTBR0_EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on a virtual address that is translated using TTBR0_EL1 due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID1, bit [52]
When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging in AArch64 state'.

<table>
<thead>
<tr>
<th>TBID1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TCR_EL1.TBI1 applies to Instruction and Data accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>TCR_EL1.TBI1 applies to Data accesses only.</td>
</tr>
</tbody>
</table>

This affects addresses where the address would be translated by tables pointed to by TTBR1_EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID0, bit [51]

When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging in AArch64 state'.

<table>
<thead>
<tr>
<th>TBID0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TCR_EL1.TBI0 applies to Instruction and Data accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>TCR_EL1.TBI0 applies to Data accesses only.</td>
</tr>
</tbody>
</table>

This affects addresses where the address would be translated by tables pointed to by TTBR0_EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU162, bit [50]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL1.

<table>
<thead>
<tr>
<th>HWU162</th>
<th>Meaning</th>
</tr>
</thead>

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
HWU060, bit [44]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates implementation defined hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

<table>
<thead>
<tr>
<th>HWU060</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For translations using TTBR0_EL1, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an implementation defined purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>For translations using TTBR0_EL1, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an implementation defined purpose if the value of TCR_EL1.HPD0 is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

On a Warm reset, this field resets to an architecturally unknown value.

Otherwise:

Reserved, RES0.

HWU059, bit [43]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates implementation defined hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

<table>
<thead>
<tr>
<th>HWU059</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For translations using TTBR0_EL1, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an implementation defined purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>For translations using TTBR0_EL1, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an implementation defined purpose if the value of TCR_EL1.HPD0 is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

On a Warm reset, this field resets to an architecturally unknown value.

Otherwise:

Reserved, RES0.

HPD1, bit [42]

When FEAT_HPDS is implemented:

Hierarchical Permission Disable. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR1_EL1.

<table>
<thead>
<tr>
<th>HPD1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hierarchical permissions are enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hierarchical permissions are disabled.</td>
</tr>
</tbody>
</table>

When disabled, the permissions are treated as if the bits are zero.

On a Warm reset, this field resets to an architecturally unknown value.
Otherwise:

Reserved, RES0.

**HPD0, bit [41]**

When FEAT_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0_EL1.

<table>
<thead>
<tr>
<th>HPD0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hierarchical permissions are enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hierarchical permissions are disabled.</td>
</tr>
</tbody>
</table>

When disabled, the permissions are treated as if the bits are zero.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**HD, bit [40]**

When FEAT_HAFDBS is implemented:

Hardware management of dirty state in stage 1 translations from EL0 and EL1.

<table>
<thead>
<tr>
<th>HD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 1 hardware management of dirty state disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**HA, bit [39]**

When FEAT_HAFDBS is implemented:

Hardware Access flag update in stage 1 translations from EL0 and EL1.

<table>
<thead>
<tr>
<th>HA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 1 Access flag update disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 1 Access flag update enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**TBI1, bit [38]**

Top Byte ignored. Indicates whether the top byte of an address is used for address match for the TTBR1_EL1 region, or ignored and used for tagged addresses.
TBI1, Top Byte Used in the Address Calculation

<table>
<thead>
<tr>
<th>TBI1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Top Byte used in the address calculation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Top Byte ignored in the address calculation.</td>
</tr>
</tbody>
</table>

This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by TTBR1_EL1. It has an effect whether the EL1&0 translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL1.TBID1 is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI1 is 1 and bit [55] of the target address to be stored to the PC is 1, then bits[63:56] of that target address are also set to 1 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

TBI0, Top Byte Ignored

<table>
<thead>
<tr>
<th>TBI0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Top Byte used in the address calculation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Top Byte ignored in the address calculation.</td>
</tr>
</tbody>
</table>

This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL1. It has an effect whether the EL1&0 translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL1.TBID0 is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI0 is 1 and bit [55] of the target address to be stored to the PC is 0, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

AS, ASID Size

<table>
<thead>
<tr>
<th>AS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>8 bit - the upper 8 bits of TTBR0_EL1 and TTBR1_EL1 are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB.</td>
</tr>
<tr>
<td>0b1</td>
<td>16 bit - the upper 16 bits of TTBR0_EL1 and TTBR1_EL1 are used for allocation and matching in the TLB.</td>
</tr>
</tbody>
</table>

If the implementation has only 8 bits of ASID, this field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [35]

Reserved, RES0.

IPS, Intermediate Physical Address Size
<table>
<thead>
<tr>
<th>IPS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>32 bits, 4GB.</td>
</tr>
<tr>
<td>0b001</td>
<td>36 bits, 64GB.</td>
</tr>
<tr>
<td>0b010</td>
<td>40 bits, 1TB.</td>
</tr>
<tr>
<td>0b011</td>
<td>42 bits, 4TB.</td>
</tr>
<tr>
<td>0b100</td>
<td>44 bits, 16TB.</td>
</tr>
<tr>
<td>0b101</td>
<td>48 bits, 256TB.</td>
</tr>
<tr>
<td>0b110</td>
<td>52 bits, 4PB.</td>
</tr>
</tbody>
</table>

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB and FEAT_LPA2 is not implemented, the value 0b110 is treated as reserved.

It is **IMPLEMENTATION DEFINED** whether an implementation that does not implement FEAT_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL1 are 0b0000.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### TG1, bits [31:30]

Granule size for the **TTBR1_EL1**.

<table>
<thead>
<tr>
<th>TG1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>16KB.</td>
</tr>
<tr>
<td>0b10</td>
<td>4KB.</td>
</tr>
<tr>
<td>0b11</td>
<td>64KB.</td>
</tr>
</tbody>
</table>

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an **IMPLEMENTATION DEFINED** choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is **IMPLEMENTATION DEFINED** whether the value read back is the value programmed or the value that corresponds to the size chosen.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using **TTBR1_EL1**.

<table>
<thead>
<tr>
<th>SH1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is **CONSTRAINED UNPREDICTABLE**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using **TTBR1_EL1**.
### ORGN1

<table>
<thead>
<tr>
<th>Meaning</th>
<th>ORGN1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using **TTBR1_EL1**.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>IRGN1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### EPD1, bit [23]

Translation table walk disable for translations using **TTBR1_EL1**. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using **TTBR1_EL1**. The encoding of this bit is:

<table>
<thead>
<tr>
<th>Meaning</th>
<th>EPD1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Perform translation table walks using <strong>TTBR1_EL1</strong>.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on an address that is translated using <strong>TTBR1_EL1</strong> generates a Translation fault. No translation table walk is performed.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### A1, bit [22]

Selects whether **TTBR0_EL1** or **TTBR1_EL1** defines the ASID. The encoding of this bit is:

<table>
<thead>
<tr>
<th>Meaning</th>
<th>A1</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>TTBR0_EL1</strong> ASID defines the ASID.</td>
<td>0b0</td>
</tr>
<tr>
<td><strong>TTBR1_EL1</strong> ASID defines the ASID.</td>
<td>0b1</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### T1SZ, bits [21:16]

The size offset of the memory region addressed by **TTBR1_EL1**. The region size is $2^{(64-T1SZ)}$ bytes.

The maximum and minimum possible values for T1SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

**Note**

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TG0, bits [15:14]**

Granule size for the TTBR0_EL1.

<table>
<thead>
<tr>
<th>TG0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>4KB</td>
</tr>
<tr>
<td>0b01</td>
<td>64KB</td>
</tr>
<tr>
<td>0b10</td>
<td>16KB</td>
</tr>
</tbody>
</table>

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SH0, bits [13:12]**

Shareability attribute for memory associated with translation table walks using TTBR0_EL1.

<table>
<thead>
<tr>
<th>SH0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**ORGN0, bits [11:10]**

Outer cacheability attribute for memory associated with translation table walks using TTBR0_EL1.

<table>
<thead>
<tr>
<th>ORGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IRGN0, bits [9:8]**

Inner cacheability attribute for memory associated with translation table walks using TTBR0_EL1.

<table>
<thead>
<tr>
<th>IRGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EPD0, bit [7]**

Translation table walk disable for translations using TTBRO_EL1. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBRO_EL1. The encoding of this bit is:

<table>
<thead>
<tr>
<th>EPD0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Perform translation table walks using TTBRO_EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on an address that is translated using TTBRO_EL1 generates a Translation fault. No translation table walk is performed.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [6]**

Reserved, RES0.

**T0SZ, bits [5:0]**

The size offset of the memory region addressed by TTBRO_EL1. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

*Note*

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TCR_EL1**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic TCR_EL1 or TCR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, TCR_EL1

<table>
<thead>
<tr>

TCR_EL2, Translation Control Register (EL2)

The TCR_EL2 characteristics are:

**Purpose**

The control register for stage 1 of the EL2, or EL2&0, translation regime:

- When the Effective value of HCR_EL2.E2H is 0, this register controls stage 1 of the EL2 translation regime, that supports a single VA range, translated using TTBR0_EL2.
- When the value of HCR_EL2.E2H is 1, this register controls stage 1 of the EL2&0 translation regime, that supports both:
  - A lower VA range, translated using TTBR0_EL2.
  - A higher VA range, translated using TTBR1_EL2.

**Configuration**

AArch64 System register TCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HTC[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

TCR_EL2 is a 64-bit register.

**Field descriptions**

The TCR_EL2 bit assignments are:

**When HCR_EL2.E2H == 0:**

Any of the bits in TCR_EL2, other than the A1 bit and the EPDx bits when they have the value 1, are permitted to be cached in a TLB.

**Bits [63:33]**

Reserved, RES0.

**DS, bit [32]**

**When FEAT_LPA2 is implemented:**

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 1 of the EL2 translation regime.
Bits[49:48] of translation descriptors are res0. Bits[9:8] in block and page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware. The minimum value of TCR_EL2.T0SZ is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault. Output address[51:48] is 0b0000. Bits[49:48] of translation descriptors hold output address[49:48]. Bits[9:8] of translation table descriptors hold output address[51:50]. The shareability information of block and page descriptors for cacheable locations is determined by TCR_EL2.SH0. The minimum value of TCR_EL2.T0SZ is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault. All calculations of the stage 1 base address are modified for tables of fewer than 8 entries so that the table is aligned to 64 bytes. Bits[5:2] of TTBRO_EL2 are used to hold bits[51:48] of the output address in all cases.

**Note**
As FEAT_LVA must be implemented if TCR_EL2.DS == 1, the minimum value of the TCR_EL2.T0SZ field is 12, as determined by that extension.

For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00.

**Note**
This forces alignment of the ranges used by the TLBI range instructions.

This field is res0 for a 64KB translation granule.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, res0.

**Bit [31]**

Reserved, res1.

**TCMA, bit [30]**

When FEAT_MTE is implemented:

Controls the generation of Unchecked accesses at EL2 when address [59:56] = 0b0000.

<table>
<thead>
<tr>
<th>TCMA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on the generation of Unchecked accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>All accesses are Unchecked.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**TBID, bit [29]**

*When FEAT_PAuth is implemented:*

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging in AArch64 state'.

<table>
<thead>
<tr>
<th>TBID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TCR_EL2.TBI applies to Instruction and Data accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>TCR_EL2.TBI applies to Data accesses only.</td>
</tr>
</tbody>
</table>

This affects addresses where the address would be translated by tables pointed to by TTBR0_EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HWU62, bit [28]**

*When FEAT_HPDS2 is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU62</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HWU61, bit [27]**

*When FEAT_HPDS2 is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU61</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.</td>
</tr>
</tbody>
</table>
The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HWU60, bit [26]**

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU60</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HWU59, bit [25]**

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU59</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HPD, bit [24]**

When FEAT_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0_EL2.
<table>
<thead>
<tr>
<th>HPD</th>
<th>Meaning</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hierarchical permissions are enabled.</td>
<td>In this case, bit[61] (APTable[0]) and bit[59] (PXNTable) of the next level descriptor attributes are required to be ignored by the PE and are no longer reserved, allowing them to be used by software.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hierarchical permissions are disabled.</td>
<td></td>
</tr>
</tbody>
</table>

When disabled, the permissions are treated as if the bits are zero.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Bit [23]**

Reserved, RES1.

**HD, bit [22]**

*When FEAT_HAFDBS is implemented:*

Hardware management of dirty state in stage 1 translations from EL2.

<table>
<thead>
<tr>
<th>HD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 1 hardware management of dirty state disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**HA, bit [21]**

*When FEAT_HAFDBS is implemented:*

Hardware Access flag update in stage 1 translations from EL2.

<table>
<thead>
<tr>
<th>HA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 1 Access flag update disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 1 Access flag update enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**TBI, bit [20]**

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the **TTBR0_EL2** region, or ignored and used for tagged addresses.
For more information, see 'Address tagging in AArch64 state'.

<table>
<thead>
<tr>
<th>TBI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Top Byte used in the address calculation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Top Byte ignored in the address calculation.</td>
</tr>
</tbody>
</table>

This affects addresses generated in EL2 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL2. It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If FEAT_PAAuth is implemented and TCR_EL2.TBID is 1, then this field only applies to Data accesses.

If the value of TBI is 1, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL2.
- An exception taken to EL2.
- An exception return to EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [19]**

Reserved, RES0.

**PS, bits [18:16]**

Physical Address Size.

<table>
<thead>
<tr>
<th>PS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>32 bits, 4GB.</td>
</tr>
<tr>
<td>0b01</td>
<td>36 bits, 64GB.</td>
</tr>
<tr>
<td>0b10</td>
<td>40 bits, 1TB.</td>
</tr>
<tr>
<td>0b11</td>
<td>42 bits, 4TB.</td>
</tr>
<tr>
<td>0b100</td>
<td>44 bits, 16TB.</td>
</tr>
<tr>
<td>0b101</td>
<td>48 bits, 256TB.</td>
</tr>
<tr>
<td>0b110</td>
<td>52 bits, 4PB.</td>
</tr>
</tbody>
</table>

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB and FEAT_LPA2 is not implemented, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement FEAT_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL2 are 0b0000.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TG0, bits [15:14]**

Granule size for the TTBR0_EL2.

<table>
<thead>
<tr>
<th>TG0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>4KB.</td>
</tr>
<tr>
<td>0b01</td>
<td>64KB.</td>
</tr>
<tr>
<td>0b10</td>
<td>16KB.</td>
</tr>
</tbody>
</table>

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.
It is **IMPLEMENTATION DEFINED** whether the value read back is the value programmed or the value that corresponds to the size chosen.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**SH0, bits [13:12]**

Shareability attribute for memory associated with translation table walks using TTBR0_EL2.

<table>
<thead>
<tr>
<th>SH0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is **CONSTRAINED UNPREDICTABLE**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**ORGN0, bits [11:10]**

Outer cacheability attribute for memory associated with translation table walks using TTBR0_EL2.

<table>
<thead>
<tr>
<th>ORGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IRGN0, bits [9:8]**

Inner cacheability attribute for memory associated with translation table walks using TTBR0_EL2.

<table>
<thead>
<tr>
<th>IRGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [7:6]**

Reserved, RES0.

**T0SZ, bits [5:0]**

The size offset of the memory region addressed by TTBR0_EL2. The region size is \(2^{(64-T0SZ)}\) bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

**Note**

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.
For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**When FEAT_VHE is implemented and HCR_EL2.E2H == 1:**

This view of the register is only valid from Armv8.1 when HCR_EL2.E2H is 1.

Any of the bits in TCR_EL2 are permitted to be cached in a TLB.

### Bits [63:60]

Reserved, RES0.

### DS, bit [59]

**When FEAT_LPA2 is implemented:**

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 1 of the EL2&0 translation regime.
Bits[49:48] of translation descriptors are \texttt{RES0}.

The minimum value of the TCR\_EL2.\{T0SZ, T1SZ\} fields is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.

Output address[51:48] is \texttt{0b0000}.

The shareability information of block and page descriptors for cacheable locations is determined by:

- TCR\_EL2.SH0 if the VA is an address that is translated using tables pointed to by TTBR\_EL2.
- TCR\_EL2.SH1 if the VA is an address that is translated using tables pointed to by TTBR\_EL2.

The minimum value of the TCR\_EL2.\{T0SZ, T1SZ\} fields is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.

All calculations of the stage 1 base address are modified for tables of fewer than 16 entries so that the table is aligned to 64 bytes. Bits[5:2] of TTBR\_EL2 or TTBR\_EL2 are used to hold bits[51:48] of the output address in all cases.

\textbf{Note}
As FEAT\_LVA must be implemented if TCR\_EL2.DS == 1, the minimum value of the TCR\_EL2.\{T0SZ, T1SZ\} fields is 12, as determined by that extension.

For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as \texttt{0b0000}. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as \texttt{0b00}.

\textbf{Note}
This forces alignment of the ranges used by the TLBI range instructions.

This field is \texttt{RES0} for a 64KB translation granule.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{Otherwise:}

Reserved, \texttt{RES0}.

\textbf{TCMA1, bit [58]}

\textbf{When FEAT\_MTE is implemented:}

Controls the generation of Unchecked accesses at EL2, and at EL0 if HCR\_EL2.TGE=1, when address[59:55] = \texttt{0b11111}.

<table>
<thead>
<tr>
<th>TCMA1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on the generation of Unchecked accesses at EL2 or EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>All accesses are Unchecked.</td>
</tr>
</tbody>
</table>

\textbf{Note}
Software may change this control bit on a context switch.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.
Otherwise:
Reserved, RES0.

**TCMA0, bit [57]**

*When FEAT_MTE is implemented:*

Controls the generation of Unchecked accesses at EL2, and at EL0 if \( \text{HCR}_{EL2}.\text{TGE}=1 \), when \( \text{address}[59:55] = 0b00000 \).

<table>
<thead>
<tr>
<th>TCMA0</th>

</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Unprivileged access to any address translated by ( \text{TTBR}_{0_EL2} ) will not generate a fault by this mechanism.</td>
</tr>
<tr>
<td>0b1</td>
<td>Unprivileged access to any address translated by ( \text{TTBR}_{0_EL2} ) will generate a level 0 translation fault.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally \text{UNKNOWN} value.

Otherwise:
Reserved, RES0.
NFD1, bit [54]

When FEAT_SVE is implemented:

Non-fault translation table walk disable for stage 1 translations using TTBR1_EL2.

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using TTBR1_EL2.

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

For more information, see 'The Scalable Vector Extension (SVE)'.

<table>
<thead>
<tr>
<th>NFD1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not disable stage 1 translation table walks using TTBR1_EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on a virtual address that is translated using TTBR1_EL2 due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD0, bit [53]

When FEAT_SVE is implemented:

Non-fault translation table walk disable for stage 1 translations using TTBR0_EL2.

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using TTBR0_EL2.

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

For more information, see 'The Scalable Vector Extension (SVE)'.

<table>
<thead>
<tr>
<th>NFD0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not disable stage 1 translation table walks using TTBR0_EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on a virtual address that is translated using TTBR0_EL2 due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID1, bit [52]
When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging in AArch64 state'.

<table>
<thead>
<tr>
<th>TBID1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TCR_EL2.TBI1 applies to Instruction and Data accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>TCR_EL2.TBI1 applies to Data accesses only.</td>
</tr>
</tbody>
</table>

This affects addresses where the address would be translated by tables pointed to by TTBR1_EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**TBID0, bit [51]**

When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

For more information, see 'Address tagging in AArch64 state'.

<table>
<thead>
<tr>
<th>TBID0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TCR_EL2.TBI0 applies to Instruction and Data accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>TCR_EL2.TBI0 applies to Data accesses only.</td>
</tr>
</tbody>
</table>

This affects addresses where the address would be translated by tables pointed to by TTBR0_EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HWU162, bit [50]**

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL2.

<table>
<thead>
<tr>
<th>HWU162</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HWU160, bit [48]**

*When FEAT_HPDS2 is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBRI_EL2.

<table>
<thead>
<tr>
<th>HWU160</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For translations using TTBRI_EL2, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>For translations using TTBRI_EL2, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HWU159, bit [47]**

*When FEAT_HPDS2 is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBRI_EL2.
Meaning

| 0b0 | For translations using `TTBR1_EL2`, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | For translations using `TTBR1_EL2`, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1. |

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU062, bit [46]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using `TTBR0_EL1`.

Meaning

| 0b0 | For translations using `TTBR0_EL1`, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | For translations using `TTBR0_EL1`, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1. |

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU061, bit [45]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using `TTBR0_EL1`.

Meaning

| 0b0 | For translations using `TTBR0_EL1`, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | For translations using `TTBR0_EL1`, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1. |

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
HWU060, bit [44]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

<table>
<thead>
<tr>
<th>HWU060</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For translations using TTBR0_EL1, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>For translations using TTBR0_EL1, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU059, bit [43]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

<table>
<thead>
<tr>
<th>HWU059</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For translations using TTBR0_EL1, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>For translations using TTBR0_EL1, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD1, bit [42]

When FEAT_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR1_EL2.

<table>
<thead>
<tr>
<th>HPD1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hierarchical permissions are enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hierarchical permissions are disabled.</td>
</tr>
</tbody>
</table>

When disabled, the permissions are treated as if the bits are zero.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**HPD0, bit [41]**

*When FEAT_HPDS is implemented:*

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBRO_EL2.

<table>
<thead>
<tr>
<th>HPD0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hierarchical permissions are enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hierarchical permissions are disabled.</td>
</tr>
</tbody>
</table>

When disabled, the permissions are treated as if the bits are zero.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HD, bit [40]**

*When FEAT_HAFDBS is implemented:*

Hardware management of dirty state in stage 1 translations from EL2.

<table>
<thead>
<tr>
<th>HD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 1 hardware management of dirty state disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HA, bit [39]**

*When FEAT_HAFDBS is implemented:*

Hardware Access flag update in stage 1 translations from EL2.

<table>
<thead>
<tr>
<th>HA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 1 Access flag update disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 1 Access flag update enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**TBI1, bit [38]**

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the TTBRI_EL2 region, or ignored and used for tagged addresses.
For more information, see 'Address tagging in AArch64 state'.

<table>
<thead>
<tr>
<th>TBI1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Top Byte used in the address calculation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Top Byte ignored in the address calculation.</td>
</tr>
</tbody>
</table>

This affects addresses generated in EL0 and EL2 using AArch64 where the address would be translated by tables pointed to by TTBR1_EL2. It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL2.TBID1 is 1, then this field only applies to Data accesses.

If the value of TBI1 is 1 and bit [55] of the target address to be stored to the PC is 1, then bits[63:56] of that target address are also set to 1 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

TBI0, bit [37]

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the TTBR0_EL2 region, or ignored and used for tagged addresses.

For more information, see 'Address tagging in AArch64 state'.

<table>
<thead>
<tr>
<th>TBI0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Top Byte used in the address calculation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Top Byte ignored in the address calculation.</td>
</tr>
</tbody>
</table>

This affects addresses generated in EL0 and EL2 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL2. It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL2.TBID0 is 1, then this field only applies to Data accesses.

If the value of TBI0 is 1 and bit [55] of the target address to be stored to the PC is 0, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

AS, bit [36]

ASID Size.

<table>
<thead>
<tr>
<th>AS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>8 bit - the upper 8 bits of TTBR0_EL2 and TTBR1_EL2 are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB.</td>
</tr>
<tr>
<td>0b1</td>
<td>16 bit - the upper 16 bits of TTBR0_EL2 and TTBR1_EL2 are used for allocation and matching in the TLB.</td>
</tr>
</tbody>
</table>

If the implementation has only 8 bits of ASID, this field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [35]

Reserved, RES0.
**IPS, bits [34:32]**

Intermediate Physical Address Size.

<table>
<thead>
<tr>
<th>IPS</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>32 bits, 4GB.</td>
<td></td>
</tr>
<tr>
<td>0b001</td>
<td>36 bits, 64GB.</td>
<td></td>
</tr>
<tr>
<td>0b010</td>
<td>40 bits, 1TB.</td>
<td></td>
</tr>
<tr>
<td>0b011</td>
<td>42 bits, 4TB.</td>
<td></td>
</tr>
<tr>
<td>0b100</td>
<td>44 bits, 16TB.</td>
<td></td>
</tr>
<tr>
<td>0b101</td>
<td>48 bits, 256TB.</td>
<td></td>
</tr>
<tr>
<td>0b110</td>
<td>52 bits, 4PB.</td>
<td>When FEAT_LPA is implemented</td>
</tr>
</tbody>
</table>

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB, the value 0b110 is treated as reserved.

It is implementation defined whether an implementation that does not implement FEAT_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL2 are 0b0000.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TG1, bits [31:30]**

Granule size for the **TTBR1_EL2**.

<table>
<thead>
<tr>
<th>TG1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>16KB.</td>
</tr>
<tr>
<td>0b10</td>
<td>4KB.</td>
</tr>
<tr>
<td>0b11</td>
<td>64KB.</td>
</tr>
</tbody>
</table>

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an implementation defined choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is implementation defined whether the value read back is the value programmed or the value that corresponds to the size chosen.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SH1, bits [29:28]**

Shareability attribute for memory associated with translation table walks using **TTBR1_EL2**.

<table>
<thead>
<tr>
<th>SH1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is constrained unpredictable.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**ORGN1, bits [27:26]**

Outer cacheability attribute for memory associated with translation table walks using **TTBR1_EL2**.
### ORGN1, Meaning

<table>
<thead>
<tr>
<th>Bits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using **TTBR1_EL2**.

<table>
<thead>
<tr>
<th>Bits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### EPD1, bit [23]

Translation table walk disable for translations using **TTBR1_EL2**. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using **TTBR1_EL2**. The encoding of this bit is:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Perform translation table walks using <strong>TTBR1_EL2</strong>.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on an address that is translated using <strong>TTBR1_EL2</strong> generates a Translation fault. No translation table walk is performed.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### A1, bit [22]

Selects whether **TTBR0_EL2** or **TTBR1_EL2** defines the ASID. The encoding of this bit is:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><strong>TTBR0_EL2</strong> ASID defines the ASID.</td>
</tr>
<tr>
<td>0b1</td>
<td><strong>TTBR1_EL2</strong> ASID defines the ASID.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### T1SZ, bits [21:16]

The size offset of the memory region addressed by **TTBR1_EL2**. The region size is $2^{(64-\text{T1SZ})}$ bytes.

The maximum and minimum possible values for T1SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

**Note**

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.
On a Warm reset, this field resets to an architecturally \textbf{UNKNOWN} value.

\textbf{TG0, bits [15:14]}

Granule size for the \texttt{TTBR0_EL2}.

\begin{center}
\begin{tabular}{|c|c|}
\hline
\textbf{TG0} & \textbf{Meaning} \\
\hline
0b00 & 4KB. \\
0b01 & 64KB. \\
0b10 & 16KB. \\
\hline
\end{tabular}
\end{center}

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an \texttt{IMPLEMENTATION DEFINED} choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is \texttt{IMPLEMENTATION DEFINED} whether the value read back is the value programmed or the value that corresponds to the size chosen.

On a Warm reset, this field resets to an architecturally \textbf{UNKNOWN} value.

\textbf{SH0, bits [13:12]}

Shareability attribute for memory associated with translation table walks using \texttt{TTBR0_EL2}.

\begin{center}
\begin{tabular}{|c|c|}
\hline
\textbf{SH0} & \textbf{Meaning} \\
\hline
0b00 & Non-shareable. \\
0b10 & Outer Shareable. \\
0b11 & Inner Shareable. \\
\hline
\end{tabular}
\end{center}

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is \texttt{CONSTRAINED UNPREDICTABLE}.

On a Warm reset, this field resets to an architecturally \textbf{UNKNOWN} value.

\textbf{ORGN0, bits [11:10]}

Outer cacheability attribute for memory associated with translation table walks using \texttt{TTBR0_EL2}.

\begin{center}
\begin{tabular}{|c|c|}
\hline
\textbf{ORGN0} & \textbf{Meaning} \\
\hline
0b00 & Normal memory, Outer Non-cacheable. \\
0b01 & Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable. \\
0b10 & Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable. \\
0b11 & Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable. \\
\hline
\end{tabular}
\end{center}

On a Warm reset, this field resets to an architecturally \textbf{UNKNOWN} value.

\textbf{IRGN0, bits [9:8]}

Inner cacheability attribute for memory associated with translation table walks using \texttt{TTBR0_EL2}.

\begin{center}
\begin{tabular}{|c|c|}
\hline
\textbf{IRGN0} & \textbf{Meaning} \\
\hline
0b00 & Normal memory, Inner Non-cacheable. \\
0b01 & Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable. \\
0b10 & Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable. \\
0b11 & Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable. \\
\hline
\end{tabular}
\end{center}

On a Warm reset, this field resets to an architecturally \textbf{UNKNOWN} value.
**EPD0, bit [7]**

Translation table walk disable for translations using TTBR0_EL2. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR0_EL2. The encoding of this bit is:

<table>
<thead>
<tr>
<th>EPD0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Perform translation table walks using TTBR0_EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on an address that is translated using TTBR0_EL2 generates a Translation fault. No translation table walk is performed.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [6]**

Reserved, RES0.

**T0SZ, bits [5:0]**

The size offset of the memory region addressed by TTBR0_EL2. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

**Note**

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the TCR_EL2**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic TCR_EL2 or TCR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

**MRS <Xt>, TCR_EL2**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>

endif
TCR_EL3, Translation Control Register (EL3)

The TCR_EL3 characteristics are:

**Purpose**

The control register for stage 1 of the EL3 translation regime.

**Configuration**

This register is present only when EL3 is implemented. Otherwise, direct accesses to TCR_EL3 are undefined.

**Attributes**

TCR_EL3 is a 64-bit register.

**Field descriptions**

The TCR_EL3 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 |
| RES0 | DS | RES1 | TCMA | TBID | HWU62 | HWU61 | HWU60 | HWU59 | HDHA | TBI | RES0 | PS | TG0 | SH0 | ORGN0 | IRGN0 | RES0 | T0SZ |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 |

Any of the bits in TCR_EL3 are permitted to be cached in a TLB.

**Bits [63:33]**

Reserved, RES0.

**DS, bit [32]**

When FEAT_LPA2 is implemented:

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 1 of the EL3 translation regime.
Meaning

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bits[49:48] of translation descriptors hold output address[49:48]. Bits[9:8] of table translation descriptors hold output address[51:50]. The shareability information of block and page descriptors for cacheable locations is determined by TCR_EL3.SH0. The minimum value of TCR_EL3.T0SZ is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault. All calculations of the stage 1 base address are modified for tables of fewer than 8 entries so that the table is aligned to 64 bytes. Bits[5:2] of TTB0_EL3 are used to hold bits[51:48] of the output address in all cases.</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>Note: As FEAT_LVA must be implemented if TCR_EL3.DS == 1, the minimum value of the TCR_EL3.T0SZ field is 12, as determined by that extension. For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00.</td>
<td></td>
</tr>
</tbody>
</table>

Note

As FEAT_LVA must be implemented if TCR_EL3.DS == 1, the minimum value of the TCR_EL3.T0SZ field is 12, as determined by that extension.

For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00.

This field is RES0 for a 64KB translation granule.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [31]

Reserved, RES1.

TCMA, bit [30]

When FEAT_MTE is implemented:

Controls the generation of Unchecked accesses at EL3 when address [59:56] = 0b0000.

<table>
<thead>
<tr>
<th>TCMA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on the generation of Unchecked accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>All accesses are Unchecked.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**TBID, bit [29]**

When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

<table>
<thead>
<tr>
<th>TBID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TCR_EL3.TBI applies to Instruction and Data accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>TCR_EL3.TBI applies to Data accesses only.</td>
</tr>
</tbody>
</table>

This affects addresses where the address would be translated by tables pointed to by TTBR0_EL3.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**HWU62, bit [28]**

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU62</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**HWU61, bit [27]**

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU61</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**HWU60, bit [26]**

*When FEAT_HPDS2 is implemented:*

Hardware Use. Indicates **IMPLEMENTATION DEFINED** hardware use of bit[60] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU60</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an <strong>IMPLEMENTATION DEFINED</strong> purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an <strong>IMPLEMENTATION DEFINED</strong> purpose if the value of TCR_EL3.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**HWU59, bit [25]**

*When FEAT_HPDS2 is implemented:*

Hardware Use. Indicates **IMPLEMENTATION DEFINED** hardware use of bit[59] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU59</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an <strong>IMPLEMENTATION DEFINED</strong> purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an <strong>IMPLEMENTATION DEFINED</strong> purpose if the value of TCR_EL3.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**HPD, bit [24]**

*When FEAT_HPDS is implemented:*

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0_EL3.
**HPD**

<table>
<thead>
<tr>
<th>Meaning</th>
<th>0b0</th>
<th>Hierarchical permissions are enabled.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0b1</td>
<td>Hierarchical permissions are disabled.</td>
</tr>
</tbody>
</table>

**Note**
In this case, bit[61] \( \text{APTTable}[0] \) and bit[59] \( \text{PXNTable} \) of the next level descriptor attributes are required to be ignored by the PE, and are no longer reserved, allowing them to be used by software.

When disabled, the permissions are treated as if the bits are zero.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**Bit [23]**

Reserved, **RES1**.

**HD, bit [22]**

When **FEAT_HAFDBS** is implemented:

Hardware management of dirty state in stage 1 translations from EL3.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>0b0</th>
<th>Stage 1 hardware management of dirty state disabled.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0b1</td>
<td>Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**HA, bit [21]**

When **FEAT_HAFDBS** is implemented:

Hardware Access flag update in stage 1 translations from EL3.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>0b0</th>
<th>Stage 1 Access flag update disabled.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0b1</td>
<td>Stage 1 Access flag update enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**TBI, bit [20]**

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the **TTBR0_EL3** region, or ignored and used for tagged addresses.
<table>
<thead>
<tr>
<th>TBI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Top Byte used in the address calculation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Top Byte ignored in the address calculation.</td>
</tr>
</tbody>
</table>

This affects addresses generated in EL3 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL3. It has an effect whether the EL3 translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL3.TBID is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI is 1, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL3.
- A exception taken to EL3.
- An exception return to EL3.

For more information, see 'Address tagging in AArch64 state'.

**Note**

This control determines the scope of address tagging. It never causes an exception to be generated.

On a Warm reset, this field resets to an architecturally unknown value.

**Bit [19]**

Reserved, RES0.

**PS, bits [18:16]**

Physical Address Size.

<table>
<thead>
<tr>
<th>PS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>32 bits, 4GB.</td>
</tr>
<tr>
<td>0b001</td>
<td>36 bits, 64GB.</td>
</tr>
<tr>
<td>0b010</td>
<td>40 bits, 1TB.</td>
</tr>
<tr>
<td>0b011</td>
<td>42 bits, 4TB.</td>
</tr>
<tr>
<td>0b100</td>
<td>44 bits, 16TB.</td>
</tr>
<tr>
<td>0b101</td>
<td>48 bits, 256TB.</td>
</tr>
<tr>
<td>0b110</td>
<td>52 bits, 4PB.</td>
</tr>
</tbody>
</table>

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB and FEAT_LPA2 is not implemented, the value 0b110 is treated as reserved.

It is implementation defined whether an implementation that does not implement FEAT_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL3 are 0b0000.

On a Warm reset, this field resets to an architecturally unknown value.

**TG0, bits [15:14]**

Granule size for the TTBR0_EL3.

<table>
<thead>
<tr>
<th>TG0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>4KB.</td>
</tr>
<tr>
<td>0b01</td>
<td>64KB.</td>
</tr>
<tr>
<td>0b10</td>
<td>16KB.</td>
</tr>
</tbody>
</table>
Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SH0, bits [13:12]**

Shareability attribute for memory associated with translation table walks using TTBR0_EL3.

<table>
<thead>
<tr>
<th>SH0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**ORGN0, bits [11:10]**

Outer cacheability attribute for memory associated with translation table walks using TTBR0_EL3.

<table>
<thead>
<tr>
<th>ORGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IRGN0, bits [9:8]**

Inner cacheability attribute for memory associated with translation table walks using TTBR0_EL3.

<table>
<thead>
<tr>
<th>IRGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [7:6]**

Reserved, RES0.

**T0SZ, bits [5:0]**

The size offset of the memory region addressed by TTBR0_EL3. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.
Note

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the TCR_EL3

Accesses to this register use the following encodings:

**TFSR_EL2, Tag Fault Status Register (EL2)**

The TFSR_EL2 characteristics are:

**Purpose**

Holds accumulated Tag Check Faults occurring in EL2 that are not taken precisely.

**Configuration**

This register is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to TFSR_EL2 are UNDEFINED.

**Attributes**

TFSR_EL2 is a 64-bit register.

**Field descriptions**

The TFSR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>62</td>
</tr>
<tr>
<td>-----</td>
<td>-----------------------------</td>
</tr>
<tr>
<td>RES0</td>
<td>RES0</td>
</tr>
</tbody>
</table>

**Bits [63:2]**

Reserved, RES0.

**TF1, bit [1]**

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b1 occurs.

When **HCR_EL2.E2H==0b0**, this field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TF0, bit [0]**

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b0 occurs.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TFSR_EL2**

When **HCR_EL2.E2H==1**, without explicit synchronization, access from EL2 using the mnemonic TFSR_EL2 or TFSR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>

TFSR_EL3, Tag Fault Status Register (EL3)

The TFSR_EL3 characteristics are:

**Purpose**

Holds accumulated Tag Check Faults occurring in EL3 that are not taken precisely.

**Configuration**

This register is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to TFSR_EL3 are **UNDEFINED**.

**Attributes**

TFSR_EL3 is a 64-bit register.

**Field descriptions**

The TFSR_EL3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>62</td>
<td>61</td>
</tr>
<tr>
<td>-----</td>
<td>----------------</td>
<td>-------------</td>
</tr>
<tr>
<td>63</td>
<td>62</td>
<td>61</td>
</tr>
</tbody>
</table>

**Bits [63:1]**

Reserved, RES0.

**TF0, bit [0]**

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b0 occurs.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the TFSR_EL3**

**TLBI ALLE1, TLBI ALLE1NXS, TLB Invalidate All, EL1**

The TLBI ALLE1, TLBI ALLE1NXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If $\text{SCR\_EL3}_\text{NS}$ is 0 and the entry would be required to translate an address using the Secure EL1&0 translation regime.
- If $\text{SCR\_EL3}_\text{NS}$ is 1 and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.

The invalidation applies to entries with any VMID.

The invalidation only applies to the PE that executes this System instruction.

**Note**

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI ALLE1, TLBI ALLE1NXS is a 64-bit System instruction.

**Field descriptions**

This instruction has no applicable fields.

The value in the register specified by $<Xt>$ is ignored.

**Executing the TLBI ALLE1, TLBI ALLE1NXS instruction**

When executing this instruction $Xt$ should be encoded as $0b11111$. If the $Xt$ field is not set to $0b11111$, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the $Xt$ field is set to $0b11111$.

The TLBI ALLE3, TLBI ALLE3NXS characteristics are:

**Purpose**

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be required to translate an address using the EL3 translation regime.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI ALLE3, TLBI ALLE3NXS is a 64-bit System instruction.

**Field descriptions**

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

**Executing the TLBI ALLE3, TLBI ALLE3NXS instruction**

When executing this instruction Xt should be encoded as 0b11111. If the Xt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Xt field is set to 0b11111.

Accesses to this instruction use the following encodings:

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>0b000</td>

TLBI ALLE3IS, TLBI ALLE3ISNXS, TLB Invalidate All, EL3, Inner Shareable

The TLBI ALLE3IS, TLBI ALLE3ISNXS characteristics are:

**Purpose**

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be required to translate an address using the EL3 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI ALLE3IS, TLBI ALLE3ISNXS is a 64-bit System instruction.

**Field descriptions**

This instruction has no applicable fields.

The value in the register specified by \(<Xt>\) is ignored.

**Executing the TLBI ALLE3IS, TLBI ALLE3ISNXS instruction**

When executing this instruction \(Xt\) should be encoded as \(0b11111\). If the \(Xt\) field is not set to \(0b11111\), it is \textit{CONSTRAINED UNPREDICTABLE} whether:

- The instruction is \textit{UNDEFINED}.
- The instruction behaves as if the \(Xt\) field is set to \(0b11111\).

Accesses to this instruction use the following encodings:

\[

TLBI ALLE3OS, TLBI ALLE3OSNXS, TLB Invalidate All, EL3, Outer Shareable

The TLBI ALLE3OS, TLBI ALLE3OSNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be required to translate an address using the EL3 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI ALLE3OS, TLBI ALLE3OSNXS are UNDEFINED.

Attributes

TLBI ALLE3OS, TLBI ALLE3OSNXS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing the TLBI ALLE3OS, TLBI ALLE3OSNXS instruction

When executing this instruction Xt should be encoded as 0b11111. If the Xt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Xt field is set to 0b11111.

Accesses to this instruction use the following encodings:

TLBIALLE3OSNXS{
\,<Xt>\}
TLBI ASIDE1, TLBI ASIDE1NXS, TLB Invalidate by ASID, EL1

The TLBI ASIDE1, TLBI ASIDE1NXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID, and would be required to translate an address using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate an address using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate an address using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI ASIDE1, TLBI ASIDE1NXS is a 64-bit System instruction.

**Field descriptions**

The TLBI ASIDE1, TLBI ASIDE1NXS input value bit assignments are:

<table>
<thead>
<tr>
<th>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</th>

TLBI ASIDE1IS, TLBI ASIDE1ISNXS, TLB Invalidate by ASID, EL1, Inner Shareable

The TLBI ASIDE1IS, TLBI ASIDE1ISNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- When EL2 is implemented and enabled in the Security state described by the current value of `SCR_EL3.NS`:
  - If `HCR_EL2.{E2H, TGE}` is not \{1, 1\}, the entry would be used with the current VMID, and would be required to translate an address using the EL1&0 translation regime.
  - If `HCR_EL2.{E2H, TGE}` is \{1, 1\}, the entry would be required to translate an address using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate an address using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If `FEAT_XS` is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

    TLBI_ASID(SecurityStateAtEL(EL1), Regime_EL10, VMID[], Shareability_Inner, TLBI_ExcludeXS, X[t]);
end
TLBI ASIDE1OS, TLBI ASIDE1OSNXS, TLB Invalidate by ASID, EL1, Outer Shareable

The TLBI ASIDE1OS, TLBI ASIDE1OSNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate an address using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate an address using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate an address using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI ASIDE1OS, TLBI ASIDE1OSNXS are UNDEFINED.

**Attributes**

TLBI ASIDE1OS, TLBI ASIDE1OSNXS is a 64-bit System instruction.

**Field descriptions**

The TLBI ASIDE1OS, TLBI ASIDE1OSNXS input value bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|

| ASID |     |
| RES0 |     |

Page 1626
ASID, bits [63:48]

ASID value to match. Any appropriate TLB entries that match the ASID values will be affected by this System instruction.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Bits [47:0]

Reserved, RES0.

The TLBI IPAS2E1, TLBI IPAS2E1NXS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI IPAS2E1, TLBI IPAS2E1NXS is a 64-bit System instruction.

**NS, bit [63]**

When FEAT_SEL2 is implemented:

Not Secure. Specifies the IPA space.
### NS

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IPA is in the Secure IPA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>IPA is in the Non-secure IPA space.</td>
</tr>
</tbody>
</table>

When the instruction is executed in Non-secure state, this field is **RES0**, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented or is disabled in the current Security state, this field is **RES0**.

**Otherwise:**

Reserved, **RES0**.

**Bits [62:48]**

Reserved, **RES0**.

**TTL, bits [47:44]**

**When FEAT_TTL is implemented:**

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is <strong>RES0</strong>.</td>
</tr>
</tbody>
</table>
| 0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as:

  - 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00.
  - 0b01 : Level 1.
  - 0b10 : Level 2.
  - 0b11 : Level 3. |
| 0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as:

  - 0b00 : Reserved. Treat as if TTL<3:2> is 0b00.
  - 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00.
  - 0b10 : Level 2.
  - 0b11 : Level 3. |
| 0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as:

  - 0b00 : Reserved. Treat as if TTL<3:2> is 0b00.
  - 0b01 : Level 1.
  - 0b10 : Level 2.
  - 0b11 : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, **RES0**.

**Bits [43:40]**

Reserved, **RES0**.
IPA[51:48], bits [39:36]

When FEAT_LPA is implemented:

Extension to IPA[47:12]. See IPA[47:12] for more details.

Otherwise:

Reserved, RES0.

IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When FEAT_LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

    end
else
    TLBI_IPAS2(SecurityStateAtEL(EL1), Regime_EL10, VMID[], Shareability_None, TLBI_Level_Any, TLBI_ExcludeXS, X[t]);
The TLBI IPAS2E1IS, TLBI IPAS2E1ISNXS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see ‘Invalidation of TLB entries from stage 2 translations’.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI IPAS2E1IS, TLBI IPAS2E1ISNXS is a 64-bit System instruction.

**Field descriptions**

The TLBI IPAS2E1IS, TLBI IPAS2E1ISNXS input value bit assignments are:
NS, bit [63]

When FEAT_SEL2 is implemented:

Not Secure. Specifies the IPA space.

<table>
<thead>
<tr>
<th>NS</th>

              TLBIExcludeXS, X[t]);
The TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see ‘Invalidation of TLB entries from stage 2 translations’.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS are UNDEFINED.

**Attributes**

TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS is a 64-bit System instruction.

**Field descriptions**

The TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS input value bit assignments are:

</tbody>
</table>

**NS, bit [63]**
When FEAT_SEL2 is implemented:

Not Secure. Specifies the IPA space.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IPA is in the Secure IPA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>IPA is in the Non-secure IPA space.</td>
</tr>
</tbody>
</table>

When the instruction is executed in Non-secure state, this field is res0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented or is disabled in the current Security state, this field is res0.

Otherwise:

Reserved, res0.

Bits [62:48]

Reserved, res0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is res0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, res0.

Bits [43:40]

Reserved, res0.
IPA[51:48], bits [39:36]

Extension to IPA[47:12]. See IPA[47:12] for more details.

IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When FEAT_LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

Executing the TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS instruction

TLBI IPAS2LE1IS, TLBI IPAS2LE1ISNXS, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Inner Shareable

The TLBI IPAS2LE1IS, TLBI IPAS2LE1ISNXS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- One of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see ‘Invalidation of TLB entries from stage 2 translations’.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

</tbody>
</table>

**NS, bit [63]**

Page 1649
When FEAT_SEL2 is implemented:

Not Secure. Specifies the IPA space.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IPA is in the Secure IPA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>IPA is in the Non-secure IPA space.</td>
</tr>
</tbody>
</table>

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented or is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:40]

Reserved, RES0.
IPA[51:48], bits [39:36]

Extension to IPA[47:12]. See IPA[47:12] for more details.

IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When FEAT_LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

Executing the TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS instruction

Accesses to this instruction use the following encodings:

TLBI IPAS2LE10S{, <Xt>}

if !IsFeatureImplemented(FEAT_XS) then UNDEFINED;
elseif PSTATE.EL == EL0 then UNDEFINED;
elseif PSTATE.EL == EL1 then
  if EL2Enabled() && HCR_EL2.NV == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    UNDEFINED;
elseif PSTATE.EL == EL2 then
  TLBI_IPAS2(SecurityStateAtEL(EL1), Regime_EL10, VMID[], Shareability_Outer, TLBILevel_Last, TLBI_ExcludeXS, X[t]);
elseif PSTATE.EL == EL3 then
  if !EL2Enabled() then
    //no operation
  else
    TLBI_IPAS2(SecurityStateAtEL(EL1), Regime_EL10, VMID[], Shareability_Outer, TLBILevel_Last, TLBI_ExcludeXS, X[t]);
The TLBI RIPAS2E1, TLBI RIPAS2E1NXS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula \([\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{(5 \times \text{SCALE} + 1)} \times \text{Translation_Granule_Size})]\).

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 00000000000.

- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.

- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 000000000000.

For more information about the architectural requirements for this System instruction, see ‘Invalidation of TLB entries from stage 2 translations’.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RIPAS2E1, TLBI RIPAS2E1NXS are undefined.

Attributes

TLBI RIPAS2E1, TLBI RIPAS2E1NXS is a 64-bit System instruction.

Field descriptions

The TLBI RIPAS2E1, TLBI RIPAS2E1NXS input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

| NS | RES0 | TG | SCALE | NUM | TTL | BaseADDR |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

NS, bit [63]

When FEAT_SEL2 is implemented:

Not Secure. Specifies the IPA space.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IPA is in the Secure IPA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>IPA is in the Non-secure IPA space.</td>
</tr>
</tbody>
</table>

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented or is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.
NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation</td>
</tr>
<tr>
<td></td>
<td>table entries.</td>
</tr>
<tr>
<td>0b01</td>
<td>All entries to invalidate are Level 1 translation table entries.</td>
</tr>
<tr>
<td></td>
<td>If FEAT_LPA2 is not implemented, when using a 16KB translation</td>
</tr>
<tr>
<td></td>
<td>granule, this value is reserved and hardware should treat this</td>
</tr>
<tr>
<td></td>
<td>field as 0b00.</td>
</tr>
<tr>
<td>0b10</td>
<td>All entries to invalidate are Level 2 translation table entries.</td>
</tr>
<tr>
<td>0b11</td>
<td>All entries to invalidate are Level 3 translation table entries.</td>
</tr>
</tbody>
</table>

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RIPAS2E1, TLBI RIPAS2E1NXS instruction

    // no operation
  else
    TLBI_RIPAS2(SecurityStateAtEL(EL1), Regime_EL10, VMID[], Shareability_None, TLBILevel_ANY, TLBI_ExcludeXS, X[t]);
The TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula \( \text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{(5 \times \text{SCALE} + 1)} \times \text{Translation_Granule_Size}) \).

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 00000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS are UNDEFINED.

Attributes

TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS is a 64-bit System instruction.

The TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula \([\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1)\times2^{(5\times\text{SCALE} + 1)} \times \text{Translation_Granule_Size})]\).

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.

- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 000000000.

- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS are **UNDEFINED**.

Attributes

TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS is a 64-bit System instruction.

Field descriptions

The TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Bit Assignment</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>NS</td>
<td>Not Secure. Specifies the IPA space.</td>
</tr>
<tr>

<td>Reserved, RES0.</td>
</tr>
<tr>
<td>57</td>
<td>BaseADDR</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

**NS, bit [63]**

When FEAT_SEL2 is implemented:

Not Secure. Specifies the IPA space.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IPA is in the Secure IPA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>IPA is in the Non-secure IPA space.</td>
</tr>
</tbody>
</table>

When the instruction is executed in Non-secure state, this field is **RES0**, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented or is disabled in the current Security state, this field is **RES0**.

Otherwise:

Reserved, **RES0**.

**Bits [62:48]**

Reserved, **RES0**.

**TG, bits [47:46]**

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

**SCALE, bits [45:44]**

The exponent element of the calculation that is used to produce the upper range.
NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation</td>
</tr>
<tr>
<td></td>
<td>table entries.</td>
</tr>
<tr>
<td>0b01</td>
<td>All entries to invalidate are Level 1 translation table entries.</td>
</tr>
<tr>
<td></td>
<td>If FEAT_LPA2 is not implemented, when using a 16KB translation</td>
</tr>
<tr>
<td></td>
<td>granule, this value is reserved and hardware should treat this field</td>
</tr>
<tr>
<td></td>
<td>as 0b00.</td>
</tr>
<tr>
<td>0b10</td>
<td>All entries to invalidate are Level 2 translation table entries.</td>
</tr>
<tr>
<td>0b11</td>
<td>All entries to invalidate are Level 3 translation table entries.</td>
</tr>
</tbody>
</table>

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

The TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- One of the following applies:
  - \( \text{SCR}_{\text{EL3}} \).NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - \( \text{SCR}_{\text{EL3}} \).NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula \([\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \star 2^{(5 \star \text{SCALE} + 1)} \star \text{Translation_Granule_Size})]\).

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 00000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 00000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT-xs is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

The TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- One of the following applies:
  - SCR_EL3_NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3_NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula \[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{5 \times \text{SCALE} + 1}) \times \text{Translation_Granule_Size}\].

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS are **undefined**.

**Attributes**

TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS is a 64-bit System instruction.

TLBI RVAAE1, TLBI RVAAE1NXS, TLB Range Invalidate by VA, All ASID, EL1

The TLBI RVAAE1, TLBI RVAAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3:NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \([\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{5\times\text{SCALE} + 1}) \times \text{Translation_Granule Size})\).

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

The TLBI RVAAE1IS, TLBI RVAAE1ISNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of $\text{SCR_EL3}$.NS:
  - If $\text{HCR_EL2}$.{E2H, TGE} is not $\{1, 1\}$, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If $\text{HCR_EL2}$.{E2H, TGE} is $\{1, 1\}$, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula $[(\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1)\times 2^{(5\times \text{SCALE} + 1)} \times \text{Translation_Granule_Size})]$.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if $\text{SCR_EL3}.EEL2==1$, then:

- A PE with $\text{SCR_EL3}.EEL2==1$ is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with $\text{SCR_EL3}.EEL2==0$.
- A PE with $\text{SCR_EL3}.EEL2==0$ is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with $\text{SCR_EL3}.EEL2==1$.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

**Note**

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

The range of addresses invalidated is *UNPREDICTABLE* when:

- For the 4K translation granule:
  - If $\text{TTL}==01$ and $\text{BaseADDR}[29:12]$ is not equal to $000000000000000000$.  
  - If $\text{TTL}==10$ and $\text{BaseADDR}[20:12]$ is not equal to $000000000$.  
- For the 16K translation granule:
  - If $\text{TTL}==10$ and $\text{BaseADDR}[24:14]$ is not equal to $00000000000$.  
- For the 64K translation granule:
  - If $\text{TTL}==01$ and $\text{BaseADDR}[41:16]$ is not equal to $00000000000000000000$.  

Page 1681
If `TTL==10` and `BaseADDR[28:16]` is not equal to `0000000000000000`.

If `FEAT_XS` is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

### Configuration

This instruction is present only when `FEAT_TLBIRANGE` is implemented. Otherwise, direct accesses to TLBI RVAAE11IS, TLBI RVAAE11ISNXS are **UNDEFINED**.

### Attributes

TLBI RVAAE11IS, TLBI RVAAE11ISNXS is a 64-bit System instruction.

### Field descriptions

The TLBI RVAAE11IS, TLBI RVAAE11ISNXS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>62-61</td>
<td>TG</td>
</tr>
<tr>
<td>59-58</td>
<td>Translation granule size.</td>
</tr>
<tr>
<td>54</td>
<td>SCALE</td>
</tr>
<tr>
<td>50</td>
<td>NUM</td>
</tr>
<tr>
<td>49</td>
<td>TTL</td>
</tr>
<tr>
<td>0</td>
<td>BaseADDR</td>
</tr>
</tbody>
</table>

#### Bits [63:48]

Reserved, RES0.

#### TG, bits [47:46]

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

#### SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

#### NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

#### TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.
### TTL

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation table entries.</td>
</tr>
<tr>
<td>0b01</td>
<td>All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.</td>
</tr>
<tr>
<td>0b10</td>
<td>All entries to invalidate are Level 2 translation table entries.</td>
</tr>
<tr>
<td>0b11</td>
<td>All entries to invalidate are Level 3 translation table entries.</td>
</tr>
</tbody>
</table>

#### BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

- When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.
- When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

- When using a 4KB translation granule, this field is BaseADDR[48:12].
- When using a 16KB translation granule, this field is BaseADDR[50:14].
- When using a 64KB translation granule, this field is BaseADDR[52:16].

end
The TLBI RVAAE1OS, TLBI RVAAE1OSNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \([\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1)\times 2^5\times \text{SCALE} + 1) \times \text{Translation_Granule_Size}]\).

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

**Note**

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIO is implemented. Otherwise, direct accesses to TLBI RVAAE1OS, TLBI RVAAE1OSNXS are UNDEFINED.

Attributes

TLBI RVAAE1OS, TLBI RVAAE1OSNXS is a 64-bit System instruction.

### BaseADDR, bits [36:0]

**When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:**

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

**Otherwise:**

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

            endif
        endif
    endif
endif
The TLBI RVAALE1, TLBI RVAALE1NXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*2^[5*SCALE +1] * Translation_Granule_Size)].

The invalidation applies to the PE that executes this System instruction.

**Note**

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 00000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAALE1, TLBI RVAALE1NXS are **UNDEFINED**.
Attributes

TLBI RVAALE1, TLBI RVAALE1NXS is a 64-bit System instruction.

Field descriptions

The TLBI RVAALE1, TLBI RVAALE1NXS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>

<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>62</td>
<td>TG, Translation granule size.</td>
</tr>
<tr>
<td>61</td>
<td>SCALE, The exponent element of the calculation that is used to produce the upper range.</td>
</tr>
<tr>
<td>60</td>
<td>NUM, The base element of the calculation that is used to produce the upper range.</td>
</tr>
<tr>
<td>59</td>
<td>TTL, TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.</td>
</tr>
<tr>
<td>58</td>
<td>BaseADDR, The starting address for the range of the maintenance instructions.</td>
</tr>
</tbody>
</table>

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation table entries.</td>
</tr>
<tr>
<td>0b01</td>
<td>All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.</td>
</tr>
<tr>
<td>0b10</td>
<td>All entries to invalidate are Level 2 translation table entries.</td>
</tr>
<tr>
<td>0b11</td>
<td>All entries to invalidate are Level 3 translation table entries.</td>
</tr>
</tbody>
</table>

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.
When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

            TLBI_ExcludeXS, X[t]);
The TLBI RVAELE1IS, TLBI RVAELE1ISNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \([\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} +1)\times2^{(5\times\text{SCALE}+1)} \times \text{Translation_Granule_Size})]\).

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

**Note**

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.
- For the 64K translation granule:
If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.

If TTL==10 and BaseADDR[28:16] is not equal to 000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

TLBI_RVAALE1ISNXS{, <Xt>}

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>0b0000</td>
<td>0b1001</td>
<td>0b0010</td>
<td>0b111</td>
</tr>
</tbody>
</table>
The TLBI RVALE1OS, TLBI RVALE1OSNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.

- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.

- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

- The entry is within the address range determined by the formula \([\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{(5\times\text{SCALE} + 1)} \times \text{Translation_Granule_Size})]\). The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

**Note**

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 0000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.

- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.

- For the 64K translation granule:
If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.

If TTL==10 and BaseADDR[28:16] is not equal to 000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

### Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVAALE1OS, TLBI RVAALE1OSNXS are UNDEFINED.

### Attributes

TLBI RVAALE1OS, TLBI RVAALE1OSNXS is a 64-bit System instruction.

### Field descriptions

The TLBI RVAALE1OS, TLBI RVAALE1OSNXS input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | TG | SCALE | NUM | TTL | BaseADDR |

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:48]**

Reserved, RES0.

**TG, bits [47:46]**

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

**SCALE, bits [45:44]**

The exponent element of the calculation that is used to produce the upper range.

**NUM, bits [43:39]**

The base element of the calculation that is used to produce the upper range.

**TTL, bits [38:37]**

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.
### TLB TTL

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation table entries.</td>
</tr>
<tr>
<td>0b01</td>
<td>All entries to invalidate are Level 1 translation table entries.</td>
</tr>
<tr>
<td></td>
<td>If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.</td>
</tr>
<tr>
<td>0b10</td>
<td>All entries to invalidate are Level 2 translation table entries.</td>
</tr>
<tr>
<td>0b11</td>
<td>All entries to invalidate are Level 3 translation table entries.</td>
</tr>
</tbody>
</table>

### BaseADDR, bits [36:0]

**When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:**

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

- When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.
- When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

**Otherwise:**

The starting address for the range of the maintenance instruction.

- When using a 4KB translation granule, this field is BaseADDR[48:12].
- When using a 16KB translation granule, this field is BaseADDR[50:14].
- When using a 64KB translation granule, this field is BaseADDR[52:16].

TLBI RVAE1, TLBI RVAE1NXS, TLB Range Invalidate by VA, EL1

The TLBI RVAE1, TLBI RVAE1NXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of `SCR_EL3.NS`:
  - If `HCR_EL2.{E2H, TGE}` is not `{1, 1}`, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If `HCR_EL2.{E2H, TGE}` is `{1, 1}`, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \([\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{(5 \times \text{SCALE} + 1)} \times \text{Translation_Granule_Size})]\).

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 000000000000.

**Configuration**

This instruction is present only when `FEAT_TLBIRANGE` is implemented. Otherwise, direct accesses to TLBI RVAE1, TLBI RVAE1NXS are **UNDEFINED**.

**Attributes**

TLBI RVAE1, TLBI RVAE1NXS is a 64-bit System instruction.
Field descriptions

The TLBI RVAE1, TLBI RVAE1NXS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit Positions</th>
<th>ASID</th>
<th>TG</th>
<th>SCALE</th>
<th>NUM</th>
<th>TTL</th>
<th>BaseADDR</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-48</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>31-0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation table entries.</td>
</tr>
<tr>
<td>0b01</td>
<td>All entries to invalidate are Level 1 translation table entries.</td>
</tr>
<tr>
<td></td>
<td>If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.</td>
</tr>
<tr>
<td>0b10</td>
<td>All entries to invalidate are Level 2 translation table entries.</td>
</tr>
<tr>
<td>0b11</td>
<td>All entries to invalidate are Level 3 translation table entries.</td>
</tr>
</tbody>
</table>

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.
When using a 4KB translation granule, BaseADDR[15:12] is treated as \texttt{0b0000}.

When using a 16KB translation granule, BaseADDR[15:14] is treated as \texttt{0b00}.

\textbf{Otherwise:}

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

\textbf{Executing the TLBI RVAE1, TLBI RVAE1NXS instruction}

TLBI RVAE1IS, TLBI RVAE1ISNXS, TLB Range Invalidate by VA, EL1, Inner Shareable

The TLBI RVAE1IS, TLBI RVAE1ISNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3 NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula\[BaseADDR <= VA < BaseADDR + ((NUM +1)*2^{5 SCALE} +1) * Translation_Granule_Size).\]

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
TLBI RVAE1IS, TLBI RVAE1ISNXS, TLB Range Invalidate by VA, EL1, Inner Shareable

- If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000.
- If TTL==10 and BaseADDR[28:16] is not equal to 000000000000.

**Configuration**

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE1IS, TLBI RVAE1ISNXS are UNDEFINED.

**Attributes**

TLBI RVAE1IS, TLBI RVAE1ISNXS is a 64-bit System instruction.

<td></td>
<td></td>
</tr>
</tbody>
</table>

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

**TG, bits [47:46]**

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

**SCALE, bits [45:44]**

The exponent element of the calculation that is used to produce the upper range.

**NUM, bits [43:39]**

The base element of the calculation that is used to produce the upper range.

**TTL, bits [38:37]**

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.
<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation</td>
</tr>
<tr>
<td></td>
<td>table entries.</td>
</tr>
<tr>
<td>0b01</td>
<td>All entries to invalidate are Level 1 translation table entries.</td>
</tr>
<tr>
<td></td>
<td>If FEAT_LPA2 is not implemented, when using a 16KB translation</td>
</tr>
<tr>
<td></td>
<td>granule, this value is reserved and hardware should treat this</td>
</tr>
<tr>
<td></td>
<td>field as 0b00.</td>
</tr>
<tr>
<td>0b10</td>
<td>All entries to invalidate are Level 2 translation table entries.</td>
</tr>
<tr>
<td>0b11</td>
<td>All entries to invalidate are Level 3 translation table entries.</td>
</tr>
</tbody>
</table>

**BaseADDR, bits [36:0]**

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

**Executing the TLBI RVAE1IS, TLBI RVAE1ISNXS instruction**

Accesses to this instruction use the following encodings:

TLBI RVAE1IS{, <Xt>}

The TLBI RVAE1OS, TLBI RVAE1OSNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.E2H, TGE is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.E2H, TGE is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1)2^{(5 \times \text{SCALE} + 1)} \times \text{Translation	extunderscore Granule	extunderscore Size})\].

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVAE1OS, TLBI RVAE1OSNXS are **UNDEFINED**.

Attributes

TLBI RVAE1OS, TLBI RVAE1OSNXS is a 64-bit System instruction.

</tbody>
</table>

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.
<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>

</tr>
</tbody>
</table>

**BaseADDR, bits [36:0]**

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

- When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.
- When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

- When using a 4KB translation granule, this field is BaseADDR[48:12].
- When using a 16KB translation granule, this field is BaseADDR[50:14].
- When using a 64KB translation granule, this field is BaseADDR[52:16].

  end
end
The TLBI RVAE2, TLBI RVAE2NXS characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula
  \[ \text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{(5\times\text{SCALE} + 1)} \times \text{Translation Granule Size}) \], using the EL2 or EL2&0 translation regime.
- If \( \text{HCR\_EL2}.E2H = 0 \), the entry is from any level of the translation table walk.
- If \( \text{HCR\_EL2}.E2H = 1 \), one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk and matches the specified ASID.

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.

- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.

- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE2, TLBI RVAE2NXS are **UNDEFINED**.
Attributes

TLBI RVAE2, TLBI RVAE2NXS is a 64-bit System instruction.

</tr>
</tbody>
</table>

### BaseADDR, bits [36:0]

**When FEAT_LPA2 is implemented and TCR_EL2.DS == 1:**

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

**Otherwise:**

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

The TLBI RVAE2IS, TLBI RVAE2ISNXS characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula $[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{(5 \times \text{SCALE} + 1)} \times \text{Translation\_Granule\_Size})]$, using the EL2 or EL2&0 translation regime.
- If $HCR\_EL2.E2H == 0$, the entry is from any level of the translation table walk.
- If $HCR\_EL2.E2H == 1$, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk and matches the specified ASID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE2IS, TLBI RVAE2ISNXS are **UNDEFINED**.
Attributes

TLBI RVAE2IS, TLBI RVAE2ISNXS is a 64-bit System instruction.

### BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL2.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.
When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].
When using a 16KB translation granule, this field is BaseADDR[50:14].
When using a 64KB translation granule, this field is BaseADDR[52:16].

else
  TLBI_RVA(SecurityStateAtEL(EL2), Regime_EL2, VMID[], Shareability_Inner, TLBILevel_Any,
  TLBI_ExcludeXS, X[t]);
The TLBI RVAE2OS, TLBI RVAE2OSNXS characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula \[ BaseADDR \leq VA < BaseADDR + ((NUM +1)*2^{(5\times SCALE +1)} \times Translation\_Granule\_Size) \], using the EL2 or EL2&0 translation regime.
- If \texttt{HCR\_EL2} \_E2H == 0, the entry is from any level of the translation table walk.
- If \texttt{HCR\_EL2} \_E2H == 1, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk and matches the specified ASID.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 000000000000.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT\_TLBIRANGE is implemented and FEAT\_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVAE2OS, TLBI RVAE2OSNXS are UNDEFINED.
Attributes

TLBI RVAE2OS, TLBI RVAE2OSNXS is a 64-bit System instruction.

Field descriptions

The TLBI RVAE2OS, TLBI RVAE2OSNXS input value bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASID</td>
<td>[63:48]</td>
<td>Translation Granule Size</td>
</tr>
<tr>
<td>TG</td>
<td>[47:46]</td>
<td>Translation Granule Size</td>
</tr>
<tr>
<td>SCALE</td>
<td>[45:44]</td>
<td>Translation Granule Size</td>
</tr>
<tr>
<td>NUM</td>
<td>[43:39]</td>
<td>Translation Granule Size</td>
</tr>
<tr>
<td>TTL</td>
<td>[38:37]</td>
<td>Translation Granule Size</td>
</tr>
<tr>
<td>BaseADDR</td>
<td></td>
<td>Translation Granule Size</td>
</tr>
</tbody>
</table>

**ASID, bits [63:48]**

When HCR_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

**TG, bits [47:46]**

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

**SCALE, bits [45:44]**

The exponent element of the calculation that is used to produce the upper range.

**NUM, bits [43:39]**

The base element of the calculation that is used to produce the upper range.

**TTL, bits [38:37]**

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.
<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>

TLBI RVAE3IS, TLBI RVAE3ISNXS, TLB Range Invalidate by VA, EL3, Inner Shareable

The TLBI RVAE3IS, TLBI RVAE3ISNXS characteristics are:

**Purpose**

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*2[(5*SCALE +1) * Translation_Granule_Size])].

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is **unpredictable** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 00000000.

- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.

- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE3IS, TLBI RVAE3ISNXS are **undefined**.

**Attributes**

TLBI RVAE3IS, TLBI RVAE3ISNXS is a 64-bit System instruction.

**Field descriptions**

The TLBI RVAE3IS, TLBI RVAE3ISNXS input value bit assignments are:
Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

<table>
<thead>

  TLBI_RVA(SecurityStateAtEL(EL3), Regime_EL3, VMID[], Shareability_Inner, TLBILevel_Any, TLBI_ExcludeXS, X[t]);
The TLBI RVAE3OS, TLBI RVAE3OSNXS characteristics are:

**Purpose**

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.
- The entry is within the address range determined by the formula \(\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{(5 \times \text{SCALE} + 1)} \times \text{Translation Granule Size})\).

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 00000000.

- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000.

- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVAE3OS, TLBI RVAE3OSNXS are **UNDEFINED**.

**Attributes**

TLBI RVAE3OS, TLBI RVAE3OSNXS is a 64-bit System instruction.

**Field descriptions**

The TLBI RVAE3OS, TLBI RVAE3OSNXS input value bit assignments are:
Bits [63:48]

Reserved. RES0.

TG, bits [47:46]

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>

The TLBI RVALE1, TLBI RVALE1NXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.E2H, TGE is not \{1, 1\}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.E2H, TGE is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{(5 \times \text{SCALE} + 1) \times \text{TranslationGranuleSize}})\].

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL=01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL=10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL=10 and BaseADDR[24:14] is not equal to 0000000000.
- For the 64K translation granule:
  - If TTL=01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL=10 and BaseADDR[28:16] is not equal to 0000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

The TLBI RVALE1IS, TLBI RVALE1ISNXS, TLB Range Invalidate by VA, Last level, EL1, Inner Shareable characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \( \{1, 1\} \), the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \( \{1, 1\} \), the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \([\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1)^2(5\times\text{SCALE} + 1) \times \text{Translation_Granule_Size})]\).

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000000000.
If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBRANGE is implemented. Otherwise, direct accesses to TLBI RVALE1IS, TLBI RVALE1ISNXS are **UNDEFINED**.

**Attributes**

TLBI RVALE1IS, TLBI RVALE1ISNXS is a 64-bit System instruction.

**Field descriptions**

The TLBI RVALE1IS, TLBI RVALE1ISNXS input value bit assignments are:

| Bit 63 | Bit 62 | Bit 61 | Bit 60 | Bit 59 | Bit 58 | Bit 57 | Bit 56 | Bit 55 | Bit 54 | Bit 53 | Bit 52 | Bit 51 | Bit 50 | Bit 49 | Bit 48 | Bit 47 | Bit 46 | Bit 45 | Bit 44 | Bit 43 | Bit 42 | Bit 41 | Bit 40 | Bit 39 | Bit 38 | Bit 37 | Bit 36 | Bit 35 | Bit 34 | Bit 33 | Bit 32 |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| ASID   | TG     | SCALE  | NUM    | TTL    | BaseADDR |
| 31     | 30     | 29     | 28     | 27     | 26     | 25     | 24     | 23     | 22     | 21     | 20     | 19     | 18     | 17     | 16     | 15     | 14     | 13     | 12     | 11     | 10     | 9      | 8      | 7      | 6      | 5      | 4      | 3      | 2      | 1      | 0      |

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

**TG, bits [47:46]**

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>

    end if;
end if;
The TLBI RVALE1OS, TLBI RVALE1OSNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of `SCR_EL3.NS`:
  - If `HCR_EL2.{E2H, TGE}` is not `{1, 1}`, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If `HCR_EL2.{E2H, TGE}` is `{1, 1}`, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \[ \text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1)2^{(5\times\text{SCALE} + 1)} \times \text{Translation\_Granule\_Size}) \].

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if `SCR_EL3.EEL2==1`, then:

- A PE with `SCR_EL3.EEL2==1` is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with `SCR_EL3.EEL2==0`.
- A PE with `SCR_EL3.EEL2==0` is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with `SCR_EL3.EEL2==1`.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000.
If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVALE1OS, TLBI RVALE1OSNXS are **UNDEFINED**.

**Attributes**

TLBI RVALE1OS, TLBI RVALE1OSNXS is a 64-bit System instruction.

**Field descriptions**

The TLBI RVALE1OS, TLBI RVALE1OSNXS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>ASID</td>
</tr>
<tr>
<td>62</td>
<td>TG</td>
</tr>
<tr>
<td>61</td>
<td>SCALE</td>
</tr>
<tr>
<td>60</td>
<td>NUM</td>
</tr>
<tr>
<td>59</td>
<td>TTL</td>
</tr>
<tr>
<td>58</td>
<td>BaseADDR</td>
</tr>
</tbody>
</table>

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

**TG, bits [47:46]**

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

**SCALE, bits [45:44]**

The exponent element of the calculation that is used to produce the upper range.

**NUM, bits [43:39]**

The base element of the calculation that is used to produce the upper range.
**TTL, bits [38:37]**

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation table entries.</td>
</tr>
<tr>
<td>0b01</td>
<td>All entries to invalidate are Level 1 translation table entries.</td>
</tr>
<tr>
<td></td>
<td>If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.</td>
</tr>
<tr>
<td>0b10</td>
<td>All entries to invalidate are Level 2 translation table entries.</td>
</tr>
<tr>
<td>0b11</td>
<td>All entries to invalidate are Level 3 translation table entries.</td>
</tr>
</tbody>
</table>

**BaseADDR, bits [36:0]**

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

TLBI RVALE2IS, TLBI RVALE2ISNXS, TLB Range Invalidate by VA, Last level, EL2, Inner Shareable

The TLBI RVALE2IS, TLBI RVALE2ISNXS characteristics are:

### Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula \[ \text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times (5^{\text{SCALE}} + 1) \times \text{Translation_Granule_Size}) \] using the EL2 or EL2&0 translation regime.
- If \( \text{HCR}_{\text{EL2}}.E2H == 0 \), the entry is from the final level of the translation table walk.
- If \( \text{HCR}_{\text{EL2}}.E2H == 1 \), one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 00000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 000000000000.

If \( \text{FEAT}_{\text{XS}} \) is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

### Configuration

This instruction is present only when \( \text{FEAT}_{\text{TBLIRANGE}} \) is implemented. Otherwise, direct accesses to TLBI RVALE2IS, TLBI RVALE2ISNXS are **UNDEFINED**.

### Attributes

TLBI RVALE2IS, TLBI RVALE2ISNXS is a 64-bit System instruction.
Field descriptions

The TLBI RVALE2IS, TLBI RVALE2ISNXS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-62</td>
<td>ASID</td>
</tr>
<tr>
<td>61-60</td>
<td>TG</td>
</tr>
<tr>
<td>59-58</td>
<td>SCALE</td>
</tr>
<tr>
<td>57-48</td>
<td>NUM</td>
</tr>
<tr>
<td>47-37</td>
<td>TTL</td>
</tr>
<tr>
<td>36-32</td>
<td>BaseADDR</td>
</tr>
</tbody>
</table>

ASID, bits [63:48]

When HCR_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation table entries.</td>
</tr>
<tr>
<td>0b01</td>
<td>All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.</td>
</tr>
<tr>
<td>0b10</td>
<td>All entries to invalidate are Level 2 translation table entries.</td>
</tr>
<tr>
<td>0b11</td>
<td>All entries to invalidate are Level 3 translation table entries.</td>
</tr>
</tbody>
</table>
BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL2.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.
When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b0.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].
When using a 16KB translation granule, this field is BaseADDR[50:14].
When using a 64KB translation granule, this field is BaseADDR[52:16].

    end if
end if
The TLBI RVALE2OS, TLBI RVALE2OSNXS characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula
  \[ \text{Base ADDR} \leq \text{VA} < \text{Base ADDR} + ((\text{NUM} + 1) \times 2^{(5 \times \text{SCALE} + 1)} \times \text{Translation Granule Size}) \] using the EL2 or EL2&0 translation regime.
- If `HCR_EL2.E2H == 0`, the entry is from the final level of the translation table walk.
- If `HCR_EL2.E2H == 1`, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 00000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVALE2OS, TLBI RVALE2OSNXS are **UNDEFINED**.

**Attributes**

TLBI RVALE2OS, TLBI RVALE2OSNXS is a 64-bit System instruction.

   UNDEFINED;
elsif PSTATE.EL == EL2 then
   UNDEFINED;
elsif PSTATE.EL == EL3 then
   TLBI_RVA(SecurityStateAtEL(EL3), Regime_EL3, VMID[], Shareability_None, TLBILevel_Last, TLBI_ExcludeXS, X[t]);
The TLBI RVALE3IS, TLBI RVALE3ISNXS characteristics are:

**Purpose**

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.
- The entry is within the address range determined by the formula \[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{(5 \times \text{SCALE} + 1)} \times \text{Translation Granule Size})\].

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 00000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVALE3IS, TLBI RVALE3ISNXS are UNDEFINED.

**Attributes**

TLBI RVALE3IS, TLBI RVALE3ISNXS is a 64-bit System instruction.

**Field descriptions**

The TLBI RVALE3IS, TLBI RVALE3ISNXS input value bit assignments are:
Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>

<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation table entries.</td>
</tr>
<tr>
<td>0b01</td>
<td>All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.</td>
</tr>
<tr>
<td>0b10</td>
<td>All entries to invalidate are Level 2 translation table entries.</td>
</tr>
<tr>
<td>0b11</td>
<td>All entries to invalidate are Level 3 translation table entries.</td>
</tr>
</tbody>
</table>

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL3.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].
When using a 16KB translation granule, this field is BaseADDR[50:14].
When using a 64KB translation granule, this field is BaseADDR[52:16].

TLBI VAAE1, TLBI VAAE1NXS, TLB Invalidate by VA, All ASID, EL1

The TLBI VAAE1, TLBI VAAE1NXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of `SCR_EL3`.NS:
  - If `HCR_EL2.{E2H, TGE}` is not \{1, 1\}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If `HCR_EL2.{E2H, TGE}` is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

**Note**

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If `FEAT_XS` is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VAAE1, TLBI VAAE1NXS is a 64-bit System instruction.

**Field descriptions**

The TLBI VAAE1, TLBI VAAE1NXS input value bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0 | TTL | VA[55:12] |

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|

Bits [63:48]

Reserved, RES0.
**TTL, bits [47:44]**

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAAE1, TLBI VAAE1NXS instruction**

TLBI VAAE1IS, TLBI VAAE1ISNXS, TLB Invalidate by VA, All ASID, EL1, Inner Shareable

The TLBI VAAE1IS, TLBI VAAE1ISNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

**Note**

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VAAE1IS, TLBI VAAE1ISNXS is a 64-bit System instruction.
Field descriptions

The TLBI VAAE1IS, TLBI VAAE1ISNXS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-48</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>47-44</td>
<td>When FEAT_TTL is implemented:</td>

<td>0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
• Where a 16KB translation granule is being used, bits \([1:0]\) of this field are RES0 and ignored when the instruction is executed, because VA\([13:12]\) have no effect on the operation of the instruction.

• Where a 64KB translation granule is being used, bits \([3:0]\) of this field are RES0 and ignored when the instruction is executed, because VA\([15:12]\) have no effect on the operation of the instruction.

TLBI VAAE1OS, TLBI VAAE1OSNXS, TLB Invalidate by VA, All ASID, EL1, Outer Shareable

The TLBI VAAE1OS, TLBI VAAE1OSNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3_NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

**Note**

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI VAAE1OS, TLBI VAAE1OSNXS are **UNDEFINED**.
Attributes

TLBI VAAE1OS, TLBI VAAE1OSNXS is a 64-bit System instruction.

Field descriptions

The TLBI VAAE1OS, TLBI VAAE1OSNXS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>62</td>
<td>RES0</td>
</tr>
<tr>
<td>61</td>
<td>TTL</td>
</tr>
<tr>
<td>60</td>
<td>VA[55:12]</td>
</tr>
</tbody>
</table>

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.
The treatment of the low-order bits of this field depends on the translation granularity size, as follows:

- Where a 4KB translation granularity is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granularity is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granularity is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

      TLBI_ExcludeXS, X[t]);
  endif
endif
TLBI VAALE1, TLBI VAALE1NXS, TLB Invalidate by VA, All ASID, Last level, EL1

The TLBI VAALE1, TLBI VAALE1NXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of `SCR_EL3.NS`:
  - If `HCR_EL2.{E2H, TGE}` is not \{1, 1\}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If `HCR_EL2.{E2H, TGE}` is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

**Note**

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VAALE1, TLBI VAALE1NXS is a 64-bit System instruction.

**Field descriptions**

The TLBI VAALE1, TLBI VAALE1NXS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:62</td>
<td>RES0</td>
</tr>
<tr>
<td>61:51</td>
<td>TTL</td>
</tr>
<tr>
<td>50:42</td>
<td>VA[55:12]</td>
</tr>
<tr>
<td>31:0</td>
<td>VA[55:12]</td>
</tr>
</tbody>
</table>

**Bits [63:48]**

Reserved, RES0.
TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

  endif
The TLBI VAALE1IS, TLBI VAALE1ISNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3_NS:
  - If \( \text{HCR}_\text{EL2}.\{\text{E2H}, \text{TGE}\} \) is not \( \{1, 1\} \), the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If \( \text{HCR}_\text{EL2}.\{\text{E2H}, \text{TGE}\} \) is \( \{1, 1\} \), the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with \( \text{SCR}_\text{EL3}.\text{EEL2}==1 \) is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with \( \text{SCR}_\text{EL3}.\text{EEL2}==0 \).
- A PE with \( \text{SCR}_\text{EL3}.\text{EEL2}==0 \) is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with \( \text{SCR}_\text{EL3}.\text{EEL2}==1 \).
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

**Note**

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VAALE1IS, TLBI VAALE1ISNXS is a 64-bit System instruction.
Field descriptions

The TLBI VAALE1IS, TLBI VAALE1ISNXS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

**TTL, bits [47:44]**

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.

Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

The TLBI VAALE1OS, TLBI VAALE1OSNXS characteristics are:

### Purpose

Invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

### Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

### Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

### Configuration

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI VAALE1OS, TLBI VAALE1OSNXS are UNDEFINED.
Attributes

TLBI VAALE1OS, TLBI VAALE1OSNXS is a 64-bit System instruction.

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
</tbody>
</table>
| 0b01xx  | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as:
| 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00.
| 0b01 : Level 1.
| 0b10 : Level 2.
| 0b11 : Level 3. |
| 0b10xx  | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as:
| 0b00 : Reserved. Treat as if TTL<3:2> is 0b00.
| 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00.
| 0b10 : Level 2.
| 0b11 : Level 3. |
| 0b11xx  | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as:
| 0b00 : Reserved. Treat as if TTL<3:2> is 0b00.
| 0b01 : Level 1.
| 0b10 : Level 2.
| 0b11 : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.
The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

The TLBI VAE1, TLBI VAE1NXS, TLB Invalidate by VA, EL1

The TLBI VAE1, TLBI VAE1NXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VAE1, TLBI VAE1NXS is a 64-bit System instruction.

**Field descriptions**

The TLBI VAE1, TLBI VAE1NXS input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ASID | TTL | VA[55:12] |

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.
Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

**TTL, bits [47:44]**

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAE1, TLBI VAE1NXS instruction**

    TLBI_ExcludeXS, X[t]);
TLBI VAE1IS, TLBI VAE1ISNXS, TLB Invalidate by VA, EL1, Inner Shareable

The TLBI VAE1IS, TLBI VAE1ISNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is res0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, res0.
VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

            TLBI_ExcludeXS, X[t]);
else
    TLBI_VA(SecurityStateAtEL(EL1), Regime_EL10, VMID[], Shareability_Inner, TLBILevel_Any,
        TLBI_ExcludeXS, X[t]);
TLBI VAE1OS, TLBI VAE1OSNXS, TLB Invalidate by VA, EL1, Outer Shareable

The TLBI VAE1OS, TLBI VAE1OSNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI VAE1OS, TLBI VAE1OSNXS are UNDEFINED.
Attributes

TLBI VAE1OS, TLBI VAE1OSNXS is a 64-bit System instruction.

Field descriptions

The TLBI VAE1OS, TLBI VAE1OSNXS input value bit assignments are:

<td>0</td>
</tr>
</tbody>
</table>

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is res0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, res0.
VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAE1OS, TLBI VAE1OSNXS instruction

    endif
TLBI VAE2, TLBI VAE2NXS, TLB Invalidate by VA, EL2

The TLBI VAE2, TLBI VAE2NXS characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be required to translate the specified VA using the EL2 or the EL2&0 translation regime.
- If $HCR_{EL2}.E2H == 0$, the entry is from any level of the translation table walk.
- If $HCR_{EL2}.E2H == 1$, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk and matches the specified ASID.

The invalidation applies to the PE that executes this System instruction.

If $FEAT_{XS}$ is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VAE2, TLBI VAE2NXS is a 64-bit System instruction.

**Field descriptions**

The TLBI VAE2, TLBI VAE2NXS input value bit assignments are:

TLBI VAE2IS, TLBI VAE2ISNXS, TLB Invalidate by VA, EL2, Inner Shareable

The TLBI VAE2IS, TLBI VAE2ISNXS characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be required to translate the specified VA using the EL2 or the EL2&0 translation regime.
- If `HCR_EL2.E2H == 0`, the entry is from any level of the translation table walk.
- If `HCR_EL2.E2H == 1`, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk and matches the specified ASID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If `FEAT_XS` is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

</tbody>
</table>

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.
Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

**TTL, bits [47:44]**

*When FEAT_TTL is implemented:*

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

*Otherwise:*

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAE2IS, TLBI VAE2ISNXS instruction**

TLBI VAE2OS, TLBI VAE2OSNXS, TLB Invalidate by VA, EL2, Outer Shareable

The TLBI VAE2OS, TLBI VAE2OSNXS characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be required to translate the specified VA using the EL2 or the EL2&0 translation regime.
- If `HCR_EL2.E2H == 0`, the entry is from any level of the translation table walk.
- If `HCR_EL2.E2H == 1`, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk and matches the specified ASID.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If `FEAT_XS` is implemented, the nXS variant of this System instruction is defined. Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when `FEAT_TLBIOS` is implemented. Otherwise, direct accesses to TLBI VAE2OS, TLBI VAE2OSNXS are **UNDEFINED**.

**Attributes**

TLBI VAE2OS, TLBI VAE2OSNXS is a 64-bit System instruction.

**Field descriptions**

The TLBI VAE2OS, TLBI VAE2OSNXS input value bit assignments are:

</tbody>
</table>

Page 1820
### ASID, bits [63:48]

When `HCR_EL2.E2H == 1`:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

**Otherwise:**

Reserved, `RES0`.

### TTL, bits [47:44]

When `FEAT_TTL` is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is <code>RES0</code>.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: If <code>FEAT_LPA2</code> is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: If <code>FEAT_LPA2</code> is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, `RES0`.

### VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as `RES0`.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:
Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.

Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.

Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

    endif
endif

The TLBI VAE3, TLBI VAE3NXS characteristics are:

**Purpose**

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VAE3, TLBI VAE3NXS is a 64-bit System instruction.

**Field descriptions**

The TLBI VAE3, TLBI VAE3NXS input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | TTL | VA[55:12] |

**Bits [63:48]**

Reserved, RES0.

**TTL, bits [47:44]**

*When FEAT_TTL is implemented:*

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.
### TTL | Meaning
---|---
0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as:
0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00.
0b01 : Level 1.
0b10 : Level 2.
0b11 : Level 3.
0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as:
0b00 : Reserved. Treat as if TTL<3:2> is 0b00.
0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00.
0b10 : Level 2.
0b11 : Level 3.
0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as:
0b00 : Reserved. Treat as if TTL<3:2> is 0b00.
0b01 : Level 1.
0b10 : Level 2.
0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

### VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

### Executing the TLBI VAE3, TLBI VAE3NXS instruction

Accesses to this instruction use the following encodings:

| RES0|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |
|     | TTL |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |
|     |     | VA[55:12]|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

**Bits [63:48]**

Reserved, RES0.

**TTL, bits [47:44]**

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.
### TTL | Meaning
--- | ---
0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as:
0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00.
0b01 : Level 1.
0b10 : Level 2.
0b11 : Level 3.
0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as:
0b00 : Reserved. Treat as if TTL<3:2> is 0b00.
0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00.
0b10 : Level 2.
0b11 : Level 3.
0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as:
0b00 : Reserved. Treat as if TTL<3:2> is 0b00.
0b01 : Level 1.
0b10 : Level 2.
0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

### VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

### Executing the TLBI VAE3IS, TLBI VAE3ISNXS instruction

Accesses to this instruction use the following encodings:

```
TLBI VAE3IS{, <Xt>}
```

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>0b110</td>
<td>0b1000</td>

<td>0b001</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    TLBI_VA(SecurityStateAtEL(EL3), Regime_EL3, VMID[], Shareability_Inner, TLBILevel_Any,
             TLBI_AllAttr, X[t]);

TLBI VAE3ISNXS{, <Xt>}

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>0b110</td>
<td>0b1001</td>
<td>0b0011</td>
<td>0b001</td>
</tr>
</tbody>
</table>

if !IsFeatureImplemented(FEAT_XS) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    TLBI_VA(SecurityStateAtEL(EL3), Regime_EL3, VMID[], Shareability_Inner, TLBILevel_Any,
             TLBI_ExcludeXS, X[t]);
The TLBI VAE3OS, TLBI VAE3OSNXS characteristics are:

**Purpose**

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI VAE3OS, TLBI VAE3OSNXS are UNDEFINED.

**Attributes**

TLBI VAE3OS, TLBI VAE3OSNXS is a 64-bit System instruction.

**Field descriptions**

The TLBI VAE3OS, TLBI VAE3OSNXS input value bit assignments are:

<p>| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|     |</p>
<table>
<thead>
<tr>
<th>RES0</th>
<th>TTL</th>
<th>VA[55:12]</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>30</td>
<td>29</td>
</tr>
</tbody>
</table>

**Bits [63:48]**

Reserved, RES0.

**TTL, bits [47:44]**

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.
<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

The TLBI VALE1, TLBI VALE1NXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \(\{1, 1\}\), the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \(\{1, 1\}\), the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VALE1, TLBI VALE1NXS is a 64-bit System instruction.

**Field descriptions**

The TLBI VALE1, TLBI VALE1NXS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-32</td>
<td>ASID</td>
</tr>
<tr>
<td>31-0</td>
<td>VA[55:12]</td>
</tr>
<tr>
<td></td>
<td>TTL</td>
</tr>
</tbody>
</table>

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.
Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

**TTL, bits [47:44]**

When **FEAT_TTL** is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If <strong>FEAT_LPA2</strong> is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : If <strong>FEAT_LPA2</strong> is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VALE1, TLBI VALE1NXS instruction**

Accesses to this instruction use the following encodings:
if PSTATE.EL == EL0 then
  UNDEFINED;

    TLBI_ExcludeXS, X[t]);
endif
The TLBI VALE1IS, TLBI VALE1ISNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of `SCR_EL3 NS`:
  - If `HCR_EL2.E2H, TGE` is not (1, 1), the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If `HCR_EL2.E2H, TGE` is (1, 1), the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if `SCR_EL3.EEL2==1`, then:

- A PE with `SCR_EL3.EEL2==1` is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with `SCR_EL3.EEL2==0`.
- A PE with `SCR_EL3.EEL2==0` is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with `SCR_EL3.EEL2==1`.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VALE1IS, TLBI VALE1ISNXS is a 64-bit System instruction.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.
If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

### Executing the TLBI VALE1IS, TLBI VALE1ISNXS instruction

Accesses to this instruction use the following encodings:

**TLBI VALE1IS{,<Xt>}**

<table>
<thead>

  endif;
The TLBI VALE1OS, TLBI VALE1OSNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.E2H, TGE is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.E2H, TGE is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBiOS is implemented. Otherwise, direct accesses to TLBI VALE1OS, TLBI VALE1OSNXS are UNDEFINED.
Attributes

TLBI VALE1OS, TLBI VALE1OSNXS is a 64-bit System instruction.

</table>

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is res0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as:</td>
</tr>
<tr>
<td></td>
<td>0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00.</td>
</tr>
<tr>
<td></td>
<td>0b01 : Level 1.</td>
</tr>
<tr>
<td></td>
<td>0b10 : Level 2.</td>
</tr>
<tr>
<td></td>
<td>0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as:</td>
</tr>
<tr>
<td></td>
<td>0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00.</td>
</tr>
<tr>
<td></td>
<td>0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00.</td>
</tr>
<tr>
<td></td>
<td>0b10 : Level 2.</td>
</tr>
<tr>
<td></td>
<td>0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as:</td>
</tr>
<tr>
<td></td>
<td>0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00.</td>
</tr>
<tr>
<td></td>
<td>0b01 : Level 1.</td>
</tr>
<tr>
<td></td>
<td>0b10 : Level 2.</td>
</tr>
<tr>
<td></td>
<td>0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, res0.
**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granularity size, as follows:

- Where a 4KB translation granularity is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granularity is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granularity is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

  else
    TLBI_VA(SecurityStateAtEL(EL1), Regime_EL10, VMID[], Shareability_Outer, TLBLevel_Last,
    TLBI_ExcludeXS, X[t]);
The TLBI VALE2, TLBI VALE2NXS characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime.
- If HCR_EL2.E2H == 0, the entry is from the final level of the translation table walk.
- If HCR_EL2.E2H == 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VALE2, TLBI VALE2NXS is a 64-bit System instruction.

**Field descriptions**

The TLBI VALE2, TLBI VALE2NXS input value bit assignments are:

**ASID, bits [63:48]**

When HCR_EL2.E2H == 1:

- ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.
- Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.
If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level.</td>
</tr>
<tr>
<td></td>
<td>Hardware must assume that the entry can be from any level.</td>
</tr>
<tr>
<td></td>
<td>In this case, TTL&lt;1:0&gt; is RES0.</td>

<td>The entry comes from a 16KB translation granule. The level of walk</td>
</tr>
<tr>
<td></td>
<td>for the leaf level 0bxx is encoded as:</td>
</tr>
<tr>
<td></td>
<td>0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00.</td>
</tr>
<tr>
<td></td>
<td>0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat</td>
</tr>
<tr>
<td></td>
<td>as if TTL&lt;3:2&gt; is 0b00.</td>
</tr>
<tr>
<td></td>
<td>0b10 : Level 2.</td>
</tr>
<tr>
<td></td>
<td>0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk</td>
</tr>
<tr>
<td></td>
<td>for the leaf level 0bxx is encoded as:</td>
</tr>
<tr>
<td></td>
<td>0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00.</td>
</tr>
<tr>
<td></td>
<td>0b01 : Level 1.</td>
</tr>
<tr>
<td></td>
<td>0b10 : Level 2.</td>
</tr>
<tr>
<td></td>
<td>0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.
Executing the TLBI VALE2, TLBI VALE2NXS instruction

```
TLBI VALE2IS, TLBI VALE2ISNXS, TLB Invalidate by VA, Last level, EL2, Inner Shareable

The TLBI VALE2IS, TLBI VALE2ISNXS characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime.
- If $HCR_{EL2}.E2H == 0$, the entry is from the final level of the translation table walk.
- If $HCR_{EL2}.E2H == 1$, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VALE2IS, TLBI VALE2ISNXS is a 64-bit System instruction.

**Field descriptions**

The TLBI VALE2IS, TLBI VALE2ISNXS input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ASID | TTL | VA[55:12] |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.
If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

**TTL, bits [47:44]**

**When FEAT_TTL is implemented:**

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VALE2IS, TLBI VALE2ISNXS instruction**

Accesses to this instruction use the following encodings:
if PSTATE.EL == EL0 then

               TLBI_ExcludeXS, X[t]);
    end if;
  end if;
endif;
The TLBI VALE2OS, TLBI VALE2OSNXS characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime.
- If \( \text{HCR\_EL2\_E2H} \) == 0, the entry is from the final level of the translation table walk.
- If \( \text{HCR\_EL2\_E2H} \) == 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI VALE2OS, TLBI VALE2OSNXS are UNDEFINED.

**Attributes**

TLBI VALE2OS, TLBI VALE2OSNXS is a 64-bit System instruction.

**Field descriptions**

The TLBI VALE2OS, TLBI VALE2OSNXS input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ASID | TTL | VA[55:12] |

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**ASID, bits [63:48]**

When \( \text{HCR\_EL2\_E2H} \) == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.
Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

**TTL, bits [47:44]**

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is res0.</td>
</tr>
</tbody>
</table>
| 0b01xx  | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as:
|         | 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. |
|         | 0b01 : Level 1.                                                        |
|         | 0b10 : Level 2.                                                       |
|         | 0b11 : Level 3.                                                       |
| 0b10xx  | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as:
|         | 0b00 : Reserved. Treat as if TTL<3:2> is 0b00.                         |
|         | 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. |
|         | 0b10 : Level 2.                                                       |
|         | 0b11 : Level 3.                                                       |
| 0b11xx  | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as:
|         | 0b00 : Reserved. Treat as if TTL<3:2> is 0b00.                         |
|         | 0b01 : Level 1.                                                       |
|         | 0b10 : Level 2.                                                       |
|         | 0b11 : Level 3.                                                       |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.
Executing the TLBI VALE2OS, TLBI VALE2OSNXS instruction

<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VALE3, TLBI VALE3NXS instruction**

Accesses to this instruction use the following encodings:

```
TLBI VALE3{, <Xt>}
```

  TLBI VA(SecurityStateAtEL(EL3), Regime_EL3, VMID[], Shareability_None, TLBILevel_Last,
          TLBI_ExcludeXS, X[t]);
The TLBI VALE3IS, TLBI VALE3ISNXS characteristics are:

**Purpose**

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VALE3IS, TLBI VALE3ISNXS is a 64-bit System instruction.

**Field descriptions**

TLBI VALE3OS, TLBI VALE3OSNXS, TLB Invalidate by VA, Last level, EL3, Outer Shareable

The TLBI VALE3OS, TLBI VALE3OSNXS characteristics are:

**Purpose**

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI VALE3OS, TLBI VALE3OSNXS are UNDEFINED.

**Attributes**

TLBI VALE3OS, TLBI VALE3OSNXS is a 64-bit System instruction.

**Field descriptions**

The TLBI VALE3OS, TLBI VALE3OSNXS input value bit assignments are:

<p>| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32 |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|</p>
<table>
<thead>
<tr>
<th>RES0</th>
<th>TTL</th>
<th>VA[55:12]</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>30</td>
<td>29</td>
</tr>
</tbody>
</table>

**Bits [63:48]**

Reserved, RES0.

**TTL, bits [47:44]**

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.
If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

**VA(55:12), bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VALE3OS, TLBI VALE3OSNXS instruction**

TLBI VMALLE1, TLBI VMALLE1NXS, TLB Invalidate by VMID, All at stage 1, EL1

The TLBI VMALLE1, TLBI VMALLE1NXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3:NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

**Note**

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VMALLE1, TLBI VMALLE1NXS is a 64-bit System instruction.

**Field descriptions**

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

**Executing the TLBI VMALLE1, TLBI VMALLE1NXS instruction**

When executing this instruction Xt should be encoded as 0b11111. If the Xt field is not set to 0b11111, it is constrained unpredictable whether:

- The instruction is Undefined.
The instruction behaves as if the Xt field is set to 0b1111.

Accesses to this instruction use the following encodings:

    end
end
TLBI VMALLE1IS, TLBI VMALLE1ISNXS, TLB Invalidate by VMID, All at stage 1, EL1, Inner Shareable

The TLBI VMALLE1IS, TLBI VMALLE1ISNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \(\{1, 1\}\), the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \(\{1, 1\}\), the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

---

**Note**

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

---

**Note**

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

---

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VMALLE1IS, TLBI VMALLE1ISNXS is a 64-bit System instruction.
Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing the TLBI VMALLE1IS, TLBI VMALLE1ISNXS instruction

When executing this instruction Xt should be encoded as 0b11111. If the Xt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Xt field is set to 0b11111.

Accesses to this instruction use the following encodings:

The TLBI VMALLE1OS, TLBI VMALLE1OSNXS characteristics are:

### Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

### Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

### Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

### Configuration

This instruction is present only when FEAT_TLBIO1OS is implemented. Otherwise, direct accesses to TLBI VMALLE1OS, TLBI VMALLE1OSNXS are UNDEFINED.
Attributes

TLBI VMALLE1OS, TLBI VMALLE1OSNXS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing the TLBI VMALLE1OS, TLBI VMALLE1OSNXS instruction

When executing this instruction Xt should be encoded as 0b11111. If the Xt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Xt field is set to 0b11111.

Accesses to this instruction use the following encodings:

The TLBI VMALLS12E1IS, TLBI VMALLS12E1ISNXS, TLB Invalidate by VMID, All at Stage 1 and 2, EL1, Inner Shareable characteristics are:

### Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If SCR_EL3.NS is 0, then:
  - The entry would be required to translate an address using the Secure EL1&0 translation regime.
  - If FEAT_SEL2 is implemented and enabled, the entry would be used with the current VMID.
- If SCR_EL3.NS is 1, then:
  - The entry would be required to translate an address using the Non-secure EL1&0 translation regime.
  - If Non-secure EL2 is implemented, the entry would be used with the current VMID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

### Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

### Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

### Configuration

There are no configuration notes.

TPIDR_EL0, EL0 Read/Write Software Thread ID Register

The TPIDR_EL0 characteristics are:

**Purpose**

Provides a location where software executing at EL0 can store thread identifying information, for OS management purposes.

The PE makes no use of this register.

**Configuration**

AArch64 System register TPIDR_EL0 bits [31:0] are architecturally mapped to AArch32 System register TPIDRURW[31:0].

**Attributes**

TPIDR_EL0 is a 64-bit register.

**Field descriptions**

The TPIDR_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

Thread ID. Thread identifying information stored by software running at this Exception level.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TPIDR_EL0**

Accesses to this register use the following encodings:

MRS <Xt>, TPIDR_EL0

TPIDR_EL2, EL2 Software Thread ID Register

The TPIDR_EL2 characteristics are:

**Purpose**

Provides a location where software executing at EL2 can store thread identifying information, for OS management purposes.

The PE makes no use of this register.

**Configuration**

AArch64 System register TPIDR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HTPIDR[31:0]

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

TPIDR_EL2 is a 64-bit register.

**Field descriptions**

TRFCR_EL2, Trace Filter Control Register (EL2)

The TRFCR_EL2 characteristics are:

**Purpose**

Provides EL2 controls for Trace.

**Configuration**

AArch64 System register TRFCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HTRFCR[31:0].

This register is present only when FEAT_TRF is implemented. Otherwise, direct accesses to TRFCR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

TRFCR_EL2 is a 64-bit register.

**Field descriptions**

The TRFCR_EL2 bit assignments are:

<table>

TTBR0_EL1, Translation Table Base Register 0 (EL1)

The TTBR0_EL1 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the EL1&0 translation regime, and other information for this translation regime.

Configuration

AArch64 System register TTBR0_EL1 bits [63:0] are architecturally mapped to AArch32 System register TTBR0[63:0].

Attributes

TTBR0_EL1 is a 64-bit register.

Field descriptions

The TTBR0_EL1 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

ASID, bits [63:48]

An ASID for the translation table base address. The TCR_EL1.A1 field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR[47:1], bits [47:1]

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL1.T0SZ, the translation stage, and the translation granule size.

Note

A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of TCR_EL1.IPS is not 0b110, then:

- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are 0b0000.
If FEAT_LPA is implemented and the value of TCR_EL1.IPS is \texttt{0b110}, then:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is \texttt{RES0}.
- When \(x>6\), register bits[(x-1):6] are \texttt{RES0}.

\textbf{Note}

\texttt{TCR_EL1.IPS==0b110} is permitted when:

- FEAT_LPA is implemented and the 64KB translation granule is used.
- FEAT_LPA2 is implemented and the 4KB or 16KB translation granule is used.

When the value of \texttt{ID_AA64MMFR0_EL1.PARange} indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when \texttt{TCR_EL1.IPS} is \texttt{0b110} and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If any register bit[47:1] that is defined as \texttt{RES0} has the value 1 when a translation table walk is done using TTBR0_EL1, then the translation table base address might be misaligned, with effects that are \texttt{CONSTRAINED UNPREDICTABLE}, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{CnP, bit [0]}

\textbf{When FEAT_TTCNP is implemented:}

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL1.CnP is 1.

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| \texttt{0b0} | The translation table entries pointed to by TTBR0_EL1, for the current translation regime and ASID, are permitted to differ from corresponding entries for TTBR0_EL1 for other PEs in the Inner Shareable domain. This is not affected by:  
  - The value of TTBR0_EL1.CnP on those other PEs.  
  - The value of the current ASID.  
  - If EL2 is implemented and enabled in the current Security state, the value of the current VMID. |
| \texttt{0b1} | The translation table entries pointed to by TTBR0_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL1.CnP is 1 and all of the following apply:  
  - The translation table entries are pointed to by TTBR0_EL1.  
  - The translation tables relate to the same translation regime.  
  - The ASID is the same as the current ASID.  
  - If EL2 is implemented and enabled in the current Security state, the value of the current VMID. |

This field is permitted to be cached in a TLB.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

\textbf{Note}

If the value of the TTBR0_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are \texttt{CONSTRAINED}
UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Accessing the TTBR0_EL1**

When HCR\_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic TTBR0\_EL1 or TTBR0\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

    UNDEFINED;
TTBR0_EL2, Translation Table Base Register 0 (EL2)

The TTBR0_EL2 characteristics are:

**Purpose**

When **HCR_EL2.E2H** is 0, holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL2 translation regime, and other information for this translation regime.

When **HCR_EL2.E2H** is 1, holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the EL2&0 translation regime, and other information for this translation regime.

**Configuration**

AArch64 System register TTBR0_EL2 bits [47:1] are architecturally mapped to AArch32 System register **HTTBR[47:1]**.

If EL2 is not implemented, this register is **RES0** from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

TTBR0_EL2 is a 64-bit register.

**Field descriptions**

The TTBR0_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>ASID</th>
<th>BADDR[47:1]</th>
<th>CnP</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASID, bits [63:48]</td>
<td>BADDR[47:1]</td>
<td></td>
</tr>
</tbody>
</table>

**ASID, bits [63:48]**

When **FEAT_VHE** is implemented:

When **HCR_EL2.E2H** is 0, this field is **RES0**.

When **HCR_EL2.E2H** is 1, it holds an ASID for the translation table base address. The **TCR_EL2.A1** field selects either TTBR0_EL2.ASID or TTBR1_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are **RES0**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**BADDR[47:1], bits [47:1]**

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.
Address bit \( x \) is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of \( x \) is 6. The AArch64 Virtual Memory System Architecture chapter describes how \( x \) is calculated based on the value of \( \text{TCR_EL2}.T0SZ \), the translation stage, and the translation granule size.

### Note

A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of \( \text{TCR_EL2}.\{I\}PS \) is not \( 0b110 \), then:

- Register bits\([x-1]:1\] are \( \text{RES0} \).
- If the implementation supports 52-bit PAs and IPAs, then bits \( A[51:48] \) of the stage 1 translation table base address are \( 0b0000 \).

If FEAT_LPA is implemented and the value of \( \text{TCR_EL2}.\{I\}PS \) is \( 0b110 \), then:

- Bits \( A[51:48] \) of the stage 1 translation table base address bits are in register bits\([5:2]\).
- Register bit\([1]\) is \( \text{RES0} \).
- When \( x>6 \), register bits\([x-1]:6\] are \( \text{RES0} \).

### Note

The OA size specified by \( \text{TCR_EL2}.\{I\}PS \) is determined as follows:

- The value of \( \text{TCR_EL2}.PS \) when the value of \( \text{HCR_EL2}.E2H \) is 0.
- The value of \( \text{TCR_EL2}.IPS \) when the value of \( \text{HCR_EL2}.E2H \) is 1.

\( \text{TCR_EL2}.\{I\}PS==0b110 \) is permitted when:

- FEAT_LPA is implemented and the 64KB translation granule is used.
- FEAT_LPA2 is implemented and the 4KB or 16KB translation granule is used.

When the value of \( \text{ID_AA64MMFR0_EL1}.\text{PARange} \) indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when \( \text{TCR_EL2}.\{I\}PS \) is \( 0b110 \) and the value of register bits\([5:2]\) is nonzero, an Address size fault is generated.

If any register \( [47:1] \) that is defined as \( \text{RES0} \) has the value 1 when a translation table walk is done using TTBR0_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits \( A[(x-1):0] \) of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL2.CnP is 1.
The translation table entries pointed to by TTBR0_EL2 for the current translation regime, and ASID if applicable, are permitted to differ from corresponding entries for TTBR0_EL2 for other PEs in the Inner Shareable domain. This is not affected by:

- The value of TTBR0_EL2.CnP on those other PEs.
- When the current translation regime is the EL2&0 regime, the value of the current ASID.

The translation table entries pointed to by TTBR0_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL2.CnP is 1 and all of the following apply:

- The translation table entries are pointed to by TTBR0_EL2.
- The translation tables relate to the same translation regime.
- If that translation regime is the EL2&0 regime, the ASID is the same as the current ASID.

This field is permitted to be cached in a TLB.

**Note**

If the value of the TTBR0_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are **CONSTRAINED UNPREDICTABLE**, see ‘CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values’.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Accessing the TTBR0_EL2**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic TTBR0_EL2 or TTBR0_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, TTBR0_EL2

TTBR0_EL3, Translation Table Base Register 0 (EL3)

The TTBR0_EL3 characteristics are:

**Purpose**

Holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL3 translation regime, and other information for this translation regime.

**Configuration**

This register is present only when EL3 is implemented. Otherwise, direct accesses to TTBR0_EL3 are UNDEFINED.

**Attributes**

TTBR0_EL3 is a 64-bit register.

**Field descriptions**

The TTBR0_EL3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
</tr>
<tr>
<td>62</td>
<td>BADDR[47:1]</td>
</tr>
<tr>
<td>31</td>
<td>CnP</td>
</tr>
</tbody>
</table>

**Bits [63:48]**

Reserved, RES0.

**BADDR[47:1], bits [47:1]**

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL3.T0SZ, the translation stage, and the translation granule size.

**Note**

A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of TCR_EL3.PS is not 0b110, then:

- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are 0b0000.

If FEAT_LPA is implemented and the value of TCR_EL3.PS is 0b110, then:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.
- When x>6, register bits[(x-1):6] are RES0.
Note

TCR_EL3.PS==0b110 is permitted when:

• FEAT_LPA is implemented and the 64KB translation granule is used.
• FEAT_LPA2 is implemented and the 4KB or 16KB translation granule is used.

When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when TCR_EL3.PS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR0_EL3, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

• Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
• The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:
Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL3 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL3.CnP is 1.

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The translation table entries pointed to by TTBR0_EL3, for the current translation regime, are permitted to differ from corresponding entries for TTBR0_EL3 for other PEs in the Inner Shareable domain. This is not affected by the value of TTBR0_EL3.CnP on those other PEs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The translation table entries pointed to by TTBR0_EL3 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL3.CnP is 1 and the translation table entries are pointed to by TTBR0_EL3.</td>
</tr>
</tbody>
</table>

This field is permitted to be cached in a TLB.

Note

If the value of the TTBR0_EL3.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL3s do not point to the same translation table entries the results of translations using TTBR0_EL3 are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

esif PSTATE.EL == EL3 then
  TTBR0_EL3 = X[t];
The TTBR1_EL1 characteristics are:

**Purpose**

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the EL1&0 stage 1 translation regime, and other information for this translation regime.

**Configuration**

AArch64 System register TTBR1_EL1 bits [63:0] are architecturally mapped to AArch32 System register TTBR1[63:0].

**Attributes**

TTBR1_EL1 is a 64-bit register.

**Field descriptions**

The TTBR1_EL1 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

**ASID, bits [63:48]**

An ASID for the translation table base address. The TCR_EL1.A1 field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**BADDR[47:1], bits [47:1]**

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL1.TSZ, the translation stage, and the translation granule size.

**Note**

A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of TCR_EL1.IPS is not 0b110, then:

- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are 0b0000.
If Feat_Lpa is implemented and the value of TCR_EL1.IPS is 0b110, then:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.
- When x>6, register bits[(x-1):6] are RES0.

**Note**

TCR_EL1.IPS==0b110 is permitted when:

- Feat_Lpa is implemented and the 64KB translation granule is used.
- Feat_Lpa2 is implemented and the 4KB or 16KB translation granule is used.

When the value of ID_AA64MMFR0_EL1_PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when TCR_EL1.IPS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR1_EL1, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CnP, bit [0]**

*When Feat_TTCNP is implemented:*

Common not Private. This bit indicates whether each entry that is pointed to by TTBR1_EL1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1_EL1.CnP is 1.

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0   | The translation table entries pointed to by TTBR1_EL1, for the current translation regime and ASID, are permitted to differ from corresponding entries for TTBR1_EL1 for other PEs in the Inner Shareable domain. This is not affected by:  
- The value of TTBR1_EL1.CnP on those other PEs.  
- The value of the current ASID.  
- If EL2 is implemented and enabled in the current Security state, the value of the current VMID. |
| 0b1   | The translation table entries pointed to by TTBR1_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1_EL1.CnP is 1 and all of the following apply:  
- The translation table entries are pointed to by TTBR1_EL1.  
- The translation tables relate to the same translation regime.  
- The ASID is the same as the current ASID.  
- If EL2 is implemented and enabled in the current Security state, the value of the current VMID. |

This field is permitted to be cached in a TLB.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

**Note**

If the value of the TTBR1_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED.
**UNPREDICTABLE**, see ‘CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values’.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Accessing the TTBR1_EL1**

When **HCR_EL2.E2H** is 1, without explicit synchronization, access from EL3 using the mnemonic TTBR1_EL1 or TTBR1_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Access to this register use the following encodings:

**MRS <Xt>, TTBR1_EL1**

The TTBR1_EL2 characteristics are:

**Purpose**

When HCR_EL2.E2H is 1, holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the EL2&0 translation regime, and other information for this translation regime.

**Note**

When HCR_EL2.E2H is 0, the contents of this register are ignored by the PE, except for a direct read or write of the register.

**Configuration**

This register is present only when FEAT_VHE is implemented. Otherwise, direct accesses to TTBR1_EL2 are **UNDEFINED**.

If EL2 is not implemented, this register is **RES0** from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

TTBR1_EL2 is a 64-bit register.

**Field descriptions**

The TTBR1_EL2 bit assignments are:

</tr>
</tbody>
</table>

**ASID, bits [63:48]**

An ASID for the translation table base address. The TCR_EL2.A1 field selects either TTBR0_EL2.ASID or TTBR1_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are **RES0**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**BADDR[47:1], bits [47:1]**

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL2.T1SZ, the translation stage, and the translation granule size.

**Note**
A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of \texttt{TCR EL2}.(1)PS is not 0b110, then:

• Register bits[(x-1):1] are res0.
• If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are 0b0000.

If \texttt{FEAT LPA} is implemented and the value of \texttt{TCR EL2}.(1)PS is 0b110, then:

• Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
• Register bit[1] is res0.
• When x>6, register bits[(x-1):6] are res0.

\textbf{Note}

The OA size specified by \texttt{TCR EL2}.(1)PS is determined as follows:

• The value of \texttt{TCR EL2}.PS when the value of \texttt{HCR EL2} E2H is 0.
• The value of \texttt{TCR EL2}.IPS when the value of \texttt{HCR EL2} E2H is 1.

\texttt{TCR EL2}.(1)PS==0b110 is permitted when:

• \texttt{FEAT LPA} is implemented and the 64KB translation granule is used.
• \texttt{FEAT LPA2} is implemented and the 4KB or 16KB translation granule is used.

When the value of \texttt{ID AA64MMFRO EL1} PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when \texttt{TCR EL2}.(1)PS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If any register bit[47:1] that is defined as res0 has the value 1 when a translation table walk is done using \texttt{TTBR1 EL2}, then the translation table base address might be misaligned, with effects that are \textsc{constrained} \textsc{unpredictable}, and must be one of the following:

• Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
• The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

On a Warm reset, this field resets to an architecturally \textsc{unknown} value.

\textbf{CnP, bit [0]}

\textit{When FEAT_TTCNP is implemented:}

Common not Private. This bit indicates whether each entry that is pointed to by TBR1_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBRI_EL2.CnP is 1.

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0 | The translation table entries pointed to by TTBRI_EL2 for the current ASID are permitted to differ from corresponding entries for TTBRI_EL2 for other PEs in the Inner Shareable domain. This is not affected by:
  • The value of TTBRI_EL2.CnP on those other PEs.
  • The value of the current ASID. |

| 0b1 | The translation table entries pointed to by TTBRI_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBRI_EL2.CnP is 1 and all of the following apply:
  • The translation table entries are pointed to by TTBRI_EL2.
  • The ASID is the same as the current ASID. |

This field is permitted to be cached in a TLB.
• TTBR1_EL2 is accessible only when the value of HCR_EL2.E2H is 1, meaning the current translation regime is the EL2\&0 regime.
• If the value of the TTBR1_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Accessing the TTBR1_EL2**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic TTBR1_EL2 or TTBR1_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

VBAR_EL1, Vector Base Address Register (EL1)

The VBAR_EL1 characteristics are:

**Purpose**

Holds the vector base address for any exception that is taken to EL1.

**Configuration**

AArch64 System register VBAR_EL1 bits [31:0] are architecturally mapped to AArch32 System register `VBAR[31:0]`.

**Attributes**

VBAR_EL1 is a 64-bit register.

**Field descriptions**

The VBAR_EL1 bit assignments are:

<p>| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|</p>
<table>

<th>Vector Base Address</th>
<th>RES0</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>30</td>
<td>29</td>
</tr>
</tbody>
</table>

**Bits [63:11]**

Vector Base Address. Base address of the exception vectors for exceptions taken to EL1.

**Note**

If the implementation does not support FEAT_LVA, then:

- If tagged addresses are being used, bits [55:48] of VBAR_EL1 must be the same or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:48] of VBAR_EL1 must be the same or else the use of the vector address will result in a recursive exception.

If the implementation supports FEAT_LVA, then:

- If tagged addresses are being used, bits [55:52] of VBAR_EL1 must be the same or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:52] of VBAR_EL1 must be the same or else the use of the vector address will result in a recursive exception.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [10:0]**

Reserved, RES0.
Accessing the VBAR_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic VBAR_EL1 or VBAR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

VBAR_EL2, Vector Base Address Register (EL2)

The VBAR_EL2 characteristics are:

Purpose

Holds the vector base address for any exception that is taken to EL2.

Configuration

AArch64 System register VBAR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HVBAR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VBAR_EL2 is a 64-bit register.

Field descriptions

The VBAR_EL2 bit assignments are:

Bits [63:11]

Vector Base Address. Base address of the exception vectors for exceptions taken to EL2.

Note

If FEAT_LVA is implemented:

- If HCR_EL2.E2H == 0b1:
  - If tagged addresses are being used, bits [55:52] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.
  - If tagged addresses are not being used, bits [63:52] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.
- If HCR_EL2.E2H == 0b0:
  - If tagged addresses are being used, bits [55:52] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.
  - If tagged addresses are not being used, bits [63:52] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.

If FEAT_LVA is not implemented:

- If HCR_EL2.E2H == 0b1:
  - If tagged addresses are being used, bits [55:48] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.
If tagged addresses are not being used, bits [63:48] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.

- If HCR_EL2.E2H == 0b0:
  - If tagged addresses are being used, bits [55:48] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.
  - If tagged addresses are not being used, bits [63:48] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [10:0]

Reserved, RES0.

### Accessing the VBAR_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic VBAR_EL2 or VBAR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

**Bits [63:11]**

Vector Base Address. Base address of the exception vectors for exceptions taken to EL3.

**Note**

If the implementation does not support FEAT_LVA, then:

- If tagged addresses are being used, bits [55:48] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:48] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.

If the implementation supports FEAT_LVA, then:

- If tagged addresses are being used, bits [55:52] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:52] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [10:0]**

Reserved, RES0.

The VDISR_EL2 characteristics are:

**Purpose**

Records that a virtual SError interrupt has been consumed by an ESB instruction executed at EL1.

An indirect write to VDISR_EL2 made by an ESB instruction does not require an explicit synchronization operation for the value written to be observed by a direct read of DISR_EL1 or DISR occurring in program order after the ESB instruction.

**Configuration**

AArch64 System register VDISR_EL2 bits [31:0] are architecturally mapped to AArch32 System register VDISR[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to VDISR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is res0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VDISR_EL2 is a 64-bit register.

**Field descriptions**

The VDISR_EL2 bit assignments are:

**Bits [63:32]**

Reserved, **RES0**.

**A, bit [31]**

Set to 1 when an ESB instruction defers a virtual SError interrupt.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [30:16]**

Reserved, **RES0**.

**AET, bits [15:14]**

The value copied from **VSESR_EL2.AET**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [13]**

Reserved, **RES0**.

**ExT, bit [12]**

The value copied from **VSESR_EL2.ExT**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [11:10]**

Reserved, **RES0**.
LPAE, bit [9]

Format.

Set to TTBCE.AE when an ESB instruction defers a virtual SError interrupt.

<table>
<thead>
<tr>
<th>LPAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>Using the Long-descriptor table format.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status code. Set to 0b010001 when an ESB instruction defers a virtual SError interrupt.

<table>
<thead>
<tr>
<th>STATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b010001</td>
<td>Asynchronous SError interrupt.</td>
</tr>
</tbody>
</table>

All other values are reserved.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the VDISR_EL2

An indirect write to VDISR_EL2 made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of DISR_EL1 or DISR occurring in program order after the ESB instruction.

Accesses to this register use the following encodings:

### MRS <Xt>, VDISR_EL2

VMPIDR_EL2, Virtualization Multiprocessor ID Register

The VMPIDR_EL2 characteristics are:

**Purpose**

Holds the value of the Virtualization Multiprocessor ID. This is the value returned by EL1 reads of MPIDR_EL1.

**Configuration**

AArch64 System register VMPIDR_EL2 bits [31:0] are architecturally mapped to AArch32 System register VMPIDR[31:0].

If EL2 is not implemented, reads of this register return the value of the MPIDR_EL1 and writes to the register are ignored.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VMPIDR_EL2 is a 64-bit register.

**Field descriptions**

The VMPIDR_EL2 bit assignments are:

**Bits [63:40]**

Reserved, RES0.

**Aff3, bits [39:32]**

Affinity level 3. See the description of VMPIDR_EL2.Aff0 for more information.

Aff3 is not supported in AArch32 state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [31]**

Reserved, RES1.

**U, bit [30]**

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

<table>
<thead>
<tr>
<th>U</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Processor is part of a multiprocessor system.</td>
</tr>
<tr>
<td>0b1</td>
<td>Processor is part of a uniprocessor system.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Bits [29:25]
Reserved, RES0.

MT, bit [24]
Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of VMPIDR_EL2.Aff0 for more information about affinity levels.

<table>
<thead>
<tr>
<th>MT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Performance of PEs at the lowest affinity level is largely independent.</td>
</tr>
<tr>
<td>0b1</td>
<td>Performance of PEs at the lowest affinity level is very interdependent.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Aff2, bits [23:16]
Affinity level 2. See the description of VMPIDR_EL2.Aff0 for more information.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Aff1, bits [15:8]
Affinity level 1. See the description of VMPIDR_EL2.Aff0 for more information.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Aff0, bits [7:0]
Affinity level 0. This is the affinity level that is most significant for determining PE behavior. Higher affinity levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the VMPIDR_EL2
Accesses to this register use the following encodings:

MRS <Xt>, VMPIDR_EL2

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

elsif PSTATE.EL == EL3 then
  return MPIDR_EL1;
The VNCR_EL2 characteristics are:

**Purpose**

When FEAT_NV2 is implemented, holds the base address that is used to define the memory location that is accessed by transformed reads and writes of System registers.

**Configuration**

This register is present only when FEAT_NV2 is implemented. Otherwise, direct accesses to VNCR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VNCR_EL2 is a 64-bit register.

**Field descriptions**

The VNCR_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RESS | BADDR |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**RESS, bits [63:53]**

Reserved, Sign extended. If the bits marked as RESS do not all have the same value, then there is a CONSTRAINED UNPREDICTABLE choice between:

- Generating an EL2 translation regime Translation abort on use of the VNCR_EL2 register.
- Bits[63:49] of VNCR_EL2 are treated as the same value as bit[48] for all purposes other than reading back the register.
- Bits[63:49] of VNCR_EL2 are treated as the same value as bit[48] for all purposes.
- If the virtual address space for EL2 supports more than 48 bits, bits[63:53] of VNCR_EL2 are treated as the same value as bit[52] for all purposes other than reading back the register.
- If the virtual address space for EL2 supports more than 48 bits, bits[63:53] of VNCR_EL2 are treated as the same value as bit[52].

Where the EL2 translation regime has upper and lower address ranges, bit[52] is used to select between those address ranges to determine if the address space supports more than 48 bits.

**BADDR, bits [52:12]**

Base Address. If the virtual address space for EL2 does not support more than 48 bits, then bits [52:49] are RESS.

When a register read/write is transformed to be a Load or Store, the address of the load/store is to SignOffset(VNCR_EL2.BADDR:Offset<11:0>, 64).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [11:0]**

Reserved, RES0.

VPIDR_EL2, Virtualization Processor ID Register

The VPIDR_EL2 characteristics are:

**Purpose**

Holds the value of the Virtualization Processor ID. This is the value returned by EL1 reads of MIDR_EL1.

**Configuration**

AArch64 System register VPIDR_EL2 bits [31:0] are architecturally mapped to AArch32 System register VPIDR[31:0].

If EL2 is not implemented, reads of this register return the value of the MIDR_EL1 and writes to the register are ignored.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VPIDR_EL2 is a 64-bit register.

**Field descriptions**

The VPIDR_EL2 bit assignments are:

| Bit 63 | Bit 62 | Bit 61 | Bit 60 | Bit 59 | Bit 58 | Bit 57 | Bit 56 | Bit 55 | Bit 54 | Bit 53 | Bit 52 | Bit 51 | Bit 50 | Bit 49 | Bit 48 | Bit 47 | Bit 46 | Bit 45 | Bit 44 | Bit 43 | Bit 42 | Bit 41 | Bit 40 | Bit 39 | Bit 38 | Bit 37 | Bit 36 | Bit 35 | Bit 34 | Bit 33 | Bit 32 |

</tr>
<tr>
<td>0x69</td>
<td>i</td>
<td>Intel Corporation</td>
</tr>
</tbody>
</table>

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**Variant, bits [23:20]**

An implementation-defined variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Architecture, bits [19:16]**

Architecture version. Defined values are:

<table>
<thead>
<tr>
<th>Architecture</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>Armv4.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Armv4T.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Armv5 (obsolete).</td>
</tr>
<tr>
<td>0b0100</td>
<td>Armv5T.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Armv5TE.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Armv5TEJ.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Armv6.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Architectural features are individually identified in the ID_* registers, see 'ID registers'.</td>
</tr>
</tbody>
</table>

All other values are reserved.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**PartNum, bits [15:4]**

An implementation-defined primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Revision, bits [3:0]**

An implementation-defined revision number for the device.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the VPIDR_EL2**

Accesses to this register use the following encodings:

\[
\text{MRS} \ <Xt>, \ \text{VPIDR\_EL2}
\]

The VESR_EL2 characteristics are:

**Purpose**

Provides the syndrome value reported to software on taking a virtual SError interrupt exception to EL1, or on executing an ESB instruction at EL1.

When the virtual SError interrupt is taken to EL1 using AArch64, then the syndrome value is reported in ESR_EL1.

When the virtual SError interrupt is taken to EL1 using AArch32, then the syndrome value is reported in DFSR.{AET, Ext} and the remainder of DFSR is set as defined by VMSAv8-32. For more information, see The AArch32 Virtual Memory System Architecture.

When the virtual SError interrupt is deferred by an ESB instruction, then the syndrome value is written to VDISR_EL2.

**Configuration**

AArch64 System register VESR_EL2 bits [31:0] are architecturally mapped to AArch32 System register VDFSR[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to VESR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VESR_EL2 is a 64-bit register.

**Field descriptions**

The VESR_EL2 bit assignments are:

**When EL1 is using AArch32:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

| RES0 |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:16]**

Reserved, RES0.

**AET, bits [15:14]**

When a virtual SError interrupt is taken to EL1 using AArch32, DFSR[15:4] is set to VESR_EL2.AET.

When a virtual SError interrupt is deferred by an ESB instruction, VDISR_EL2[15:4] is set to VESR_EL2.AET.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Bit [13]
Reserved, RES0.

ExT, bit [12]

When a virtual SError interrupt is taken to EL1 using AArch32, DFSR[12] is set to VSESR_EL2.ExT.
When a virtual SError interrupt is deferred by an ESB instruction, VDISR_EL2[12] is set to VSESR_EL2.ExT.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:0]
Reserved, RES0.

When EL1 is using AArch64:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0 | IDS | RES0 | ISS |
| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  |  9  |  8  |  7  |  6  |  5  |  4  |  3  |  2  |  1  |  0 |

Bits [63:25]
Reserved, RES0.

IDS, bit [24]

When a virtual SError interrupt is taken to EL1 using AArch64, ESR_EL1[24] is set to VSESR_EL2.IDS.
When a virtual SError interrupt is deferred by an ESB instruction, VDISR_EL2[24] is set to VSESR_EL2.IDS.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [23:0]

When a virtual SError interrupt is taken to EL1 using AArch64, ESR_EL1[23:0] is set to VSESR_EL2.ISS.
When a virtual SError interrupt is deferred by an ESB instruction, VDISR_EL2[23:0] is set to VSESR_EL2.ISS.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

</tbody>
</table>

Any of the bits in VSTCR_EL2 are permitted to be cached in a TLB.

**Bits [63:34]**

Reserved, RES0.

**SL2, bit [33]**

*When FEAT_LPA2 is implemented:*

Starting level of the Secure stage 2 translation lookup controlled by VSTCR_EL2.

If VTCR_EL2.DS == 1, then VSTCR_EL2.SL2, in combination with VSTCR_EL2.SL0, gives encodings for the Secure stage 2 translation table walk initial lookup level.

If VTCR_EL2.DS == 0, then VSTCR_EL2.SL2 is RES0.

If the translation granule size is not 4KB, then this field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.
**Bit [32]**

Reserved, RES0.

**Bit [31]**

Reserved, RES1.

**SA, bit [30]**

Secure stage 2 translation output address space.

<table>
<thead>
<tr>
<th>SA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All stage 2 translations for the Secure IPA space access the Secure PA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>All stage 2 translations for the Secure IPA space access the Non-secure PA space.</td>
</tr>
</tbody>
</table>

When the value of VSTCR_EL2.SW is 1, this bit behaves as 1 for all purposes other than reading back the value of the bit.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**SW, bit [29]**

Secure stage 2 translation address space.

<table>
<thead>
<tr>
<th>SW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All stage 2 translation table walks for the Secure IPA space are to the Secure PA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>All stage 2 translation table walks for the Secure IPA space are to the Non-secure PA space.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [28:16]**

Reserved, RES0.

**TG0, bits [15:14]**

Secure stage 2 granule size for **VSTTBR_EL2**.

<table>
<thead>
<tr>
<th>TG0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>4KB.</td>
</tr>
<tr>
<td>0b01</td>
<td>64KB.</td>
</tr>
<tr>
<td>0b10</td>
<td>16KB.</td>
</tr>
</tbody>
</table>

Other values are reserved.

If **FEAT_GTG** is implemented, **ID_AA64MMFR0_EL1** {TGran4_2, TGran16_2, TGran64_2} indicate which granule sizes are supported for Level 2 translation.

If **FEAT_GTG** is not implemented, **ID_AA64MMFR0_EL1** {TGran4, TGran16, TGran64} indicate which granule sizes are supported.

If the value is programmed to either a reserved value, or a size that has not been implemented, then for all purposes other than read back from this register, the hardware will treat the field as if it has been programmed to an **IMPLEMENTATION DEFINED** choice of the sizes that has been implemented.

It is **IMPLEMENTATION DEFINED** whether the value read back is the value programmed or the value that corresponds to the size chosen.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Bits [13:8]

Reserved, RES0.

SL0, bits [7:6]

When FEAT_TTST is implemented:

Starting level of the Secure stage 2 translation lookup, controlled by VSTCR_EL2. The meaning of this field depends on the value of VSTCR_EL2.TG0.

<table>
<thead>
<tr>
<th>SL0</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b00  | If VSTCR_EL2.TG0 is 0b00 (4KB granule):  
       | - If FEAT_LPA2 is not implemented, start at level 2.  
       | - If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 2.  
       | - If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b1, start at level -1. |
|       | If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3. |
| 0b01  | If VSTCR_EL2.TG0 is 0b00 (4KB granule):  
       | - If FEAT_LPA2 is not implemented, start at level 1.  
       | - If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 1.  
       | - If FEAT_LPA2 is implemented, the combination of VSTCR_EL2.SL0 == 01 and VSTCR_EL2.SL2 == 1 is reserved. |
|       | If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2. |
| 0b10  | If VSTCR_EL2.TG0 is 0b00 (4KB granule):  
       | - If FEAT_LPA2 is not implemented, start at level 0.  
       | - If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 0.  
       | - If FEAT_LPA2 is implemented, the combination of VSTCR_EL2.SL0 == 10 and VSTCR_EL2.SL2 == 1 is reserved. |
|       | If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1. |
| 0b11  | If VSTCR_EL2.TG0 is 0b00 (4KB granule):  
       | - If FEAT_LPA2 is not implemented, start at level 3.  
       | - If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 3.  
       | - If FEAT_LPA2 is implemented, the combination of VSTCR_EL2.SL0 == 11 and VSTCR_EL2.SL2 == 1 is reserved. |
|       | If VSTCR_EL2.TG0 is 0b10 (16KB granule) and FEAT_LPA2 is implemented, start at level 0. |

If this field is programmed to a value that is not consistent with the programming of VSTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Starting level of the Secure stage 2 translation lookup, controlled by VSTCR_EL2. The meaning of this field depends on the value of VSTCR_EL2.TG0.
SL0 | Meaning
---|---
0b00 | If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 2. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.
0b01 | If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 1. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.
0b10 | If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 0. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of VSTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**T0SZ, bits [5:0]**

The size offset of the memory region addressed by VSTTBR_EL2. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for this field depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

If this field is programmed to a value that is not consistent with the programming of SL0, then a stage 2 level 0 Translation fault is generated.

**Note**

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

VSTTBR_EL2, Virtualization Secure Translation Table Base Register

The VSTTBR_EL2 characteristics are:

**Purpose**

The base register for stage 2 of the Secure EL1&0 translation regime. Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the Secure EL1&0 translation regime, and other information for this translation stage.

**Configuration**

This register is present only when FEAT_SEL2 is implemented. Otherwise, direct accesses to VSTTBR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VSTTBR_EL2 is a 64-bit register.

**Field descriptions**

The VSTTBR_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | BADDR |

Any of the bits in VSTTBR_EL2 are permitted to be cached in a TLB.

**Bits [63:48]**

Reserved, RES0.

**BADDR, bits [47:1]**

Translation table base address, A[47:x] or A[51:x].

**Note**

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes FEAT_LPA and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

If the value of VTCR_EL2. PS is 0b110, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
  - If x >= 6 then z=x.
  - Otherwise, z=6.
- When z>x register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
When \( x > 6 \) register bits\([(x-1):6]\) are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.

**Note**

When the value of \( \text{ID}_{\text{AA64MMFR0_EL1}}.\text{PARange} \) indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the Effective value of \( \text{VTCR}_{\text{EL2}}.\text{PS} \) is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of \( \text{VTCR}_{\text{EL2}}.\text{PS} \) is not 0b110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:48] of the translation table base addresses used in this stage of translation are 0b0000.

If any VSTTBR_EL2[47:1] bit that is defined as RES0 has the value 1 when a translation table walk is performed using VSTTBR_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is one of the values written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how \( x \) is calculated based on the value of \( \text{VTCR}_{\text{EL2}}.\text{T0SZ} \), the stage of translation, and the translation granule size.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CnP, bit [0]**

Common not Private, for stage 2 of the Secure EL1&0 translation regime. In an implementation that includes FEAT_TTCNP, indicates whether each entry that is pointed to by VSTTBR_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VSTTBR_EL2.CnP is 1.

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>

</tr>
<tr>
<td>0b1</td>
<td>The translation table entries pointed to by VSTTBR_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VSTTBR_EL2.CnP is 1 and the VMID is the same as the current VMID.</td>
</tr>
</tbody>
</table>

**Note**

If the value of VSTTBR_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VSTTBR_EL2s do not point to the same translation table entries when using the current VMID, then the results of translations using VSTTBR_EL2 are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the VSTTBR_EL2**

Accesses to this register use the following encodings:
MRS $<Xt>$, VSTTBR_EL2

```
<table>
<thead>

```
VTCR_EL2, Virtualization Translation Control Register

The VTCR_EL2 characteristics are:

**Purpose**

The control register for stage 2 of the EL1&0 translation regime.

**Configuration**

AArch64 System register VTCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register VTCR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VTCR_EL2 is a 64-bit register.

**Field descriptions**

The VTCR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Bit Assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-34</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>33</td>
<td>SL2, bit [33]</td>
</tr>
<tr>
<td>32-0</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

Any of the bits in VTCR_EL2 are permitted to be cached in a TLB.

**Bits [63:34]**

Reserved, RES0.

**SL2, bit [33]**

*When FEAT_LPA2 is implemented:*

Starting level of the stage 2 translation lookup controlled by VTCR_EL2.

If VTCR_EL2.DS == 1, then VTCR_EL2.SL2, in combination with VTCR_EL2.SL0, gives encodings for the stage 2 translation table walk initial lookup level.

If VTCR_EL2.DS == 0, then VTCR_EL2.SL2 is RES0.

If the translation granule size is not 4KB, then this field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.
**DS, bit [32]**

When **FEAT_LPA2** is implemented:

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 2 of the EL1&0 translation regime.

<table>
<thead>
<tr>
<th>DS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bits[49:48] of translation descriptors are RES0. Bits[9:8] in block and page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware. The minimum value of VTCR_EL2.T0SZ is 16. Any memory access using a smaller value generates a stage 2 level 0 translation table fault. The minimum value of VSTCR_EL2.T0SZ is 16. Any memory access using a smaller value generates a stage 2 level 0 translation table fault. Output address[51:48] is 0000.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bits[49:48] of translation descriptors hold output address[49:48]. Bits[9:8] in translation descriptors hold output address[51:50]. The shareability information of block and page descriptors for cacheable locations is determined by VTCR_EL2.SH0. The minimum value of VTCR_EL2.T0SZ is 12. Any memory access using a smaller value generates a stage 2 level 0 translation table fault. The minimum value of VSTCR_EL2.T0SZ is 12. Any memory access using a smaller value generates a stage 2 level 0 translation table fault.</td>
</tr>
</tbody>
</table>

**Note**
As FEAT_LPA must be implemented if VTCR_EL2.DS == 1, the minimum values of VTCR_EL2.T0SZ and VSTCR_EL2.T0SZ are 12, as determined by that extension.

For the TLBI range instructions affecting IPA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 00.

**Note**
This forces alignment of the ranges used by the TLBI range instructions.

This field is RES0 for a 64KB translation granule.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Bit [31]**

Reserved, RES1.

**NSA, bit [30]**

When **FEAT_SEL2** is implemented:

Non-secure stage 2 translation output address space.
NSA, bit [29]

When FEAT_SEL2 is implemented:

Non-secure stage 2 translation table address space.

<table>
<thead>
<tr>
<th>NSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All stage 2 translations for the Non-secure IPA space of the Secure EL1&amp;0 translation regime access the Secure PA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>All stage 2 translations for the Non-secure IPA space of the Secure EL1&amp;0 translation regime access the Non-secure PA space.</td>
</tr>
</tbody>
</table>

This bit behaves as 1 for all purposes other than reading back the value of the bit when one of the following is true:

- The PE is executing in Non-secure state.
- The value of VTCR_EL2.NSW is 1.
- The value of VSTCR_EL2.SA is 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSW, bit [29]

When FEAT_SEL2 is implemented:

Non-secure stage 2 translation table address space.

<table>
<thead>
<tr>
<th>NSW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All stage 2 translation table walks for the Non-secure IPA space of the Secure EL1&amp;0 translation regime are to the Secure PA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>All stage 2 translation table walks for the Non-secure IPA space of the Secure EL1&amp;0 translation regime are to the Non-secure PA space.</td>
</tr>
</tbody>
</table>

When the PE is executing in Non-secure state, this bit behaves as 1 for all purposes other than reading back the value of the bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU62, bit [28]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 2 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU62</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[62] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[62] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
HWU61, bit [27]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 2 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU61</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[61] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[61] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU60, bit [26]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 2 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU60</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[60] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[60] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU59, bit [25]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 2 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU59</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[59] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[59] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
**Bits [24:23]**

Reserved, RES0.

**HD, bit [22]**

*When FEAT_HAFDBS is implemented:*

Hardware management of dirty state in stage 2 translations when EL2 is enabled in the current Security state.

<table>
<thead>
<tr>
<th>HD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 2 hardware management of dirty state disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 2 hardware management of dirty state enabled, only if the VTCR_EL2.HA bit is also set to 1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HA, bit [21]**

*When FEAT_HAFDBS is implemented:*

Hardware Access flag update in Non-secure and Secure stage 2 translations when EL2 is enabled in the current Security state.

<table>
<thead>
<tr>
<th>HA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 2 Access flag update disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 2 Access flag update enabled.</td>
</tr>
</tbody>
</table>

**Otherwise:**

Reserved, RES0.

**Bit [20]**

Reserved, RES0.

**VS, bit [19]**

*When FEAT_VMID16 is implemented:*

VMID Size.

<table>
<thead>
<tr>
<th>VS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>8 bit - the upper 8 bits of VTTBR_EL2 and VSTTBR_EL2 are ignored by the hardware, and treated as if they are all zeros, for every purpose except when reading back the register.</td>
</tr>
<tr>
<td>0b1</td>
<td>16 bit - the upper 8 bits of VTTBR_EL2 and VSTTBR_EL2 are used for allocation and matching in the TLB.</td>
</tr>
</tbody>
</table>

If the implementation only supports an 8-bit VMID, this field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.
**PS, bits [18:16]**

Physical address Size for the Second Stage of translation.

<table>
<thead>
<tr>
<th>PS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>32 bits, 4GB.</td>
</tr>
<tr>
<td>0b001</td>
<td>36 bits, 64GB.</td>
</tr>
<tr>
<td>0b010</td>
<td>40 bits, 1TB.</td>
</tr>
<tr>
<td>0b011</td>
<td>42 bits, 4TB.</td>
</tr>
<tr>
<td>0b100</td>
<td>44 bits, 8GB.</td>
</tr>
<tr>
<td>0b101</td>
<td>48 bits, 256TB.</td>
</tr>
<tr>
<td>0b110</td>
<td>52 bits, 4PB.</td>
</tr>
</tbody>
</table>

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granularity is not 64KB and FEAT_LPA2 is not implemented, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement FEAT_LPA supports setting the value of 0b110 for the 64KB translation granularity size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by VTCR_EL2 are 0b0000.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TG0, bits [15:14]**

Granule size for the VTTBR_EL2.

<table>
<thead>
<tr>
<th>TG0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>4KB.</td>
</tr>
<tr>
<td>0b01</td>
<td>64KB.</td>
</tr>
<tr>
<td>0b10</td>
<td>16KB.</td>
</tr>
</tbody>
</table>

Other values are reserved.

If FEAT_GTG is implemented, ID_AA64MMFR0_EL1.{TGran4_2, TGran16_2, TGran64_2} indicate which granule sizes are supported for Level 2 translation.

If FEAT_GTG is not implemented, ID_AA64MMFR0_EL1.{TGran4, TGran16, TGran64} indicate which granule sizes are supported.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SH0, bits [13:12]**

Shareability attribute for memory associated with translation table walks using VTTBR_EL2 or VSTTBR_EL2.

<table>
<thead>
<tr>
<th>SH0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using VTTBR_EL2 or VSTTBR_EL2.

<table>
<thead>
<tr>
<th>ORGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using VTTBR_EL2 or VSTTBR_EL2.

<table>
<thead>
<tr>
<th>IRGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

SL0, bits [7:6]

When FEAT_TTST is implemented:

Starting level of the stage 2 translation lookup, controlled by VTCR_EL2. The meaning of this field depends on the value of VTCR_EL2.TG0.
If VTCR_EL2.TG0 is \(0b00\) (4KB granularity):
- If FEAT_LPA2 is not implemented, start at level 2.
- If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is \(0b0\), start at level 2.
- If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is \(0b1\), start at level -1.

If VTCR_EL2.TG0 is \(0b10\) (16KB granularity) or \(0b01\) (64KB granularity), start at level 3.

If VTCR_EL2.TG0 is \(0b00\) (4KB granularity):
- If FEAT_LPA2 is not implemented, start at level 1.
- If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is \(0b0\), start at level 1.
- If FEAT_LPA2 is implemented, the combination of VTCR_EL2.SL0 == \(0b1\) and VTCR_EL2.SL2 == \(0b1\) is reserved.

If VTCR_EL2.TG0 is \(0b10\) (16KB granularity) or \(0b01\) (64KB granularity), start at level 2.

If VTCR_EL2.TG0 is \(0b00\) (4KB granularity):
- If FEAT_LPA2 is not implemented, start at level 0.
- If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is \(0b0\), start at level 0.
- If FEAT_LPA2 is implemented, the combination of VTCR_EL2.SL0 == \(0b1\) and VTCR_EL2.SL2 == \(0b1\) is reserved.

If VTCR_EL2.TG0 is \(0b10\) (16KB granularity) or \(0b01\) (64KB granularity), start at level 1.

If VTCR_EL2.TG0 is \(0b00\) (4KB granularity):
- If FEAT_LPA2 is not implemented, start at level 3.
- If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is \(0b0\), start at level 3.
- If FEAT_LPA2 is implemented, the combination of VTCR_EL2.SL0 == \(0b1\) and VTCR_EL2.SL2 == \(0b1\) is reserved.

If this field is programmed to a value that is not consistent with the programming of VTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Starting level of the stage 2 translation lookup, controlled by VTCR_EL2. The meaning of this field depends on the value of VTCR_EL2.TG0.

If VTCR_EL2.TG0 is \(0b00\) (4KB granularity), start at level 2. If VTCR_EL2.TG0 is \(0b10\) (16KB granularity) or \(0b01\) (64KB granularity), start at level 3.

If VTCR_EL2.TG0 is \(0b00\) (4KB granularity), start at level 1. If VTCR_EL2.TG0 is \(0b10\) (16KB granularity) or \(0b01\) (64KB granularity), start at level 2.

If VTCR_EL2.TG0 is \(0b00\) (4KB granularity), start at level 0. If VTCR_EL2.TG0 is \(0b10\) (16KB granularity) or \(0b01\) (64KB granularity), start at level 1.

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of VTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**T0SZ, bits [5:0]**

The size offset of the memory region addressed by VTTBR_EL2. The region size is \(2^{(64-T0SZ)}\) bytes.
The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

If this field is programmed to a value that is not consistent with the programming of SL0, then a stage 2 level 0 Translation fault is generated.

---

**Note**

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

---

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Accessing the VTCR_EL2

Any of the bits in VTCR_EL2 are permitted to be cached in a TLB.

Accesses to this register use the following encodings:

**MRS <Xt>, VTCR_EL2**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b100</td>
<td>0b0010</td>
<td>0b0001</td>
<td>0b010</td>
</tr>
</tbody>
</table>

```plaintext
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

    VTCR_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    VTCR_EL2 = X[t];
```
VTTBR_EL2, Virtualization Translation Table Base Register

The VTTBR_EL2 characteristics are:

**Purpose**

Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the EL1&0 translation regime, and other information for this translation regime.

**Configuration**

AArch64 System register VTTBR_EL2 bits [63:0] are architecturally mapped to AArch32 System register VTTBR[63:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VTTBR_EL2 is a 64-bit register.

**Field descriptions**

The VTTBR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>VMID Encoding</th>
<th>BADDR</th>
<th>CnP</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-0</td>
<td>VMID</td>
<td>BADDR</td>
<td>CnP</td>
</tr>
<tr>
<td>31-0</td>
<td>VMID</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**VMID, bits [63:48]**

VMID encoding when FEAT_VMID16 is implemented or (VTCR_EL2.VS == 1 or AArch32 is supported at any Exception level)

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>VMID Encoding</th>
</tr>
</thead>
<tbody>
<tr>
<td>15-0</td>
<td>VMID</td>
</tr>
</tbody>
</table>

**VMID, bits [15:0]**

The VMID for the translation table.

If EL2 is using AArch32, or if the implementation has an 8-bit VMID, this field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

VMID encoding when FEAT_VMID16 is not implemented or (VTCR_EL2.VS == 0 or the implementation only supports execution in AArch64 state)

<table>
<thead>
<tr>
<th>Bit Position</th>

</tr>
</thead>
<tbody>
<tr>
<td>15-0</td>
<td>RES0</td>
</tr>
</tbody>
</table>

Page 1971
Bits [15:8]

Reserved, RES0.

VMID, bits [7:0]

The VMID for the translation table.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- The VTCR_EL2.VS is 0.
- FEAT_VMID16 is not implemented.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

Translation table base address, A[47:x] or A[51:x], bits[47:1].

Note

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes FEAT_LPA and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes FEAT_LPA, if the value of VTCR_EL2.PS is 0b110, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
  - If x >= 6 then z=x.
  - Otherwise, z=6.
- When z>x register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When x>6 register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes FEAT_TTCNP, bit[0] of the stage 1 translation table base address is zero.

Note

- In an implementation that includes FEAT_LPA a VTCR_EL2.PS value of 0b110, that selects a PA size of 52 bits, is permitted only when using the 64KB translation granule.
- When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the Effective value of VTCR_EL2.PS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of VTCR_EL2.PS is not 0b110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:48] of the translation table base addresses used in this stage of translation are 0b0000.

Note

This definition applies:

- To an implementation that includes FEAT_LPA and is using a translation granule smaller than 64KB.
- To any implementation that does not include FEAT_LPA.
If any VTTBR_EL2[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using VTTBR_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of VTCR_EL2.T0SZ, the stage of translation, and the translation granule size.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CnP, bit [0]**

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by VTTBR_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VTTBR_EL2.CnP is 1.

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The translation table entries pointed to by VTTBR_EL2 are permitted to differ from the entries for VTTBR_EL2 for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.</td>
</tr>
<tr>
<td>0b1</td>
<td>The translation table entries pointed to by VTTBR_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VTTBR_EL2.CnP is 1 and the VMID is the same as the current VMID.</td>
</tr>
</tbody>
</table>

This field is permitted to be cached in a TLB.

**Note**

If the value of VTTBR_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VTTBR_EL2s do not point to the same translation table entries when using the current VMID then the results of translations using VTTBR_EL2 are CONSTRAINED UNPREDICTABLE, see ‘CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values’.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Accessing the VTTBR_EL2**

Accesses to this register use the following encodings:

ZCR_EL1, SVE Control Register for EL1

The ZCR_EL1 characteristics are:

**Purpose**

The SVE Control Register for EL1 is used to control aspects of SVE visible at Exception levels EL1 and EL0.

**Configuration**

This register is present only when FEAT_SVE is implemented. Otherwise, direct accesses to ZCR_EL1 are **UNDEFINED**.

When \texttt{HCR_EL2.\{E2H, TGE\} == \{1, 1\}} and EL2 is enabled in the current Security state, the fields in this register have no effect on execution at EL0.

**Attributes**

ZCR_EL1 is a 64-bit register.

**Field descriptions**

The ZCR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

**Bits [63:9]**

Reserved, RES0.

**Bits [8:4]**

Reserved, RAZ/WI.

**LEN, bits [3:0]**

Effective Scalable Vector Length.

Constrains the scalable vector register length for EL1 and EL0 to \((\text{LEN}+1)\times 128\) bits.

For all purposes other than returning the result of a direct read of ZCR_EL1, this field behaves as if:

- It is set to the minimum of the stored value and the constrained length inherited from more privileged Exception levels in the current Security state.
- It is rounded down to the nearest implemented vector length.

An indirect read of ZCR_EL1.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Accessing the ZCR_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic ZCR_EL1 or ZCR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

The ZCR_EL3 characteristics are:

**Purpose**

The SVE Control Register for EL3 is used to control aspects of SVE visible at all Exception levels.

**Configuration**

This register is present only when FEAT_SVE is implemented. Otherwise, direct accesses to ZCR_EL3 are UNDEFINED.

**Attributes**

ZCR_EL3 is a 64-bit register.

**Field descriptions**

The ZCR_EL3 bit assignments are:

| Bits [63:9] | Reserved, RES0. |
| Bits [8:4]  | Reserved, RAZ/WI. |
| LEN, bits [3:0] | Effective Scalable Vector Length. |

Constrains the scalable vector register length for all Exception levels to (LEN+1)x128 bits.

For all purposes other than returning the result of a direct read of ZCR_EL3, this field behaves as if:

- It is rounded down to the nearest implemented vector length.

An indirect read of ZCR_EL3.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ZCR_EL3**

Accesses to this register use the following encodings:

MRS <Xt>, ZCR_EL3

| op0 | op1 | CRn | CRm | op2 |

ACTLR, Auxiliary Control Register

The ACTLR characteristics are:

**Purpose**

Provides IMPLEMENTATION DEFINED configuration and control options for execution at EL1 and EL0.

**Configuration**

AArch32 System register ACTLR bits [31:0] are architecturally mapped to AArch64 System register \texttt{ACTLR_EL1[31:0]}.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ACTLR are UNDEFINED.

Some bits might define global configuration settings, and be common to the Secure and Non-secure instances of the register.

**Attributes**

ACTLR is a 32-bit register.

**Field descriptions**

The ACTLR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ACTLR**

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>}, \{#\}<opc1>, <Rt>, <CRn>, <CRm>, \{#\}<opc2>\
\]

ACTLR2, Auxiliary Control Register 2

The ACTLR2 characteristics are:

**Purpose**

Provides additional space to the ACTLR register to hold IMPLEMENTATION DEFINED trap functionality for execution at EL1 and EL0.

**Configuration**

AArch32 System register ACTLR2 bits [31:0] are architecturally mapped to AArch64 System register ACTLR_EL1[63:32].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ACTLR2 are UNDEFINED.

In Armv8.0 and Armv8.1, it is IMPLEMENTATION DEFINED whether this register is implemented, or whether it causes UNDEFINED exceptions when accessed. The implementation of this register can be detected by examining ID_MMFR4.AC2.

From Armv8.2 this register must be implemented.

**Attributes**

ACTLR2 is a 32-bit register.

**Field descriptions**

The ACTLR2 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

</tbody>
</table>

This register is RES0 in the following cases:

- When an implementation does not provide any IMPLEMENTATION DEFINED memory attributes.
- When the Long-descriptor translation table format is not used.

If EL3 is implemented and is using AArch32:

- AMAIR0(S) gives the value for memory accesses from Secure state.
- AMAIR0(NS) gives the value for memory accesses from Non-secure states other than Hyp mode.

Any IMPLEMENTATION DEFINED memory attributes are additional qualifiers for the memory locations and must not change the architectured behavior specified by MAIR0 and MAIR1.

In a typical implementation, AMAIR0 and AMAIR1 split into eight one-byte fields, corresponding to the MAIRn.Attr<n> fields, but the architecture does not require them to do so.

**IMPLEMENTATION DEFINED, bits [31:0]**

**IMPLEMENTATION DEFINED.**

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the AMAIR0**

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T10 == '1' then

            AMAIR0_S = R[t];
        else
            AMAIR0_NS = R[t];

The AMAIR1 characteristics are:

**Purpose**

When using the Long-descriptor format translation tables for stage 1 translations, provides IMPLEMENTATION DEFINED memory attributes for the memory regions specified by MAIR1.

**Configuration**

AArch32 System register AMAIR1 bits [31:0] are architecturally mapped to AArch64 System register AMAIR_EL1[63:32].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to AMAIR1 are UNDEFINED.

When EL3 is using AArch32, write access to AMAIR1(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

**Attributes**

AMAIR1 is a 32-bit register.

**Field descriptions**

The AMAIR1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

AMCFGR, Activity Monitors Configuration Register

The AMCFGR characteristics are:

**Purpose**

Global configuration register for the activity monitors.

Provides information on supported features, the number of counter groups implemented, the total number of activity monitor event counters implemented, and the size of the counters. AMCFGR is applicable to both the architected and the auxiliary counter groups.

**Configuration**

AArch32 System register AMCFGR bits [31:0] are architecturally mapped to AArch64 System register AMCFGR_EL0[31:0].

AArch32 System register AMCFGR bits [31:0] are architecturally mapped to External register AMCFGR[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCFGR are UNDEFINED.

**Attributes**

AMCFGR is a 32-bit register.

**Field descriptions**

The AMCFGR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| NCG | RES0 | HDBG | RAZ | SIZE | N |

**NCG, bits [31:28]**

Defines the number of counter groups.

The number of implemented counter groups is defined as \([\text{AMCFGR.NCG} + 1]\).

If the number of implemented auxiliary activity monitor event counters is zero, this field has a value of \(0b0000\). Otherwise, this field has a value of \(0b0001\).

**Bits [27:25]**

Reserved, RES0.

**HDBG, bit [24]**

Halt-on-debug supported.

From Armv8, this feature must be supported, and so this bit is \(0b1\).

<table>
<thead>
<tr>
<th>HDBG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>(0b0)</td>
<td>AMCR.HDBG is RES0.</td>
</tr>
<tr>
<td>(0b1)</td>
<td>AMCR.HDBG is read/write.</td>
</tr>
</tbody>
</table>
Bits [23:14]

Reserved, RAZ.

SIZE, bits [13:8]

Defines the size of activity monitor event counters.

The size of the activity monitor event counters implemented by the Activity Monitors Extension is defined as \([\text{AMCFGR.SIZE} + 1]\). From Armv8, the counters are 64-bit, and so this field is \(0b111111\).

Note

Software also uses this field to determine the spacing of counters in the memory-map. From Armv8, the counters are at doubleword-aligned addresses.

N, bits [7:0]

Defines the number of activity monitor event counters.

The total number of counters implemented in all groups by the Activity Monitors Extension is defined as \([\text{AMCFGR.N} + 1]\).

Accessing the AMCFGR

The AMCGCR characteristics are:

**Purpose**

Provides information on the number of activity monitor event counters implemented within each counter group.

**Configuration**

AArch32 System register AMCGCR bits [31:0] are architecturally mapped to AArch64 System register AMCGCR_EL0[31:0].

AArch32 System register AMCGCR bits [31:0] are architecturally mapped to External register AMCGCR[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCGCR are UNDEFINED.

**Attributes**

AMCGCR is a 32-bit register.

**Field descriptions**

The AMCGCR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>30</td>
<td>CG1NC</td>
</tr>
<tr>
<td>29</td>
<td>CG0NC</td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**CG1NC, bits [15:8]**

Counter Group 1 Number of Counters. The number of counters in the auxiliary counter group.

In an implementation that includes FEAT_AMUv1, the permitted range of values is 0 to 16.

**CG0NC, bits [7:0]**

Counter Group 0 Number of Counters. The number of counters in the architected counter group.

In an implementation that includes FEAT_AMUv1, the value of this field is 4.

**Accessing the AMCGCR**

Accesses to this register use the following encodings:

AMCGCR, Activity Monitors Counter Group Configuration Register
AMCNTENCLR0, Activity Monitors Count Enable Clear Register 0

The AMCNTENCLR0 characteristics are:

**Purpose**

Disable control bits for the architected activity monitors event counters, AMEVCNTR0<n>.

**Configuration**

AArch32 System register AMCNTENCLR0 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENCLR0_EL0[31:0].

AArch32 System register AMCNTENCLR0 bits [31:0] are architecturally mapped to External register AMCNTENCLR0[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR0 are UNDEFINED.

**Attributes**

AMCNTENCLR0 is a 32-bit register.

**Field descriptions**

The AMCNTENCLR0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | P15 | P14 | P13 | P12 | P11 | P10 | P9 | P8 | P7 | P6 | P5 | P4 | P3 | P2 | P1 | P0 |

Bits [31:16]

Reserved, RES0.

P<n>, bit [n], for n = 15 to 0

Activity monitor event counter disable bit for AMEVCNTR0<n>.

Bits [31:16] are RES0. Bits [15:N] are RAZ/WI. N is the value in AMCGCR.CG0NC.

Possible values of each bit are:

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that AMEVCNTR0&lt;n&gt; is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that AMEVCNTR0&lt;n&gt; is enabled. When written, disables AMEVCNTR0&lt;n&gt;.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.

**Bits [31:16]**

Reserved, RES0.

**P<n>**, bit [n], for n = 15 to 0

Activity monitor event counter enable bit for AMEVCNTR1<n>.

Bits [31:16] are RES0. Bits [15:N] are RAZ/WI. N is the value in AMCGCR.CG1NC.

Possible values of each bit are:

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that AMEVCNTR1&lt;n&gt; is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that AMEVCNTR1&lt;n&gt; is enabled. When written, enables AMEVCNTR1&lt;n&gt;.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.

**Accessing the AMCNTENSET1**

If the number of auxiliary activity monitor event counters implemented is zero, reads and writes of AMCNTENSET1 are UNDEFINED.
The number of auxiliary activity monitor counters implemented is zero when \texttt{AMCFGR.NCG == 0b0000}.

Accesses to this register use the following encodings:

\[
\text{MRC\{<c}\}{\{<q>\} \ <\text{coproc}, \ {#}<\text{opc1}, \ <\text{Rt}, \ <\text{CRn}, \ <\text{CRm}\{, \ {#}<\text{opc2}\}}
\]

AMCR, Activity Monitors Control Register

The AMCR characteristics are:

**Purpose**

Global control register for the activity monitors implementation. AMCR is applicable to both the architected and the auxiliary counter groups.

**Configuration**

AArch32 System register AMCR bits [31:0] are architecturally mapped to AArch64 System register AMCR_EL0[31:0].

AArch32 System register AMCR bits [31:0] are architecturally mapped to External register AMCR[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCR are UNDEFINED.

**Attributes**

AMCR is a 32-bit register.

**Field descriptions**

The AMCR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
|     | CG1RZ | RES0 |   | HDBG | RES0 |

**Bits [31:18]**

Reserved, RES0.

**CG1RZ, bit [17]**

*When FEAT_AMUv1p1 is implemented:*

Counter Group 1 Read Zero.

<table>
<thead>
<tr>
<th>CG1RZ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>System register reads of AMEVCNTR1&lt;n&gt; return the event count at all implemented and enabled Exception levels.</td>
</tr>
<tr>
<td>0b1</td>
<td>If the current Exception level is the highest implemented Exception level, system register reads of AMEVCNTR1&lt;n&gt; return the event count. Otherwise, reads of AMEVCNTR1&lt;n&gt; return a zero value.</td>
</tr>
</tbody>
</table>

**Note**

Reads from the memory-mapped view are unaffected by this field.

**Otherwise:**

Reserved, RES0.
Bits [16:11]
Reserved, RES0.

HDBG, bit [10]
This bit controls whether activity monitor counting is halted when the PE is halted in Debug state.

<table>
