\]

\( V_{\text{part}}[d, \text{part}] = \text{result}; \)
SQSHRUN, SQSHRUN2

Signed saturating Shift Right Unsigned Narrow (immediate). This instruction reads each signed integer value in the vector of the source SIMD&FP register, right shifts each value by an immediate value, saturates the result to an unsigned integer value that is half the original width, places the final result into a vector, and writes the vector to the destination SIMD&FP register. The results are truncated. For rounded results, see SQRSRUN.

The SQSHRUN instruction writes the vector to the lower half of the destination register and clears the upper half, while the SQSHRUN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Signed saturating extract Narrow. This instruction reads each vector element from the source SIMD&FP register, saturates the value to half the original width, places the result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. The destination vector elements are half as long as the source vector elements. All the values in this instruction are signed integer values.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit \( FPSR.QC \) is set.

The \( SQXTN \) instruction writes the vector to the lower half of the destination register and clears the upper half, while the \( SQXTN2 \) instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the \( CPACR_EL1 \), \( CPTR_EL2 \), and \( CPTR_EL3 \) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

**SRHADD**

Signed Rounding Halving Add. This instruction adds corresponding signed integer values from the two source SIMD&FP registers, shifts each result right one bit, places the results into a vector, and writes the vector to the destination SIMD&FP register.

The results are rounded. For truncated results, see **SHADD**.

Depending on the settings in the **CPACR_EL1**, **CPTR_EL2**, and **CPTR_EL3** registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

SRI

Shift Right and Insert (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each vector element by an immediate value, and inserts the result into the corresponding vector element in the destination SIMD&FP register such that the new zero bits created by the shift are not inserted but retain their existing value. Bits shifted out of the right of each vector element of the source register are lost.

The following figure shows an example of the operation of shift right by 3 for an 8-bit vector element.

![Diagram showing example of shift right operation]

Depending on the settings in the \texttt{CPACR_EL1}, \texttt{CPTR_EL2}, and \texttt{CPTR_EL3} registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: \texttt{Scalar} and \texttt{Vector}

\textbf{Scalar}

\begin{verbatim}

bits(esize) shifted;
for e = 0 to elements-1
    shifted = LSR(Elem[operand, e, esize], shift);
    Elem[result, e, esize] = (Elem[operand2, e, esize] AND NOT(mask)) OR shifted;
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
**SRSHL**

Signed Rounding Shift Left (register). This instruction takes each signed integer value in the vector of the first source SIMD&FP register, shifts it by a value from the least significant byte of the corresponding element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register. If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a rounding right shift. For a truncating shift, see **SSHL**.

Depending on the settings in the **CPACR_EL1**, **CPTR_EL2**, and **CPTR_EL3** registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: **Scalar** and **Vector**

Signed Rounding Shift Right and Accumulate (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, and accumulates the final results with the vector elements of the destination SIMD&FP register. All the values in this instruction are signed integer values. The results are rounded. For truncated results, see SSRA.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

### Operation

**CheckFPAdvSIMDEnabled64();**

bits(datasize) operand = V[n];
bits(datasize) operand2;
bits(datasize) result;
integer round_const = if round then (1 << (shift - 1)) else 0;
integer element;

operand2 = if accumulate then V[d] else Zeros();
for e = 0 to elements-1
    element = (Int(Elem(operand, e, esize), unsigned) + round_const) >> shift;
    Elem(result, e, esize) = Elem(operand2, e, esize) + element<esize-1:0>;

V[d] = result;
**SSHL**

Signed Shift Left (register). This instruction takes each signed integer value in the vector of the first source SIMD&FP register, shifts each value by a value from the least significant byte of the corresponding element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a truncating right shift. For a rounding shift, see [SRSHL](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [Scalar](#) and [Vector](#).

</tbody>
</table>

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

**Operation**

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;

integer round_const = 0;
integer shift;
integer element;
boolean sat;

for e = 0 to elements-1
    shift = SInt(Elem[operand2, e, esize]<7:0>);
    if rounding then
        round_const = 1 << (-shift - 1);    // 0 for left shift, 2^(n-1) for right shift
        element = (Int(Elem[operand1, e, esize], unsigned) + round_const) << shift;
    if saturating then
        (Elem[result, e, esize], sat) = SatQ(element, esize, unsigned);
        if sat then FPSR.QC = '1';
    else
        Elem[result, e, esize] = element<esize-1:0>;
V[d] = result;
```

**Operational information**

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
**SSHLL, SSHLL2**

Signed Shift Left Long (immediate). This instruction reads each vector element from the source SIMD&FP register, left shifts each vector element by the specified shift amount, places the result into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements. All the values in this instruction are signed integer values.

The SSHLL instruction extracts vector elements from the lower half of the source register, while the SSHLL2 instruction extracts vector elements from the upper half of the source register.

Depending on the settings in the `CPACR_EL1`, `CPTR_EL2`, and `CPTR_EL3` registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is used by the alias **SXTL, SXTL2**.

![Hexadecimal notation](image)

```
SSHLL\{2\} <Vd>..<Ta>, <Vn>..<Tb>, #<shift>
```

The second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:

<table>
<thead>
<tr>
<th>Q</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>[absent]</td>
</tr>
<tr>
<td>1</td>
<td>[present]</td>
</tr>
</tbody>
</table>

**<Vd>** Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

**<Ta>** Is an arrangement specifier, encoded in “immh”:

<table>
<thead>
<tr>
<th>immh</th>
<th>&lt;Ta&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>SEE Advanced SIMD modified immediate</td>

<tr>
<td>1xxx</td>
<td>x</td>
<td>RESERVED</td>
</tr>
</tbody>
</table>

**<shift>** Is the left shift amount, in the range 0 to the source element width in bits minus 1, encoded in "immh:immb":

```
integer d = UInt(Rd);
integer n = UInt(Rn);
if immh == '0000' then SEE(asimdimm);
if immh<3> == '1' then UNDEFINED;
integer esize = 8 << HighestSetBit(immh);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;
integer shift = UInt(immh:immb) - esize;
boolean unsigned = (U == '1');
```
### Alias Conditions

<table>
<thead>
<tr>
<th>Alias</th>
<th>Is preferred when</th>
</tr>
</thead>
<tbody>
<tr>
<td>SXTL, SXTL2</td>
<td>immh == '000' &amp; BitCount(immh) == 1</td>
</tr>
</tbody>
</table>

### Operation

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = Vpart[n, part];
bits(datasize*2) result;
integer element;

for e = 0 to elements-1
    element = Int(Elem[operand, e, esize], unsigned) << shift;
    Elem[result, e, 2*esize] = element<2*esize-1:0>;

V[d] = result;
```

### Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
SSHR

Signed Shift Right (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, places the final result into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are signed integer values. The results are truncated. For rounded results, see SRSHR.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

<td>(128-UInt(immh:immb))</td>
</tr>
</tbody>
</table>

Operation

```c
CheckFPAdvSIMDEnabled64();
b_bits(datasize) operand = V[n];
b_bits(datasize) operand2;
b_bits(datasize) result;
integer round_const = if round then (1 << (shift - 1)) else 0;
integer element;
operand2 = if accumulate then V[d] else Zeros();
for e = 0 to elements-1
    element = (Int(Elem[operand, e, esize], unsigned) + round_const) >> shift;
    Elem[result, e, esize] = Elem[operand2, e, esize] + element<esize-1:0>;
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
SSUBL, SSUBL2

Signed Subtract Long. This instruction subtracts each vector element in the lower or upper half of the second source SIMD&FP register from the corresponding vector element of the first source SIMD&FP register, places the results into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are signed integer values. The destination vector elements are twice as long as the source vector elements.

The SSUBL instruction extracts each source vector from the lower half of each source register, while the SSUBL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

ST2 (multiple structures)

Store multiple 2-element structures from two registers. This instruction stores multiple 2-element structures from two SIMD&FP registers to memory, with interleaving. Every element of each register is stored. Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: No offset and Post-index

No offset

</tr>
<tr>
<td>11</td>
<td>0</td>
<td>RESERVED</td>
</tr>
<tr>
<td>11</td>
<td>1</td>
<td>2D</td>
</tr>
</tbody>
</table>

<Vt2> is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.
<Xn|SP> is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm> is the post-index immediate offset, encoded in "Q":
<table>
<thead>
<tr>
<th>Q</th>
<th>&lt;imm&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>#16</td>
</tr>
<tr>
<td>1</td>
<td>#32</td>
</tr>
</tbody>
</table>

<Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the “Rm” field.

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
ST4 (multiple structures)

Store multiple 4-element structures from four registers. This instruction stores multiple 4-element structures to memory from four SIMD&FP registers, with interleaving. Every element of each register is stored. Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: No offset and Post-index

No offset

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
STNP (SIMD&FP)

Store Pair of SIMD&FP registers, with Non-temporal hint. This instruction stores a pair of SIMD&FP registers to memory, issuing a hint to the memory system that the access is non-temporal. The address used for the store is calculated from an address from a base register value and an immediate offset. For information about non-temporal pair instructions, see Load/Store SIMD and Floating-point Non-temporal pair.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

32-bit (opc == 00)

STNP <St1>, <St2>, [<Xn|SP>{, #<imm>}]

64-bit (opc == 01)

STNP <Dt1>, <Dt2>, [<Xn|SP>{, #<imm>}]  // Empty.

128-bit (opc == 10)

STNP <Qt1>, <Qt2>, [<Xn|SP>{, #<imm>}]  // Empty.

Assembler Symbols

<Dt1> Is the 64-bit name of the first SIMD&FP register to be transferred, encoded in the "Rt" field.
<Dt2> Is the 64-bit name of the second SIMD&FP register to be transferred, encoded in the "Rt2" field.
<Qt1> Is the 128-bit name of the first SIMD&FP register to be transferred, encoded in the "Rt" field.
<Qt2> Is the 128-bit name of the second SIMD&FP register to be transferred, encoded in the "Rt2" field.
<St1> Is the 32-bit name of the first SIMD&FP register to be transferred, encoded in the "Rt" field.
<St2> Is the 32-bit name of the second SIMD&FP register to be transferred, encoded in the "Rt2" field.
<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm> For the 32-bit variant: is the optional signed immediate byte offset, a multiple of 4 in the range -256 to 252, defaulting to 0 and encoded in the "imm7" field as <imm>/4.
For the 64-bit variant: is the optional signed immediate byte offset, a multiple of 8 in the range -512 to 504, defaulting to 0 and encoded in the "imm7" field as <imm>/8.
For the 128-bit variant: is the optional signed immediate byte offset, a multiple of 16 in the range -1024 to 1008, defaulting to 0 and encoded in the "imm7" field as <imm>/16.

Shared Decode

```plaintext

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
STR (immediate, SIMD&FP)

Store SIMD&FP register (immediate offset). This instruction stores a single SIMD&FP register to memory. The
address that is used for the store is calculated from a base register value and an immediate offset.
Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and
Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 3 classes: Post-index, Pre-index and Unsigned offset

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

**Operation**

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bite eso) element1;
bite eso) element2;
for e = 0 to elements-1
    element1 = Elem[operand1, e, eso];
    element2 = Elem[operand2, e, eso];
    if sub_op then
        Elem[result, e, eso] = element1 - element2;
    else
        Elem[result, e, eso] = element1 + element2;
V[d] = result;
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
**SUBHN, SUBHN2**

Subtract returning High Narrow. This instruction subtracts each vector element in the second source SIMD&FP register from the corresponding vector element in the first source SIMD&FP register, places the most significant half of the result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. All the values in this instruction are signed integer values.

The results are truncated. For rounded results, see `RSUBHN`.

The `SUBHN` instruction writes the vector to the lower half of the destination register and clears the upper half, while the `SUBHN2` instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the `CPACR_EL1`, `CPTR_EL2`, and `CPTR_EL3` registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

    Elem[result, e, esize] = sum<2*esize-1:esize>;
Vpart[d, part] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
SUDOT (by element)

Dot product index form with signed and unsigned integers. This instruction performs the dot product of the four signed 8-bit integer values in each 32-bit element of the first source register with the four unsigned 8-bit integer values in an indexed 32-bit element of the second source register, accumulating the result into the corresponding 32-bit element of the destination vector.

From Armv8.2 to Armv8.5, this is an optional instruction. From Armv8.6 it is mandatory for implementations that include Advanced SIMD to support it. \textit{ID\_AA64ISAR1\_EL1}.I8MM indicates whether this instruction is supported.

Vector
(Armv8.6)

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

\quad \texttt{\texttt{Elem}[\text{result}, e, 32] = \text{res};}
\texttt{\mathbf{V}[d] = \text{result};}
SUQADD

Signed saturating Accumulate of Unsigned value. This instruction adds the unsigned integer values of the vector elements in the source SIMD&FP register to corresponding signed integer values of the vector elements in the destination SIMD&FP register, and writes the resulting signed integer values to the destination SIMD&FP register. If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |

SXTL, SXTL2

Signed extend Long. This instruction duplicates each vector element in the lower or upper half of the source SIMD&FP register into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements. All the values in this instruction are signed integer values. The SXTL instruction extracts the source vector from the lower half of the source register, while the SXTL2 instruction extracts the source vector from the upper half of the source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This is an alias of SSSHLL, SSSHLL2. This means:

- The encodings in this description are named to match the encodings of SSSHLL, SSSHLL2.
- The description of SSSHLL, SSSHLL2 gives the operational pseudocode for this instruction.

$$\begin{array}{cccccccccccc}
\hline
& Q & 0 & 1 & 1 & 1 & 1 & 0 & != 0000 & 0 & 0 & 0 & 1 & 0 & 0 & 1 & 0 & Rn & Rd & U & immh & immb
\end{array}$$

SXTL{2} <Vd>.<Ta>, <Vn>.<Tb>

is equivalent to

SSHL{2} <Vd>.<Ta>, <Vn>.<Tb>, #0

and is the preferred disassembly when BitCount(immh) == 1.

Assembler Symbols

2  

Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in "Q":

$$\begin{array}{c|c}
\text{Q} & \text{2} \\
\hline
0 & [\text{absent}] \\
1 & [\text{present}] \\
\end{array}$$

<Vd>  

Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta>  

Is an arrangement specifier, encoded in "immh":

$$\begin{array}{c|c}
\text{immh} & \text{<Ta>} \\
\hline
0000 & \text{SEE Advanced SIMD modified immediate} \\
0001 & 8H \\
001x & 4S \\
01xx & 2D \\
1xxx & \text{RESERVED} \\
\end{array}$$

<Vn>  

Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Tb>  

Is an arrangement specifier, encoded in “immh:Q”:

$$\begin{array}{c|c|c|c}
\text{immh} & \text{Q} & \text{<Tb>} \\
\hline
0000 & x & \text{SEE Advanced SIMD modified immediate} \\
0001 & 0 & 8B \\
0001 & 1 & 16B \\
001x & 0 & 4H \\
001x & 1 & 8H \\
01xx & 0 & 2S \\
01xx & 1 & 4S \\
1xxx & x & \text{RESERVED} \\
\end{array}$$

Operation

The description of SSSHLL, SSSHLL2 gives the operational pseudocode for this instruction.
Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
Table vector Lookup. This instruction reads each value from the vector elements in the index source SIMD&FP register, uses each result as an index to perform a lookup in a table of bytes that is described by one to four source table SIMD&FP registers, places the lookup result in a vector, and writes the vector to the destination SIMD&FP register. If an index is out of range for the table, the result for that lookup is 0. If more than one source register is used to describe the table, the first source register describes the lowest bytes of the table.

Depending on the settings in the `CPACR_EL1`, `CPTR_EL2`, and `CPTR_EL3` registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

</tr>
</tbody>
</table>

- `<Vn>` for the four register table, three register table and two register table variant: is the name of the first SIMD&FP table register, encoded in the "Rn" field.
  
  For the single register table variant: is the name of the SIMD&FP table register, encoded in the "Rn" field.

- `<Vn+1>` is the name of the second SIMD&FP table register, encoded as "Rn" plus 1 modulo 32.
- `<Vn+2>` is the name of the third SIMD&FP table register, encoded as "Rn" plus 2 modulo 32.
- `<Vn+3>` is the name of the fourth SIMD&FP table register, encoded as "Rn" plus 3 modulo 32.
- `<Vm>` is the name of the SIMD&FP index register, encoded in the "Rm" field.
Operation

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) indices = V[m];
bits(128*regs) table = Zeros();
bits(datasize) result;
integer index;

// Create table from registers
for i = 0 to regs-1
    table<128*i+127:128*i> = V[n];
    n = (n + 1) MOD 32;

result = if is tbl then Zeros() else V[d];
for i = 0 to elements-1
    index = UInt(Elem[indices, i, 8]);
    if index < 16 * regs then
        Elem[result, i, 8] = Elem[table, index, 8];
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
Table vector lookup extension. This instruction reads each value from the vector elements in the index source SIMD&FP register, uses each result as an index to perform a lookup in a table of bytes that is described by one to four source table SIMD&FP registers, places the lookup result in a vector, and writes the vector to the destination SIMD&FP register. If an index is out of range for the table, the existing value in the vector element of the destination register is left unchanged. If more than one source register is used to describe the table, the first source register describes the lowest bytes of the table.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

<Vn> For the four register table, three register table and two register table variant: is the name of the first SIMD&FP table register, encoded in the "Rn" field.
For the single register table variant: is the name of the SIMD&FP table register, encoded in the "Rn" field.

<Vn+1> Is the name of the second SIMD&FP table register, encoded as "Rn" plus 1 modulo 32.
<Vn+2> Is the name of the third SIMD&FP table register, encoded as "Rn" plus 2 modulo 32.
<Vn+3> Is the name of the fourth SIMD&FP table register, encoded as "Rn" plus 3 modulo 32.
<Vm> Is the name of the SIMD&FP index register, encoded in the "Rm" field.
Operation

CheckFPAdvSIMDEnabled64();
bits(datasize) indices = V[m];
bits(128*regs) table = Zeros();
bits(datasize) result;
integer index;

// Create table from registers
for i = 0 to regs-1
   table<128*i+127:128*i> = V[n];
   n = (n + 1) MOD 32;
result = if is_tbl then Zeros() else V[d];
for i = 0 to elements-1
   index = UInt(Elem[indices, i, 8]);
   if index < 16 * regs then
      Elem[result, i, 8] = Elem[table, index, 8];
V[d] = result;

Operational information

If PSTATE.DIT is 1:
   • The execution time of this instruction is independent of:
      ◦ The values of the data supplied in any of its registers.
      ◦ The values of the NZCV flags.
   • The response of this instruction to asynchronous exceptions does not vary based on:
      ◦ The values of the data supplied in any of its registers.
      ◦ The values of the NZCV flags.
**TRN1**

Transpose vectors (primary). This instruction reads corresponding even-numbered vector elements from the two source SIMD&FP registers, starting at zero, places each result into consecutive elements of a vector, and writes the vector to the destination SIMD&FP register. Vector elements from the first source register are placed into even-numbered elements of the destination vector, starting at zero, while vector elements from the second source register are placed into odd-numbered elements of the destination vector.

By using this instruction with TRN2, a 2 x 2 matrix can be transposed. The following figure shows an example of the operation of TRN1 and TRN2 halfword operations where Q = 0.

![Example figure](image)

Depending on the settings in the `CPACR_EL1`, `CPTR_EL2`, and `CPTR_EL3` registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

UABAL, UABAL2

Unsigned Absolute difference and Accumulate Long. This instruction subtracts the vector elements in the lower or upper half of the second source SIMD&FP register from the corresponding vector elements of the first source SIMD&FP register, and accumulates the absolute values of the results into the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements. All the values in this instruction are unsigned integer values.

The UABAL instruction extracts each source vector from the lower half of each source register, while the UABAL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

```

Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
UADDLP

Unsigned Add Long Pairwise. This instruction adds pairs of adjacent unsigned integer values from the vector in the source SIMD&FP register, places the result into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

V[d] = sum<2*esize-1:0>;
```

Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
- The values of the data supplied in any of its registers.
- The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
UADDW, UADDW2

Unsigned Add Wide. This instruction adds the vector elements of the first source SIMD&FP register to the corresponding vector elements in the lower or upper half of the second source SIMD&FP register, places the result in a vector, and writes the vector to the SIMD&FP destination register. The vector elements of the destination register and the first source register are twice as long as the vector elements of the second source register. All the values in this instruction are unsigned integer values.

The UADDW instruction extracts vector elements from the lower half of the second source register, while the UADDW2 instruction extracts vector elements from the upper half of the second source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

UCVTF (vector, fixed-point)

Unsigned fixed-point Convert to Floating-point (vector). This instruction converts each element in a vector from fixed-point to floating-point using the rounding mode that is specified by the `FPCR`, and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in `FPCR`, the exception results in either a flag being set in `FPSR`, or a synchronous exception being generated. For more information, see `Floating-point exception traps`.

Depending on the settings in the `CPACR_EL1`, `CPTR_EL2`, and `CPTR_EL3` registers, and the Security state and Exception level in which the instruction is executed, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Operation

CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];

bits(esize) element;
FPCRTYPE fpcr = FPCR[];
boolean merge = elements == 1 && IsMerging(fpcr);
bites(128) result = if merge then V[d] else Zeros();

for e = 0 to elements - 1
    element = Elem[operand, e, esize];
    Elem[result, e, esize] = FixedToFP(element, fracbits, unsigned, fpcr, rounding);

V[d] = result;
UCVTF (vector, integer)

Unsigned integer Convert to Floating-point (vector). This instruction converts each element in a vector from an unsigned integer value to a floating-point value using the rounding mode that is specified by the FPCR, and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exception traps.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the Security state and Exception level in which the instruction is executed, an attempt to execute the instruction might be trapped.

It has encodings from 4 classes: Scalar half precision, Scalar single-precision and double-precision, Vector half precision and Vector single-precision and double-precision

Scalar half precision

UCVTF (scalar, fixed-point)

Unsigned fixed-point Convert to Floating-point (scalar). This instruction converts the unsigned value in the 32-bit or 64-bit general-purpose source register to a floating-point value using the rounding mode that is specified by the FPCR, and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exception traps.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the Security state and Exception level in which the instruction is executed, an attempt to execute the instruction might be trapped.

```
UCVTF (scalar, integer)

Unsigned integer Convert to Floating-point (scalar). This instruction converts the unsigned integer value in the
general-purpose source register to a floating-point value using the rounding mode that is specified by the FPCR, and
writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception
results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see
Floating-point exception traps.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and
Exception level, an attempt to execute the instruction might be trapped.

```
UDOT (by element)

Dot Product unsigned arithmetic (vector, by element). This instruction performs the dot product of the four 8-bit elements in each 32-bit element of the first source register with the four 8-bit elements of an indexed 32-bit element in the second source register, accumulating the result into the corresponding 32-bit element of the destination register. Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

In Armv8.2 and Armv8.3, this is an optional instruction. From Armv8.4 it is mandatory for all implementations to support it.

ID_AA64ISARO_EL1.DP indicates whether this instruction is supported.

Vector (Armv8.2)

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

**$<Vn>$**
Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

**$<Vm>$**
Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

**Operation**

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
integer element1;
integer element2;
integer maxmin;

for e = 0 to elements-1
    element1 = Int(Elem(operand1, e, esize), unsigned);
    element2 = Int(Elem(operand2, e, esize), unsigned);
    maxmin = if minimum then Min(element1, element2) else Max(element1, element2);
    Elem(result, e, esize) = maxmin<esize-1:0>;
V[d] = result;
```

**Operational information**

If $\text{PSTATE.DIT}$ is 1:
• The execution time of this instruction is independent of:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
UMAXP

Unsigned Maximum Pairwise. This instruction creates a vector by concatenating the vector elements of the first source SIMD&FP register after the vector elements of the second source SIMD&FP register, reads each pair of adjacent vector elements in the two source SIMD&FP registers, writes the largest of each pair of unsigned integer values into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the `CPACR_EL1`, `CPTR_EL2`, and `CPTR_EL3` registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

- **Assembler Symbols**
  - `<Vd>` is the name of the SIMD&FP destination register, encoded in the "Rd" field.
  - `<T>` is an arrangement specifier, encoded in "size:Q":
    - size | Q | <T>

UMINV
Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
UMLAL, UMLAL2 (by element)

Unsigned Multiply-Add Long (vector, by element). This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register and accumulates the results with the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

The UMLAL instruction extracts vector elements from the lower half of the first source register, while the UMLAL2 instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

```
integer idxdsize = if H == '1' then 128 else 64;
integer index;
bit Rmhi;
case size of
  when '01' index = UInt(H:L:M); Rmhi = '0';
  when '10' index = UInt(H:L); Rmhi = M;
  otherwise UNDEFINED;
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rmhi:Rm);
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;
boolean unsigned = (U == '1');
boolean sub_op = (o2 == '1');
```

Assembler Symbols

Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in "Q":

```
<table>
<thead>
<tr>
<th>Q</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>absent</td>
</tr>
<tr>
<td>1</td>

    Elem[result, e, 2*esize] = accum;
V[d] = result;

Operational information

If PSTATE.DIT is 1:
    • The execution time of this instruction is independent of:
        ◦ The values of the data supplied in any of its registers.
        ◦ The values of the NZCV flags.
    • The response of this instruction to asynchronous exceptions does not vary based on:
        ◦ The values of the data supplied in any of its registers.
        ◦ The values of the NZCV flags.
UMLSL, UMLSL2 (by element)

Unsigned Multiply-Subtract Long (vector, by element). This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register and subtracts the results from the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

The UMLSL instruction extracts vector elements from the lower half of the first source register, while the UMLSL2 instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Assembler Symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in "Q":

UMMLA (vector)

Unsigned 8-bit integer matrix multiply-accumulate. This instruction multiplies the 2x8 matrix of unsigned 8-bit integer values in the first source vector by the 8x2 matrix of unsigned 8-bit integer values in the second source vector. The resulting 2x2 32-bit integer matrix product is destructively added to the 32-bit integer matrix accumulator in the destination vector. This is equivalent to performing an 8-way dot product per destination element.

From Armv8.2 to Armv8.5, this is an optional instruction. From Armv8.6 it is mandatory for implementations that include Advanced SIMD to support it. ID_AA64ISAR1_EL1.18MM indicates whether this instruction is supported.

Vector
(Armv8.6)

![Matrix Multiplication Diagram]

  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

---

For the 64-reg, UMOV-64-reg variant: is the element index encoded in "imm5<4>".
UMULL, UMULL2 (by element)

Unsigned Multiply Long (vector, by element). This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

The UMULL instruction extracts vector elements from the lower half of the first source register, while the UMULL2 instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
**UMULL, UMULL2 (vector)**

Unsigned Multiply long (vector). This instruction multiplies corresponding vector elements in the lower or upper half of the two source SIMD&FP registers, places the result in a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied. All the values in this instruction are unsigned integer values.

The UMULL instruction extracts each source vector from the lower half of each source register, while the UMULL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
| 0 | Qi | 0 1 1 1 0 | size | 1 | Rm | 1 1 0 0 0 0 | Rn | Rd |

UMULL2{2} <Vd>, <Ta>, <Vn>, <Tb>, <Vm>, <Tb>
```

```plaintext
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;
boolean unsigned = (U == '1');
```

**Assembler Symbols**

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:

```
<table>
<thead>
<tr>
<th>Q</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>[absent]</td>
</tr>
<tr>
<td>1</td>
<td>[present]</td>
</tr>
</tbody>
</table>
```

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> Is an arrangement specifier, encoded in “size”:

```
<table>
<thead>
<tr>
<th>size</th>
<th>&lt;Ta&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>8H</td>
</tr>
<tr>
<td>01</td>
<td>4S</td>
</tr>
<tr>
<td>10</td>
<td>2D</td>
</tr>
<tr>
<td>11</td>
<td>RESERVED</td>
</tr>
</tbody>
</table>
```

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in “size:Q”:

```
<table>
<thead>
<tr>
<th>size</th>
<th>Q</th>
<th>&lt;Tb&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>0</td>
<td>8B</td>

</tr>
<tr>
<td>10</td>
<td>1</td>
<td>4S</td>
</tr>
<tr>
<td>11</td>
<td>x</td>
<td>RESERVED</td>
</tr>
</tbody>
</table>
```

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.
Operation

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part];
bits(datasize) operand2 = Vpart[m, part];
bits(2*datasize) result;
integer element1;
integer element2;
for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    Elem[result, e, 2*esize] = (element1*element2)<2*esize-1:0>;
V[d] = result;

Operational information

If PSTATE.DIT is 1:
  • The execution time of this instruction is independent of:
    ◦ The values of the data supplied in any of its registers.
    ◦ The values of the NZCV flags.
  • The response of this instruction to asynchronous exceptions does not vary based on:
    ◦ The values of the data supplied in any of its registers.
    ◦ The values of the NZCV flags.
UQADD

Unsigned saturating Add. This instruction adds the values of corresponding elements of the two source SIMD&FP registers, places the results into a vector, and writes the vector to the destination SIMD&FP register. If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

```
<table>
<thead>
<tr>

Unsigned saturating Rounding Shift Left (register). This instruction takes each vector element of the first source SIMD&FP register, shifts the vector element by a value from the least significant byte of the corresponding vector element of the second source SIMD&FP register, places the results into a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. Otherwise, it is a right shift. The results are rounded. For truncated results, see **UQSHL**.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit **FPSR.QC** is set.

Depending on the settings in the **CPACR_EL1**, **CPTR_EL2**, and **CPTR_EL3** registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: **Scalar** and **Vector**

Unsigned saturating Rounded Shift Right Narrow (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, puts the final result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The results are rounded. For truncated results, see UQRSHRN.

The UQRSHRN instruction writes the vector to the lower half of the destination register and clears the upper half, while the UQRSHRN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

UQSHL (register)

Unsigned saturating Shift Left (register). This instruction takes each element in the vector of the first source SIMD&FP register, shifts the element by a value from the least significant byte of the corresponding element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. Otherwise, it is a right shift. The results are truncated. For rounded results, see UQRSHL.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

UQSHRN, UQSHRN2

Unsigned saturating Shift Right Narrow (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, saturates each shifted result to a value that is half the original width, puts the final result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The results are truncated. For rounded results, see UQRSHRN.

The UQSHRN instruction writes the vector to the lower half of the destination register and clears the upper half, while the UQSHRN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

**UQXTN, UQXTN2**

Unsigned saturating extract Narrow. This instruction reads each vector element from the source SIMD&FP register, saturates each value to half the original width, places the result into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are unsigned integer values.

If saturation occurs, the cumulative saturation bit \(\text{FPSR}.\text{QC}\) is set.

The \(\text{UQXTN}\) instruction writes the vector to the lower half of the destination register and clears the upper half, while the \(\text{UQXTN2}\) instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the \(\text{CPACR}_\text{EL1}, \text{CPTR}_\text{EL2},\) and \(\text{CPTR}_\text{EL3}\) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: **Scalar** and **Vector**

### Scalar

### Assembler Symbols

2  

Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in "Q":

\[
\begin{array}{c|c}
\text{Q} & 2 \\
\hline
0 & [\text{absent}] \\
1 & [\text{present}] \\
\end{array}
\]

\(<\text{Vd}>\)  

Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

\(<\text{Tb}>\)  

Is an arrangement specifier, encoded in "size:Q":

Copyright © 2010-2020 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.
**URHADD**

Unsigned Rounding Halving Add. This instruction adds corresponding unsigned integer values from the two source SIMD&FP registers, shifts each result right one bit, places the results into a vector, and writes the vector to the destination SIMD&FP register.

The results are rounded. For truncated results, see **UHADD**.

Depending on the settings in the **CPACR_EL1**, **CPTR_EL2**, and **CPTR_EL3** registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

The operand is encoded in the **{<Vd>,<T>}, <Vn>,<T>, <Vm>,<T>** fields.

- **<Vd>** is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- **<T>** is an arrangement specifier, encoded in "size:Q".
- **<Vn>** is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- **<Vm>** is the name of the second SIMD&FP source register, encoded in the "Rm" field.

**Operation**

```plaintext
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean unsigned = (U == '1');
```

```plaintext
integer element1;
integer element2;
for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    Elem[result, e, esize] = (element1+element2+1)<esize:1>;
V[d] = result;
```

**Assembler Symbols**

- **<Vd>** is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- **<T>** is an arrangement specifier, encoded in "size:Q".
- **<Vn>** is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- **<Vm>** is the name of the second SIMD&FP source register, encoded in the "Rm" field.
URSHL

Unsigned Rounding Shift Left (register). This instruction takes each element in the vector of the first source SIMD&FP register, shifts the vector element by a value from the least significant byte of the corresponding element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a rounding right shift. Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

### Scalar

**USDOT (by element)**

Dot Product index form with unsigned and signed integers. This instruction performs the dot product of the four unsigned 8-bit integer values in each 32-bit element of the first source register with the four signed 8-bit integer values in an indexed 32-bit element of the second source register, accumulating the result into the corresponding 32-bit element of the destination register.

From Armv8.2 to Armv8.5, this is an **OPTIONAL** instruction. From Armv8.6 it is mandatory for implementations that include Advanced SIMD to support it. *ID_AA64ISAR1_EL1*.I8MM indicates whether this instruction is supported.

**Vector**

USHL

Unsigned Shift Left (register). This instruction takes each element in the vector of the first source SIMD&FP register, shifts each element by a value from the least significant byte of the corresponding element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a truncating right shift. For a rounding shift, see USHR.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

<table>
<thead>
<tr>

V[d] = result;
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

Internal version only: isa v32.12, AdvSIMD v29.04, pseudocode v2020-09_xml, sve v2020-09_rc2b ; Build timestamp: 2020-09-30T23:12

**USHLL, USHLL2**

Unsigned Shift Left Long (immediate). This instruction reads each vector element in the lower or upper half of the source SIMD&FP register, shifts the unsigned integer value left by the specified number of bits, places the result into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements.

The USHLL instruction extracts vector elements from the lower half of the source register, while the USHLL2 instruction extracts vector elements from the upper half of the source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is used by the alias **UXTL, UXTL2**.

![Assembler Symbols]

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:

<table>
<thead>
<tr>
<th>Q</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>[absent]</td>

### Operation

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = Vpart[n, part];
bits(datasize*2) result;
integer element;

for e = 0 to elements-1
   element = Int(Elem[operand, e, esize], unsigned) << shift;
   Elem[result, e, 2*esize] = element<2*esize-1:0>;

V[d] = result;
```

### Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
USHR

Unsigned Shift Right (immediate). This instruction reads each vector element in the source SIMD&FP register, right
shifts each result by an immediate value, writes the final result to a vector, and writes the vector to the destination
SIMD&FP register. All the values in this instruction are unsigned integer values. The results are truncated. For
rounded results, see USHR.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and
Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Operation

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) operand2;
bits(datasize) result;
integer round_const = if round then (1 << (shift - 1)) else 0;
integer element;
operand2 = if accumulate then V[d] else Zeros();
for e = 0 to elements-1
  element = (Int(Elem[operand, e, esize], unsigned) + round_const) >> shift;
  Elem[result, e, esize] = Elem[operand2, e, esize] + element<esize-1:0>;
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
USMMLA (vector)

Unsigned and signed 8-bit integer matrix multiply-accumulate. This instruction multiplies the 2x8 matrix of unsigned 8-bit integer values in the first source vector by the 8x2 matrix of signed 8-bit integer values in the second source vector. The resulting 2x2 32-bit integer matrix product is destructively added to the 32-bit integer matrix accumulator in the destination vector. This is equivalent to performing an 8-way dot product per destination element. From Armv8.2 to Armv8.5, this is an OPTIONAL instruction. From Armv8.6 it is mandatory for implementations that include Advanced SIMD to support it. \textit{ID\_AA64ISAR1\_EL1}.I8MM indicates whether this instruction is supported.

Vector
(Armv8.6)

\end{verbatim}
**USQADD**

Unsigned saturating Accumulate of Signed value. This instruction adds the signed integer values of the vector elements in the source SIMD&FP register to corresponding unsigned integer values of the vector elements in the destination SIMD&FP register, and accumulates the resulting unsigned integer values with the vector elements of the destination SIMD&FP register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: **Scalar** and **Vector**

USRA

Unsigned Shift Right and Accumulate (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, and accumulates the final results with the vector elements of the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The results are truncated. For rounded results, see USRRA.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

```

### Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
USUBL, USUBL2

Unsigned Subtract Long. This instruction subtracts each vector element in the lower or upper half of the second source SIMD&FP register from the corresponding vector element of the first source SIMD&FP register, places the result into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The destination vector elements are twice as long as the source vector elements.

The USUBL instruction extracts each source vector from the lower half of each source register, while the USUBL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10  9  8  7  6  5  4  3  2  1  0

Operation

CheckFPAdvSIMDEnabled64();
bits(2*datasize) operand1 = V[n];
bits(datasize) operand2 = Vpart[m, part];
bits(2*datasize) result;
integer element1;
integer element2;
integer sum;

for e = 0 to elements-1
  element1 = Int(Elem[operand1, e, 2*esize], unsigned);
  element2 = Int(Elem[operand2, e, esize], unsigned);
  if sub_op then
    sum = element1 - element2;
  else
    sum = element1 + element2;
  Elem[result, e, 2*esize] = sum<2*esize-1:0>;
V[d] = result;

Operational information

If PSTATE.DIT is 1:
  • The execution time of this instruction is independent of:
    ◦ The values of the data supplied in any of its registers.
    ◦ The values of the NZCV flags.
  • The response of this instruction to asynchronous exceptions does not vary based on:
    ◦ The values of the data supplied in any of its registers.
    ◦ The values of the NZCV flags.
**UXTL, UXTL2**

Unsigned extend Long. This instruction copies each vector element from the lower or upper half of the source SIMD&FP register into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements.

The UXTL instruction extracts vector elements from the lower half of the source register, while the UXTL2 instruction extracts vector elements from the upper half of the source register.

Depending on the settings in the **CPACR_EL1, CPTR_EL2, and CPTR_EL3** registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This is an alias of **USHLL, USHLL2**. This means:

- The encodings in this description are named to match the encodings of **USHLL, USHLL2**.
- The description of **USHLL, USHLL2** gives the operational pseudocode for this instruction.

**Operation**

The description of **USHLL, USHLL2** gives the operational pseudocode for this instruction.
Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
UZP1

Unzip vectors (primary). This instruction reads corresponding even-numbered vector elements from the two source SIMD&FP registers, starting at zero, places the result from the first source register into consecutive elements in the lower half of a vector, and the result from the second source register into consecutive elements in the upper half of a vector, and writes the vector to the destination SIMD&FP register.

This instruction can be used with UZP2 to de-interleave two vectors.

The following figure shows an example of the operation of UZP1 and UZP2 with the arrangement specifier 8B.

```
Vn A7 A6 A5 A4 A3 A2 A1 A0
Vm B7 B6 B5 B4 B3 B2 B1 B0
```

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

```
0 Q 0 0 1 1 1 0 size 0 Rm 0 0 1 1 0 Rn 1 0 Rd
```

```
UZP1 <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
ninteger datasize = if Q == '1' then 128 else 64;
ninteger elements = datasize DIV esize;
ninteger part = UInt(op);
```

**Assembler Symbols**

- **<Vd>** Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- **<T>** Is an arrangement specifier, encoded in "size:Q":

<table>
<thead>
<tr>

</tbody>
</table>

- **<Vn>** Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- **<Vm>** Is the name of the second SIMD&FP source register, encoded in the "Rm" field.
**Operation**

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operandl = V[n];
bits(datasize) operandh = V[m];
bits(datasize) result;

bits(datasize*2) zipped = operandh:operandl;
for e = 0 to elements-1
    Elem[result, e, esize] = Elem[zipped, 2*e+part, esize];
```

```c
V[d] = result;
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
UZP2

Unzip vectors (secondary). This instruction reads corresponding odd-numbered vector elements from the two source SIMD&FP registers, places the result from the first source register into consecutive elements in the lower half of a vector, and the result from the second source register into consecutive elements in the upper half of a vector, and writes the vector to the destination SIMD&FP register.

This instruction can be used with UZP1 to de-interleave two vectors.

The following figure shows an example of the operation of UZP1 and UZP2 with the arrangement specifier 8B.

```
<table>
<thead>
<tr>
<th>Vd</th>

</tbody>
</table>
```

- `<Vn>` Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- `<Vm>` Is the name of the second SIMD&FP source register, encoded in the "Rm" field.
Operation

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operandl = V[n];
bits(datasize) operandh = V[m];
bits(datasize) result;

bits(datasize*2) zipped = operandh:operandl;
for e = 0 to elements-1
    Elem[result, e, esize] = Elem[zipped, 2*e+part, esize];
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
XAR

Exclusive OR and Rotate performs a bitwise exclusive OR of the 128-bit vectors in the two source SIMD&FP registers, rotates each 64-bit element of the resulting 128-bit vector right by the value specified by a 6-bit immediate value, and writes the result to the destination SIMD&FP register.

This instruction is implemented only when `FEAT_SHA3` is implemented.

### Advanced SIMD (Armv8.2)

```plaintext
<table>
<thead>

</tr>
</tbody>
</table>
```

**Operation**

```plaintext
XAR <Vd>.2D, <Vn>.2D, <Vm>.2D, #<imm6>

if !HaveSHA3Ext() then UNDEFINED;
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

Assembler Symbols

- `<Vd>` Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- `<Vn>` Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- `<Vm>` Is the name of the second SIMD&FP source register, encoded in the "Rm" field.
- `<imm6>` Is a rotation right, encoded in "imm6”.

```plaintext
AArch64.CheckFPAdvSIMDEnabled();

bits(128) Vm = V[m];
bits(128) Vn = V[n];
bits(128) tmp;
tmp = Vn EOR Vm;
V[d] = ROR(tmp<127:64>, UInt(imm6)):ROR(tmp<63:0>, UInt(imm6));
```

### Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
Extract Narrow. This instruction reads each vector element from the source SIMD&FP register, narrows each value to half the original width, places the result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. The destination vector elements are half as long as the source vector elements.

The XTN instruction writes the vector to the lower half of the destination register and clears the upper half, while the XTN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the \texttt{CPACR_EL1}, \texttt{CPTR_EL2}, and \texttt{CPTR_EL3} registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

\[
\begin{array}{ccccccccccccccc}

- \texttt{integer datasize = 64};
- \texttt{integer part = UInt(Q)};
- \texttt{integer elements = datasize \div esize};

\textbf{Assembler Symbols}

- \texttt{2} is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:
  
  \[
  \begin{array}{c|c}
  Q & 2 \\
  \hline
  0 & \text{[absent]} \\
  1 & \text{[present]} \\
  \end{array}
  \]

- \texttt{\langle Vd \rangle} is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- \texttt{\langle Tb \rangle} is an arrangement specifier, encoded in “size:Q”:
  
  \[
  \begin{array}{c|c|c}
  \text{size} & \text{Q} & \langle Tb \rangle \\
  \hline
  00 & 0 & 8B \\
  00 & 1 & 16B \\
  01 & 0 & 4H \\
  01 & 1 & 8H \\
  10 & 0 & 2S \\
  10 & 1 & 4S \\
  11 & x & \text{RESERVED} \\
  \end{array}
  \]

- \texttt{\langle Vn \rangle} is the name of the SIMD&FP source register, encoded in the "Rn" field.
- \texttt{\langle Ta \rangle} is an arrangement specifier, encoded in “size”:
  
  \[
  \begin{array}{c|c}
  \text{size} & \langle Ta \rangle \\
  \hline
  00 & 8H \\
  01 & 4S \\
  10 & 2D \\
  11 & \text{RESERVED} \\
  \end{array}
  \]
Operation

```c
CheckFPAdvSIMDEnabled64();
bias(2*datasize) operand = \text{V}[n];
bias(datasize) result;
bias(2*esize) element;

for e = 0 to elements-1
    element = \text{Elem}[\text{operand}, e, 2*esize];
    \text{Elem}[\text{result}, e, \text{esize}] = \text{element}<\text{esize}-1:0>;
\text{Vpart}[\text{d}, \text{part}] = \text{result};
```

Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

ZIP1

Zip vectors (primary). This instruction reads adjacent vector elements from the lower half of two source SIMD&FP
registers as pairs, interleaves the pairs and places them into a vector, and writes the vector to the destination
SIMD&FP register. The first pair from the first source register is placed into the two lowest vector elements, with
subsequent pairs taken alternately from each source register.

This instruction can be used with ZIP2 to interleave two vectors.

The following figure shows an example of the operation of ZIP1 and ZIP2 with the arrangement specifier 8B.

```
<table>
<thead>
<tr>
<th>Vm</th>
<th>A7</th>
<th>A6</th>
<th>A5</th>
<th>A4</th>

**ASR (immediate, unpredicated):** Arithmetic shift right by immediate (unpredicated).

**ASR (vectors):** Arithmetic shift right by vector (predicated).

**ASR (wide elements, predicated):** Arithmetic shift right by 64-bit wide elements (predicated).

**ASR (wide elements, unpredicated):** Arithmetic shift right by 64-bit wide elements (unpredicated).

**ASRD:** Arithmetic shift right for divide by immediate (predicated).

**ASRR:** Reversed arithmetic shift right by vector (predicated).

**BIC (immediate):** Bitwise clear bits using immediate (unpredicated): an alias of AND (immediate).

**BIC (vectors, predicated):** Bitwise clear vectors (predicated).

**BIC (vectors, unpredicated):** Bitwise clear vectors (unpredicated).

**BIC, BICS (predicates):** Bitwise clear predicates.

**BRKA, BRKAS:** Break after first true condition.

**BRKB, BRKBS:** Break before first true condition.

**BRKN, BRKNS:** Propagate break to next partition.

**BRKPA, BRKPAS:** Break after first true condition, propagating from previous partition.

**BRKPB, BRKPBS:** Break before first true condition, propagating from previous partition.

**CLASTA (scalar):** Conditionally extract element after last to general-purpose register.

**CLASTA (SIMD&FP scalar):** Conditionally extract element after last to SIMD&FP scalar register.

**CLASTA (vectors):** Conditionally extract element after last to vector register.

**CLASTB (scalar):** Conditionally extract last element to general-purpose register.

**CLASTB (SIMD&FP scalar):** Conditionally extract last element to SIMD&FP scalar register.

**CLASTB (vectors):** Conditionally extract last element to vector register.
CLS: Count leading sign bits (predicated).
CLZ: Count leading zero bits (predicated).

CMP<cc> (immediate): Compare vector to immediate.
CMP<cc> (vectors): Compare vectors.
CMP<cc> (wide elements): Compare vector to 64-bit wide elements.

CMPL (vectors): Compare signed less than or equal to vector, setting the condition flags: an alias of CMP<cc> (vectors).
CMPO (vectors): Compare unsigned lower than vector, setting the condition flags: an alias of CMP<cc> (vectors).
CMPS (vectors): Compare unsigned lower or same as vector, setting the condition flags: an alias of CMP<cc> (vectors).
CMPLT (vectors): Compare signed less than vector, setting the condition flags: an alias of CMP<cc> (vectors).

CNOT: Logically invert boolean condition in vector (predicated).

CNTB, CNTD, CNTH, CNTW: Set scalar to multiple of predicate constraint element count.
CNTP: Set scalar to count of true predicate elements.

COMPACT: Shuffle active elements of vector to the right and fill with zero.

CPY (immediate, merging): Copy signed integer immediate to vector elements (merging).
CPY (immediate, zeroing): Copy signed integer immediate to vector elements (zeroing).
CPY (scalar): Copy general-purpose register to vector elements (predicated).
CPY (SIMD&FP scalar): Copy SIMD&FP scalar register to vector elements (predicated).

CTERMEQ, CTERMNE: Compare and terminate loop.

DECB, DECD, DECH, DECW (scalar): Decrement scalar by multiple of predicate constraint element count.
DECD, DECH, DECW (vector): Decrement vector by multiple of predicate constraint element count.

DECP (scalar): Decrement scalar by count of true predicate elements.
DECP (vector): Decrement vector by count of true predicate elements.

DUP (immediate): Broadcast signed immediate to vector elements (unpredicated).
DUP (indexed): Broadcast indexed element to vector (unpredicated).
DUP (scalar): Broadcast general-purpose register to vector elements (unpredicated).
DUPM: Broadcast logical bitmask immediate to vector (unpredicated).

EQR: Bitwise exclusive OR with inverted immediate (unpredicated): an alias of EOR (immediate).
EOR (immediate): Bitwise exclusive OR with immediate (unpredicated).
EOR (vectors, predicated): Bitwise exclusive OR vectors (predicated).
EOR (vectors, unpredicated): Bitwise exclusive OR vectors (unpredicated).
EOR, EORS (predicates): Bitwise exclusive OR predicates.

FABD: Floating-point absolute difference (predicated).
**FABS**: Floating-point absolute value (predicated).

**FAC<cc>**: Floating-point absolute compare vectors.

**FACLE**: Floating-point absolute compare less than or equal: an alias of FAC<cc>.

**FACLT**: Floating-point absolute compare less than: an alias of FAC<cc>.

**FADD (immediate)**: Floating-point add immediate (predicated).

**FADD (vectors, predicated)**: Floating-point add vector (predicated).

**FADD (vectors, unpredicated)**: Floating-point add vector (unpredicated).

**FADDA**: Floating-point add strictly-ordered reduction, accumulating in scalar.

**FADDV**: Floating-point add recursive reduction to scalar.

**FCADD**: Floating-point complex add with rotate (predicated).

**FCM<cc> (vectors)**: Floating-point compare vectors.

**FCM<cc> (zero)**: Floating-point compare vector with zero.

**FCMLA (indexed)**: Floating-point complex multiply-add by indexed values with rotate.

**FCMLA (vectors)**: Floating-point complex multiply-add with rotate (predicated).

**FCMLE (vectors)**: Floating-point compare less than or equal to vector: an alias of FCM<cc> (vectors).

**FCMLT (vectors)**: Floating-point compare less than vector: an alias of FCM<cc> (vectors).

**FCPY**: Copy 8-bit floating-point immediate to vector elements (predicated).

**FCVT**: Floating-point convert precision (predicated).

**FCVTZS**: Floating-point convert to signed integer, rounding toward zero (predicated).

**FCVTZU**: Floating-point convert to unsigned integer, rounding toward zero (predicated).

**FDIV**: Floating-point divide by vector (predicated).

**FDIVR**: Floating-point reversed divide by vector (predicated).

**FDUP**: Broadcast 8-bit floating-point immediate to vector elements (unpredicated).

**FEXPA**: Floating-point exponential accelerator.

**FMAD**: Floating-point fused multiply-add vectors (predicated), writing multiplicand \( Z_{dn} = Z_a + Z_{dn} \times Z_m \).

**FMAX (immediate)**: Floating-point maximum with immediate (predicated).

**FMAX (vectors)**: Floating-point maximum (predicated).

**FMAXNM (immediate)**: Floating-point maximum number with immediate (predicated).

**FMAXNM (vectors)**: Floating-point maximum number (predicated).

**FMAXNMV**: Floating-point maximum number recursive reduction to scalar.

**FMAXV**: Floating-point maximum recursive reduction to scalar.

**FMIN (immediate)**: Floating-point minimum with immediate (predicated).

**FMIN (vectors)**: Floating-point minimum (predicated).

**FMINNM (immediate)**: Floating-point minimum number with immediate (predicated).

**FMINNM (vectors)**: Floating-point minimum number (predicated).

**FMINNNMV**: Floating-point minimum number recursive reduction to scalar.
**FMINV**: Floating-point minimum recursive reduction to scalar.

**FMLA (indexed)**: Floating-point fused multiply-add by indexed elements \((Zda = Zda + Zn \times Zm[\text{indexed}])\).

**FMLA (vectors)**: Floating-point fused multiply-add vectors (predicated), writing addend \([Zda = Zda + Zn \times Zm]\).

**FMLS (indexed)**: Floating-point fused multiply-subtract by indexed elements \((Zda = Zda + -Zn \times Zm[\text{indexed}])\).

**FMLS (vectors)**: Floating-point fused multiply-subtract vectors (predicated), writing addend \([Zda = Zda + -Zn \times Zm]\).

**FMOV (immediate, predicated)**: Move 8-bit floating-point immediate to vector elements (predicated): an alias of FCPY.

**FMOV (immediate, unpredicated)**: Move 8-bit floating-point immediate to vector elements (unpredicated): an alias of FDUP.

**FMOV (zero, predicated)**: Move floating-point +0.0 to vector elements (predicated): an alias of CPY (immediate, merging).

**FMOV (zero, unpredicated)**: Move floating-point +0.0 to vector elements (unpredicated): an alias of DUP (immediate).

**FMSB**: Floating-point fused multiply-subtract vectors (predicated), writing multiplicand \([Zdn = Za + -Zdn \times Zm]\).

**FMUL (immediate)**: Floating-point multiply by immediate (predicated).

**FMUL (indexed)**: Floating-point multiply by indexed elements.

**FMUL (vectors, predicated)**: Floating-point multiply vectors (predicated).

**FMUL (vectors, unpredicated)**: Floating-point multiply vectors (unpredicated).

**FMULX**: Floating-point multiply-extended vectors (predicated).

**FNEG**: Floating-point negate (predicated).

**FNMA**: Floating-point negated fused multiply-add vectors (predicated), writing multiplicand \([Zdn = -Za + -Zdn \times Zm]\).

**FNMLA**: Floating-point negated fused multiply-add vectors (predicated), writing addend \([Zda = -Zda + -Zn \times Zm]\).

**FNMLS**: Floating-point negated fused multiply-subtract vectors (predicated), writing addend \([Zda = -Zda + Zn \times Zm]\).

**FNMSB**: Floating-point negated fused multiply-subtract vectors (predicated), writing multiplicand \([Zdn = -Za + Zdn \times Zm]\).

**FRECPE**: Floating-point reciprocal estimate (unpredicated).

**FRECPS**: Floating-point reciprocal step (unpredicated).

**FRECPX**: Floating-point reciprocal exponent (predicated).

**FRINT<r>**: Floating-point round to integral value (predicated).

**FRSROTE**: Floating-point reciprocal square root estimate (unpredicated).

**FRSROTS**: Floating-point reciprocal square root step (unpredicated).

**FScale**: Floating-point adjust exponent by vector (predicated).

**FSORT**: Floating-point square root (predicated).

**FSUB (immediate)**: Floating-point subtract immediate (predicated).

**FSUB (vectors, predicated)**: Floating-point subtract vectors (predicated).

**FSUB (vectors, unpredicated)**: Floating-point subtract vectors (unpredicated).

**FSUBR (immediate)**: Floating-point reversed subtract from immediate (predicated).

**FSUBR (vectors)**: Floating-point reversed subtract vectors (predicated).

**FTMAD**: Floating-point trigonometric multiply-add coefficient.
**A64 -- SVE Instructions (alphabetic order)**

**FTSMUL**: Floating-point trigonometric starting value.

**FTSSEL**: Floating-point trigonometric select coefficient.

**INCB, INCD, INCH, INCW (scalar)**: Increment scalar by multiple of predicate constraint element count.

**INCD, INCH, INCW (vector)**: Increment vector by multiple of predicate constraint element count.

**INCP (scalar)**: Increment scalar by count of true predicate elements.

**INCP (vector)**: Increment vector by count of true predicate elements.

**INDEX (immediate, scalar)**: Create index starting from immediate and incremented by general-purpose register.

**INDEX (immediates)**: Create index starting from and incremented by immediate.

**INDEX (scalar, immediate)**: Create index starting from general-purpose register and incremented by immediate.

**INDEX (scalars)**: Create index starting from and incremented by general-purpose register.

**INSR (scalar)**: Insert general-purpose register in shifted vector.

**INSR (SIMD&FP scalar)**: Insert SIMD&FP scalar register in shifted vector.

**LASTA (scalar)**: Extract element after last to general-purpose register.

**LASTA (SIMD&FP scalar)**: Extract element after last to SIMD&FP scalar register.

**LASTB (scalar)**: Extract last element to general-purpose register.

**LASTB (SIMD&FP scalar)**: Extract last element to SIMD&FP scalar register.

**LD1B (scalar plus immediate)**: Contiguous load unsigned bytes to vector (immediate index).

**LD1B (scalar plus scalar)**: Contiguous load unsigned bytes to vector (scalar index).

**LD1B (scalar plus vector)**: Gather load unsigned bytes to vector (vector index).

**LD1B (vector plus immediate)**: Gather load unsigned bytes to vector (immediate index).

**LD1D (scalar plus immediate)**: Contiguous load doublewords to vector (immediate index).

**LD1D (scalar plus scalar)**: Contiguous load doublewords to vector (scalar index).

**LD1D (scalar plus vector)**: Gather load doublewords to vector (vector index).

**LD1D (vector plus immediate)**: Gather load doublewords to vector (immediate index).

**LD1H (scalar plus immediate)**: Contiguous load unsigned halfwords to vector (immediate index).

**LD1H (scalar plus scalar)**: Contiguous load unsigned halfwords to vector (scalar index).

**LD1H (scalar plus vector)**: Gather load unsigned halfwords to vector (vector index).

**LD1H (vector plus immediate)**: Gather load unsigned halfwords to vector (immediate index).

**LD1RB**: Load and broadcast unsigned byte to vector.

**LD1RD**: Load and broadcast doubleword to vector.

**LD1RH**: Load and broadcast unsigned halfword to vector.

**LD1ROB (scalar plus immediate)**: Contiguous load and replicate sixteen bytes (immediate index).

**LD1ROB (scalar plus scalar)**: Contiguous load and replicate sixteen bytes (scalar index).

**LD1ROD (scalar plus immediate)**: Contiguous load and replicate two doublewords (immediate index).

**LD1ROD (scalar plus scalar)**: Contiguous load and replicate two doublewords (scalar index).

**LD1ROH (scalar plus immediate)**: Contiguous load and replicate eight halfwords (immediate index).
**LD1RH (scalar plus scalar)**: Contiguous load and replicate eight halfwords (scalar index).

**LD1ROW (scalar plus immediate)**: Contiguous load and replicate four words (immediate index).

**LD1ROW (scalar plus scalar)**: Contiguous load and replicate four words (scalar index).

**LD1RSB**: Load and broadcast signed byte to vector.

**LD1RSH**: Load and broadcast signed halfword to vector.

**LD1RSW**: Load and broadcast signed word to vector.

**LD1RW**: Load and broadcast unsigned word to vector.

**LD1SB (scalar plus immediate)**: Contiguous load signed bytes to vector (immediate index).

**LD1SB (scalar plus scalar)**: Contiguous load signed bytes to vector (scalar index).

**LD1SB (scalar plus vector)**: Gather load signed bytes to vector (vector index).

**LD1SH (scalar plus immediate)**: Contiguous load signed halfwords to vector (immediate index).

**LD1SH (scalar plus scalar)**: Contiguous load signed halfwords to vector (scalar index).

**LD1SH (scalar plus vector)**: Gather load signed halfwords to vector (vector index).

**LD1SW (scalar plus immediate)**: Contiguous load signed words to vector (immediate index).

**LD1SW (scalar plus scalar)**: Contiguous load signed words to vector (scalar index).

**LD1SW (scalar plus vector)**: Gather load signed words to vector (vector index).

**LD1W (scalar plus immediate)**: Contiguous load unsigned words to vector (immediate index).

**LD1W (scalar plus scalar)**: Contiguous load unsigned words to vector (scalar index).

**LD1W (scalar plus vector)**: Gather load unsigned words to vector (vector index).

**LD2B (scalar plus immediate)**: Contiguous load two-byte structures to two vectors (immediate index).

**LD2B (scalar plus scalar)**: Contiguous load two-byte structures to two vectors (scalar index).

**LD2D (scalar plus immediate)**: Contiguous load two-doubleword structures to two vectors (immediate index).

**LD2D (scalar plus scalar)**: Contiguous load two-doubleword structures to two vectors (scalar index).

**LD2H (scalar plus immediate)**: Contiguous load two-halfword structures to two vectors (immediate index).

**LD2H (scalar plus scalar)**: Contiguous load two-halfword structures to two vectors (scalar index).

**LD2W (scalar plus immediate)**: Contiguous load two-word structures to two vectors (immediate index).

**LD2W (scalar plus scalar)**: Contiguous load two-word structures to two vectors (scalar index).

**LD3B (scalar plus immediate)**: Contiguous load three-byte structures to three vectors (immediate index).

**LD3B (scalar plus scalar)**: Contiguous load three-byte structures to three vectors (scalar index).

**LD3D (scalar plus immediate)**: Contiguous load three-doubleword structures to three vectors (immediate index).

**LD3D (scalar plus scalar)**: Contiguous load three-doubleword structures to three vectors (scalar index).

**LD3H (scalar plus immediate)**: Contiguous load three-halfword structures to three vectors (immediate index).

**LD3H (scalar plus scalar)**: Contiguous load three-halfword structures to three vectors (scalar index).
LD3H (scalar plus scalar): Contiguous load three-halfword structures to three vectors (scalar index).
LD3W (scalar plus immediate): Contiguous load three-word structures to three vectors (immediate index).
LD3W (scalar plus scalar): Contiguous load three-word structures to three vectors (scalar index).
LD4B (scalar plus immediate): Contiguous load four-byte structures to four vectors (immediate index).
LD4B (scalar plus scalar): Contiguous load four-byte structures to four vectors (scalar index).
LD4D (scalar plus immediate): Contiguous load four-doubleword structures to four vectors (immediate index).
LD4D (scalar plus scalar): Contiguous load four-doubleword structures to four vectors (scalar index).
LD4H (scalar plus immediate): Contiguous load four-halfword structures to four vectors (immediate index).
LD4H (scalar plus scalar): Contiguous load four-halfword structures to four vectors (scalar index).
LD4W (scalar plus immediate): Contiguous load four-word structures to four vectors (immediate index).
LD4W (scalar plus scalar): Contiguous load four-word structures to four vectors (scalar index).
LDFF1B (scalar plus scalar): Contiguous load first-fault unsigned bytes to vector (scalar index).
LDFF1B (scalar plus vector): Gather load first-fault unsigned bytes to vector (vector index).
LDFF1B (vector plus immediate): Gather load first-fault unsigned bytes to vector (immediate index).
LDFF1D (scalar plus scalar): Contiguous load first-fault doublewords to vector (scalar index).
LDFF1D (scalar plus vector): Gather load first-fault doublewords to vector (vector index).
LDFF1D (vector plus immediate): Gather load first-fault doublewords to vector (immediate index).
LDFF1H (scalar plus scalar): Contiguous load first-fault unsigned halfwords to vector (scalar index).
LDFF1H (scalar plus vector): Gather load first-fault unsigned halfwords to vector (vector index).
LDFF1H (vector plus immediate): Gather load first-fault unsigned halfwords to vector (immediate index).
LDFF1SB (scalar plus scalar): Contiguous load first-fault signed bytes to vector (scalar index).
LDFF1SB (scalar plus vector): Gather load first-fault signed bytes to vector (vector index).
LDFF1SB (vector plus immediate): Gather load first-fault signed bytes to vector (immediate index).
LDFF1SH (scalar plus scalar): Contiguous load first-fault signed halfwords to vector (scalar index).
LDFF1SH (scalar plus vector): Gather load first-fault signed halfwords to vector (vector index).
LDFF1SH (vector plus immediate): Gather load first-fault signed halfwords to vector (immediate index).
LDFF1SW (scalar plus scalar): Contiguous load first-fault signed words to vector (scalar index).
LDFF1SW (scalar plus vector): Gather load first-fault signed words to vector (vector index).
LDFF1SW (vector plus immediate): Gather load first-fault signed words to vector (immediate index).
LDFF1W (scalar plus scalar): Contiguous load first-fault unsigned words to vector (scalar index).
LDFF1W (scalar plus vector): Gather load first-fault unsigned words to vector (vector index).
LDFF1W (vector plus immediate): Gather load first-fault unsigned words to vector (immediate index).
LDNF1B: Contiguous load non-fault unsigned bytes to vector (immediate index).
LDNF1D: Contiguous load non-fault doublewords to vector (immediate index).
LDNF1H: Contiguous load non-fault unsigned halfwords to vector (immediate index).
LDNF1SB: Contiguous load non-fault signed bytes to vector (immediate index).
**LDNF1SH**: Contiguous load non-fault signed halfwords to vector (immediate index).

**LDNF1SW**: Contiguous load non-fault signed words to vector (immediate index).

**LDNF1W**: Contiguous load non-fault unsigned words to vector (immediate index).

**LDNT1B (scalar plus immediate)**: Contiguous load non-temporal bytes to vector (immediate index).

**LDNT1B (scalar plus scalar)**: Contiguous load non-temporal bytes to vector (scalar index).

**LDNT1D (scalar plus immediate)**: Contiguous load non-temporal doublewords to vector (immediate index).

**LDNT1D (scalar plus scalar)**: Contiguous load non-temporal doublewords to vector (scalar index).

**LDNT1H (scalar plus immediate)**: Contiguous load non-temporal halfwords to vector (immediate index).

**LDNT1H (scalar plus scalar)**: Contiguous load non-temporal halfwords to vector (scalar index).

**LDNT1W (scalar plus immediate)**: Contiguous load non-temporal words to vector (immediate index).

**LDNT1W (scalar plus scalar)**: Contiguous load non-temporal words to vector (scalar index).

**LDR (predicate)**: Load predicate register.

**LDR (vector)**: Load vector register.

**LSL (immediate, predicated)**: Logical shift left by immediate (predicated).

**LSL (immediate, unpredicated)**: Logical shift left by immediate (unpredicated).

**LSL (vectors)**: Logical shift left by vector (predicated).

**LSL (wide elements, predicated)**: Logical shift left by 64-bit wide elements (predicated).

**LSL (wide elements, unpredicated)**: Logical shift left by 64-bit wide elements (unpredicated).

**LSLR**: Reversed logical shift left by vector (predicated).

**LSR (immediate, predicated)**: Logical shift right by immediate (predicated).

**LSR (immediate, unpredicated)**: Logical shift right by immediate (unpredicated).

**LSR (vectors)**: Logical shift right by vector (predicated).

**LSR (wide elements, predicated)**: Logical shift right by 64-bit wide elements (predicated).

**LSR (wide elements, unpredicated)**: Logical shift right by 64-bit wide elements (unpredicated).

**LSRR**: Reversed logical shift right by vector (predicated).

**MAD**: Multiply-add vectors (predicated), writing multiplicand \([Zdn = Za + Zdn \times Zm]\).

**MLA**: Multiply-add vectors (predicated), writing addend \([Zda = Zda + Zn \times Zm]\).

**MLS**: Multiply-subtract vectors (predicated), writing addend \([Zda = Zda - Zn \times Zm]\).

**MOV (bitmask immediate)**: Move logical bitmask immediate to vector (unpredicated): an alias of DUPM.

**MOV (immediate, predicated, merging)**: Move signed integer immediate to vector elements (merging): an alias of CPY (immediate, merging).

**MOV (immediate, predicated, zeroing)**: Move signed integer immediate to vector elements (zeroing): an alias of CPY (immediate, zeroing).

**MOV (immediate, unpredicated)**: Move signed immediate to vector elements (unpredicated): an alias of DUP (immediate).

**MOV (predicate, predicated, merging)**: Move predicates (merging): an alias of SEL (predicates).

**MOV (predicate, predicated, zeroing)**: Move predicates (zeroing): an alias of AND, ANDS (predicates).

**MOV (predicate, unpredicated)**: Move predicate (unpredicated): an alias of ORR, ORRS (predicates).
MOV (scalar, predicated): Move general-purpose register to vector elements (predicated): an alias of CPY (scalar).

MOV (scalar, unpredicated): Move general-purpose register to vector elements (unpredicated): an alias of DUP (scalar).

MOV (SIMD&FP scalar, unpredicated): Move indexed element or SIMD&FP scalar to vector (unpredicated): an alias of DUP (indexed).

MOVPREFIX (predicated): Move prefix (predicated).

MOVPREFIX (unpredicated): Move prefix (unpredicated).

MOVPS (predicated): Move predicates (zeroing), setting the condition flags: an alias of AND, ANDS (predicates).

MOVPS (unpredicated): Move predicate (unpredicated), setting the condition flags: an alias of ORR, ORRS (predicates).

MSB: Multiply-subtract vectors (predicated), writing multiplicand \([Zdn = Za - Zdn \times Zm]\).

MUL (immediate): Multiply by immediate (unpredicated).

MUL (vectors): Multiply vectors (predicated).

NAND, NANDS: Bitwise NAND predicates.

NEG: Negate (predicated).

NOR, NORS: Bitwise NOR predicates.

NOT (predicate): Bitwise invert predicate: an alias of EOR, EORS (predicates).

NOT (vector): Bitwise invert vector (predicated).

NOTS: Bitwise invert predicate, setting the condition flags: an alias of EOR, EORS (predicates).

OR (immediate): Bitwise inclusive OR with inverted immediate (unpredicated): an alias of ORR (immediate).

OR, ORS (predicates): Bitwise inclusive OR inverted predicate.

OR (immediate): Bitwise inclusive OR with immediate (unpredicated).

OR (vectors, predicated): Bitwise inclusive OR vectors (predicated).

OR (vectors, unpredicated): Bitwise inclusive OR vectors (unpredicated).

OR, ORS (predicates): Bitwise inclusive OR predicate.

ORV: Bitwise inclusive OR reduction to scalar.

PFALSE: Set all predicate elements to false.

PFIRST: Set the first active predicate element to true.

PNEXT: Find next active predicate.

PRFS (scalar plus immediate): Contiguous prefetch bytes (immediate index).

PRFS (scalar plus scalar): Contiguous prefetch bytes (scalar index).

PRFS (scalar plus vector): Gather prefetch bytes (scalar plus vector).

PRFS (vector plus immediate): Gather prefetch bytes (vector plus immediate).

PRFS (scalar plus immediate): Contiguous prefetch doublewords (immediate index).

PRFS (scalar plus scalar): Contiguous prefetch doublewords (scalar index).
PRFD (scalar plus vector): Gather prefetch doublewords (scalar plus vector).
PRFD (vector plus immediate): Gather prefetch doublewords (vector plus immediate).
PRFH (vector plus immediate): Contiguous prefetch halfwords (vector plus immediate).
PRFH (scalar plus immediate): Contiguous prefetch halfwords (immediate index).
PRFH (scalar plus vector): Gather prefetch halfwords (scalar plus vector).
PRFH (vector plus immediate): Gather prefetch halfwords (vector plus immediate).
PRFW (scalar plus immediate): Contiguous prefetch words (immediate index).
PRFW (scalar plus scalar): Contiguous prefetch words (scalar index).
PRFW (scalar plus vector): Gather prefetch words (scalar plus vector).
PRFW (vector plus immediate): Gather prefetch words (vector plus immediate).
PTEST: Set condition flags for predicate.
PTRUE, PTRUES: Initialise predicate from named constraint.
PUNPKHI, PUNPKLO: Unpack and widen half of predicate.
RBIT: Reverse bits (predicated).
RDFFR (unpredicated): Read the first-fault register.
RDFFR, RDFFRS (predicated): Return predicate of successfully loaded elements.
RDVL: Read multiple of vector register size to scalar register.
REV (predicate): Reverse all elements in a predicate.
REV (vector): Reverse all elements in a vector (unpredicated).
REVB, REVH, REVW: Reverse bytes / halfwords / words within elements (predicated).
SABD: Signed absolute difference (predicated).
SADDV: Signed add reduction to scalar.
SCVTF: Signed integer convert to floating-point (predicated).
SDIV: Signed divide (predicated).
SDIVR: Signed reversed divide (predicated).
SDOT (indexed): Signed integer indexed dot product.
SDOT (vectors): Signed integer dot product.
SEL (predicates): Conditionally select elements from two predicates.
SEL (vectors): Conditionally select elements from two vectors.
SETFFR: Initialise the first-fault register to all true.
SMAX (immediate): Signed maximum with immediate (unpredicated).
SMAX (vectors): Signed maximum vectors (predicated).
SMAXV: Signed maximum reduction to scalar.
SMIN (immediate): Signed minimum with immediate (unpredicated).
SMIN (vectors): Signed minimum vectors (predicated).
SMINV: Signed minimum reduction to scalar.
SMULH: Signed multiply returning high half (predicated).

SPLICE: Splice two vectors under predicate control.

SQADD (immediate): Signed saturating add immediate (unpredicated).

SQADD (vectors): Signed saturating add vectors (unpredicated).

SQDECB: Signed saturating decrement scalar by multiple of 8-bit predicate constraint element count.

SQDECD (scalar): Signed saturating decrement scalar by multiple of 64-bit predicate constraint element count.

SQDECD (vector): Signed saturating decrement vector by multiple of 64-bit predicate constraint element count.

SQDECH (scalar): Signed saturating decrement scalar by multiple of 16-bit predicate constraint element count.

SQDECH (vector): Signed saturating decrement vector by multiple of 16-bit predicate constraint element count.

SQDECP (scalar): Signed saturating decrement scalar by count of true predicate elements.

SQDECP (vector): Signed saturating decrement vector by count of true predicate elements.

SQINCB: Signed saturating increment scalar by multiple of 8-bit predicate constraint element count.

SQINCD (scalar): Signed saturating increment scalar by multiple of 64-bit predicate constraint element count.

SQINCD (vector): Signed saturating increment vector by multiple of 64-bit predicate constraint element count.

SQINCH (scalar): Signed saturating increment scalar by multiple of 16-bit predicate constraint element count.

SQINCH (vector): Signed saturating increment vector by multiple of 16-bit predicate constraint element count.

SQINCP (scalar): Signed saturating increment scalar by count of true predicate elements.

SQINCP (vector): Signed saturating increment vector by count of true predicate elements.

SQINCW (scalar): Signed saturating increment scalar by multiple of 32-bit predicate constraint element count.

SQINCW (vector): Signed saturating increment vector by multiple of 32-bit predicate constraint element count.

SQSUB (immediate): Signed saturating subtract immediate (unpredicated).

SQSUB (vectors): Signed saturating subtract vectors (unpredicated).

ST1B (scalar plus immediate): Contiguous store bytes from vector (immediate index).

ST1B (scalar plus scalar): Contiguous store bytes from vector (scalar index).

ST1B (scalar plus vector): Scatter store bytes from a vector (vector index).

ST1B (vector plus immediate): Scatter store bytes from a vector (immediate index).

ST1D (scalar plus immediate): Contiguous store doublewords from vector (immediate index).

ST1D (scalar plus scalar): Contiguous store doublewords from vector (scalar index).

ST1D (scalar plus vector): Scatter store doublewords from a vector (vector index).

ST1D (vector plus immediate): Scatter store doublewords from a vector (immediate index).

ST1H (scalar plus immediate): Contiguous store halfwords from vector (immediate index).

ST1H (scalar plus scalar): Contiguous store halfwords from vector (scalar index).

ST1H (scalar plus vector): Scatter store halfwords from a vector (vector index).

ST1H (vector plus immediate): Scatter store halfwords from a vector (immediate index).
ST1W (scalar plus immediate): Contiguous store words from vector (immediate index).
ST1W (scalar plus scalar): Contiguous store words from vector (scalar index).
ST1W (scalar plus vector): Scatter store words from a vector (vector index).
ST1W (vector plus immediate): Scatter store words from a vector (immediate index).
ST2B (scalar plus immediate): Contiguous store two-byte structures from two vectors (immediate index).
ST2B (scalar plus scalar): Contiguous store two-byte structures from two vectors (scalar index).
ST2D (scalar plus immediate): Contiguous store two-doubleword structures from two vectors (immediate index).
ST2D (scalar plus scalar): Contiguous store two-doubleword structures from two vectors (scalar index).
ST2H (scalar plus immediate): Contiguous store two-halfword structures from two vectors (immediate index).
ST2H (scalar plus scalar): Contiguous store two-halfword structures from two vectors (scalar index).
ST2W (scalar plus immediate): Contiguous store two-word structures from two vectors (immediate index).
ST2W (scalar plus scalar): Contiguous store two-word structures from two vectors (scalar index).
ST3B (scalar plus immediate): Contiguous store three-byte structures from three vectors (immediate index).
ST3B (scalar plus scalar): Contiguous store three-byte structures from three vectors (scalar index).

**A64 -- SVE Instructions (alphabetic order)**

- **STR (predicate):** Store predicate register.
- **STR (vector):** Store vector register.
- **SUB (immediate):** Subtract immediate (unpredicated).
- **SUB (vectors, predicated):** Subtract vectors (predicated).
- **SUB (vectors, unpredicated):** Subtract vectors (unpredicated).
- **SUBR (immediate):** Reversed subtract from immediate (unpredicated).
- **SUBR (vectors):** Reversed subtract vectors (predicated).
- **SUNPKHI, SUNPKLO:** Signed unpack and extend half of vector.
- **SXTB, SXTH, SXTW:** Signed byte / halfword / word extend (predicated).
- **TBL:** Programmable table lookup in single vector table.
- **TRN1, TRN2 (predicates):** Interleave even or odd elements from two predicates.
- **TRN1, TRN2 (vectors):** Interleave even or odd elements from two vectors.
- **UABD:** Unsigned absolute difference (predicated).
- **UADDV:** Unsigned add reduction to scalar.
- **UCVTF:** Unsigned integer convert to floating-point (predicated).
- **UDIV:** Unsigned divide (predicated).
- **UDIVR:** Unsigned reversed divide (predicated).
- **UDOT (indexed):** Unsigned integer indexed dot product.
- **UDOT (vectors):** Unsigned integer dot product.
- **UMAX (immediate):** Unsigned maximum with immediate (unpredicated).
- **UMAX (vectors):** Unsigned maximum vectors (predicated).
- **UMAXV:** Unsigned maximum reduction to scalar.
- **UMIN (immediate):** Unsigned minimum with immediate (unpredicated).
- **UMIN (vectors):** Unsigned minimum vectors (predicated).
- **UMINV:** Unsigned minimum reduction to scalar.
- **UMULH:** Unsigned multiply returning high half (predicated).
- **UQADD (immediate):** Unsigned saturating add immediate (unpredicated).
- **UQADD (vectors):** Unsigned saturating add vectors (unpredicated).
- **UQDECB:** Unsigned saturating decrement scalar by multiple of 8-bit predicate constraint element count.
- **UQDECD (scalar):** Unsigned saturating decrement scalar by multiple of 64-bit predicate constraint element count.
- **UQDECD (vector):** Unsigned saturating decrement vector by multiple of 64-bit predicate constraint element count.
- **UQDECH (scalar):** Unsigned saturating decrement scalar by multiple of 16-bit predicate constraint element count.
- **UQDECH (vector):** Unsigned saturating decrement vector by multiple of 16-bit predicate constraint element count.
- **UQDECP (scalar):** Unsigned saturating decrement scalar by count of true predicate elements.
- **UQDECP (vector):** Unsigned saturating decrement vector by count of true predicate elements.
- **UQDECW (scalar):** Unsigned saturating decrement scalar by multiple of 32-bit predicate constraint element count.
UQDECW (vector): Unsigned saturating decrement vector by multiple of 32-bit predicate constraint element count.
UQINCB: Unsigned saturating increment scalar by multiple of 8-bit predicate constraint element count.
UQINCD (scalar): Unsigned saturating increment scalar by multiple of 64-bit predicate constraint element count.
UQINCD (vector): Unsigned saturating increment vector by multiple of 64-bit predicate constraint element count.
UQINCH (scalar): Unsigned saturating increment scalar by multiple of 16-bit predicate constraint element count.
UQINCH (vector): Unsigned saturating increment vector by multiple of 16-bit predicate constraint element count.
UQINCP (scalar): Unsigned saturating increment scalar by count of true predicate elements.
UQINCP (vector): Unsigned saturating increment vector by count of true predicate elements.
UQINCW (scalar): Unsigned saturating increment scalar by multiple of 32-bit predicate constraint element count.
UQINCW (vector): Unsigned saturating increment vector by multiple of 32-bit predicate constraint element count.
UQSUB (immediate): Unsigned saturating subtract immediate (unpredicated).
UQSUB (vectors): Unsigned saturating subtract vectors (unpredicated).
UUNPKHI, UUNPKLO: Unsigned unpack and extend half of vector.
UXTB, UXTH, UXTW: Unsigned byte / halfword / word extend (predicated).
UZP1, UZP2 (predicates): Concatenate even or odd elements from two predicates.
UZP1, UZP2 (vectors): Concatenate even or odd elements from two vectors.
WHILELE: While incrementing signed scalar less than or equal to scalar.
WHILELO: While incrementing unsigned scalar lower than scalar.
WHILELS: While incrementing unsigned scalar lower or same as scalar.
WHILELT: While incrementing signed scalar less than scalar.
WRFFR: Write the first-fault register.
ZIP1, ZIP2 (predicates): Interleave elements from two half predicates.
ZIP1, ZIP2 (vectors): Interleave elements from two half vectors.
ABS

Absolute value (predicated).

Compute the absolute value of the signed integer in each active element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

</tr>
</tbody>
</table>

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand = Z[n];
bits(VL) result = Z[d];
for e = 0 to elements-1
    integer element = SInt(Elem[operand, e, esize]);
    if ElemP[mask, e, esize] == '1' then
        element = Abs(element);
        Elem[result, e, esize] = element<esize-1:0>;
Z[d] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

ADD (vectors, predicated)

Add vectors (predicated).

Add active elements of the second source vector to corresponding elements of the first source vector and destructively place the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

```
if !HaveSVE() then UNDEFINED;
integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer dn = UInt(Zdn);
integer m = UInt(Zm);
```

### Assembler Symbols

- `<Zdn>`: Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.
- `<T>`: Is the size specifier, encoded in "size":
  - 00: B
  - 01: H
  - 10: S
  - 11: D
- `<Pg>`: Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- `<Zm>`: Is the name of the second source scalable vector register, encoded in the "Zm" field.

### Operation

```
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand1 = Z[dn];
bits(VL) operand2 = Z[m];
bits(VL) result;
for e = 0 to elements-1
    bits(esize) element1 = Elem[operand1, e, esize];
    bits(esize) element2 = Elem[operand2, e, esize];
    if ElemP[mask, e, esize] == '1' then
        Elem[result, e, esize] = element1 + element2;
    else
        Elem[result, e, esize] = Elem[operand1, e, esize];

Z[dn] = result;
```

### Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
ADD (immediate)

Add immediate (unpredicated).

Add an unsigned immediate to each element of the source vector, and destructively place the results in the corresponding elements of the source vector. This instruction is unpredicated.

The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a positive multiple of 256 in the range 256 to 65280.

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<uimm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

```
>             <Zdn>.<T>, <Zdn>.<T>, #<imm>{,<shift>}
```

If !HaveSVE() then UNDEFINED;
if size:sh == '001' then UNDEFINED;
integer esize = 8 * UInt(size);
integer dn = UInt(Zdn);
integer imm = UInt(uimm8);
if sh == '1' then imm = imm << 8;

Assembler Symbols

<Zdn>  Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T>  Is the size specifier, encoded in "size":

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

<imm>  Is an unsigned immediate in the range 0 to 255, encoded in the "imm8" field.

<shift>  Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in "sh":

<table>
<thead>
<tr>
<th>sh</th>
<th>&lt;shift&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>LSL #0</td>
</tr>
<tr>
<td>1</td>
<td>LSL #8</td>
</tr>
</tbody>
</table>

Operation

```
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn];
bits(VL) result;
for e = 0 to elements-1
    bits(esize) element1 = Elem[operand1, e, esize];
    Elem[result, e, esize] = element1 + imm;
Z[dn] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
ADD (vectors, unpredicated)

Add vectors (unpredicated).

Add all elements of the second source vector to corresponding elements of the first source vector and place the results in the corresponding elements of the destination vector. This instruction is unpredicated.

```
<table>
<thead>
<tr>
<th>size</th>
<th>Zm</th>
<th>Zn</th>
<th>Zd</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>

<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

- `<Zn>` is the name of the first source scalable vector register, encoded in the "Zn" field.
- `<Zm>` is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) result;
for e = 0 to elements-1
    bits(esize) element1 = Elem[operand1, e, esize];
    bits(esize) element2 = Elem[operand2, e, esize];
    Elem[result, e, esize] = element1 + element2;
Z[d] = result;
```
ADDPL

Add multiple of predicate register size to scalar register.

Add the current predicate register size in bytes multiplied by an immediate in the range -32 to 31 to the 64-bit source general-purpose register or current stack pointer and place the result in the 64-bit destination general-purpose register or current stack pointer.

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |

ADR

Compute vector address.

Optionally sign or zero-extend the least significant 32-bits of each element from a vector of offsets or indices in the second source vector, scale each index by 2, 4 or 8, add to a vector of base addresses from the first source vector, and place the resulting addresses in the destination vector. This instruction is unpredicated.

It has encodings from 3 classes: Packed offsets, Unpacked 32-bit signed offsets and Unpacked 32-bit unsigned offsets.

### Packed offsets

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

AND, ANDS (predicates)

Bitwise AND predicates.

Bitwise AND active elements of the second source predicate with corresponding elements of the first source predicate and place the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Optionally sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

This instruction is used by the aliases MOV (predicated), and MOV (predicate, predicated, zeroing).

It has encodings from 2 classes: Not setting the condition flags and Setting the condition flags

Not setting the condition flags

```
   31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10  9  8  7  6  5  4  3  2  1  0
0 0 1 0 0 1 1 0 0 0 0 0 0 0 1 0 0 1 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0
```

if !HaveSVE() then UNDEFINED;
integer esize = 8;
integer g = UInt(Pg);
integer n = UInt(Pn);
integer m = UInt(Pm);
integer d = UInt(Pd);
boolean setflags = FALSE;

Setting the condition flags

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
AND (immediate)

Bitwise AND with immediate (unpredicated).

Bitwise AND an immediate with each 64-bit element of the source vector, and destructively place the results in the corresponding elements of the source vector. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16, 32 or 64 bits. This instruction is unpredicated.

This instruction is used by the pseudo-instruction BIC (immediate).

    Elem[result, e, esize] = (element1 >> shift)<<(esize-1:0>);
  else
    Elem[result, e, esize] = Elem[operand1, e, esize];
Z[dn] = result;

ASRD
Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
ASRR

Reversed arithmetic shift right by vector (predicated).

Reversed shift right, preserving the sign bit, active elements of the second source vector by corresponding elements of the first source vector and destructively place the results in the corresponding elements of the first source vector. The shift amount operand is a vector of unsigned elements in which all bits are significant, and not used modulo the element size. Inactive elements in the destination vector register remain unmodified.

    else
        Elem[result, e, esize] = Elem[operand1, e, esize];
Z[dn] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
**BIC (Immediate)**

Bitwise clear bits using immediate (unpredicated).

Bitwise clear bits using immediate with each 64-bit element of the source vector, and destructively place the results in the corresponding elements of the source vector. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16, 32 or 64 bits. This instruction is unpredicated.

This is a pseudo-instruction of `AND (Immediate)`. This means:

- The encodings in this description are named to match the encodings of `AND (Immediate)`.
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of `AND (Immediate)` gives the operational pseudocode for this instruction.

if setflags then
  PSTATE.<N,Z,C,V> = PredTest(mask, result, esize);
P[d] = result;
BRKPB, BRKPBS

Break before first true condition, propagating from previous partition.

If the last active element of the first source predicate is false then set the destination predicate to all-false. Otherwise sets destination predicate elements up to but not including the first active and true source element to true, then sets subsequent elements to false. Inactive elements in the destination predicate register are set to zero. Optionally sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

It has encodings from 2 classes: Not setting the condition flags and Setting the condition flags

Not setting the condition flags

</table>

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand1 = Z[dn];
bits(VL) operand2 = Z[m];
bits(VL) result;
integer last = LastActiveElement(mask, esize);
if last < 0 then
  result = operand1;
else
  if !isBefore then
    last = last + 1;
  if last >= elements then last = 0;
  for e = 0 to elements-1
    Elem[result, e, esize] = Elem[operand2, last, esize];
Z[dn] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
Count leading sign bits (predicated).

Count leading sign bits in each active element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

Assembler Symbols

- <Zd> is the name of the destination scalable vector register, encoded in the "Zd" field.
- <T> is the size specifier, encoded in "size":
  - 00: B
  - 01: H
  - 10: S
  - 11: D
- <Pg> is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- <Zn> is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

CheckSVEEnabled();

integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);

for e = 0 to elements-1

bits(esize) element = Elem[operand, e, esize];
if ElemP[mask, e, esize] == '1'

bits(esize) result = CountLeadingSignBits(element)<esize-1:0>);
Z[d] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction is undefined if:

• The MOVPRFX instruction does not refer to the same destination register as this instruction.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The MOVPRFX instruction must be predicated using the same governing predicate register.
• The MOVPRFX instruction specifies the same destination register as this instruction.
• The destination register cannot refer to architectural register state referenced by any other source operand.

The assembler instruction must not refer to any architectural registers that are referenced by any other source operand.

CLZ

Count leading zero bits (predicated).

Count leading zero bits in each active element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

CLZ <Zd>.<T>, <Pg>/M, <Zn>.<T>

if !HaveSVE() then UNDEFINED;
integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);

Assembler Symbols

- <Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.
- <T> Is the size specifier, encoded in "size":

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

- <Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- <Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand = Z[n];
bits(VL) result = Z[d];
for e = 0 to elements-1
    bits(esize) element = Elem[operand, e, esize];
    if ElemP[mask, e, esize] == '1' then
        Elem[result, e, esize] = CountLeadingZeroBits(element)<esize-1:0>;
Z[d] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
CMP<cc> (immediate)

Compare vector to immediate.

Compare active integer elements in the source vector with an immediate, and place the boolean results of the specified comparison in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

The <cc> symbol specifies one of the standard ARM condition codes: EQ, GE, GT, HI, HS, LE, LO, LS, LT or NE.

It has encodings from 10 classes: Equal, Greater than, Greater than or equal, Higher, Higher or same, Less than, Less than or equal, Lower, Lower or same and Not equal.

Assembler Symbols

<Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.
Is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

Is the name of the source scalable vector register, encoded in the "Zn" field.

For the equal, greater than, greater than or equal, less than, less than or equal and not equal variant: is the signed immediate operand, in the range -16 to 15, encoded in the “imm5” field.

For the higher, higher or same, lower and lower or same variant: is the unsigned immediate operand, in the range 0 to 127, encoded in the “imm7” field.

Operation

```plaintext
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand1 = Z[n];
bits(PL) result;
for e = 0 to elements-1
   integer element1 = Int(Elem[operand1, e, esize], unsigned);
   if ElemP[mask, e, esize] == '1' then
      boolean cond;
      case op of
         when Cmp_EQ cond = element1 == imm;

CMP<cc> (wide elements)

Compare vector to 64-bit wide elements.

Compare active integer elements in the first source vector with overlapping 64-bit doubleword elements in the second source vector and place the boolean results of the specified comparison in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

The <cc> symbol specifies one of the standard ARM condition codes: EQ, GE, GT, HI, HS, LE, LO, LS, LT or NE.

It has encodings from 10 classes: **Equal**, **Greater than**, **Greater than or equal**, **Higher**, **Higher or same**, **Less than**, **Less than or equal**, **Lower**, **Lower or same** and **Not equal**

CMPLE (vectors)

Compare signed less than or equal to vector, setting the condition flags.

Compare active signed integer elements in the first source vector being less than or equal to corresponding signed elements in the second source vector, and place the boolean results of the comparison in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

This is a pseudo-instruction of CMP<cc> (vectors). This means:

- The encodings in this description are named to match the encodings of CMP<cc> (vectors).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of CMP<cc> (vectors) gives the operational pseudocode for this instruction.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

Operation

The description of CMP<cc> (vectors) gives the operational pseudocode for this instruction.
**CNOT**

Logically invert boolean condition in vector (predicated).

Logically invert the boolean value in each active element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

Boolean TRUE is any non-zero value in a source, and one in a result element. Boolean FALSE is always zero.

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
CNTB, CNTD, CNTH, CNTW

Set scalar to multiple of predicate constraint element count.

Determines the number of active elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then places the result in the scalar destination.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 4 classes: Byte, Doubleword, Halfword and Word

### Byte

Set scalar to count of true predicate elements.

Counts the number of active and true elements in the source predicate and places the scalar result in the destination general-purpose register. Inactive predicate elements are not counted.

```
0 0 1 0 0 1 0 1 size 1 0 0 0 0 | 0 1 0 Pg 0 | Pn | Rd
```

```
if !HaveSVE() then UNDEFINED;
integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Pn);
integer d = UInt(Rd);
```

### Assembler Symbols

| <Xd> | Is the 64-bit name of the destination general-purpose register, encoded in the "Rd" field. |
|<Pg> | Is the name of the governing scalable predicate register, encoded in the "Pg" field. |
|<Pn> | Is the name of the source scalable predicate register, encoded in the "Pn" field. |
|<T>  | Is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

### Operation

```
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(PL) operand = P[n];
bits(64) sum = Zeros();
for e = 0 to elements-1
    if ElemP[mask, e, esize] == '1' && ElemP[operand, e, esize] == '1' then
        sum = sum + 1;
X[d] = sum;
```

Shuffle active elements of vector to the right and fill with zero.

Read the active elements from the source vector and pack them into the lowest-numbered elements of the destination vector. Then set any remaining elements of the destination vector to zero.

\[
\begin{array}{cccccccccccccc}
0 & 0 & 0 & 0 & 0 & 1 & 0 & 1 & \text{size} & 1 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & \text{Pg} & \text{Zn} & \text{Zd}
\end{array}
\]

COMPACT \(<\text{Zd}.<\text{T}>, <\text{Pg}>, <\text{Zn}>.<\text{T}>\)

\[
\begin{align*}

**CPY (immediate, zeroing)**

Copy signed integer immediate to vector elements (zeroing).

Copy a signed integer immediate to each active element in the destination vector. Inactive elements in the destination vector register are set to zero.

The immediate operand is a signed value in the range -128 to +127, and for element widths of 16 bits or higher it may also be a signed multiple of 256 in the range -32768 to +32512 (excluding 0). The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<imm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

This instruction is used by the alias **MOV (immediate, predicated, zeroing)**.

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |
|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| 0 0 0 0 0 1 0 1 | size | 0 1 | Pg | 0 0 | sh | imm8 | Zd |

**Assembler Symbols**

- `<Zd>` Is the name of the destination scalable vector register, encoded in the "Zd" field.
- `<T>` Is the size specifier, encoded in “size”:
  
<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

- `<Pg>` Is the name of the governing scalable predicate register, encoded in the "Pg" field.
- `<imm>` Is a signed immediate in the range -128 to 127, encoded in the "imm8" field.
- `<shift>` Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in “sh”:

<table>
<thead>
<tr>
<th>sh</th>
<th>&lt;shift&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>LSL #0</td>
</tr>
<tr>
<td>1</td>
<td>LSL #8</td>
</tr>
</tbody>
</table>
**Operation**

```c
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) dest = Z[d];
bits(VL) result;

for e = 0 to elements-1
    if ElemP[mask, e, esize] == '1' then
        Elem[result, e, esize] = imm<esize-1:0>;
    elsif merging then
        Elem[result, e, esize] = Elem[dest, e, esize];
    else
        Elem[result, e, esize] = Zeros();

Z[d] = result;
```
**CPY (immediate, merging)**

Copy signed integer immediate to vector elements (merging).

Copy a signed integer immediate to each active element in the destination vector. Inactive elements in the destination vector register remain unmodified.

The immediate operand is a signed value in the range -128 to +127, and for element widths of 16 bits or higher it may also be a signed multiple of 256 in the range -32768 to +32512 (excluding 0).

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<simm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

This instruction is used by the aliases **FMOV (zero, predicated)**, and **MOV (immediate, predicated, merging)**.

---

**Assembler Symbols**

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in "size":

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>

<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>
```

- `<Pg>`: Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- `<R>`: Is a width specifier, encoded in “size”:

```
<table>
<thead>
<tr>
<th>size</th>
<th>&lt;R&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>01</td>
<td>W</td>
</tr>
<tr>
<td>x0</td>
<td>W</td>
</tr>
<tr>
<td>11</td>
<td>X</td>
</tr>
</tbody>
</table>
```

- `<n|SP>`: Is the number [0-30] of the general-purpose source register or the name SP (31), encoded in the "Rn" field.

### Operation

```
CheckSVEEnabled();
integer elements = VL DIV esize;
bis(PL) mask = P[g];
bis(64) operand1;
if n == 31 then
    operand1 = SP[];
else
    operand1 = X[n];
bis(VL) result = Z[d];
for e = 0 to elements-1
    if Elem[mask, e, esize] == '1' then
        Elem[result, e, esize] = operand1<esize-1:0>;
Z[d] = result;
```
Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
CPY (SIMD&FP scalar)

Copy SIMD&FP scalar register to vector elements (predicated).

Copy the SIMD & floating-point scalar source register to each active element in the destination vector.Inactive elements in the destination vector register remain unmodified.

This instruction is used by the alias MOV (SIMD&FP scalar, predicated).

```
| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |
|-----------------------------------------------|---------------|---------------|
| 00 00 00 01 01 | size | 1 0 0 0 0 0 1 0 0 | Pg | Vn | Zd |
```

CPY <Zd>.<T>, <Pg>/M, <V><n>

if !HaveSVE() then UNDEFINED;
integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Vn);
integer d = UInt(Zd);

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the “Zd” field.

<T> Is the size specifier, encoded in “size”:

```
<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>

<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>
```

<n> Is the number [0-31] of the source SIMD&FP register, encoded in the “Vn” field.

Operation

```
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(esize) operand1 = V[n];
bits(VL) result = Z[d];
for e = 0 to elements - 1
    if ElemP[mask, e, esize] == '1' then
        Elem[result, e, esize] = operand1;
Z[d] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
**CTERMEQ, CTERMNE**

Compare and terminate loop.

Detect termination conditions in serialized vector loops. Tests whether the comparison between the scalar source operands holds true and if not tests the state of the !LAST condition flag (C) which indicates whether the previous flag-setting predicate instruction selected the last element of the vector partition.

The Z and C condition flags are preserved by this instruction. The N and V condition flags are set as a pair to generate one of the following conditions for a subsequent conditional instruction:

* GE (N=0 & V=0): continue loop (compare failed and last element not selected);
* LT (N=0 & V=1): terminate loop (last element selected);
* LT (N=1 & V=0): terminate loop (compare succeeded);

The scalar source operands are 32-bit or 64-bit general-purpose registers of the same size.

It has encodings from 2 classes: **Equal** and **Not equal**

### Equal

```
0 0 1 0 0 1 1 sz 1 Rm 0 0 1 0 0 0 Rn 0 0 0 0 0
```

CTERMEQ <R><n>, <R><m>

if !HaveSVE() then UNDEFINED;
integer esize = 32 << UInt(sz);
integer n = UInt(Rn);
integer m = UInt(Rm);
SVECmp op = Cmp_EQ;

### Not equal

```
0 0 1 0 0 1 1 sz 1 Rm 0 0 1 0 0 0 Rn 1 0 0 0 0
```

CTERMNE <R><n>, <R><m>

if !HaveSVE() then UNDEFINED;
integer esize = 32 << UInt(sz);
integer n = UInt(Rn);
integer m = UInt(Rm);
SVECmp op = Cmp_NE;

### Assembler Symbols

**<R>** Is a width specifier, encoded in "sz":

<table>
<thead>
<tr>
<th>sz</th>
<th>&lt;R&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>W</td>
</tr>
<tr>
<td>1</td>
<td>X</td>
</tr>
</tbody>
</table>

**<n>** Is the number [0-30] of the source general-purpose register or the name ZR (31), encoded in the "Rn" field.

**<m>** Is the number [0-30] of the source general-purpose register or the name ZR (31), encoded in the "Rm" field.
Operation

```plaintext
CheckSVEEnabled();
bits(esize) operand1 = X[n];
bits(esize) operand2 = X[m];
integer element1 = UInt(operand1);
integer element2 = UInt(operand2);
boolean term;

case op of
    when Cmp_EQ term = element1 == element2;
    when Cmp_NE term = element1 != element2;
if term then
    PSTATE.N = '1';
PSTATE.V = '0';
else
    PSTATE.N = '0';
PSTATE.V = (NOT PSTATE.C);
```
DECB, DECD, DECH, DECW (scalar)

Decrement scalar by multiple of predicate constraint element count.

Determines the number of active elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement the scalar destination.

The named predicate constraint limits the number of active elements in a single predicate to:

* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 4 classes: Byte, Doubleword, Halfword and Word

**Byte**

</tr>
</tbody>
</table>

<imm> Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the “imm4” field.

Operation

CheckSVEEnabled();
integer count = DecodePredCount(pat, esize);
bits(64) operand1 = X[dn];

X[dn] = operand1 - (count * imm);
DECD, DECH, DECW (vector)

Decrement vector by multiple of predicate constraint element count.

Determines the number of active elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement all destination vector elements.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 3 classes: Doubleword, Halfword and Word

Doubleword

```assembly
DECD <Zdn>.D{, <pattern>{, MUL #<imm>}}
```

if !HaveSVE() then UNDEFINED;
integer esize = 64;

</tbody>
</table>

Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.

**Operation**

```c
CheckSVEEnabled();
integer elements = VL DIV esize;
integer count = DecodePredCount(pat, esize);
bits(VL) operand1 = Z[dn];
bits(VL) result;
for e = 0 to elements-1
    Elem[result, e, esize] = Elem[operand1, e, esize] - (count * imm);
Z[dn] = result;
```

**Operational information**

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
DECP (scalar)

Decrement scalar by count of true predicate elements.

Counts the number of true elements in the source predicate and then uses the result to decrement the scalar destination.

<table>
<thead>
<tr>
<th>size</th>
<th>esize</th>
<th>Pm</th>
<th>Rdn</th>
</tr>
</thead>
<tbody>

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(64) operand1 = X[dn];
bits(PL) operand2 = P[m];
integer count = 0;

for e = 0 to elements-1
  if ElemP[operand2, e, esize] == '1' then
    count = count + 1;

X[dn] = operand1 - count;
DECP (vector)

Decrement vector by count of true predicate elements.

Counts the number of true elements in the source predicate and then uses the result to decrement all destination vector elements.

The predicate size specifier may be omitted in assembler source code, but this is deprecated and will be prohibited in a future release of the architecture.

```
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

- `<Pm>` Is the name of the source scalable predicate register, encoded in the "Pm" field.

**Operation**

```
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn];
bits(PL) operand2 = P[m];
bits(VL) result;
integer count = 0;
for e = 0 to elements-1
    if ElemP(operand2, e, esize] == '1' then
        count = count + 1;
for e = 0 to elements-1
    Elem[result, e, esize] = Elem[operand1, e, esize] - count;
Z[dn] = result;
```

**Operational information**

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

Internal version only: isa v32.12, AdvSIMD v29.04, pseudocode v2020-09_xml, sve v2020-09_rc2b ; Build timestamp: 2020-09-30T23:12
DUP (immediate)

Broadcast signed immediate to vector elements (unpredicated).

Unconditionally broadcast the signed integer immediate into each element of the destination vector. This instruction is unpredicated.

The immediate operand is a signed value in the range -128 to +127, and for element widths of 16 bits or higher it may also be a signed multiple of 256 in the range -32768 to +32512 (excluding 0).

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<simm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

This instruction is used by the aliases FMOV (zero, unpredicated), and MOV (immediate, unpredicated).

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>

**DUP (indexed)**

Broadcast indexed element to vector (unpredicated).

Unconditionally broadcast the indexed source vector element into each element of the destination vector. This instruction is unpredicated.

The immediate element index is in the range of 0 to 63 (bytes), 31 (halfwords), 15 (words), 7 (doublewords) or 3 (quadwords). Selecting an element beyond the accessible vector length causes the destination vector to be set to zero.

This instruction is used by the alias **MOV (SIMD&FP scalar, unpredicated)**.

<table>
<thead>
<tr>
<th>31 30 29 28 27 26 25 24 23 22 21 20</th>

Operation

```
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[n];
bits(VL) result;
bits(esize) element;

if index >= elements then
    element = Zeros();
else
    element = Elem[operand1, index, esize];
result = Replicate(element);
Z[d] = result;
```
**DUPM**

Broadcast logical bitmask immediate to vector (unpredicated).

Unconditionally broadcast the logical bitmask immediate into each element of the destination vector. This instruction is unpredicated. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16, 32 or 64 bits.

This instruction is used by the alias **MOV (bitmask immediate)**.

EON

Bitwise exclusive OR with inverted immediate (unpredicated).

Bitwise exclusive OR an inverted immediate with each 64-bit element of the source vector, and destructively place the results in the corresponding elements of the source vector. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16, 32 or 64 bits. This instruction is unpredicated.

This is a pseudo-instruction of EOR (immediate). This means:

• The encodings in this description are named to match the encodings of EOR (immediate).
• The assembler syntax is used only for assembly, and is not used on disassembly.
• The description of EOR (immediate) gives the operational pseudocode for this instruction.

```
0 0 0 0 1 0 1 0 1 0 0 0 0 imm13 Zdn
```

EON <Zdn>.<T>, <Zdn>.<T>, #<const>

is equivalent to

EOR <Zdn>.<T>, <Zdn>.<T>, #(-<const> - 1)

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the “Zdn” field.

<T> Is the size specifier, encoded in “imm13<12>:imm13<5:0>”:

<table>
<thead>
<tr>
<th>imm13&lt;12&gt;</th>
<th>imm13&lt;5:0&gt;</th>

<td>RESERVED</td>
</tr>
<tr>
<td>1</td>
<td>xxxxxx</td>
<td>D</td>
</tr>
</tbody>
</table>

<const> Is a 64, 32, 16 or 8-bit bitmask consisting of replicated 2, 4, 8, 16, 32 or 64 bit fields, each field containing a rotated run of non-zero bits, encoded in the “imm13” field.

Operation

The description of EOR (immediate) gives the operational pseudocode for this instruction.

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

• The MOVPRFX instruction must be unpredicated.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
EOR, EORS (predicates)

Bitwise exclusive OR predicates.

Bitwise exclusive OR active elements of the second source predicate with corresponding elements of the first source predicate and place the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Optionally sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

This instruction is used by the aliases NOTS, and NOT (predicate).

It has encodings from 2 classes: Not setting the condition flags and Setting the condition flags

### Not setting the condition flags

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 0 1 0 0 1 0 1 | | | | Pm | 0 | 1 | Pg | 1 | | | Nn | 0 | Pd | 1
```

if !HaveSVE() then UNDEFINED;
integer esize = 8;
integer g = UInt(Pg);
integer n = UInt(Pn);
integer m = UInt(Pm);
integer d = UInt(Pd);
boolean setflags = FALSE;

### Setting the condition flags

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 0 1 0 0 1 0 1 | | | | Pm | 0 | 1 | Pg | 1 | | | Nn | 0 | Pd | 1
```

if !HaveSVE() then UNDEFINED;
integer esize = 8;
integer g = UInt(Pg);
integer n = UInt(Pn);
integer m = UInt(Pm);
integer d = UInt(Pd);
boolean setflags = TRUE;

### Assembler Symbols

- `<Pd>` Is the name of the destination scalable predicate register, encoded in the "Pd" field.
- `<Pg>` Is the name of the governing scalable predicate register, encoded in the "Pg" field.
- `<Pn>` Is the name of the first source scalable predicate register, encoded in the "Pn" field.
- `<Pm>` Is the name of the second source scalable predicate register, encoded in the "Pm" field.

### Alias Conditions

<table>
<thead>
<tr>
<th>Alias</th>
<th>Is preferred when</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOTS</td>
<td>Pm == Pg</td>
</tr>
<tr>
<td>NOT (predicate)</td>
<td>Pm == Pg</td>
</tr>
</tbody>
</table>
Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(PL) operand1 = P[n];
bits(PL) operand2 = P[m];
bits(PL) result;

for e = 0 to elements-1
  bit element1 = ElemP[operand1, e, esize];
  bit element2 = ElemP[operand2, e, esize];
  if ElemP[mask, e, esize] == '1' then
    ElemP[result, e, esize] = element1 EOR element2;
  else
    ElemP[result, e, esize] = '0';

if setflags then
  PSTATE.<N,Z,C,V> = PredTest(mask, result, esize);
P[d] = result;
### EOR (vectors, predicated)

Bitwise exclusive OR vectors (predicated).

Bitwise exclusive OR active elements of the second source vector with corresponding elements of the first source vector and destructively place the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

![VEX instruction encoding](image)

**EOR** `<Zdn>`, `<T>`, `<Pg>/M`, `<Zm>`, `<T>`

if !HaveSVE() then UNDEFINED;

integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer dn = UInt(Zdn);
integer m = UInt(Zm);

#### Assembler Symbols

- `<Zdn>`: Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.
- `<T>`: Is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th><code>&lt;T&gt;</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

- `<Pg>`: Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- `<Zm>`: Is the name of the second source scalable vector register, encoded in the "Zm" field.

#### Operation

CheckSVEEnabled();

integer elements = VL DIV esize;

bits(PL) mask = P[g];

bits(VL) operand1 = Z[dn];

bits(VL) operand2 = Z[m];

bits(VL) result;

for e = 0 to elements-1

bits(esize) element1 = Elem[operand1, e, esize];

bits(esize) element2 = Elem[operand2, e, esize];

if ElemP[mask, e, esize] == '1' then

    Elem[result, e, esize] = element1 EOR element2;

else

    Elem[result, e, esize] = Elem[operand1, e, esize];

Z[dn] = result;

#### Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
EOR (immediate)

Bitwise exclusive OR with immediate (unpredicated).

Bitwise exclusive OR an immediate with each 64-bit element of the source vector, and destructively place the results in the corresponding elements of the source vector. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16, 32 or 64 bits. This instruction is unpredicated.

This instruction is used by the pseudo-instruction EON.

$$\text{EOR } <\text{Zdn}>, <\text{T}>, <\text{Zdn}>, <\text{T}>, \#<\text{const}>$$

```plaintext
if !HaveSVE() then UNDEFINED;
integer dn = UInt(Zdn);
bits(64) imm;
(imm, -) = DecodeBitMasks(imm13<12>, imm13<5:0>, imm13<11:6>, TRUE);
```

Assembler Symbols

- `<Zdn>` is the name of the source and destination scalable vector register, encoded in the "Zdn" field.
- `<T>` is the size specifier, encoded in “imm13<12>:imm13<5:0>”:

<table>
<thead>
<tr>
<th>imm13&lt;12&gt;</th>
<th>imm13&lt;5:0&gt;</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0xxxxx</td>
<td>S</td>
</tr>
<tr>
<td>0</td>
<td>10xxxx</td>
<td>H</td>
</tr>
<tr>
<td>0</td>
<td>110xxx</td>
<td>B</td>
</tr>
<tr>
<td>0</td>
<td>1110xx</td>
<td>B</td>
</tr>
<tr>
<td>0</td>
<td>11110x</td>
<td>B</td>
</tr>
<tr>
<td>0</td>
<td>111110</td>
<td>RESERVED</td>
</tr>
<tr>
<td>0</td>
<td>111111</td>
<td>RESERVED</td>
</tr>
<tr>
<td>1</td>
<td>xxxxxx</td>
<td>D</td>
</tr>
</tbody>
</table>

- `<const>` is a 64, 32, 16 or 8-bit bitmask consisting of replicated 2, 4, 8, 16, 32 or 64 bit fields, each field containing a rotated run of non-zero bits, encoded in the “imm13” field.

Operation

```plaintext
CheckSVEEnabled();
integer elements = VL DIV 64;
bits(VL) operand = Z[dn];
bits(VL) result;
for e = 0 to elements-1
  bits(64) element1 = Elem[operand, e, 64];
  Elem[result, e, 64] = element1 EOR imm;
Z[dn] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

Copyright © 2010-2020 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.
EOR (vectors, unpredicated)

Bitwise exclusive OR vectors (unpredicated).

Bitwise exclusive OR all elements of the second source vector with corresponding elements of the first source vector and place the results in the corresponding elements of the destination vector. This instruction is unpredicated.

```
0 0 0 0 0 1 0 0 1 0 1  Zm  |  0 0 1 1 0 0  |  Zn  |  Zd
```

\[ \text{EOR } <Zd>.D, <Zn>.D, <Zm>.D \]

if \! \texttt{HaveSVE}() then UNDEFINED;
integer n = \texttt{UInt}(Zn);
integer m = \texttt{UInt}(Zm);
integer d = \texttt{UInt}(Zd);

**Assembler Symbols**

- \(<Zd>\) is the name of the destination scalable vector register, encoded in the “Zd” field.
- \(<Zn>\) is the name of the first source scalable vector register, encoded in the “Zn” field.
- \(<Zm>\) is the name of the second source scalable vector register, encoded in the “Zm” field.

**Operation**

\[ \text{CheckSVEEnabled}(); \]
\[ \text{bits}(VL) \ \text{operand1} = Z[n]; \]
\[ \text{bits}(VL) \ \text{operand2} = Z[m]; \]
\[ Z[d] = \text{operand1 EOR operand2}; \]

EORV

Bitwise exclusive OR reduction to scalar.

Bitwise exclusive OR horizontally across all lanes of a vector, and place the result in the SIMD&FP scalar destination register. Inactive elements in the source vector are treated as zero.

</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

Operation

CheckSVEEnabled();

integer elements = VL DIV esize;

bits(PL) mask = P[g];

bits(VL) operand = Z[n];

bits(esize) result = Zeros(esize);

for e = 0 to elements - 1
    if ElemP[mask, e, esize] == '1' then
        result = result EOR Elem[operand, e, esize];

V[d] = result;
Extract vector from pair of vectors.

Copy the indexed byte up to the last byte of the first source vector to the bottom of the result vector, then fill the remainder of the result starting from the first byte of the second source vector. The result is placed destructively in the first source vector. This instruction is unpredicated.

An index that is greater than or equal to the vector length in bytes is treated as zero, leaving the destination and first source vector unmodified.

<table>
<thead>
<tr>
<th>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>

```
```

```c
if !HaveSVE() then UNDEFINED;
integer esize = 8;
integer dn = UInt(Zdn);
integer m = UInt(Zm);
integer position = UInt(imm8h:imm8l);
```

**Assembler Symbols**

- `<Zdn>` Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.
- `<Zm>` Is the name of the second source scalable vector register, encoded in the "Zm" field.
- `<imm>` Is the unsigned immediate operand, in the range 0 to 255, encoded in the "imm8h:imm8l" fields.

**Operation**

```c
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn];
bits(VL) operand2 = Z[m];
bits(VL) result;
if position >= elements then
    position = 0;
position = position << 3;
bits(VL+2) concat = operand2 : operand1;
result = concat<position+VL-1:position>;
Z[dn] = result;
```

**Operational information**

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
Floating-point absolute difference (predicated).

Compute the absolute difference of active floating-point elements of the second source vector and corresponding floating-point elements of the first source vector and destructively place the result in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

FABD <Zdn>.<T>, <Pg>/M, <Zm>.<T>, <Zm>.<T>

if !HaveSVE() then UNDEFINED;
if size == '00' then UNDEFINED;
integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer dn = UInt(Zdn);
integer m = UInt(Zm);

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in "size":

<table>

        Elem[result, e, esize] = FPAbs(FPSub(element1, element2, FPCR[]));
    else
        Elem[result, e, esize] = element1;
Z[dn] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
FABS

Floating-point absolute value (predicated).

Take the absolute value of each active floating-point element of the source vector, and place the results in the corresponding elements of the destination vector. This clears the sign bit and cannot signal a floating-point exception. Inactive elements in the destination vector register remain unmodified.

</tbody>
</table>

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand = Z[n];
bits(VL) result = Z[d];
for e = 0 to elements-1
  bits(esize) element = Elem[operand, e, esize];
  if ElemP[mask, e, esize] == '1' then
    Elem[result, e, esize] = FPAbs(element);
Z[d] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

• The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
**FAC<cc>**

Floating-point absolute compare vectors.

Compare active absolute values of floating-point elements in the first source vector with corresponding absolute values of elements in the second source vector, and place the boolean results of the specified comparison in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Does not set the condition flags.

The <cc> symbol specifies one of the standard ARM condition codes: GE, GT, LE, or LT.

This instruction is used by the pseudo-instructions FACLE and FACLT.

It has encodings from 2 classes: Greater than and Greater than or equal

### Greater than

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 1 1 0 0 1 0 1 0 0 0 0 1 1 1 0 1 0 0 0 1 0 1 0 0

FACGT <Pd>.<T>, <Pg>/Z, <Zn>.<T>, <Zm>.<T>

if !HaveSVE() then UNDEFINED;
if size == '00' then UNDEFINED;
integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Pd);
SVECmp op = Cmp_GT;

### Greater than or equal

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 1 1 0 0 1 1 0 0 0 0 1 1 0 1 0 0 0 1 0 1 0 0 0 1 0 0

FACGE <Pd>.<T>, <Pg>/Z, <Zn>.<T>, <Zm>.<T>

if !HaveSVE() then UNDEFINED;
if size == '00' then UNDEFINED;
integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Pd);
SVECmp op = Cmp_GE;

### Assembler Symbols

- **<Pd>** is the name of the destination scalable predicate register, encoded in the "Pd" field.
- **<T>** is the size specifier, encoded in "size":

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>RESERVED</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

- **<Pg>** is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- **<Zn>** is the name of the first source scalable vector register, encoded in the "Zn" field.
- **<Zm>** is the name of the second source scalable vector register, encoded in the "Zm" field.
Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(PL) result;

for e = 0 to elements-1
    bits(esize) element1 = Elem[operand1, e, esize];
    bits(esize) element2 = Elem[operand2, e, esize];
    if ElemP[mask, e, esize] == '1' then
        case op of
            when Cmp_GE res = FPCompareGE(FPAbs(element1), FPAbs(element2), FPCR[]);
            when Cmp_GT res = FPCompareGT(FPAbs(element1), FPAbs(element2), FPCR[]);
        ElemP[result, e, esize] = if res then '1' else '0';
        else
            ElemP[result, e, esize] = '0';

P[d] = result;
FACLE

Floating-point absolute compare less than or equal.

Compare active absolute values of floating-point elements in the first source vector being less than or equal to corresponding absolute values of elements in the second source vector, and place the boolean results of the comparison in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Does not set the condition flags.

This is a pseudo-instruction of FAC<cc>. This means:

- The encodings in this description are named to match the encodings of FAC<cc>.
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of FAC<cc> gives the operational pseudocode for this instruction.

\[
\begin{array}{cccccccccccccccccccccccc}

    else
        Elem[result, e, esize] = element1;
Z[dn] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

• The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
• The MOVPRFX instruction must specify the same destination register as this instruction.
The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
FADD (vectors, predicated)

Floating-point add vector (predicated).

Add active floating-point elements of the second source vector to corresponding floating-point elements of the first source vector and destructively place the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

   else
      Elem[result, e, esize] = element1;
Z[dn] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicate, or be predicate using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
FADD (vectors, unpredicated)

Floating-point add vector (unpredicated).

Add all floating-point elements of the second source vector to corresponding elements of the first source vector and place the results in the corresponding elements of the destination vector. This instruction is unpredicated.

FADDA

Floating-point add strictly-ordered reduction, accumulating in scalar.

Floating-point add a SIMD&FP scalar source and all active lanes of the vector source and place the result destructively in the SIMD&FP scalar source register. Vector elements are processed strictly in order from low to high, with the scalar source providing the initial value. Inactive elements in the source vector are ignored.

FADDA <V><dn>, <Pg>, <V><dn>, <Zm>.

FCADD

Floating-point complex add with rotate (predicated).

Add the real and imaginary components of the active floating-point complex numbers from the first source vector to the complex numbers from the second source vector which have first been rotated by 90 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation, equivalent to multiplying the complex numbers in the second source vector by ±j beforehand. Destructively place the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

```
| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |

**FCMLA (vectors)**

Floating-point complex multiply-add with rotate (predicated).

Multiply the duplicated real components for rotations 0 and 180, or imaginary components for rotations 90 and 270, of the floating-point complex numbers in the first source vector by the corresponding complex number in the second source vector rotated by 0, 90, 180 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation.

Then destructively add the products to the corresponding components of the complex numbers in the addend and destination vector, without intermediate rounding.

These transformations permit the creation of a variety of multiply-add and multiply-subtract operations on complex numbers by combining two of these instructions with the same vector operands but with rotations that are 90 degrees apart.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element. Inactive elements in the destination vector register remain unmodified.

Z[da] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
FCMLA (indexed)

Floating-point complex multiply-add by indexed values with rotate.

Multiply the duplicated real components for rotations 0 and 180, or imaginary components for rotations 90 and 270, of the floating-point complex numbers in each 128-bit segment of the first source vector by the specified complex number in the corresponding the second source vector segment rotated by 0, 90, 180 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation.

Then destructively add the products to the corresponding components of the complex numbers in the addend and destination vector, without intermediate rounding.

These transformations permit the creation of a variety of multiply-add and multiply-subtract operations on complex numbers by combining two of these instructions with the same vector operands but with rotations that are 90 degrees apart.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

The complex numbers within the second source vector are specified using an immediate index which selects the same complex number position within each 128-bit vector segment. The index range is from 0 to one less than the number of complex numbers per 128-bit segment, encoded in 1 to 2 bits depending on the size of the complex number. This instruction is unpredicated.

It has encodings from 2 classes: Half-precision and Single-precision

**Half-precision**

```assembly
```

```c
if !HaveSVE() then UNDEFINED;
integer esize = 16;
integer index = UInt(i2);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);
integer sel_a = UInt(rot<0>);
integer sel_b = UInt(NOT(rot<0>));
boolean neg_i = (rot<1> == '1');
boolean neg_r = (rot<0> != rot<1>);
```

**Single-precision**

```assembly
FCMLA <Zda>.S, <Zn>.S, <Zm>.S[<imm>], <const>
```

```c
if !HaveSVE() then UNDEFINED;
integer esize = 32;
integer index = UInt(i1);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);
integer sel_a = UInt(rot<0>);
integer sel_b = UInt(NOT(rot<0>));
boolean neg_i = (rot<1> == '1');
boolean neg_r = (rot<0> != rot<1>);
```

**Assembler Symbols**

<Zda> is the name of the third source and destination scalable vector register, encoded in the “Zda” field.
<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> For the half-precision variant: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field.

For the single-precision variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.

<imm> For the half-precision variant: is the index of a Real and Imaginary pair, in the range 0 to 3, encoded in the "i2" field.

For the single-precision variant: is the index of a Real and Imaginary pair, in the range 0 to 1, encoded in the "i1" field.

<const> Is the const specifier, encoded in "rot":

<table>
<thead>
<tr>
<th>rot</th>
<th>&lt;const&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>#0</td>
</tr>
<tr>
<td>01</td>
<td>#90</td>
</tr>
<tr>
<td>10</td>
<td>#180</td>
</tr>
<tr>
<td>11</td>
<td>#270</td>
</tr>
</tbody>
</table>

Operation

```
CheckSVEEnabled();
integer pairs = VL DIV (2 * esize);
integer pairspersegment = 128 DIV (2 * esize);
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) operand3 = Z[da];
bits(VL) result;
for p = 0 to pairs-1
    segmentbase = p - (p MOD pairspersegment);
    s = segmentbase + index;
    addend_r = Elem[operand3, 2 * p + 0, esize];
    addend_i = Elem[operand3, 2 * p + 1, esize];
    elt1_a = Elem[operand1, 2 * p + sel_a, esize];
    elt2_a = Elem[operand2, 2 * s + sel_a, esize];
    elt2_b = Elem[operand2, 2 * s + sel_b, esize];
    if neg_r then elt2_a = FPNeg(elt2_a);
    if neg_i then elt2_b = FPNeg(elt2_b);
    addend_r = FPMulAdd(addend_r, elt1_a, elt2_a, FPCR[]);
    addend_i = FPMulAdd(addend_i, elt1_a, elt2_b, FPCR[]);
    Elem[result, 2 * p + 0, esize] = addend_r;
    Elem[result, 2 * p + 1, esize] = addend_i;
Z[da] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
**FCMLE (vectors)**

Floating-point compare less than or equal to vector.

Compare active floating-point elements in the first source vector being less than or equal to corresponding elements in the second source vector, and place the boolean results of the comparison in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Does not set the condition flags.

This is a pseudo-instruction of **FCM<cc> (vectors)**. This means:

- The encodings in this description are named to match the encodings of **FCM<cc> (vectors)**.
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of **FCM<cc> (vectors)** gives the operational pseudocode for this instruction.

</table>

- `<Pg>` is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

Operation

The description of FCM<cc> (vectors) gives the operational pseudocode for this instruction.
FCPY

Copy 8-bit floating-point immediate to vector elements (predicated).

Copy a floating-point immediate into each active element in the destination vector. Inactive elements in the destination vector register remain unmodified.

This instruction is used by the alias FMOV (immediate, predicated).

```
| 0 0 0 0 0 0 1 0 1 | 0 1 | 1 1 0 | imm8 | Zd |
```

FCPY <Zd>,<T>, <Pg>/M, #<const>

```java
if !HaveSVE() then UNDEFINED;
if size == '00' then UNDEFINED;
integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer d = UInt(Zd);
bits(esize) imm = VFPExpandImm(imm8);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in "size":

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>RESERVED</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

<Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.

<const> Is a floating-point immediate value expressable as ±n×16×2^r, where n and r are integers such that 16 ≤ n ≤ 31 and -3 ≤ r ≤ 4, i.e. a normalized binary floating-point encoding with 1 sign bit, 3-bit exponent, and 4-bit fractional part, encoded in the "imm8" field.

Operation

```java
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) result = Z[d];
for e = 0 to elements-1
    if ElemP[mask, e, esize] == '1' then
        Elem[result, e, esize] = imm;
Z[d] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
FCVT

Floating-point convert precision (predicated).

Convert the size and precision of each active floating-point element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

Since the input and result types have a different size the smaller type is held unpacked in the least significant bits of elements of the larger size. When the input is the smaller type the upper bits of each source element are ignored. When the result is the smaller type the results are zero-extended to fill each destination element.

    if ElemP[mask, e, esize] == '1' then
        bits(d_esize) res = FPConvertSVE(element<s_esize-1:0>, FPCR[]);
        Elem[result, e, esize] = ZeroExtend(res);

Z[d] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
FCVTZS

Floating-point convert to signed integer, rounding toward zero (predicated).

Convert to the signed integer nearer to zero from each active floating-point element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

If the input and result types have a different size the smaller type is held unpacked in the least significant bits of elements of the larger size. When the input is the smaller type the upper bits of each source element are ignored. When the result is the smaller type the results are sign-extended to fill each destination element.

It has encodings from 7 classes: **Half-precision to 16-bit**, **Half-precision to 32-bit**, **Half-precision to 64-bit**, **Single-precision to 32-bit**, **Single-precision to 64-bit**, **Double-precision to 32-bit** and **Double-precision to 64-bit**

FDUP <Zd>,<T>, #<const>

if !HaveSVE() then UNDEFINED;
if size == '00' then UNDEFINED;
integer esize = 8 << UInt(size);
integer d = UInt(Zd);
bits(esize) imm = VFPExpandImm(imm8);

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>RESERVED</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

<const> Is a floating-point immediate value expressable as ±n×16×2^r, where n and r are integers such that 16 ≤ n ≤ 31 and -3 ≤ r ≤ 4, i.e. a normalized binary floating-point encoding with 1 sign bit, 3-bit exponent, and 4-bit fractional part, encoded in the “imm8” field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) result;
for e = 0 to elements-1
    Elem[result, e, esize] = imm;
Z[d] = result;
FEXPA

Floating-point exponential accelerator.

The FEXPA instruction accelerates the polynomial series calculation of the \( \exp(x) \) function.

The double-precision variant copies the low 52 bits of an entry from a hard-wired table of 64-bit coefficients, indexed by the low 6 bits of each element of the source vector, and prepends to that the next 11 bits of the source element \((\text{src}<16:6>)\), setting the sign bit to zero.

The single-precision variant copies the low 23 bits of an entry from hard-wired table of 32-bit coefficients, indexed by the low 6 bits of each element of the source vector, and prepends to that the next 8 bits of the source element \((\text{src}<13:6>)\), setting the sign bit to zero.

The half-precision variant copies the low 10 bits of an entry from hard-wired table of 16-bit coefficients, indexed by the low 5 bits of each element of the source vector, and prepends to that the next 5 bits of the source element \((\text{src}<9:5>)\), setting the sign bit to zero.

A coefficient table entry with index \( M \) holds the floating-point value \( 2^{(m/64)} \), or for the half-precision variant \( 2^{(m/32)} \).

This instruction is unpredicated.

FEXPA \(<Zd>\,<T>\), \(<Zn>\,<T>

Z[d] &= \text{result} ;
\end{align*}
\]
**FMAD**

Floating-point fused multiply-add vectors (predicated), writing multiplicand \([Zdn = Za + Zdn \times Zm]\).

Multiply the corresponding active floating-point elements of the first and second source vectors and add to elements of the third (addend) vector without intermediate rounding. Destructively place the results in the destination and first source (multiplicand) vector. Inactive elements in the destination vector register remain unmodified.

<td>D</td>
</tr>
</tbody>
</table>

- `<Pg>` Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- `<const>` Is the floating-point immediate value, encoded in “i1”:
  
<table>
<thead>
<tr>
<th>i1</th>
<th>&lt;const&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>#0.0</td>
</tr>
<tr>
<td>1</td>
<td>#1.0</td>
</tr>
</tbody>
</table>

Operation

```
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand1 = Z[dn];
bits(VL) result;
for e = 0 to elements-1
  bits(esize) element1 = Elem[operand1, e, esize];
  if ElemP[mask, e, esize] == '1' then
    Elem[result, e, esize] = FPMin(element1, imm, FPCR[]);  
  else
    Elem[result, e, esize] = element1;
Z[dn] = result;
```  

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
**FMIN (vectors)**

Floating-point minimum (predicated).

Determine the minimum of active floating-point elements of the second source vector and corresponding floating-point elements of the first source vector and destructively place the results in the corresponding elements of the first source vector. If either element value is NaN then the result is NaN. Inactive elements in the destination vector register remain unmodified.

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

• The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
FMLA (indexed)

Floating-point fused multiply-add by indexed elements (Zda = Zda + Zn * Zm[indexed]).

Multiply all floating-point elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment. The products are then destructively added without intermediate rounding to the corresponding elements of the addend and destination vector.

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 1 to 3 bits depending on the size of the element. This instruction is unpredicated.

It has encodings from 3 classes: **Half-precision**, **Single-precision** and **Double-precision**

### Half-precision

```
0 1 1 0 1 0 0 1 | i3h:1 | i3l  | Zm 0 0 0 0 0 0 | Zn | Zda

```

if !HaveSVE() then UNDEFINED;

integer index = UInt(i3h:i3l);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);
boolean op1_neg = FALSE;
boolean op3_neg = FALSE;

### Single-precision

```
0 1 1 0 1 0 0 1 | 0 1 | i2  | Zm 0 0 0 0 0 0 | Zn | Zda

FMLA <Zda>.S, <Zn>.S, <Zm>[<imm>]
```

if !HaveSVE() then UNDEFINED;
integer esize = 32;
integer index = UInt(i2);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);
boolean op1_neg = FALSE;
boolean op3_neg = FALSE;

### Double-precision

```
0 1 1 0 1 0 0 1 | 1 1 | i1  | Zm 0 0 0 0 0 0 | Zn | Zda

FMLA <Zda>.D, <Zn>.D, <Zm>[<imm>]
```

if !HaveSVE() then UNDEFINED;
integer esize = 64;
integer index = UInt(i1);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);
boolean op1_neg = FALSE;
boolean op3_neg = FALSE;
Assembler Symbols

<Zda>       Is the name of the third source and destination scalable vector register, encoded in the “Zda” field.
<Zn>        Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>        For the half-precision and single-precision variant: is the name of the second source scalable vector register Z0-Z7, encoded in the “Zm” field.
             For the double-precision variant: is the name of the second source scalable vector register Z0-Z15, encoded in the “Zm” field.
<imm>       For the half-precision variant: is the immediate index, in the range 0 to 7, encoded in the "i3h:i3l" fields.
             For the single-precision variant: is the immediate index, in the range 0 to 3, encoded in the "i2" field.
             For the double-precision variant: is the immediate index, in the range 0 to 1, encoded in the "i1" field.

    if op3_neg then element3 = FPNeg(element3);
    Elem[result, e, esize] = FPMulAdd(element3, element1, element2, FPCR[]);
  else
    Elem[result, e, esize] = element3;
Z[da] = result;
Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
FMLS (indexed)

Floating-point fused multiply-subtract by indexed elements (Zda = Zda + -Zn * Zm[indexed]).

Multiply all floating-point elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment. The products are then destructively subtracted without intermediate rounding from the corresponding elements of the addend and destination vector. The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 1 to 3 bits depending on the size of the element. This instruction is unpredicated.

It has encodings from 3 classes: Half-precision, Single-precision and Double-precision

Half-precision

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Assembler Symbols

<Zda> Is the name of the third source and destination scalable vector register, encoded in the “Zda” field.

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> For the half-precision and single-precision variant: is the name of the second source scalable vector register Z0-Z7, encoded in the “Zm” field.
For the double-precision variant: is the name of the second source scalable vector register Z0-Z15, encoded in the “Zm” field.

<imm> For the half-precision variant: is the immediate index, in the range 0 to 7, encoded in the "i3h:i3l" fields.
For the single-precision variant: is the immediate index, in the range 0 to 3, encoded in the "i2" field.
For the double-precision variant: is the immediate index, in the range 0 to 1, encoded in the “i1" field.

Operation

```
CheckSVEEnabled();
integer elements = VL DIV esize;
integer eltspersegment = 128 DIV esize;
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) result = Z[da];
for e = 0 to elements-1
  integer segmentbase = e - (e MOD eltspersegment);
  integer s = segmentbase + index;
  bits(esize) element1 = Elem[operand1, e, esize];
  bits(esize) element2 = Elem[operand2, s, esize];
  bits(esize) element3 = Elem[result, e, esize];
  if op1_neg then element1 = FPNeg(element1);
  if op3_neg then element3 = FPNeg(element3);
  Elem[result, e, esize] = FPMulAdd(element3, element1, element2, FPCR[]);
Z[da] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
FMOV (zero, predicated)

Move floating-point +0.0 to vector elements (predicated).

Move floating-point constant +0.0 to each active element in the destination vector. Inactive elements in the destination vector register remain unmodified.

This is a pseudo-instruction of CPY (immediate, merging). This means:

- The encodings in this description are named to match the encodings of CPY (immediate, merging).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of CPY (immediate, merging) gives the operational pseudocode for this instruction.

FMOV <Zd>.<T>, <Pg>/M, #0.0

is equivalent to

CPY <Zd>.<T>, <Pg>/M, #0

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in "size":

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>RESERVED</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

<Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.

Operation

The description of CPY (immediate, merging) gives the operational pseudocode for this instruction.

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
**FMOV (zero, unpredicated)**

Move floating-point +0.0 to vector elements (unpredicated).

Unconditionally broadcast the floating-point constant +0.0 into each element of the destination vector. This instruction is unpredicated.

This is a pseudo-instruction of **DUP (immediate)**. This means:

- The encodings in this description are named to match the encodings of **DUP (immediate)**.
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of **DUP (immediate)** gives the operational pseudocode for this instruction.

```
FMOV <Zd>.<T>, #0.0
```

is equivalent to

```
DUP <Zd>.<T>, #0
```

**Assembler Symbols**

- **<Zd>** is the name of the destination scalable vector register, encoded in the "Zd" field.
- **<T>** is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>RESERVED</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

**Operation**

The description of **DUP (immediate)** gives the operational pseudocode for this instruction.

<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

<Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.

<const> Is a floating-point immediate value expressable as ±n×16×2^r, where n and r are integers such that 16 ≤ n ≤ 31 and -3 ≤ r ≤ 4, i.e. a normalized binary floating-point encoding with 1 sign bit, 3-bit exponent, and 4-bit fractional part, encoded in the “imm8” field.

Operation

The description of FCPY gives the operational pseudocode for this instruction.

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
FMOV (immediate, unpredicated)

Move 8-bit floating-point immediate to vector elements (unpredicated).

Unconditionally broadcast the floating-point immediate into each element of the destination vector. This instruction is unpredicated.

This is an alias of FDUP. This means:

- The encodings in this description are named to match the encodings of FDUP.
- The description of FDUP gives the operational pseudocode for this instruction.

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 | 0 0 1 0 0 1 0 1 | size | 1 1 1 | 0 0 | 1 1 1 | 0 | imm8 | Zd |

FMOV <Zd>,<T>, #<const>

is equivalent to

FDUP <Zd>,<T>, #<const>

and is always the preferred disassembly.

Assembler Symbols

<Zd> is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> is the size specifier, encoded in "size":

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>

FMUL (indexed)

Floating-point multiply by indexed elements.

Multiply all floating-point elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment. The results are placed in the corresponding elements of the destination vector.

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 1 to 3 bits depending on the size of the element. This instruction is unpredicated.

It has encodings from 3 classes: Half-precision, Single-precision and Double-precision

Half-precision

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the \"Zd\" field.

<Zn> Is the name of the first source scalable vector register, encoded in the \"Zn\" field.
<Zm> For the half-precision and single-precision variant: is the name of the second source scalable vector register Z0-Z7, encoded in the “Zm” field.

For the double-precision variant: is the name of the second source scalable vector register Z0-Z15, encoded in the “Zm” field.

<imm> For the half-precision variant: is the immediate index, in the range 0 to 7, encoded in the "i3h:i3l" fields.

For the single-precision variant: is the immediate index, in the range 0 to 3, encoded in the "i2" field.

For the double-precision variant: is the immediate index, in the range 0 to 1, encoded in the "i1" field.

**Operation**

```c
CheckSVEEnabled();
integer elements = VL DIV esize;
integer eltspersegment = 128 DIV esize;
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) result;
for e = 0 to elements-1
    integer segmentbase = e - (e MOD eltspersegment);
    integer s = segmentbase + index;
    bits(esize) element1 = Elem[operand1, e, esize];
    bits(esize) element2 = Elem[operand2, s, esize];
    Elem[result, e, esize] = FPMul(element1, element2, FPCR[]);
Z[d] = result;
```

**FMULX**

Floating-point multiply-extended vectors (predicated).

Multiply active floating-point elements of the first source vector by corresponding floating-point elements of the second source vector except that $\infty \times 0.0$ gives 2.0 instead of NaN, and destructively place the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

The instruction can be used with FRECPX to safely convert arbitrary elements in mathematical vector space to UNIT VECTORS or DIRECTION VECTORS with length 1.

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 1 1 0 0 1 0 1 | size | 0 0 | 1 0 1 | 0 | 1 0 0 | Pg | Zm | Zdn
```

**Assembler Symbols**

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>RESERVED</td>
</tr>
<tr>

</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

**Operation**

```
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand1 = Z[dn];
bits(VL) operand2 = Z[m];
bits(VL) result;
for e = 0 to elements-1
  bits(esize) element1 = Elem[operand1, e, esize];
  bits(esize) element2 = Elem[operand2, e, esize];
  if Elem[mask, e, esize] == '1' then
    Elem[result, e, esize] = FPMulX(element1, element2, FPCR[]);
  else
    Elem[result, e, esize] = element1;
Z[dn] = result;
```

**Operational information**

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

FNEG

Floating-point negate (predicated).

Negate each active floating-point element of the source vector, and place the results in the corresponding elements of
the destination vector. This inverts the sign bit and cannot signal a floating-point exception. Inactive elements in the
destination vector register remain unmodified.

### Assembler Symbols

| <Zd> | Is the name of the destination scalable vector register, encoded in the "Zd" field. |
| <T>  | Is the size specifier, encoded in "size":                                      |

### Operation

```plaintext
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P(g);
bits(VL) operand = Z(n);
bits(VL) result = Z(d);
for e = 0 to elements-1
    bits(esize) element = Elem(operand, e, esize);
    if ElemP(mask, e, esize) == '1' then
        Elem(result, e, esize) = FPNeg(element);
Z[d] = result;
```

### Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction
must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is
UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register
  and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand
  register of this instruction.
Floating-point negated fused multiply-add vectors (predicated), writing multiplicand \[ Z_{dn} = -Z_{a} + -Z_{dn} \times Z_{m} \].

Multiply the corresponding active floating-point elements of the first and second source vectors and add to elements of the third (addend) vector without intermediate rounding. Destructively place the negated results in the destination and first source (multiplicand) vector. Inactive elements in the destination vector register remain unmodified.

FNMAD symbol meanings:

- <Zdn>: Name of the first source and destination scalable vector register, encoded in the "Zdn" field.
- <T>: Size specifier, encoded in "size":
  - 00: RESERVED
  - 01: H
  - 10: S
  - 11: D
- <Pg>: Name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- <Zm>: Name of the second source scalable vector register, encoded in the "Zm" field.
- <Za>: Name of the third source scalable vector register, encoded in the "Za" field.

**Operation**

```c
if !HaveSVE() then UNDEFINED;
if size == '00' then UNDEFINED;
integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer dn = UInt(Zdn);

    Elem[result, e, esize] = FPRecipStepFused(element1, element2);
Z[d] = result;
**FRECPX**

Floating-point reciprocal exponent (predicated).

Invert the exponent and zero the fractional part of each active floating-point element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

The result of this instruction can be used with FMULX to convert arbitrary elements in mathematical vector space to "unit vectors" or "direction vectors" of length 1.

Z[d] = result;

**Operational information**

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
FRINT<r>

Floating-point round to integral value (predicated).

Round to an integral floating-point value with the specified rounding option from each active floating-point element of
the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in
the destination vector register remain unmodified.

The <r> symbol specifies one of the following rounding options: N (to nearest, with ties to even), A (to nearest, with
ties away from zero), M (toward minus Infinity), P (toward plus Infinity), Z (toward zero), I (current FPCR rounding
mode), or X (current FPCR rounding mode, signalling inexact).

It has encodings from 7 classes: Current mode, Current mode signalling inexact, Nearest with ties to away, Nearest
with ties to even, Toward zero, Toward minus infinity and Toward plus infinity.

Current mode

  - `01` H
  - `10` S
  - `11` D
- `<Pg>` Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- `<Zm>` Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand1 = Z[dn];
bits(VL) operand2 = Z[m];
bits(VL) result;
for e = 0 to elements-1
  bits(esize) element1 = Elem[operand1, e, esize];
bits(esize) element2 = Elem[operand2, e, esize];
  if ElemP[mask, e, esize] == '1' then
    Elem[result, e, esize] = FPSub(element1, element2, FPCR[]);
  else
    Elem[result, e, esize] = element1;
Z[dn] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
FSUB (vectors, predicated)
FSUB (vectors, unpredicated)

Floating-point subtract vectors (unpredicated).

Subtract all floating-point elements of the second source vector from corresponding elements of the first source vector and place the results in the corresponding elements of the destination vector. This instruction is unpredicated.

FSUBR (immediate)

Floating-point reversed subtract from immediate (predicated).

Reversed subtract from an immediate each active floating-point element of the source vector, and destructively place the results in the corresponding elements of the source vector. The immediate may take the value +0.5 or +1.0 only. Inactive elements in the destination vector register remain unmodified.

```

      Elem[result, e, esize] = element1;
Z[dn] = result;
```

Operational Information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
**FTMAD**

Floating-point trigonometric multiply-add coefficient.

The FTMAD instruction calculates the series terms for either \( \sin(x) \) or \( \cos(x) \), where the argument \( x \) has been adjusted to be in the range \(-\pi/4 < x \leq \pi/4\).

To calculate the series terms of \( \sin(x) \) and \( \cos(x) \) the initial source operands of FTMAD should be zero in the first source vector and \( x^2 \) in the second source vector. The FTMAD instruction is then executed eight times to calculate the sum of eight series terms, which gives a result of sufficient precision.

The FTMAD instruction multiplies each element of the first source vector by the absolute value of the corresponding element of the second source vector and performs a fused addition of each product with a value obtained from a table of hard-wired coefficients, and places the results destructively in the first source vector.

The coefficients are different for \( \sin(x) \) and \( \cos(x) \), and are selected by a combination of the sign bit in the second source element and an immediate index in the range 0 to 7.

This instruction is unpredicated.

<table>
<thead>
<tr>
<th>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 1 1 0 0 1 0 1</td>

</tbody>
</table>

FTMAD <Zdn>.<T>,<Zm>.<T>,<Zm>.<T>,<Zm>.<T>, #<imm>

if !HaveSVE() then UNDEFINED;
if size == '00' then UNDEFINED;
integer esize = 8 << UInt(size);
integer dn = UInt(Zdn);
integer m = UInt(Zm);
integer imm = UInt(imm3);

**Assembler Symbols**

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>RESERVED</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

<imm> Is the unsigned immediate operand, in the range 0 to 7, encoded in the "imm3" field.

**Operation**

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn];
bits(VL) operand2 = Z[m];
bits(VL) result;

for e = 0 to elements-1
    bits(esize) element1 = Elem[operand1, e, esize];
bits(esize) element2 = Elem[operand2, e, esize];
    Elem[result, e, esize] = FPTrigMAdd(imm, element1, element2, FPCR[]);  
Z[dn] = result;

**Operational information**

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
**FTSMUL**

Floating-point trigonometric starting value.

The FTSMUL instruction calculates the initial value for the FTMAD instruction. The instruction squares each element in the first source vector and then sets the sign bit to a copy of bit 0 of the corresponding element in the second source register, and places the results in the destination vector. This instruction is unpredicated.

To compute \( \sin(x) \) or \( \cos(x) \) the instruction is executed with elements of the first source vector set to \( x \), adjusted to be in the range \(-\pi/4 < x \leq \pi/4\).

The elements of the second source vector hold the corresponding value of the quadrant \( \phi \) number as an integer not a floating-point value. The value \( \phi \) satisfies the relationship \((2q-1) \times \pi/4 < x \leq (2q+1) \times \pi/4\).

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 0  | 1  | 1  | 0  | 0  | 1  | 0  | 1  | 0  | 0  | 1  | 1  | 0  | 0  | 0  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 0  | 0  | 0  | 0  | 1  | 1  | 1  | 0  |

**Assembler Symbols**

- \(<Zd>\) Is the name of the destination scalable vector register, encoded in the "Zd" field.
- \(<T>\) Is the size specifier, encoded in "size":
  - \(00\) RESERVED
  - \(01\) H
  - \(10\) S
  - \(11\) D
- \(<Zn>\) Is the name of the first source scalable vector register, encoded in the "Zn" field.
- \(<Zm>\) Is the name of the second source scalable vector register, encoded in the "Zm" field.

**Operation**

```plaintext
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) result;
for e = 0 to elements-1
    bits(esize) element1 = Elem[operand1, e, esize];
    bits(esize) element2 = Elem[operand2, e, esize];
    Elem[result, e, esize] = FPTriGSMul(element1, element2, FPCR[]);
Z[d] = result;
```

FTSSEL

Floating-point trigonometric select coefficient.

The FTSSEL instruction selects the coefficient for the final multiplication in the polynomial series approximation. The instruction places the value 1.0 or a copy of the first source vector element in the destination element, depending on bit 0 of the quadrant number \( Q \) held in the corresponding element of the second source vector. The sign bit of the destination element is copied from bit 1 of the corresponding value of \( Q \). This instruction is unpredicated.

To compute \( \sin(x) \) or \( \cos(x) \) the instruction is executed with elements of the first source vector set to \( x \), adjusted to be in the range \(-\pi/4 < x \leq \pi/4\).

The elements of the second source vector hold the corresponding value of the quadrant \( Q \) number as an integer not a floating-point value. The value \( Q \) satisfies the relationship \((2q-1) \times \pi/4 < x \leq (2q+1) \times \pi/4\).

### Assembler Symbols

- **<Zd>** Is the name of the destination scalable vector register, encoded in the “Zd” field.

INCB, INCD, INCH, INCW (scalar)

Increment scalar by multiple of predicate constraint element count.

Determines the number of active elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment the scalar destination.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 4 classes: Byte, Doubleword, Halfword and Word

Byte

</tbody>
</table>

<imm> Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.

Operation

CheckSVEEnabled();
integer count = DecodePredCount(pat, esize);
bits(64) operand1 = X[dn];

X[dn] = operand1 + (count * imm);
INCD, INCH, INCW (vector)

Increment vector by multiple of predicate constraint element count.

Determines the number of active elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment all destination vector elements.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 3 classes: Doubleword, Halfword and Word.

</tbody>
</table>

<imm> Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.

Operation

```c
CheckSVEEnabled();
integer elements = VL DIV esize;
integer count = DecodePredCount(pat, esize);
bits(VL) operand1 = Z[dn];
bits(VL) result;
for e = 0 to elements-1
  Elem[result, e, esize] = Elem[operand1, e, esize] + (count * imm);
Z[dn] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
INCP (scalar)

Increment scalar by count of true predicate elements.

Counts the number of true elements in the source predicate and then uses the result to increment the scalar destination.

```
<table>

LD1B (vector plus immediate)

Gather load unsigned bytes to vector (immediate index).

Gather load of unsigned bytes to active elements of a vector register from memory addresses generated by a vector base plus immediate index. The index is in the range 0 to 31. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

It has encodings from 2 classes: **32-bit element** and **64-bit element**

32-bit element

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0 |

integer esize = 64;
integer msize = 8;
boolean unsigned = TRUE;
integer offset = UInt(imm5);

Assembler Symbols

<Zt> Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the base scalable vector register, encoded in the "Zn" field.

<imm> Is the optional unsigned immediate byte offset, in the range 0 to 31, defaulting to 0, encoded in the "imm5" field.
Operation

```plaintext
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) base = Z[n];
bits(64) addr;
bits(PL) mask = P[g];
bits(VL) result;
bits(msize) data;
constant integer mbytes = msize DIV 8;

if HaveMTEExt() then SetTagCheckedInstruction(TRUE);

for e = 0 to elements-1
  if ElemP[mask, e, esize] == '1' then
    addr = ZeroExtend(Elem[base, e, esize], 64) + offset * mbytes;
    data = Mem[addr, mbytes, AccType_NORMAL];
    Elem[result, e, esize] = Extend(data, esize, unsigned);
  else
    Elem[result, e, esize] = Zeros();

Z[t] = result;
```
LD1B (scalar plus immediate)

Contiguous load unsigned bytes to vector (immediate index).

Contiguous load of unsigned bytes to elements of a vector register from the memory address generated by a 64-bit scalar base and immediate index in the range -8 to 7 which is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address. Inactive elements will not not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 4 classes: 8-bit element, 16-bit element, 32-bit element and 64-bit element.

8-bit element

```
LD1B { <Zt>.B }, <Pg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

LD1B (scalar plus vector)

Gather load unsigned bytes to vector (vector index).

Gather load of unsigned bytes to active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally sign or zero-extended from 32 to 64 bits. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

It has encodings from 3 classes: 32-bit unpacked unscaled offset, 32-bit unscaled offset and 64-bit unscaled offset

LD1D (scalar plus vector)

Gather load doublewords to vector (vector index).

Gather load of doublewords to active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and then optionally multiplied by 8. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

It has encodings from 4 classes: 32-bit unpacked scaled offset, 32-bit unpacked unscaled offset, 64-bit scaled offset and 64-bit unscaled offset.

32-bit unpacked scaled offset

```
LD1D { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Zm>.D, <mod> #3]
```

if !HaveSVE() then UNDEFINED;

  Elem[result, e, esize] = Zeros();
  addr = addr + mbytes;
Z[t] = result;
**LD1H (scalar plus scalar)**

Contiguous load unsigned halfwords to vector (scalar index).

Contiguous load of unsigned halfwords to elements of a vector register from the memory address generated by a 64-bit scalar base and scalar index which is multiplied by 2 and added to the base address. After each element access the index value is incremented, but the index register is not updated. Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 3 classes: 16-bit element, 32-bit element and 64-bit element.

### 16-bit element

LD1H (scalar plus vector)

Gather load unsigned halfwords to vector (vector index).

Gather load of unsigned halfwords to active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and then optionally multiplied by 2. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

It has encodings from 6 classes: 32-bit scaled offset , 32-bit unpacked scaled offset , 32-bit unpacked unscaled offset , 32-bit unscaled offset , 64-bit scaled offset and 64-bit unscaled offset

LD1RB

Load and broadcast unsigned byte to vector.

Load a single unsigned byte from a memory address generated by a 64-bit scalar base address plus an immediate offset which is in the range 0 to 63.

Broadcast the loaded data into all active elements of the destination vector, setting the inactive elements to zero. If all elements are inactive then the instruction will not perform a read from Device memory or cause a data abort.

It has encodings from 4 classes: 8-bit element, 16-bit element, 32-bit element and 64-bit element.

8-bit element

            Elem[result, e, esize] = Extend(data, esize, unsigned);
        else
            Elem[result, e, esize] = Zeros();
Z[t] = result;
LD1RD

Load and broadcast doubleword to vector.

Load a single doubleword from a memory address generated by a 64-bit scalar base address plus an immediate offset which is a multiple of 8 in the range 0 to 504.

Broadcast the loaded data into all active elements of the destination vector, setting the inactive elements to zero. If all elements are inactive then the instruction will not perform a read from Device memory or cause a data abort.

```
LD1RD {<Zt>.D }, <Pg>/Z, [<Xn|SP>{, #<imm>}] 
```

```java
if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Rn);
integer g = UInt(Pg);
integer esize = 64;
integer msize = 64;
boolean unsigned = TRUE;
integer offset = UInt(imm6);
```

**Assembler Symbols**

- `<Zt>` Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
- `<Pg>` Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- `<Xn|SP>` Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- `<imm>` Is the optional unsigned immediate byte offset, a multiple of 8 in the range 0 to 504, defaulting to 0, encoded in the "imm6" field.
Operation

LD1RH

Load and broadcast unsigned halfword to vector.

Load a single unsigned halfword from a memory address generated by a 64-bit scalar base address plus an immediate offset which is a multiple of 2 in the range 0 to 126.

Broadcast the loaded data into all active elements of the destination vector, setting the inactive elements to zero. If all elements are inactive then the instruction will not perform a read from Device memory or cause a data abort.

It has encodings from 3 classes: 16-bit element, 32-bit element and 64-bit element

16-bit element

**LD1SB (scalar plus vector)**

Gather load signed bytes to vector (vector index).

Gather load of signed bytes to active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally sign or zero-extended from 32 to 64 bits. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

It has encodings from 3 classes: 32-bit unpacked unscaled offset, 32-bit unscaled offset and 64-bit unscaled offset.

### 32-bit unpacked unscaled offset

```
| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |

LD1SW (vector plus immediate)

Gather load signed words to vector (immediate index).

Gather load of signed words to active elements of a vector register from memory addresses generated by a vector base plus immediate index. The index is a multiple of 4 in the range 0 to 124. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

**LD4W (scalar plus scalar)**

Contiguous load four-word structures to four vectors (scalar index).

Contiguous load four-word structures, each to the same element number in four vector registers from the memory address generated by a 64-bit scalar base and a 64-bit scalar index register scaled by the element size (LSL option) and added to the base address. After each structure access the index value is incremented by four. The index register is not updated by the instruction.

Each predicate element applies to the same element number in each of the four vector registers, or equivalently to the four consecutive words in memory which make up each structure. Inactive elements will not cause a read from Device memory or signal a fault, and the corresponding element is set to zero in each of the four destination vector registers.

```assembly
LD4W

if !HaveSVE() then UNDEFINED;
if Rm == '11111' then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer g = UInt(Pg);
integer esize = 32;
integer nreg = 4;
```

**Assembler Symbols**

- `<Zt1>` Is the name of the first scalable vector register to be transferred, encoded in the "Zt" field.
- `<Zt2>` Is the name of the second scalable vector register to be transferred, encoded as "Zt" plus 1 modulo 32.
- `<Zt3>` Is the name of the third scalable vector register to be transferred, encoded as "Zt" plus 2 modulo 32.
- `<Zt4>` Is the name of the fourth scalable vector register to be transferred, encoded as "Zt" plus 3 modulo 32.
- `<Pg>` Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- `<Xn|SP>` Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- `<Xm>` Is the 64-bit name of the general-purpose offset register, encoded in the "Rm" field.

**LDFF1D (scalar plus vector)**

Gather load first-fault doublewords to vector (vector index).

Gather load with first-faulting behavior of doublewords to active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and then optionally multiplied by 8. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

It has encodings from 4 classes: 32-bit unpacked scaled offset, 32-bit unpacked unscaled offset, 64-bit scaled offset and 64-bit unscaled offset.

### 32-bit unpacked scaled offset

```
 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
 1 1 0 0 0 1 0 1 1 xs 1 Zm 0 1 1 Pg Rn Zt
```

**LDFF1D** { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Zm>.D, <mod> #3]

```java
if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Rn);
integer m = UInt(Zm);
integer g = UInt(Pg);
integer esize = 64;
integer msize = 64;
integer offs_size = 32;
boolean unsigned = TRUE;
boolean offs_unsigned = xs == '0';
integer scale = 3;
```

### 32-bit unpacked unscaled offset

```
 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
 1 1 0 0 0 1 0 1 1 xs 0 Zm 0 1 1 Pg Rn Zt
```

**LDFF1D** { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Zm>.D, <mod>]

```java
if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);

LDFF1SB (scalar plus scalar)

Contiguous load first-fault signed bytes to vector (scalar index).

Contiguous load with first-faulting behavior of signed bytes to elements of a vector register from the memory address generated by a 64-bit scalar base and scalar index which is added to the base address. After each element access the index value is incremented, but the index register is not updated. Inactive elements will not not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 3 classes: 16-bit element, 32-bit element and 64-bit element

16-bit element

LDFF1SB { <Zt>.H }, <Pg>/Z, [<Xn|SP>{, <Xm>}] if !HaveSVE() then UNDEFINED;

```
LDFF1SH (scalar plus vector)

Gather load first-fault signed halfwords to vector (vector index).

Gather load with first-faulting behavior of signed halfwords to active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and then optionally multiplied by 2. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

It has encodings from 6 classes: 32-bit scaled offset, 32-bit unpacked scaled offset, 32-bit unpacked unscaled offset, 32-bit unscaled offset, 64-bit scaled offset and 64-bit unscaled offset

LDFF1SW (scalar plus vector)

Gather load first-fault signed words to vector (vector index).

Gather load with first-faulting behavior of signed words to active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and then optionally multiplied by 4.Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

It has encodings from 4 classes: 32-bit unpacked scaled offset, 32-bit unpacked unscaled offset, 64-bit scaled offset and 64-bit unscaled offset.

32-bit unpacked scaled offset

LDNF1SH

Contiguous load non-fault signed halfwords to vector (immediate index).

Contiguous load with non-faulting behavior of signed halfwords to elements of a vector register from the memory address generated by a 64-bit scalar base and immediate index in the range -8 to 7 which is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address. Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 2 classes: 32-bit element and 64-bit element

LDNT1H (scalar plus scalar)

Contiguous load non-temporal halfwords to vector (scalar index).

Contiguous load non-temporal of halfwords to elements of a vector register from the memory address generated by a 64-bit scalar base and scalar index which is multiplied by 2 and added to the base address. After each element access the index value is incremented, but the index register is not updated. Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

A non-temporal load is a hint to the system that this data is unlikely to be referenced again soon.

```
LDNT1H { <Zt>.H }, <Pg>/Z, [<Xn|SP>, <Xm>, LSL #1]
```

Assembler Symbols

- `<Zt>` is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
- `<Pg>` is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- `<Xn|SP>` is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- `<Xm>` is the 64-bit name of the general-purpose offset register, encoded in the "Rm" field.

Operation

```
CheckSVEEnabled();

LSLR

Reversed logical shift left by vector (predicated).

Reversed shift left active elements of the second source vector by corresponding elements of the first source vector
and destructively place the results in the corresponding elements of the first source vector. The shift amount operand
is a vector of unsigned elements in which all bits are significant, and not used modulo the element size. Inactive
elements in the destination vector register remain unmodified.

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction
must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is
UNPREDICTABLE:
- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register
  and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
**LSR (immediate, predicated)**

Logical shift right by immediate (predicated).

Shift right by immediate, inserting zeroes, each active element of the source vector, and destructively place the results in the corresponding elements of the source vector. The immediate shift amount is an unsigned value in the range 1 to number of bits per element. Inactive elements in the destination vector register remain unmodified.

</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

- **<Pg>** Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- **<Zn>** Is the name of the first source scalable vector register, encoded in the "Zn" field.
- **<Zm>** Is the name of the second source scalable vector register, encoded in the "Zm" field.

**Operation**

```plaintext
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) operand3 = Z[da];
bits(VL) result;

for e = 0 to elements-1
  integer element1 = UInt(Elem[operand1, e, esize]);
  integer element2 = UInt(Elem[operand2, e, esize]);
  if Elem[mask, e, esize] == '1' then
    integer product = element1 * element2;
    if sub_op then
      Elem[result, e, esize] = Elem[operand3, e, esize] - product;
    else
      Elem[result, e, esize] = Elem[operand3, e, esize] + product;
  else
    Elem[result, e, esize] = Elem[operand3, e, esize];

Z[da] = result;
```
Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
MOV (predicate, predicated, zeroing)

Move predicates (zeroing).

Read active elements from the source predicate and place in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Does not set the condition flags.

This is an alias of AND, ANDS (predicates). This means:

- The encodings in this description are named to match the encodings of AND, ANDS (predicates).
- The description of AND, ANDS (predicates) gives the operational pseudocode for this instruction.

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

| S | 0 0 1 0 1 0 1 0 0 0 0 0 0 0 0 0 | Pm | 0 1 | Pg | 0 | Pn | 0 | Pd |

MOV <Pd>.B, <Pg>/Z, <Pn>.B

is equivalent to

and is the preferred disassembly when $S == '0' \&\& Pn == Pm.$

Assembler Symbols

<Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.

<Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.

<Pn> Is the name of the first source scalable predicate register, encoded in the "Pn" field.

Operation

The description of AND, ANDS (predicates) gives the operational pseudocode for this instruction.

**MOV (immediate, predicated, zeroing)**

Move signed integer immediate to vector elements (zeroing).

Move a signed integer immediate to each active element in the destination vector. Inactive elements in the destination vector register are set to zero.

The immediate operand is a signed value in the range -128 to +127, and for element widths of 16 bits or higher it may also be a signed multiple of 256 in the range -32768 to +32512 (excluding 0).

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<simm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

This is an alias of **CPY (immediate, zeroing)**. This means:

- The encodings in this description are named to match the encodings of **CPY (immediate, zeroing)**.
- The description of **CPY (immediate, zeroing)** gives the operational pseudocode for this instruction.

M
```

MOV <Zd>.<T>, <Pg>/Z, #<imm>{, <shift>}

is equivalent to

CPY <Zd>.<T>, <Pg>/Z, #<imm>{, <shift>}

and is always the preferred disassembly.

**Assembler Symbols**

- `<Zd>` is the name of the destination scalable vector register, encoded in the "Zd" field.
- `<T>` is the size specifier, encoded in "size":

  ```plaintext
  size | <T> |
  ----|-----|
  00  | B   |
  01  | H   |
  10  | S   |
  11  | D   |
  ``

- `<Pg>` is the name of the governing scalable predicate register, encoded in the "Pg" field.
- `<imm>` is a signed immediate in the range -128 to 127, encoded in the "imm8" field.
- `<shift>` is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in "sh":

  ```plaintext
  sh | <shift> |
  ---|---------|
  0  | LSL #0  |
  1  | LSL #8  |
  ``

**Operation**

The description of **CPY (immediate, zeroing)** gives the operational pseudocode for this instruction.
MOV (immediate, predicated, merging)

Move signed integer immediate to vector elements (merging).

Move a signed integer immediate to each active element in the destination vector. Inactive elements in the destination vector register remain unmodified.

The immediate operand is a signed value in the range -128 to +127, and for element widths of 16 bits or higher it may also be a signed multiple of 256 in the range -32768 to +32512 (excluding 0).

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is \( \# <\text{imm8}> , \text{LSL} \ #8 \). However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as \( \#0 , \text{LSL} \ #8 \).

This is an alias of CPY (immediate, merging). This means:

- The encodings in this description are named to match the encodings of CPY (immediate, merging).
- The description of CPY (immediate, merging) gives the operational pseudocode for this instruction.

</tbody>
</table>

<n|SP> Is the number [0-30] of the general-purpose source register or the name SP (31), encoded in the "Rn" field.

Operation

The description of CPY (scalar) gives the operational pseudocode for this instruction.

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction
must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is
UNPREDICTABLE:

• The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register
and source element size as this instruction.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand
register of this instruction.
MOV (SIMD&FP scalar, predicated)

Move SIMD&FP scalar register to vector elements (predicated).

Move the SIMD & floating-point scalar source register to each active element in the destination vector. Inactive elements in the destination vector register remain unmodified.

This is an alias of CPY (SIMD&FP scalar). This means:

- The encodings in this description are named to match the encodings of CPY (SIMD&FP scalar).
- The description of CPY (SIMD&FP scalar) gives the operational pseudocode for this instruction.

\[
\text{MOV } <Zd>, <T>, <Pg>/M, <V><n>
\]

is equivalent to

\[
\text{CPY } <Zd>, <T>, <Pg>/M, <V><n>
\]

and is always the preferred disassembly.

Assembler Symbols

- **<Zd>** Is the name of the destination scalable vector register, encoded in the "Zd" field.
- **<T>** Is the size specifier, encoded in “size”:
  \[
  \begin{array}{c|c}
  \text{size} & \text{<T>} \\
  \hline
  00 & B \\
  01 & H \\
  10 & S \\
  11 & D \\
  \end{array}
  \]
- **<Pg>** Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- **<V>** Is a width specifier, encoded in “size”:
  \[
  \begin{array}{c|c}
  \text{size} & \text{<V>} \\
  \hline
  00 & B \\
  01 & H \\
  10 & S \\
  11 & D \\
  \end{array}
  \]
- **<n>** Is the number [0-31] of the source SIMD&FP register, encoded in the "Vn" field.

Operation

The description of CPY (SIMD&FP scalar) gives the operational pseudocode for this instruction.

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
MOV (immediate, unpredicated)

Move signed immediate to vector elements (unpredicated).

Unconditionally broadcast the signed integer immediate into each element of the destination vector. This instruction is unpredicated.

The immediate operand is a signed value in the range -128 to +127, and for element widths of 16 bits or higher it may also be a signed multiple of 256 in the range -32768 to +32512 (excluding 0).

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<simm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

This is an alias of DUP (immediate). This means:

- The encodings in this description are named to match the encodings of DUP (immediate).
- The description of DUP (immediate) gives the operational pseudocode for this instruction.

\[
\begin{array}{|c|c|c|c|c|c|c|c|c|c|}
\hline
\hline

\hline
\end{array}
\]

MOV <Zd>.<T>, #<imm>{, <shift>}

is equivalent to

DUP <Zd>.<T>, #<imm>{, <shift>}

and is always the preferred disassembly.

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.
<T> Is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>

<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

<imm> Is a signed immediate in the range -128 to 127, encoded in the "imm8" field.
<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in “sh”:

<table>
<thead>
<tr>
<th>sh</th>
<th>&lt;shift&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>LSL #0</td>
</tr>
<tr>
<td>1</td>
<td>LSL #8</td>
</tr>
</tbody>
</table>

Operation

The description of DUP (immediate) gives the operational pseudocode for this instruction.
**MOV (scalar, unpredicated)**

Move general-purpose register to vector elements (unpredicated).

Unconditionally broadcast the general-purpose scalar source register into each element of the destination vector. This instruction is unpredicated.

This is an alias of **DUP (scalar)**. This means:

- The encodings in this description are named to match the encodings of **DUP (scalar)**.
- The description of **DUP (scalar)** gives the operational pseudocode for this instruction.

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |

</tr>
</tbody>
</table>

- **<n|SP>** Is the number [0-30] of the general-purpose source register or the name SP (31), encoded in the "Rn" field.

**Operation**

The description of **DUP (scalar)** gives the operational pseudocode for this instruction.
MOV (SIMD&FP scalar, unpredicated)

Move indexed element or SIMD&FP scalar to vector (unpredicated).

Unconditionally broadcast the SIMD&FP scalar into each element of the destination vector. This instruction is unpredicated.

This is an alias of DUP (indexed). This means:

- The encodings in this description are named to match the encodings of DUP (indexed).
- The description of DUP (indexed) gives the operational pseudocode for this instruction.

\[
\begin{array}{cccccccccccccccccc}

\end{array}
\]

MOV <Zd>.<T>, <V><n>

is equivalent to

DUP <Zd>.<T>, <Zn>.<T>[0]

and is the preferred disassembly when BitCount(imm2:tsz) == 1.

MOV <Zd>.<T>, <Zn>.<T>[<imm>]

is equivalent to

DUP <Zd>.<T>, <Zn>.<T>[<imm>]

and is the preferred disassembly when BitCount(imm2:tsz) > 1.

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in "tsz":

\[
\begin{array}{c|c}
\text{tsz} & \text{T} \\
00000 & \text{RESERVED} \\
xxxx1 & B \\
xxx10 & H \\
x1000 & S \\
x1000 & D \\
10000 & Q \\
\end{array}
\]

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<imm> Is the immediate index, in the range 0 to one less than the number of elements in 512 bits, encoded in "imm2:tsz".

<V> Is a width specifier, encoded in "tsz":

\[
\begin{array}{c|c}
\text{tsz} & \text{V} \\
00000 & \text{RESERVED} \\
xxxx1 & B \\
xxx10 & H \\
x1000 & S \\
x1000 & D \\
10000 & Q \\
\end{array}
\]

<n> Is the number [0-31] of the source SIMD&FP register, encoded in the "Zn" field.

Operation

The description of DUP (indexed) gives the operational pseudocode for this instruction.
MOV (bitmask immediate)

Move logical bitmask immediate to vector (unpredicated).

Unconditionally broadcast the logical bitmask immediate into each element of the destination vector. This instruction is unpredicated. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16, 32 or 64 bits.

This is an alias of DUPM. This means:

- The encodings in this description are named to match the encodings of DUPM.
- The description of DUPM gives the operational pseudocode for this instruction.

<table>

</tbody>
</table>

MOV <Zd>.<T>, #<const>

is equivalent to

DUPM <Zd>.<T>, #<const>

and is the preferred disassembly when SVEMoveMaskPreferred(imm13).

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “imm13<12>:imm13<5:0>”:

<const> Is a 64, 32, 16 or 8-bit bitmask consisting of replicated 2, 4, 8, 16, 32 or 64 bit fields, each field containing a rotated run of non-zero bits, encoded in the “imm13” field.

Operation

The description of DUPM gives the operational pseudocode for this instruction.
MOV (predicate, unpredicated)

Move predicate (unpredicated).

Read all elements from the source predicate and place in the destination predicate. This instruction is unpredicated. Does not set the condition flags.

This is an alias of ORR, ORRS (predicates). This means:

- The encodings in this description are named to match the encodings of ORR, ORRS (predicates).
- The description of ORR, ORRS (predicates) gives the operational pseudocode for this instruction.

\[
\begin{array}{cccccccccccccccccccc}
0 & 0 & 1 & 0 & 0 & 1 & 0 & 1 & 1 & 0 & 0 & 0 & Pm & 0 & 1 & Pg & 0 & Pn & 0 & 0 & Pd \\
\end{array}
\]

MOV <Pd>.B, <Pn>.B

is equivalent to

and is the preferred disassembly when \( S == '0' && Pn == Pm && Pm == Pg \).

Assembler Symbols

- <Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.
- <Pn> Is the name of the first source scalable predicate register, encoded in the "Pn" field.

Operation

The description of ORR, ORRS (predicates) gives the operational pseudocode for this instruction.
MOV (vector, unpredicated)

Move vector register (unpredicated).

Move vector register. This instruction is unpredicated.

This is an alias of **ORR (vectors, unpredicated)**. This means:

- The encodings in this description are named to match the encodings of **ORR (vectors, unpredicated)**.
- The description of **ORR (vectors, unpredicated)** gives the operational pseudocode for this instruction.

\[
\begin{array}{cccccccccccccccccc}
\hline
0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 1 & 1 & \text{Zm} & 0 & 0 & 1 & 1 & 0 & 0 & \text{Zn} & \text{Zd}
\end{array}
\]

MOV `<Zd>`.D, `<Zn>`.D

is equivalent to

ORR `<Zd>`.D, `<Zn>`.D, `<Zn>`.D

and is the preferred disassembly when `Zn == Zm`.

**Assembler Symbols**

`<Zd>` Is the name of the destination scalable vector register, encoded in the "Zd" field.

`<Zn>` Is the name of the first source scalable vector register, encoded in the "Zn" field.

**Operation**

The description of **ORR (vectors, unpredicated)** gives the operational pseudocode for this instruction.
MOV (predicate, predicated, merging)

Move predicates (merging).

Read active elements from the source predicate and place in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register remain unmodified. Does not set the condition flags.

This is an alias of SEL (predicates). This means:

- The encodings in this description are named to match the encodings of SEL (predicates).
- The description of SEL (predicates) gives the operational pseudocode for this instruction.

\[
\begin{array}{cccccccccccccccc}
\hline
0 & 0 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & Pm & 0 & 1 & Pg & 1 & Pn & 1 & 1 & \\
\end{array}
\]

MOV <Pd>.B, <Pg>/M, <Pn>.B

is equivalent to

and is the preferred disassembly when \( Pd == Pm \).

Assembler Symbols

\(<Pd>\) Is the name of the destination scalable predicate register, encoded in the "Pd" field.

\(<Pg>\) Is the name of the governing scalable predicate register, encoded in the "Pg" field.

\(<Pn>\) Is the name of the first source scalable predicate register, encoded in the "Pn" field.

Operation

The description of SEL (predicates) gives the operational pseudocode for this instruction.
MOV (vector, predicated)

Move vector elements (predicated).

Move elements from the source vector to the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

This is an alias of SEL (vectors). This means:

- The encodings in this description are named to match the encodings of SEL (vectors).
- The description of SEL (vectors) gives the operational pseudocode for this instruction.

Assembler Symbols

- **<Zd>** Is the name of the destination scalable vector register, encoded in the "Zd" field.
- **<T>** Is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

- **<Pg>** Is the name of the governing scalable predicate register, encoded in the "Pg" field.
- **<Zn>** Is the name of the first source scalable vector register, encoded in the "Zn" field.

Operation

The description of SEL (vectors) gives the operational pseudocode for this instruction.
Move prefix (predicated).

The predicated MOVPRFX instruction is a hint to hardware that the instruction may be combined with the destructive instruction which follows it in program order to create a single constructive operation. Since it is a hint it is also permitted to be implemented as a discrete vector copy, and the result of executing the pair of instructions with or without combining is identical. The choice of combined versus discrete operation may vary dynamically. Unless the combination of a constructive operation with merging predication is specifically required, it is strongly recommended that for performance reasons software should prefer to use the zeroing form of predicated MOVPRFX or the unpredicated MOVPRFX instruction.

Although the operation of the instruction is defined as a simple predicated vector copy, it is required that the prefixed instruction at PC+4 must be an SVE destructive binary or ternary instruction encoding, or a unary operation with merging predication, but excluding other MOVPRFX instructions. The prefixed instruction must specify the same predicate register, and have the same maximum element size (ignoring a fixed 64-bit "wide vector" operand), and the same destination vector as the MOVPRFX instruction. The prefixed instruction must not use the destination register in any other operand position, even if they have different names but refer to the same architectural register state. Any other use is UNPREDICTABLE.

```
MOVPRFX <Zd>.<T>, <Pg>/<ZM>, <Zn>.<T>
```

```
if !HaveSVE() then UNDEFINED;
integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);
boolean merging = (M == '1');
```

Assembler Symbols

- `<Zd>` is the name of the destination scalable vector register, encoded in the "Zd" field.
- `<T>` is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

- `<Pg>` is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- `<ZM>` is the predication qualifier, encoded in "M":

<table>
<thead>
<tr>
<th>M</th>
<th>&lt;ZM&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Z</td>
</tr>
<tr>
<td>1</td>
<td>M</td>
</tr>
</tbody>
</table>

- `<Zn>` is the name of the source scalable vector register, encoded in the "Zn" field.
Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand1 = Z[n];
bits(VL) dest = Z[d];
bits(VL) result;

for e = 0 to elements-1
    bits(esize) element = Elem[operand1, e, esize];
    if ElemP[mask, e, esize] == '1' then
        Elem[result, e, esize] = element;
    elsif merging then
        Elem[result, e, esize] = Elem[dest, e, esize];
    else
        Elem[result, e, esize] = Zeros();
endfor

Z[d] = result;
MOVRFX (unpredicated)

Move prefix (unpredicated).

The unpredicated MOVRFX instruction is a hint to hardware that the instruction may be combined with the destructive instruction which follows it in program order to create a single constructive operation. Since it is a hint it is also permitted to be implemented as a discrete vector copy, and the result of executing the pair of instructions with or without combining is identical. The choice of combined versus discrete operation may vary dynamically. Although the operation of the instruction is defined as a simple unpredicated vector copy, it is required that the prefixed instruction at PC+4 must be an SVE destructive binary or ternary instruction encoding, or a unary operation with merging predication, but excluding other MOVRFX instructions. The prefixed instruction must specify the same destination vector as the MOVRFX instruction. The prefixed instruction must not use the destination register in any other operand position, even if they have different names but refer to the same architectural register state. Any other use is UNPREDICTABLE.

MOVRFX <Zd>, <Zn>

if !HaveSVE() then UNDEFINED;
integer n = UInt(Zn);
integer d = UInt(Zd);

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

CheckSVEEnabled();
bits(VL) result = Z[n];
Z[d] = result;

Copyright © 2010-2020 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.
**MOV$S (predicated)**

Move predicates (zeroing), setting the condition flags.

Read active elements from the source predicate and place in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

This is an alias of **AND, ANDS (predicates)**. This means:

- The encodings in this description are named to match the encodings of **AND, ANDS (predicates)**.
- The description of **AND, ANDS (predicates)** gives the operational pseudocode for this instruction.

\[
\begin{array}{cccccccccc}
0 & 0 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 1 \\
\end{array}
\]

\[
\begin{array}{cccccccccc}
Pm & 0 & 1 & Pg & 0 & Pn & 0 & Pd & 1 & 0 \\
\end{array}
\]

MOV$S <Pd>.B, <Pg>/Z, <Pn>.B

is equivalent to

and is the preferred disassembly when \$ == '1' && Pn == Pm.

**Assembler Symbols**

- **<Pd>** Is the name of the destination scalable predicate register, encoded in the "Pd" field.
- **<Pg>** Is the name of the governing scalable predicate register, encoded in the "Pg" field.
- **<Pn>** Is the name of the first source scalable predicate register, encoded in the "Pn" field.

**Operation**

The description of **AND, ANDS (predicates)** gives the operational pseudocode for this instruction.
**MOVS (unpredicated)**

Move predicate (unpredicated), setting the condition flags.

Read all elements from the source predicate and place in the destination predicate. This instruction is unpredicated. Sets the **FIRST** (N), **NONE** (Z), **!LAST** (C) condition flags based on the predicate result, and the V flag to zero.

This is an alias of **ORR, ORRS (predicates)**. This means:

- The encodings in this description are named to match the encodings of **ORR, ORRS (predicates)**.
- The description of **ORR, ORRS (predicates)** gives the operational pseudocode for this instruction.

![Predicate Register Encoding](image)

MOVS $<Pd>.B$, $<Pn>.B$

is equivalent to

and is the preferred disassembly when $S == '1' \land Pn == Pm \land Pm == Pg$.

**Assembler Symbols**

- $<Pd>$ Is the name of the destination scalable predicate register, encoded in the "Pd" field.
- $<Pn>$ Is the name of the first source scalable predicate register, encoded in the "Pn" field.

**Operation**

The description of **ORR, ORRS (predicates)** gives the operational pseudocode for this instruction.
Multiply-subtract vectors (predicated), writing multiplicand \([Zdn = Za - Zdn \cdot Zm]\).

Multiply the corresponding active elements of the first and second source vectors and subtract from elements of the third (addend) vector. Destructively place the results in the destination and first source (multiplicand) vector. Inactive elements in the destination vector register remain unmodified.

```
0 0 0 0 0 1 0 0  size 0  Zm  1 1 1  Pg  Za  Zdn  op
```

**Assembler Symbols**

- `<Zdn>`: Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.
- `<T>`: Is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

- `<Pg>`: Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- `<Zm>`: Is the name of the second source scalable vector register, encoded in the "Zm" field.
- `<Za>`: Is the name of the third source scalable vector register, encoded in the "Za" field.

**Operation**

```java
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(P) mask = P[g];
bv_true(on) operand1 = Z[dn];
bv_true(on) operand2 = Z[m];
bv_true(on) operand3 = Z[a];
bv_true(on) result;
for e = 0 to elements-1
  integer element1 = UInt(Elem[operand1, e, esize]);
  integer element2 = UInt(Elem[operand2, e, esize]);
  if !ElementP[mask, e, esize] then
    integer product = element1 * element2;
  if sub_op then
    Elem[result, e, esize] = Elem[operand3, e, esize] - product;
  else
    Elem[result, e, esize] = Elem[operand3, e, esize] + product;
  else
    Elem[result, e, esize] = Elem[operand1, e, esize];
Z[dn] = result;
```
Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
MUL (vectors)

Multiply vectors (predicated).

Multiply active elements of the first source vector by corresponding elements of the second source vector and
destructively place the results in the corresponding elements of the first source vector. Inactive elements in the
destination vector register remain unmodified.

```
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

        Elem[result, e, esize] = product<esize-1:0>;
    else
        Elem[result, e, esize] = Elem[operand1, e, esize];
Z[dn] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction
must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is
UNPREDICTABLE:
- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register
  and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
MUL (immediate)

Multiply by immediate (unpredicated).

Multiply by an immediate each element of the source vector, and destructively place the results in the corresponding elements of the source vector. The immediate is a signed 8-bit value in the range -128 to +127, inclusive. This instruction is unpredicated.

```
MUL <Zdn>.<T>, <Zdn>.<T>, #<imm>
```

if !HaveSVE() then UNDEFINED;
integer esize = 8 << UInt(size);
integer dn = UInt(Zdn);
integer imm = SInt(imm8);

Assembler Symbols

| 01    | H    |
| 10    | S    |
| 11    | D    |
| <imm> | Is the signed immediate operand, in the range -128 to 127, encoded in the "imm8" field. |

Operation

```
CheckSVEEnabled();
integer elements = VL DIV esize;
bis(VL) operand1 = Z[dn];
bis(VL) result;
for e = 0 to elements-1
    integer element1 = SInt(Elem[operand1, e, esize]);
    Elem[result, e, esize] = (element1 * imm)<esize-1:0>;
Z[dn] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
NAND, NANDS

Bitwise NAND predicates.

Bitwise NAND active elements of the second source predicate with corresponding elements of the first source predicate and place the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Optionally sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

It has encodings from 2 classes: Not setting the condition flags and Setting the condition flags

Not setting the condition flags

\[
\begin{array}{cccccccccccccccccccccccc}
0 & 0 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 1 & 0 & 0 & Pm & 0 & 1 & Pg & 1 & Pn & 1 & Pd & S \\

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand = Z[n];
bits(VL) result = Z[d];
for e = 0 to elements-1
    bits(esize) element = Elem[operand, e, esize];
    if ElemP[mask, e, esize] == '1' then
        Elem[result, e, esize] = NOT element;
Z[d] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

Internal version only: isa v32.12, AdvSIMD v29.04, pseudocode v2020-09_xml, sve v2020-09_rc2b ; Build timestamp: 2020-09-30T23:12

NOTS

Bitwise invert predicate, setting the condition flags.

Bitwise invert each active element of the source predicate, and place the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

This is an alias of EOR, EORS (predicates). This means:

- The encodings in this description are named to match the encodings of EOR, EORS (predicates).
- The description of EOR, EORS (predicates) gives the operational pseudocode for this instruction.

\[
\begin{array}{cccccccccccccccc}
0 & 0 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 1 & 0 & 1 & 0 & 0 & \text{Pm} & 0 & 1 & \text{Pg} & 1 & \text{Pn} & 0 & \text{Pd} \\
\end{array}
\]

NOTS \(<\text{Pd}>.B, <\text{Pg}>/Z, <\text{Pn}>.B\)

is equivalent to

EORS \(<\text{Pd}>.B, <\text{Pg}>/Z, <\text{Pn}>.B, <\text{Pg}>.B\)

and is the preferred disassembly when \(\text{Pm} == \text{Pg}\).

Assembler Symbols

- \(<\text{Pd}>\) Is the name of the destination scalable predicate register, encoded in the "Pd" field.
- \(<\text{Pg}>\) Is the name of the governing scalable predicate register, encoded in the "Pg" field.
- \(<\text{Pn}>\) Is the name of the first source scalable predicate register, encoded in the "Pn" field.

Operation

The description of EOR, EORS (predicates) gives the operational pseudocode for this instruction.
ORN (immediate)

Bitwise inclusive OR with inverted immediate (unpredicated).

Bitwise inclusive OR an inverted immediate with each 64-bit element of the source vector, and destructively place the results in the corresponding elements of the source vector. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16, 32 or 64 bits. This instruction is unpredicated.

This is a pseudo-instruction of ORR (immediate). This means:

- The encodings in this description are named to match the encodings of ORR (immediate).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of ORR (immediate) gives the operational pseudocode for this instruction.

```
ORN <Zdn>.<T>, <Zdn>.<T>, #<const>
```

is equivalent to

```
ORN <Zdn>.<T>, <Zdn>.<T>, #(<const> - 1)
```

**Assembler Symbols**

- `<Zdn>` is the name of the source and destination scalable vector register, encoded in the “Zdn” field.
- `<T>` is the size specifier, encoded in “imm13<12>:imm13<5:0>”:

<table>
<thead>
<tr>
<th>imm13&lt;12&gt;</th>

integer dn = UInt(Pdn);

Assembler Symbols

<Pdn> Is the name of the source and destination scalable predicate register, encoded in the "Pdn" field.
<Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.

Operation

```
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(PL) result = P[dn];
integer first = -1;
for e = 0 to elements-1
    if ElemP[mask, e, esize] == '1' && first == -1 then
        first = e;
if first >= 0 then
    ElemP[result, first, esize] = '1';
PSTATE.<N,Z,C,V> = PredTest(mask, result, esize);
P[dn] = result;
```
PNEXT

Find next active predicate.

An instruction used to construct a loop which iterates over all active elements in a predicate. If all source predicate elements are false it sets the first active predicate element in the destination predicate to true. Otherwise it determines the next active predicate element following the last true source predicate element, and if one is found sets the corresponding destination predicate element to true. All other destination predicate elements are set to false. Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Gather prefetch bytes (vector plus immediate).

Gather prefetch of bytes from the active memory addresses generated by a vector base plus immediate index. The index is in the range 0 to 31. Inactive addresses are not prefetched from memory.

The <prfop> symbol specifies the prefetch hint as a combination of three options: access type PLD for load or PST for store; target cache level L1, L2 or L3; temporality (KEEP for temporal or STRM for non-temporal).

It has encodings from 2 classes: 32-bit element and 64-bit element

### 32-bit element

PRFD (scalar plus vector)

Gather prefetch doublewords (scalar plus vector).

Gather prefetch of doublewords from the active memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and then multiplied by 8. Inactive addresses are not prefetched from memory.

The <prfop> symbol specifies the prefetch hint as a combination of three options: access type PLD for load or PST for store; target cache level L1, L2 or L3; temporality (KEEP for temporal or STRM for non-temporal).

It has encodings from 3 classes: 32-bit scaled offset, 32-bit unpacked scaled offset and 64-bit scaled offset

32-bit scaled offset

```
|31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0|
|1 0 0 0 0 1 0 0 0 |xs| 1 | Zm | 0 | 1 | 1 | Pg | Rn | 0 | prfop|
```

if !HaveSVE() then UNDEFINED;
integer esize = 32;
integer g = UInt(Pg);
integer n = UInt(Rn);
integer m = UInt(Zm);
integer level = UInt(prfop<2:1>);
boolean stream = (prfop<0> == '1');
pref_hint = if prfop<3> == '0' then Prefetch_READ else Prefetch_WRITE;
integer offs_size = 32;
boolean offs_unsigned = (xs == '0');
integer scale = 3;

32-bit unpacked scaled offset

```
|31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0|

**PRFH (scalar plus immediate)**

Contiguous prefetch halfwords (immediate index).

Contiguous prefetch of halfword elements from the memory address generated by a 64-bit scalar base and immediate index in the range -32 to 31 which is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.

The predicate may be used to suppress prefetches from unwanted addresses.

    addr = base + (off << scale);
    Hint_Prefetch(addr, pref_hint, level, stream);
PRFW (vector plus immediate)

Gather prefetch words (vector plus immediate).

Gather prefetch of words from the active memory addresses generated by a vector base plus immediate index. The index is a multiple of 4 in the range 0 to 124. Inactive addresses are not prefetched from memory.
The `<prfop>` symbol specifies the prefetch hint as a combination of three options: access type PLD for load or PST for store; target cache level L1, L2 or L3; temporality (KEEP for temporal or STRM for non-temporal).

It has encodings from 2 classes: 32-bit element and 64-bit element

### 32-bit element

```
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 1  | 0  | 0  | 1  | 0  | 0  | 0  | 1  | 1  | 1  | Pg | Zn | 0  | prfop |
```

```
PRFW <prfop>, <Pg>, [<Zn>.S{, #<imm}>]

if !HaveSVE() then UNDEFINED;
integer esize = 32;
integer g = UInt(Pg);
integer n = UInt(Zn);
integer level = UInt(prfop<2:1>);
boolean stream = (prfop<0> == '1');
pref_hint = if prfop<3> == '0' then Prefetch_READ else Prefetch_WRITE;
integer scale = 2;
integer offset = UInt(imm5);
```

### 64-bit element

```
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 1  | 1  | 0  | 0  | 1  | 0  | 0  | 0  | 1  | 1  | Pg | Zn | 0  | prfop |
```

```
PRFW <prfop>, <Pg>, [<Zn>.D{, #<imm}>]

if !HaveSVE() then UNDEFINED;
integer esize = 64;
integer g = UInt(Pg);
integer n = UInt(Zn);
integer level = UInt(prfop<2:1>);
boolean stream = (prfop<0> == '1');
pref_hint = if prfop<3> == '0' then Prefetch_READ else Prefetch_WRITE;
integer scale = 2;
integer offset = UInt(imm5);
```

PRFW (scalar plus immediate)

Contiguous prefetch words (immediate index).

Contiguous prefetch of word elements from the memory address generated by a 64-bit scalar base and immediate index in the range -32 to 31 which is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.

The predicate may be used to suppress prefetches from unwanted addresses.

for e = 0 to elements-1
    if ElemP[mask, e, esize] == '1' then
        Hint_Prefetch(addr, pref_hint, level, stream);
    addr = addr + (1 << scale);
```
## PRFW (scalar plus scalar)

Contiguous prefetch words (scalar index).

Contiguous prefetch of word elements from the memory address generated by a 64-bit scalar base and scalar index which is multiplied by 4 and added to the base address. After each element prefetch the index value is incremented, but the index register is not updated.

The predicate may be used to suppress prefetches from unwanted addresses.

PRFW (scalar plus vector)

Gather prefetch words (scalar plus vector).

Gather prefetch of words from the active memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and then multiplied by 4. Inactive addresses are not prefetched from memory.

The <prfop> symbol specifies the prefetch hint as a combination of three options: access type PLD for load or PST for store; target cache level L1, L2 or L3; temporality (KEEP for temporal or STRM for non-temporal).

It has encodings from 3 classes: **32-bit scaled offset**, **32-bit unpacked scaled offset** and **64-bit scaled offset**

### 32-bit scaled offset

```
 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
 1 0 0 0 0 1 0 0 0 | Zm | 0 | 1 | 0 | Pg | Rn | 0 | prfop
```

if !HaveSVE() then UNDEFINED;
integer esize = 32;
integer g = UInt(Pg);
integer n = UInt(Rn);
integer m = UInt(Zm);
integer level = UInt(prfop<2:1>);
boolean stream = (prfop<0> == '1');
pref_hint = if prfop<3> == '0' then Prefetch_READ else Prefetch_WRITE;
integer offs_size = 32;
boolean offs_unsigned = (xs == '0');
integer scale = 2;

### 32-bit unpacked scaled offset

```
 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
 1 1 0 0 0 1 0 0 0 | Zm | 0 | 1 | 0 | Pg | Rn | 0 | prfop
```

if !HaveSVE() then UNDEFINED;
integer esize = 64;
integer g = UInt(Pg);
integer n = UInt(Rn);

integer n = UInt(Pn);

Assembler Symbols

<Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.
<Pn> Is the name of the source scalable predicate register, encoded in the "Pn" field.

Operation

CheckSVEEnabled();
bite(PL) mask = P[g];
bite(PL) result = P[n];
PSTATE.<N,Z,C,V> = PredTest(mask, result, esize);
**PTRUE, PTRUES**

Initialise predicate from named constraint.

Set elements of the destination predicate to true if the element number satisfies the named predicate constraint, or to false otherwise. If the constraint specifies more elements than are available at the current vector length then all elements of the destination predicate are set to false.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception. Optionally sets the **FIRST** (N), **NONE** (Z), **!LAST** (C) condition flags based on the predicate result, and the V flag to zero.

It has encodings from 2 classes: **Not setting the condition flags** and **Setting the condition flags**

### Not setting the condition flags

PUNPKHI, PUNPKLO

Unpack and widen half of predicate.

Unpack elements from the lowest or highest half of the source predicate and place in elements of twice their size within the destination predicate. This instruction is unpredicated.

It has encodings from 2 classes: **High half** and **Low half**

**High half**

<table>
<thead>

PUNPKLO <Pd>.H, <Pn>.B

if !HaveSVE() then UNDEFINED;
integer esize = 16;
integer n = UInt(Pn);
integer d = UInt(Pd);
boolean hi = FALSE;

**Assembler Symbols**

<Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pn> Is the name of the source scalable predicate register, encoded in the "Pn" field.

**Operation**

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) operand = P[n];
bits(PL) result;

for e = 0 to elements-1
     ElemP[result, e, esize] = ElemP[operand, if hi then e + elements else e, esize DIV 2];

P[d] = result;
RBIT

Reverse bits (predicated).

Reverse bits in each active element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

```
| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10  9  8  7  6  5  4  3  2  1  0 |

<td>D</td>
</tr>
</tbody>
</table>

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand = Z[n];
bits(VL) result = Z[d];
for e = 0 to elements-1
    bits(esize) element = Elem[operand, e, esize];
    if Elem[mask, e, esize] == '1' then
        Elem[result, e, esize] = BitReverse(element);
Z[d] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
RDFFR (unpredicated)

Read the first-fault register.

Read the first-fault register (FFR) and place in the destination predicate without predication.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

Asmmebler Symbols

<Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.

Operation

CheckSVEEnabled();
bias(PL) ffr = FFR[];
P[d] = ffr;
RDFFR, RDFFRS (predicated)

Return predicate of successfully loaded elements.

Read the first-fault register (FFR) and place active elements in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Optionally sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

It has encodings from 2 classes: Not setting the condition flags and Setting the condition flags

Not setting the condition flags

SCVTF

Signed integer convert to floating-point (predicated).

Convert to floating-point from the signed integer in each active element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

If the input and result types have a different size the smaller type is held unpacked in the least significant bits of elements of the larger size. When the input is the smaller type the upper bits of each source element are ignored. When the result is the smaller type the results are zero-extended to fill each destination element.

It has encodings from 7 classes: 16-bit to half-precision, 32-bit to half-precision, 32-bit to single-precision, 32-bit to double-precision, 64-bit to half-precision, 64-bit to single-precision and 64-bit to double-precision.

16-bit to half-precision

```

• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
SDOT (vectors)

Signed integer dot product.

The signed integer dot product instruction computes the dot product of a group of four signed 8-bit or 16-bit integer values held in each 32-bit or 64-bit element of the first source vector multiplied by a group of four signed 8-bit or 16-bit integer values in the corresponding 32-bit or 64-bit element of the second source vector, and then destructively adds the widened dot product to the corresponding 32-bit or 64-bit element of the destination vector.

This instruction is unpredicated.

\[
\begin{array}{ccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccc
Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
SDOT (indexed)

Signed integer indexed dot product.

The signed integer indexed dot product instruction computes the dot product of a group of four signed 8-bit or 16-bit integer values held in each 32-bit or 64-bit element of the first source vector multiplied by a group of four signed 8-bit or 16-bit integer values in an indexed 32-bit or 64-bit element of the second source vector, and then destructively adds the widened dot product to the corresponding 32-bit or 64-bit element of the destination vector.

The groups within the second source vector are specified using an immediate index which selects the same group position within each 128-bit vector segment. The index range is from 0 to one less than the number of groups per 128-bit segment, encoded in 1 to 2 bits depending on the size of the group. This instruction is unpredicated.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 1 0 0 0 1 0 0 1 0 1 i2 Zm 0 0 0 0 0 0 Zn Zda

if !HaveSVE() then UNDEFINED;
integer esize = 32;
integer index = UInt(i2);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);

64-bit

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 1 0 0 0 1 0 0 1 1 i1 Zm 0 0 0 0 0 0 Zn Zda

if !HaveSVE() then UNDEFINED;
integer esize = 64;
integer index = UInt(i1);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);

Assembler Symbols

<Zda> Is the name of the third source and destination scalable vector register, encoded in the “Zda” field.

<Zn> Is the name of the first source scalable vector register, encoded in the “Zn” field.

<Zm> For the 32-bit variant: is the name of the second source scalable vector register Z0-Z7, encoded in the “Zm” field.
For the 64-bit variant: is the name of the second source scalable vector register Z0-Z15, encoded in the “Zm” field.

<imm> For the 32-bit variant: is the immediate index of a quadtuplet of four 8-bit elements within each 128-bit vector segment, in the range 0 to 3, encoded in the “i2” field.
For the 64-bit variant: is the immediate index of a quadtuplet of four 16-bit elements within each 128-bit vector segment, in the range 0 to 1, encoded in the “i1” field.
Operation

**CheckSVEEnabled();**

integer elements = \texttt{VL} \texttt{DIV} esize;
integer eltspersegment = 128 \texttt{DIV} esize;

bits(\texttt{VL}) operand1 = \texttt{Z}[n];

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction
must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is
UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register
  and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
SMAX (immediate)

Signed maximum with immediate (unpredicated).

Determine the signed maximum of an immediate and each element of the source vector, and destructively place the results in the corresponding elements of the source vector. The immediate is a signed 8-bit value in the range -128 to +127, inclusive. This instruction is unpredicated.

<table>
<thead>
<tr>
<th>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>

Z[dn] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:
• The MOVPRFX instruction must be unpredicated.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
**SQADD (immediate)**

Signed saturating add immediate (unpredicated).

Signed saturating add of an unsigned immediate to each element of the source vector, and destructively place the results in the corresponding elements of the source vector. Each result element is saturated to the N-bit element’s signed integer range \(-2^{(N-1)}\) to \((2^{(N-1)})-1\). This instruction is unpredicated.

The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a positive multiple of 256 in the range 256 to 65280.

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is “#<imm8>, LSL #8”. However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as “#0, LSL #8”.

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 | size | 1 0 0 1 0 0 | 1 0 | 0 | 1 1 | sh | imm8 | Zdn |

SQADD <Zdn>.<T>, <Zdn>.<T>, #<imm>{, <shift>}

if !HaveSVE() then UNDEFINED;
if size:sh == '001' then UNDEFINED;
integer esize = 8 << UInt(size);
integer dn = UInt(Zdn);
integer imm = UInt(imm8);
if sh == '1' then imm = imm << 8;
boolean unsigned = FALSE;

### Assembler Symbols

- `<Zdn>` Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.
- `<T>` Is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th><code>&lt;T&gt;</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

- `<imm>` Is an unsigned immediate in the range 0 to 255, encoded in the "imm8" field.
- `<shift>` Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in “sh”:

<table>
<thead>
<tr>
<th>sh</th>
<th><code>&lt;shift&gt;</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>LSL #0</td>
</tr>
<tr>
<td>1</td>
<td>LSL #8</td>
</tr>
</tbody>
</table>

### Operation

`CheckSVEEnabled();`
integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn];
bits(VL) result;
for e = 0 to elements-1
    integer element1 = Int(Elem[operand1, e, esize], unsigned);
    (Elem[result, e, esize], -) = SatQ(element1 + imm, esize, unsigned);
Z[dn] = result;

### Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:
• The MOVPRFX instruction must be unpredicated.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
**SQADD (vectors)**

Signed saturating add vectors (unpredicated).

Signed saturating add all elements of the second source vector to corresponding elements of the first source vector and place the results in the corresponding elements of the destination vector. Each result element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. This instruction is unpredicated.

\text{Z}[d] = \text{result};
Signed saturating decrement scalar by multiple of 8-bit predicate constraint element count.

Determines the number of active 8-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement the scalar destination. The result is saturated to the source general-purpose register's signed integer range. A 32-bit saturated result is then sign-extended to 64 bits.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 2 classes: 32-bit and 64-bit

### 32-bit

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

- <imm> is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the “imm4” field.
Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
integer count = DecodePredCount(pat, esize);
bits(VL) operand1 = Z[dn];
bits(VL) result;

for e = 0 to elements-1
    integer element1 = Int(Elem[operand1, e, esize], unsigned);
    (Elem[result, e, esize], -) = SatQ(element1 - (count * imm), esize, unsigned);

Z[dn] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
SIGNED SATURATING DECREMENT SCALAR BY MULTIPLE OF 16-BIT PREDICATE CONSTRAINT ELEMENT COUNT

Determines the number of active 16-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement the scalar destination. The result is saturated to the source general-purpose register’s signed integer range. A 32-bit saturated result is then sign-extended to 64 bits.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 2 classes: **32-bit** and **64-bit**

**<imm>**  
Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the “imm4” field.
Operation

```c
CheckSVEEnabled();
integer elements = VL DIV esize;
integer count = DecodePredCount(pat, esize);
bits(VL) operand1 = Z[dn];
bits(VL) result;

for e = 0 to elements-1
    integer element1 = Int(Elem[operand1, e, esize], unsigned);
    (Elem[result, e, esize], -) = SatQ(element1 - (count * imm), esize, unsigned);

Z[dn] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
SQDECP (scalar)

Signed saturating decrement scalar by count of true predicate elements.

Counts the number of true elements in the source predicate and then uses the result to decrement the scalar destination. The result is saturated to the source general-purpose register’s signed integer range. A 32-bit saturated result is then sign-extended to 64 bits.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

<Wdn> Is the 32-bit name of the source and destination general-purpose register, encoded in the “Rdn” field.
Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(ssize) operand1 = X[dn];
bits(PL) operand2 = P[m];
bits(ssize) result;
integer count = 0;

for e = 0 to elements-1
  if ElemP[operand2, e, esize] == '1'
    count = count + 1;

integer element = Int(operand1, unsigned);
(result, -) = SatQ(element - count, ssize, unsigned);
X[dn] = Extend(result, 64, unsigned);
SQDECP (vector)

Signed saturating decrement vector by count of true predicate elements.

Counts the number of true elements in the source predicate and then uses the result to decrement all destination vector elements. The results are saturated to the element signed integer range.

The predicate size specifier may be omitted in assembler source code, but this is deprecated and will be prohibited in a future release of the architecture.

<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

<Pm> Is the name of the source scalable predicate register, encoded in the "Pm" field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn];
bits(PL) operand2 = P[m];
bits(VL) result;
integer count = 0;
for e = 0 to elements-1
    if ElemP[operand2, e, esize] == '1' then
        count = count + 1;
for e = 0 to elements-1
    integer element = Int(Elem[operand1, e, esize], unsigned);
    (Elem[result, e, esize], -) = SatQ(element - count, esize, unsigned);
Z[dn] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
SQDECW (scalar)

Signed saturating decrement scalar by multiple of 32-bit predicate constraint element count.

Determines the number of active 32-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement the scalar destination. The result is saturated to the source general-purpose register’s signed integer range. A 32-bit saturated result is then sign-extended to 64 bits.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 2 classes: 32-bit and 64-bit

SQINCD (vector)

Signed saturating increment vector by multiple of 64-bit predicate constraint element count.

Determines the number of active 64-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment all destination vector elements. The results are saturated to the 64-bit signed integer range.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

\]

\[
Z[dn] = \text{result};
\]

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
SQINCH (scalar)

Signed saturating increment scalar by multiple of 16-bit predicate constraint element count.

Determines the number of active 16-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment the scalar destination. The result is saturated to the source general-purpose register’s signed integer range. A 32-bit saturated result is then sign-extended to 64 bits.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 2 classes: 32-bit and 64-bit

**Operational information**

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
SQINCW (scalar)

Signed saturating increment scalar by multiple of 32-bit predicate constraint element count.

Determines the number of active 32-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment the scalar destination. The result is saturated to the source general-purpose register's signed integer range. A 32-bit saturated result is then sign-extended to 64 bits.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 2 classes: 32-bit and 64-bit

**SQINCW (vector)**

Signed saturating increment vector by multiple of 32-bit predicate constraint element count.

 Determines the number of active 32-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment all destination vector elements. The results are saturated to the 32-bit signed integer range.

The named predicate constraint limits the number of active elements in a single predicate to:

* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

</tbody>
</table>

<imm> Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the “imm4” field.
Operation

```plaintext
CheckSVEEnabled();
integer elements = VL DIV esize;
integer count = DecodePredCount(pat, esize);
bits(VL) operand1 = Z[dn];
bits(VL) result;

for e = 0 to elements-1
    integer element1 = Int(Elem[operand1, e, esize], unsigned);
    (Elem[result, e, esize], -) = SatQ(element1 + (count * imm), esize, unsigned);
Z[dn] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

Copyright © 2010-2020 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.
**SQSUB (immediate)**

Signed saturating subtract immediate (unpredicated).

Signed saturating subtract of an unsigned immediate from each element of the source vector, and destructively place the results in the corresponding elements of the source vector. Each result element is saturated to the N-bit element’s signed integer range $-2^{(N-1)}$ to $(2^{(N-1)}-1$. This instruction is unpredicated.

The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a positive multiple of 256 in the range 256 to 65280.

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<imm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

### Assembler Symbols

- `<Zdn>`: Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.
- `<T>`: Is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>

<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

- `<imm>`: Is an unsigned immediate in the range 0 to 255, encoded in the "imm8" field.
- `<shift>`: Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in “sh”:

<table>
<thead>
<tr>
<th>sh</th>
<th>&lt;shift&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>LSL #0</td>
</tr>
<tr>
<td>1</td>
<td>LSL #8</td>
</tr>
</tbody>
</table>

### Operation

```plaintext
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn];
bits(VL) result;
for e = 0 to elements-1
    integer element1 = Int(Elem[operand1, e, esize], unsigned);
    (Elem[result, e, esize], ·) = SatQ(element1 - imm, esize, unsigned);
Z[dn] = result;
```

### Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:
• The MOVPRFX instruction must be unpredicated.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

SQSUB (vectors)

Signed saturating subtract vectors (unpredicated).

Signed saturating subtract all elements of the second source vector from corresponding elements of the first source vector and place the results in the corresponding elements of the destination vector. Each result element is saturated to the N-bit element's signed integer range \(-2^{(N-1)}\) to \((2^{(N-1)})-1\). This instruction is unpredicated.

ST1B (vector plus immediate)

Scatter store bytes from a vector (immediate index).

Scatter store of bytes from the active elements of a vector register to the memory addresses generated by a vector
base plus immediate index. The index is in the range 0 to 31. Inactive elements are not written to memory.

It has encodings from 2 classes: 32-bit element and 64-bit element

32-bit element

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 1  | 1  | 1  | 0  | 0  | 1  | 0  | 0  | 0  | 1  | 1  | imm5 | 1  | 0  | 1  | Pg  | Zn  | Zt  |
| msz<1> | msz<0> |

ST1B { <Zt>.S }, <Pg>, [<Zn>.S{, #imm}>]

if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Zn);
integer g = UInt(Pg);
integer esize = 32;
integer msize = 8;
integer offset = UInt(imm5);

64-bit element

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 1  | 1  | 1  | 0  | 0  | 1  | 0  | 0  | 0  | 1  | 0  | imm5 | 1  | 0  | 1  | Pg  | Zn  | Zt  |
| msz<1> | msz<0> |

ST1B { <Zt>.D }, <Pg>, [<Zn>.D{, #imm}>]

if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Zn);
integer g = UInt(Pg);
integer esize = 64;
integer msize = 8;
integer offset = UInt(imm5);

Assembler Symbols

<Zt> Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn> Is the name of the base scalable vector register, encoded in the “Zn” field.
<imm> Is the optional unsigned immediate byte offset, in the range 0 to 31, defaulting to 0, encoded in the “imm5” field.
Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) base = Z[n];
bits(VL) src = Z[t];
bits(PL) mask = P[g];
bits(64) addr;
constant integer mbytes = msize DIV 8;

if HaveMTEExt() then SetTagCheckedInstruction(TRUE);

for e = 0 to elements-1
  if ElemP[mask, e, esize] == '1'
      addr = ZeroExtend(Elem[base, e, esize], 64) + offset * mbytes;
      Mem[addr, mbytes, AccType_NORMAL] = Elem[src, e, esize]<msize-1:0>;

ST1B (scalar plus immediate)

Contiguous store bytes from vector (immediate index).

Contiguous store of bytes from elements of a vector register to the memory address generated by a 64-bit scalar base and immediate index in the range -8 to 7 which is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address. Inactive elements are not written to memory.

ST1D (scalar plus immediate)

Contiguous store doublewords from vector (immediate index).

Contiguous store of doublewords from elements of a vector register to the memory address generated by a 64-bit scalar base and immediate index in the range -8 to 7 which is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address. Inactive elements are not written to memory.

ST1D (scalar plus vector)

Scatter store doublewords from a vector (vector index).

Scatter store of doublewords from the active elements of a vector register to the memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and then optionally multiplied by 8. Inactive elements are not written to memory.

It has encodings from 4 classes: 32-bit unpacked scaled offset, 32-bit unpacked unscaled offset, 64-bit scaled offset and 64-bit unscaled offset.

### 32-bit unpacked scaled offset

ST1H (scalar plus immediate)

Contiguous store halfwords from vector (immediate index).

Contiguous store of halfwords from elements of a vector register to the memory address generated by a 64-bit scalar base and immediate index in the range -8 to 7 which is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address. Inactive elements are not written to memory.

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Assembler Symbols

- `<Zt>` Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
- `<T>` Is the size specifier, encoded in “size”:
  
<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>RESERVED</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

- `<Pg>` Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- `<Xn|SP>` Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- `<imm>` Is the optional signed immediate vector offset, in the range -8 to 7, defaulting to 0, encoded in the "imm4" field.

Operation

```
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(64) base;
bits(64) addr;
bits(PL) mask = P[g];
bits(VL) src = Z[t];
constant integer mbytes = msize DIV 8;

**ST1H (scalar plus vector)**

Scatter store halfwords from a vector (vector index).

Scatter store of halfwords from the active elements of a vector register to the memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and then optionally multiplied by 2. Inactive elements are not written to memory.

It has encodings from 6 classes: 32-bit scaled offset, 32-bit unpacked scaled offset, 32-bit unpacked unscaled offset, 32-bit unscaled offset, 64-bit scaled offset and 64-bit unscaled offset.

### 32-bit scaled offset

```
  31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
[1 1 1 0 0 1 0 0 | 1 1 1 | Zm | 1 | xs | 0 | Pg | Rn | Zt]

Scatter store words from a vector (vector index).

Scatter store of words from the active elements of a vector register to the memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and then optionally multiplied by 4. Inactive elements are not written to memory.

It has encodings from 6 classes: 32-bit scaled offset, 32-bit unpacked scaled offset, 32-bit unpacked unscaled offset, 32-bit unscaled offset, 64-bit scaled offset and 64-bit unscaled offset

### 32-bit scaled offset

<table>
<thead>
<tr>

**ST2B (scalar plus immediate)**

Contiguous store two-byte structures from two vectors (immediate index).

Contiguous store two-byte structures, each from the same element number in two vector registers to the memory address generated by a 64-bit scalar base and an immediate index which is a multiple of 2 in the range -16 to 14 that is multiplied by the vector's in-memory size, irrespective of predication.

Each predicate element applies to the same element number in each of the two vector registers, or equivalently to the two consecutive bytes in memory which make up each structure. Inactive structures are not written to memory.

```assembly
ST2B { <Zt1>.B, <Zt2>.B }, <Pg>, [<Xn|SP>{, #<imm>, MUL VL}}
```

### Assembler Symbols

- `<Zt1>`: Is the name of the first scalable vector register to be transferred, encoded in the "Zt" field.
- `<Zt2>`: Is the name of the second scalable vector register to be transferred, encoded as "Zt" plus 1 modulo 32.
- `<Pg>`: Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- `<Xn|SP>`: Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- `<imm>`: Is the optional signed immediate vector offset, a multiple of 2 in the range -16 to 14, defaulting to 0, encoded in the "imm4" field.

### Operation

```assembly
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(64) base;
bits(64) addr;

ST4W (scalar plus scalar)

Contiguous store four-word structures from four vectors (scalar index).

Contiguous store four-word structures, each from the same element number in four vector registers to the memory address generated by a 64-bit scalar base and a 64-bit scalar index register scaled by the element size (LSL option) and added to the base address. After each structure access the index value is incremented by four. The index register is not updated by the instruction.

Each predicate element applies to the same element number in each of the four vector registers, or equivalently to the four consecutive words in memory which make up each structure. Inactive structures are not written to memory.

```

Store predicate register.

Store a predicate register to a memory address generated by a 64-bit scalar base, plus an immediate offset in the range -256 to 255 which is multiplied by the current predicate register size in bytes. This instruction is unpredicated. The store is performed as a stream of bytes containing 8 consecutive predicate bits in ascending element order, without any endian conversion.

</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

< Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand1 = Z[dn];
bits(VL) operand2 = Z[m];
bits(VL) result;
for e = 0 to elements-1
    bits(esize) element1 = Elem[operand1, e, esize];
    bits(esize) element2 = Elem[operand2, e, esize];
    if ElemP[mask, e, esize] == '1' then
        Elem[result, e, esize] = element1 - element2;
    else
        Elem[result, e, esize] = Elem[operand1, e, esize];
Z[dn] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
SUB (immediate)

Subtract immediate (unpredicated).

Subtract an unsigned immediate from each element of the source vector, and destructively place the results in the corresponding elements of the source vector. This instruction is unpredicated.

The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a positive multiple of 256 in the range 256 to 65280.

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<imm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

The instruction is encoded in the following format:

```
0 0 1 0 0 1 0 1 | size 1 0 0 0 1 1 1 sh | imm8 | Zdn
```

**Assembler Symbols**

- `<Zdn>` Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.
- `<T>` Is the size specifier, encoded in "size":

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

- `<imm>` Is an unsigned immediate in the range 0 to 255, encoded in the "imm8" field.
- `<shift>` Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in "sh":

<table>
<thead>
<tr>
<th>sh</th>
<th>&lt;shift&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>LSL #0</td>
</tr>
<tr>
<td>1</td>
<td>LSL #8</td>
</tr>
</tbody>
</table>

**Operation**

```plaintext
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn];
bits(VL) result;
for e = 0 to elements-1
    bits(esize) element1 = Elem[operand1, e, esize];
    Elem[result, e, esize] = element1 - imm;
Z[dn] = result;
```

**Operational information**

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
**SUB (vectors, unpredicated)**

Subtract vectors (unpredicated).

Subtract all elements of the second source vector from corresponding elements of the first source vector and place the results in the corresponding elements of the destination vector. This instruction is unpredicated.

<table>

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```c
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand = Z[n];
bits(VL) result = Z[d];

for e = 0 to elements-1
    bits(esize) element = Elem[operand, e, esize];
    if Elem[mask, e, esize] == '1' then
        Elem[result, e, esize] = Extend(element<s_esize-1:0>, esize, unsigned);

Z[d] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

Internal version only: isa v32.12, AdvSIMD v29.04, pseudocode v2020-09_xml, sve v2020-09_rc2b ; Build timestamp: 2020-09-30T23:12

Programmable table lookup in single vector table.

Reads each element of the second source (index) vector and uses its value to select an indexed element from the first source (table) vector, and places the indexed table element in the destination vector element corresponding to the index vector element. If an index value is greater than or equal to the number of vector elements then it places zero in the corresponding destination vector element.

Since the index values can select any element in a vector this operation is not naturally vector length agnostic.

    integer element = $\text{UInt(Elem[operand, e, esize])}$;
    sum = sum + element;

$\text{V}[d]$ = sum<63:0>;
**UCVTF**

Unsigned integer convert to floating-point (predicated).

Convert to floating-point from the unsigned integer in each active element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

If the input and result types have a different size the smaller type is held unpacked in the least significant bits of elements of the larger size. When the input is the smaller type the upper bits of each source element are ignored. When the result is the smaller type the results are zero-extended to fill each destination element.

It has encodings from 7 classes: 16-bit to half-precision, 32-bit to half-precision, 32-bit to single-precision, 32-bit to double-precision, 64-bit to half-precision, 64-bit to single-precision and 64-bit to double-precision

    res = res + element1 * element2;
  Elem[result, e, esize] = res;
Z[da] = result;
Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
UDOT (indexed)

Unsigned integer indexed dot product.

The unsigned integer indexed dot product instruction computes the dot product of a group of four unsigned 8-bit or 16-bit integer values held in each 32-bit or 64-bit element of the first source vector multiplied by a group of four unsigned 8-bit or 16-bit integer values in an indexed 32-bit or 64-bit element of the second source vector, and then destructively adds the widened dot product to the corresponding 32-bit or 64-bit element of the destination vector. The groups within the second source vector are specified using an immediate index which selects the same group position within each 128-bit vector segment. The index range is from 0 to one less than the number of groups per 128-bit segment, encoded in 1 to 2 bits depending on the size of the group. This instruction is unpredicated.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit

```assembly
```

if !HaveSVE() then UNDEFINED;
integer esize = 32;
integer index = UInt(i2);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);

64-bit

```assembly
```

if !HaveSVE() then UNDEFINED;
integer esize = 64;
integer index = UInt(i1);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);

Assembler Symbols

- `<Zda>` Is the name of the third source and destination scalable vector register, encoded in the “Zda” field.
- `<Zn>` Is the name of the first source scalable vector register, encoded in the “Zn” field.
- `<Zm>` For the 32-bit variant: is the name of the second source scalable vector register Z0-Z7, encoded in the “Zm” field.
  For the 64-bit variant: is the name of the second source scalable vector register Z0-Z15, encoded in the “Zm” field.
- `<imm>` For the 32-bit variant: is the immediate index of a quaduplet of four 8-bit elements within each 128-bit vector segment, in the range 0 to 3, encoded in the “i2” field.
  For the 64-bit variant: is the immediate index of a quaduplet of four 16-bit elements within each 128-bit vector segment, in the range 0 to 1, encoded in the “i1” field.
Operation

CheckSVEEnabled();
integer elements = \texttt{VL} \texttt{DIV} esize;
integer eltspersegment = 128 \texttt{DIV} esize;
bits(\texttt{VL}) operand1 = \texttt{Z}[n];
bits(\texttt{VL}) operand2 = \texttt{Z}[m];
bits(\texttt{VL}) operand3 = \texttt{Z}[da];
bits(\texttt{VL}) result;

\begin{verbatim}
for e = 0 to elements-1
    integer segmentbase = e - (e MOD eltspersegment);
    integer s = segmentbase + index;
    bits(esize) res = \texttt{Elem}[operand3, e, esize];
    for i = 0 to 3
        integer element1 = \texttt{UInt}(\texttt{Elem}[operand1, 4 \times e + i, esize \texttt{DIV} 4]);
        integer element2 = \texttt{UInt}(\texttt{Elem}[operand2, 4 \times s + i, esize \texttt{DIV} 4]);
        res = res + element1 \times element2;
    \texttt{Elem}[result, e, esize] = res;
\end{verbatim}

\texttt{Z}[da] = result;

Operational information

This instruction might be immediately preceded in program order by a \texttt{MOVPRFX} instruction. The \texttt{MOVPRFX} instruction must conform to all of the following requirements, otherwise the behavior of the \texttt{MOVPRFX} and this instruction is UNPREDICTABLE:

\begin{itemize}
    \item The \texttt{MOVPRFX} instruction must be unpredicated.
    \item The \texttt{MOVPRFX} instruction must specify the same destination register as this instruction.
    \item The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
\end{itemize}
**UMAX (vectors)**

Unsigned maximum vectors (predicated).

Determine the unsigned maximum of active elements of the second source vector and corresponding elements of the first source vector and destructively place the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

</tbody>
</table>

**Operation**

```plaintext
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand = Z[n];
integer minimum = if unsigned then (2^esize - 1) else (2^(esize-1) - 1);
for e = 0 to elements-1
    if ElemP[mask, e, esize] == '1' then
        integer element = Int(Elem[operand, e, esize], unsigned);
        minimum = Min(minimum, element);
V[d] = minimum<esize-1:0>;
```

Copyright © 2010-2020 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.
Unsigned multiply returning high half (predicated).

Widening multiply unsigned integer values in active elements of the first source vector by corresponding elements of the second source vector and destructively place the high half of the result in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

```
if !HaveSVE() then UNDEFINED;
integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer dn = UInt(Zdn);
integer m = UInt(Zm);
boolean unsigned = TRUE;
```

### Assembler Symbols

- `<Zdn>` is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.
- `<T>` is the size specifier, encoded in "size":
  - `00` B
  - `01` H
  - `10` S
  - `11` D
- `<Pg>` is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- `<Zm>` is the name of the second source scalable vector register, encoded in the "Zm" field.

### Operation

```
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand1 = Z[dn];
bits(VL) operand2 = Z[m];
bits(VL) result;
for e = 0 to elements-1
    integer element1 = Int(Elem[operand1, e, esize], unsigned);
    integer element2 = Int(Elem[operand2, e, esize], unsigned);
    if Elem[mask, e, esize] == '1' then
        integer product = (element1 * element2) >> esize;
        Elem[result, e, esize] = product<esize-1:0>;
    else
        Elem[result, e, esize] = Elem[operand1, e, esize];
Z[dn] = result;
```

### Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
UQADD (immediate)

Unsigned saturating add immediate (unpredicated).

Unsigned saturating add of an unsigned immediate to each element of the source vector, and destructively place the results in the corresponding elements of the source vector. Each result element is saturated to the N-bit element's unsigned integer range 0 to \((2^N)-1\). This instruction is unpredicated.

The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a positive multiple of 256 in the range 256 to 65280.

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<uimm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

### Assembler Symbols

- **<Zdn>** is the name of the source and destination scalable vector register, encoded in the "Zdn" field.
- **<T>** is the size specifier, encoded in "size":

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

- **<imm>** is an unsigned immediate in the range 0 to 255, encoded in the "imm8" field.
- **<shift>** is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in "sh":

<table>
<thead>
<tr>
<th>sh</th>
<th>&lt;shift&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>LSL #0</td>
</tr>
<tr>
<td>1</td>
<td>LSL #8</td>
</tr>
</tbody>
</table>

### Operation

```plaintext
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn];
bits(VL) result;
for e = 0 to elements-1
   integer element1 = Int(Elem[operand1, e, esize], unsigned);
   (Elem[result, e, esize], -) = SatQ(element1 + imm, esize, unsigned);
Z[dn] = result;
```

### Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:
• The MOVPRFX instruction must be unpredicated.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
UQADD (vectors)

Unsigned saturating add vectors (unpredicated).

Unsigned saturating add all elements of the second source vector to corresponding elements of the first source vector
and place the results in the corresponding elements of the destination vector. Each result element is saturated to the
N-bit element’s unsigned integer range 0 to \((2^N) - 1\). This instruction is unpredicated.

```
0 0 0 0 0 1 0 0 | size | 1 | Zm | 0 0 0 1 0 1 | Zn | Zd |
```

UQADD <Zd>.<T>, <Zn>.<T>, <Zm>.<T>

if !HaveSVE() then UNDEFINED;
integer esize = 8 << UInt(size);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);
boolean unsigned = TRUE;

Assembler Symbols

- `<Zd>` Is the name of the destination scalable vector register, encoded in the "Zd" field.
- `<T>` Is the size specifier, encoded in “size”:
  - size | <T>
    - 00 | B
    - 01 | H
    - 10 | S
    - 11 | D
- `<Zn>` Is the name of the first source scalable vector register, encoded in the "Zn" field.
- `<Zm>` Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) result;
for e = 0 to elements-1
   integer element1 = Int(Elem[operand1, e, esize], unsigned);
   integer element2 = Int(Elem[operand2, e, esize], unsigned);
   (Elem[result, e, esize], -) = SatQ(element1 + element2, esize, unsigned);
Z[d] = result;
```

UQDECB

Unsigned saturating decrement scalar by multiple of 8-bit predicate constraint element count.

Determines the number of active 8-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement the scalar destination. The result is saturated to the general-purpose register's unsigned integer range.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit

```
0 0 0 0 0 0 1 0 0 0 0 0 1 0 1 0 imm4 1 1 1 1 1 1 1{, <pattern>}{, MUL #<imm>}}
```

```java
if !HaveSVE() then UNDEFINED;
integer esize = 8;
integer dn = UInt(Rdn);
bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;
boolean unsigned = TRUE;
integer ssize = 32;
```

64-bit

```
0 0 0 0 0 0 1 0 0 0 0 0 1 1 imm4 1 1 1 1 1 1 1{, <pattern>}{, MUL #<imm>}}
```

```java
if !HaveSVE() then UNDEFINED;
integer esize = 8;
integer dn = UInt(Rdn);
bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;
boolean unsigned = TRUE;
integer ssize = 64;
```

Assembler Symbols

<Wdn> Is the 32-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.
<Xdn> Is the 64-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.
<pattern> Is the optional pattern specifier, defaulting to ALL, encoded in "pattern";
<pattern>  
| 00000 | POW2   | 00001 | VL1    |
| 00010 | VL2    | 00011 | VL3    |

UQDECH (vector)

Unsigned saturating decrement vector by multiple of 16-bit predicate constraint element count.

Determines the number of active 16-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement all destination vector elements. The results are saturated to the 16-bit unsigned integer range.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

```
size<1>size<0> D U

UQDECH <Zdn>.H{, <pattern>{, MUL #<imm>}}
```

if !HaveSVE() then UNDEFINED;
integer esize = 16;
integer dn = UInt(Zdn);
bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;
boolean unsigned = TRUE;

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the “Zdn” field.
<pattern> Is the optional pattern specifier, defaulting to ALL, encoded in "pattern":

</tbody>
</table>

<imm> Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the “imm4” field.
Operation

```c
CheckSVEenabled();
integer elements = VL DIV esize;
integer count = DecodePredCount(pat, esize);
bits(VL) operand1 = Z[dn];
bits(VL) result;

for e = 0 to elements-1
    integer element1 = Int(Elem[operand1, e, esize], unsigned);
    (Elem[result, e, esize], -) = SatQ(element1 - (count * imm), esize, unsigned);

Z[dn] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
UQDECP (scalar)

Unsigned saturating decrement scalar by count of true predicate elements.

Counts the number of true elements in the source predicate and then uses the result to decrement the scalar destination. The result is saturated to the general-purpose register's unsigned integer range.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit

```
0 0 1 0 0 1 0 | size 1 0 1 0 1 1 1 0 0 1 0 0
D U sf
Pm Rdn
```

UQDECP <Wdn>, <Pm>.<T>

if !HaveSVE() then UNDEFINED;
integer esize = 8 << UInt(size);
integer m = UInt(Pm);
integer dn = UInt(Rdn);
boolean unsigned = TRUE;
integer ssize = 32;

64-bit

```
0 0 1 0 0 1 0 1 | size 1 0 1 0 1 1 1 0 0 1 1 0
D U sf
Pm Rdn
```

UQDECP <Xdn>, <Pm>.<T>

if !HaveSVE() then UNDEFINED;
integer esize = 8 << UInt(size);
integer m = UInt(Pm);
integer dn = UInt(Rdn);
boolean unsigned = TRUE;
integer ssize = 64;

Assembler Symbols

<Wdn> Is the 32-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.
<Xdn> Is the 64-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.
<Pm> Is the name of the source scalable predicate register, encoded in the "Pm" field.
<T> Is the size specifier, encoded in "size":

<table>
<thead>
<tr>
<th>size</th>

<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>
Operation

\texttt{CheckSVEEnabled();}
\texttt{integer elements = VL \, DIV \, esize;}
\texttt{bits(ssize) operand1 = X[dn];}
\texttt{bits(PL) operand2 = P[m];}
\texttt{bits(ssize) result;}
\texttt{integer count = 0;}

\texttt{for \, e = 0 \, to \, elements-1}
\texttt{\quad \text{if } \texttt{ElemP}[operand2, \, e, \, esize] \, == \, '1' \, then}
\texttt{\quad \quad count = count + 1;}

\texttt{integer \, element = \texttt{Int}(operand1, \, unsigned);} \quad \texttt{(result, \, -) = \texttt{SatQ}(element \, - \, count, \, ssize, \, unsigned);} \quad \texttt{X[dn] = \texttt{Extend}(result, \, 64, \, unsigned);}
UQDECP (vector)

Unsigned saturating decrement vector by count of true predicate elements.

Counts the number of true elements in the source predicate and then uses the result to decrement all destination vector elements. The results are saturated to the element unsigned integer range.

The predicate size specifier may be omitted in assembler source code, but this is deprecated and will be prohibited in a future release of the architecture.

The `Pm` and `Zdn` fields encode the names of the source and destination scalable vector registers, respectively. The `T` field encodes the size specifier, which can be `00` (reserved), `01` (H), `10` (S), or `11` (D). The `unsigned` field determines whether the results should be treated as unsigned.

Assembler Symbols

- `<Zdn>` is the name of the source and destination scalable vector register, encoded in the “Zdn” field.
- `<T>` is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>RESERVED</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

- `<Pm>` is the name of the source scalable predicate register, encoded in the “Pm” field.

Operation

```plaintext
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn];
bits(PL) operand2 = P[m];
bits(VL) result;
integer count = 0;
for e = 0 to elements-1
  if ElemP[operand2, e, esize] == '1' then
    count = count + 1;
for e = 0 to elements-1
  integer element = Int(Elem[operand1, e, esize], unsigned);
  (Elem[result, e, esize], '-') = SatQ(element - count, esize, unsigned);
Z[dn] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
UQDECW (scalar)

Unsigned saturating decrement scalar by multiple of 32-bit predicate constraint element count.

Determines the number of active 32-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement the scalar destination. The result is saturated to the general-purpose register's unsigned integer range.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

UQINCD (vector)

Unsigned saturating increment vector by multiple of 64-bit predicate constraint element count.

Determines the number of active 64-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment all destination vector elements. The results are saturated to the 64-bit unsigned integer range.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

<imm> is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the “imm4” field.
Operation

```c
CheckSVEEnabled();
integer elements = VL DIV esize;
integer count = DecodePredCount(pat, esize);
bits(VL) operand1 = Z[dn];
bits(VL) result;

for e = 0 to elements-1
    integer element1 = Int(Elem[operand1, e, esize], unsigned);
    (Elem[result, e, esize], '-') = SatQ(element1 + (count * imm), esize, unsigned);

Z[dn] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
UQINCH (scalar)

Unsigned saturating increment scalar by multiple of 16-bit predicate constraint element count.

Determines the number of active 16-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment the scalar destination. The result is saturated to the general-purpose register's unsigned integer range.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 2 classes: 32-bit and 64-bit

<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

<Pm> Is the name of the source scalable predicate register, encoded in the "Pm" field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn];
bits(PL) operand2 = P[m];
bits(VL) result;
integer count = 0;
for e = 0 to elements-1
   if ElemP[operand2, e, esize] == '1' then
      count = count + 1;
for e = 0 to elements-1
   integer element = Int(Elem[operand1, e, esize], unsigned);
   (Elem[result, e, esize], -) = SatQ(element + count, esize, unsigned);
Z[dn] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

• The MOVPRFX instruction must be unpredicated.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
UQINC (scalar)

Unsigned saturating increment scalar by multiple of 32-bit predicate constraint element count.

Determines the number of active 32-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment the scalar destination. The result is saturated to the general-purpose register's unsigned integer range.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 2 classes: 32-bit and 64-bit

UQINCW (vector)

Unsigned saturating increment vector by multiple of 32-bit predicate constraint element count.

Determines the number of active 32-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment all destination vector elements. The results are saturated to the 32-bit unsigned integer range.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

UQSUB (immediate)

Unsigned saturating subtract immediate (unpredicated).

Unsigned saturating subtract an unsigned immediate from each element of the source vector, and destructively place the results in the corresponding elements of the source vector. Each result element is saturated to the N-bit element's unsigned integer range 0 to \((2^N)-1\). This instruction is unpredicated.

The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a positive multiple of 256 in the range 256 to 65280.

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<imm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in "size":

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

<imm> Is an unsigned immediate in the range 0 to 255, encoded in the "imm8" field.

<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in "sh":

<table>
<thead>
<tr>
<th>sh</th>
<th>&lt;shift&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>LSL #0</td>
</tr>
<tr>
<td>1</td>
<td>LSL #8</td>
</tr>
</tbody>
</table>

Operation

\(\text{CheckSVEEnabled}()\);
integer elements = \(\text{VL} \div \text{esize}\);
bits(\text{VL}) \text{ operand1} = Z[\text{dn}];
bits(\text{VL}) \text{ result};
for \(e = 0\) to elements-1
    integer element1 = \(\text{Int}(\text{Elem} [\text{operand1}, e, \text{esize}], \text{unsigned})\);
    (\text{Elem}[\text{result}, e, \text{esize}, \cdot]) = \text{SatQ}(\text{element1} - \text{imm}, \text{esize}, \text{unsigned});
\]
\(Z[\text{dn}] = \text{result};\)

Operational information

This instruction might be immediately preceded in program order by a \text{MOVPRFX} instruction. The \text{MOVPRFX} instruction must conform to all of the following requirements, otherwise the behavior of the \text{MOVPRFX} and this instruction is UNPREDICTABLE:
• The MOVPRFX instruction must be unpredicated.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
Unsigned saturating subtract vectors (unpredicated).

Unsigned saturating subtract all elements of the second source vector from corresponding elements of the first source vector and place the results in the corresponding elements of the destination vector. Each result element is saturated to the N-bit element's unsigned integer range 0 to \(2^N-1\). This instruction is unpredicated.

WHILELE

While incrementing signed scalar less than or equal to scalar.

Generate a predicate that starting from the lowest numbered element is true while the incrementing value of the first, signed scalar operand is less than or equal to the second scalar operand and false thereafter up to the highest numbered element.

If the second scalar operand is equal to the maximum signed integer value then a condition which includes an equality test can never fail and the result will be an all-true predicate.

The full width of the scalar operands is significant for the purposes of comparison, and the full width first operand is incremented by one for each destination predicate element, irrespective of the predicate result element size. The first general-purpose source register is not itself updated.

The predicate result is placed in the predicate destination register. Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

    operand1 = operand1 + 1;

PSTATE.<N,Z,C,V> = PredTest(mask, result, esize);
P[d] = result;
WRFFR

Write the first-fault register.

Read the source predicate register and place in the first-fault register (FFR). This instruction is intended to restore a saved FFR and is not recommended for general use by applications.

This instruction requires that the source predicate contains a MONOTONIC predicate value, in which starting from bit 0 there are zero or more 1 bits, followed only by 0 bits in any remaining bit positions. If the source is not a monotonic predicate value, then the resulting value in the FFR will be UNPREDICTABLE. It is not possible to generate a non-monotonic value in FFR when using SETFFR followed by first-fault or non-fault loads.

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 0 1 0 0 1 0 0 1 0 1 0 0 0 1 0 0 1 0 0 0 0 0

WRFFR <Pn>.B
```

```
if !HaveSVE() then UNDEFINED;
integer n = UInt(Pn);
```

Assemble Symbol

- `<Pn>` Is the name of the source scalable predicate register, encoded in the "Pn" field.

**Operation**

```
CheckSVEEnabled();
bits(PL) operand = P[n];
hsb = HighestSetBit(operand);
if hsb < 0 || IsOnes(operand<hsb:0>) then
    FFR[] = operand;
else // not a monotonic predicate
    FFR[] = bits(PL) UNKNOWN;
```
ZIP1, ZIP2 (predicates)

Interleave elements from two half predicates.

Interleave alternating elements from the lowest or highest halves of the first and second source predicates and place in elements of the destination predicate. This instruction is unpredicated.

It has encodings from 2 classes: High halves and Low halves.

**High halves**
