System Register index by functional group

Below are indexes for registers with the following main functional groups:

- **ID**
- **Memory**
- **Other**
- **Exception**
- **Special**
- **PSTATE**
- **Cache**
- **Address**
- **TLB**
- **PMU**
- **Reset**
- **Thread**
- **IMP DEF**
- **Timer**
- **Debug**
- **CTI**
- **Virt**
- **Secure**
- **Float**
- **Legacy**
- **Trace**
- **GIC**
- **GICD**
- **GICC**
- **GICR**
- **GICH**
- **GTS**
- **RAS**
- **MPAM**
- **Pointer authentication**
- **GIC ITS registers**

In the **ID** functional group:

### System Register index by functional group

#### Exec state | Name | Description
--- | --- | ---
AArch64 | **RMR_EL2** | Reset Management Register (EL2)
AArch64 | **RMR_EL3** | Reset Management Register (EL3)
AArch64 | **RVBAR_EL1** | Reset Vector Base Address Register (if EL2 and EL3 not implemented)
AArch64 | **RVBAR_EL2** | Reset Vector Base Address Register (if EL3 not implemented)
AArch64 | **RVBAR_EL3** | Reset Vector Base Address Register (if EL3 implemented)

**In the Thread functional group:**

#### Exec state | Name | Description
--- | --- | ---
AArch32 | **HTPIDR** | Hyp Software Thread ID Register
AArch32 | **TPIDRPRW** | PL1 Software Thread ID Register
AArch32 | **TPIDRURO** | PL0 Read-Only Software Thread ID Register
AArch32 | **TPIDRURW** | PL0 Read/Write Software Thread ID Register
AArch64 | **SCXTNUM_EL0** | EL0 Read/Write Software Context Number
AArch64 | **SCXTNUM_EL1** | EL1 Read/Write Software Context Number
AArch64 | **SCXTNUM_EL2** | EL2 Read/Write Software Context Number
AArch64 | **SCXTNUM_EL3** | EL3 Read/Write Software Context Number
AArch64 | **TPIDRRO_EL0** | EL0 Read-Only Software Thread ID Register
AArch64 | **TPIDR_EL0** | EL0 Read/Write Software Thread ID Register
AArch64 | **TPIDR_EL1** | EL1 Software Thread ID Register
AArch64 | **TPIDR_EL2** | EL2 Software Thread ID Register
AArch64 | **TPIDR_EL3** | EL3 Software Thread ID Register

**In the IMP DEF functional group:**

#### Exec state | Name | Description
--- | --- | ---
AArch32 | **ACTLR** | Auxiliary Control Register
AArch32 | **ACTLR2** | Auxiliary Control Register 2
AArch32 | **ADFSR** | Auxiliary Data Fault Status Register
AArch32 | **AIDR** | Auxiliary ID Register
AArch32 | **AIFSR** | Auxiliary Instruction Fault Status Register
AArch32 | **AMAIR0** | Auxiliary Memory Attribute Indirection Register 0
AArch32 | **AMAIR1** | Auxiliary Memory Attribute Indirection Register 1
AArch32 | **HACTLR** | Hyp Auxiliary Control Register
AArch32 | **HACTLR2** | Hyp Auxiliary Control Register 2
AArch32 | **HADFSR** | Hyp Auxiliary Data Fault Status Register
AArch32 | **HAIFSR** | Hyp Auxiliary Instruction Fault Status Register
AArch32 | **HAMAIR0** | Hyp Auxiliary Memory Attribute Indirection Register 0
AArch32 | **HAMAIR1** | Hyp Auxiliary Memory Attribute Indirection Register 1
AArch64 | **ACTLR_EL1** | Auxiliary Control Register (EL1)
AArch64 | **ACTLR_EL2** | Auxiliary Control Register (EL2)
AArch64 | **ACTLR_EL3** | Auxiliary Control Register (EL3)
AArch64 | **AFSR0_EL1** | Auxiliary Fault Status Register 0 (EL1)
AArch64 | **AFSR0_EL2** | Auxiliary Fault Status Register 0 (EL2)
AArch64 | **AFSR0_EL3** | Auxiliary Fault Status Register 0 (EL3)
AArch64 | **AFSR1_EL1** | Auxiliary Fault Status Register 1 (EL1)
AArch64 | **AFSR1_EL2** | Auxiliary Fault Status Register 1 (EL2)
AArch64 | **AFSR1_EL3** | Auxiliary Fault Status Register 1 (EL3)
AArch64 | **AIDR_EL1** | Auxiliary ID Register
AArch64 | **AMAIR_EL1** | Auxiliary Memory Attribute Indirection Register (EL1)
AArch64 | **AMAIR_EL2** | Auxiliary Memory Attribute Indirection Register (EL2)
AArch64 | **AMAIR_EL3** | Auxiliary Memory Attribute Indirection Register (EL3)
AArch64 | **HACR_EL2** | Hypervisor Auxiliary Control Register
AArch64 | **S1 <op1> <Cn> <Cm> <op2>** | IMPLEMENTATION DEFINED maintenance instructions
AArch64 | **S3 <op1> <Cn> <Cm> <op2>** | IMPLEMENTATION DEFINED registers

**In the Timer functional group:**

#### Exec state | Name | Description
--- | --- | ---
AArch32 | **CNTFRQ** | Counter-timer Frequency register
AArch32 | **CNTHPS_CTL** | Counter-timer Secure Physical Timer Control Register (EL2)

### System Register index by functional group

#### Exec state | Name | Description
--- | --- | ---
AArch64 | TLBI RIPAS2LE1 | TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1
AArch64 | TLBI RIPAS2LE1IS | TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Inner Shareable
AArch64 | TLBI RIPAS2LE1OS | TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable
AArch64 | TPIIDR_EL2 | EL2 Software Thread ID Register
AArch64 | TTBR0_EL2 | Translation Table Base Register 0 (EL2)
AArch64 | TTBR1_EL2 | Translation Table Base Register 1 (EL2)
AArch64 | VBAR_EL2 | Vector Base Address Register (EL2)
AArch64 | VMPIDR_EL2 | Virtualization Multiprocessor ID Register
AArch64 | VPIDR_EL2 | Virtualization Processor ID Register
AArch64 | VTCR_EL2 | Virtualization Translation Control Register
AArch64 | VTTR_EL2 | Virtualization Translation Table Base Register

**In the Secure functional group:**

#### Exec state | Name | Description
--- | --- | ---
AArch32 | ICC_MCTLR | Interrupt Controller Monitor Control Register
AArch32 | ICC_MSRE | Interrupt Controller Monitor System Register Enable register
AArch32 | MVBAR | Monitor Vector Base Address Register
AArch32 | NSACR | Non-Secure Access Control Register
AArch32 | SCR | Secure Configuration Register
AArch32 | SDR | Secure Debug Control Register
AArch32 | SDER | Secure Debug Enable Register
AArch64 | ACTLR_EL3 | Auxiliary Control Register (EL3)
AArch64 | AFSR0_EL3 | Auxiliary Fault Status Register 0 (EL3)
AArch64 | AFSR1_EL3 | Auxiliary Fault Status Register 1 (EL3)
AArch64 | AMAIR_EL3 | Auxiliary Memory Attribute Indirection Register (EL3)
AArch64 | CPTIR_EL3 | Architectural Feature Trap Register (EL3)
AArch64 | ICC_CTLR_EL3 | Interrupt Controller Control Register (EL3)
AArch64 | ICC_SRE_EL3 | Interrupt Controller System Register Enable register (EL3)
AArch64 | MDCR_EL3 | Monitor Debug Configuration Register (EL3)
AArch64 | SCR_EL3 | Secure Configuration Register
AArch64 | SDER32_EL3 | AArch32 Secure Debug Enable Register
AArch64 | VBAR_EL3 | Vector Base Address Register (EL3)

**In the Float functional group:**

#### Exec state | Name | Description
--- | --- | ---
AArch32 | FPEXC | Floating-Point Exception Control register
AArch32 | FPSCR | Floating-Point Status and Control Register
AArch32 | FPSID | Floating-Point System ID register
AArch32 | MVFR0 | Media and VFP Feature Register 0
AArch32 | MVFR1 | Media and VFP Feature Register 1
AArch32 | MVFR2 | Media and VFP Feature Register 2
AArch64 | FPCR | Floating-point Control Register
AArch64 | FPEXC32_EL2 | Floating-Point Exception Control register
AArch64 | FPSR | Floating-point Status Register
AArch64 | MVFR0_EL1 | AArch32 Media and VFP Feature Register 0
AArch64 | MVFR1_EL1 | AArch32 Media and VFP Feature Register 1
AArch64 | MVFR2_EL1 | AArch32 Media and VFP Feature Register 2

**In the Legacy functional group:**

#### Exec state | Name | Description
--- | --- | ---
AArch32 | CP15DMB | Data Memory Barrier System instruction
AArch32 | CP15DSB | Data Synchronization Barrier System instruction
AArch32 | CP15SIB | Instruction Synchronization Barrier System instruction
AArch32 | FCSEIDR | FCSE Process ID register
AArch32 | IDIR | Jazelle ID Register

AMCFGR, Activity Monitors Configuration Register

The AMCFGR characteristics are:

**Purpose**

Global configuration register for the activity monitors.

Provides information on supported features, the number of counter groups implemented, the total number of activity monitor event counters implemented, and the size of the counters. AMCFGR is applicable to both the architected and the auxiliary counter groups.

**Configuration**

External register AMCFGR bits [31:0] are architecturally mapped to AArch64 System register AMCFGR_EL0[31:0].

External register AMCFGR bits [31:0] are architecturally mapped to AArch32 System register AMCFGR[31:0].

The power domain of AMCFGR is IMPLEMENTATION DEFINED.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCFGR are RES0.

**Attributes**

AMCFGR is a 32-bit register.

**Field descriptions**

The AMCFGR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| NCG | RES0 | HDBG | RAZ | SIZE | N |

**NCG, bits [31:28]**

Defines the number of counter groups.

The number of implemented counter groups is defined as [AMCFGR.NCG + 1].

If the number of implemented auxiliary activity monitor event counters is zero, this field has a value of 0b0000. Otherwise, this field has a value of 0b0001.

**Bits [27:25]**

Reserved, RES0.

**HDBG, bit [24]**

Halt-on-debug supported.

From Armv8, this feature must be supported, and so this bit is 0b1.

<table>
<thead>
<tr>
<th>HDBG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>AMCR.HDBG is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>AMCR.HDBG is read/write.</td>
</tr>
</tbody>
</table>
Bits [23:14]

Reserved, RAZ.

SIZE, bits [13:8]

Defines the size of activity monitor event counters.

The size of the activity monitor event counters implemented by the Activity Monitors Extension is defined as [AMCFGR.SIZE + 1].

From Armv8, the counters are 64-bit, and so this field is 0b111111.

Note

Software also uses this field to determine the spacing of counters in the memory-map. From Armv8, the counters are at doubleword-aligned addresses.

N, bits [7:0]

Defines the number of activity monitor event counters.

The total number of counters implemented in all groups by the Activity Monitors Extension is defined as [AMCFGR.N + 1].

Accessing the AMCFGR

AMCFGR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xE00</td>
<td>AMCFGR</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
The AMCGCR characteristics are:

**Purpose**

Provides information on the number of activity monitor event counters implemented within each counter group.

**Configuration**

External register AMCGCR bits [31:0] are architecturally mapped to AArch64 System register AMCGCR_EL0[31:0].

External register AMCGCR bits [31:0] are architecturally mapped to AArch32 System register AMCGCR[31:0].

The power domain of AMCGCR is IMPLEMENTATION DEFINED.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCGCR are RES0.

**Attributes**

AMCGCR is a 32-bit register.

**Field descriptions**

The AMCGCR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>CG1NC</td>
<td>CG0NC</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**CG1NC, bits [15:8]**

Counter Group 1 Number of Counters. The number of counters in the auxiliary counter group.

In AMUv1, the permitted range of values is 0 to 16.

**CG0NC, bits [7:0]**

Counter Group 0 Number of Counters. The number of counters in the architected counter group.

In AMUv1, the value of this field is 4.

**Accessing the AMCGCR**

AMCGCR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xCE0</td>
<td>AMCGCR</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
AMCIDR0, Activity Monitors Component Identification Register 0

The AMCIDR0 characteristics are:

**Purpose**

Provides information to identify an activity monitors component.

For more information, see About the Component identification scheme in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

The power domain of AMCIDR0 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCIDR0 are RES0.

**Attributes**

AMCIDR0 is a 32-bit register.

**Field descriptions**

The AMCIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>27-8</td>
<td>Reserved</td>
</tr>
<tr>
<td>7-0</td>
<td>PRMBL_0</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_0, bits [7:0]**

Preamble. Must read as 0x0D.

**Accessing the AMCIDR0**

**AMCIDR0 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFF0</td>
<td>AMCIDR0</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
AMCIDR1, Activity Monitors Component Identification Register 1

The AMCIDR1 characteristics are:

**Purpose**

Provides information to identify an activity monitors component.

For more information, see About the Component identification scheme in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

The power domain of AMCIDR1 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCIDR1 are RES0.

**Attributes**

AMCIDR1 is a 32-bit register.

**Field descriptions**

The AMCIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
<td></td>
</tr>
<tr>

<tr>
<td>0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**CLASS, bits [7:4]**

Component class. Reads as 0x9, CoreSight component.

**PRMBL_1, bits [3:0]**

Preamble. Reads as 0x0.

**Accessing the AMCIDR1**

AMCIDR1 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFF4</td>
<td>AMCIDR1</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
AMCIDR2, Activity Monitors Component Identification Register 2

The AMCIDR2 characteristics are:

**Purpose**

Provides information to identify an activity monitors component.

For more information, see About the Component identification scheme in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

The power domain of AMCIDR2 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCIDR2 are RES0.

**Attributes**

AMCIDR2 is a 32-bit register.

**Field descriptions**

The AMCIDR2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>28-10</td>
<td>PRMBL_2, bits [7:0]</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_2, bits [7:0]**

Preamble. Reads as 0x05.

**Accessing the AMCIDR2**

AMCIDR2 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFF8</td>
<td>AMCIDR2</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
AMCIDR3, Activity Monitors Component Identification Register 3

The AMCIDR3 characteristics are:

**Purpose**

Provides information to identify an activity monitors component.

For more information, see About the Component identification scheme in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

The power domain of AMCIDR3 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCIDR3 are RES0.

**Attributes**

AMCIDR3 is a 32-bit register.

**Field descriptions**

The AMCIDR3 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 | PRMBL_3 |

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble. Reads as 0xB1.

**Accessing the AMCIDR3**

**AMCIDR3 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFFC</td>
<td>AMCIDR3</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
AMCNTENCLR0, Activity Monitors Count Enable Clear Register 0

The AMCNTENCLR0 characteristics are:

**Purpose**

Disable control bits for the architected event counters, AMEVCTR0<n>.

**Configuration**

External register AMCNTENCLR0 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENCLR0_EL0[31:0].

External register AMCNTENCLR0 bits [31:0] are architecturally mapped to AArch32 System register AMCNTENCLR0[31:0].

The power domain of AMCNTENCLR0 is IMPLEMENTATION DEFINED. Some or all RW fields of this register have defined reset values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR0 are RES0.

**Attributes**

AMCNTENCLR0 is a 32-bit register.

**Field descriptions**

The AMCNTENCLR0 bit assignments are:

<table>
<thead>
<tr>
<th>P&lt;n&gt;, bit [n]</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
</tr>
<tr>
<td>---------------</td>
</tr>
</tbody>
</table>

**P<n>, bit [n], for n = 0 to 31**

Activity monitor event counter disable bit for AMEVCTR0<n>.

Bits [31:N] are RAZ/WI. N is the value in AMCGCR.CG0NC.

Possible values of each bit are:

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that AMEVCTR0&lt;n&gt; is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that AMEVCTR0&lt;n&gt; is enabled. When written, disables AMEVCTR0&lt;n&gt;.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.

**Accessing the AMCNTENCLR0**

AMCNTENCLR0 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xC20</td>
<td>AMCNTENSET0</td>
</tr>
</tbody>
</table>
Accesses on this interface are RO.
AMCNTENCLR1, Activity Monitors Count Enable Clear Register 1

The AMCNTENCLR1 characteristics are:

**Purpose**

Disable control bits for the auxiliary activity monitors event counters, AMEVCNTR1<n>.

**Configuration**

External register AMCNTENCLR1 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENCLR1_EL0[31:0].

External register AMCNTENCLR1 bits [31:0] are architecturally mapped to AArch32 System register AMCNTENCLR1[31:0].

The power domain of AMCNTENCLR1 is IMPLEMENTATION DEFINED. Some or all RW fields of this register have defined reset values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR1 are RES0.

**Attributes**

AMCNTENCLR1 is a 32-bit register.

**Field descriptions**

The AMCNTENCLR1 bit assignments are:

```
  31  30  29  28  27  26  25  24  23  22  21  20  19  18  17  16  15  14  13  12  11  10  9  8  7  6  5  4  3  2  1  0
         P<n>, bit [n]
```

**P<n>, bit [n], for n = 0 to 31**

Activity monitor event counter disable bit for AMEVCNTR1<n>.

Bits [31:N] are RAZ/WI. N is the value in AMCGCR.CG1NC.

Possible values of each bit are:

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that AMEVCNTR1&lt;n&gt; is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that AMEVCNTR1&lt;n&gt; is enabled. When written, disable AMEVCNTR1&lt;n&gt;.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.

**Accessing the AMCNTENCLR1**

If the number of auxiliary activity monitor event counters implemented is zero, reads and writes of AMCNTENCLR1 are CONSTRAINED UNPREDICTABLE, and accesses to the register behave as RAZ/WI.

**Note**

The number of auxiliary activity monitor event counters implemented is zero exactly when AMCFGR.NCG == 0b0000.

**AMCNTENCLR1 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xC24</td>
<td>AMCNTENCLR1</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
AMCNTENSET0, Activity Monitors Count Enable Set Register 0

The AMCNTENSET0 characteristics are:

**Purpose**

Enable control bits for the architected activity monitors event counters, AMEVCNTR0<\text{n}>

**Configuration**

External register AMCNTENSET0 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENSET0_EL0[31:0].

External register AMCNTENSET0 bits [31:0] are architecturally mapped to AArch32 System register AMCNTENSET0[31:0].

The power domain of AMCNTENSET0 is IMPLEMENTATION DEFINED. Some or all RW fields of this register have defined reset values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET0 are RES0.

**Attributes**

AMCNTENSET0 is a 32-bit register.

**Field descriptions**

The AMCNTENSET0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>P&lt;n&gt; bit [n]</td>
<td></td>
</tr>
</tbody>
</table>

P<n>, bit [n], for n = 0 to 31

Activity monitor event counter enable bit for AMEVCNTR0<\text{n}>

Bits [31:N] are RAZ/WI. N is the value in AMCGCR.CG0NC.

Possible values of each bit are:

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that AMEVCNTR0&lt;\text{n}&gt; is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that AMEVCNTR0&lt;\text{n}&gt; is enabled. When written, enables AMEVCNTR0&lt;\text{n}&gt;.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.

**Accessing the AMCNTENSET0**

AMCNTENSET0 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xC00</td>
<td>AMCNTENSET0</td>
</tr>
</tbody>
</table>
Accesses on this interface are **RO**.
AMCNTENSET1, Activity Monitors Count Enable Set Register 1

The AMCNTENSET1 characteristics are:

**Purpose**

Enable control bits for the auxiliary activity monitors event counters, AMEVCTR1<n>.

**Configuration**

External register AMCNTENSET1 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENSET1_EL0[31:0].

External register AMCNTENSET1 bits [31:0] are architecturally mapped to AArch32 System register AMCNTENSET1[31:0].

The power domain of AMCNTENSET1 is IMPLEMENTATION DEFINED. Some or all RW fields of this register have defined reset values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET1 are RES0.

**Attributes**

AMCNTENSET1 is a 32-bit register.

**Field descriptions**

The AMCNTENSET1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| P<n>, bit [n] |

**P<n>, bit [n], for n = 0 to 31**

Activity monitor event counter enable bit for AMEVCTR1<n>.

Bits [31:N] are RAZ/WI. N is the value in AMCGCR.CG1NC.

Possible values of each bit are:

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that AMEVCTR1&lt;n&gt; is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that AMEVCTR1&lt;n&gt; is enabled. When written, enables AMEVCTR1&lt;n&gt;.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.

**Accessing the AMCNTENSET1**

If the number of auxiliary activity monitor event counters implemented is zero, reads and writes of AMCNTENSET1 are CONSTRAINED UNPREDICTABLE, and accesses to the register behave as RAZ/WI.

**Note**
The number of auxiliary activity monitor counters implemented is zero exactly when `AMCFG.NCG == 0b0000`.

**AMCNTENSET1 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xC04</td>
<td>AMCNTENSET1</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
**AMCR, Activity Monitors Control Register**

The AMCR characteristics are:

### Purpose

Global control register for the activity monitors implementation. AMCR is applicable to both the architected and the auxiliary counter groups.

### Configuration

External register AMCR bits [31:0] are architecturally mapped to AArch64 System register AMCR_EL0[31:0].

External register AMCR bits [31:0] are architecturally mapped to AArch32 System register AMCR[31:0].

The power domain of AMCR is IMPLEMENTATION DEFINED.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCR are RES0.

### Attributes

AMCR is a 32-bit register.

### Field descriptions

The AMCR bit assignments are:

<table>
<thead>
<tr>

</tbody>
</table>

**Bits [31:11]**

Reserved, RES0.

**HDBG, bit [10]**

This bit controls whether activity monitor counting is halted when the PE is halted in Debug state.

<table>
<thead>
<tr>
<th>HDBG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Activity monitors do not halt counting when the PE is halted in Debug state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Activity monitors halt counting when the PE is halted in Debug state.</td>
</tr>
</tbody>
</table>

**Bits [9:0]**

Reserved, RAZ/WI.

### Accessing the AMCR

AMCR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xE04</td>
<td>AMCR</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
AMDEVAFF0, Activity Monitors Device Affinity Register 0

The AMDEVAFF0 characteristics are:

**Purpose**

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the AMU component relates to.

**Configuration**

The power domain of AMDEVAFF0 is **IMPLEMENTATION DEFINED**.

Implementation of this register is **OPTIONAL**.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMDEVAFF0 are **RES0**.

**Attributes**

AMDEVAFF0 is a 32-bit register.

**Field descriptions**

The AMDEVAFF0 bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>MPIDR_EL1 low half</td>
</tr>
</tbody>
</table>

**MPIDR_EL1 low half, bits [31:0]**

MPIDR_EL1 low half. Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented Exception level.

**Accessing the AMDEVAFF0**

AMDEVAFF0 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFA8</td>
<td>AMDEVAFF0</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
The AMDEVAFF1 characteristics are:

**Purpose**

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the AMU component relates to.

**Configuration**

The power domain of AMDEVAFF1 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMDEVAFF1 are RES0.

**Attributes**

AMDEVAFF1 is a 32-bit register.

**Field descriptions**

The AMDEVAFF1 bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>MPIDR_EL1 high half, bits [31:0]</td>
</tr>
</tbody>
</table>

MPIDR_EL1 high half. Read-only copy of the high half of MPIDR_EL1, as seen from the highest implemented Exception level.

**Accessing the AMDEVAFF1**

AMDEVAFF1 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFAC</td>
<td>AMDEVAFF1</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
The AMDEVARCH characteristics are:

**Purpose**

Identifies the programmers' model architecture of the AMU component.

**Configuration**

The power domain of AMDEVARCH is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMDEVARCH are RES0.

**Attributes**

AMDEVARCH is a 32-bit register.

**Field descriptions**

The AMDEVARCH bit assignments are:

<table>
<thead>
<tr>
<th></th>
<th>ARCHITECT</th>
<th>PRESENT</th>
<th>REVISION</th>
<th>ARCHID</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>30</td>
<td>29</td>
<td>28</td>
<td>27</td>
</tr>
</tbody>
</table>

**ARCHITECT, bits [31:21]**

Defines the architecture of the component. For AMU, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

**PRESENT, bit [20]**

When set to 1, indicates that the DEVARCH is present.

This field is 1 in Armv8.

**REVISION, bits [19:16]**

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

<table>
<thead>
<tr>
<th>REVISION</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Architecture revision is AMUv1.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**ARCHID, bits [15:0]**

Defines this part to be an AMU component. For architectures defined by Arm this is further subdivided.

For AMU:
• Bits [15:12] are the architecture version, 0x0.
• Bits [11:0] are the architecture part number, 0xA66.

This corresponds to AMU architecture version AMUv1.

**Accessing the AMDEVARCH**

AMDEVARCH can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFBC</td>
<td>AMDEVARCH</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
AMDEVTYPE, Activity Monitors Device Type Register

The AMDEVTYPE characteristics are:

**Purpose**

Indicates to a debugger that this component is part of a PE's performance monitor interface.

**Configuration**

The power domain of AMDEVTYPE is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMDEVTYPE are RES0.

**Attributes**

AMDEVTYPE is a 32-bit register.

**Field descriptions**

The AMDEVTYPE bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>27-8</td>
<td>SUB</td>
</tr>
<tr>
<td>15-4</td>
<td>MAJOR</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SUB, bits [7:4]**

Subtype. Reads as 0x1, to indicate this is a component within a PE.

**MAJOR, bits [3:0]**

Major type. Reads as 0x6, to indicate this is a performance monitor component.

**Accessing the AMDEVTYPE**

AMDEVTYPE can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFCC</td>
<td>AMDEVTYPE</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
AMEVCNTR0<n>, Activity Monitors Event Counter Registers 0, n = 0 - 15

The AMEVCNTR0<n> characteristics are:

**Purpose**

Provides access to the architected activity monitor event counters.

**Configuration**

External register AMEVCNTR0<n> bits [63:0] are architecturally mapped to AArch64 System register AMEVCNTR0<n>_EL0[63:0].

External register AMEVCNTR0<n> bits [63:0] are architecturally mapped to AArch32 System register AMEVCNTR0<n>[63:0].

The power domain of AMEVCNTR0<n> is IMPLEMENTATION DEFINED. Some or all RW fields of this register have defined reset values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR0<n> are RES0.

**Attributes**

AMEVCNTR0<n> is a 64-bit register.

**Field descriptions**

The AMEVCNTR0<n> bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>62</th>
<th>61</th>
<th>60</th>
<th>59</th>
<th>58</th>

<td>5</td>
<td>4</td>
<td>3</td>
<td>2</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

**ACNT, bits [63:0]**

Architected activity monitor event counter n.

Value of architected activity monitor event counter n, where n is the number of this register and is a number from 0 to 15.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

On a Cold reset, this field resets to 0.

**Accessing the AMEVCNTR0<n>**

If <n> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVCNTR0<n> are CONSTRAINED UNPREDICTABLE, and accesses to the register behave as RAZ/WI.

**Note**

AMECGCR.CG0NC identifies the number of architected activity monitor event counters.
AMEVCNTR0\(<n>\) can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0x000 + 8n</td>
<td>AMEVCNTR0(&lt;n&gt;)</td>
<td>31:0</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.

<table>
<thead>
<tr>
<th>Component</th>

<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0x004 + 8n</td>
<td>AMEVCNTR0(&lt;n&gt;)</td>
<td>63:32</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
AMEVCNTR1<n>, Activity Monitors Event Counter
Registers 1, n = 0 - 15

The AMEVCNTR1<n> characteristics are:

**Purpose**

Provides access to the auxiliary activity monitor event counters.

**Configuration**

External register AMEVCNTR1<n> bits [63:0] are architecturally mapped to AArch64 System register AMEVCNTR1<n>_EL0[63:0].

External register AMEVCNTR1<n> bits [63:0] are architecturally mapped to AArch32 System register AMEVCNTR1<n>[63:0].

The power domain of AMEVCNTR1<n> is IMPLEMENTATION DEFINED. Some or all RW fields of this register have defined reset values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR1<n> are RES0.

**Attributes**

AMEVCNTR1<n> is a 64-bit register.

**Field descriptions**

The AMEVCNTR1<n> bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

**ACNT, bits [63:0]**

Auxiliary activity monitor event counter n.

Value of auxiliary activity monitor event counter n, where n is the number of this register and is a number from 0 to 15.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

On a Cold reset, this field resets to 0.

**Accessing the AMEVCNTR1<n>**

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVCNTR1<n> are CONSTRAINED UNPREDICTABLE, and accesses to the register behave as RAZ/WI.

**Note**

AMECGCR.CG1NC identifies the number of auxiliary activity monitor event counters.
AMEVCNTR1<n> can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0x100 + 8n</td>
<td>AMEVCNTR1&lt;n&gt;</td>
<td>31:0</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.

<table>

<td>evtCount</td>
</tr>
</tbody>
</table>

**Bits [31:25]**

Reserved, RAZ.

**Bits [24:16]**

Reserved, RES0.

**evtCount, bits [15:0]**

Event to count. The event number of the event that is counted by the architected activity monitor event counter AMEVCNTR0<n>. The value of this field is architecturally mandated for each architected counter.

The following table shows the mapping between required event numbers and the corresponding counters:

<table>
<thead>
<tr>
<th>evtCount</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x0011</td>
<td>Processor frequency cycles</td>
<td>When n == 0</td>
</tr>
<tr>
<td>0x4004</td>
<td>Constant frequency cycles</td>
<td>When n == 1</td>
</tr>
<tr>
<td>0x0008</td>
<td>Instructions retired</td>
<td>When n == 2</td>
</tr>
<tr>
<td>0x4005</td>
<td>Memory stall cycles</td>
<td>When n == 3</td>
</tr>
</tbody>
</table>
Accessing the AMEVTYPO0\langle n\rangle

If \langle n\rangle is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVTYPO0\langle n\rangle are CONSTRAINED UNPREDICTABLE, and accesses to the register behave as RAZ/WI.

Note

AMCGCR.CG0NC identifies the number of architected activity monitor event counters.

AMEVTYPO0\langle n\rangle can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0x400 + 4n</td>
<td>AMEVTYPO0\langle n\rangle</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
The AMEVTYPE1\textsubscript{n} characteristics are:

**Purpose**

Provides information on the events that an auxiliary activity monitor event counter AMEVCNTR1\textsubscript{n} counts.

**Configuration**

External register AMEVTYPE1\textsubscript{n} bits [31:0] are architecturally mapped to AArch64 System register AMEVTYPE1\textsubscript{n}_EL0[31:0].

External register AMEVTYPE1\textsubscript{n} bits [31:0] are architecturally mapped to AArch32 System register AMEVTYPE1\textsubscript{n}[31:0].

The power domain of AMEVTYPE1\textsubscript{n} is IMPLEMENTATION DEFINED.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPE1\textsubscript{n} are RES0.

**Attributes**

AMEVTYPE1\textsubscript{n} is a 32-bit register.

**Field descriptions**

The AMEVTYPE1\textsubscript{n} bit assignments are:

\[
\begin{array}{cccccccccccccccccc}
\hline
\text{RAZ} & \text{RES0} & \text{evtCount} \\
\end{array}
\]

**Bits [31:25]**

Reserved, RAZ.

**Bits [24:16]**

Reserved, RES0.

**evtCount, bits [15:0]**

Event to count. The event number of the event that is counted by the auxiliary activity monitor event counter AMEVCNTR1\textsubscript{n}.

It is IMPLEMENTATION DEFINED what values are supported by each counter.

If software writes a value to this field which is not supported by the corresponding counter AMEVCNTR1\textsubscript{n}, then:

- It is UNPREDICTABLE which event will be counted.
- The value read back is UNKNOWN.

**Note**

The event counted by AMEVCNTR1\textsubscript{n} might be fixed at implementation. In this case, the field is read-only and writes are UNDEFINED.
If the corresponding counter \texttt{AMEVCNTR1\langle n\rangle} is enabled, writes to this register have \textit{UNPREDICTABLE} results.

\section*{Accessing the AMEVTYPER1\langle n\rangle}

If \( <n> \) is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of \texttt{AMEVTYPER1\langle n\rangle} are \textit{CONSTRAINED UNPREDICTABLE}, and accesses to the register behave as RAZ/WI.

\begin{center}
\begin{tabular}{|c|c|c|}
\hline
Component & Offset & Instance \\
\hline
AMU & 0x480 + 4n & AMEVTYPER1\langle n\rangle \\
\hline
\end{tabular}
\end{center}

Note

\texttt{AMCGCR.CG1NC} identifies the number of auxiliary activity monitor event counters.

\texttt{AMEVTYPER1\langle n\rangle} can be accessed through the memory-mapped interfaces:

Accesses on this interface are \textbf{RO}.
AMIIDR, Activity Monitors Implementation Identification Register

The AMIIDR characteristics are:

**Purpose**

Defines the implementer and revisions of the AMU.

**Configuration**

The power domain of AMIIDR is IMPLEMENTATION DEFINED.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMIIDR are RES0.

**Attributes**

AMIIDR is a 32-bit register.

**Field descriptions**

The AMIIDR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**ProductID, bits [31:20]**

This field is an AMU part identifier.

The value of this field is IMPLEMENTATION DEFINED.

If AMPIDR0 is implemented, AMPIDR0.PART_0 matches bits [27:20] of this field.

If AMPIDR1 is implemented, AMPIDR1.PART_1 matches bits [31:28] of this field.

**Variant, bits [19:16]**

This field distinguishes product variants or major revisions of the product.

The value of this field is IMPLEMENTATION DEFINED.

If AMPIDR2 is implemented, AMPIDR2.REVISION matches AMIIDR.Variant.

**Revision, bits [15:12]**

This field distinguishes minor revisions of the product.

The value of this field is IMPLEMENTATION DEFINED.

If AMPIDR3 is implemented, AMPIDR3.REVAND matches AMIIDR.Revision.

**Implementer, bits [11:0]**

Contains the JEP106 code of the company that implemented the AMU.

For an Arm implementation, this field reads as 0x43B.
Bits [11:8] contain the JEP106 continuation code of the implementer.

Bit 7 is RES0

Bits [6:0] contain the JEP106 identity code of the implementer.

If AMPIDR4 is implemented, AMPIDR4.DES_2 matches bits [11:8] of this field.

If AMPIDR2 is implemented, AMPIDR2.DES_1 matches bits [6:4] of this field.

If AMPIDR1 is implemented, AMPIDR1.DES_0 matches bits [3:0] of this field.

**Accessing the AMIIDR**

**AMIIDR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xE08</td>
<td>AMIIDR</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
The AMPIDR0 characteristics are:

**Purpose**

Provides information to identify an activity monitors component.

For more information, see About the Peripheral identification scheme in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

The power domain of AMPIDR0 is **IMPLEMENTATION DEFINED**.

Implementation of this register is **OPTIONAL**.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMPIDR0 are **RES0**.

**Attributes**

AMPIDR0 is a 32-bit register.

**Field descriptions**

The AMPIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>

**Bits [31:8]**

Reserved, RES0.

**REVISION, bits [7:4]**

Part major revision. Parts can also use this field to extend Part number to 16-bits.

The value of this field is IMPLEMENTATION DEFINED.

**JEDEC, bit [3]**

RAO. Indicates a JEP106 identity code is used.

**DES_1, bits [2:0]**

Designer, most significant bits of JEP106 ID code.

The value of this field is IMPLEMENTATION DEFINED. For Arm Limited, this field is 0b011.
Accessing the AMPIDR2

AMPIDR2 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFE8</td>
<td>AMPIDR2</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
AMPIDR3, Activity Monitors Peripheral Identification Register 3

The AMPIDR3 characteristics are:

**Purpose**

Provides information to identify an activity monitors component.

For more information, see "About the Peripheral identification scheme" in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

The power domain of AMPIDR3 is **IMPLEMENTATION DEFINED**.

Implementation of this register is **OPTIONAL**.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMPIDR3 are **RES0**.

**Attributes**

AMPIDR3 is a 32-bit register.

**Field descriptions**

The AMPIDR3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>

</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, **RES0**.

**REVAND, bits [7:4]**

Part minor revision. Parts using AMPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.

The value of this field is **IMPLEMENTATION DEFINED**.

**CMOD, bits [3:0]**

Customer modified. Indicates someone other than the Designer has modified the component.

The value of this field is **IMPLEMENTATION DEFINED**.

**Accessing the AMPIDR3**

AMPIDR3 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFEC</td>
<td>AMPIDR3</td>
</tr>
</tbody>
</table>
Accesses on this interface are RO.
AMPIDR4, Activity Monitors Peripheral Identification Register 4

The AMPIDR4 characteristics are:

**Purpose**

Provides information to identify an activity monitors component.

For more information, see About the Peripheral identification scheme in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

The power domain of AMPIDR4 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMPIDR4 are RES0.

**Attributes**

AMPIDR4 is a 32-bit register.

**Field descriptions**

The AMPIDR4 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 | SIZE | DES_2 |

**Bits [31:8]**

Reserved, RES0.

**SIZE, bits [7:4]**

Size of the component. $\log_2$ of the number of 4KB pages from the start of the component to the end of the component ID registers.

This field reads as 0b0000.

**DES_2, bits [3:0]**

Designer. JEP106 continuation code, least significant nibble.

The value of this field is IMPLEMENTATION DEFINED. For Arm Limited, this field is 0b0100.

**Accessing the AMPIDR4**

AMPIDR4 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFD0</td>
<td>AMPIDR4</td>
</tr>
</tbody>
</table>
Accesses on this interface are **RO**.
ASICCTL, CTI External Multiplexer Control register

The ASICCTL characteristics are:

**Purpose**

Can be used to provide implementation defined controls for the CTI. For example, the register might be used to control multiplexors for additional implementation defined triggers. The implementation defined controls provided by this register might modify the architecturally defined behavior of the CTI.

**Note**

The architecturally-defined triggers must not be multiplexed.

**Configuration**

It is implementation defined whether ASICCTL is implemented in the Core power domain or in the Debug power domain.

If it is implemented in the Core power domain then it is implementation defined whether it is in the Cold reset domain or the Warm reset domain.

This register must reset to a value that supports the architecturally-defined behavior of the CTI. Changing the value of the register from its reset value causes implementation defined behavior that might differ from the architecturally-defined behavior of the CTI.

Other than the requirements listed in this register description, all aspects of the reset behavior of the ASICCTL are implementation defined.

**Attributes**

ASICCTL is a 32-bit register.

**Field descriptions**

The ASICCTL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>Implementation defined</td>
</tr>
</tbody>
</table>

**Accessing the ASICCTL**

ASICCTL can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x144</td>
<td>ASICCTL</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are RO.
- Otherwise accesses to this register are IMPDEF.
CNTACR<n>, Counter-timer Access Control Registers, n = 0 - 7

The CNTACR<n> characteristics are:

**Purpose**

Provides top-level access controls for the elements of a timer frame. CNTACR<n> provides the controls for frame CNTBaseN.

In addition to the CNTACR<n> control:

- CNTNSAR controls whether CNTACR<n> is accessible by Non-secure accesses.
- If frame CNTEL0BaseN is implemented, the CNTEL0ACR in frame CNTBaseN provides additional control of accesses to frame CNTEL0BaseN.

**Configuration**

The power domain of CNTACR<n> is **IMPLEMENTATION DEFINED**. RW fields in this register reset to architecturally **UNKNOWN** values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.

For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Implemented only if the value of CNTTIDR.Frame<n> is 1.

An implementation of the counters might not provide configurable access to some or all of the features. In this case, the associated field in the CNTACR<n> register is:

- RAZ/WI if access is always denied.
- RAO/WI if access is always permitted.

**Attributes**

CNTACR<n> is a 32-bit register.

**Field descriptions**

The CNTACR<n> bit assignments are:

<table>
<thead>
<tr>
<th>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>
<th>RES0</th>
<th>RWPT</th>
<th>RWVT</th>
<th>RVOFF</th>
<th>RFRO</th>
<th>RVCT</th>
<th>RPCT</th>
</tr>
</thead>
</table>

**Bits [31:6]**

Reserved, RES0.

**RWPT, bit [5]**

Read/write access to the EL1 Physical Timer registers CNTP_CVAL, CNTP_TVAL, and CNTP_CTL in frame <n>. The possible values of this bit are:

<table>
<thead>
<tr>
<th>RWPT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No access to the EL1 Physical Timer registers in frame &lt;n&gt;. The registers are RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read/write access to the EL1 Physical Timer registers in frame &lt;n&gt;.</td>
</tr>
</tbody>
</table>
This field resets to an architecturally **UNKNOWN** value.

**RWVT, bit [4]**

Read/write access to the Virtual Timer register **CNTV_CVAL**, **CNTV_TVAL**, and **CNTV_CTL**, in frame <n>. The possible values of this bit are:

<table>
<thead>
<tr>
<th>RWVT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No access to the Virtual Timer registers in frame &lt;n&gt;. The registers are RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read/write access to the Virtual Timer registers in frame &lt;n&gt;.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**RVOFF, bit [3]**

Read-only access to **CNTVOFF**, in frame <n>. The possible values of this bit are:

<table>
<thead>
<tr>
<th>RVOFF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No access to <strong>CNTVOFF</strong> in frame &lt;n&gt;. The register is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read-only access to <strong>CNTVOFF</strong> in frame &lt;n&gt;.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**RFRQ, bit [2]**

Read-only access to **CNTFRQ**, in frame <n>. The possible values of this bit are:

<table>
<thead>
<tr>
<th>RFRQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No access to <strong>CNTFRQ</strong> in frame &lt;n&gt;. The register is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read-only access to <strong>CNTFRQ</strong> in frame &lt;n&gt;.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**RVCT, bit [1]**

Read-only access to **CNTVCT**, in frame <n>. The possible values of this bit are:

<table>
<thead>
<tr>
<th>RVCT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No access to <strong>CNTVCT</strong> in frame &lt;n&gt;. The register is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read-only access to <strong>CNTVCT</strong> in frame &lt;n&gt;.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**RPCT, bit [0]**

Read-only access to **CNTPCT**, in frame <n>. The possible values of this bit are:

<table>
<thead>
<tr>
<th>RPCT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No access to <strong>CNTPCT</strong> in frame &lt;n&gt;. The register is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read-only access to <strong>CNTPCT</strong> in frame &lt;n&gt;.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**Accessing the CNTACR<n>**

In a system that recognizes two Security states:

- **CNTACR<n>** is always accessible by Secure accesses.
- **CNTNSAR NS<n>** determines whether CNTACR<n> is accessible by Non-secure accesses.
**CNTACR<n>, Counter-timer Access Control Registers, n = 0 - 7**

**CNTACR<n> can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTRLBase</td>
<td>0x040 + 4n</td>
<td>CNTACR&lt;n&gt;</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
CNTCR, Counter Control Register

The CNTCR characteristics are:

**Purpose**

Enables the counter, controls the counter frequency setting, and controls counter behavior during debug.

**Configuration**

The power domain of CNTCR is **IMPLEMENTATION DEFINED**. Some or all RW fields of this register have defined reset values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.

**Attributes**

CNTCR is a 32-bit register.

**Field descriptions**

The CNTCR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | FCREQ | RES0 | SCEN | HDBG | EN |

**Bits [31:18]**

Reserved, RES0.

**FCREQ, bits [17:8]**

Frequency change request. Indicates the number of the entry in the Frequency modes table to select.

Selecting an unimplemented entry, or an entry that contains 0, has no effect on the counter.

The maximum number of entries in the Frequency modes table is **IMPLEMENTATION DEFINED** up to a maximum of 1004 entries, see ‘The Frequency modes table’ in Chapter I1 of the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile. An implementation is only required to implement an FCREQ field that can hold values from 0 to the highest supported Frequency modes table entry. Any unrequired most-significant bits of FCREQ can be implemented as RES0.

This field resets to 0.

**Bits [7:3]**

Reserved, RES0.

**SCEN, bit [2]**

When ARMv8.4-CNTSC is implemented:

Scale Enable.

<table>
<thead>
<tr>
<th>SCEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Scaling is not enabled. The counter value is incremented by 0x1.0000000 for each counter tick.</td>
</tr>
<tr>
<td>0b1</td>
<td>Scaling is enabled. The counter is incremented by CNTSCR.ScaleVal for each counter tick.</td>
</tr>
</tbody>
</table>
The SCEN bit can only be changed when the counter is disabled, when CNTCR.EN == 0.

If the value of CNTCR.SCEN changes when CNTCR.EN == 1 then:

- The counter value becomes UNKNOWN.
- The counter value remains UNKNOWN on future ticks of the clock.

When the CNTCV register in the CNTControlBase frame of the memory mapped counter module is written to, the accumulated fraction information is reset to zero.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HDBG, bit [1]**

Halt-on-debug. Controls whether a Halt-on-debug signal halts the system counter:

<table>
<thead>
<tr>
<th>HDBG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>System counter ignores Halt-on-debug.</td>
</tr>
<tr>
<td>0b1</td>
<td>Asserted Halt-on-debug signal halts system counter update.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**EN, bit [0]**

Enables the counter:

<table>
<thead>
<tr>
<th>EN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>System counter disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>System counter enabled.</td>
</tr>
</tbody>
</table>

This field resets to 0.

**Accessing the CNTCR**

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

**CNTCR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x000</td>
<td>CNTCR</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
CNTCV, Counter Count Value register

The CNTCV characteristics are:

**Purpose**

Indicates the current count value.

**Configuration**

The power domain of CNTCV is IMPLEMENTATION DEFINED. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.

For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Attributes**

CNTCV is a 64-bit register.

**Field descriptions**

The CNTCV bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**CountValue, bits [63:0]**

Indicates the counter value.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTCV**

<table>
<thead>
<tr>
<th>Frame</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>CNTControlBase</td>
<td>RW</td>
</tr>
<tr>
<td>CNTReadBase</td>
<td>RO</td>
</tr>
</tbody>
</table>

A write to CNTCV must be visible in the CNTPCT register of each running processor in a finite time.

For the instance of the register in the CNTControlBase frame:

- In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, and therefore this register instance, is implemented only in the Secure memory map.
- If the counter is enabled, the effect of writing to the register is UNKNOWN.

In an implementation that supports 64-bit atomic memory accesses, this register must be accessible using a 64-bit atomic access.

**CNTCV can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x008</td>
<td>CNTCV</td>
<td>63.0</td>
</tr>
</tbody>
</table>
Accesses on this interface are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTReadBase</td>
<td>0x000</td>
<td>CNTCV</td>
<td>63:0</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
CNTEL0ACR, Counter-timer EL0 Access Control Register

The CNTEL0ACR characteristics are:

Purpose

An implementation of CNTEL0ACR in the frame at CNTBaseN controls whether the \texttt{CNTPCT}, \texttt{CNTVCT}, \texttt{CNTFRO}, EL1 Physical Timer, and Virtual Timer registers are visible in the frame at CNTEL0BaseN.

Configuration

The power domain of CNTEL0ACR is \texttt{IMPLEMENTATION DEFINED}. RW fields in this register reset to architecturally \texttt{UNKNOWN} values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.

Implementation of this register is \texttt{OPTIONAL}.

For more information see ‘Power and reset domains for the system level implementation of the Generic Timer’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Attributes

CNTEL0ACR is a 32-bit register.

Field descriptions

The CNTEL0ACR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:10]

Reserved, RES0.

ELOPTEN, bit [9]

Second view read/write access control for the EL1 Physical Timer registers. This bit controls whether the \texttt{CNTP_CVAL}, \texttt{CNTP_TVAL}, and \texttt{CNTP_CTL} registers in the current CNTBaseN frame are also accessible in the corresponding CNTEL0BaseN frame. The possible values of this bit are:

<table>
<thead>
<tr>
<th>ELOPTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No access. Registers are RES0 in the second view.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access permitted. If the registers are accessible in the current frame then they are accessible in the second view.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally \texttt{UNKNOWN} value.

ELOVTEN, bit [8]

Second view read/write access control for the Virtual Timer registers. This bit controls whether the \texttt{CNTV_CVAL}, \texttt{CNTV_TVAL}, and \texttt{CNTV_CTL} registers in the current CNTBaseN frame are also accessible in the corresponding CNTEL0BaseN frame. The possible values of this bit are:
### EL0VTEN, bit [1]

Second view read access control for **CNTVCT** and **CNTFRQ**. The possible values of this bit are:

<table>
<thead>
<tr>
<th>EL0VTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><strong>CNTVCT</strong> is not visible in the second view. If EL0PCTEN is set to 0, <strong>CNTFRQ</strong> is not visible in the second view.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access permitted. If <strong>CNTVCT</strong> and <strong>CNTFRQ</strong> are visible in the current frame then they are visible in the second view.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

### EL0PCTEN, bit [0]

Second view read access control for **CNTPCT** and **CNTFRQ**. The possible values of this bit are:

<table>
<thead>
<tr>
<th>EL0PCTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><strong>CNTPCT</strong> is not visible in the second view. If EL0VTEN is set to 0, <strong>CNTFRQ</strong> is not visible in the second view.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access permitted. If <strong>CNTPCT</strong> and <strong>CNTFRQ</strong> are visible in the current frame then they are visible in the second view.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

### Accessing the CNTEL0ACR

CNTEL0ACR can be implemented in any implemented CNTBaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' in Chapter 11 of the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

If CNTEL0ACR is not implemented in an implemented CNTBaseN frame:

- The register location in that frame is RAZ/WI.
- If the corresponding CNTEL0BaseN frame is implemented, the registers **CNTFRQ**, **CNTP_CTL**, **CNTP_CVAL**, **CNTP_TVAL**, **CNTPCT**, **CNTV_CTL**, **CNTV_CVAL**, **CNTV_TVAL**, and **CNTVCT** are not visible in that frame.

### CNTEL0ACR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x014</td>
<td>CNTEL0ACR</td>
</tr>
</tbody>
</table>
Accesses on this interface are RW.
The CNTFID0 characteristics are:

**Purpose**

Indicates the base frequency of the system counter.

**Configuration**

The power domain of CNTFID0 is **IMPLEMENTATION DEFINED**. RW fields in this register reset to architecturally **UNKNOWN** values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.

For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

The possible frequencies for the system counter are stored in the Frequency modes table as 32-bit words starting with the base frequency, CNTFID0. For more information see 'The Frequency modes table' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

The final entry in the Frequency modes table must be followed by a 32-bit word of zero value, to mark the end of the table.

Typically, the Frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.

If the Frequency modes table is in read/write memory, Arm strongly recommends that the table is not updated once the system is running.

**Attributes**

CNTFID0 is a 32-bit register.

**Field descriptions**

The CNTFID0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Frequency, bits [31:0]**

The base frequency of the system counter, in Hz.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the CNTFID0**

It is **IMPLEMENTATION DEFINED** whether this register is RO or RW

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

**CNTFID0 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x020</td>
<td>CNTFID0</td>
</tr>
</tbody>
</table>
Accesses on this interface are RO or RW.
CNTFID<n>, Counter Frequency IDs, n > 0

The CNTFID<n> characteristics are:

**Purpose**

Indicates alternative system counter update frequencies.

**Configuration**

The power domain of CNTFID<n> is IMPLEMENTATION DEFINED. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.

For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

The possible frequencies for the system counter are stored in the Frequency modes table as 32-bit words starting with the base frequency, CNTFID0, see 'The Frequency modes table' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

The number of CNTFID<n> registers is IMPLEMENTATION DEFINED, and the only required CNTFID<n> register is CNTFID0.

The final entry in the Frequency modes table must be followed by a 32-bit word of zero value, to mark the end of the table.

Typically, the Frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.

If the Frequency modes table is in read/write memory, Arm strongly recommends that the table is not updated once the system is running.

**Attributes**

CNTFID<n> is a 32-bit register.

**Field descriptions**

The CNTFID<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | Frequency |

**Frequency, bits [31:0]**

A system counter update frequency, in Hz. Must be an exact divisor of the base frequency. Arm strongly recommends that all frequency values in the Frequency modes table are integer power-of-two divisors of the base frequency.

When the system timer is operating at a lower frequency than the base frequency, the increment applied at each counter update is given by:

\[
\text{increment} = \frac{\text{base frequency}}{\text{selected frequency}}
\]

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTFID<n>**

It is IMPLEMENTATION DEFINED whether this register is RO or RW.
In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes these registers, is implemented only in the Secure memory map.

CNTFID<\(n\)> can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x020 + 4(n)</td>
<td>CNTFID&lt;(n)&gt;</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO or RW.
CNTFRQ, Counter-timer Frequency

The CNTFRQ characteristics are:

**Purpose**

This register is provided so that software can discover the frequency of the system counter. The instance of the register in the CNTCTLBase frame must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

**Configuration**

The power domain of CNTFRQ is IMPLEMENTATION DEFINED. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.

For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Attributes**

CNTFRQ is a 32-bit register.

**Field descriptions**

The CNTFRQ bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Clock frequency**

Bits [31:0]

Clock frequency. Indicates the system counter clock frequency, in Hz.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTFRQ**

CNTFRQ must be implemented as an RW register in the CNTCTLBase frame.

In a system that recognizes two Security states, the instance of the register in the CNTCTLBase frame is only accessible by Secure accesses.

CNTFRQ can be implemented as a RO register in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' in Chapter I2 of the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTFRQ is accessible in that frame, as a RO register, if the value of CNTACR<n>.RFRQ is 1.
- Otherwise, the CNTFRQ address in that frame is RAZ/WI.
For an implemented CNTEL0BaseN frame:

- CNTFRQ is accessible as a RO register in that frame if both:
  - CNTFRQ is accessible in the corresponding CNTBaseN frame.
  - Either the value of CNTEL0ACR.EL0VCTEN is 1 or the value of CNTEL0ACR.EL0PCTEN is 1.
- Otherwise, the CNTFRQ address in that frame is RAZ/WI.

**CNTFRQ can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x010</td>
<td>CNTFRQ</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.

<table>
<thead>
<tr>
<th>Component</th>

<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTLBase</td>
<td>0x000</td>
<td>CNTFRQ</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
CNTID, Counter Identification Register

The CNTID characteristics are:

**Purpose**

Indicates whether counter scaling is implemented.

**Configuration**

The power domain of CNTID is IMPLEMENTATION DEFINED.

This register is present only when ARMv8.4-CNTSC is implemented. Otherwise, direct accesses to CNTID are RES0.

**Attributes**

CNTID is a 32-bit register.

**Field descriptions**

The CNTID bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>CNTSC</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:4]**

Reserved, RES0.

**CNTSC, bits [3:0]**

Indicates whether Counter Scaling is implemented

<table>
<thead>
<tr>
<th>CNTSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Counter scaling is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Counter scaling is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Accessing the CNTID**

In a system that supports Secure and Non-secure memory maps, the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTID can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x1C</td>
<td>CNTID</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
CNTNSAR, Counter-timer Non-secure Access Register

The CNTNSAR characteristics are:

**Purpose**

Provides the highest-level control of whether frames CNTBaseN and CNTEL0BaseN are accessible by Non-secure accesses.

**Configuration**

The power domain of CNTNSAR is **IMPLEMENTATION DEFINED**. RW fields in this register reset to architecturally **UNKNOWN** values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.

For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Attributes**

CNTNSAR is a 32-bit register.

**Field descriptions**

The CNTNSAR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>30</td>
<td>NS7</td>
</tr>
<tr>
<td>29</td>
<td>NS6</td>
</tr>
<tr>
<td>28</td>
<td>NS5</td>
</tr>
<tr>
<td>27</td>
<td>NS4</td>
</tr>
<tr>
<td>26</td>
<td>NS3</td>
</tr>
<tr>
<td>25</td>
<td>NS2</td>
</tr>
<tr>
<td>24</td>
<td>NS1</td>
</tr>
<tr>
<td>23</td>
<td>NS0</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**NS<n>, bit [n], for n = 0 to 7**

Non-secure access to frame n. The possible values of this bit are:

<table>
<thead>
<tr>
<th>NS&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Secure access only. Behaves as RES0 to Non-secure accesses.</td>
</tr>
<tr>
<td>01</td>
<td>Secure and Non-secure accesses permitted.</td>
</tr>
</tbody>
</table>

This bit also determines whether, in the CNTCTLBase frame, CNTACR<n> and CNTVOFF<n> are accessible to Non-secure accesses.

If frame CNTBase<n>:

- Is not implemented, then NS<n> is RES0.
- Is not Configurable access, and is accessible only by Secure accesses, then NS<n> is RES0.
- Is not Configurable access, and is accessible by both Secure and Non-secure accesses, then NS<n> is RES1.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the CNTNSAR**

In a system that recognizes two Security states, this register is only accessible by Secure accesses.
CNTNSAR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTLBase</td>
<td>0x004</td>
<td>CNTNSAR</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
CNTP_CTL, Counter-timer Physical Timer Control

The CNTP_CTL characteristics are:

**Purpose**

Control register for the EL1 physical timer.

**Configuration**

The power domain of CNTP_CTL is IMPLEMENTATION DEFINED. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.

For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Attributes**

CNTP_CTL is a 32-bit register.

**Field descriptions**

The CNTP_CTL bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see 'Operation of the CompareValue views of the timers' and 'Operation of the TimerValue views of the timers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, chapter D6.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>
For more information, see the description of the ISTATUS bit.

This field resets to an architecturally **UNKNOWN** value.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from **CNTP_TVAL** continues to count down.

---

**Note**

Disabling the output signal might be a power-saving option.

This field resets to an architecturally **UNKNOWN** value.

### Accessing the CNTP_CTL

CNTP_CTL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' in Chapter I1 of the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTP_CTL is accessible in that frame if the value of **CNTACR<n>.RWPT** is 1.
- Otherwise, the CNTP_CTL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_CTL is accessible in that frame if both:
  - CNTP_CTL is accessible in the corresponding CNTBaseN frame:
  - The value of **CNTEL0ACR.EL0PTEN** is 1.
- Otherwise, the CNTP_CTL address in that frame is RAZ/WI.

**CNTP_CTL can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x02C</td>
<td>CNTP_CTL</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x02C</td>
<td>CNTP_CTL</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
The CNTP_CVAL characteristics are:

**Purpose**

Holds the 64-bit compare value for the EL1 physical timer.

**Configuration**

The power domain of CNTP_CVAL is IMPLEMENTATION DEFINED. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.

For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Attributes**

CNTP_CVAL is a 64-bit register.

**Field descriptions**

The CNTP_CVAL bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 
| 
| 
| 
| CompareValue |
| CompareValue |

**CompareValue, bits [63:0]**

Holds the EL1 physical timer CompareValue.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTP_CTL.ISTATUS is set to 1.
- An interrupt is generated if CNTP_CTL.IMASK is 0.

When CNTP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTP_CVAL**

CNTP_CVAL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' in Chapter I1 of the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.
For an implemented CNTBaseN frame:

- CNTP_CVAL is accessible in that frame if the value of `CNTACR<n>_.RWPT` is 1.
- Otherwise, the CNTP_CVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_CVAL is accessible in that frame if both:
  - CNTP_CVAL is accessible in the corresponding CNTBaseN frame:
  - The value of `CNTEL0ACR_EL0PTEN` is 1.
- Otherwise, the CNTP_CVAL address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTP_CVAL register must be accessible as an atomic 64-bit value.

**CNTP_CVAL can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x020</td>

<td>0x024</td>
<td>CNTP_CVAL</td>
<td>63:32</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
CNTP_TVAL, Counter-timer Physical Timer TimerValue

The CNTP_TVAL characteristics are:

**Purpose**

Holds the timer value for the EL1 physical timer.

**Configuration**

The power domain of CNTP_TVAL is **IMPLEMENTATION DEFINED**. RW fields in this register reset to architecturally **UNKNOWN** values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.

For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Attributes**

CNTP_TVAL is a 32-bit register.

**Field descriptions**

The CNTP_TVAL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | TimerValue

**TimerValue, bits [31:0]**

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If CNTP_CTL.ENABLE is 0, the value returned is **UNKNOWN**.
- If CNTP_CTL.ENABLE is 1, the value returned is (CompareValue - CNTPCT).

On a write of this register, CompareValue is set to (CNTPCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTP_CTL.ISTATUS is set to 1.
- If CNTP_CTL.IMASK is 0, an interrupt is generated.

When CNTP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the CNTP_TVAL**

CNTP_TVAL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' in Chapter I1 of the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:
- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTP_TVAL is accessible in that frame if the value of CNTACR<n>.RWPT is 1.
- Otherwise, the CNTP_TVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_TVAL is accessible in that frame if both:
  - CNTP_TVAL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.ELOPTEN is 1.
- Otherwise, the CNTP_TVAL address in that frame is RAZ/WI.

**CNTP_TVAL can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x028</td>
<td>CNTP_TVAL</td>

<td>CNTEL0BaseN</td>
<td>0x028</td>
<td>CNTP_TVAL</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
CNTPCT, Counter-timer Physical Count

The CNTPCT characteristics are:

**Purpose**

Holds the 64-bit physical count value.

**Configuration**

The power domain of CNTPCT is IMPLEMENTATION DEFINED.

For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Attributes**

CNTPCT is a 64-bit register.

**Field descriptions**

The CNTPCT bit assignments are:

<table>
<thead>
<tr>

</tbody>
</table>

**Bits [63:0]**

Physical count value.

**Accessing the CNTPCT**

CNTPCT can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame, as a RO register.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' in Chapter I1 of the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTPCT is accessible in that frame, as a RO register, if the value of CNTACR<n>.RPCT is 1.
- Otherwise, the CNTPCT address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTPCT is accessible in that frame if both:
  - CNTPCT is accessible in the corresponding CNTBaseN frame.
  - The value of CNTEL0ACR.EL0PCTEN is 1.
- Otherwise, the CNTPCT address in that frame is RAZ/WI.
If the implementation supports 64-bit atomic accesses, then the CNTPCT register must be accessible as an atomic 64-bit value.

**CNTPCT can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>

</tbody>
</table>

Accesses on this interface are **RO**.
CNTSCR, Counter Scale Register

The CNTSCR characteristics are:

**Purpose**

Enables the counter, controls the counter frequency setting, and controls counter behavior during debug.

**Configuration**

The power domain of CNTSCR is IMPLEMENTATION DEFINED. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.

This register is present only when ARMv8.4-CNTSC is implemented. Otherwise, direct accesses to CNTSCR are RES0.

For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Attributes**

CNTSCR is a 32-bit register.

**Field descriptions**

The CNTSCR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>ScaleVal</td>
</tr>
</tbody>
</table>

**ScaleVal, bits [31:0]**

Scale Value

When counter scaling is enabled, ScaleVal is the amount added to the counter value for every counter tick.

Counter tick is defined as one period of the current operating frequency of the Generic counter.

ScaleVal is expressed as an unsigned fixed point number with an 8-bit integer value and a 24-bit fractional value.

CNTSCR.ScaleVal can only be changed when CNTCR.EN == 0. If the value of this field is changed when CNTCR.EN == 1:

- The counter value becomes UNKNOWN.
- The counter value remains UNKNOWN on future ticks of the clock.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTSCR**

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

**CNTSCR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x10</td>
<td>CNTSCR</td>
</tr>
</tbody>
</table>
Accesses on this interface are **RW**.
The CNTSR characteristics are:

**Purpose**

Provides counter frequency status information.

**Configuration**

The power domain of CNTSR is IMPLEMENTATION DEFINED. Some or all RW fields of this register have defined reset values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.

For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Attributes**

CNTSR is a 32-bit register.

**Field descriptions**

The CNTSR bit assignments are:

```
   31  30  29  28  27  26  25  24  23  22  21  20  19  18  17  16  15  14  13  12  11  10  9  8  7  6  5  4  3  2  1  0
   FCACK RES0 DBGH RES0
```

**FCACK, bits [31:8]**

Frequency change acknowledge. Indicates the currently selected entry in the Frequency modes table, see 'The Frequency modes table' in Chapter I1 of the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to 0.

**Bits [7:2]**

Reserved, RES0.

**DBGH, bit [1]**

Indicates whether the counter is halted because the Halt-on-debug signal is asserted:

<table>
<thead>
<tr>
<th>DBGH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Counter is not halted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Counter is halted.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**Bit [0]**

Reserved, RES0.
Accessing the CNTSR

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTSR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x004</td>
<td>CNTSR</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
CNTTIDR, Counter-timer Timer ID Register

The CNTTIDR characteristics are:

**Purpose**

Indicates the implemented timers in the memory map, and their features. For each value of N from 0 to 7 it indicates whether:

- Frame CNTBaseN is a view of an implemented timer.
- Frame CNTBaseN has a second view, CNTEL0BaseN.
- Frame CNTBaseN has a virtual timer capability.

**Configuration**

The power domain of CNTTIDR is IMPLEMENTATION DEFINED.

For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Attributes**

CNTTIDR is a 32-bit register.

**Field descriptions**

The CNTTIDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Frame7</td>
</tr>
<tr>
<td>30</td>
<td>Frame6</td>
</tr>
<tr>
<td>29</td>
<td>Frame5</td>
</tr>
<tr>
<td>28</td>
<td>Frame4</td>
</tr>
<tr>
<td>27</td>
<td>Frame3</td>
</tr>
<tr>
<td>26</td>
<td>Frame2</td>
</tr>
<tr>
<td>25</td>
<td>Frame1</td>
</tr>
<tr>
<td>24</td>
<td>Frame0</td>
</tr>
</tbody>
</table>

**Frame<n>, bits [4n+3:4n], for n = 0 to 7**

A 4-bit field indicating the features of frame CNTBase<n>.

Bit[3] of the field is RES0.

Bit[2], the FEL0 subfield, indicates whether frame CNTBase<n> has a second view, CNTEL0Base<n>. The possible values of this bit are:

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Frame&lt;n&gt; does not have a second view. The CNTEL0ACR register in the first view of the frame is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Frame&lt;n&gt; has a second view, CNTEL0Base&lt;n&gt;.</td>
</tr>
</tbody>
</table>

If bit[0] is 0, bit[2] is RES0.

Bit[1], the FVI subfield, indicates whether both:

- Frame CNTBase<n> implements the virtual timer registers CNTV_CVAL, CNTV_TVAL, and CNTV_CTL.
- This CNTCTLBase frame implements the virtual timer offset register CNTVOFF<n>.

The possible values of bit[1] are:

<table>
<thead>
<tr>
<th>Bit[1]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Frame&lt;n&gt; does not have virtual capability. The virtual time and offset registers are RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Frame&lt;n&gt; has virtual capability. The virtual time and offset registers are implemented</td>
</tr>
</tbody>
</table>

If bit[0] is 0, bit[1] is RES0.
Bit[0], the FI subfield, indicates whether frame CNTBase\(<n>\) is implemented. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Bit[0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Frame(&lt;n&gt;) is not implemented. All registers associated with the frame are RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Frame(&lt;n&gt;) is implemented</td>
</tr>
</tbody>
</table>

### Accessing the CNTTIDR

In a system that recognizes two Security states this register is accessible by both Secure and Non-secure accesses.

**CNTTIDR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTLBase</td>
<td>0x008</td>
<td>CNTTIDR</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
The CNTV_CTL characteristics are:

**Purpose**

Control register for the virtual timer.

**Configuration**

The power domain of CNTV_CTL is **IMPLEMENTATION DEFINED**. RW fields in this register reset to architecturally **UNKNOWN** values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.

For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Attributes**

CNTV_CTL is a 32-bit register.

**Field descriptions**

The CNTV_CTL bit assignments are:

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
```

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is **UNKNOWN**.

For more information see 'Operation of the CompareValue views of the timers' and 'Operation of the TimerValue views of the timers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, chapter D6.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>
For more information, see the description of the ISTATUS bit.

This field resets to an architecturally **UNKNOWN** value.

### ENABLE, bit [0]

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from **CNTV_TVAL** continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

This field resets to an architecturally **UNKNOWN** value.

## Accessing the CNTV_CTL

**CNTV_CTL** can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' in Chapter I1 of the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- **CNTV_CTL** is accessible in that frame if the value of **CNTACR<n>**.RWVT is 1.
- Otherwise, the **CNTV_CTL** address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- **CNTV_CTL** is accessible in that frame if both:
  - **CNTV_CTL** is accessible in the corresponding CNTBaseN frame.
  - The value of **CNTEL0ACR**.EL0VTEN is 1.
- Otherwise, the **CNTV_CTL** address in that frame is RAZ/WI.

**CNTV_CTL** can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x03C</td>
<td>CNTV_CTL</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x03C</td>
<td>CNTV_CTL</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
The CNTV_CVAL characteristics are:

**Purpose**

Holds the 64-bit compare value for the virtual timer.

**Configuration**

The power domain of CNTV_CVAL is `IMPLEMENTATION DEFINED`. RW fields in this register reset to architecturally `UNKNOWN` values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.

For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Attributes**

CNTV_CVAL is a 64-bit register.

**Field descriptions**

The CNTV_CVAL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>CompareValue</td>

</tbody>
</table>

**CompareValue, bits [63:0]**

Holds the virtual timer CompareValue.

When `CNTV_CTL`.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- `CNTV_CTL`.ISTATUS is set to 1.
- An interrupt is generated if `CNTV_CTL`.IMASK is 0.

When `CNTV_CTL`.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count.

This field resets to an architecturally `UNKNOWN` value.

**Accessing the CNTV_CVAL**

CNTV_CVAL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' in Chapter I1 of the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.
For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_CVAL is accessible in that frame if the value of CNTACR<n>.RWVT is 1.
- Otherwise, the CNTV_CVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV_CVAL is accessible in that frame if both:
  - CNTV_CVAL is accessible in the corresponding CNTBaseN frame
  - The value of CNTEL0ACR.EL0VTEN is 1.
- Otherwise, the CNTV_CVAL address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTV_CVAL register must be accessible as an atomic 64-bit value.

**CNTV_CVAL can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x030</td>
<td>CNTV_CVAL</td>
<td>31:0</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>

**CNTV_TVAL, Counter-timer Virtual Timer TimerValue**

The CNTV_TVAL characteristics are:

**Purpose**

Holds the timer value for the virtual timer.

**Configuration**

The power domain of CNTV_TVAL is IMPLEMENTATION DEFINED. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.

For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Attributes**

CNTV_TVAL is a 32-bit register.

**Field descriptions**

The CNTV_TVAL bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>

<td></td>
<td></td>
</tr>
</tbody>
</table>

**TimerValue, bits [31:0]**

The TimerValue view of the virtual timer.

On a read of this register:

- If CNTV_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTV_CTL.ENABLE is 1, the value returned is (CompareValue - CNTVCT).

On a write of this register, CompareValue is set to (CNTVCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTV_CTL.ISTATUS is set to 1.
- If CNTV_CTL.IMASK is 0, an interrupt is generated.

When CNTV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTV_TVAL**

CNTV_TVAL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' in Chapter I1 of the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:
• Whether the CNTBaseN frame has virtual timer capability.
• Whether the corresponding CNTEL0BaseN frame is implemented.
• For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

• CNTV_TVAL is accessible in that frame if the value of CNTACR<n>.RWVT is 1.
• Otherwise, the CNTV_TVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

• CNTV_TVAL is accessible in that frame if both:
  ◦ CNTV_TVAL is accessible in the corresponding CNTBaseN frame:
  ◦ The value of CNTEL0ACR.EL0VTEN is 1.
• Otherwise, the CNTV_TVAL address in that frame is RAZ/WI.

**CNTV_TVAL can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x038</td>

</tr>
</tbody>
</table>

Accesses on this interface are RW.
CNTVCT, Counter-timer Virtual Count

The CNTVCT characteristics are:

**Purpose**

Holds the 64-bit virtual count value.

**Configuration**

The power domain of CNTVCT is IMPLEMENTATION DEFINED.

For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Attributes**

CNTVCT is a 64-bit register.

**Field descriptions**

The CNTVCT bit assignments are:

<table>

</thead>
</table>

**Bits [63:0]**

Virtual count value.

**Accessing the CNTVCT**

CNTVCT can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame, as a RO register.

'CNTCTRL status and control fields for the CNTBaseN and CNTEL0BaseN frames' in Chapter I1 of the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTVCT is accessible in that frame, as a RO register, if the value of CNTACR\textless n\textgreater .RVCT is 1.
- Otherwise, the CNTVCT address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTVCT is accessible in that frame if both:
  - CNTVCT is accessible in the corresponding CNTBaseN frame.
  - The value of CNTEL0ACR.ELOVCTEN is 1.
- Otherwise, the CNTVCT address in that frame is RAZ/WI.
If the implementation supports 64-bit atomic accesses, then the CNTVCT register must be accessible as an atomic 64-bit value.

**CNTVCT can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>

<td>CNTVCT</td>
<td>63:32</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
The CNTVOFF characteristics are:

**Purpose**

Holds the 64-bit virtual offset for a CNTBaseN frame that has virtual timer capability. This is the offset between real time and virtual time.

**Configuration**

The power domain of CNTVOFF is IMPLEMENTATION DEFINED.

On a reset of the reset domain in which an RW instance of this register is implemented, RW fields in the register reset to UNKNOWN values. The register is not affected by a reset of any other reset domain. For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in Chapter I1 of the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Attributes**

CNTVOFF is a 64-bit register.

**Field descriptions**

The CNTVOFF bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | Virtual offset |
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | Virtual offset |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |

**Bits [63:0]**

Virtual offset.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTVOFF**

CNTVOFF is implemented, as a RO register, in any implemented CNTBaseN frame that has virtual timer capability.

'CNTCTRLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' in Chapter I1 of the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTVOFF is accessible in that frame, as a RO register, if the value of CNTACR<n>.RVOFF is 1.
- Otherwise, the CNTVOFF address in that frame is RAZ/WI.

**Note**
CNTVOFF is never visible in any CNTEL0BaseN frame. This means that the CNTVOFF address in any implemented CNTEL0BaseN frame is RAZ/WI.

In an implementation that supports 64-bit atomic accesses, a CNTVOFF{<n>} register must be accessible as an atomic 64-bit value.

**CNTVOFF can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x018</td>
<td>31:0</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x01C</td>
<td>63:32</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
The CNTVOFF<\text{n}> characteristics are:

**Purpose**

Holds the 64-bit virtual offset for frame CNTBase<\text{n}>. This is the offset between real time and virtual time.

**Configuration**

The power domain of CNTVOFF<\text{n}> is **IMPLEMENTATION DEFINED**.

On a reset of the reset domain in which an RW instance of this register is implemented, RW fields in the register reset to **UNKNOWN** values. The register is not affected by a reset of any other reset domain. For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in Chapter I1 of the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Attributes**

CNTVOFF<\text{n}> is a 64-bit register.

**Field descriptions**

The CNTVOFF<\text{n}> bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Virtual offset</td>
</tr>
<tr>
<td>62</td>
<td>Virtual offset</td>
</tr>
<tr>
<td>31</td>
<td>Virtual offset</td>
</tr>
<tr>
<td>30</td>
<td>Virtual offset</td>
</tr>
<tr>
<td>0</td>
<td>Virtual offset</td>
</tr>
</tbody>
</table>

**Bits [63:0]**

Virtual offset.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the CNTVOFF<\text{n}>**

In the CNTCTLBBase frame a CNTVOFF<\text{n}> register must be implemented, as a RW register, for each CNTBaseN frame that has virtual timer capability.

---

**Note**

The value of <\text{n}> in an instance of CNTVOFF<\text{n}> specifies the value of N for the associated CNTBaseN frame.

---

In a system that recognizes two Security states, for any CNTVOFF<\text{n}> register in the CNTCTLBBase frame:

- CNTVOFF<\text{n}> is always accessible by Secure accesses.
- CNTNSAR.NS<\text{n}> determines whether CNTVOFF<\text{n}> is accessible by Non-secure accesses.

The register location of any unimplemented CNTVOFF<\text{n}> register in the CNTCTLBBase frame is RAZ/WI.

The CNTVOFF<\text{n}> register is accessible in the CNTBaseN frame using CNTVOFF.

In an implementation that supports 64-bit atomic accesses, then the CNTVOFF<\text{n}> registers must be accessible as atomic 64-bit values.
CNTVOFF<n> can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTLBase</td>
<td>0x080 + 8n</td>
<td>31:0</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTLBase</td>
<td>0x084 + 8n</td>
<td>63:32</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
CounterID<n>, Counter ID registers, n = 0 - 11

The CounterID<n> characteristics are:

**Purpose**

IMPLEMENTATION DEFINED identification registers 0 to 11 for the memory-mapped Generic Timer.

**Configuration**

The power domain of CounterID<n> is IMPLEMENTATION DEFINED.

For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

These registers are implemented independently in each of the implemented Generic Timer memory-mapped frames.

If the implementation of the Counter ID registers requires an architecture version, the value for this version of the Arm Generic Timer is version 0.

The Counter ID registers can be implemented as a set of CoreSight ID registers, comprising Peripheral ID Registers and Component ID Registers. An implementation of these registers for the Generic Timer must use a Component class value of 0xF.

**Attributes**

CounterID<n> is a 32-bit register.

**Field descriptions**

The CounterID<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

**Accessing the CounterID<n>**

These registers must be implemented, as RO registers, in every implemented Generic Timer memory-mapped frame.

For the CNTCTLBase frame, in a system that recognizes two Security states these registers are accessible by both Secure and Non-secure accesses.

For the CNTControlBase frame, in a system that supports Secure and Non-secure memory maps the frame is implemented only in the Secure memory map, meaning these registers are implemented only in the Secure memory map.

For the CNTBaseN frames, 'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' in Chapter I1 of the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile describes the status fields that identify whether a frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.
CounterID<\text{n}> can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>$0xFD0 + 4n$</td>
<td>CounterID&lt;\text{n}&gt;</td>

</tbody>
</table>
The CTIAPPCLEAR characteristics are:

**Purpose**

Clears bits of the Application Trigger register.

**Configuration**

CTIAPPCLEAR is in the Debug power domain.

**Attributes**

CTIAPPCLEAR is a 32-bit register.

### Field descriptions

The CTIAPPCLEAR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**APPCLEAR<x>, bit [x]**

Application trigger <x> disable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field. Writing to this bit has the following effect:

<table>
<thead>
<tr>
<th>APPCLEAR&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>Clear corresponding bit in CTIAPPTRIG to 0 and clear the corresponding channel event.</td>
</tr>
</tbody>
</table>

If the ECT does not support multicycle channel events, use of CTIAPPCLEAR is deprecated and the debugger must only use CTIAPPULSE.

### Accessing the CTIAPPCLEAR

CTIAPPCLEAR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x018</td>
<td>CTIAPPCLEAR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **WI**.
- When !SoftwareLockStatus() accesses to this register are **WO**.
CTIAPPULSE, CTI Application Pulse register

The CTIAPPULSE characteristics are:

**Purpose**

Causes event pulses to be generated on ECT channels.

**Configuration**

CTIAPPULSE is in the Debug power domain.

**Attributes**

CTIAPPULSE is a 32-bit register.

**Field descriptions**

The CTIAPPULSE bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>APPULSE&lt;31&gt;, no effect.</td>
</tr>
<tr>
<td>30</td>
<td>APPULSE&lt;30&gt;, channel 0 event pulse generated.</td>
</tr>
<tr>
<td>29</td>
<td>APPULSE&lt;29&gt;, channel 1 event pulse generated.</td>
</tr>
<tr>
<td>28</td>
<td>APPULSE&lt;28&gt;, channel 2 event pulse generated.</td>
</tr>
<tr>
<td>27</td>
<td>APPULSE&lt;27&gt;, channel 3 event pulse generated.</td>
</tr>
<tr>
<td>...</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td>APPULSE&lt;0&gt;, channel N event pulse generated.</td>
</tr>
</tbody>
</table>

Writing to this bit has the following effect:

<table>
<thead>
<tr>
<th>APPULSE&lt;31:0&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>No effect.</td>
</tr>
<tr>
<td>01</td>
<td>Channel &lt;x&gt; event pulse generated.</td>
</tr>
</tbody>
</table>

**Note**

- The CTIAPPULSE operation does not affect the state of the Application Trigger register, CTIAPPTRIG. If the channel is active, either because of an earlier event or from the application trigger, then the value written to CTIAPPULSE might have no effect.
- Multiple pulse events that occur close together might be merged into a single pulse event.

**Accessing the CTIAPPULSE**

It is CONSTRAINED UNPREDICTABLE whether a write to CTIAPPULSE generates an event on a channel if CTICONTROL.GLBEN is 0.

CTIAPPULSE can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x01C</td>
<td>CTIAPPULSE</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are WI.
- When !SoftwareLockStatus() accesses to this register are WO.
CTIAPPSET, CTI Application Trigger Set register

The CTIAPPSET characteristics are:

**Purpose**
Sets bits of the Application Trigger register.

**Configuration**
CTIAPPSET is in the Debug power domain. RW fields in this register reset to architecturally **UNKNOWN** values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.

**Attributes**
CTIAPPSET is a 32-bit register.

**Field descriptions**
The CTIAPPSET bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>APPSET&lt;x&gt;, bit [x]</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**APPSET<x>, bit [x], for x = 0 to 31**
Application trigger <x> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the **CTIDEVID.NUMCHAN** field.

Possible values of this bit are:

<table>
<thead>
<tr>
<th>APPSET&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Reading this means the application trigger is inactive. Writing this has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reading this means the application trigger is active. Writing this sets the corresponding bit in CTIAPTPTRIG to 1 and generates a channel event.</td>
</tr>
</tbody>
</table>

If the ECT does not support multicycle channel events, use of CTIAPPSET is deprecated and the debugger must only use **CTIAPPULSE**.

On a External debug reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the CTIAPPSET**

**CTIAPPSET can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x014</td>
<td>CTIAPPSET</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `SoftwareLockStatus()` accesses to this register are **RO**.
- When `!SoftwareLockStatus()` accesses to this register are **RW**.
CTIAUTHSTATUS, CTI Authentication Status register

The CTIAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for CTI.

Configuration

CTIAUTHSTATUS is in the Debug power domain.

This register is OPTIONAL, and is required for CoreSight compliance.

Attributes

CTIAUTHSTATUS is a 32-bit register.

Field descriptions

The CTIAUTHSTATUS bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>RAZ</td>
</tr>

<td>Reserved</td>
</tr>
</tbody>
</table>

Bits [31:8]

Reserved, RES0.

Bits [7:4]

Reserved, RAZ.

NSNID, bits [3:2]

If EL3 is not implemented and the implemented Security state is Secure state, holds the same value as DBGAUTHSTATUS_EL1.SNID.

Otherwise, holds the same value as DBGAUTHSTATUS_EL1.NSNID.

NSID, bits [1:0]

If EL3 is not implemented and the implemented Security state is Secure state, holds the same value as DBGAUTHSTATUS_EL1.SID.

Otherwise, holds the same value as DBGAUTHSTATUS_EL1.NSID.

Accessing the CTIAUTHSTATUS

CTIAUTHSTATUS can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFB8</td>
<td>CTIAUTHSTATUS</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
CTICHINSTATUS, CTI Channel In Status register

The CTICHINSTATUS characteristics are:

Purpose

Provides the raw status of the ECT channel inputs to the CTI.

Configuration

CTICHINSTATUS is in the Debug power domain.

Attributes

CTICHINSTATUS is a 32-bit register.

Field descriptions

The CTICHINSTATUS bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHIN&lt;n&gt;, bit [n]</td>
<td>Input channel &lt;n&gt; status.</td>
</tr>
</tbody>
</table>

Bits [31:N] are RAZ. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Possible values of this bit are:

<table>
<thead>
<tr>
<th>CHIN&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Input channel &lt;n&gt; is inactive.</td>
</tr>
<tr>
<td>0b1</td>
<td>Input channel &lt;n&gt; is active.</td>
</tr>
</tbody>
</table>

If the ECT channels do not support multicycle events then it is IMPLEMENTATION DEFINED whether an input channel can be observed as active.

Accessing the CTICHINSTATUS

CTICHINSTATUS can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x138</td>
<td>CTICHINSTATUS</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
The CTICHOUTSTATUS characteristics are:

**Purpose**

Provides the status of the ECT channel outputs from the CTI.

**Configuration**

CTICHOUTSTATUS is in the Debug power domain.

**Attributes**

CTICHOUTSTATUS is a 32-bit register.

**Field descriptions**

The CTICHOUTSTATUS bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>CHOUT&lt;n&gt;, bit [n]</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>CHOUT&lt;n&gt;, bit [n] for n = 0 to 31</td>
</tr>
</tbody>
</table>

Output channel <n> status.

Bits [31:N] are RAZ. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Possible values of this bit are:

<table>
<thead>
<tr>
<th>CHOUT&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Output channel &lt;n&gt; is inactive.</td>
</tr>
<tr>
<td>0b1</td>
<td>Output channel &lt;n&gt; is active.</td>
</tr>
</tbody>
</table>

If the ECT channels do not support multicycle events then it is IMPLEMENTATION DEFINED whether an output channel can be observed as active.

**Note**

The value in CTICHOUTSTATUS is after gating by the channel gate. For more information, see CTIGATE.

**Accessing the CTICHOUTSTATUS**

CTICHOUTSTATUS can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x13C</td>
<td>CTICHOUTSTATUS</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
CTICIDR0, CTI Component Identification Register 0

The CTICIDR0 characteristics are:

**Purpose**

Provides information to identify a CTI component.

For more information see 'About the Component identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

**Configuration**

CTICIDR0 is in the Debug power domain.

Implementation of this register is **OPTIONAL**.

This register is required for CoreSight compliance.

**Attributes**

CTICIDR0 is a 32-bit register.

**Field descriptions**

The CTICIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>27-8</td>
<td>PRMBL_0</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_0, bits [7:0]**

Preamble. Must read as 0x0D.

**Accessing the CTICIDR0**

CTICIDR0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFFF0</td>
<td>CTICIDR0</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
CTICIDR1, CTI Component Identification Register 1

The CTICIDR1 characteristics are:

**Purpose**

Provides information to identify a CTI component.

For more information see 'About the Component identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

**Configuration**

CTICIDR1 is in the Debug power domain.

Implementation of this register is **OPTIONAL**.

This register is required for CoreSight compliance.

**Attributes**

CTICIDR1 is a 32-bit register.

**Field descriptions**

The CTICIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:8</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>7:4</td>
<td>Component class. Reads as 0x9, debug component.</td>
</tr>
<tr>
<td>3:0</td>
<td>Preamble. RAZ.</td>
</tr>
</tbody>
</table>

**Accessing the CTICIDR1**

**CTICIDR1 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFF4</td>
<td>CTICIDR1</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
The CTICIDR2 characteristics are:

**Purpose**

Provides information to identify a CTI component.

For more information see 'About the Component identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

**Configuration**

CTICIDR2 is in the Debug power domain.

Implementation of this register is Optional.

This register is required for CoreSight compliance.

**Attributes**

CTICIDR2 is a 32-bit register.

**Field descriptions**

The CTICIDR2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>7-0</td>
<td>Preamble (PRMBL_2)</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_2, bits [7:0]**

Preamble. Must read as 0x05.

**Accessing the CTICIDR2**

CTICIDR2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFF8</td>
<td>CTICIDR2</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
The CTICIDR3 characteristics are:

**Purpose**

Provides information to identify a CTI component.

For more information see 'About the Component identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

**Configuration**

CTICIDR3 is in the Debug power domain.

Implementation of this register is **OPTIONAL**.

This register is required for CoreSight compliance.

**Attributes**

CTICIDR3 is a 32-bit register.

**Field descriptions**

The CTICIDR3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>PRMBL_3</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_3, bits [7:0]**

Preamble. Must read as 0xB1.

**Accessing the CTICIDR3**

**CTICIDR3 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFFC</td>
<td>CTICIDR3</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
CTICLAIMCLR, CTI CLAIM Tag Clear register

The CTICLAIMCLR characteristics are:

**Purpose**

Used by software to read the values of the CLAIM bits, and to clear CLAIM tag bits to 0.

**Configuration**

CTICLAIMCLR is in the Debug power domain. Some or all RW fields of this register have defined reset values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.

Implementation of this register is **OPTIONAL**.

**Attributes**

CTICLAIMCLR is a 32-bit register.

**Field descriptions**

The CTICLAIMCLR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | CLAIM[<x>], bit [x] |

**CLAIM[<x>], bit [x], for x = 0 to 31**

CLAIM tag clear bit.

For values of x greater than or equal to the IMPLEMENTATION DEFINED number of CLAIM tags, this bit is RAZ/SBZ. Software can rely on these bits reading as zero, and must use a Should-Be-Zero policy on writes. Implementations must ignore writes.

For other values of x, reads return the value of CLAIM[<x>] and the behavior on writes is:

<table>
<thead>
<tr>
<th>CLAIM[&lt;x&gt;]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Indirectly clear CLAIM[&lt;x&gt;] to 0.</td>
</tr>
</tbody>
</table>

A single write to CTICLAIMCLR can clear multiple tags to 0.

An External Debug reset clears the CLAIM tag bits to 0.

**Accessing the CTICLAIMCLR**

**CTICLAIMCLR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFA4</td>
<td>CTICLAIMCLR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.
CTICLAIMSET, CTI CLAIM Tag Set register

The CTICLAIMSET characteristics are:

**Purpose**

Used by software to set CLAIM bits to 1.

**Configuration**

CTICLAIMSET is in the Debug power domain. Some or all RW fields of this register have defined reset values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.

Implementation of this register is **OPTIONAL**.

**Attributes**

CTICLAIMSET is a 32-bit register.

**Field descriptions**

The CTICLAIMSET bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>CLAIM[x] Bit Assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 - 0</td>
<td>CLAIM[x], for x = 0 to 31</td>
</tr>
</tbody>
</table>

CLAIM[x], bit [x], for x = 0 to 31

CLAIM tag set bit.

For values of x greater than or equal to the **IMPLEMENTATION DEFINED** number of CLAIM tags, this bit is RAZ/SBZ. Software can rely on these bits reading as zero, and must use a Should-Be-Zero policy on writes. Implementations must ignore writes.

For other values of x, the bit is RAO and the behavior on writes is:

<table>
<thead>
<tr>
<th>CLAIM[x]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Indirectly set CLAIM[x] tag to 1.</td>
</tr>
</tbody>
</table>

A single write to CTICLAIMSET can set multiple tags to 1.

An External Debug reset clears the CLAIM tag bits to 0.

**Accessing the CTICLAIMSET**

CTICLAIMSET can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFA0</td>
<td>CTICLAIMSET</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.
The CTICONTROL characteristics are:

**Purpose**

Controls whether the CTI is enabled.

**Configuration**

CTICONTROL is in the Debug power domain. Some or all RW fields of this register have defined reset values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.

**Attributes**

CTICONTROL is a 32-bit register.

**Field descriptions**

The CTICONTROL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>30</td>
<td>GLBEN (bit 0) Enables or disables the CTI mapping functions. Possible values of this field are:</td>
</tr>
<tr>
<td>29</td>
<td>0b0: CTI mapping functions and application trigger disabled.</td>
</tr>
<tr>
<td>28</td>
<td>0b1: CTI mapping functions and application trigger enabled.</td>
</tr>
</tbody>
</table>

When GLBEN is 0, the input channel to output trigger, input trigger to output channel, and application trigger functions are disabled and do not signal new events on either output triggers or output channels. If a previously asserted output trigger has not been acknowledged, it remains asserted after the mapping functions are disabled. All output triggers are disabled by CTI reset.

If the ECT supports multicycle channel events any existing output channel events will be terminated.

On an External debug reset, this field resets to 0.

**Accessing the CTICONTROL**

CTICONTROL can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x000</td>
<td>CTICONTROL</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are RO.
- When !SoftwareLockStatus() accesses to this register are RW.
CTIDEVAFF0, CTI Device Affinity register 0

The CTIDEVAFF0 characteristics are:

**Purpose**

Copy of the low half of the PE **MPIDR_EL1** register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

In an Armv8.5 compliant implementation the CTI must be CTIv2.

If this register is implemented, then **CTIDEVAFF1** must also be implemented. If the CTI of a PE does not implement the CTI Device Affinity registers, the CTI block of the external debug memory map must be located 64KB above the debug registers in the external debug interface.

**Configuration**

CTIDEVAFF0 is in the Debug power domain.

Implementation of this register is OPTIONAL.

**Attributes**

CTIDEVAFF0 is a 32-bit register.

**Field descriptions**

The CTIDEVAFF0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**MPIDR_EL1 low half, bits [31:0]**

**MPIDR_EL1** low half. Read-only copy of the low half of **MPIDR_EL1**, as seen from the highest implemented Exception level.

**Accessing the CTIDEVAFF0**

**CTIDEVAFF0 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFA8</td>
<td>CTIDEVAFF0</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
CTIDEVAFF1, CTI Device Affinity register 1

The CTIDEVAFF1 characteristics are:

**Purpose**

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

If the CTI is CTIv1, this register is **OPTIONAL**. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

In an Armv8.5 compliant implementation the CTI must be CTIv2.

If this register is implemented, then CTIDEVAFF0 must also be implemented. If the CTI of a PE does not implement the CTI Device Affinity registers, the CTI block of the external debug memory map must be located 64KB above the debug registers in the external debug interface.

**Configuration**

CTIDEVAFF1 is in the Debug power domain.

Implementation of this register is **OPTIONAL**.

**Attributes**

CTIDEVAFF1 is a 32-bit register.

**Field descriptions**

The CTIDEVAFF1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**MPIDR_EL1 high half, bits [31:0]**

**MPIDR_EL1** high half. Read-only copy of the high half of **MPIDR_EL1**, as seen from the highest implemented Exception level.

**Accessing the CTIDEVAFF1**

**CTIDEVAFF1 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFAC</td>
<td>CTIDEVAFF1</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
The CTIDEVARCH characteristics are:

**Purpose**

Identifies the programmers' model architecture of the CTI component.

If the CTI is CTIv1, this register is *optional*. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

In an Armv8.5 compliant implementation the CTI must be CTIv2.

If this register is not implemented, CTIDEVAFF0 and CTIDEVAFF1 are also not implemented.

**Configuration**

CTIDEVARCH is in the Debug power domain.

Implementation of this register is *optional*.

**Attributes**

CTIDEVARCH is a 32-bit register.

**Field descriptions**

The CTIDEVARCH bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>ARCHITECT</td>
<td>Defines the architecture of the component. For CTI, this is Arm Limited.</td>
<td></td>
</tr>
<tr>
<td>PRESENT</td>
<td>When set to 1, indicates that the DEVARCH is present.</td>
<td></td>
</tr>
<tr>
<td>REVISION</td>
<td>Revision.</td>
<td></td>
</tr>
<tr>
<td>ARCHID</td>
<td>Defines the architecture revision of the component.</td>
<td></td>
</tr>
</tbody>
</table>

**ARCHITECT, bits [31:21]**

Defines the architecture of the component. For CTI, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

**PRESEN T, bit [20]**

When set to 1, indicates that the DEVARCH is present.

This field is 1 in Armv8.

**REVISION, bits [19:16]**

Revision.

Defines the architecture revision of the component.

<table>
<thead>
<tr>
<th>REVISION</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>First revision.</td>
<td></td>
</tr>
<tr>
<td>0b0001</td>
<td>As 0b0000, and also adds support for CTIDEVCTL, When ARMv8.3-DoPD is implemented</td>
<td></td>
</tr>
</tbody>
</table>

All other values are reserved.
ARCHID, bits [15:0]

Defines this part to be an Armv8 debug component. For architectures defined by Arm this is further subdivided.

For CTI:

- Bits [15:12] are the architecture version, 0x1.
- Bits [11:0] are the architecture part number, 0xA14.

This corresponds to CTI architecture version CTIv2.

Accessing the CTIDEVARCH

CTIDEVARCH can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFBC</td>
<td>CTIDEVARCH</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
CTIDEVCTL, CTI Device Control register

The CTIDEVCTL characteristics are:

**Purpose**

Provides target-specific device controls

**Configuration**

CTIDEVCTL is in the Debug power domain. Some or all RW fields of this register have defined reset values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.

This register is present only when ARMv8.3-DoPD is implemented. Otherwise, direct accesses to CTIDEVCTL are RES0.

**Attributes**

CTIDEVCTL is a 32-bit register.

**Field descriptions**

The CTIDEVCTL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td></td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>30</td>
<td>RCE</td>
<td>Reset Catch Enable.</td>
</tr>
<tr>
<td>29</td>

</tr>
</tbody>
</table>

**Bits [31:2]**

Reserved, RES0.

**RCE, bit [1]**

Reset Catch Enable.

<table>
<thead>
<tr>
<th>RCE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Reset Catch debug event disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reset Catch debug event enabled.</td>
</tr>
</tbody>
</table>

On a External debug reset, this field resets to 0.

**OSUCE, bit [0]**

OS Unlock Catch Enable

<table>
<thead>
<tr>
<th>OSUCE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>OS Unlock Catch debug event disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>OS Unlock Catch debug event enabled.</td>
</tr>
</tbody>
</table>

On a External debug reset, this field resets to 0.

**Accessing the CTIDEVCTL**

CTIDEVCTL can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
</table>

Page 3318
This interface is accessible as follows:

- When `SoftwareLockStatus()` accesses to this register are **RO**.
- When `!SoftwareLockStatus()` accesses to this register are **RW**.
CTIDEVID, CTI Device ID register 0

The CTIDEVID characteristics are:

**Purpose**

Describes the CTI component to the debugger.

**Configuration**

CTIDEVID is in the Debug power domain.

**Attributes**

CTIDEVID is a 32-bit register.

**Field descriptions**

The CTIDEVID bit assignments are:

<table>
<thead>
<tr>
<th>Bit assignments</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0 INOUT RES0 NUMCHAN RES0 NUMTRIG RES0 EXTMUXNUM</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

**Bits [31:26]**

Reserved, RES0.

**INOUT, bits [25:24]**

Input/output options. Indicates presence of the input gate. If the CTM is not implemented or CTIv2 is not implemented, this field is RAZ.

<table>
<thead>
<tr>
<th>INOUT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td><strong>CTIGATE</strong> does not mask propagation of input events from external channels.</td>
</tr>
<tr>
<td>0b01</td>
<td><strong>CTIGATE</strong> masks propagation of input events from external channels.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Bits [23:22]**

Reserved, RES0.

**NUMCHAN, bits [21:16]**

Number of ECT channels implemented. IMPLEMENTATION DEFINED. For Armv8, valid values are:

<table>
<thead>
<tr>
<th>NUMCHAN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000011</td>
<td>3 channels (0..2) implemented.</td>
</tr>
<tr>
<td>0b000100</td>
<td>4 channels (0..3) implemented.</td>
</tr>
<tr>
<td>0b000101</td>
<td>5 channels (0..4) implemented.</td>
</tr>
<tr>
<td>0b000110</td>
<td>6 channels (0..5) implemented.</td>
</tr>
</tbody>
</table>

and so on up to 0b100000, 32 channels (0..31) implemented.

All other values are reserved.
Bits [15:14]

Reserved, RES0.

NUMTRIG, bits [13:8]

Number of triggers implemented. IMPLEMENTATION DEFINED. This is one more than the index of the largest trigger, rather than the actual number of triggers.

For Armv8, valid values are:

<table>
<thead>
<tr>
<th>NUMTRIG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000011</td>
<td>Up to 3 triggers (0..2) implemented.</td>
</tr>
<tr>
<td>0b001000</td>
<td>Up to 8 triggers (0..7) implemented.</td>
</tr>
<tr>
<td>0b001001</td>
<td>Up to 9 triggers (0..8) implemented.</td>
</tr>
<tr>
<td>0b001010</td>
<td>Up to 10 triggers (0..9) implemented.</td>
</tr>
</tbody>
</table>

and so on up to 0b100000, 32 triggers (0..31) implemented.

All other values are reserved. If the PE contains a Trace extension, this field must be at least 0b001000. There is no guarantee that any of the implemented triggers, including the highest numbered, are connected to any components.

Bits [7:5]

Reserved, RES0.

EXTMUXNUM, bits [4:0]

Number of multiplexors available on triggers. This value is used in conjunction with External Control register, ASICCTL.

Accessing the CTIDEVID

CTIDEVID can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFC8</td>
<td>CTIDEVID</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
CTIDEVID1, CTI Device ID register 1

The CTIDEVID1 characteristics are:

**Purpose**

Reserved for future information about the CTI component to the debugger.

**Configuration**

CTIDEVID1 is in the Debug power domain.

**Attributes**

CTIDEVID1 is a 32-bit register.

**Field descriptions**

The CTIDEVID1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>Reserved</td>
<td>RES0</td>
</tr>
</tbody>
</table>

**Accessing the CTIDEVID1**

CTIDEVID1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFC4</td>
<td>CTIDEVID1</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
The CTIDEVID2 characteristics are:

**Purpose**

Reserved for future information about the CTI component to the debugger.

**Configuration**

CTIDEVID2 is in the Debug power domain.

**Attributes**

CTIDEVID2 is a 32-bit register.

**Field descriptions**

The CTIDEVID2 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Reserved, RES0.

**Accessing the CTIDEVID2**

CTIDEVID2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFC0</td>
<td>CTIDEVID2</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
CTIDEVTYPE, CTI Device Type register

The CTIDEVTYPE characteristics are:

**Purpose**

Indicates to a debugger that this component is part of a PEs cross-trigger interface.

**Configuration**

CTIDEVTYPE is in the Debug power domain.

Implementation of this register is **OPTIONAL**.

**Attributes**

CTIDEVTYPE is a 32-bit register.

**Field descriptions**

The CTIDEVTYPE bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | SUB | MAJOR |

**Bits [31:8]**

Reserved, RES0.

**SUB, bits [7:4]**

Subtype. Must read as 0x1 to indicate this is a component within a PE.

**MAJOR, bits [3:0]**

Major type. Must read as 0x4 to indicate this is a cross-trigger component.

**Accessing the CTIDEVTYPE**

CTIDEVTYPE can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFCC</td>
<td>CTIDEVTYPE</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.

Copyright © 2010-2019 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.
CTIGATE, CTI Channel Gate Enable register

The CTIGATE characteristics are:

**Purpose**

Determines whether events on channels propagate through the CTM to other ECT components, or from the CTM into the CTI.

**Configuration**

CTIGATE is in the Debug power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.

**Attributes**

CTIGATE is a 32-bit register.

**Field descriptions**

The CTIGATE bit assignments are:

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
```

<table>
<thead>
<tr>
<th>GATE&lt;x&gt;, bit [x]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel &lt;x&gt; gate enable.</td>
</tr>
</tbody>
</table>

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Possible values of this bit are:

<table>
<thead>
<tr>
<th>GATE&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disable output and, if CTIDEVID.INOUT == 0b01, input channel &lt;x&gt; propagation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Enable output and, if CTIDEVID.INOUT == 0b01, input channel &lt;x&gt; propagation.</td>
</tr>
</tbody>
</table>

If GATE[x] is set to 0, no new events will be propagated to the ECT, and if the ECT supports multicycle channel events any existing output channel events will be terminated.

On a External debug reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CTIGATE**

**CTIGATE can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x140</td>
<td>CTIGATE</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.
The CTIINEN<n> characteristics are:

**Purpose**

Enables the signaling of an event on output channels when input trigger event n is received by the CTI.

**Configuration**

CTIINEN<n> is in the Debug power domain. RW fields in this register reset to architecturally **UNKNOWN** values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.

If input trigger n is not connected, the behavior of CTIINEN<n> is **IMPLEMENTATION DEFINED**.

**Attributes**

CTIINEN<n> is a 32-bit register.

**Field descriptions**

The CTIINEN<n> bit assignments are:

<table>
<thead>
<tr>
<th>INEN&lt;x&gt;, bit [x]</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
</tr>
</tbody>
</table>

**INEN<x>, bit [x], for x = 0 to 31**

Input trigger <n> to output channel <x> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Possible values of this bit are:

<table>
<thead>
<tr>
<th>INEN&lt;x&gt;</th>
<th>Meaning</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Input trigger &lt;n&gt; will not generate an event on output channel &lt;x&gt;.</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>Input trigger &lt;n&gt; will generate an event on output channel &lt;x&gt;.</td>
<td></td>
</tr>
</tbody>
</table>

On a External debug reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the CTIINEN<n>**

CTIINEN<n> can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x020 + 4n</td>
<td>CTIINEN&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.
CTIINTACK, CTI Output Trigger Acknowledge register

The CTIINTACK characteristics are:

**Purpose**

Can be used to deactivate the output triggers.

**Configuration**

CTIINTACK is in the Debug power domain.

**Attributes**

CTIINTACK is a 32-bit register.

**Field descriptions**

The CTIINTACK bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>ACK&lt;31&gt;</td>
</tr>
<tr>
<td>30</td>
<td>ACK&lt;30&gt;</td>
</tr>
<tr>
<td>29</td>
<td>ACK&lt;29&gt;</td>
</tr>
<tr>
<td>28</td>
<td>ACK&lt;28&gt;</td>
</tr>
<tr>
<td>27</td>
<td>ACK&lt;27&gt;</td>
</tr>
<tr>
<td>26</td>
<td>ACK&lt;26&gt;</td>
</tr>
<tr>
<td>25</td>
<td>ACK&lt;25&gt;</td>
</tr>
<tr>
<td>24</td>
<td>ACK&lt;24&gt;</td>
</tr>
<tr>
<td>23</td>
<td>ACK&lt;23&gt;</td>
</tr>
<tr>
<td>22</td>
<td>ACK&lt;22&gt;</td>
</tr>
<tr>
<td>21</td>
<td>ACK&lt;21&gt;</td>
</tr>
<tr>
<td>20</td>
<td>ACK&lt;20&gt;</td>
</tr>
<tr>
<td>19</td>
<td>ACK&lt;19&gt;</td>
</tr>
<tr>
<td>18</td>
<td>ACK&lt;18&gt;</td>
</tr>
<tr>
<td>17</td>
<td>ACK&lt;17&gt;</td>
</tr>
<tr>
<td>16</td>
<td>ACK&lt;16&gt;</td>
</tr>
<tr>
<td>15</td>
<td>ACK&lt;15&gt;</td>
</tr>
<tr>
<td>14</td>
<td>ACK&lt;14&gt;</td>
</tr>
<tr>
<td>13</td>
<td>ACK&lt;13&gt;</td>
</tr>
<tr>
<td>12</td>
<td>ACK&lt;12&gt;</td>
</tr>
<tr>
<td>11</td>
<td>ACK&lt;11&gt;</td>
</tr>
<tr>
<td>10</td>
<td>ACK&lt;10&gt;</td>
</tr>
<tr>
<td>9</td>
<td>ACK&lt;9&gt;</td>
</tr>
<tr>
<td>8</td>
<td>ACK&lt;8&gt;</td>
</tr>
<tr>
<td>7</td>
<td>ACK&lt;7&gt;</td>
</tr>
<tr>
<td>6</td>
<td>ACK&lt;6&gt;</td>
</tr>
<tr>
<td>5</td>
<td>ACK&lt;5&gt;</td>
</tr>
<tr>
<td>4</td>
<td>ACK&lt;4&gt;</td>
</tr>
<tr>
<td>3</td>
<td>ACK&lt;3&gt;</td>
</tr>
<tr>
<td>2</td>
<td>ACK&lt;2&gt;</td>
</tr>
<tr>
<td>1</td>
<td>ACK&lt;1&gt;</td>
</tr>
<tr>
<td>0</td>
<td>ACK&lt;0&gt;</td>
</tr>
</tbody>
</table>

**ACK<n>, bit [n], for n = 0 to 31**

Acknowledge for output trigger <n>.

Bits [31:N] are RAZ/WI. N is the number of CTI triggers implemented as defined by the CTIDEVID NUMTRIG field.

If any of the following is true, writes to ACK<n> are ignored:

- n >= CTIDEVID NUMTRIG, the number of implemented triggers.
- Output trigger n is not active.
- The channel mapping function output, as controlled by CTIOUTEN<n>, is still active.

Otherwise, if any of the following are true, it is IMPLEMENTATION DEFINED whether writes to ACK<n> are ignored:

- Output trigger n is not implemented.
- Output trigger n is not connected.
- Output trigger n is self-acknowledging and does not require software acknowledge.

Otherwise, the behavior on writes to ACK<n> is as follows:

<table>
<thead>
<tr>
<th>ACK&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No effect</td>
</tr>
<tr>
<td>0b1</td>
<td>Deactivate the trigger</td>
</tr>
</tbody>
</table>

**Accessing the CTIINTACK**

A debugger must read CTITRIGOUTSTATUS to confirm that the output trigger has been acknowledged before generating any event that must be ordered after the write to CTIINTACK, such as a write to CTIAPPPULSE to activate another trigger.

**CTIINTACK can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x010</td>
<td>CTIINTACK</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **WI**.
- When !SoftwareLockStatus() accesses to this register are **WO**.
CTIITCTRL, CTI Integration mode Control register

The CTIITCTRL characteristics are:

**Purpose**

Enables the CTI to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

**Configuration**

It is IMPLEMENTATION DEFINED whether CTIITCTRL is implemented in the Core power domain or in the Debug power domain. Some or all RW fields of this register have defined reset values, and:

- The register is not affected by a Warm reset.
- If the register is implemented in the Core power domain the reset values apply on a Cold reset, and the register is not affected by an External debug reset.
- If the register is implemented in the Debug power domain the reset values apply on an External debug reset, and the register is not affected by a Cold reset.

Implementation of this register is OPTIONAL.

**Attributes**

CTIITCTRL is a 32-bit register.

**Field descriptions**

The CTIITCTRL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>RES0</td>
<td>Reserved</td>
</tr>
<tr>
<td>0</td>
<td>IME</td>
<td>Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>IME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Integration mode enabled.</td>
</tr>
</tbody>
</table>

On a Implementation reset, this field resets to 0.

**Accessing the CTIITCTRL**

CTIITCTRL can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xF00</td>
<td>CTIITCTRL</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
CTIITCTRL, CTI Integration mode Control register

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register are **IMPDEF**.
CTILAR, CTI Lock Access Register

The CTILAR characteristics are:

**Purpose**

Allows or disallows access to the CTI registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

**Configuration**

CTILAR is in the Debug power domain.

If ARMv8.4-Debug is implemented, the Software Lock is not implemented.

Software uses CTILAR to set or clear the lock, and **CTILSR** to check the current status of the lock.

**Attributes**

CTILAR is a 32-bit register.

**Field descriptions**

The CTILAR bit assignments are:

**When the Software Lock is implemented:**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**KEY, bits [31:0]**

Lock Access control. Writing the key value \(0xC5ACCE55\) to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component’s registers through a memory-mapped interface.

**Otherwise:**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**RES0**

Reserved, RES0.
Accessing the CTILAR

CTILAR can be accessed through a memory-mapped access to the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFB0</td>
<td>CTILAR</td>
</tr>
</tbody>
</table>

Accesses on this interface are WO.
CTILSR, CTI Lock Status Register

The CTILSR characteristics are:

### Purpose

Indicates the current status of the Software Lock for CTI registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

### Configuration

CTILSR is in the Debug power domain. Some or all RW fields of this register have defined reset values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.

If ARMv8.4-Debug is implemented, the Software Lock is not implemented.

Software uses **CTILAR** to set or clear the lock, and CTILSR to check the current status of the lock.

### Attributes

CTILSR is a 32-bit register.

### Field descriptions

The CTILSR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    | RES0 |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [31:3]**

Reserved, RES0.

**nTT, bit [2]**

Not thirty-two bit access required. RAZ.

**SLK, bit [1]**

*When the Software Lock is implemented.*

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when the Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when the Software Lock is implemented, possible values of this field are:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Lock clear. Writes are permitted to this component’s registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>Lock set. Writes to this component's registers are ignored, and reads have no side effects.</td>
</tr>
</tbody>
</table>

On a External debug reset, this field resets to 1.
Otherwise:

Reserved, RAZ.

**SLI, bit [0]**

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

<table>
<thead>
<tr>
<th>SLI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Software Lock not implemented or not memory-mapped access.</td>
</tr>
<tr>
<td>0b1</td>
<td>Software Lock implemented and memory-mapped access.</td>
</tr>
</tbody>
</table>

**Accessing the CTILSR**

CTILSR can be accessed through a memory-mapped access to the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFB4</td>
<td>CTILSR</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
The CTIOUTEN<n> characteristics are:

**Purpose**

Defines which input channels generate output trigger n.

**Configuration**

CTIOUTEN<n> is in the Debug power domain. RW fields in this register reset to architecturally **UNKNOWN** values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.

If output trigger n is not connected, the behavior of CTIOUTEN<n> is **IMPLEMENTATION DEFINED**.

**Attributes**

CTIOUTEN<n> is a 32-bit register.

**Field descriptions**

The CTIOUTEN<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**OUTEN<x>, bit [x], for x = 0 to 31**

Input channel <x> to output trigger <n> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Possible values of this bit are:

<table>
<thead>
<tr>
<th>OUTEN&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An event on input channel &lt;x&gt; will not cause output trigger &lt;n&gt; to be asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>An event on input channel &lt;x&gt; will cause output trigger &lt;n&gt; to be asserted.</td>
</tr>
</tbody>
</table>

On a External debug reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the CTIOUTEN<n>**

CTIOUTEN<n> can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x0A0 + 4n</td>
<td>CTIOUTEN&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.
CTIPIDR0, CTI Peripheral Identification Register 0

The CTIPIDR0 characteristics are:

**Purpose**

Provides information to identify a CTI component.

For more information see 'About the Peripheral identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

**Configuration**

CTIPIDR0 is in the Debug power domain.

Implementation of this register is **OPTIONAL**.

This register is required for CoreSight compliance.

**Attributes**

CTIPIDR0 is a 32-bit register.

**Field descriptions**

The CTIPIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>7-0</td>
<td>Part number, least significant byte, PART_0</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PART_0, bits [7:0]**

Part number, least significant byte.

**Accessing the CTIPIDR0**

CTIPIDR0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFE0</td>
<td>CTIPIDR0</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
The CTIPIDR1 characteristics are:

**Purpose**

Provides information to identify a CTI component.

For more information see 'About the Peripheral identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

**Configuration**

CTIPIDR1 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

**Attributes**

CTIPIDR1 is a 32-bit register.

**Field descriptions**

The CTIPIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>DES_0</td>
</tr>
<tr>
<td>29</td>
<td>PART_1</td>
</tr>
<tr>
<td>28</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>27</td>
<td>Designer, least</td>
</tr>
<tr>
<td>26</td>
<td>significant nibble of</td>
</tr>
<tr>
<td>25</td>
<td>JEP106 ID code. For</td>
</tr>
<tr>
<td>24</td>
<td>Arm Limited, this</td>
</tr>
<tr>
<td>23</td>
<td>field is 0b1011.</td>
</tr>
<tr>
<td>22</td>
<td>Part number, most</td>
</tr>
<tr>
<td>21</td>
<td>significant nibble.</td>
</tr>
</tbody>
</table>

**Accessing the CTIPIDR1**

CTIPIDR1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFE4</td>
<td>CTIPIDR1</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
The CTIPIDR2 characteristics are:

**Purpose**

Provides information to identify a CTI component.

For more information see 'About the Peripheral identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

**Configuration**

CTIPIDR2 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

**Attributes**

CTIPIDR2 is a 32-bit register.

**Field descriptions**

The CTIPIDR2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-8</td>
<td>RESERVED, RES0</td>
</tr>
<tr>
<td>7-4</td>
<td>REVISION, bits [7:4]</td>
</tr>
<tr>
<td>3</td>
<td>JEDEC, bit [3]</td>
</tr>
<tr>
<td>2-0</td>
<td>DES_1, bits [2:0]</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**REVISION, bits [7:4]**

Part major revision. Parts can also use this field to extend Part number to 16-bits.

**JEDEC, bit [3]**

RAO. Indicates a JEP106 identity code is used.

**DES_1, bits [2:0]**

Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is 0b011.

**Accessing the CTIPIDR2**

CTIPIDR2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFE8</td>
<td>CTIPIDR2</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
CTIPIDR3, CTI Peripheral Identification Register 3

The CTIPIDR3 characteristics are:

**Purpose**

Provides information to identify a CTI component.

For more information see 'About the Peripheral identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

**Configuration**

CTIPIDR3 is in the Debug power domain.

Implementation of this register is **OPTIONAL**.

This register is required for CoreSight compliance.

**Attributes**

CTIPIDR3 is a 32-bit register.

**Field descriptions**

The CTIPIDR3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td>Reserved</td>
</tr>
<tr>
<td>27</td>
<td>REVAND</td>
<td>Part minor revision. Parts using CTIPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.</td>
</tr>
<tr>
<td>23</td>
<td>CMOD</td>
<td>Customer modified. Indicates someone other than the Designer has modified the component.</td>
</tr>
</tbody>
</table>

Accessing the CTIPIDR3

**CTIPIDR3 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFEC</td>
<td>CTIPIDR3</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
CTIPIDR4, CTI Peripheral Identification Register 4

The CTIPIDR4 characteristics are:

**Purpose**

Provides information to identify a CTI component.

For more information see 'About the Peripheral identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

**Configuration**

CTIPIDR4 is in the Debug power domain.

Implementation of this register is **OPTIONAL**.

This register is required for CoreSight compliance.

**Attributes**

CTIPIDR4 is a 32-bit register.

**Field descriptions**

The CTIPIDR4 bit assignments are:

<table>
<thead>
<tr>
<th></th>
<th>RES0</th>
<th>SIZE</th>
<th>DES_2</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>30</td>
<td>29</td>
<td>28</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SIZE, bits [7:4]**

Size of the component. RAZ. Log2 of the number of 4KB pages from the start of the component to the end of the component ID registers.

**DES_2, bits [3:0]**

Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is 0b0100.

**Accessing the CTIPIDR4**

CTIPIDR4 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFD0</td>
<td>CTIPIDR4</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
CTITRIGINSTATUS, CTI Trigger In Status register

The CTITRIGINSTATUS characteristics are:

**Purpose**

Provides the status of the trigger inputs.

**Configuration**

CTITRIGINSTATUS is in the Debug power domain.

**Attributes**

CTITRIGINSTATUS is a 32-bit register.

**Field descriptions**

The CTITRIGINSTATUS bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**TRIN<n>, bit [n], for n = 0 to 31**

Trigger input <n> status.

Bits [31:N] are RAZ. N is the number of CTI triggers implemented as defined by the CTIDEVID.NUMTRIG field.

Possible values of this bit are:

<table>
<thead>
<tr>
<th>TRIN&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Input trigger n is inactive.</td>
</tr>
<tr>
<td>0b1</td>
<td>Input trigger n is active.</td>
</tr>
</tbody>
</table>

Not implemented and not-connected input triggers are always inactive.

It is IMPLEMENTATION DEFINED whether an input trigger that does not support multicycle events can be observed as active.

**Accessing the CTITRIGINSTATUS**

CTITRIGINSTATUS can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x130</td>
<td>CTITRIGINSTATUS</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
The CTITRIGOUTSTATUS characteristics are:

**Purpose**

Provides the raw status of the trigger outputs, after processing by any IMPLEMENTATION DEFINED trigger interface logic. For output triggers that are self-acknowledging, this is only meaningful if the CTI implements multicycle channel events.

**Configuration**

CTITRIGOUTSTATUS is in the Debug power domain.

**Attributes**

CTITRIGOUTSTATUS is a 32-bit register.

**Field descriptions**

The CTITRIGOUTSTATUS bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>TROUT&lt;n&gt;</td>
<td>Trigger output &lt;n&gt; status.</td>
</tr>
</tbody>
</table>

Bits [31:N] are RAZ. N is the value in CTIDEVID.NUMTRIG.

If n < N, and output trigger <n> is implemented and connected, and either the trigger is not self-acknowledging or the CTI implements multicycle channel events, then permitted values for TROUT<n> are:

<table>
<thead>
<tr>
<th>TROUT&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Output trigger n is inactive.</td>
</tr>
<tr>
<td>0b1</td>
<td>Output trigger n is active.</td>
</tr>
</tbody>
</table>

Otherwise when n < N it is IMPLEMENTATION DEFINED whether TROUT<n> behaves as described here or is RAZ.

**Accessing the CTITRIGOUTSTATUS**

CTITRIGOUTSTATUS can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x134</td>
<td>CTITRIGOUTSTATUS</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
DBGAUTHSTATUS_EL1, Debug Authentication Status register

The DBGAUTHSTATUS_EL1 characteristics are:

**Purpose**

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

**Configuration**

External register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to AArch64 System register `DBGAUTHSTATUS_EL1[31:0]`.

External register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to AArch32 System register `DBGAUTHSTATUS[31:0]`.

It is IMPLEMENTATION DEFINED whether DBGAUTHSTATUS_EL1 is implemented in the Core power domain or in the Debug power domain.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

DBGAUTHSTATUS_EL1 is a 32-bit register.

**Field descriptions**

The DBGAUTHSTATUS_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>SNID</td>
<td>SID</td>
<td>NSNID</td>
<td>NSID</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SNID, bits [7:6]**

When ARMv8.4-Debug is implemented:

Secure non-invasive debug.

`ExternalSecureNoninvasiveDebugEnabled() == ExternalSecureInvasiveDebugEnabled()`.

This field has the same value as DBGAUTHSTATUS_EL1.SID.

Otherwise:

Secure non-invasive debug.
### SNID, bits [5:4]

Secure invasive debug.

<table>
<thead>
<tr>
<th>SNID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Not implemented. EL3 is not implemented and the Effective value of SCR_EL3_NS is 1.</td>
</tr>
<tr>
<td>0b10</td>
<td>Implemented and disabled. ExternalSecureInvasiveDebugEnabled() == FALSE.</td>
</tr>
<tr>
<td>0b11</td>
<td>Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE.</td>
</tr>
</tbody>
</table>

All other values are reserved.

### NSNID, bits [3:2]

When ARMv8.4-Debug is implemented:

Non-secure non-invasive debug.

<table>
<thead>
<tr>
<th>NSNID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Not implemented. EL3 is not implemented and the Effective value of SCR_EL3_NS is 0.</td>
</tr>
<tr>
<td>0b11</td>
<td>Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.</td>
</tr>
</tbody>
</table>

If the Effective value of SCR\_EL3\_NS is 1, or if EL3 is implemented and EL2 is not implemented, this field reads as 0b11.

All other values are reserved.

Otherwise:

Non-secure non-invasive debug.

<table>
<thead>
<tr>
<th>NSNID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Not implemented. EL3 is not implemented and the Effective value of SCR_EL3_NS is 0.</td>
</tr>
<tr>
<td>0b10</td>
<td>Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE.</td>
</tr>
<tr>
<td>0b11</td>
<td>Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.</td>
</tr>
</tbody>
</table>

All other values are reserved.

### NSID, bits [1:0]

Non-secure invasive debug.
<table>
<thead>
<tr>
<th>NSID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.</td>
</tr>
<tr>
<td>0b10</td>
<td>Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE.</td>
</tr>
<tr>
<td>0b11</td>
<td>Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Accessing the DBGAUTHSTATUS_EL1**

DBGAUTHSTATUS_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFB8</td>
<td>DBGAUTHSTATUS_EL1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
The DBGBCR<n>_EL1 characteristics are:

**Purpose**

Holds control information for a breakpoint. Forms breakpoint n together with value register DBGBVR<n>_EL1.

**Configuration**

External register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGBCR<n>_EL1[31:0].

External register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGBCR<n>[31:0].

DBGBCR<n>_EL1 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

If breakpoint n is not implemented then accesses to this register are:

- RES0 when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess().
- A CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR otherwise.

**Attributes**

DBGBCR<n>_EL1 is a 32-bit register.

**Field descriptions**

The DBGBCR<n>_EL1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | BT | LBN | SSC | HMC | RES0 | BAS | RES0 | PMC | E |

When the E field is zero, all the other fields in the register are ignored.

**Bits [31:24]**

Reserved, RES0.

**BT, bits [23:20]**

Breakpoint Type. Possible values are:
<table>
<thead>
<tr>
<th>BT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Unlinked instruction address match. <strong>DBGVR&lt;n&gt;_EL1</strong> is the address of an instruction.</td>
</tr>
<tr>
<td>0b0001</td>
<td>As 0b0000 but linked to a Context matching breakpoint.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Unlinked Context ID match. When ARMv8.1-VHE is implemented, EL2 is using AArch64, and the Effective value of <strong>HCR_EL2.E2H</strong> is 1, if either the PE is executing at EL0 with <strong>HCR_EL2.TGE</strong> set to 1 or the PE is executing at EL2, then <strong>DBGVR&lt;n&gt;_EL1.ContextID</strong> must match the <strong>CONTEXTIDR_EL2</strong> value. Otherwise, <strong>DBGVR&lt;n&gt;_EL1.ContextID</strong> must match the <strong>CONTEXTIDR_EL1</strong> value.</td>

</tbody>
</table>

Constraints on breakpoint programming mean some values are reserved under certain conditions.

For more information on the operation of the SSC, HMC, and PMC fields, and on the effect of programming this field to a reserved value, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug) and 'Reserved DBGBCR<n>_EL1.BT values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug).

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**LBN**, bits [19:16]

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an **UNKNOWN** value.

This field is ignored when the value of DBGBCR<n>_EL1.E is 0.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**SSC**, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information, including the effect of programming the fields to a reserved set of values, see 'Reserved DBGBCR<n>_EL1.{SSC, HMC, PMC} values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug).
For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug).

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**HMC, bit [13]**

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see DBGBCR<n>_EL1 SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug).

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [12:9]**

Reserved, **RES0**.

**BAS, bits [8:5]**

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state. In an AArch64 only implementation, this field is reserved, **RES1**.

The permitted values depend on the breakpoint type.

For Address match breakpoints in either AArch32 or AArch64 state, the permitted values are:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Match instruction at</th>
<th>Constraint for debuggers</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0011</td>
<td>DBGVR&lt;n&gt;_EL1</td>
<td>Use for T32 instructions</td>
</tr>
<tr>
<td>0b1100</td>
<td>DBGVR&lt;n&gt;_EL1 + 2</td>
<td>Use for T32 instructions</td>
</tr>
<tr>
<td>0b1111</td>
<td>DBGVR&lt;n&gt;_EL1</td>
<td>Use for A64 and A32 instructions</td>
</tr>
</tbody>
</table>

All other values are reserved.

For more information, see 'Using the BAS field in Address Match breakpoints' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G2 (AArch32 Self-hosted Debug).

For Address mismatch breakpoints in an AArch32 stage 1 translation regime, the permitted values are:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Match instruction at</th>
<th>Constraint for debuggers</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>-</td>
<td>Use for a match anywhere breakpoint</td>
</tr>
<tr>
<td>0b0011</td>
<td>DBGVR&lt;n&gt;_EL1</td>
<td>Use for stepping T32 instructions</td>
</tr>
<tr>
<td>0b1100</td>
<td>DBGVR&lt;n&gt;_EL1 + 2</td>
<td>Use for stepping T32 instructions</td>
</tr>
<tr>
<td>0b1111</td>
<td>DBGVR&lt;n&gt;_EL1</td>
<td>Use for stepping A64 and A32 instructions</td>
</tr>
</tbody>
</table>

For more information, see 'Using the BAS field in Address Match breakpoints' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G2 (AArch32 Self-hosted Debug).

For Context matching breakpoints, this field is **RES1** and ignored.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [4:3]**

Reserved, **RES0**.
PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the \texttt{DBGBCR<n>\_EL1.SSC} description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug).

On a Cold reset, this field resets to an architecturally \texttt{UNKNOWN} value.

E, bit [0]

Enable breakpoint \texttt{DBGBVR<n>\_EL1}. Possible values are:

\begin{table}[h]
\centering
\begin{tabular}{|c|c|}
\hline
E & Meaning \\
\hline
0b0 & Breakpoint disabled. \\
0b1 & Breakpoint enabled. \\
\hline
\end{tabular}
\end{table}

On a Cold reset, this field resets to an architecturally \texttt{UNKNOWN} value.

Accessing the \texttt{DBGBCR<n>\_EL1}

\begin{table}[h]
\centering
\begin{tabular}{|c|c|c|}
\hline
Component & Offset & Instance \\
\hline
Debug & 0x408 + 16n & DBGBCR<n>\_EL1 \\
\hline
\end{tabular}
\end{table}

This interface is accessible as follows:

- When \texttt{IsCorePowered()}, \texttt{!DoubleLockStatus()}, \texttt{!OSLockStatus()}, \texttt{AllowExternalDebugAccess()} and \texttt{SoftwareLockStatus()} accesses to this register are \texttt{RO}.
- When \texttt{IsCorePowered()}, \texttt{!DoubleLockStatus()}, \texttt{!OSLockStatus()}, \texttt{AllowExternalDebugAccess()} and \texttt{!SoftwareLockStatus()} accesses to this register are \texttt{RW}.
- Otherwise accesses to this register generate an error response.

DBGBVR<n>_EL1, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n>_EL1 characteristics are:

**Purpose**

Holds a virtual address, or a VMID and/or a context ID, for use in breakpoint matching. Forms breakpoint n together with control register DBGBCR<n>_EL1.

**Configuration**

External register DBGBVR<n>_EL1 bits [63:0] are architecturally mapped to AArch64 System register DBGBVR<n>_EL1[63:0].

External register DBGBVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGBVR<n>[31:0].

External register DBGBVR<n>_EL1 bits [63:32] are architecturally mapped to AArch32 System register DBGBXVR<n>[31:0].

DBGBVR<n>_EL1 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

If breakpoint n is not implemented then accesses to this register are:

- RES0 when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess().
- A CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR otherwise.

**Attributes**

How this register is interpreted depends on the value of DBGBCR<n>_EL1.BT.

- When DBGBCR<n>_EL1.BT is 0b000x, this register holds a virtual address.
- When DBGBCR<n>_EL1.BT is 0b001x, 0b011x, or 0b110x, this register holds a Context ID.
- When DBGBCR<n>_EL1.BT is 0b100x, this register holds a VMID.
- When DBGBCR<n>_EL1.BT is 0b101x, this register holds a VMID and a Context ID.
- When DBGBCR<n>_EL1.BT is 0b111x, this register holds two Context ID values.

For other values of DBGBCR<n>_EL1.BT, this register is RES0.

**Field descriptions**

The DBGBVR<n>_EL1 bit assignments are:

**When DBGBCR<n>_EL1.BT == 0b000x:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

**RESS[14:4], bits [63:53]**

Reserved, Sign extended. Software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:
• The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
• The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

**VA[52:49], bits [52:49]**

When ARMv8.2-LVA is implemented:

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

**VA[48:2], bits [48:2]**

If the address is being matched in an AArch64 stage 1 translation regime:

• This field contains bits[48:2] of the address for comparison.
• When ARMv8.2-LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, VA[52:49] are RESS.

If the address is being matched in an AArch32 stage 1 translation regime, the first 20 bits of this field are **RES0**, and the rest of the field contains bits[31:2] of the address for comparison.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [1:0]**

Reserved, **RES0**.

**When DBGBCR<n>_EL1.BT == 0b001x:**

</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, **RES0**.

**ContextID, bits [31:0]**

Context ID value for comparison.

The value is compared against **CONTEXTIDR_EL2** when ARMv8.1-VHE is implemented, EL2 is using AArch64, **HCR_EL2.E2H** is 1, and either:

• The PE is executing at EL2.
• **HCR_EL2.TGE** is 1, the PE is executing at EL0, and EL2 is enabled in the current Security state.

Otherwise, the value is compared against **CONTEXTIDR** when the PE is executing at AArch32, or **CONTEXTIDR_EL1** when the PE is executing at AArch64.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
When DBGBCR<n>_EL1.BT == 0b011x:

| Bits [63:32] | Reserved, RES0. |
| ContextID, bits [31:0] | When ARMv8.1-VHE is implemented: |
| Context ID value for comparison against CONTEXTIDR_EL1. |
| On a Cold reset, this field resets to an architecturally UNKNOWN value. |
| Otherwise: |
| Reserved, RES0. |

When DBGBCR<n>_EL1.BT == 0b100x and HaveEL(EL2):

| Bits [63:48] | Reserved, RES0. |
| VMID[15:8], bits [47:40] | When ARMv8.1-VHE is implemented: |
| Extension to VMID[7:0]. See VMID[7:0] for more details. |
| On a Cold reset, this field resets to an architecturally UNKNOWN value. |
| Otherwise: |
| Reserved, RES0. |

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits in the following cases.

- EL2 is using AArch32.
- ARMv8.1-VMID16 is not implemented.

When ARMv8.1-VMID16 is implemented and EL2 is using AArch64, it is IMPLEMENTATION DEFINED whether the VMID is 8 bits or 16 bits.

VMID[15:8] is RES0 if any of the following applies:

- The implementation has an 8-bit VMID.
• VTCR_EL2.VS has a value of 0.
• EL2 is using AArch32.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [31:0]**

Reserved, RES0.

**When DBGBCR<n>_EL1.BT == 0b101x and HaveEL(EL2):**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | VMID[15:8] | VMID[7:0] |

**Bits [63:48]**

Reserved, RES0.

**VMID[15:8], bits [47:40]**

**When ARMv8.1-VMID16 is implemented:**

Extension to VMID[7:0]. See VMID[7:0] for more details.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**VMID[7:0], bits [39:32]**

VMID value for comparison.

The VMID is 8 bits in the following cases.

• EL2 is using AArch32.
• ARMv8.1-VMID16 is not implemented.

When ARMv8.1-VMID16 is implemented and EL2 is using AArch64, it is **IMPLEMENTATION DEFINED** whether the VMID is 8 bits or 16 bits.

VMID[15:8] is RES0 if any of the following applies:

• The implementation has an 8-bit VMID.
• VTCR_EL2.VS has a value of 0.
• EL2 is using AArch32.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**ContextID, bits [31:0]**

Context ID value for comparison against CONTEXTIDR_EL1.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
When DBGBCR<\text{n}_>EL1.BT == 0b110x and HaveEL(EL2):

ContextID2, bits [63:32]

When ARMv8.1-VHE is implemented:

- Context ID value for comparison against CONTEXTIDR_EL2.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

- Reserved, RES0.

ContextID, bits [31:0]

When ARMv8.1-VHE is implemented:

- Context ID value for comparison against CONTEXTIDR_EL1.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

- Reserved, RES0.

Accessing the DBGBVR<\text{n}_>EL1

---

Note
SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

**DBGBVR<n>_EL1 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x40&lt;n&gt; + 16n</td>
<td>DBGBVR&lt;n&gt;_EL1</td>
<td>63:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.
The DBGCLAIMCLR_EL1 characteristics are:

**Purpose**

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0.

The architecture does not define any functionality for the CLAIM tag bits.

**Note**

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the DBGCLAIMSET_EL1 register.

**Configuration**

External register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch64 System register
DBGCLAIMCLR_EL1[31:0].

External register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register
DBGCLAIMCLR[31:0].

DBGCLAIMCLR_EL1 is in the Core power domain. Some or all RW fields of this register have defined reset values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

An implementation must include eight CLAIM tag bits.

**Attributes**

DBGCLAIMCLR_EL1 is a 32-bit register.

**Field descriptions**

The DBGCLAIMCLR_EL1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| RAZ/SBZ | CLAIM |

**Bits [31:8]**

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

**CLAIM, bits [7:0]**

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.

Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

On a Cold reset, this field resets to 0.
Accessing the DBGCLAIMCLR_EL1

DBGCLAIMCLR_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFA4</td>
<td>DBGCLAIMCLR_EL1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()` and `SoftwareLockStatus()` accesses to this register are **RO**.
- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()` and `!SoftwareLockStatus()` accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.
The DBGCLAIMSET_EL1 characteristics are:

**Purpose**

Used by software to set the CLAIM tag bits to 1.

The architecture does not define any functionality for the CLAIM tag bits.

**Note**

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the DBGCLAIMCLR_EL1 register.

**Configuration**

External register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGCLAIMSET_EL1[31:0].

External register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGCLAIMSET[31:0].

DBGCLAIMSET_EL1 is in the Core power domain.

An implementation must include eight CLAIM tag bits.

**Attributes**

DBGCLAIMSET_EL1 is a 32-bit register.

**Field descriptions**

The DBGCLAIMSET_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RAZ/SBZ</td>
</tr>
<tr>
<td>30</td>
<td></td>
</tr>
<tr>
<td>29</td>
<td></td>
</tr>
<tr>
<td>28</td>
<td></td>
</tr>
<tr>
<td>27</td>
<td></td>
</tr>
<tr>
<td>26</td>

</tr>
<tr>
<td>2</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td><strong>CLAIM</strong></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

**CLAIM, bits [7:0]**

Set CLAIM tag bits.

This field is RAO.

Writing a 1 to one of these bits sets the corresponding CLAIM tag bit to 1. This is an indirect write to the CLAIM tag bits. A single write operation can set multiple CLAIM tag bits to 1.

Writing 0 to one of these bits has no effect.
Accessing the DBGCLAIMSET_EL1

DBGCLAIMSET_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFA0</td>
<td>DBGCLAIMSET_EL1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
The DBGDTRRX_EL0 characteristics are:

**Purpose**

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communications Channel.

**Configuration**

External register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to AArch64 System register DBGDTRRX_EL0[31:0].

External register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRRXint[31:0].

DBGDTRRX_EL0 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

**Attributes**

DBGDTRRX_EL0 is a 32-bit register.

**Field descriptions**

The DBGDTRRX_EL0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| Update DTRRX |

**Bits [31:0]**

Update DTRRX.

 Writes to this register:

- If RXfull is set to 1, set DTRRX to UNKNOWN.
- If RXfull is set to 0, update the value in DTRRX.

After the write, RXfull is set to 1.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRRX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull remains unchanged.

For the full behavior of the Debug Communications Channel, see The Debug Communication Channel and Instruction Transfer Register4.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
Accessing the DBGDTRRX_EL0

If EDSCR.ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in memory access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

DBGDTRRX_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x080</td>
<td>DBGDTRRX_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
The DBGDTRTX_EL0 characteristics are:

**Purpose**

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communication Channel.

**Configuration**

External register DBGDTRTX_EL0 bits [31:0] are architecturally mapped to AArch64 System register DBGDTRTX_EL0[31:0].

External register DBGDTRTX_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRTXint[31:0].

DBGDTRTX_EL0 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

**Attributes**

DBGDTRTX_EL0 is a 32-bit register.

**Field descriptions**

The DBGDTRTX_EL0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

Return DTRTX

**Bits [31:0]**

Return DTRTX.

Reads of this register:

- If TXfull is set to 1, return the last value written to DTRTX.
- If TXfull is set to 0, return an UNKNOWN value.

After the read, TXfull is cleared to 0.

Writes to this register:

- If TXfull is set to 1, set DTRTX to UNKNOWN.
- If TXfull is set to 0, update the value in DTRTX.

After the write, TXfull remains unchanged.

For the full behavior of the Debug Communications Channel, see The Debug Communication Channel and Instruction Transfer Register.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
Accessing the DBGDTRTX_EL0

If `EDSCR.ITE == 0` when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in memory access mode that has not completed execution is **CONSTRAINED UNPREDICTABLE**, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an **UNKNOWN** state.

**DBGDTRTX_EL0 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x08C</td>
<td>DBGDTRTX_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()` and `SoftwareLockStatus()` accesses to this register are **RO**.
- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()` and `!SoftwareLockStatus()` accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.
DBGWCR\textsubscript{n} EL1, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR\textsubscript{n} EL1 characteristics are:

**Purpose**

Holds control information for a watchpoint. Forms watchpoint \( \text{n} \) together with value register DBGWVR\textsubscript{n} EL1.

**Configuration**

External register DBGWCR\textsubscript{n} EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGWCR\textsubscript{n} EL1[31:0].

External register DBGWCR\textsubscript{n} EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGWCR\textsubscript{n}[31:0].

DBGWCR\textsubscript{n} EL1 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

If watchpoint \( \text{n} \) is not implemented then accesses to this register are:

- When IsCorePowered() \&\& !DoubleLockStatus() \&\& !OSLockStatus() \&\& AllowExternalDebugAccess(), RES0.
- Otherwise, a CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR.

**Attributes**

DBGWCR\textsubscript{n} EL1 is a 32-bit register.

**Field descriptions**

The DBGWCR\textsubscript{n} EL1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | MASK | RES0 | WT | LBN | SSC | HMC | BAS | LSC | PAC | E |

When the E field is zero, all the other fields in the register are ignored.

**Bits [31:29]**

Reserved, RES0.

**MASK, bits [28:24]**

Address mask. Only objects up to 2GB can be watched using a single mask.

<table>
<thead>
<tr>
<th>MASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00000</td>
<td>No mask.</td>
</tr>
<tr>
<td>0b00001</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b00010</td>
<td>Reserved.</td>
</tr>
</tbody>
</table>

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCR\textsubscript{n} EL1.
- The watchpoint is disabled.
Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [23:21]**

Reserved, **RES0**.

**WT, bit [20]**

Watchpoint type. Possible values are:

<table>
<thead>
<tr>
<th>WT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Unlinked data address match.</td>
</tr>
<tr>
<td>0b1</td>
<td>Linked data address match.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**LBN, bits [19:16]**

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**SSC, bits [15:14]**

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug).

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**HMC, bit [13]**

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug).

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**BAS, bits [12:5]**

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by `DBGWVR<n>_EL1` is being watched.

<table>
<thead>
<tr>
<th>BAS</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xxxx111x</td>
<td>Match byte at <code>DBGWVR&lt;n&gt;_EL1</code> + 1</td>
</tr>
<tr>
<td>xxxx1xxx</td>
<td>Match byte at <code>DBGWVR&lt;n&gt;_EL1</code> + 2</td>
</tr>
<tr>
<td>xxxx11xx</td>
<td>Match byte at <code>DBGWVR&lt;n&gt;_EL1</code> + 3</td>
</tr>
<tr>
<td>xxxx1111</td>
<td>Match byte at <code>DBGWVR&lt;n&gt;_EL1</code> + 4</td>
</tr>
</tbody>
</table>

In cases where `DBGWVR<n>_EL1` addresses a double-word:
BAS Description, if DBGWVR<n>_EL1[2] == 0

<table>
<thead>
<tr>
<th>BAS</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xxx1xxxx</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1 + 4</td>
</tr>
<tr>
<td>xx1xxxx</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1 + 5</td>
</tr>
<tr>
<td>x1xxxxxx</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1 + 6</td>
</tr>
<tr>
<td>1xxxxxxx</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1 + 7</td>
</tr>
</tbody>
</table>

The valid values for BAS are non-zero binary number all of whose set bits are contiguous. All other values are reserved and must not be used by software. See 'Reserved DBGWCR<n>.BAS values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G2 (AArch32 Self-hosted Debug).

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**LSC, bits [4:3]**

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

<table>
<thead>
<tr>
<th>LSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00b1</td>
<td>Match instructions that load from a watchpointed address.</td>
</tr>
<tr>
<td>01b0</td>
<td>Match instructions that store to a watchpointed address.</td>
</tr>
<tr>
<td>01b1</td>
<td>Match instructions that load from or store to a watchpointed address.</td>
</tr>
</tbody>
</table>

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**PAC, bits [2:1]**

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and HMC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug).

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**E, bit [0]**

Enable watchpoint n. Possible values are:

<table>
<thead>
<tr>
<th>E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Watchpoint disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Watchpoint enabled.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the DBGWCR<n>_EL1**

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

**DBGWCR<n>_EL1 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x808 + 16n</td>
<td>DBGWCR&lt;n&gt;_EL1</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When `IsCorePowered()`, `DoubleLockStatus()`, `OSLockStatus()`, `AllowExternalDebugAccess()` and `SoftwareLockStatus()` accesses to this register are **RO**.
- When `IsCorePowered()`, `DoubleLockStatus()`, `OSLockStatus()`, `AllowExternalDebugAccess()` and `SoftwareLockStatus()` accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.
The DBGWVR\textsubscript{\textit{n}} \_ EL1 characteristics are:

**Purpose**

Holds a data address value for use in watchpoint matching. Forms watchpoint \textit{n} together with control register DBGWCR\textsubscript{\textit{n}} \_ EL1.

**Configuration**

External register DBGWVR\textsubscript{\textit{n}} \_ EL1 bits [63:0] are architecturally mapped to AArch64 System register DBGWVR\textsubscript{\textit{n}} \_ EL1[63:0].

External register DBGWVR\textsubscript{\textit{n}} \_ EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGWVR\textsubscript{\textit{n}}[31:0].

DBGWVR\textsubscript{\textit{n}} \_ EL1 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

If watchpoint \textit{n} is not implemented then accesses to this register are:

- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess(), RES0.
- Otherwise, a CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR.

**Attributes**

DBGWVR\textsubscript{\textit{n}} \_ EL1 is a 64-bit register.

**Field descriptions**

The DBGWVR\textsubscript{\textit{n}} \_ EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Positions</th>
<th>Field Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-11</td>
<td>Reserved, Sign extended. Hardware and software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1. Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:</td>
</tr>
<tr>
<td>23-12</td>
<td>The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.</td>
</tr>
<tr>
<td>32</td>
<td>The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.</td>
</tr>
</tbody>
</table>

**VA[52:49]**, bits [52:49]

When ARMv8.2-LVA is implemented:

On a Cold reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

**VA[48:2], bits [48:2]**

Bits[48:2] of the address value for comparison.

When ARMv8.2-LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, VA[52:49] are RESS.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [1:0]**

Reserved, RES0.

**Accessing the DBGWVR<n>_EL1**

**Note**

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

**DBGWVR<n>_EL1 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x800 +</td>
<td>DBGWVR&lt;n&gt;_EL1</td>
<td>63:0</td>
</tr>
<tr>
<td></td>
<td>16n</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.
EDAA32PFR, External Debug AArch32 Processor Feature Register

The EDAA32PFR characteristics are:

**Purpose**

Provides information about implemented PE features.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

**Configuration**

It is **IMPLEMENTATION DEFINED** whether EDAA32PFR is implemented in the Core power domain or in the Debug power domain.

This register is present only when the implementation only supports execution in AArch32 state. Otherwise, direct accesses to EDAA32PFR are **RES0**.

**Attributes**

EDAA32PFR is a 64-bit register.

**Field descriptions**

The EDAA32PFR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-16</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>15-12</td>
<td>EL3, bits.</td>
</tr>
</tbody>
</table>

**Bits [63:16]**

Reserved, RES0.

**EL3, bits [15:12]**

AArch32 EL3 Exception level handling. Defined values are:

<table>
<thead>
<tr>
<th>EL3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL3 is not implemented or can be executed in AArch64 state.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EL3 can be executed in AArch32 state only.</td>
</tr>
</tbody>
</table>

When the value of **EDPFR.EL3** is non-zero, this field must be 0b0000.

All other values are reserved.

**Note**

**EDPFR.EL1, EL0** indicate whether EL1 and EL0 can only be executed in AArch32 state.
EL2, bits [11:8]

AArch32 EL2 Exception level handling. Defined values are:

<table>
<thead>
<tr>
<th>EL2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL2 is not implemented or can be executed in AArch64 state.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EL2 can be executed in AArch32 state only.</td>
</tr>
</tbody>
</table>

When the value of EDPFR.EL2 is non-zero, this field must be 0b0000.

All other values are reserved.

---

Note

EDPFR.{EL1, EL0} indicate whether EL1 and EL0 can only be executed in AArch32 state.

---

PMSA, bits [7:4]

Indicates support for a PMSA. Defined values are:

<table>
<thead>
<tr>
<th>PMSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>PMSA not supported.</td>
</tr>
<tr>
<td>0b0100</td>
<td>Support for an Armv8-R PMSAv8-32.</td>
</tr>
</tbody>
</table>

All other values are reserved. In Armv8-A, the only permitted value is 0b0000.

VMSA, bits [3:0]

Indicates support for a VMSA. When the PMSA field is nonzero, determines support for a VMSA. When the PMSA field is 0b0000, VMSA is supported. Defined values are:

<table>
<thead>
<tr>
<th>VMSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>VMSA not supported.</td>
</tr>
</tbody>
</table>

All other values are reserved. In Armv8-A, the only permitted value is 0b0000.

**Accessing the EDAA32PFR**

EDAA32PFR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x060</td>
<td>EDAA32PFR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.
EDACR, External Debug Auxiliary Control Register

The EDACR characteristics are:

**Purpose**

Allows implementations to support IMPLEMENTATION DEFINED controls.

**Configuration**

It is IMPLEMENTATION DEFINED whether EDACR is implemented in the Core power domain or in the Debug power domain. RW fields in this register reset to architecturally UNKNOWN values, and:

- The register is not affected by a Warm reset.
- If the register is implemented in the Core power domain the reset values apply on a Cold reset, and the register is not affected by an External debug reset.
- If the register is implemented in the Debug power domain the reset values apply on an External debug reset, and the register is not affected by a Cold reset.

Changing this register from its reset value causes IMPLEMENTATION DEFINED behavior, including possible deviation from the architecturally-defined behavior.

If the EDACR contains any control bits that must be preserved over power down, then these bits must be accessible by the external debug interface when the OS Lock is locked, OSLR_EL1.OSLK == 1, and when the Core is powered off.

**Attributes**

EDACR is a 32-bit register.

**Field descriptions**

The EDACR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| IMPLEMENTATION DEFINED | IMPLEMENTATION DEFINED, bits [31:0] |

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

**Accessing the EDACR**

EDACR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x094</td>
<td>EDACR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register are IMPDEF.
EDCIDR0, External Debug Component Identification Register 0

The EDCIDR0 characteristics are:

**Purpose**

Provides information to identify an external debug component.

For more information see 'About the Component identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

**Configuration**

It is IMPLEMENTATION DEFINED whether EDCIDR0 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDCIDR0 is a 32-bit register.

**Field descriptions**

The EDCIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td></td>
</tr>
<tr>
<td>29</td>
<td></td>
</tr>
<tr>
<td>28</td>
<td></td>
</tr>
<tr>
<td>27</td>
<td></td>
</tr>
<tr>
<td>26</td>
<td></td>
</tr>
<tr>
<td>25</td>
<td></td>
</tr>
<tr>
<td>24</td>
<td></td>
</tr>
<tr>
<td>23</td>
<td>22</td>
</tr>
<tr>
<td>21</td>
<td>20</td>
</tr>
<tr>
<td>19</td>
<td>18</td>

<td>12</td>
</tr>
<tr>
<td>11</td>
<td>10</td>
</tr>
<tr>
<td>9</td>
<td>8</td>
</tr>
<tr>
<td>7</td>
<td>6</td>
</tr>
<tr>
<td>5</td>
<td>4</td>
</tr>
<tr>
<td>3</td>
<td>2</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_0, bits [7:0]**

Preamble. Must read as 0x0D.

**Accessing the EDCIDR0**

EDCIDR0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFF0</td>
<td>EDCIDR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
EDCIDR1, External Debug Component Identification Register 1

The EDCIDR1 characteristics are:

**Purpose**

Provides information to identify an external debug component.

For more information see 'About the Component identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

**Configuration**

It is **IMPLEMENTATION DEFINED** whether EDCIDR1 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is **OPTIONAL**.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDCIDR1 is a 32-bit register.

**Field descriptions**

The EDCIDR1 bit assignments are:

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0 | CLASS | PRMBL_1 |

**Bits [31:8]**

Reserved, RES0.

**CLASS, bits [7:4]**

Component class. Reads as 0x9, debug component.

**PRMBL_1, bits [3:0]**

Preamble. RAZ.

**Accessing the EDCIDR1**

EDCIDR1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFF4</td>
<td>EDCIDR1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
• When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are RO.
• Otherwise accesses to this register generate an error response.
EDCIDR2, External Debug Component Identification Register 2

The EDCIDR2 characteristics are:

**Purpose**

Provides information to identify an external debug component.

For more information see 'About the Component identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

**Configuration**

It is **IMPLEMENTATION DEFINED** whether EDCIDR2 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is **OPTIONAL**.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDCIDR2 is a 32-bit register.

**Field descriptions**

The EDCIDR2 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| RES0 | PRMBL_2 |

**Bits [31:8]**

Reserved, RES0.

**PRMBL_2, bits [7:0]**

Preamble. Must read as 0x05.

**Accessing the EDCIDR2**

**EDCIDR2 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFF8</td>
<td>EDCIDR2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
EDCIFDR3, External Debug Component Identification Register 3

The EDCIFDR3 characteristics are:

**Purpose**

Provides information to identify an external debug component.

For more information see 'About the Component identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

**Configuration**

It is IMPLEMENTATION DEFINED whether EDCIFDR3 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDCIFDR3 is a 32-bit register.

**Field descriptions**

The EDCIFDR3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td></td>
</tr>
<tr>

</tr>
<tr>
<td>8</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>PRMBL_3</td>
</tr>
<tr>
<td>6</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_3, bits [7:0]**

Preamble. Must read as 0xB1.

**Accessing the EDCIFDR3**

**EDCIFDR3 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFFC</td>
<td>EDCIFDR3</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
EDCIDSRS, External Debug Context ID Sample Register

The EDCIDSRS characteristics are:

**Purpose**

Contains the sampled value of the Context ID, captured on reading EDPCSR[31:0].

**Configuration**

EDCIDSRS is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

This register is present only when ARMv8.0-PCSample is implemented and ARMv8.2-PCSample is not implemented. Otherwise, direct accesses to EDCIDSRS are RES0.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

**Note**

ARMv8.2-PCSample implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

**Attributes**

EDCIDSRS is a 32-bit register.

**Field descriptions**

The EDCIDSRS bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**CONTEXTIDR, bits [31:0]**

Context ID. The value of CONTEXTIDR that is associated with the most recent EDPCSR sample. When the most recent EDPCSR sample was generated:

- If EL1 is using AArch64, then the Context ID is sampled from CONTEXTIDR_EL1.
- If EL1 is using AArch32, then the Context ID is sampled from CONTEXTIDR. If EL3 is implemented and is using AArch32, then CONTEXTIDR is a banked register, and EDCIDSRS samples the current banked copy of CONTEXTIDR for the Security state that is associated with the most recent EDPCSR sample.

Because the value written to EDCIDSRS is an indirect read of CONTEXTIDR, it is CONSTRAINED UNPREDICTABLE whether EDCIDSRS is set to the original or new value if EDPCSR samples:

- An instruction that writes to CONTEXTIDR.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the EDCIDSRS**

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN' in chapter H7.
EDCIDSR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x0A4</td>
<td>EDCIDSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
EDDEVAFF0, External Debug Device Affinity register 0

The EDDEVAFF0 characteristics are:

**Purpose**

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

**Configuration**

It is implementation defined whether EDDEVAFF0 is implemented in the Core power domain or in the Debug power domain.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

EDDEVAFF0 is a 32-bit register.

**Field descriptions**

The EDDEVAFF0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>MPIDR_EL1 low half</td>
</tr>
</tbody>
</table>

**MPIDR_EL1 low half, bits [31:0]**

MPIDR_EL1 low half. Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented Exception level.

**Accessing the EDDEVAFF0**

EDDEVAFF0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFA8</td>
<td>EDDEVAFF0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
EDDEVAFF1, External Debug Device Affinity register 1

The EDDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

Configuration

It is IMPLEMENTATION DEFINED whether EDDEVAFF1 is implemented in the Core power domain or in the Debug power domain.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVAFF1 is a 32-bit register.

Field descriptions

The EDDEVAFF1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

MPIDR_EL1 high half, bits [31:0]

MPIDR_EL1 high half. Read-only copy of the high half of MPIDR_EL1, as seen from the highest implemented Exception level.

Accessing the EDDEVAFF1

EDDEVAFF1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFAC</td>
<td>EDDEVAFF1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
EDDEVARCH, External Debug Device Architecture register

The EDDEVARCH characteristics are:

**Purpose**

Identifies the programmers' model architecture of the external debug component.

**Configuration**

It is Implementation Defined whether EDDEVARCH is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is Optional.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

EDDEVARCH is a 32-bit register.

**Field descriptions**

The EDDEVARCH bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ARCHITECT | PRESENT | REVISION | ARCHVER | ARCHPART |

**ARCHITECT, bits [31:21]**

Defines the architecture of the component. For debug, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

**PRESENT, bit [20]**

When set to 1, indicates that the DEVARCH is present.

This field is 1 in Armv8.

**REVISION, bits [19:16]**

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

For debug, the revision defined by Armv8-A is 0x0.

All other values are reserved.

**ARCHVER, bits [15:12]**

Defines the architecture version of the component. This is the same value as ID_AA64DFR0_EL1 DebugVer and DBGIDR Version. The defined values of this field are:
<table>
<thead>
<tr>
<th>ARCHVER</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0110</td>
<td>Armv8.0 Debug architecture.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Armv8.0 Debug architecture with Virtualization Host Extensions.</td>
</tr>
<tr>
<td>0b1000</td>
<td>Armv8.2 Debug architecture.</td>
</tr>
<tr>
<td>0b1001</td>
<td>Armv8.4 Debug architecture.</td>
</tr>
</tbody>
</table>

ARMv8.4-Debug adds the functionality indicated by the value 0b1001. ARMv8.2-Debug adds the functionality indicated by the value 0b1000. If ARMv8.1-VHE is not implemented, the only permitted value is 0b0110.

The fields ARCHVER and ARCHPART together form the field ARCHID, so that ARCHVER is ARCHID[15:12].

**ARCHPART, bits [11:0]**

<table>
<thead>
<tr>
<th>ARCHPART</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0xA15</td>
<td>The part number of the Armv8-A debug component.</td>
</tr>
</tbody>
</table>

The fields ARCHVER and ARCHPART together form the field ARCHID, so that ARCHPART is ARCHID[11:0].

**Accessing the EDDEVARCH**

**EDDEVARCH can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFBC</td>
<td>EDDEVARCH</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
EDDEVID, External Debug Device ID register 0

The EDDEVID characteristics are:

Purpose

Provides extra information for external debuggers about features of the debug implementation.

Configuration

It is implementation defined whether EDDEVID is implemented in the Core power domain or in the Debug power domain.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVID is a 32-bit register.

Field descriptions

The EDDEVID bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | AuxRegs | RES0 | DebugPower | PCSample |

Bits [31:28]

Reserved, RES0.

AuxRegs, bits [27:24]

Indicates support for Auxiliary registers. Permitted values for this field are:

<table>
<thead>
<tr>
<th>AuxRegs</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for External Debug Auxiliary Control Register, <em>EDACR</em>.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Bits [23:8]

Reserved, RES0.

DebugPower, bits [7:4]

From Armv8.3:

Indicates support for the ARMv8.3-DoPD feature. Defined values of this field are:
### DebugPower

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>ARMv8.3-DoPD not implemented. Registers in the external debug interface register map are implemented in a mix of the Debug and Core power domains.</td>
</tr>
<tr>
<td>0b0001</td>
<td>ARMv8.3-DoPD implemented. All registers in the external debug interface register map are implemented in the Core power domain.</td>
</tr>
</tbody>
</table>

ARMv8.3-DoPD implements the functionality added by the value 0b0001.

All other values are reserved.

**Otherwise:**

Reserved, RES0.

### PCSample, bits [3:0]

Indicates the level of PC Sample-based Profiling support using external debug registers. Permitted values of this field are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>PC Sample-based Profiling Extension is not implemented in the external debug registers space.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Only EDPCSR and EDCIDSR are implemented. This option is only permitted if EL3 and EL2 are not implemented.</td>
</tr>
<tr>
<td>0b0011</td>
<td>EDPCSR, EDCIDSR, and EDVIDSR are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

When ARMv8.2-PCSample is implemented, the only permitted value is 0b0000.

**Note**

ARMv8.2-PCSample implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of PMDEVID.PCSample.

### Accessing the EDDEVID

**EDDEVID can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFC8</td>
<td>EDDEVID</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
EDDEVID1, External Debug Device ID register 1

The EDDEVID1 characteristics are:

**Purpose**

Provides extra information for external debuggers about features of the debug implementation.

**Configuration**

It is implementation defined whether EDDEVID1 is implemented in the Core power domain or in the Debug power domain.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

EDDEVID1 is a 32-bit register.

**Field descriptions**

The EDDEVID1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>31</td>

</tr>
<tr>
<td>1</td>
<td>2</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
</tr>
</tbody>
</table>

**Bits [31:4]**

Reserved, RES0.

**PCSROffset, bits [3:0]**

This field indicates the offset applied to PC samples returned by reads of EDPCSR. Permitted values of this field in Armv8 are:

<table>
<thead>
<tr>
<th>PCSROffset</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EDPCSR not implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>EDPCSR implemented, and samples have no offset applied and do not sample the instruction set state in AArch32 state.</td>
</tr>
</tbody>
</table>

When ARMv8.2-PCSample is implemented, the only permitted value is 0b0000.

**Note**

ARMv8.2-PCSample implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of PMDEVID.PCSample.

**Accessing the EDDEVID1**

EDDEVID1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Debug</td>
<td>0xFC4</td>
<td>EDDEVID1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
EDDEVID2, External Debug Device ID register 2

The EDDEVID2 characteristics are:

**Purpose**

Reserved for future descriptions of features of the debug implementation.

**Configuration**

It is IMPLEMENTATION DEFINED whether EDDEVID2 is implemented in the Core power domain or in the Debug power domain.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

EDDEVID2 is a 32-bit register.

**Field descriptions**

The EDDEVID2 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0

**Bits [31:0]**

Reserved, RES0.

**Accessing the EDDEVID2**

EDDEVID2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFC0</td>
<td>EDDEVID2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
EDDEVTYPE, External Debug Device Type register

The EDDEVTYPE characteristics are:

**Purpose**

Indicates to a debugger that this component is part of a PEs debug logic.

**Configuration**

It is implementation defined whether EDDEVTYPE is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is optional.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

EDDEVTYPE is a 32-bit register.

**Field descriptions**

The EDDEVTYPE bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>SUB</td>
<td>MAJOR</td>
<td></td>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SUB, bits [7:4]**

Subtype. Must read as 0x1 to indicate this is a component within a PE.

**MAJOR, bits [3:0]**

Major type. Must read as 0x5 to indicate this is a debug logic component.

**Accessing the EDDEVTYPE**

EDDEVTYPE can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFCC</td>
<td>EDDEVTYPE</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
EDDFR, External Debug Feature Register

The EDDFR characteristics are:

**Purpose**

Provides top level information about the debug system.

**Note**

Debuggers must use **EDDEVARCH** to determine the Debug architecture version.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

It is **IMPLEMENTATION DEFINED** whether EDDFR is implemented in the Core power domain or in the Debug power domain.

**Attributes**

EDDFR is a 64-bit register.

**Field descriptions**

The EDDFR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>62</td>

</tr>
<tr>
<td>32</td>
<td>RESERVED</td>
</tr>
</tbody>
</table>

**Bits [63:44]**

Reserved, RES0.

**TraceFilt, bits [43:40]**

**From Armv8.4:**

Armv8.4 Self-hosted Trace Extension version. The defined values of this field are:

<table>
<thead>
<tr>
<th>TraceFilt</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Armv8.4 Self-hosted Trace Extension is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Armv8.4 Self-hosted Trace Extension is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Otherwise:**

Reserved, RES0.
**Bits [39:32]**

Reserved, UNKNOWN.

**CTX_CMPs, bits [31:28]**

Number of breakpoints that are context-aware, minus 1. These are the highest numbered breakpoints.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64DFR0_EL1.CTX_CMPs.

**Bits [27:24]**

Reserved, RES0.

**WRPs, bits [23:20]**

Number of watchpoints, minus 1. The value of $0b0000$ is reserved.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64DFR0_EL1.WRPs.

**Bits [19:16]**

Reserved, RES0.

**BRPs, bits [15:12]**

Number of breakpoints, minus 1. The value of $0b0000$ is reserved.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64DFR0_EL1.BRPs.

**PMUVer, bits [11:8]**

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the Alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.1.4.

Defined values are:

<table>
<thead>
<tr>
<th>PMUVer</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>$0b0000$</td>
<td>Performance Monitors Extension not implemented.</td>
</tr>
<tr>
<td>$0b0001$</td>
<td>Performance Monitors Extension implemented, PMUv3.</td>
</tr>
</tbody>
</table>
| $0b0100$ | PMUv3 for Armv8.1. As $0b0001$, and also includes support for:  
  • Extended 16-bit PMEVTYPE<_{n}EL0.evtCount field.  
  • If EL2 is implemented, the MDCR_EL2.HPMD control bit. |
| $0b0101$ | PMUv3 for Armv8.4. As $0b0100$ and also includes support for the PMMIR register. |
| $0b0110$ | PMUv3 for Armv8.5. As $0b0101$ and also includes support for:  
  • 64-bit event counters.  
  • If EL2 is implemented, the MDCR_EL2.HCCD control bit.  
  • If EL3 is implemented, the MDCR_EL3.SCCD control bit. |
| $0b1111$ | IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value in new implementations. |

ARMv8.1-PMU implements the functionality added by the value $0b0100$. 
ARMv8.4-PMU implements the functionality added by the value 0b0101.

ARMv8.5-PMU implements the functionality added by the value 0b0110.

All other values are reserved.

From Armv8.1, the value 0b0001 is not permitted.

From Armv8.4, the value 0b0100 is not permitted.

From Armv8.5, the value 0b0101 is not permitted.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64DFR0_EL1.PMUVer:

**TraceVer, bits [7:4]**

Trace support. Indicates whether System register interface to a PE trace unit is implemented. Defined values are:

<table>
<thead>
<tr>
<th>TraceVer</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>PE trace unit System registers not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>PE trace unit System registers implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

A value of 0b0000 only indicates that no System register interface to a PE trace unit is implemented. A PE trace unit might nevertheless be implemented without a System register interface.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64DFR0_EL1.TraceVer:

**Bits [3:0]**

Reserved, UNKNOWN.

**Accessing the EDDFR**

**EDDFR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xD28</td>
<td>EDDFR</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are RO.
- Otherwise accesses to this register are IMPDEF.

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xD2C</td>
<td>EDDFR</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are RO.
- Otherwise accesses to this register are IMPDEF.
The EDECCR characteristics are:

**Purpose**

Controls Exception Catch debug events.

**Configuration**

External register EDECCR bits [31:0] are architecturally mapped to AArch64 System register `OSECCR_EL1[31:0]`.

External register EDECCR bits [31:0] are architecturally mapped to AArch32 System register `DBGOSECCR[31:0]`.

EDECCR is in the Core power domain. Some or all RW fields of this register have defined reset values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

**Attributes**

EDECCR is a 32-bit register.

**Field descriptions**

The EDECCR bit assignments are:

**When ARMv8.2-Debug is implemented:**

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>NSR3</td>
<td>NSR2</td>
<td>NSR1</td>
<td>NSR0</td>
<td>SR3</td>
<td>SR2</td>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, `RES0`.

**NSR<n>, bit [n+12], for n = 0 to 3**

Controls Non-secure exception catch on exception return to EL<n> in conjunction with NSE<n>. See the summary of Exception Catch debug event control for information.

If EL3 is not implemented and the PE behaves as if `SCR_EL3`.NS is set to 0, this field is reserved, `RES0`. Otherwise, possible values for this field are:

<table>
<thead>
<tr>
<th>NSR&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If the corresponding NSE&lt;n&gt; bit is 0, then Exception Catch debug events are disabled for Non-secure Exception level &lt;n&gt;. If the corresponding NSE&lt;n&gt; bit is 1, then Exception Catch debug events are enabled for exception entry, reset entry and exception return to Non-secure Exception level &lt;n&gt;.</td>
</tr>
<tr>
<td>0b1</td>
<td>If the corresponding NSE&lt;n&gt; bit is 0, then Exception Catch debug events are enabled for exception returns to Non-secure Exception level &lt;n&gt;. If the corresponding NSE&lt;n&gt; bit is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure Exception level &lt;n&gt;.</td>
</tr>
</tbody>
</table>
It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level is permitted to generate an Exception Catch debug event.

A value of the NSR field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the NSR field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for NSR by a read of EDECCR is UNKNOWN.

On a Cold reset, this field resets to 0.

SR\(n\), bit \([n+8]\), for \(n = 0\) to 3

Controls Secure exception catch on exception return to EL\(n\) in conjunction with SE\(n\). See the summary of Exception Catch debug event control for information.

If EL3 is not implemented and the PE behaves as if SCR_EL3.NS is set to 1, this field is reserved, RES0. Otherwise, possible values for this field are:

<table>
<thead>
<tr>
<th>SR(n)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If the corresponding SE(n) bit is 0, then Exception Catch debug events are disabled for Secure Exception level (n). If the corresponding SE(n) bit is 1, then Exception Catch debug events are enabled for exception entry, reset entry and exception return to Secure Exception level (n).</td>
</tr>
<tr>
<td>0b1</td>
<td>If the corresponding SE(n) bit is 0, then Exception Catch debug events are enabled for exception returns to Secure Exception level (n). If the corresponding SE(n) bit is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure Exception level (n).</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.

NSE\(n\), bit \([n+4]\), for \(n = 0\) to 3

Coarse-grained Non-secure exception catch for EL\(n\). This controls whether Exception Catch debug events are enabled for Non-secure EL\(n\). This also controls:

- The behavior of exception catch on exception entry to EL\(n\).
- The behavior of exception catch on exception return to EL\(n\) in conjunction with NSR\(n\).

If EL3 is not implemented and the PE behaves as if SCR_EL3.NS is set to 0, this field is reserved, RES0. Otherwise, possible values for this field are:
### NSE<n>

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0  If the corresponding NSR&lt;n&gt; bit is 0, then Exception Catch debug events are disabled for Non-secure Exception level &lt;n&gt;.</td>
</tr>
<tr>
<td>If the corresponding NSR&lt;n&gt; bit is 1, then Exception Catch debug events are enabled for exception returns to Non-secure Exception level &lt;n&gt;.</td>
</tr>
<tr>
<td>0b1  If the corresponding NSR&lt;n&gt; bit is 0, then Exception Catch debug events are enabled for exception entry, reset entry and exception return to Non-secure Exception level &lt;n&gt;.</td>
</tr>
<tr>
<td>If the corresponding NSR&lt;n&gt; bit is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure Exception level &lt;n&gt;.</td>
</tr>
</tbody>
</table>

A value of the NSE field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the NSE field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for NSE by a read of EDECCR is UNKNOWN.

On a Cold reset, this field resets to 0.

### SE<n>, bit [n], for n = 0 to 3

Coarse-grained Secure exception catch for EL<n>. This field controls whether Exception Catch debug events are enabled for Secure EL<n>.

- The behavior of exception catch on exception entry to EL<n>.
- The behavior of exception catch on exception return to EL<n> in conjunction with SR<n>.

If EL3 is not implemented and the PE behaves as if SCR_EL3.NS is set to 1, this field is reserved, RES0. Otherwise, possible values for this field are:

<table>
<thead>
<tr>
<th>SE&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If the corresponding SR&lt;n&gt; bit is 0, then Exception Catch debug events are disabled for Secure Exception level &lt;n&gt;.</td>
</tr>
<tr>
<td>If the corresponding SR&lt;n&gt; bit is 1, then Exception Catch debug events are enabled for exception returns to Secure Exception level &lt;n&gt;.</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>If the corresponding SR&lt;n&gt; bit is 0, then Exception Catch debug events are enabled for exception entry, reset entry and exception return to Secure Exception level &lt;n&gt;.</td>
</tr>
<tr>
<td>If the corresponding SR&lt;n&gt; bit is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure Exception level &lt;n&gt;.</td>
<td></td>
</tr>
</tbody>
</table>

A value of the SE field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the SE field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for SE by a read of EDECCR is UNKNOWN.

On a Cold reset, this field resets to 0.

### Otherwise:

| RES0                           | NSE3                           | NSE2                           | NSE1                           | NSE0                           | SE3                             | SE2                             | SE1                             | SE0                             |

**Bits [31:8]**

Reserved, RES0.
**NSE<\text{n}>**, bit \([n+4]\), for \text{n} = 0 to 3

Coarse-grained Non-secure exception catch. If EL3 and EL2 are not implemented and the PE behaves as if \text{SCR}_{EL3}.NS is set to 0, this field is reserved, RES0. Otherwise, possible values for this field are:

<table>
<thead>
<tr>
<th>NSE&lt;\text{n}&gt;</th>
<th>Meaning</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Exception Catch debug events are disabled for Non-secure Exception level &lt;n&gt;.</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>Exception Catch debug events are enabled for Non-secure Exception level &lt;n&gt;.</td>
<td></td>
</tr>
</tbody>
</table>

A value of the NSE field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the NSE field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for NSE by a read of EDECCR is \text{UNKNOWN}.

**SE<\text{n}>**, bit \([n]\), for \text{n} = 0 to 3

Coarse-grained Secure exception catch. If EL3 is not implemented and the PE behaves as if \text{SCR}_{EL3}.NS is set to 1, this field is reserved, RES0. Otherwise, possible values for this field are:

<table>
<thead>
<tr>
<th>SE&lt;\text{n}&gt;</th>
<th>Meaning</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Exception Catch debug events are disabled for Secure Exception level &lt;n&gt;.</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>Exception Catch debug events are enabled for Secure Exception level &lt;n&gt;.</td>
<td></td>
</tr>
</tbody>
</table>

A value of the SE field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the SE field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for SE by a read of EDECCR is \text{UNKNOWN}.

**Accessing the EDECCR**

**EDECCR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x098</td>
<td>EDECCR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are \text{RO}.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are \text{RW}.
- Otherwise accesses to this register generate an error response.
The EDECR characteristics are:

**Purpose**

Controls Halting debug events.

**Configuration**

It is **IMPLEMENTATION DEFINED** whether EDECR is implemented in the Core power domain or in the Debug power domain. Some or all RW fields of this register have defined reset values, and:

- The register is not affected by a Warm reset.
- If the register is implemented in the Core power domain the reset values apply on a Cold reset, and the register is not affected by an External debug reset.
- If the register is implemented in the Debug power domain the reset values apply on an External debug reset, and the register is not affected by a Cold reset.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

EDECR is a 32-bit register.

**Field descriptions**

The EDECR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | SS | RCE | OSUCE |

**Bits [31:3]**

Reserved, RES0.

**SS, bit [2]**

Halting step enable. Possible values of this field are:

<table>
<thead>
<tr>
<th>SS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Halting step debug event disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Halting step debug event enabled.</td>
</tr>
</tbody>
</table>

If the value of EDECR.SS is changed when the PE is in Non-debug state, behavior is **CONSTRAINED UNPREDICTABLE** as described in 'Changing the value of EDECR.SS when not in Debug state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

The following resets apply:

- On a Cold reset, this field resets to:
  - If ARMv8.3-DoPD is implemented, 0.
- On a External debug reset, this field resets to:
  - If ARMv8.3-DoPD is not implemented, 0.
RCE, bit [1]

When ARMv8.3-DoPD is not implemented:

Reset Catch Enable.

<table>
<thead>
<tr>
<th>RCE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Reset Catch debug event disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reset Catch debug event enabled.</td>
</tr>
</tbody>
</table>

On a External debug reset, this field resets to 0.

Otherwise:

Reserved, RES0.

OSUCE, bit [0]

When ARMv8.3-DoPD is not implemented:

OS Unlock Catch Enable.

<table>
<thead>
<tr>
<th>OSUCE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>OS Unlock Catch debug event disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>OS Unlock Catch debug event enabled.</td>
</tr>
</tbody>
</table>

On a External debug reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Accessing the EDECR

EDECR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x024</td>
<td>EDECR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When (ARMv8.3-DoPD is not implemented or IsCorePowered()) and SoftwareLockStatus() accesses to this register are RO.
- When (ARMv8.3-DoPD is not implemented or IsCorePowered()) and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise access to this register generate an error response.
EDESR, External Debug Event Status Register

The EDESR characteristics are:

**Purpose**

Indicates the status of internally pending Halting debug events.

**Configuration**

EDESR is in the Core power domain. Some or all RW fields of this register have defined reset values. The field descriptions identify when the reset values apply.

**Attributes**

EDESR is a 32-bit register.

**Field descriptions**

The EDESR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 |
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | SS   |
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RCOSUC |

**Bits [31:3]**

Reserved, RES0.

**SS, bit [2]**

**When ARMv8.3-DoPD is implemented:**

Halting step debug event pending. Possible values of this field are:

<table>
<thead>
<tr>
<th>SS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Reading this means that a Halting step debug event is not pending.</td>
</tr>
<tr>
<td></td>
<td>Writing this means no action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reading this means that a Halting step debug event is pending.</td>
</tr>
<tr>
<td></td>
<td>Writing this clears the pending Halting step debug event.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.

**Otherwise:**

Halting step debug event pending. Possible values of this field are:

<table>
<thead>
<tr>
<th>SS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Reading this means that a Halting step debug event is not pending.</td>
</tr>
<tr>
<td></td>
<td>Writing this means no action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reading this means that a Halting step debug event is pending.</td>
</tr>
<tr>
<td></td>
<td>Writing this clears the pending Halting step debug event.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to the value in EDECR.SS.

**RC, bit [1]**

Reset Catch debug event pending. Possible values of this field are:
## RC, bit [0]

Reading this means that a Reset Catch debug event is not pending. Writing this means no action.

Reading this means that a Reset Catch debug event is pending. Writing this clears the pending Reset Catch debug event.

On a Warm reset, this field resets to:

- If ARMv8.3-DoPD is implemented, The value in `CTIDEVCTL.RCE`.
- If ARMv8.3-DoPD is not implemented, The value in `EDECR.RCE`.

### OSUC, bit [0]

OS Unlock Catch debug event pending. Possible values of this field are:

<table>
<thead>
<tr>
<th>OSUC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Reading this means that an OS Unlock Catch debug event is not pending. Writing this means no action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reading this means that an OS Unlock Catch debug event is pending. Writing this clears the pending OS Unlock Catch debug event.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

## Accessing the EESDR

If a request to clear a pending Halting debug event is received at or about the time when halting becomes allowed, it is constrained unpredictable whether the event is taken.

If Core power is removed while a Halting debug event is pending, it is lost. However, it might become pending again when the Core is powered back on and Cold reset.

### EESDR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x020</td>
<td>EESDR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()` and `SoftwareLockStatus()` accesses to this register are RO.
- When `IsCorePowered()`, `!DoubleLockStatus()` and `!SoftwareLockStatus()` accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
EDITCTRL, External Debug Integration mode Control register

The EDITCTRL characteristics are:

**Purpose**

Enables the external debug to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

**Configuration**

It is IMPLEMENTATION DEFINED whether EDITCTRL is implemented in the Core power domain or in the Debug power domain. Some or all RW fields of this register have defined reset values, and:

- The register is not affected by a Warm reset.
- If the register is implemented in the Core power domain the reset values apply on a Cold reset, and the register is not affected by an External debug reset.
- If the register is implemented in the Debug power domain the reset values apply on an External debug reset, and the register is not affected by a Cold reset.

Implementation of this register is OPTIONAL.

**Attributes**

EDITCTRL is a 32-bit register.

**Field descriptions**

The EDITCTRL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td>Reserved</td>
</tr>
<tr>
<td>30</td>
<td>IME</td>
<td>Integration mode enable</td>
</tr>
</tbody>
</table>

**Bits [31:1]**

Reserved, RES0.

**IME, bit [0]**

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

<table>
<thead>
<tr>
<th>IME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Integration mode enabled.</td>
</tr>
</tbody>
</table>

On a Implementation reset, this field resets to 0.

**Accessing the EDITCTRL**

EDITCTRL can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xF00</td>
<td>EDITCTRL</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register are **IMPDEF**.
**EDITR, External Debug Instruction Transfer Register**

The EDITR characteristics are:

**Purpose**

Used in Debug state for passing instructions to the PE for execution.

**Configuration**

EDITR is in the Core power domain.

**Attributes**

EDITR is a 32-bit register.

**Field descriptions**

The EDITR bit assignments are:

**When in AArch32 state:**

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
```

<table>
<thead>
<tr>
<th>31:16</th>
<th>15:0</th>
</tr>
</thead>
<tbody>
<tr>
<td>T32Second</td>
<td>T32First</td>
</tr>
</tbody>
</table>

T32Second, bits [31:16]

Second halfword of the T32 instruction to be executed on the PE. When EDITR contains a 16-bit T32 instruction, this field is ignored. For more information see 'Behavior in Debug state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H2, Debug State.

T32First, bits [15:0]

First halfword of the T32 instruction to be executed on the PE.

**When in AArch64 state:**

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
```

A64 instruction to be executed on the PE.

**Bits [31:0]**

A64 instruction to be executed on the PE.

**Accessing the EDITR**

If **EDSCR**, ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any instruction issued through the ITR in Normal access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.
EDITR ignores writes if the PE is in Non-debug state.

**EDITR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x084</td>
<td>EDITR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **WI**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **WO**.
- Otherwise accesses to this register generate an error response.
EDLAR, External Debug Lock Access Register

The EDLAR characteristics are:

**Purpose**

Allows or disallows access to the external debug registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

**Configuration**

It is defined whether EDLAR is implemented in the Core power domain or in the Debug power domain.

If ARMv8.3-DoPD is implemented, then ARMv8.0-SoftwareLock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If ARMv8.3-DoPD is not implemented, then this register is in the Debug power domain.

Software uses EDLAR to set or clear the lock, and EDLSR to check the current status of the lock.

**Attributes**

EDLAR is a 32-bit register.

**Field descriptions**

The EDLAR bit assignments are:

**When the Software Lock is implemented:**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>KEY</td>
</tr>
<tr>
<td>30</td>
<td></td>
</tr>
<tr>
<td>29</td>
<td></td>
</tr>
<tr>
<td>28</td>
<td></td>
</tr>
<tr>
<td>27</td>
<td></td>
</tr>
<tr>
<td>26</td>
<td></td>
</tr>
<tr>
<td>25</td>
<td></td>
</tr>
<tr>
<td>24</td>
<td></td>
</tr>
<tr>
<td>23</td>
<td></td>
</tr>
<tr>
<td>22</td>
<td></td>
</tr>
<tr>
<td>21</td>
<td></td>
</tr>
<tr>
<td>20</td>
<td></td>
</tr>
<tr>
<td>19</td>
<td></td>
</tr>
<tr>
<td>18</td>
<td></td>
</tr>
<tr>
<td>17</td>
<td></td>
</tr>
<tr>
<td>16</td>
<td></td>
</tr>
<tr>
<td>15</td>
<td></td>
</tr>
<tr>
<td>14</td>
<td></td>
</tr>
<tr>
<td>13</td>
<td></td>
</tr>
<tr>
<td>12</td>
<td></td>
</tr>
<tr>
<td>11</td>
<td></td>
</tr>
<tr>
<td>10</td>
<td></td>
</tr>
<tr>
<td>9</td>
<td></td>
</tr>
<tr>
<td>8</td>

<td></td>
</tr>
<tr>
<td>2</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

KEY, bits [31:0]

Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component’s registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component’s registers through a memory mapped interface.

**Otherwise:**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td></td>
</tr>

</tr>
<tr>
<td>3</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

Otherwise

**Bits [31:0]**

Reserved, RES0.
Accessing the EDLAR

EDLAR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFB0</td>
<td>EDLAR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are WO.
- Otherwise accesses to this register generate an error response.
EDLSR, External Debug Lock Status Register

The EDLSR characteristics are:

**Purpose**

Indicates the current status of the software lock for external debug registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

**Configuration**

It is IMPLEMENTATION DEFINED whether EDLSR is implemented in the Core power domain or in the Debug power domain. Some or all RW fields of this register have defined reset values, and:

- The register is not affected by a Warm reset.
- If the register is implemented in the Core power domain the reset values apply on a Cold reset, and the register is not affected by an External debug reset.
- If the register is implemented in the Debug power domain the reset values apply on an External debug reset, and the register is not affected by a Cold reset.

If ARMv8.3-DoPD is implemented, then ARMv8.0-SoftwareLock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If ARMv8.3-DoPD is not implemented, then this register is in the Debug power domain.

Software uses EDLAR to set or clear the lock, and EDLSR to check the current status of the lock.

**Attributes**

EDLSR is a 32-bit register.

**Field descriptions**

The EDLSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>30</td>
<td>nTT, bit [2]</td>

<tr>
<td>29</td>
<td>Not thirty-two bit access required. RAZ.</td>
</tr>
<tr>
<td>28</td>
<td>SLK, bit [1]</td>
</tr>
<tr>
<td>27</td>
<td>When the Software Lock is implemented.:</td>
</tr>
<tr>
<td>26</td>
<td>Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when the Software Lock is not implemented, this field is RES0.</td>
</tr>
<tr>
<td>25</td>
<td>For memory-mapped accesses when the Software Lock is implemented, possible values of this field are:</td>
</tr>
</tbody>
</table>

Page 3419
SLK, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

<table>
<thead>
<tr>
<th>SLI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Software Lock not implemented or not memory-mapped access.</td>
</tr>
<tr>
<td>0b1</td>
<td>Software Lock implemented and memory-mapped access.</td>
</tr>
</tbody>
</table>

Accessing the EDLSR

EDLSR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFB4</td>
<td>EDLSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
EDPCSR, External Debug Program Counter Sample Register

The EDPCSR characteristics are:

**Purpose**

Holds a sampled instruction address value.

**Configuration**

EDPCSR is in the Core power domain. RW fields in this register reset to architecturally **UNKNOWN** values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

This register is present only when ARMv8.0-PCSample is implemented and ARMv8.2-PCSample is not implemented. Otherwise, direct accesses to EDPCSR are **RES0**.

Implemented only if the **OPTIONAL** PC Sample-based Profiling Extension is implemented in the external debug registers space.

**Note**

ARMv8.2-PCSample implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

**Attributes**

EDPCSR is a pair of 32-bit registers.

If ARMv8.1-VHE is implemented, the format of this register differs depending on the value of EDSCR.SC2.

**Field descriptions**

The EDPCSR bit assignments are:

**When ARMv8.1-VHE is not implemented or EDSCR.SC2 == 0:**

<table>
<thead>
<tr>

</tbody>
</table>

**PC Sample high word, EDPCSRhi**

**PC Sample low word**

**Bits [63:32]**

PC Sample high word, EDPCSRhi. If EDVIDSR.HV == 0 then this field is RAZ, otherwise bits [63:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from EDVIDSR. {NS,E2,E3}.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [31:0]**

PC Sample low word. EDPCSRlo, bits[31:0] of the sampled instruction address value.

EDPCSRlo reads as 0xFFFFFFFF when any of the following are true:
The PE is in Debug state.
PC Sample-based profiling is prohibited.

If an instruction has retired since the PE left Reset state, then the first read of EDPCSR[31:0] is permitted but not required to return 0xFFFFFFFF.

EDPCSRlo reads as an UNKNOWN value when any of the following are true:

- The PE is in Reset state.
- No instruction has retired since the PE left Reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No instruction has retired since the last read of EDPCSR[31:0].

For the cases where a read of EDPCSR[31:0] returns 0xFFFFFFFF or an UNKNOWN value, the read has the side-effect of setting EDPCSRhi, EDCIDSR, and EDVIDSR to UNKNOWN values.

Otherwise, a read of EDPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to EDPCSRhi, EDCIDSR, and EDVIDSR. The translation regime that EDPCSR samples can be determined from EDVIDSR. {NS,E2,E3}.

For a read of EDPCSR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and EDPCSRhi, EDCIDSR, and EDVIDSR are unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ARMv8.1-VHE is implemented and EDSCR.SC2 == 1:

<table>
<thead>
<tr>
<th>NS</th>
<th>EL</th>
<th>RES0</th>
<th>PC Sample high word, EDPCSRhi</th>
<th>PC Sample low word</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>30</td>
<td>29</td>
<td>28</td>
<td>27</td>
</tr>
</tbody>
</table>

**NS, bit [63]**

Non-secure state sample. Indicates the Security state that is associated with the most recent EDPCSR sample or, when it is read as a single atomic 64-bit read, the current EDPCSR sample. The translation regime that EDPCSR samples can be determined from EDPCSR. {NS,EL}.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sample is from Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Sample is from Non-secure state.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**EL, bits [62:61]**

Exception level status sample. Indicates the Exception level that is associated with the most recent EDPCSR sample or, when it is read as a single atomic 64-bit read, the current EDPCSR sample. The translation regime that EDPCSR samples can be determined from EDPCSR. {NS,EL}.

<table>
<thead>
<tr>
<th>EL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Sample is from EL0.</td>
</tr>
<tr>
<td>0b01</td>
<td>Sample is from EL1.</td>
</tr>
<tr>
<td>0b10</td>
<td>Sample is from EL2.</td>
</tr>
<tr>
<td>0b11</td>
<td>Sample is from EL3.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [60:56]**

Reserved, RES0.
Bits [55:32]

PC Sample high word, EDPCSRhi. Bits [55:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

PC Sample low word. EDPCSRlo, bits[31:0] of the sampled instruction address value.

EDPCSRlo reads as 0xFFFFFFFF when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If an instruction has retired since the PE left Reset state, then the first read of EDPCSR[31:0] is permitted but not required to return 0xFFFFFFFF.

EDPCSRlo reads as an UNKNOWN value when any of the following are true:

- The PE is in Reset state.
- No instruction has retired since the PE left Reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No instruction has retired since the last read of EDPCSR[31:0].

For the cases where a read of EDPCSR[31:0] returns 0xFFFFFFFF or an UNKNOWN value, the read has the side-effect of setting EDPCSRhi, EDCIDSR, and EDVIDSR to UNKNOWN values.

Otherwise, a read of EDPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to EDPCSRhi, EDCIDSR, and EDVIDSR. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

For a read of EDPCSR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and EDPCSRhi, EDCIDSR, and EDVIDSR are unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the EDPCSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

EDPCSR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x0A0</td>
<td>EDPCSR</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x0AC</td>
<td>EDPCSR</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
EDPFR, External Debug Processor Feature Register

The EDPFR characteristics are:

**Purpose**

Provides information about implemented PE features.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

It is IMPLEMENTATION DEFINED whether EDPFR is implemented in the Core power domain or in the Debug power domain.

**Attributes**

EDPFR is a 64-bit register.

**Field descriptions**

The EDPFR bit assignments are:

| Bit 63 | Bit 62 | Bit 61 | Bit 60 | Bit 59 | Bit 58 | Bit 57 | Bit 56 | Bit 55 | Bit 54 | Bit 53 | Bit 52 | Bit 51 | Bit 50 | Bit 49 | Bit 48 | Bit 47 | Bit 46 | Bit 45 | Bit 44 | Bit 43 | Bit 42 | Bit 41 | Bit 40 | Bit 39 | Bit 38 | Bit 37 | Bit 36 | Bit 35 | Bit 34 | Bit 33 | Bit 32 |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|

**Bits [63:60]**

From Armv8.5:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

**Bits [59:56]**

From Armv8.5:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

**Bits [55:52]**

Reserved, RES0.
Bits [51:48]
From Armv8.4:
Reserved, UNKNOWN.

Otherwise:
Reserved, RES0.

AMU, bits [47:44]
From Armv8.4:
Activity Monitors Extension. Defined values are:

<table>
<thead>
<tr>
<th>AMU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Activity Monitors Extension is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Activity Monitors Extension version 1 is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.4-AMUv1 implements the functionality identified by the value 0b0001.

In Armv8.0, Armv8.1, Armv8.2, and Armv8.3, the only permitted value is 0b0000.

From Armv8.4, the permitted values are 0b0000 and 0b0001.

Otherwise:
Reserved, RES0.

Bits [43:40]
From Armv8.2:
Reserved, UNKNOWN.

Otherwise:
Reserved, RES0.

SEL2, bits [39:36]
From Armv8.4:
Secure EL2. Defined values are:

<table>
<thead>
<tr>
<th>SEL2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Secure EL2 is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Secure EL2 is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Otherwise:
Reserved, RES0.
SVE, bits [35:32]

From Armv8.2:

Scalable Vector Extension. Defined values are:

<table>
<thead>
<tr>
<th>SVE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SVE is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SVE is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Otherwise:

Reserved, RES0.

Bits [31:28]

From Armv8.2:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

GIC, bits [27:24]

System register GIC interface support. Defined values are:

<table>
<thead>
<tr>
<th>GIC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>GIC CPU interface system registers not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.</td>
</tr>
<tr>
<td>0b0011</td>
<td>System register interface to version 4.1 of the GIC CPU interface is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64PFR0_EL1.GIC.

AdvSIMD, bits [23:20]

Advanced SIMD. Defined values are:

<table>
<thead>
<tr>
<th>AdvSIMD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Advanced SIMD is implemented, including support for the following SISD and SIMD operations:</td>
</tr>
<tr>
<td></td>
<td>• Integer byte, halfword, word and doubleword element operations.</td>
</tr>
<tr>
<td></td>
<td>• Single-precision and double-precision floating-point arithmetic.</td>
</tr>
<tr>
<td></td>
<td>• Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.</td>
</tr>
<tr>
<td>0b0001</td>
<td>As for 0b0000, and also includes support for half-precision floating-point arithmetic.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Advanced SIMD is not implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field must have the same value as the FP field.
The permitted values are:

- 0b0000 in an implementation with Advanced SIMD support, that does not include the ARMv8.2-FP16 extension.
- 0b0001 in an implementation with Advanced SIMD support, that includes the ARMv8.2-FP16 extension.
- 0b1111 in an implementation without Advanced SIMD support.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64PFR0_EL1.AdvSIMD.

**FP, bits [19:16]**

Floating-point. Defined values are:

<table>
<thead>
<tr>
<th>FP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Floating-point is implemented, and includes support for:</td>
</tr>
<tr>
<td></td>
<td>• Single-precision and double-precision floating-point types.</td>
</tr>
<tr>
<td></td>
<td>• Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.</td>
</tr>
<tr>
<td>0b0001</td>
<td>As for 0b0000, and also includes support for half-precision floating-point arithmetic.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Floating-point is not implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field must have the same value as the AdvSIMD field.

The permitted values are:

- 0b0000 in an implementation with floating-point support, that does not include the ARMv8.2-FP16 extension.
- 0b0001 in an implementation with floating-point support, that includes the ARMv8.2-FP16 extension.
- 0b1111 in an implementation without floating-point support.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64PFR0_EL1.FP.

**EL3, bits [15:12]**

AArch64 EL3 Exception level handling. Defined values are:

<table>
<thead>
<tr>
<th>EL3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL3 is not implemented or cannot be executed in AArch64 state.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EL3 can be executed in AArch64 state only.</td>
</tr>
<tr>
<td>0b0010</td>
<td>EL3 can be executed in either AArch64 or AArch32 state.</td>
</tr>
</tbody>
</table>

When the value of EDAA32PFR.EL3 is non-zero, this field must be 0b0000.

All other values are reserved.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64PFR0_EL1.EL3.

**EL2, bits [11:8]**

AArch64 EL2 Exception level handling. Defined values are:

<table>
<thead>
<tr>
<th>EL2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL2 is not implemented or cannot be executed in AArch64 state.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EL2 can be executed in AArch64 state only.</td>
</tr>
<tr>
<td>0b0010</td>
<td>EL2 can be executed in either AArch64 or AArch32 state.</td>
</tr>
</tbody>
</table>

When the value of EDAA32PFR.EL2 is non-zero, this field must be 0b0000.

All other values are reserved.
In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of `ID_AA64PFR0_EL1_EL.EL2`.

**EL1, bits [7:4]**

AArch64 EL1 Exception level handling. Defined values are:

<table>
<thead>
<tr>
<th>EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL1 cannot be executed in AArch64 state. EL1 can be executed in AArch32 state only.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EL1 can be executed in AArch64 state only.</td>
</tr>
<tr>
<td>0b0010</td>
<td>EL1 can be executed in either AArch64 or AArch32 state.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of `ID_AA64PFR0_EL1_EL.EL1`.

**EL0, bits [3:0]**

AArch64 EL0 Exception level handling. Defined values are:

<table>
<thead>
<tr>
<th>EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL0 cannot be executed in AArch64 state. EL0 can be executed in AArch32 state only.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EL0 can be executed in AArch64 state only.</td>
</tr>
<tr>
<td>0b0010</td>
<td>EL0 can be executed in either AArch64 or AArch32 state.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of `ID_AA64PFR0_EL1_EL.EL0`.

**Accessing the EDPFR**

**EDPFR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xD20</td>
<td>EDPFR</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `IsCorePowered()` and `!DoubleLockStatus()` accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xD24</td>
<td>EDPFR</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `IsCorePowered()` and `!DoubleLockStatus()` accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.
EDPIDR0, External Debug Peripheral Identification Register 0

The EDPIDR0 characteristics are:

**Purpose**

Provides information to identify an external debug component.

For more information see 'About the Peripheral identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

**Configuration**

It is **IMPLEMENTATION DEFINED** whether EDPIDR0 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is **OPTIONAL**.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDPIDR0 is a 32-bit register.

**Field descriptions**

The EDPIDR0 bit assignments are:

| Bit 31 | Bit 30 | Bit 29 | Bit 28 | Bit 27 | Bit 26 | Bit 25 | Bit 24 | Bit 23 | Bit 22 | Bit 21 | Bit 20 | Bit 19 | Bit 18 | Bit 17 | Bit 16 | Bit 15 | Bit 14 | Bit 13 | Bit 12 | Bit 11 | Bit 10 | Bit 9  | Bit 8  | Bit 7  | Bit 6  | Bit 5  | Bit 4  | Bit 3  | Bit 2  | Bit 1  | Bit 0  |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
|        |        |        |        |        |        |        |        |        | RES0   |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |
| **RES0** |        |        |        |        |        |        |        |        |        | **PART_0** |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |

**Bits [31:8]**

Reserved, RES0.

**PART_0, bits [7:0]**

Part number, least significant byte.

**Accessing the EDPIDR0**

EDPIDR0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFE0</td>
<td>EDPIDR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
EDPIDR1, External Debug Peripheral Identification Register 1

The EDPIDR1 characteristics are:

**Purpose**

Provides information to identify an external debug component.

For more information see 'About the Peripheral identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

**Configuration**

It is IMPLEMENTATION DEFINED whether EDPIDR1 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDPIDR1 is a 32-bit register.

**Field descriptions**

The EDPIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>27-24</td>
<td>DES_0</td>
</tr>
<tr>
<td>20-16</td>
<td>PART_1</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**DES_0, bits [7:4]**

Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is 0b1011.

**PART_1, bits [3:0]**

Part number, most significant nibble.

**Accessing the EDPIDR1**

EDPIDR1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFE4</td>
<td>EDPIDR1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
• When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are RO.
• Otherwise accesses to this register generate an error response.
EDPIDR2, External Debug Peripheral Identification Register 2

The EDPIDR2 characteristics are:

**Purpose**

Provides information to identify an external debug component.

For more information see 'About the Peripheral identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

**Configuration**

It is IMPLEMENTATION DEFINED whether EDPIDR2 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDPIDR2 is a 32-bit register.

**Field descriptions**

The EDPIDR2 bit assignments are:

```
| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  |  9  |  8  |  7  |  6  |  5  |  4  |  3  |  2  |  1  |  0  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0| REVISION | JEDEC | DES_1 |

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.

JEDEC, bit [3]

RAO. Indicates a JEP106 identity code is used.

DES_1, bits [2:0]

Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is 0b011.
Accessing the EDPIDR2

EDPIDR2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
EDPIDR3, External Debug Peripheral Identification Register 3

The EDPIDR3 characteristics are:

**Purpose**

Provides information to identify an external debug component.

For more information see 'About the Peripheral identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

**Configuration**

It is **IMPLEMENTATION DEFINED** whether EDPIDR3 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is **OPTIONAL**.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDPIDR3 is a 32-bit register.

**Field descriptions**

The EDPIDR3 bit assignments are:

<table>
<thead>

</tbody>
</table>

Reserved, RES0.

**REVAND, bits [7:4]**

Part minor revision. Parts using EDPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.

**CMOD, bits [3:0]**

Customer modified. Indicates someone other than the Designer has modified the component.

**Accessing the EDPIDR3**

EDPIDR3 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFEC</td>
<td>EDPIDR3</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
EDPIDR4, External Debug Peripheral Identification Register 4

The EDPIDR4 characteristics are:

**Purpose**

Provides information to identify an external debug component.

For more information see 'About the Peripheral identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

**Configuration**

It is **IMPLEMENTATION DEFINED** whether EDPIDR4 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is **OPTIONAL**.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDPIDR4 is a 32-bit register.

**Field descriptions**

The EDPIDR4 bit assignments are:

|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

**Bits [31:8]**

Reserved, RES0.

**SIZE, bits [7:4]**

Size of the component. RAZ. Log2 of the number of 4KB pages from the start of the component to the end of the component ID registers.

**DES_2, bits [3:0]**

Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is 0b0100.

**Accessing the EDPIDR4**

EDPIDR4 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFD0</td>
<td>EDPIDR4</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
EDPRCR, External Debug Power/Reset Control Register

The EDPRCR characteristics are:

**Purpose**

Controls the PE functionality related to powerup, reset, and powerdown.

**Configuration**

EDPRCR contains fields that are in the Core power domain and fields that are in the Debug power domain.

For RW fields see the field description for a description of the behavior of the field on a reset that applies to its power domain. However:

- Fields that are in the Core power domain are not affected by a warm reset and are not affected by an External debug reset.
- Fields that are in the Debug power domain reset to their defined reset values on an External debug reset, and are not affected by a Warm reset and are not affected by a Cold reset.

If ARMv8.3-DoPD is implemented then all fields in this register are in the Core power domain.

CORENPDRQ is the only field that is mapped between the EDPRCR and DBGPRCR and DBGPRCR_EL1.

**Attributes**

EDPRCR is a 32-bit register.

**Field descriptions**

The EDPRCR bit assignments are:

**When ARMv8.3-DoPD is implemented:**

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>

<td></td>
<td></td>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>CWRR</td>
<td>CORENPDRQ</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:2]**

Reserved, RES0.

**CWRR, bit [1]**

Warm reset request. Write-only bit that reads as zero.

The extent of the reset is IMPLEMENTATION DEFINED, but must be one of:

- The request is ignored.
- Only this PE is Warm reset.
- This PE and other components of the system, possibly including other PEs, are Warm reset.

Arm deprecates use of this bit, and recommends that implementations ignore the request.

<table>
<thead>
<tr>
<th>CWRR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Request Warm reset.</td>
</tr>
</tbody>
</table>
This field is in the Core power domain.

The PE ignores writes to this bit if any of the following are true:

- `ExternalInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Non-secure state.`
- `ExternalSecureInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Secure state.`
- `ExternalSecureInvasiveDebugEnabled() == FALSE and EL3 is implemented.`

In an implementation that includes the recommended external debug interface, this bit drives the DBGRSTREQ signal.

On a Warm reset, this field resets to 0.

Accessing this field has the following behavior:

- When `!IsCorePowered(), or DoubleLockStatus(), or OSLockStatus() or SoftwareLockStatus()`, access to this field is `WI`.
- Otherwise, access to this field is `WO`.

**CORENPDRQ, bit [0]**

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the **IMPLEMENTATION DEFINED** nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

<table>
<thead>
<tr>
<th>CORENPDRQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If the system responds to a powerdown request, it powers down Core power domain.</td>
</tr>
<tr>
<td>0b1</td>
<td>If the system responds to a powerdown request, it does not power down the Core power domain, but instead emulates a powerdown of that domain.</td>
</tr>
</tbody>
</table>

When this bit reads as `UNKNOWN`, the PE ignores writes to this bit.

This field is in the Core power domain, and permitted accesses to this field map to the `DBGPRC_EL1.CORENPDRQ` and `DBGPRC_EL1.CORENPDRQ` fields.

In an implementation that includes the recommended external debug interface, this bit drives the `DBGNOPWRDWN` signal.

It is **IMPLEMENTATION DEFINED** whether this bit is reset the Cold reset value on exit from an **IMPLEMENTATION DEFINED** software-visible retention state. For more information about retention states see Core power domain power states.

**Note**

Writes to this bit are not prohibited by the **IMPLEMENTATION DEFINED** authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The following resets apply:

- On a Cold reset, this field is set to 1 if the powerup request is implemented and the powerup request has been asserted, and is set to 0 otherwise.
- On a Warm reset, the value of this field is unchanged.

Accessing this field has the following behavior:

- When `!IsCorePowered(), or DoubleLockStatus() or OSLockStatus()`, access to this field is `UNKNOWN`.
- When `SoftwareLockStatus()`, access to this field is `RO`.
- Otherwise, access to this field is `RW`.
Otherwise:

<table>
<thead>
<tr>
<th>Bits [31:4]</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
</table>

**COREPURQ, bit [3]**

Core powerup request. Allows a debugger to request that the power controller power up the core, enabling access to the debug register in the Core power domain, and that the power controller emulates powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the *IMPLEMENTATION DEFINED* nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

<table>
<thead>
<tr>
<th>COREPURQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not request power up of the Core power domain.</td>
</tr>
<tr>
<td>0b1</td>
<td>Request power up of the Core power domain, and emulation of powerdown.</td>
</tr>
</tbody>
</table>

In an implementation that includes the recommended external debug interface, this bit drives the DBGPWRUPREQ signal.

This field is in the Debug power domain and can be read and written when the Core power domain is powered off.

**Note**

 Writes to this bit are not prohibited by the *IMPLEMENTATION DEFINED* authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a External debug reset, this field resets to 0.

Accessing this field has the following behavior:

- When SoftwareLockStatus(), access to this field is RO.
- Otherwise, access to this field is RW.

**Bit [2]**

Reserved, RES0.

**CWRR, bit [1]**

Warm reset request. Write-only bit that reads as zero.

The extent of the reset is *IMPLEMENTATION DEFINED*, but must be one of:

- The request is ignored.
- Only this PE is Warm reset.
- This PE and other components of the system, possibly including other PEs, are Warm reset.

Arm deprecates use of this bit, and recommends that implementations ignore the request.

<table>
<thead>
<tr>
<th>CWRR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Request Warm reset.</td>
</tr>
</tbody>
</table>

This field is in the Core power domain

The PE ignores writes to this bit if any of the following are true:
**External Invasive Debug Enabled() == FALSE, EL3 is not implemented, and the implemented Security state is Non-secure state.**

**External Secure Invasive Debug Enabled() == FALSE, EL3 is not implemented, and the implemented Security state is Secure state.**

**External Secure Invasive Debug Enabled() == FALSE and EL3 is implemented.**

In an implementation that includes the recommended external debug interface, this bit drives the DBGRSTREQ signal.

On a Warm reset, this field resets to 0.

Accessing this field has the following behavior:

- When !IsCorePowered(), or DoubleLockStatus(), or OSLockStatus() or SoftwareLockStatus(), access to this field is **WI**.
- Otherwise, access to this field is **WO**.

**CORENPDRO, bit [0]**

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

<table>
<thead>
<tr>
<th>CORENPDRO</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If the system responds to a powerdown request, it powers down Core power domain.</td>
</tr>
<tr>
<td>0b1</td>
<td>If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.</td>
</tr>
</tbody>
</table>

When this bit reads as **UNKNOWN**, the PE ignores writes to this bit.

This field is in the Core power domain, and permitted accesses to this field map to the **DBGPRCR.CORENPDRO** and **DBGPRCR_EL1.CORENPDRO** fields.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is **IMPLEMENTATION DEFINED** whether this bit is reset to the value of **EDPRCR.COREPURQ** on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see Core power domain power states.

**Note**

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The following resets apply:

- On a Cold reset, this field resets to the value in **EDPRCR.COREPURQ**.
- On a Warm reset, the value of this field is unchanged.

Accessing this field has the following behavior:

- When !IsCorePowered(), or DoubleLockStatus() or OSLockStatus() or SoftwareLockStatus(), access to this field is **UNKNOWN**.
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RW**.

**Accessing the EDPRCR**

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.
**EDPRCR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x310</td>
<td>EDPRCR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When (ARMv8.3-DoPD is not implemented or IsCorePowered()) and SoftwareLockStatus() accesses to this register are **RO**.
- When (ARMv8.3-DoPD is not implemented or IsCorePowered()) and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.
EDPRSR, External Debug Processor Status Register

The EDPRSR characteristics are:

Purpose

Holds information about the reset and powerdown state of the PE.

Configuration

EDPRSR contains fields that are in the Core power domain and fields that are in the Debug power domain.

Some of the fields in the Core power domain are in the Cold reset domain and others are in the Warm reset domain. See the field descriptions for more information. However:

- Fields that are in the Cold reset domain are not affected by a warm reset and are not affected by an External debug reset.
- Fields in the Warm reset domain are also reset by a Cold reset but are not affected by an External debug reset.
- Fields in the Debug power domain are not affected by a Warm reset and are not affected by a Cold reset.

If ARMv8.3-DoPD is implemented then all fields in this register are in the Core power domain.

Attributes

EDPRSR is a 32-bit register.

Field descriptions

The EDPRSR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | STAD | ETAD | SDR | PMADE | SDADE | DAD | DLK | OSLK | HALTED | SR | SPD | PU |

Bits [31:14]

Reserved, RES0.

STAD, bit [13]

When TRBE is implemented:

Sticky ETAD error. Set to 1 when a Non-secure external debug interface access to an external PE Trace Unit register returns an error because AllowExternalTraceAccess() == FALSE for the access.

<table>
<thead>
<tr>
<th>STAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No Non-secure external debug interface accesses to the PE Trace Unit registers have failed because AllowExternalTraceAccess() == FALSE for the access since EDPRSR was last read.</td>
</tr>
<tr>
<td>0b1</td>
<td>At least one Non-secure external debug interface access to the PE Trace Unit registers has failed and returned an error because AllowExternalTraceAccess() == FALSE for the access since EDPRSR was last read.</td>
</tr>
</tbody>
</table>

If the Core power domain is powered up, then, following a read of EDPRSR:

- If ARMv8.0-DoubleLock is not implemented or DoubleLockStatus() == FALSE then this bit clears to 0.
EDPRS R, External Debug Processor Status Register

- If ARMv8.0-DoubleLock is implemented and DoubleLockStatus() == TRUE then it is **CONSTRAINED UNPREDICTABLE** whether this bit clears to 0 or is unchanged.

This bit is in the Core power domain.

On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- When !IsCorePowered(), or DoubleLockStatus() or EDPRS R.R == 1, access to this field is **UNKNOWN**.
- Otherwise, access to this field is **RO**.

**Otherwise:**

Reserved, RES0.

**ETAD, bit [12]**

**When TRBE is implemented:**

External Trace Access Disable status.

<table>
<thead>
<tr>
<th>ETAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>External Non-secure PE Trace Unit accesses enabled. AllowExternalTraceAccess() == TRUE for a Non-secure access.</td>
</tr>
<tr>
<td>0b1</td>
<td>External Non-secure PE Trace Unit accesses disabled. AllowExternalTraceAccess() == FALSE for a Non-secure access.</td>
</tr>
</tbody>
</table>

This field is in the Core power domain.

Accessing this field has the following behavior:

- When !IsCorePowered(), or DoubleLockStatus() or EDPRS R.R == 1, access to this field is **UNKNOWN**.
- Otherwise, access to this field is **RO**.

**Otherwise:**

Reserved, RES0.

**SDR, bit [11]**

Sticky Debug Restart. Set to 1 when the PE exits Debug state.

Permitted values are:

<table>
<thead>
<tr>
<th>SDR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The PE has not restarted since EDPRS R was last read.</td>
</tr>
<tr>
<td>0b1</td>
<td>The PE has restarted since EDPRS R was last read.</td>
</tr>
</tbody>
</table>

**Note**

If a reset occurs when the PE is in Debug state, the PE exits Debug state. SDR is **UNKNOWN** on Warm reset, meaning a debugger must also use the SR bit to determine whether the PE has left Debug state.

If The Core power domain is powered up, then following a read of EDPRS R:

- If ARMv8.0-DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If ARMv8.0-DoubleLock is implemented and DoubleLockStatus() == TRUE, it is **CONSTRAINED UNPREDICTABLE** whether this bit clears to 0 or is unchanged.

This field is in the Core power domain and the Warm reset domain.

This field resets to an architecturally **UNKNOWN** value.
Accessing this field has the following behavior:

- When `!IsCorePowered()`, or `DoubleLockStatus()` or `EDPRSR.R == 1`, access to this field is **UNKNOWN**.
- When `SoftwareLockStatus()`, access to this field is **RO**.
- Otherwise, access to this field is **RC**.

**SPMAD, bit [10]**

*When ARMv8.4-Debug is implemented:*

Sticky EPMAD error. Set to 1 if an external debug interface access to a Performance Monitors register returns an error because `AllowExternalPMUAccess() == FALSE`.

Permitted values are:

<table>
<thead>
<tr>
<th>SPMAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No Non-secure external debug interface accesses to the external Performance Monitors registers have failed because <code>AllowExternalPMUAccess() == FALSE</code> for the access since <code>EDPRSR</code> was last read.</td>
</tr>
<tr>
<td>0b1</td>
<td>At least one Non-secure external debug interface access to the external Performance Monitors register has failed and returned an error because <code>AllowExternalPMUAccess() == FALSE</code> for the access since <code>EDPRSR</code> was last read.</td>
</tr>
</tbody>
</table>

If the Core power domain is powered up, then, following a read of `EDPRSR`:

- If ARMv8.0-DoubleLock is not implemented or `DoubleLockStatus() == FALSE`, this bit clears to 0.
- If ARMv8.0-DoubleLock is implemented, and `DoubleLockStatus() == TRUE`, it is **CONSTRAINED UNPREDICTABLE** whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- When `!IsCorePowered()`, or `DoubleLockStatus()` or `EDPRSR.R == 1`, access to this field is **UNKNOWN**.
- When `SoftwareLockStatus()`, access to this field is **RO**.
- Otherwise, access to this field is **RC**.

**Otherwise:**

Sticky EPMAD error.

<table>
<thead>
<tr>
<th>SPMAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No external debug interface accesses to the Performance Monitors registers have failed because <code>AllowExternalPMUAccess() == FALSE</code> since <code>EDPRSR</code> was last read.</td>
</tr>
<tr>
<td>0b1</td>
<td>At least one external debug interface access to the Performance Monitors registers has failed and returned an error because <code>AllowExternalPMUAccess() == FALSE</code> since <code>EDPRSR</code> was last read.</td>
</tr>
</tbody>
</table>

If the Core power domain is powered up, then, following a read of `EDPRSR`:

- If ARMv8.0-DoubleLock is not implemented or `DoubleLockStatus() == FALSE`, this bit clears to 0.
- If ARMv8.0-DoubleLock is implemented, and `DoubleLockStatus() == TRUE`, it is **CONSTRAINED UNPREDICTABLE** whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:
• When !IsCorePowered(), or OSLockStatus(), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN**.
• When SoftwareLockStatus(), access to this field is **RO**.
• Otherwise, access to this field is **RC**.

**EPMAD, bit [9]**

*When ARMv8.4-Debug is implemented:*

External Performance Monitors Access Disable status.

<table>
<thead>
<tr>
<th>EPMAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>External Non-secure Performance Monitors access enabled. AllowExternalPMUAccess() == TRUE for a Non-secure access.</td>
</tr>
<tr>
<td>0b1</td>
<td>External Non-secure Performance Monitors access disabled. AllowExternalPMUAccess() == FALSE for a Non-secure access.</td>
</tr>
</tbody>
</table>

This field is in the Core power domain.

Accessing this field has the following behavior:

• When !IsCorePowered(), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN**.
• Otherwise, access to this field is **RO**.

**Otherwise:**

External Performance Monitors access disable status.

<table>
<thead>
<tr>
<th>EPMAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>External Performance Monitors access enabled. AllowExternalPMUAccess() == TRUE.</td>
</tr>
<tr>
<td>0b1</td>
<td>External Performance Monitors access disabled. AllowExternalPMUAccess() == FALSE.</td>
</tr>
</tbody>
</table>

This field is in the Core power domain.

Accessing this field has the following behavior:

• When !IsCorePowered(), or OSLockStatus(), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN**.
• Otherwise, access to this field is **RO**.

**SDAD, bit [8]**

*When ARMv8.4-Debug is implemented:*

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because AllowExternalDebugAccess() == FALSE.

<table>
<thead>
<tr>
<th>SDAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No Non-secure external debug interface accesses to the debug registers have failed because AllowExternalDebugAccess() == FALSE for the access since EDPRSR was last read.</td>
</tr>
<tr>
<td>0b1</td>
<td>At least one Non-secure external debug interface access to the debug registers has failed and returned an error because AllowExternalDebugAccess() == FALSE for the access since EDPRSR was last read.</td>
</tr>
</tbody>
</table>

If the Core power domain is powered up, then, following a read of EDPRSR:

• If ARMv8.0[DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.  
• If ARMv8.0[DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.  

This field is in the Core power domain.
On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- When !IsCorePowered(), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN**.
- Otherwise, access to this field is **RO**.

Otherwise:

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because AllowExternalDebugAccess() == FALSE.

<table>
<thead>
<tr>
<th>SDAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No external debug interface accesses to the debug registers have failed because AllowExternalDebugAccess() == FALSE since EDPRSR was last read.</td>
</tr>
<tr>
<td>0b1</td>
<td>At least one external debug interface access to the debug registers has failed and returned an error because AllowExternalDebugAccess() == FALSE since EDPRSR was last read.</td>
</tr>
</tbody>
</table>

If the Core power domain is powered up, then, following a read of EDPRSR:

- If ARMv8.0-DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If ARMv8.0-DoubleLock is implemented and DoubleLockStatus() == TRUE, it is **CONSTRAINED UNPREDICTABLE** whether this bit clears to 0 or is unchanged.

This bit is **UNKNOWN** on reads if OSLockStatus() == TRUE and external debug writes to OSLAR_EL1 do not return an error when AllowExternalDebugAccess() == FALSE.

This field is in the Core power domain.

On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- When !IsCorePowered(), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN**.
- Otherwise, access to this field is **RO**.

**EDAD, bit [7]**

When ARMv8.4-Debug is implemented:

External Debug Access Disable status.

<table>
<thead>
<tr>
<th>EDAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>External Non-secure access to breakpoint registers, watchpoint registers, and OSLAR_EL1 enabled. AllowExternalDebugAccess() == TRUE for a Non-secure access.</td>
</tr>
<tr>
<td>0b1</td>
<td>External Non-secure access to breakpoint registers, watchpoint registers, and OSLAR_EL1 disabled. AllowExternalDebugAccess() == FALSE for a Non-secure access.</td>
</tr>
</tbody>
</table>

This field is in the Core power domain.

Accessing this field has the following behavior:

- When !IsCorePowered(), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN**.
- Otherwise, access to this field is **RO**.

When ARMv8.2-Debug is implemented:

External Debug Access Disable status.
### EDPRSR, External Debug Processor Status Register

<table>
<thead>
<tr>
<th>EDAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>External access to breakpoint registers, watchpoint registers, and <code>OSLR_EL1</code> enabled. <code>AllowExternalDebugAccess()</code> == TRUE.</td>
</tr>
<tr>
<td>0b1</td>
<td>External access to breakpoint registers, watchpoint registers, and <code>OSLR_EL1</code> disabled. <code>AllowExternalDebugAccess()</code> == FALSE.</td>
</tr>
</tbody>
</table>

This bit is not valid and reads **UNKNOWN** if `OSLockStatus()` == TRUE and external debug writes to `OSLR_EL1` do not return an error when `AllowExternalDebugAccess()` == FALSE.

This field is in the Core power domain. Accessing this field has the following behavior:

- When `!IsCorePowered()`, or `DoubleLockStatus()` or `EDPRSR.R == 1`, access to this field is **UNKNOWN**.
- Otherwise, access to this field is **RO**.

**Otherwise:**

External Debug Access Disable status.

<table>
<thead>
<tr>
<th>EDAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>External access to breakpoint registers, watchpoint registers, and <code>OSLR_EL1</code> enabled. <code>AllowExternalDebugAccess()</code> == TRUE.</td>
</tr>
<tr>
<td>0b1</td>
<td>External access to breakpoint registers, watchpoint registers disabled. It is <strong>IMPLEMENTATION DEFINED</strong> whether accesses to <code>OSLR_EL1</code> are enabled or disabled. <code>AllowExternalDebugAccess()</code> == FALSE.</td>
</tr>
</tbody>
</table>

This field is in the Core power domain. Accessing this field has the following behavior:

- When `!IsCorePowered()`, or `DoubleLockStatus()` or `EDPRSR.R == 1`, access to this field is **UNKNOWN**.
- Otherwise, access to this field is **RO**.

**DLK, bit [6]**

**When ARMv8.4-Debug is implemented:**

This field is **RES0**.

**When ARMv8.2-Debug is implemented and ARMv8.0-DoubleLock is implemented:**

Double Lock.

From Armv8.2, this field is deprecated.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When `IsCorePowered()` and `!DoubleLockStatus()`, access to this field is **RAZ**.
- Otherwise, access to this field is **UNKNOWN**.

**When ARMv8.0-DoubleLock is implemented:**

Double Lock.

This field returns the result of the pseudocode function `DoubleLockStatus()`.

If the Core power domain is powered up and `DoubleLockStatus()` == TRUE, it is **IMPLEMENTATION DEFINED** whether:
EDPRSR, External Debug Processor Status Register

- EDPRSR.PU reads as 1, EDPRSR.DLK reads as 1, and EDPRSR.SPD is \textit{UNKNOWN}.
- EDPRSR.PU reads as 0, EDPRSR.DLK is \textit{UNKNOWN}, and EDPRSR.SPD reads as 0.

This field is in the Core power domain.

<table>
<thead>
<tr>
<th>DLK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>DoubleLockStatus() returns FALSE.</td>
</tr>
<tr>
<td>0b1</td>
<td>DoubleLockStatus() returns TRUE and the Core power domain is powered up.</td>
</tr>
</tbody>
</table>

Accessing this field has the following behavior:

- When \texttt{!IsCorePowered()}, access to this field is \textit{UNKNOWN}.
- Otherwise, access to this field is \textit{RO}.

\textbf{Otherwise:}

Reserved, RES0.

\textbf{OSLK, bit [5]}

OS Lock status bit.

A read of this bit returns the value of \texttt{OSLSR_EL1.OSLK}.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When \texttt{!IsCorePowered()}, DoubleLockStatus() and EDPRSR.R == 1, access to this field is \textit{UNKNOWN}.
- Otherwise, access to this field is \textit{RO}.

\textbf{HALTED, bit [4]}

Halted status bit.

<table>
<thead>
<tr>
<th>HALTED</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PE is in Non-debug state.</td>
</tr>
<tr>
<td>0b1</td>
<td>PE is in Debug state.</td>
</tr>
</tbody>
</table>

This field is in the Core power domain.

Accessing this field has the following behavior:

- When \texttt{!IsCorePowered()}, access to this field is \textit{UNKNOWN}.
- Otherwise, access to this field is \textit{RO}.

\textbf{SR, bit [3]}

Sticky core Reset status bit.

Permitted values are:

<table>
<thead>
<tr>
<th>SR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The non-debug logic of the PE is not in reset state and has not been reset since the last time EDPRSR was read.</td>
</tr>
<tr>
<td>0b1</td>
<td>The non-debug logic of the PE is in reset state or has been reset since the last time EDPRSR was read.</td>
</tr>
</tbody>
</table>

If EDPRSR.PU reads as 1 and EDPRSR.R reads as 0, which means that the Core power domain is in a powerup state and that the non-debug logic of the PE is not in reset state, then following a read of EDPRSR:

- If ARMv8.0-DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If ARMv8.0-DoubleLock is implemented and DoubleLockStatus() == TRUE, it is \textit{UNPREDICTABLE} whether this bit clears to 0 or is unchanged.
This field is in the Core power domain and the Warm reset domain.

This field resets to 1.

Accessing this field has the following behavior:

- When !IsCorePowered() or DoubleLockStatus(), access to this field is **UNKNOWN**.
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RC**.

**R, bit [2]**

PE Reset status bit.

Permitted values are:

<table>
<thead>
<tr>
<th>R</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The non-debug logic of the PE is not in reset state.</td>
</tr>
<tr>
<td>0b1</td>
<td>The non-debug logic of the PE is in reset state.</td>
</tr>
</tbody>
</table>

If ARMv8.0-DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a **CONSTRAINED UNPREDICTABLE** value. For more information see 'EDPRSR.{DLK, R} and reset state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H6 (Debug Reset and Powerdown Support)

This field is in the Core power domain.

Accessing this field has the following behavior:

- When !IsCorePowered() or DoubleLockStatus(), access to this field is **UNKNOWN**.
- Otherwise, access to this field is **RO**.

**SPD, bit [1]**

Sticky core Powerdown status bit.

If ARMv8.0-DoubleLock is implemented and DoubleLockStatus() == TRUE, then:

- If ARMv8.2-Debug is implemented, this bit reads as 0.
- If ARMv8.2-Debug is not implemented, this bit might read as 0 or 1.

For more information, see EDPRSR.{DLK, SPD, PU} and the Core power domain.

<table>
<thead>
<tr>
<th>SPD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If EDPRSR.PU is 0, it is not known whether the state of the debug registers in the Core power domain is lost. If EDPRSR.PU is 1, the state of the debug registers in the Core power domain has not been lost.</td>
</tr>
<tr>
<td>0b1</td>
<td>The state of the debug registers in the Core power domain has been lost.</td>
</tr>
</tbody>
</table>

If the Core power domain is powered up, then, following a read of EDPRSR:

- If ARMv8.0-DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If ARMv8.0-DoubleLock is implemented and DoubleLockStatus() == TRUE, it is **CONSTRAINED UNPREDICTABLE** whether this bit clears to 0 or is unchanged.

When the Core power domain is in either retention or powerdown state, the value of EDPRSR.SPD is **IMPLEMENTATION DEFINED**. For more information, see 'EDPRSR.SPD when the Core domain is in either retention or powerdown state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H6 (Debug Reset and Powerdown Support).

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see 'EDPRSR.{DLK, SPD, PU} bits record accessibility and lost of state in Core power domain' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H6 (Debug Reset and Powerdown Support).

This field is in the Core power domain and the Cold reset domain.
On a Cold reset, this field resets to 1.

Accessing this field has the following behavior:

- When !IsCorePowered(), access to this field is RAZ.
- When IsCorePowered() and DoubleLockStatus(), access to this field is UNKNOWN.
- Otherwise, access to this field is RO.

**PU, bit [0]**

*When ARMv8.3-DoPD is implemented:*

Core powerup status bit.

Access to this field is RAO.

*When ARMv8.2-Debug is implemented:*

Core Powerup status bit. Indicates whether the debug registers in the Core power domain can be accessed.

<table>
<thead>
<tr>
<th>PU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Either the Core power domain is in a low-power or powerdown state, or ARMv8.0-DoubleLock is implemented and DoubleLockStatus() == TRUE, meaning the debug registers in the Core power domain cannot be accessed.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Core power domain is in a powerup state, and either ARMv8.0-DoubleLock is not implemented or DoubleLockStatus() == FALSE, meaning the debug registers in the Core power domain can be accessed.</td>
</tr>
</tbody>
</table>

If ARMv8.0-DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONstrained UNpredicTaBle value. For more information see 'EDPRSR.{DLK, R} and reset state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H6 (Debug Reset and Powerdown Support)

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see 'EDPRSR.{DLK, SPD, PU} bits record accessibility and lost of state in Core power domain' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H6 (Debug Reset and Powerdown Support)

Access to this field is RO.

**Otherwise:**

Core Powerup status bit. Indicates whether the debug registers in the Core power domain can be accessed.

When the Core power domain is powered-up and DoubleLockStatus() == TRUE, then the value of EDPRSR.PU is IMPLEMENTATION DEFINED. See the description of the DLK bit for more information.

Otherwise, permitted values are:

<table>
<thead>
<tr>
<th>PU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Core power domain is in a low-power or powerdown state where the debug registers in the Core power domain cannot be accessed.</td>
</tr>
<tr>
<td>0b1</td>
<td>Core power domain is in a powerup state where the debug registers in the Core power domain can be accessed.</td>
</tr>
</tbody>
</table>

If ARMv8.0-DoubleLock is implemented, the Core power domain is powered up, and DoubleLockStatus() == TRUE, it is IMPLEMENTATION DEFINED whether this bit reads as 0 or 1.

If ARMv8.0-DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONstrained UNpredicTaBle value. For more information see 'EDPRSR.{DLK, R} and reset state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H6 (Debug Reset and Powerdown Support)

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see 'EDPRSR.{DLK, SPD, PU} bits record accessibility and lost of state in Core power domain' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H6 (Debug Reset and Powerdown Support)
record accessibility and lost of state in Core power domain’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H6 (Debug Reset and Powerdown Support)

Access to this field is RO.

**Accessing the EDPRSR**

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.

If the Core power domain is powered up (EDPRSR.PU == 1), then following a read of EDPRSR:

- If ARMv8.0-DoubleLock is not implemented or DoubleLockStatus() == FALSE, then:
  - EDPRSR.{SDR, SPMAD, SDAD, SPD} are cleared to 0.
  - EDPRSR.SR is cleared to 0 if the non-debug logic of the PE is not in reset state (EDPRSR.R == 0).
- Otherwise it is CONSTRAINED UNPREDICTABLE whether or not this clearing occurs.

If the Core power domain is powered down (EDPRSR.PU == 0), then:

- EDPRSR.{SDR, SPMAD, SDAD, SR} are all UNKNOWN, and are either reset or restored on being powered up.
- EDPRSR.SPD is not cleared following a read of EDPRSR. See the SPD bit description for more information.

The clearing of bits is an indirect write to EDPRSR.

**EDPRSR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x314</td>
<td>EDPRSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
EDRCR, External Debug Reserve Control Register

The EDRCR characteristics are:

Purpose

This register is used to allow imprecise entry to Debug state and clear sticky bits in EDSCR.

Configuration

EDRCR is in the Core power domain.

Attributes

EDRCR is a 32-bit register.

Field descriptions

The EDRCR bit assignments are:

|    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 |

Bits [31:5]

Reserved, RES0.

CBRRQ, bit [4]

Allow imprecise entry to Debug state. The actions on writing to this bit are:

<table>
<thead>
<tr>
<th>CBRRQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Allow imprecise entry to Debug state, for example by canceling pending bus accesses.</td>
</tr>
</tbody>
</table>

Setting this bit to 1 allows a debugger to request imprecise entry to Debug state. An External Debug Request debug event must be pending before the debugger sets this bit to 1.

This feature is optional. If this feature is not implemented, writes to this bit are ignored.

CSPA, bit [3]

Clear Sticky Pipeline Advance. This bit is used to clear the EDSCR.PipeAdv bit to 0. The actions on writing to this bit are:

<table>
<thead>
<tr>
<th>CSPA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Clear the EDSCR.PipeAdv bit to 0.</td>
</tr>
</tbody>
</table>

CSE, bit [2]

Clear Sticky Error. Used to clear the EDSCR cumulative error bits to 0. The actions on writing to this bit are:
### CSE Meaning

<table>
<thead>
<tr>
<th>CSE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Clear the EDSCR {TXU, RXO, ERR} bits, and, if the PE is in Debug state, the EDSCR.IFO bit, to 0.</td>
</tr>
</tbody>
</table>

**Bits [1:0]**

Reserved, RES0.

### Accessing the EDRCR

EDRCR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x090</td>
<td>EDRCR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are WI.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are WO.
- Otherwise accesses to this register generate an error response.
EDSCR, External Debug Status and Control Register

The EDSCR characteristics are:

**Purpose**

Main control register for the debug implementation.

**Configuration**

External register EDSCR bits [30:29] are architecturally mapped to AArch64 System register MDCCSR_EL0[30:29].

EDSCR is in the Core power domain. Some or all RW fields of this register have defined reset values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

**Attributes**

EDSCR is a 32-bit register.

**Field descriptions**

The EDSCR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>TFO</td>
</tr>
<tr>
<td>30</td>
<td>RXfull</td>
</tr>
<tr>

</tr>
<tr>
<td>15</td>
<td>ELA</td>
</tr>
<tr>
<td>14</td>
<td>ERR</td>
</tr>
<tr>
<td>13</td>
<td>STATUS</td>
</tr>
</tbody>
</table>

**TFO, bit [31]**

Trace Filter Override. Overrides the Trace Filter controls allowing the external debugger to trace any visible Exception level.

<table>
<thead>
<tr>
<th>TFO</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Trace Filter controls are not affected.</td>
</tr>
<tr>
<td>01</td>
<td>Trace Filter controls in TRFCR_EL1, TRFCR_EL2, TRFCR, and HTRFCR are ignored.</td>
</tr>
</tbody>
</table>

When OSLSR_EL1.OSLK == 1, this bit can be indirectly read and written through the MDSCR_EL1 and DBGDSRext System registers.

This bit is ignored by the PE when ExternalSecureNoninvasiveDebugEnabled() == FALSE and the Effective value of MDCR_EL3.STE == 1.

On a Cold reset, this field resets to 0.

**Other wise:**

Reserved, RES0.

**RXfull, bit [30]**

DTRRX full.

On a Cold reset, this field resets to 0.

Access to this field is RO.
**TXfull, bit [29]**

DRTTX full.

On a Cold reset, this field resets to 0.

Access to this field is **RO**.

**ITO, bit [28]**

ITR overrun.

If the PE is in Non-debug state, this bit is **UNKNOWN**. ITO is set to 0 on entry to Debug state.

Access to this field is **RO**.

**RXO, bit [27]**

DTRRX overrun.

On a Cold reset, this field resets to 0.

Access to this field is **RO**.

**TXU, bit [26]**

DRTTX underrun.

On a Cold reset, this field resets to 0.

Access to this field is **RO**.

**PipeAdv, bit [25]**

Pipeline advance. Set to 1 every time the PE pipeline retires one or more instructions. Cleared to 0 by a write to EDRCR.CSPA.

The architecture does not define precisely when this bit is set to 1. It requires only that this happen periodically in Non-debug state to indicate that software execution is progressing.

Access to this field is **RO**.

**ITE, bit [24]**

ITR empty.

If the PE is in Non-debug state, this bit is **UNKNOWN**. It is always valid in Debug state.

Access to this field is **RO**.

**INTdis, bits [23:22]**

**When ARMv8.4-Debug is implemented:**

Interrupt disable. Disables taking interrupts in Non-Debug state.

<table>
<thead>
<tr>
<th>INTdis</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Masking of interrupts is controlled by PSTATE and interrupt routing controls.</td>
</tr>
<tr>
<td>0b1</td>
<td>If ExternalSecureDebugEnabled() == TRUE, then all interrupts, including virtual and SError interrupts, are masked. If ExternalSecureDebugEnabled() == FALSE, then all interrupts targeting Non-secure state are masked.</td>
</tr>
</tbody>
</table>
When $\text{OSLSR\_EL1. OSLK} == 1$, this field can be indirectly read and written through the $\text{MDSCR\_EL1}$ and $\text{DBGDSCR\_Ext}$ System registers.

This field is ignored by the PE and treated as zero when ExternalDebugEnabled() == FALSE.

On a Cold reset, this field resets to 0.

**Otherwise:**

Interrupt disable.

When $\text{OSLSR\_EL1. OSLK} == 1$, this field can be indirectly read and written through the $\text{MDSCR\_EL1}$ and $\text{DBGDSCR\_Ext}$ System registers.

<table>
<thead>
<tr>
<th>INTdis</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Do not disable interrupts.</td>
</tr>
<tr>
<td>0b01</td>
<td>Disable interrupts taken to Non-secure EL1.</td>
</tr>
<tr>
<td>0b10</td>
<td>Disable interrupts taken only to Non-secure EL1 and Non-secure EL2. If ExternalSecureInvasiveDebugEnabled() == TRUE, also disable interrupts taken to Secure EL1.</td>
</tr>
<tr>
<td>0b11</td>
<td>Disable interrupts taken only to Non-secure EL1 and Non-secure EL2. If ExternalSecureInvasiveDebugEnabled() == TRUE, also disable all other interrupts.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.

**TDA, bit [21]**

Traps accesses to the following debug System registers:

- AArch64: $\text{DBGBCR<n>_EL1}, \text{DBGBVR<n>_EL1}, \text{DBGWCR<n>_EL1}, \text{DBGWVR<n>_EL1}$
- AArch32: $\text{DBGBCR<n>}, \text{DBGBVR<n>}, \text{DBGBXVR<n>}, \text{DBGWCR<n>}, \text{DBGWVR<n>}$.  

The possible values of this field are:

<table>
<thead>
<tr>
<th>TDA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to debug System registers do not generate a Software Access Debug event.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to debug System registers generate a Software Access Debug event, if $\text{OSLSR_EL1. OSLK}$ is 0 and if halting is allowed.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.

**MA, bit [20]**

Memory access mode. Controls the use of memory-access mode for accessing ITR and the DCC. This bit is ignored if in Non-debug state and set to zero on entry to Debug state.

Possible values of this field are:

<table>
<thead>
<tr>
<th>MA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal access mode.</td>
</tr>
<tr>
<td>0b1</td>
<td>Memory access mode.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.

**SC2, bit [19]**

When ARMv8.0-PCSample is implemented, ARMv8.1-VHE is implemented and ARMv8.2-PCSample is not implemented:

Sample $\text{CONTEXTIDR\_EL2}$. Controls whether the PC Sample-based Profiling Extension samples $\text{CONTEXTIDR\_EL2}$ or $\text{VTTBR\_EL2}$. VMID.

<table>
<thead>
<tr>
<th>SC2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sample $\text{VTTBR_EL2}.\text{VMID}$.</td>
</tr>
<tr>
<td>0b1</td>
<td>Sample $\text{CONTEXTIDR_EL2}$.</td>
</tr>
</tbody>
</table>
On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

**NS, bit [18]**

Non-secure status. When in Debug state, gives the current Security state:

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure state, IsSecure() == TRUE.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure state, IsSecure() == FALSE.</td>
</tr>
</tbody>
</table>

In Non-debug state, this bit is UNKNOWN.

Access to this field is RO.

**Bit [17]**

Reserved, RES0.

**SDD, bit [16]**

Secure debug disabled.

On entry to Debug state:

- If entering in Secure state, SDD is set to 0.
- If entering in Non-secure state, SDD is set to the inverse of ExternalSecureInvasiveDebugEnabled().

In Debug state, the value of the SDD bit does not change, even if ExternalSecureInvasiveDebugEnabled() changes.

In Non-debug state:

- SDD returns the inverse of ExternalSecureInvasiveDebugEnabled(). If the authentication signals that control ExternalSecureInvasiveDebugEnabled() change, a context synchronization event is required to guarantee their effect.
- This bit is unaffected by the Security state of the PE.

If EL3 is not implemented and the implementation is Non-secure, this bit is RES1.

Access to this field is RO.

**Bit [15]**

Reserved, RES0.

**HDE, bit [14]**

Halting debug enable. The possible values of this field are:

<table>
<thead>
<tr>
<th>HDE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Halting disabled for Breakpoint, Watchpoint and Halt Instruction debug events.</td>
</tr>
<tr>
<td>0b1</td>
<td>Halting enabled for Breakpoint, Watchpoint and Halt Instruction debug events.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.
RW, bits [13:10]

Exception level Execution state status. In Debug state, each bit gives the current Execution state of each Exception level:

<table>
<thead>
<tr>
<th>RW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>All Exception levels are using AArch64 or the PE is in Non-debug state.</td>
</tr>
<tr>
<td>0b1110</td>
<td>The PE is in Debug state. EL0 is using AArch32. All other Exception levels are using AArch64. Only permitted if the PE is executing at EL0.</td>
</tr>
<tr>
<td>0b110x</td>
<td>The PE is in Debug state. EL0 and EL1 are using AArch32. EL2 and EL3 are using AArch64. Only permitted if EL2 is implemented and enabled in the current Security state.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The PE is in Debug state. EL0, EL1, and, if implemented in the current Security state, EL2 are using AArch32. EL3 is using AArch64. Only permitted if EL3 is implemented.</td>
</tr>
<tr>
<td>0b0xxx</td>
<td>The PE is in Debug state. All Exception levels are using AArch32.</td>
</tr>
</tbody>
</table>

In Non-debug state, this field is RAO.

Access to this field is RO.

EL, bits [9:8]

Exception level. In Debug state, this gives the current EL of the PE.

In Non-debug state, this field is RAZ.

Access to this field is RO.

A, bit [7]

SEError interrupt pending. In Debug state, indicates whether an SError interrupt is pending:

- If \texttt{HCR.EL2.\{AMO, TGE\} = \{1, 0\}}, EL2 is enabled in the current Security state, and the PE is executing at EL0 or EL1, a virtual SError interrupt.
- Otherwise, a physical SError interrupt.

<table>
<thead>
<tr>
<th>A</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No SError interrupt pending.</td>
</tr>
<tr>
<td>0b1</td>
<td>SError interrupt pending.</td>
</tr>
</tbody>
</table>

A debugger can read EDSCR to check whether an SError interrupt is pending without having to execute further instructions. A pending SError might indicate data from target memory is corrupted.

UNKNOWN in Non-debug state.

Access to this field is RO.

ERR, bit [6]

Cumulative error flag. This bit is set to 1 following exceptions in Debug state and on any signaled overrun or underrun on the DTR or EDITR.

On a Cold reset, this field resets to 0.

Access to this field is RO.

STATUS, bits [5:0]

Debug status flags.
<table>
<thead>
<tr>
<th>STATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000001</td>
<td>PE is restarting, exiting Debug state.</td>
</tr>
<tr>
<td>0b000010</td>
<td>PE is in Non-debug state.</td>
</tr>
<tr>
<td>0b000111</td>
<td>Breakpoint.</td>
</tr>
<tr>
<td>0b010011</td>
<td>External debug request.</td>
</tr>
<tr>
<td>0b011011</td>
<td>Halting step, normal.</td>
</tr>
<tr>
<td>0b011111</td>
<td>Halting step, exclusive.</td>
</tr>
<tr>
<td>0b100011</td>
<td>OS Unlock Catch.</td>
</tr>
<tr>
<td>0b100111</td>
<td>Reset Catch.</td>
</tr>
<tr>
<td>0b101011</td>
<td>Watchpoint.</td>
</tr>
<tr>
<td>0b101111</td>
<td>HLT instruction.</td>
</tr>
<tr>
<td>0b110011</td>
<td>Software access to debug register.</td>
</tr>
<tr>
<td>0b110111</td>
<td>Exception Catch.</td>
</tr>
<tr>
<td>0b111011</td>
<td>Halting step, no syndrome.</td>
</tr>
</tbody>
</table>

All other values of STATUS are reserved.

Access to this field is **RO**.

**Accessing the EDSCR**

**EDSCR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x088</td>
<td>EDSCR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.
EDVIDSR, External Debug Virtual Context Sample Register

The EDVIDSR characteristics are:

**Purpose**

Contains sampled values captured on reading EDPCSR[31:0].

**Configuration**

EDVIDSR is in the Core power domain. RW fields in this register reset to architecturally **UNKNOWN** values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

This register is present only when ARMv8.0-PCSample is implemented and ARMv8.2-PCSample is not implemented. Otherwise, direct accesses to EDVIDSR are **RES0**.

Implemented only if the **OPTIONAL** PC Sample-based Profiling Extension is implemented in the external debug registers space.

When the PC Sample-based Profiling Extension is implemented in the external debug registers space, if EL2 is not implemented and EL3 is not implemented, it is **IMPLEMENTATION DEFINED** whether EDVIDSR is implemented.

---

**Note**

ARMv8.2-PCSample implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

---

**Attributes**

If ARMv8.1-VHE is implemented, the format of this register differs depending on the value of **EDSCR.SC2**.

**Field descriptions**

The EDVIDSR bit assignments are:

**When ARMv8.1-VHE is not implemented or EDSCR.SC2 == 0:**

<table>
<thead>
<tr>
<th>NS</th>
<th>E2</th>
<th>E3</th>
<th>HV</th>
<th>RES0</th>
<th>VMID[15:8]</th>
<th>VMID</th>
</tr>
</thead>
</table>

This format applies in all Armv8.0 implementations.

**NS, bit [31]**

Non-secure state sample. Indicates the Security state associated with the most recent EDPCSR sample.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sample is from Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Sample is from Non-secure state.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**E2, bit [30]**
When HaveEL(EL2):

Exception level 2 status sample. Indicates whether the most recent EDPCSR sample was associated with EL2.

<table>
<thead>
<tr>
<th>E2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sample is not from EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Sample is from EL2.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E3, bit [29]

When HaveEL(EL3) and !HighestELUsingAArch32():

Exception level 3 status sample. Indicates whether the most recent EDPCSR sample was associated with EL3 using AArch64.

<table>
<thead>
<tr>
<th>E3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sample is not from EL3 using AArch64.</td>
</tr>
<tr>
<td>0b1</td>
<td>Sample is from EL3 using AArch64.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HV, bit [28]

EDPCSRhi (EDPCSR[63:32]) valid. Indicates whether bits [63:32] of the most recent EDPCSR sample might be nonzero:

<table>
<thead>
<tr>
<th>HV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bits[63:32] of the most recent EDPCSR sample are zero.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bits[63:32] of the most recent EDPCSR sample might be nonzero.</td>
</tr>
</tbody>
</table>

An EDVIDSR.HV value of 1 does not mean that the value of EDPCSRhi is nonzero. An EDVIDSR.HV value of 0 is a hint that EDPCSRhi (EDPCSR[63:32]) does not need to be read.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [27:16]

Reserved, RES0.

VMID[15:8], bits [15:8]

When ARMv8.1-VMID16 is implemented and HaveEL(EL2):

Extension to VMID[7:0]. See VMID[7:0] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
VMID, bits [7:0]

When HaveEL(EL2):

VMID sample. The VMID associated with the most recent EDPCSRlo (EDPCSR[31:0]) sample. When the most recent EDPCSR sample was generated:

- This field is RES0 if any of the following apply:
  - The PE is executing in Secure state.
  - The PE is executing at EL2.
- Otherwise:
  - If EL2 is using AArch64 and either ARMv8.1-VMID16 is not implemented or VTCR_EL2.VS is 1, this field is set to VTTBR_EL2.VMID.
  - If EL2 is using AArch64, ARMv8.1-VMID16 is implemented, and VTCR_EL2.VS is 0, PMVIDSR.VMID[7:0] is set to VTTBR_EL2.VMID[7:0] and PMVIDSR.VMID[15:8] is RES0.
  - If EL2 is using AArch32, this field is set to VTTBR.VMID.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When ARMv8.1-VHE is implemented and EDSCR.SC2 == 1:

CONTEXTIDR_EL2, bits [31:0]

Context ID. The value of CONTEXTIDR_EL2 that is associated with the most recent EDPCSR sample. When the most recent EDPCSR sample was generated:

- If EL2 was using AArch64 and the PE was executing in Non-secure state, then this field is set to the Context ID sampled from CONTEXTIDR_EL2.
- If EL2 was using AArch32 or the PE was executing in Secure state, then this field is set to an UNKNOWN value.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the EDVIDSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile

EDVIDSR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x0A8</td>
<td>EDVIDSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
EDWAR, External Debug Watchpoint Address Register

The EDWAR characteristics are:

Purpose

Returns the virtual data address being accessed when a Watchpoint Debug Event was triggered.

Configuration

EDWAR is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

Attributes

EDWAR is a 64-bit register.

Field descriptions

The EDWAR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Watchpoint address</td>
</tr>
<tr>
<td>62</td>
<td>Watchpoint address</td>

</tr>
<tr>
<td>1</td>
<td>Watchpoint address</td>
</tr>
<tr>
<td>0</td>
<td>Watchpoint address</td>
</tr>
</tbody>
</table>

Bits [63:0]

Watchpoint address. The data virtual address being accessed when a Watchpoint Debug Event was triggered and caused entry to Debug state. This address must be within a naturally-aligned block of memory of power-of-two size no larger than the DC ZVA block size.

The value of this register is UNKNOWN if the PE is in Non-debug state, or if Debug state was entered other than for a Watchpoint debug event.

The value of EDWAR[63:32] is UNKNOWN if Debug state was entered for a Watchpoint debug event taken from AArch32 state.

The EDWAR is subject to the same alignment rules as the reporting of a watchpointed address in the FAR. See ‘Determining the memory location that caused a Watchpoint exception’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug)

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the EDWAR

EDWAR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x030</td>
<td>EDWAR</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x034</td>
<td>EDWAR</td>
<td>63:32</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
ERRCIDR0, Component Identification Register 0

The ERRCIDR0 characteristics are:

**Purpose**

Provides discovery information for the component.

**Configuration**

Implementation of this register is **OPTIONAL**.

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRCIDR0 are **RES0**.

**Attributes**

ERRCIDR0 is a 32-bit register.

**Field descriptions**

The ERRCIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>0</td>
<td>PRMBL_0</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, **RES0**.

**PRMBL_0, bits [7:0]**

Component identification preamble, segment 0. This field reads as **0x0D**.

**Accessing the ERRCIDR0**

ERRCIDR0 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFF0</td>
<td>ERRCIDR0</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
The ERRCIDR1 characteristics are:

**Purpose**

Provides discovery information for the component.

**Configuration**

Implementation of this register is **optional**.

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRCIDR1 are **RES0**.

**Attributes**

ERRCIDR1 is a 32-bit register.

**Field descriptions**

The ERRCIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-8</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>7-4</td>
<td>Component class</td>
</tr>
<tr>
<td>3-0</td>
<td>Component identification preamble, segment 1</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**CLASS, bits [7:4]**

Component class.

<table>
<thead>
<tr>
<th>CLASS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>Generic peripheral with IMPLEMENTATION DEFINED register layout.</td>
</tr>
</tbody>
</table>

This field reads as 0xF. Other values are defined by the CoreSight Architecture.

**PRMBL_1, bits [3:0]**

Component identification preamble, segment 1. This field reads as 0x0.

**Accessing the ERRCIDR1**

**ERRCIDR1 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFF4</td>
<td>ERRCIDR1</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
ERRCIDR2, Component Identification Register 2

The ERRCIDR2 characteristics are:

**Purpose**

Provides discovery information for the component.

**Configuration**

Implementation of this register is **OPTIONAL**.

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRCIDR2 are **RES0**.

**Attributes**

ERRCIDR2 is a 32-bit register.

**Field descriptions**

The ERRCIDR2 bit assignments are:

|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| RES0 | PRMBL_2 |

**Bits [31:8]**

Reserved, **RES0**.

**PRMBL_2, bits [7:0]**

Component identification preamble, segment 2. This field reads as **0x05**.

**Accessing the ERRCIDR2**

ERRCIDR2 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFF8</td>
<td>ERRCIDR2</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
ERRCIDR3, Component Identification Register 3

The ERRCIDR3 characteristics are:

**Purpose**

Provides discovery information for the component.

**Configuration**

Implementation of this register is **OPTIONAL**.

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRCIDR3 are **RES0**.

**Attributes**

ERRCIDR3 is a 32-bit register.

**Field descriptions**

The ERRCIDR3 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | PRMBL_3 |

**Bits [31:8]**

Reserved, **RES0**.

**PRMBL_3, bits [7:0]**

Component identification preamble, segment 3. This field reads as 0xB1.

**Accessing the ERRCIDR3**

ERRCIDR3 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFFC</td>
<td>ERRCIDR3</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
The ERRCRICR0 characteristics are:

**Purpose**

Interrupt configuration register.

**Configuration**

External register ERRCRICR0 is architecturally mapped to External register ERRIRQCR4.

RW fields in this register reset to architecturally **UNKNOWN** values.

This register is present only when ARMv8.4-RAS is implemented. Otherwise, direct accesses to ERRCRICR0 are **RES0**.

Present only if interrupt configuration registers use the recommended format. Otherwise, this register is **RES0**.

**Attributes**

ERRCRICR0 is a 64-bit register.

**Field descriptions**

The ERRCRICR0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| **RES0** | **ADDR** | **RES0** |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

**Bits [63:56]**

Reserved, **RES0**.

**ADDR, bits [55:2]**

Message Signaled Interrupt address.

Specifies the address that the component writes to when signaling an interrupt.

The size of a physical address is **IMPLEMENTATION DEFINED**. Unimplemented high-order physical address bits are **RES0**.

The following resets apply:

- On a Error recovery reset, this field resets to an architecturally **UNKNOWN** value.
- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [1:0]**

Reserved, **RES0**.
Accessing the **ERRCRICR0**

**ERRCRICR0** can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xEA0</td>
<td>ERRCRICR0</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

ERRCRICR1, Critical Error Interrupt Configuration Register 1

The ERRCRICR1 characteristics are:

**Purpose**

Interrupt configuration register.

**Configuration**

External register ERRCRICR1 bits [31:0] are architecturally mapped to External register `ERRIRQCR5[31:0]`.

RW fields in this register reset to architecturally `UNKNOWN` values.

This register is present only when ARMv8.4-RAS is implemented. Otherwise, direct accesses to ERRCRICR1 are `RES0`.

Present only if interrupt configuration registers use the recommended format. Otherwise, this register is `RES0`.

**Attributes**

ERRCRICR1 is a 32-bit register.

**Field descriptions**

The ERRCRICR1 bit assignments are:

<table>
<thead>

<tr>
<td>3</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**DATA, bits [31:0]**

Payload for a message signaled interrupt.

The following resets apply:

- On a Error recovery reset, this field resets to an architecturally `UNKNOWN` value.
- On a Cold reset, this field resets to an architecturally `UNKNOWN` value.

**Accessing the ERRCRICR1**

ERRCRICR1 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xEA8</td>
<td>ERRCRICR1</td>
</tr>
</tbody>
</table>

Accesses on this interface are `RW`.
The ERRCRICR2 characteristics are:

**Purpose**

Interrupt configuration register.

**Configuration**

External register ERRCRICR2 bits [31:0] are architecturally mapped to External register ERRIRQCR5[63:32]. Some or all RW fields of this register have defined reset values. This register is present only when ARMv8.4-RAS is implemented. Otherwise, direct accesses to ERRCRICR2 are RES0. Present only if interrupt configuration registers use the recommended format. Otherwise, this register is RES0.

**Attributes**

ERRCRICR2 is a 32-bit register.

**Field descriptions**

The ERRCRICR2 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | IRQEN | NSMSI | SH | MemAttr |

**Bits [31:8]**

Reserved, RES0.

**IRQEN, bit [7]**

Message Signaled Interrupt enable.

Enables generation of message signalled interrupts.

<table>
<thead>
<tr>
<th>IRQEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Message signalled interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Message signalled interrupts are enabled.</td>
</tr>
</tbody>
</table>

If the component does not support disabling message signalled interrupts, this bit is RES0.

The following resets apply:

- On a Error recovery reset, this field resets to 0.
- On a Cold reset, this field resets to 0.

**NSMSI, bit [6]**

Security attribute.

Defines the physical address space for message signalled interrupts.
Physical address space for message signaled interrupts is Secure.

If the component prohibits Non-secure writes and does not support configuring the Security attribute, then the Security attribute for message signaled interrupts is IMPLEMENTATION DEFINED.

If the component allows Non-secure writes, then the Security attribute used for message signaled interrupts is Non-secure.

This bit is RES0 if any of the following are true:

- The component allows Non-secure writes.
- The component does not support configuring the Security attribute.

On a Cold reset, this field resets to an IMPLEMENTATION DEFINED value.

**SH, bits [5:4]**

Shareability.

Defines the Shareability domain for message signaled interrupts.

<table>
<thead>
<tr>
<th>SH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Message signaled interrupts are in the Not shared Shareability domain.</td>
</tr>
<tr>
<td>0b10</td>
<td>Message signaled interrupts are in the Outer Shareable Shareability domain.</td>
</tr>
<tr>
<td>0b11</td>
<td>Message signaled interrupts are in the Inner Shareable Shareability domain.</td>
</tr>
</tbody>
</table>

If the component does not support configuring the Shareability domain, this field is RES0, meaning the Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

The following resets apply:

- On a Error recovery reset, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**MemAttr, bits [3:0]**

Memory type.

Defines the memory type for message signaled interrupts. The values which correspond to each memory type are:

<table>
<thead>
<tr>
<th>MemAttr</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Device-nGnRnE.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Device-nGnRE.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Device-nGRE.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Device-GRE.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Outer Non-cacheable, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Outer Non-cacheable, Inner Write-Through Cacheable.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Outer Non-cacheable, Inner Write-Back Cacheable.</td>
</tr>
<tr>
<td>0b1001</td>
<td>Outer Write-Through Cacheable, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b1010</td>
<td>Outer Write-Through Cacheable, Inner Write-Through Cacheable.</td>
</tr>
<tr>
<td>0b1011</td>
<td>Outer Write-Through Cacheable, Inner Write-Back Cacheable.</td>
</tr>
<tr>
<td>0b1101</td>
<td>Outer Write-Back Cacheable, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b1110</td>
<td>Outer Write-Back Cacheable, Inner Write-Through Cacheable.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Outer Write-Back Cacheable, Inner Write-Back Cacheable.</td>
</tr>
</tbody>
</table>
If the component does not support configuring the memory type, this field is RES0, meaning the memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

Note

This is the same format as the VMSAv8-64 stage 2 memory region attributes.

The following resets apply:

- On a Error recovery reset, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the ERRCRICR2

ERRCRICR2 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xEAC</td>
<td>ERRCRICR2</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
The ERRDEVAFF characteristics are:

**Purpose**

For a group that has affinity with a single PE or cluster of PEs, ERRDEVAFF is a copy of MPIDR_EL1 or part of MPIDR_EL1:

- If the group of error records has affinity with a single PE, the affinity level is 0, ERRDEVAFF reads the same value as MPIDR_EL1, and ERRDEVAFF.F0V reads-as-one to indicate affinity level 0.
- If the group of error records has affinity with a cluster of PEs, the affinity level is 1, 2, or 3, parts of ERRDEVAFF reads the same value as parts of MPIDR_EL1, and the rest of ERRDEVAFF indicates the level.

For example, if the affinity level is 2 then all of the following are true:

- The group of error records has affinity with all PEs in the system that have the same value in MPIDR_EL1.\{Aff3,Aff2\}.
- ERRDEVAFF.\{Aff3,Aff2\} reads the same value as MPIDR_EL1.\{Aff3,Aff2\}.
- ERRDEVAFF.Aff1 reads as 0x80 and ERRDEVAFF.\{Aff0,F0V\} read-as-zero, to indicate affinity level 2.

**Configuration**

Implementation of this register is OPTIONAL.

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRDEVAFF are RES0. Present only if a group has affinity with a PE or cluster of PEs, and otherwise RES0.

**Attributes**

ERRDEVAFF is a 64-bit register.

**Field descriptions**

The ERRDEVAFF bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    | RES0 |    |    | Aff3 |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:40]**

Reserved, RES0.

**Aff3, bits [39:32]**

Affinity level 3. The MPIDR_EL1.Aff3 field, viewed from the highest Exception level of the associated PE or PEs.

**F0V, bit [31]**

Indicates that the ERRDEVAFF.Aff0 field is valid.

<table>
<thead>
<tr>
<th>F0V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERRDEVAFF.Aff0 is not valid, and the PE affinity level is 1, 2 or 3.</td>
</tr>
<tr>
<td>0b1</td>
<td>ERRDEVAFF.Aff0 is valid, and the PE affinity level is 0.</td>
</tr>
</tbody>
</table>
U, bit [30]

Uniprocessor. The MPIDR_EL1.U bit viewed from the highest Exception level of the associated PE.

<table>
<thead>
<tr>
<th>U</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>The PE is part of a multiprocessor system.</td>
</tr>
<tr>
<td>1</td>
<td>The PE is part of a uniprocessor system.</td>
</tr>
</tbody>
</table>

If ERRDEVAFF.Aff0 is not valid, this bit is not valid and reads as **UNKNOWN**.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Multithreaded. The MPIDR_EL1.MT bit viewed from the highest Exception level of the associated PE.

<table>
<thead>
<tr>
<th>MT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Performance of PEs at the lowest affinity level is largely independent.</td>
</tr>
<tr>
<td>1</td>
<td>Performance of PEs at the lowest affinity level is very interdependent.</td>
</tr>
</tbody>
</table>

If ERRDEVAFF.Aff0 is not valid, this bit is not valid and reads as **UNKNOWN**.

Aff2, bits [23:16]

Affinity level 2.

When the PE affinity level is 0, 1, or 2, this field is the MPIDR_EL1.Aff2 field viewed from the highest Exception level of the associated PE or PEs.

When the PE affinity level is 3, this field indicates that ERRDEVAFF.Aff3 field is valid, and the following values are defined:

<table>
<thead>
<tr>
<th>Aff2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x80</td>
<td>ERRDEVAFF.Aff3 is valid, and the PE affinity level is 3.</td>
</tr>
</tbody>
</table>

This field reads as 0x80.

All other values are reserved.

Aff1, bits [15:8]

Affinity level 1.

When the PE affinity level is 0 or 1, this field is the MPIDR_EL1.Aff1 field viewed from the highest Exception level of the associated PE or PEs.

When the PE affinity level is 2 or 3, this field indicates that ERRDEVAFF.Aff2 is valid, and the following values are defined:

<table>
<thead>
<tr>
<th>Aff1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x00</td>
<td>ERRDEVAFF.Aff2 is not valid, and the PE affinity level is 3.</td>
</tr>
<tr>
<td>0x80</td>
<td>ERRDEVAFF.Aff2 is valid, and the PE affinity level is 2.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Aff0, bits [7:0]

Affinity level 0.

When the PE affinity level is 0, this field is the MPIDR_EL1.Aff0 field viewed from the highest Exception level of the associated PE or PEs.
When the PE affinity level is 1, 2 or 3, this field indicates that ERRDEVAFF.Aff1 is valid, and the following values are defined:

<table>
<thead>
<tr>
<th>Aff0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x0</td>
<td>ERRDEVAFF.Aff1 is not valid, and the PE affinity level is 2 or 3.</td>
</tr>
<tr>
<td>0x80</td>
<td>ERRDEVAFF.Aff1 is valid, and the PE affinity level is 1.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Accessing the ERRDEVAFF**

**ERRDEVAFF can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFA8</td>
<td>ERRDEVAFF</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
ERRDEVARCH, Device Architecture Register

The ERRDEVARCH characteristics are:

**Purpose**

Provides discovery information for the component.

**Configuration**

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRDEVARCH are **UNDEFINED**.

**Attributes**

ERRDEVARCH is a 32-bit register.

**Field descriptions**

The ERRDEVARCH bit assignments are:

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |
| ARCHITECT | PRESENT | REVISION | ARCHVER | ARCHPART |

**ARCHITECT, bits [31:21]**

Architect.

Defines the architect of the component. Bits [31:28] are the JEP106 continuation code (JEP106 bank ID, minus 1) and bits [27:21] are the JEP106 ID code.

<table>
<thead>
<tr>
<th>ARCHITECT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01000111011</td>
<td>JEP106 continuation code 0x4, ID code 0x3B. Arm Limited.</td>
</tr>
</tbody>
</table>

This field reads as 0x23B.

Other values are defined by the JEDEC JEP106 standard.

**PRESENT, bit [20]**

DEVARCH Present.

Defines that the DEVARCH register is present.

<table>
<thead>
<tr>
<th>PRESENT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Device Architecture information not present.</td>
</tr>
<tr>
<td>0b1</td>
<td>Device Architecture information present.</td>
</tr>
</tbody>
</table>

This bit is RAO.

**REVISION, bits [19:16]**

Revision.

Defines the architecture revision of the component. The defined values of this field are:
<table>
<thead>
<tr>
<th>REVISION</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>RAS System Architecture v1.0.</td>
</tr>
<tr>
<td>0b0001</td>
<td>RAS System Architecture v1.1. As 0b0000 and also:</td>
</tr>
<tr>
<td></td>
<td>• Simplifies ERR&lt;n&gt;STATUS.</td>
</tr>
<tr>
<td></td>
<td>• Adds support for additional ERR&lt;n&gt;MISC&lt;m&gt; registers.</td>
</tr>
<tr>
<td></td>
<td>• Adds support for the optional RAS Timestamp Extension.</td>
</tr>
<tr>
<td></td>
<td>• Adds support for the optional RAS Common Fault Injection Model Extension.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**ARCHVER, bits [15:12]**

Architecture Version.

Defines the architecture version of the component. The defined values of this field are:

<table>
<thead>
<tr>
<th>ARCHVER</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>RAS System Architecture v1.</td>
</tr>
</tbody>
</table>

This field reads as 0b0000.

All other values are reserved.

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHVER is ARCHID[15:12].

**ARCHPART, bits [11:0]**

Architecture Part.

Defines the architecture of the component.

<table>
<thead>
<tr>
<th>ARCHPART</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0xA00</td>
<td>RAS system architecture.</td>
</tr>
</tbody>
</table>

This register reads as 0xA00.

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHPART is ARCHID[11:0].

**Accessing the ERRDEVARCH**

**ERRDEVARCH can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFBC</td>
<td>ERRDEVARCH</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
ERRDEVID, Device Configuration Register

The ERRDEVID characteristics are:

**Purpose**

Provides discovery information for the component.

**Configuration**

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRDEVID are UNDEFINED.

**Attributes**

ERRDEVID is a 32-bit register.

**Field descriptions**

The ERRDEVID bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>30-16</td>
<td>NUM</td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**NUM, bits [15:0]**

Highest numbered index of the error records in this group, plus one. Each implemented record is owned by a node. A node might own multiple records.

This manual describes the memory-mapped view of a group with up to 56 records, the most that can be contained in a 4KB component, meaning the highest possible value for this field is 56.

This field reads as an IMPLEMENTATION DEFINED value.

**Accessing the ERRDEVID**

**ERRDEVID can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFC8</td>
<td>ERRDEVID</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
ERRERICR0, Error Recovery Interrupt Configuration Register 0

The ERRERICR0 characteristics are:

**Purpose**

Interrupt configuration register.

**Configuration**

External register ERRERICR0 is architecturally mapped to External register ERRIRQCR2. RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRERICR0 are RES0. Present only if interrupt configuration registers use the recommended format. Otherwise, this register is RES0.

**Attributes**

ERRERICR0 is a 64-bit register.

**Field descriptions**

The ERRERICR0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | ADDR | RES0 | ADDR | RES0 | ADDR | RES0 | ADDR | RES0 | ADDR | RES0 | ADDR | RES0 | ADDR | RES0 | ADDR | RES0 | ADDR | RES0 | ADDR | RES0 | ADDR | RES0 | ADDR | RES0 | ADDR | RES0 | ADDR | RES0 |

**Bits [63:56]**

Reserved, RES0.

**ADDR, bits [55:2]**

Message Signaled Interrupt address.

Specifies the address that the component writes to when signaling an interrupt.

The size of a physical address is IMPLEMENTATION DEFINED. Unimplemented high-order physical address bits are RES0.

The following resets apply:

- On a Error recovery reset, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [1:0]**

Reserved, RES0.
**Accessing the ERRERICR0**

**ERRERICR0 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xE90</td>
<td>ERRERICR0</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
ERRERICR1, Error Recovery Interrupt Configuration Register 1

The ERRERICR1 characteristics are:

**Purpose**

Interrupt configuration register.

**Configuration**

External register ERRERICR1 bits [31:0] are architecturally mapped to External register ERRIRQCR3[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRERICR1 are RES0.

Present only if interrupt configuration registers use the recommended format. Otherwise, this register is RES0.

**Attributes**

ERRERICR1 is a 32-bit register.

**Field descriptions**

The ERRERICR1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | DATA |

**DATA, bits [31:0]**

Payload for a message signaled interrupt.

The following resets apply:

- On a Error recovery reset, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ERRERICR1**

**ERRERICR1 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xE98</td>
<td>ERRERICR1</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
ERRERICR2, Error Recovery Interrupt Configuration Register 2

The ERRERICR2 characteristics are:

**Purpose**

Interrupt configuration register.

**Configuration**

External register ERRERICR2 bits [31:0] are architecturally mapped to External register ERRIRQCR3[63:32]. Some or all RW fields of this register have defined reset values.

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRERICR2 are RES0. Present only if interrupt configuration registers use the recommended format. Otherwise, this register is RES0.

**Attributes**

ERRERICR2 is a 32-bit register.

**Field descriptions**

The ERRERICR2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Purpose</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>30</td>
<td>IRQEN</td>
<td>Message Signaled Interrupt enable. Enables generation of message signaled interrupts.</td>
</tr>
<tr>
<td>29</td>
<td>NSMSI</td>
<td>Security attribute. Defines the physical address space for message signaled interrupts.</td>
</tr>
<tr>
<td>28</td>
<td>SH</td>
<td></td>
</tr>
<tr>
<td>27</td>
<td>MemAttr</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**IRQEN, bit [7]**

Message Signaled Interrupt enable.

Enables generation of message signaled interrupts.

If the component does not support disabling message signaled interrupts, this bit is RES0.

The following resets apply:

- On a Error recovery reset, this field resets to 0.
- On a Cold reset, this field resets to 0.
### NSMSI

<table>
<thead>
<tr>
<th>NSMSI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Physical address space for message signaled interrupts is Secure.</td>
</tr>
<tr>
<td>0b1</td>
<td>Physical address space for message signaled interrupts is Non-secure.</td>
</tr>
</tbody>
</table>

If the component prohibits Non-secure writes and does not support configuring the Security attribute, then the Security attribute for message signaled interrupts is IMPLEMENTATION DEFINED.

If the component allows Non-secure writes, then the Security attribute used for message signaled interrupts is Non-secure.

This bit is RES0 if any of the following are true:

- The component allows Non-secure writes.
- The component does not support configuring the Security attribute.

On a Cold reset, this field resets to an IMPLEMENTATION DEFINED value.

### SH, bits [5:4]

Shareability.

Defines the Shareability domain for message signaled interrupts.

<table>
<thead>
<tr>
<th>SH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Message signaled interrupts are in the Not shared Shareability domain.</td>
</tr>
<tr>
<td>0b10</td>
<td>Message signaled interrupts are in the Outer Shareable Shareability domain.</td>
</tr>
<tr>
<td>0b11</td>
<td>Message signaled interrupts are in the Inner Shareable Shareability domain.</td>
</tr>
</tbody>
</table>

If the component does not support configuring the Shareability domain, this field is RES0, meaning the Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

The following resets apply:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

### MemAttr, bits [3:0]

Memory type.

Defines the memory type for message signaled interrupts. The values which correspond to each memory type are:

<table>
<thead>
<tr>
<th>MemAttr</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Device-nGnRnE.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Device-nGnRE.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Device-nGRE.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Device-GRE.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Outer Non-cacheable, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Outer Non-cacheable, Inner Write-Through Cacheable.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Outer Non-cacheable, Inner Write-Back Cacheable.</td>
</tr>
<tr>
<td>0b1001</td>
<td>Outer Write-Through Cacheable, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b1010</td>
<td>Outer Write-Through Cacheable, Inner Write-Through Cacheable.</td>
</tr>
<tr>
<td>0b1011</td>
<td>Outer Write-Through Cacheable, Inner Write-Back Cacheable.</td>
</tr>
<tr>
<td>0b1101</td>
<td>Outer Write-Back Cacheable, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b1110</td>
<td>Outer Write-Back Cacheable, Inner Write-Through Cacheable.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Outer Write-Back Cacheable, Inner Write-Back Cacheable.</td>
</tr>
</tbody>
</table>
If the component does not support configuring the memory type, this field is RES0, meaning the memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

**Note**

This is the same format as the VMSAv8-64 stage 2 memory region attributes.

The following resets apply:

- On a Error recovery reset, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ERRERICR2**

**ERRERICR2 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>

ERRFHICR0, Fault-Handling Interrupt Configuration Register 0

The ERRFHICR0 characteristics are:

**Purpose**

Interrupt configuration register.

**Configuration**

External register ERRFHICR0 is architecturally mapped to External register ERRIRQCR0. RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRFHICR0 are RES0. Present only if interrupt configuration registers use the recommended format. Otherwise, this register is RES0.

**Attributes**

ERRFHICR0 is a 64-bit register.

**Field descriptions**

The ERRFHICR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:56]</td>
<td>Reserved, RES0</td>
<td>0</td>
</tr>
<tr>
<td>[1:0]</td>
<td>Reserved, RES0</td>
<td>0</td>
</tr>
</tbody>
</table>

**Bits [63:56]**

Reserved, RES0.

**ADDR, bits [55:2]**

Message Signaled Interrupt address.

Specifies the address that the component writes to when signaling an interrupt.

The size of a physical address is IMPLEMENTATION DEFINED. Unimplemented high-order physical address bits are RES0.

The following resets apply:

- On a Error recovery reset, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [1:0]**

Reserved, RES0.
Accessing the ERRFHIRCR0

ERRFHIRCR0 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xE80</td>
<td>ERRFHIRCR0</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
The ERRFHICR1 characteristics are:

**Purpose**

Interrupt configuration register.

**Configuration**

External register ERRFHICR1 bits [31:0] are architecturally mapped to External register ERRIRQCR1[31:0]. RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRFHICR1 are RES0.

Present only if interrupt configuration registers use the recommended format. Otherwise, this register is RES0.

**Attributes**

ERRFHICR1 is a 32-bit register.

**Field descriptions**

The ERRFHICR1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| DATA |

**DATA, bits [31:0]**

Payload for a message signaled interrupt.

The following resets apply:

- On a Error recovery reset, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ERRFHICR1**

ERRFHICR1 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xE88</td>
<td>ERRFHICR1</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
ERRFHICR2, Fault-Handling Interrupt Configuration Register 2

The ERRFHICR2 characteristics are:

**Purpose**

Interrupt configuration register.

**Configuration**

External register ERRFHICR2 bits [31:0] are architecturally mapped to External register ERRIRQCR1[63:32]. Some or all RW fields of this register have defined reset values. This register is present only when RAS is implemented. Otherwise, direct accesses to ERRFHICR2 are RES0. Present only if interrupt configuration registers use the recommended format. Otherwise, this register is RES0.

**Attributes**

ERRFHICR2 is a 32-bit register.

**Field descriptions**

The ERRFHICR2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved</td>
<td>RES0</td>
<td></td>

</tr>
<tr>
<td>2</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>0</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

If the component does not support disabling message signaled interrupts, this bit is RES0.

The following resets apply:

- On a Error recovery reset, this field resets to 0.
- On a Cold reset, this field resets to 0.
<table>
<thead>
<tr>
<th>NSMSI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Physical address space for message signaled interrupts is Secure.</td>
</tr>
<tr>
<td>0b1</td>
<td>Physical address space for message signaled interrupts is Non-secure.</td>
</tr>
</tbody>
</table>

If the component prohibits Non-secure writes and does not support configuring the Security attribute, then the Security attribute for message signaled interrupts is IMPLEMENTATION DEFINED.

If the component allows Non-secure writes, then the Security attribute used for message signaled interrupts is Non-secure.

This bit is RES0 if any of the following are true:

- The component allows Non-secure writes.
- The component does not support configuring the Security attribute.

On a Cold reset, this field resets to an IMPLEMENTATION DEFINED value.

**SH, bits [5:4]**

Shareability.

Defines the Shareability domain for message signaled interrupts.

<table>
<thead>
<tr>
<th>SH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Message signaled interrupts are in the Not shared Shareability domain.</td>
</tr>
<tr>
<td>0b10</td>
<td>Message signaled interrupts are in the Outer Shareable Shareability domain.</td>
</tr>
<tr>
<td>0b11</td>
<td>Message signaled interrupts are in the Inner Shareable Shareability domain.</td>
</tr>
</tbody>
</table>

If the component does not support configuring the Shareability domain, this field is RES0, meaning the Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

The following resets apply:

- On a Error recovery reset, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**MemAttr, bits [3:0]**

Memory type.

Defines the memory type for message signaled interrupts. The values which correspond to each memory type are:

<table>
<thead>
<tr>
<th>MemAttr</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Device-nGnRnE.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Device-nGnRE.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Device-nGRE.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Device-GRE.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Outer Non-cacheable, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Outer Non-cacheable, Inner Write-Through Cacheable.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Outer Non-cacheable, Inner Write-Back Cacheable.</td>
</tr>
<tr>
<td>0b1001</td>
<td>Outer Write-Through Cacheable, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b1010</td>
<td>Outer Write-Through Cacheable, Inner Write-Through Cacheable.</td>
</tr>
<tr>
<td>0b1011</td>
<td>Outer Write-Through Cacheable, Inner Write-Back Cacheable.</td>
</tr>
<tr>
<td>0b1101</td>
<td>Outer Write-Back Cacheable, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b1110</td>
<td>Outer Write-Back Cacheable, Inner Write-Through Cacheable.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Outer Write-Back Cacheable, Inner Write-Back Cacheable.</td>
</tr>
</tbody>
</table>
If the component does not support configuring the memory type, this field is RES0, meaning the memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

**Note**

This is the same format as the VMSAv8-64 stage 2 memory region attributes.

The following resets apply:

- On a Error recovery reset, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ERRFHIRCR2**

ERRFHIRCR2 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xE8C</td>
<td>ERRFHIRCR2</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
ERRGSR, Error Group Status Register

The ERRGSR characteristics are:

**Purpose**

ERRGSR shows the status for the records in the group.

**Configuration**

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRGSR are UNDEFINED.

This manual describes the memory-mapped view of a group with up to 56 records, the most that can be contained in a 4KB component. Extra records might be added by increasing the page size and extending ERRGSR into multiple registers.

**Attributes**

ERRGSR is a 64-bit register.

**Field descriptions**

The ERRGSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>m</td>
<td>S&lt;m&gt;, bit [m], for m = 0 to 55</td>
</tr>
</tbody>
</table>

The status for Error Record <m>. A read-only copy of `ERR<m>STATUS` V.

If the corresponding record is not implemented, or the corresponding record does not support this type of reporting, this bit is RES0.

**Accessing the ERRGSR**

ERRGSR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xE00</td>
<td>ERRGSR</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
ERRIIDR, Implementation Identification Register

The ERRIIDR characteristics are:

**Purpose**

Defines the implementer of the component.

**Configuration**

Implementation of this register is **OPTIONAL**.

This register is present only when ARMv8.4-RAS is implemented. Otherwise, direct accesses to ERRIIDR are **RES0**.

**Attributes**

ERRIIDR is a 32-bit register.

**Field descriptions**

The ERRIIDR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ProductID</strong></td>
<td><strong>Variant</strong></td>
<td><strong>Revision</strong></td>
<td><strong>Implementer</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**ProductID, bits [31:20]**

IMPLEMENTATION **DEFINED**.

Part number, bits [11:0]. The part number is selected by the designer of the component.

If ERRIIDR0 and ERRIIDR1 are implemented, ERRIIDR0.PART_0 matches bits [7:0] of ERRIIDR.ProductID and ERRIIDR1.PART_1 matches bits [11:8] of ERRIIDR.ProductID.

**Variant, bits [19:16]**

IMPLEMENTATION **DEFINED**.

Component major revision.

This field distinguishes product variants or major revisions of the product.

If ERRIIDR2 is implemented, ERRIIDR2.REVISION matches ERRIIDR.Variant.

**Revision, bits [15:12]**

IMPLEMENTATION **DEFINED**.

Component minor revision.

This field distinguishes minor revisions of the product.

If ERRIIDR3 is implemented, ERRIIDR3.REVAND matches ERRIIDR.Revision.

**Implementer, bits [11:0]**

IMPLEMENTATION **DEFINED**.
Contains the JEP106 code of the company that implemented the RAS component. For an Arm implementation, this field has the value 0x43B.

Bits [11:8] contain the JEP106 continuation code of the implementer, and bits [6:0] contain the JEP106 identity code of the implementer. Bit 7 is RES0.

If ERRPIDR4 is implemented, ERRPIDR2 is implemented, and ERRPIDR1 is implemented, ERRPIDR4.DES_2 matches bits [11:8] of ERRIIDR. Implementer, ERRPIDR2.DES_1 matches bits [6:4] of ERRIIDR. Implementer, and ERRPIDR1.DES_0 matches bits [3:0] of ERRIIDR. Implementer.

Accessing the ERRIIDR

**ERRIIDR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xE10</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
ERRIRQCR\(n\), Generic Error Interrupt Configuration Register, \(n = 0 - 15\)

The ERRIRQCR\(n\) characteristics are:

**Purpose**

The ERRIRQCR\(n\) registers are IMPLEMENTATION DEFINED interrupt configuration registers.

The architecture provides a recommended format for the ERRIRQCR\(n\) registers. The registers provided by the recommended layout are:

- **ERRFHICR0, ERRFHICR1, and ERRFHICR2**, the fault-handling interrupt configuration registers. ERRFHICR\(m\) maps to ERRIRQCR0 and ERRIRQCR1.

- **ERRERICR0, ERRERICR1, and ERRERICR2**, the error recovery interrupt configuration registers. ERRERICR\(n\) maps to ERRIRQCR2 and ERRIRQCR3.

- If ARMv8.4-RAS is implemented, **ERRCRI0, ERRCRI1, and ERRCRI2**, the critical error interrupt configuration registers. ERRFHICR\(m\) maps to ERRIRQCR4 and ERRIRQCR5.

- **ERRIROSR**, the error interrupt status register. ERRIROSR maps to ERRIRQCR15.

This register describes the generic IMPLEMENTATION DEFINED format of the interrupt configuration registers, when the recommended layout is not used.

**Configuration**

Present only if the interrupt configuration registers are implemented. Otherwise, this register is RES0.

**Attributes**

ERRIRQCR\(n\) is a 64-bit register.

**Field descriptions**

The ERRIRQCR\(n\) bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED controls. This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

**Accessing the ERRIRQCR\(n\)**

ERRIRQCR\(n\) can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xE80 + 8n</td>
<td>ERRIRQCR(n)</td>
</tr>
</tbody>
</table>
Accesses on this interface are RW.
ERRIRQSR, Error Interrupt Status Register

The ERRIRQSR characteristics are:

**Purpose**

Interrupt status register.

**Configuration**

External register ERRIRQSR is architecturally mapped to External register ERRIRQCR15.

RW fields in this register reset to architecturally UNKNOWN values.

Present only if interrupt configuration registers use the recommended format. Otherwise, this register is RES0.

**Attributes**

ERRIRQSR is a 64-bit register.

**Field descriptions**

The ERRIRQSR bit assignments are:

<table>
<thead>

<tr>
<td>1</td>
<td>G11ERR</td>
</tr>
<tr>
<td>0</td>
<td>G12ERR</td>
</tr>
</tbody>
</table>

This bit is read/write-one-to-clear.

The following resets apply:

- On a Error recovery reset, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**CRIERR, bit [5]**

Critical error interrupt error.

<table>
<thead>
<tr>
<th>CRIERR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Interrupt write has not returned an error since this bit was last cleared to 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupt write has returned an error since this bit was last cleared to 0.</td>
</tr>
</tbody>
</table>

**CRI, bit [4]**

Critical error interrupt write in progress.

<table>
<thead>
<tr>
<th>CRI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Interrupt write not in progress.</td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupt write in progress.</td>
</tr>
</tbody>
</table>
Software must not disable an interrupt whilst the write is in progress.

This bit is read-only.

**Note**

This bit does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

To determine whether an interrupt is active, software must examine the individual \texttt{ERR<n>STATUS} registers.

---

**ERIERR, bit [3]**

Error recovery interrupt error.

<table>
<thead>
<tr>
<th>ERIERR</th>
<th>Meaning</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Interrupt write has not returned an error since this bit was last cleared to 0.</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupt write has returned an error since this bit was last cleared to 0.</td>
<td></td>
</tr>
</tbody>
</table>

This bit read/write-one-to-clear.

The following resets apply:

- On a Error recovery reset, this field resets to an architecturally \texttt{UNKNOWN} value.
- On a Cold reset, this field resets to an architecturally \texttt{UNKNOWN} value.

**ERI, bit [2]**

Error recovery interrupt write in progress.

<table>
<thead>
<tr>
<th>ERI</th>
<th>Meaning</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Interrupt write not in progress.</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupt write in progress.</td>
<td></td>
</tr>
</tbody>
</table>

Software must not disable an interrupt whilst the write is in progress.

This bit is read-only.

**Note**

This bit does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

To determine whether an interrupt is active, software must examine the individual \texttt{ERR<n>STATUS} registers.

---

**FHIERR, bit [1]**

Fault handling interrupt error.

<table>
<thead>
<tr>
<th>FHIERR</th>
<th>Meaning</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Interrupt write has not returned an error since this bit was last cleared to 0.</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupt write has returned an error since this bit was last cleared to 0.</td>
<td></td>
</tr>
</tbody>
</table>

This bit read/write-one-to-clear.

The following resets apply:

- On a Error recovery reset, this field resets to an architecturally \texttt{UNKNOWN} value.
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

**FHI, bit [0]**

Fault handling interrupt write in progress.

<table>
<thead>
<tr>
<th>FHI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Interrupt write not in progress.</td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupt write in progress.</td>
</tr>
</tbody>
</table>

Software must not disable an interrupt whilst the write is in progress.

This bit is read-only.

**Note**

This bit does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

To determine whether an interrupt is active, software must examine the individual **ERR<n>STATUS** registers.

**Accessing the ERRIRQSR**

ERRIRQSR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xEF8</td>
<td>ERRIRQSR</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
ERR<\(n\)>ADDR, Error Record Address Register, \(n = 0 - 65534\)

The ERR<\(n\)>ADDR characteristics are:

**Purpose**

If an error has an associated address, then this must be written to the address register when the error is recorded. It is implementation defined how the recorded addresses map to the software-visible physical addresses.

Software might have to reconstruct the actual physical addresses using the identity of the node and knowledge of the system.

**Configuration**

Some or all RW fields of this register have defined reset values.

This register is present only when RAS is implemented. Otherwise, direct accesses to ERR<\(n\)>ADDR are undefined.

The number of error records that are implemented is implementation defined.

If error record \(<n>\) is not implemented, ERR<\(n\)>ADDR is RES0.

ERR<\(q\)>FR describes the features implemented by the node that owns error record \(<n>\). \(<q>\) is the index of the first error record owned by the same node as error record \(<n>\). If the node owns a single record, then \(q = n\).

If the error record does not record the fault address, this register is RES0.

**Attributes**

ERR<\(n\)>ADDR is a 64-bit register.

**Field descriptions**

The ERR<\(n\)>ADDR bit assignments are:

<table>
<thead>
<tr>
<th>NS</th>
<th>SI</th>
<th>AI</th>
<th>VA</th>
<th>RES0</th>
<th>PADDR</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>62</td>
<td>61</td>
<td>60</td>
<td>59</td>
<td>58</td>
</tr>
<tr>
<td>31</td>
<td>30</td>
<td>29</td>
<td>28</td>
<td>27</td>
<td>26</td>
</tr>
</tbody>
</table>

**NS, bit [63]**

Non-secure attribute.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The address is Secure.</td>
</tr>
<tr>
<td>0b1</td>
<td>The address is Non-secure.</td>
</tr>
</tbody>
</table>

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**SI, bit [62]**

Secure Incorrect.
Indicates whether the NS bit is valid.

<table>
<thead>
<tr>
<th>SI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The NS bit is correct. That is, it matches the programmers' view of the Non-secure attribute for this recorded location.</td>
</tr>
<tr>
<td>0b1</td>
<td>The NS bit might not be correct, and might not match the programmers' view of the Non-secure attribute for the recorded location.</td>
</tr>
</tbody>
</table>

It is **IMPLEMENTATION DEFINED** whether this bit is read-only or read/write.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**AI, bit [61]**

Address Incorrect.

Indicates whether the PADDR field is a valid physical address that is known to match the programmers' view of the physical address for the recorded location.

<table>
<thead>
<tr>
<th>AI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The PADDR field is a valid physical address. That is, it matches the programmers' view of the physical address for the recorded location.</td>
</tr>
<tr>
<td>0b1</td>
<td>The PADDR field might not be a valid physical address, and might not match the programmers' view of the physical address for the recorded location.</td>
</tr>
</tbody>
</table>

It is **IMPLEMENTATION DEFINED** whether this bit is read-only or read/write.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**VA, bit [60]**

Virtual Address.

Indicates whether the PADDR field is a virtual address.

<table>
<thead>
<tr>
<th>VA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The PADDR field is not a virtual address.</td>
</tr>
<tr>
<td>0b1</td>
<td>The PADDR field is a virtual address.</td>
</tr>
</tbody>
</table>

No context information is provided for the virtual address. When this bit is set to 1, ERR<n>ADDR.{NS,SI,VA} must read as {0,1,1}.

Support for this bit is optional. If this bit is not implemented and the PADDR field is a virtual address, then ERR<n>ADDR.{NS,SI,VA} must read as {0,1,1}.

It is **IMPLEMENTATION DEFINED** whether this bit is read-only or read/write.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [59:56]**

Reserved, **RES0**.
PADDR, bits [55:0]

Physical Address. Address of the recorded location.

If the physical address size implemented by this component is smaller than the size of this field, then high-order bits are unimplemented and either RES0 or have a fixed read-only IMPLEMENTATION DEFINED value.

Low-order address bits might also be unimplemented and RES0, for example, if the physical address is always aligned to the size of a protection granule.

The following resets apply:

- This field is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the ERR<n>ADDR

ERR<n>ADDR ignores writes if ERR<n>STATUS.AV is set to 1.

ERR<n>ADDR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x018 + 64n</td>
<td>ERR&lt;n&gt;ADDR</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
ERR<n>CTRL, Error Record Control Register, n = 0 - 65534

The ERR<n>CTRL characteristics are:

**Purpose**

The error control register contains enable bits for the node that writes to this record, which:

- Enable error detection and correction.
- Enable an error recovery interrupt.
- Enable a fault handling interrupt.
- Enable error recovery reporting as a read or write error response.
- When ARMv.4-RAS is implemented, enable a critical error interrupt.

For each bit, if the selected node does not support the feature, then the bit is RES0. The definition of each record is IMPLEMENTATION DEFINED.

**Configuration**

Some or all RW fields of this register have defined reset values.

The number of error records that are implemented is IMPLEMENTATION DEFINED.

If error record <n> is not implemented, or error record <n> is not the first error record owned by the node, ERR<n>CTRL is RES0.

ERR<n>FR describes the features implemented by the node.

**Attributes**

ERR<n>CTRL is a 64-bit register.

**Field descriptions**

The ERR<n>CTRL bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0| CIRES0| WDUIDUI| WCFI| CFI| WUE| WFI| WUI| UE| FI| UI| IMPLEMENTATION DEFINED| ED|
| 13102928272625242322212019181716151413| 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   | 32  | 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  |

**IMPLEMENTATION DEFINED, bits [63:32]**

IMPLEMENTATION DEFINED.

Reserved for IMPLEMENTATION DEFINED controls. Must permit SBZP write policy for software.

This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

**Bits [31:14]**

Reserved, RES0.
**CI, bit [13]**

When ERR<\n>FR.CI == 0b10:

Critical error interrupt enable.

When enabled, the critical error interrupt is generated for a critical error condition.

<table>
<thead>
<tr>
<th>CI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Critical error interrupt not generated for critical errors. Critical</td>
</tr>
<tr>
<td></td>
<td>errors are treated as Uncontained errors.</td>
</tr>
<tr>
<td>0b1</td>
<td>Critical error interrupt generated for critical errors.</td>
</tr>
</tbody>
</table>

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bit [12]**

Reserved, RES0.

**WDUI, bit [11]**

When ERR<\n>FR.DUI == 0b11:

Error recovery interrupt for deferred errors on writes enable.

When enabled, the error recovery interrupt is generated for all detected Deferred errors on writes.

<table>
<thead>
<tr>
<th>WDUI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Error recovery interrupt not generated for deferred errors on writes.</td>
</tr>
<tr>
<td>0b1</td>
<td>Error recovery interrupt generated for deferred errors on writes.</td>
</tr>
</tbody>
</table>

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**DUI, bit [10]**

When ERR<\n>FR.DUI == 0b10:

Error recovery interrupt for deferred errors enable. This control applies to errors arising from both reads and writes.

When enabled, an error recovery interrupt is generated for all detected Deferred errors.

<table>
<thead>
<tr>
<th>DUI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Error recovery interrupt not generated for deferred errors.</td>
</tr>
<tr>
<td>0b1</td>
<td>Error recovery interrupt generated for deferred errors.</td>
</tr>
</tbody>
</table>
The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**When ERR<n>FR.DUI == 0b11:**

When ERR<n>FR.DUI == 0b11, this field is named RDUI.

Error recovery interrupt for deferred errors on reads enable.

When enabled, the error recovery interrupt is generated for all detected Deferred errors on reads.

<table>
<thead>
<tr>
<th>RDUI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Error recovery interrupt not generated for deferred errors on reads.</td>
</tr>
<tr>
<td>0b1</td>
<td>Error recovery interrupt generated for deferred errors on reads.</td>
</tr>
</tbody>
</table>

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**WCFI, bit [9]**

**When ERR<n>FR.CFI == 0b11:**

Fault handling interrupt for Corrected errors on writes enable.

When enabled:

- If the node implements Corrected error counters, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 1. For more information, see ERR<n>MISC0.
- Otherwise, the fault handling interrupt is also generated for all detected Corrected errors on writes.

<table>
<thead>
<tr>
<th>WCFI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault handling interrupt not generated for Corrected errors on writes.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault handling interrupt generated for Corrected errors on writes.</td>
</tr>
</tbody>
</table>

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.
**CFI, bit [8]**

**When \( \text{ERR}<n>\text{FR.CFI} == 0b10: \)**

Fault handling interrupt for Corrected errors enable. This control applies to errors arising from both reads and writes.

When enabled:

- If the node implements Corrected error counters, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 1. For more information, see \( \text{ERR}<n>\text{MISC0} \).
- Otherwise, the fault handling interrupt is generated for all detected Corrected errors.

<table>
<thead>
<tr>
<th>CFI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault handling interrupt not generated for Corrected errors.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault handling interrupt generated for Corrected errors.</td>
</tr>
</tbody>
</table>

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**When \( \text{ERR}<n>\text{FR.CFI} == 0b11: \)**

When \( \text{ERR}<n>\text{FR.CFI} == 0b11 \), this field is named RCFI.

Fault handling interrupt for Corrected errors on reads enable.

When enabled:

- If the node implements Corrected error counters, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 1. For more information, see \( \text{ERR}<n>\text{MISC0} \).
- Otherwise, the fault handling interrupt is generated for all detected Corrected errors on reads.

<table>
<thead>
<tr>
<th>RCFI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault handling interrupt not generated for Corrected errors on reads.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault handling interrupt generated for Corrected errors on reads.</td>
</tr>
</tbody>
</table>

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**WUE, bit [7]**

**When \( \text{ERR}<n>\text{FR.UE} == 0b11: \)**

In-band Uncorrected error reporting on writes enable.

When enabled, responses to writes that detect an Uncorrected error that cannot be deferred are signaled in-band as a detected Uncorrected error (External abort).
<table>
<thead>
<tr>
<th>WUE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>External abort response for Uncorrected errors disabled for writes.</td>
</tr>
<tr>
<td>0b1</td>
<td>External abort response for Uncorrected errors enabled for writes.</td>
</tr>
</tbody>
</table>

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**WFI, bit [6]**

*When ERR<n>FR.FI == 0b11:*

Fault handling interrupt on writes enable.

When enabled:

- The fault handling interrupt is generated for all detected Deferred errors and Uncorrected errors on writes.
- If the fault handling interrupt for Corrected errors control is not implemented:
  - If the node implements Corrected error counters, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 1.
  - Otherwise, the fault handling interrupt is also generated for all detected Corrected errors on writes.

<table>
<thead>
<tr>
<th>WFI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault handling interrupt disabled on writes.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault handling interrupt enabled on writes.</td>
</tr>
</tbody>
</table>

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**WUI, bit [5]**

*When ERR<n>FR.UI == 0b11:*

Uncorrected error recovery interrupt on writes enable.

When enabled, the error recovery interrupt is generated for all detected Uncorrected errors on writes that are not deferred.

<table>
<thead>
<tr>
<th>WUI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Error recovery interrupt disabled on writes.</td>
</tr>
<tr>
<td>0b1</td>
<td>Error recovery interrupt enabled on writes.</td>
</tr>
</tbody>
</table>

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
• On a Cold reset, this field resets to an architecturally *UNKNOWN* value.

**Otherwise:**

Reserved, RES0.

**UE, bit [4]**

*When ERR\(<n>\)FR.UE == 0b10:*

In-band Uncorrected error reporting enable.

When enabled, responses to transactions that detect an Uncorrected error that cannot be deferred are signaled in-band as a detected Uncorrected error (External abort).

<table>
<thead>
<tr>
<th>UE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>External abort response for Uncorrected errors disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>External abort response for Uncorrected errors enabled.</td>
</tr>
</tbody>
</table>

**Note**

This control applies to errors arising from both reads and writes.

The following resets apply:

• This bit is preserved on an Error Recovery reset.

• On a Cold reset, this field resets to an architecturally *UNKNOWN* value.

*When ERR\(<n>\)FR.UE == 0b11:*

When ERR\(<n>\)FR.UE == 0b11, this field is named RUE.

In-band Uncorrected error reporting on reads enable.

When enabled, responses to reads that detect an Uncorrected error that cannot be deferred are signaled in-band as a detected Uncorrected error (External abort).

<table>
<thead>
<tr>
<th>RUE</th>
<th>Meaning</th>

<tr>
<td>0b1</td>
<td>External abort response for Uncorrected errors enabled for reads.</td>
</tr>
</tbody>
</table>

The following resets apply:

• This bit is preserved on an Error Recovery reset.

• On a Cold reset, this field resets to an architecturally *UNKNOWN* value.

**Otherwise:**

Reserved, RES0.

**FI, bit [3]**

*When ERR\(<n>\)FR.FI == 0b10:*

Fault handling interrupt enable. This control applies to errors arising from both reads and writes.

When enabled:

• The fault handling interrupt is generated for all detected Deferred errors and Uncorrected errors.

• If the fault handling interrupt for Corrected errors control is not implemented:
If the node implements Corrected error counters, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 1.

Otherwise, the fault handling interrupt is also generated for all detected Corrected errors.

<table>
<thead>
<tr>
<th>FI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault handling interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault handling interrupt enabled.</td>
</tr>
</tbody>
</table>

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When \( \text{ERR}_n\text{FR}.FI = 0b11 \):

When \( \text{ERR}_n\text{FR}.FI = 0b11 \), this field is named \( RFI \).

Fault handling interrupt on reads enable.

When enabled:

- The fault handling interrupt is generated for all detected Deferred errors and Uncorrected errors on reads.
- If the fault handling interrupt for Corrected errors control is not implemented:
  - If the node implements Corrected error counters, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 1.
  - Otherwise, the fault handling interrupt is also generated for all detected Corrected errors on reads.

<table>
<thead>
<tr>
<th>RFI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault handling interrupt disabled on reads.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault handling interrupt enabled on reads.</td>
</tr>
</tbody>
</table>

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, \( \text{RES0} \).

\( UI, \text{bit [2]} \)

When \( \text{ERR}_n\text{FR}.UI = 0b10 \):

Uncorrected error recovery interrupt enable. This control applies to errors arising from both reads and writes.

When enabled, the error recovery interrupt is generated for all detected Uncorrected errors that are not deferred.

<table>
<thead>
<tr>
<th>UI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Error recovery interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Error recovery interrupt enabled.</td>
</tr>
</tbody>
</table>

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.
When \texttt{ERR<n>FR.UI} == 0b11:

When \texttt{ERR<n>FR.UI} == 0b11, this field is named RUI.

Uncorrected error recovery interrupt on reads enable.

When enabled, the error recovery interrupt is generated for all detected Uncorrected errors on reads that are not deferred.

<table>
<thead>
<tr>
<th>RUI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Error recovery interrupt disabled on reads.</td>
</tr>
<tr>
<td>0b1</td>
<td>Error recovery interrupt enabled on reads.</td>
</tr>
</tbody>
</table>

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally \texttt{UNKNOWN} value.

Otherwise:

Reserved, \texttt{RES0}.

**IMPLEMENTATION DEFINED, bit [1]**

IMPLEMENTATION DEFINED.

Reserved for IMPLEMENTATION DEFINED controls. Must permit SBZP write policy for software.

This bit reads as an IMPLEMENTATION DEFINED value and writes to this bit have IMPLEMENTATION DEFINED behavior.

**ED, bit [0]**

When \texttt{ERR<n>FR.ED} == 0b10:

Error reporting and logging enable.

When disabled, the node behaves as if error detection and correction are disabled, and no errors are recorded or signaled by the node. Arm recommends that, when disabled, correct error detection and correction codes are written for writes, unless disabled by an IMPLEMENTATION DEFINED control for error injection.

<table>
<thead>
<tr>
<th>ED</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Error reporting disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Error reporting enabled.</td>
</tr>
</tbody>
</table>

It is IMPLEMENTATION DEFINED whether the node fully disables error detection and correction when reporting is disabled. That is, even with error reporting disabled, the node might continue to silently correct errors. Uncorrectable errors might result in corrupt data being silently propagated by the node.

**Note**

If this node requires initialization after Cold reset to prevent signaling false errors, then Arm recommends this bit is set to 0 on Cold reset. This allows boot software to initialize a node without signaling errors. Software can enable error reporting after the node is initialized. If the Cold reset value is 1, the reset values of other controls in this register are IMPLEMENTATION DEFINED and should not be \texttt{UNKNOWN}.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
On a Cold reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

**Accessing the ERR\text{<n>CTRLR}**

**ERR\text{<n>CTRLR} can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x008 + 64n</td>
<td>ERR\text{&lt;n&gt;CTRLR}</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
**ERR<n>FR, Error Record Feature Register, n = 0 - 65534**

The ERR<n>FR characteristics are:

**Purpose**

Defines whether <n> is the first record owned by a node. If <n> is the first record owned by the node, also defines which of the common architecturally-defined features are implemented by the node and, of the implemented features, which are software programmable.

**Configuration**

This register is present only when RAS is implemented. Otherwise, direct accesses to ERR<n>FR are RES0.

Present only if error record <n> is implemented. Otherwise, this register is RES0.

The number of error records that are implemented is IMPLEMENTATION DEFINED.

If <n> is the first error record owned by a node, then ERR<n>FR.ED != 0b00.

If <n> is not the first error record owned by a node, then ERR<n>FR.ED == 0b00.

**Attributes**

ERR<n>FR is a 64-bit register.

**Field descriptions**

The ERR<n>FR bit assignments are:

**When ERR<n>FR.ED != 0b00:**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:32</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
<tr>
<td>31:26</td>
<td>Reserved for identifying IMPLEMENTATION DEFINED controls</td>
</tr>
<tr>
<td>25:24</td>
<td>TS, bits [25:24]</td>
</tr>
</tbody>
</table>

**When ARMv8.4-RAS is implemented:**

Timestamp Extension.
Indicates whether, for each error record \(<m>\) owned by this node, \(\text{ERR}<m>\text{MISC3}\) is used as the timestamp register, and, if it is, the timebase used by the timestamp.

<table>
<thead>
<tr>
<th>TS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The node does not support a timestamp register.</td>
</tr>
<tr>
<td>0b01</td>
<td>The node implements a timestamp register. The timestamp uses the same timebase as the system Generic Timer.</td>
</tr>
</tbody>
</table>

\[\text{Note}\]
For an error record which has an affinity to a PE, this is the same timer that is visible through \(\text{CNTPTC_EL0}\) at the highest Exception level on that PE.

| 0b10 | The node implements a timestamp register. The timebase for the timestamp is \text{IMPLEMENTATION DEFINED}. |

All other values are reserved.

**Otherwise:**
Reserved, \(\text{RES0}\).

**CI, bits [23:22]**
Critical error interrupt.

Indicates whether the critical error interrupt and associated controls are implemented.

<table>
<thead>
<tr>
<th>CI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>

All other values are reserved.

**INJ, bits [21:20]**

When ARMv8.4-RAS is implemented:

Fault Injection Extension.

Indicates whether the RAS Common Fault Injection Model Extension is implemented.

<table>
<thead>
<tr>
<th>INJ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The node does not support the RAS Common Fault Injection Model Extension.</td>
</tr>
<tr>
<td>0b01</td>
<td>The node implements the RAS Common Fault Injection Model Extension. See (\text{ERR}&lt;n&gt;\text{PFGF}) for more information.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Otherwise:**
Reserved, \(\text{RES0}\).

**CEO, bits [19:18]**

When \(\text{ERR}<n>\text{FR.CEC} != 0b00\):
Corrected Error overwrite.

Indicates the behavior when a second Corrected error is detected after a first Corrected error has been recorded by an error record \(<m>\) owned by the node.
### CEO

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00 Counts Corrected errors if a counter is implemented. Keeps the previous error syndrome. If the counter overflows, or no counter is implemented, then <code>ERR&lt; m &gt; STATUS. OF</code> is set to 1.</td>
</tr>
<tr>
<td>0b01 Counts Corrected errors. If <code>ERR&lt; m &gt; STATUS. OF</code> == 1 before the Corrected error is counted, then keeps the previous syndrome. Otherwise, the previous syndrome is overwritten. If the counter overflows, then <code>ERR&lt; m &gt; STATUS. OF</code> is set to 1.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Otherwise:**

Reserved, RES0.

### DUI, bits [17:16]

**When ERR< n > FR.UI != 0b00:**

Error recovery interrupt for deferred errors.

Indicates whether the node implements a control for enabling error recovery interrupts on deferred errors.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00 Does not support feature. <code>ERR&lt; n &gt; CTRL. DUI</code> is RES0.</td>
</tr>
<tr>
<td>0b10 Feature is controllable using <code>ERR&lt; n &gt; CTRL. DUI</code>.</td>
</tr>
<tr>
<td>0b11 Feature is controllable using <code>ERR&lt; n &gt; CTRL. WDUI</code> for writes and <code>ERR&lt; n &gt; CTRL. RDUI</code> for reads.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Otherwise:**

Reserved, RES0.

### RP, bit [15]

**When ERR< n > FR.CEC != 0b00:**

Repeat counter.

Indicates whether the node implements a repeat Corrected error counter in `ERR< m > MISC0` for each error record <m> owned by the node that implements a standard Corrected error counter.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0 A single CE counter is implemented.</td>
</tr>
<tr>
<td>0b1 A first (repeat) counter and a second (other) counter are implemented. The repeat counter is the same size as the primary error counter.</td>
</tr>
</tbody>
</table>

**Otherwise:**

Reserved, RES0.

### CEC, bits [14:12]

Corrected Error Counter.

Indicates whether the node implements standard Corrected error counter (CE counter) mechanisms in `ERR< m > MISC0` for each error record <m> owned by the node that can record countable errors.
CEC

<table>
<thead>
<tr>
<th>CEC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Does not implement the standard Corrected error counter model.</td>
</tr>
<tr>
<td>0b01</td>
<td>Implies an 8-bit Corrected error counter in ERR&lt;m&gt;MISC0[39:32].</td>
</tr>
<tr>
<td>0b10</td>
<td>Implements a 16-bit Corrected error counter in ERR&lt;m&gt;MISC0[47:32].</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Note**

Implementations might include other error counter models, or might include the standard model and not indicate this in ERR<n>FR.

**CFI, bits [11:10]**

When ERR<n>FR.FI != 0b00:

Fault handling interrupt for corrected errors.

Indicates whether the node implements a control for enabling fault handling interrupts on corrected errors.

<table>
<thead>
<tr>
<th>CFI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Does not support feature. ERR&lt;n&gt;CTLR.CFI is RES0.</td>

<tr>
<td>0b10</td>
<td>Feature is controllable using ERR&lt;n&gt;CTLR.CFI.</td>
</tr>
<tr>
<td>0b11</td>
<td>Feature is controllable using ERR&lt;n&gt;CTLR.WCFI for writes and ERR&lt;n&gt;CTLR.RCFI for reads.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Otherwise:

Reserved, RES0.

**UE, bits [9:8]**

In-band uncorrected error reporting.

Indicates whether the node implements in-band uncorrected error reporting (External aborts), and, if so, whether the node implements controls for enabling and disabling the reporting.

<table>
<thead>
<tr>
<th>UE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Does not support feature. ERR&lt;n&gt;CTLR.UE is RES0.</td>
</tr>
<tr>
<td>0b01</td>
<td>Feature always enabled. ERR&lt;n&gt;CTLR.UE is RES0.</td>
</tr>
<tr>
<td>0b10</td>
<td>Feature is controllable using ERR&lt;n&gt;CTLR.UE.</td>
</tr>
<tr>
<td>0b11</td>
<td>Feature is controllable using ERR&lt;n&gt;CTLR.WUE for writes and ERR&lt;n&gt;CTLR.RUE for reads.</td>
</tr>
</tbody>
</table>

**FI, bits [7:6]**

Fault handling interrupt.

Indicates whether the node implements a fault handling interrupt, and, if so, whether the node implements controls for enabling and disabling the interrupt.

<table>
<thead>
<tr>
<th>FI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Does not support feature. ERR&lt;n&gt;CTLR.FI is RES0.</td>

<tr>
<td>0b01</td>
<td>Feature always enabled. ERR&lt;n&gt;CTLR.FI is RES0.</td>
</tr>
<tr>
<td>0b10</td>
<td>Feature is controllable using ERR&lt;n&gt;CTLR.FI.</td>
</tr>
<tr>
<td>0b11</td>
<td>Feature is controllable using ERR&lt;n&gt;CTLR.WFI for writes and ERR&lt;n&gt;CTLR.RFI for reads.</td>
</tr>
</tbody>
</table>
UI, bits [5:4]

Error recovery interrupt for uncorrected errors.

Indicates whether the node implements an error recovery interrupt, and, if so, whether the node implements controls for enabling and disabling the interrupt.

<table>
<thead>
<tr>
<th>UI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Does not support feature. ERR&lt;n&gt;CTRL.UI is RES0.</td>
</tr>
<tr>
<td>0b01</td>
<td>Feature always enabled. ERR&lt;n&gt;CTRL.UI is RES0.</td>
</tr>
<tr>
<td>0b10</td>
<td>Feature is controllable using ERR&lt;n&gt;CTRL.UI.</td>
</tr>
<tr>
<td>0b11</td>
<td>Feature is controllable using ERR&lt;n&gt;CTRL.WUI for writes and ERR&lt;n&gt;CTRL.RUI for reads.</td>
</tr>
</tbody>
</table>

IMPLEMENTATION DEFINED, bits [3:2]

IMPLEMENTATION DEFINED.

This field reads as an IMPLEMENTATION DEFINED value.

ED, bits [1:0]

Error reporting and logging.

Indicates whether <n> is the first record owned by the node, and, if it is, whether the node implements controls for enabling and disabling error reporting and logging.

<table>
<thead>
<tr>
<th>ED</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>Feature always enabled. ERR&lt;n&gt;CTRL.ED is RES0.</td>
</tr>
<tr>
<td>0b10</td>
<td>Feature is controllable using ERR&lt;n&gt;CTRL.ED.</td>
</tr>
</tbody>
</table>

The value 0b11 is reserved.

When ERR<n>FR.ED == 0b00:

<table>
<thead>
<tr>
<th>Bits [63:2]</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
</table>

ED, bits [1:0]

Error reporting and logging.

Indicates whether <n> is the first record owned by the node, and, if it is, whether the node implements controls for enabling and disabling error reporting and logging.

<table>
<thead>
<tr>
<th>ED</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Error record &lt;n&gt; is not the first record owned by the node.</td>
</tr>
</tbody>
</table>

Accessing the ERR<n>FR

ERR<n>FR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x000 + 64n</td>
<td>ERR&lt;n&gt;FR</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
ERR<n>FR, Error Record Feature Register, n = 0 - 65534
ERR<n>MISC0, Error Record Miscellaneous Register 0

The ERR<n>MISC0 characteristics are:

**Purpose**

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- A Corrected error counter or counters.
- Information to identify the FRU in which the error was detected, and might contain enough information to locate the error within that FRU.
- Other state information not present in the corresponding status and address registers.

If the node <q> that owns error record <n> implements architecturally-defined error counters, so that ERR<q>FR. CEC != 0b000, and error record <n> can record countable errors, then ERR<n>MISC0 implements the architecturally-defined error counter or counters.

**Configuration**

Some or all RW fields of this register have defined reset values.

The number of error records that are implemented is IMPLEMENTATION DEFINED.

If error record <n> is not implemented, ERR<n>MISC0 is RES0.

ERR<q>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in this register, writing zero must always be supported to return the error record to an initial state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero and ignore writes are compliant with this requirement.

---

**Note**

Arm recommends that any IMPLEMENTATION DEFINED syndrome fields that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request are disabled at Cold reset and are enabled by software writing an IMPLEMENTATION DEFINED non-zero value to an IMPLEMENTATION DEFINED field in ERR<q>CTRL, where q is the index of the first error record owned by the same node as error record n. If the node owns a single record then q = n.

---

**Attributes**

ERR<n>MISC0 is a 64-bit register.

**Field descriptions**

The ERR<n>MISC0 bit assignments are:
When ERR<q>FR.CEC == 0b000:

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED syndrome. This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

When ERR<q>FR.CEC == 0b100 and ERR<q>FR.RP == 0:

IMPLEMENTATION DEFINED, bits [63:48]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED syndrome. This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

OF, bit [47]

Sticky overflow bit.

Set to 1 when the Corrected error count field is incremented and wraps through zero.

<table>
<thead>
<tr>
<th>OF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Counter has not overflowed.</td>
</tr>
<tr>
<td>0b1</td>
<td>Counter has overflowed.</td>
</tr>
</tbody>
</table>

A direct write that modifies this bit might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS. OF that clears it to zero might indirectly set this bit to an UNKNOWN value.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CEC, bits [46:32]

Corrected error count.

Incremented for each Corrected error. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are counted.

The following resets apply:

- This field is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.
IMPLEMENTATION DEFINED syndrome. This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

A direct write that modifies this bit might indirectly set \( \text{ERR}<n>\text{STATUS}.\text{OF} \) to an \textit{UNKNOWN} value and a direct write to \( \text{ERR}<n>\text{STATUS}.\text{OF} \) that clears it to zero might indirectly set this bit to an \textit{UNKNOWN} value.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally \textit{UNKNOWN} value.

### CECR, bits [38:32]

Corrected error count, repeat.

Incremented for the first countable error, which also records other syndrome for the error, and subsequently for each countable error that matches the recorded other syndrome. Corrected errors are countable errors. It is \textit{IMPLEMENTATION DEFINED} and might be \textit{UNPREDICTABLE} whether Deferred and Uncorrected errors are countable errors.

#### Note

For example, the other syndrome might include the set and way information for an error detected in a cache. This might be recorded in the \textit{IMPLEMENTATION DEFINED} \( \text{ERR}<n>\text{MISC}<m> \) fields on a first Corrected error. \( \text{ERR}<n>\text{MISC}0.\text{CECR} \) is then incremented for each subsequent Corrected Error in the same set and way.

The following resets apply:

- This field is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally \textit{UNKNOWN} value.

### IMPLEMENTATION DEFINED, bits [31:0]

\textit{IMPLEMENTATION DEFINED}.

\textit{IMPLEMENTATION DEFINED} syndrome. This field reads as an \textit{IMPLEMENTATION DEFINED} value and writes to this field have \textit{IMPLEMENTATION DEFINED} behavior.

### Accessing the \( \text{ERR}<n>\text{MISC}0 \)

Arm recommends that a miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write. When \( \text{ERR}<n>\text{STATUS}.\text{MV} \) is set to 1, the miscellaneous syndrome for the most recently recorded error should ignore writes.

\( \text{ERR}<n>\text{MISC}0 \) can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x020 + 64n</td>
<td>( \text{ERR}&lt;n&gt;\text{MISC}0 )</td>
</tr>
</tbody>
</table>

Accesses on this interface are \textit{RW}.
ERR<n>MISC1, Error Record Miscellaneous Register 1, n = 0 - 65534

The ERR<n>MISC1 characteristics are:

**Purpose**

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers can contain:

- A Corrected error counter or counters.
- Information to identify the FRU in which the error was detected, and might contain enough information to locate the error within that FRU.
- Other state information not present in the corresponding status and address registers.

**Configuration**

This register is present only when RAS is implemented. Otherwise, direct accesses to ERR<n>MISC1 are UNDEFINED.

The number of error records that are implemented is IMPLEMENTATION DEFINED.

If error record <n> is not implemented, ERR<n>MISC1 is RES0.

ERR<q>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in this register, writing zero must always be supported to return the error record to an initial state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero and ignore writes are compliant with this requirement.

---

**Note**

Arm recommends that any IMPLEMENTATION DEFINED syndrome fields that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request are disabled at Cold reset and are enabled by software writing an IMPLEMENTATION DEFINED non-zero value to an IMPLEMENTATION DEFINED field in ERR<q>CTRL, where q is the index of the first error record owned by the same node as error record n. If the node owns a single record then q = n.

---

**Attributes**

ERR<n>MISC1 is a 64-bit register.

**Field descriptions**

The ERR<n>MISC1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
<tr>
<td>32</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
<tr>
<td>31</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
<tr>
<td>0</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
</tbody>
</table>
IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED syndrome. This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

Accessing the ERR\textsubscript{<n>}-MISC1

Arm recommends that a miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.

When ERR\textsubscript{<n>}-STATUS.MV is set to 1, the miscellaneous syndrome for the most recently recorded error should ignore writes.

ERR\textsubscript{<n>}-MISC1 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x028 + 64n</td>
<td>ERR\textsubscript{&lt;n&gt;}-MISC1</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
ERR<n>MISC2, Error Record Miscellaneous Register 2, 
\( n = 0 - 65534 \)

The ERR<n>MISC2 characteristics are:

**Purpose**

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers can contain:

- A Corrected error counter or counters.
- Information to identify the FRU in which the error was detected, and might contain enough information to locate the error within that FRU.
- Other state information not present in the corresponding status and address registers.

**Configuration**

This register is present only when ARMv8.4-RAS is implemented. Otherwise, direct accesses to ERR<n>MISC2 are RES0.

The number of error records that are implemented is IMPLEMENTATION DEFINED.

If error record \( <n> \) is not implemented, ERR<n>MISC2 is RES0.

ERR<q>FR describes the features implemented by the node that owns error record \( <n> \). \( <q> \) is the index of the first error record owned by the same node as error record \( <n> \). If the node owns a single record, then \( q = n \).

For IMPLEMENTATION DEFINED fields in this register, writing zero must always be supported to return the error record to an initial state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero and ignore writes are compliant with this requirement.

**Note**

Arm recommends that any IMPLEMENTATION DEFINED syndrome fields that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request are disabled at Cold reset and are enabled by software writing an IMPLEMENTATION DEFINED non-zero value to an IMPLEMENTATION DEFINED field in ERR<q>CTRL, where \( q \) is the index of the first error record owned by the same node as error record \( n \). If the node owns a single record then \( q = n \).

**Attributes**

ERR<n>MISC2 is a 64-bit register.

**Field descriptions**

The ERR<n>MISC2 bit assignments are:

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED syndrome. This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

**Accessing the ERR\(<n>\)MISC2**

Arm recommends that a miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.

When ERR\(<n>\)STATUS.MV is set to 1, the miscellaneous syndrome for the most recently recorded error should ignore writes.

**ERR\(<n>\)MISC2 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFFFFFFFF + 64n</td>
<td>ERR(&lt;n&gt;)MISC2</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
ERR<n>MISC3, Error Record Miscellaneous Register 3, n = 0 - 65534

The ERR<n>MISC3 characteristics are:

**Purpose**

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers can contain:

- A Corrected error counter or counters.
- Information to identify the FRU in which the error was detected, and might contain enough information to locate the error within that FRU.
- Other state information not present in the corresponding status and address registers.

If the node <q> that owns error record <n> supports the RAS Timestamp Extension, then ERR<n>MISC3 contains the timestamp value for error record <n> when the error was detected. Otherwise the contents of ERR<n>MISC3 are IMPLEMENTATION DEFINED.

**Configuration**

External register ERR<n>MISC3 is architecturally mapped to AArch64 System register ERXMISC3_EL1 when ERRSELR_EL1.SEL == n.

External register ERR<n>MISC3 bits [31:0] are architecturally mapped to AArch32 System register ERXMISC6[31:0] when ERRSELR_EL1.SEL == n.

External register ERR<n>MISC3 bits [63:32] are architecturally mapped to AArch32 System register ERXMISC7[31:0] when ERRSELR_EL1.SEL == n.

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when ARMv8.4-RAS is implemented. Otherwise, direct accesses to ERR<n>MISC3 are RES0.

The number of error records that are implemented is IMPLEMENTATION DEFINED.

If error record <n> is not implemented, ERR<n>MISC3 is RES0.

ERR<q>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in this register, writing zero must always be supported to return the error record to an initial state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero and ignore writes are compliant with this requirement.

---

**Note**

Arm recommends that any IMPLEMENTATION DEFINED syndrome fields that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request are disabled at Cold reset and are enabled by software writing an IMPLEMENTATION DEFINED non-zero value to an IMPLEMENTATION DEFINED field in ERR<q>CTRL, where q is the index of the first error record owned by the same node as error record n. If the node owns a single record then q = n.
**Attributes**

ERR<n>MISC3 is a 64-bit register.

**Field descriptions**

The ERR<n>MISC3 bit assignments are:

**When ERR<q>FR.TS != 0b00:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| TS | TS |

**TS, bits [63:0]**

Timestamp.

Timestamp value recorded when the error was detected. Valid only if ERR<n>STATUS.V == 1.

See ERR<n>FR.TS.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO or RW.

**When ERR<q>FR.TS == 0b00:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| IMPLEMENTATION DEFINED | IMPLEMENTATION DEFINED |

**IMPLEMENTATION DEFINED, bits [63:0]**

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED syndrome. This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

**Accessing the ERR<n>MISC3**

Arm recommends that a miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.

When ERR<n>STATUS.MV is set to 1, the miscellaneous syndrome for the most recently recorded error should ignore writes.

ERR<n>MISC3 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x038 + 64n</td>
<td>ERR&lt;n&gt;MISC3</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
The ERR<n>PFGCDN characteristics are:

**Purpose**

Generates one of the errors enabled in the corresponding ERR<n>PFGCTL register.

**Configuration**

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when ARMv8.4-RAS is implemented. Otherwise, direct accesses to ERR<n>PFGCDN are RES0.

Present only when the RAS Common Fault Injection Model Extension is implemented by this node so that ERR<n>FR.INJ != 0b00, error record <n> is implemented, and error record <n> is the first error record owned by a node. Otherwise, RES0.

ERR<n>FR describes the features implemented by the node.

**Attributes**

ERR<n>PFGCDN is a 64-bit register.

**Field descriptions**

The ERR<n>PFGCDN bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    | RES0|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0|

**Bits [63:32]**

Reserved, RES0.

**CDN, bits [31:0]**

Countdown value.

This field is copied to Error Generation Counter when either:

- Software writes ERR<n>PFGCTL.CDNEN with 1.
- The Error Generation Counter decrements to zero and ERR<n>PFGCTL.R == 1.

While ERR<n>PFGCTL.CDNEN == 1 and the Error Generation Counter is nonzero, the counter decrements by 1 for each cycle at an IMPLEMENTATION DEFINED clock rate. When the counter reaches 0, one of the errors enabled in the ERR<n>PFGCTL register is generated.

**Note**

The current Error Generation Counter value is not visible to software.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
Accessing the **ERR<n>PFGCDN**

**ERR<n>PFGCDN can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x810 + 64n</td>
<td>ERR&lt;n&gt;PFGCDN</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
ERR<n>PFGCTL, Pseudo-fault Generation Control Register, n = 0 - 65534

The ERR<n>PFGCTL characteristics are:

**Purpose**

Enables controlled fault generation.

**Configuration**

Some or all RW fields of this register have defined reset values.

This register is present only when ARMv8.4-RAS is implemented. Otherwise, direct accesses to ERR<n>PFGCTL are RES0.

Present only when the RAS Common Fault Injection Model Extension is implemented by this node so that ERR<n>FR.INJ != 0b00, error record <n> is implemented, and error record <n> is the first error record owned by a node. Otherwise, RES0.

ERR<n>FR describes the features implemented by the node.

**Attributes**

ERR<n>PFGCTL is a 64-bit register.

**Field descriptions**

The ERR<n>PFGCTL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved</td>
<td>RES0</td>
</tr>
<tr>
<td>62</td>
<td>CDNEN</td>
<td>R</td>
</tr>
<tr>
<td>61</td>
<td>R</td>
<td></td>
</tr>
<tr>
<td>60</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**CDNEN, bit [31]**

Countdown Enable. Controls transfers from the value that is held in the ERR<n>PFGCDN into the Error Generation Counter, and enables this counter.

<table>
<thead>
<tr>
<th>CDNEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Error Generation Counter is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Error Generation Counter is enabled. On a write of 1 to this bit, the Error Generation Counter is set to ERR&lt;n&gt;PFGCDN.CDN.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.

**R, bit [30]**

Restart. Controls whether, on reaching zero, the Error Generation Counter restarts from the ERR<n>PFGCDN value, or stops.
Meaning

0b0 On reaching 0, the Error Generation Counter stops.
0b1 On reaching 0, the Error Generation Counter is set to ERR<n>PFGCDN.CDN.

This bit is RES0 if the node does not support this control.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [29:13]**

Reserved, RES0.

**MV, bit [12]**

Miscellaneous syndrome. The value that is written to ERR<n>STATUS.MV when an injected error is recorded.

<table>
<thead>
<tr>
<th>MV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERR&lt;n&gt;STATUS.MV is set to 0 when an injected error is recorded.</td>
</tr>
<tr>
<td>0b1</td>
<td>ERR&lt;n&gt;STATUS.MV is set to 1 when an injected error is recorded.</td>
</tr>
</tbody>
</table>

This bit reads-as-one if the node always records some syndrome in ERR<n>MISC<m>, setting ERR<n>STATUS.MV to 1, when an injected error is recorded.

This bit is RES0 if the node does not support this control.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**AV, bit [11]**

Address syndrome. The value that is written to ERR<n>STATUS.AV when an injected error is recorded.

<table>
<thead>
<tr>
<th>AV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERR&lt;n&gt;STATUS.AV is set to 0 when an injected error is recorded.</td>
</tr>
<tr>
<td>0b1</td>
<td>ERR&lt;n&gt;STATUS.AV is set to 1 when an injected error is recorded.</td>
</tr>
</tbody>
</table>

This bit reads-as-one if the node always sets ERR<n>STATUS.AV to 1 when an injected error is recorded.

This bit is RES0 if the node does not support this control.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**PN, bit [10]**

Poison flag. The value that is written to ERR<n>STATUS.PN when an injected error is recorded.

<table>
<thead>
<tr>
<th>PN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERR&lt;n&gt;STATUS.PN is set to 0 when an injected error is recorded.</td>
</tr>
<tr>
<td>0b1</td>
<td>ERR&lt;n&gt;STATUS.PN is set to 1 when an injected error is recorded.</td>
</tr>
</tbody>
</table>

This bit is RES0 if the node does not support this control.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**ER, bit [9]**

Error Reported flag. The value that is written to ERR<n>STATUS.ER when an injected error is recorded.

<table>
<thead>
<tr>
<th>ER</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERR&lt;n&gt;STATUS.ER is set to 0 when an injected error is recorded.</td>
</tr>
<tr>
<td>0b1</td>
<td>ERR&lt;n&gt;STATUS.ER is set to 1 when an injected error is recorded.</td>
</tr>
</tbody>
</table>

This bit is RES0 if the node does not support this control.
On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**CI, bit [8]**

Critical Error flag. The value that is written to **ERR<n>STATUS.CI** when an injected error is recorded.

<table>
<thead>
<tr>
<th>CI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><strong>ERR&lt;n&gt;STATUS.CI</strong> is set to 0 when an injected error is recorded.</td>
</tr>
<tr>
<td>0b1</td>
<td><strong>ERR&lt;n&gt;STATUS.CI</strong> is set to 1 when an injected error is recorded.</td>
</tr>
</tbody>
</table>

This bit is **RES0** if the node does not support this control.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**CE, bits [7:6]**

Corrected Error generation enable. Controls the type of Corrected Error condition that might be generated.

<table>
<thead>
<tr>
<th>CE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>No error of this type is generated.</td>
</tr>
<tr>
<td>0b01</td>
<td>A non-specific Corrected Error, that is, a Corrected Error that is</td>
</tr>
<tr>
<td></td>
<td>recorded as <strong>ERR&lt;n&gt;STATUS.CE</strong> == 0b10, might be generated</td>
</tr>
<tr>
<td></td>
<td>when the Error Generation Counter decrements to zero.</td>
</tr>
<tr>
<td>0b10</td>
<td>A transient Corrected Error, that is, a Corrected Error that is</td>
</tr>
<tr>
<td></td>
<td>recorded as <strong>ERR&lt;n&gt;STATUS.CE</strong> == 0b01, might be generated</td>
</tr>
<tr>
<td></td>
<td>when the Error Generation Counter decrements to zero.</td>
</tr>
<tr>
<td>0b11</td>
<td>A persistent Corrected Error, that is, a Corrected Error that is</td>
</tr>
<tr>
<td></td>
<td>recorded as <strong>ERR&lt;n&gt;STATUS.CE</strong> == 0b11, might be generated</td>
</tr>
<tr>
<td></td>
<td>when the Error Generation Counter decrements to zero.</td>
</tr>
</tbody>
</table>

The set of permitted values for this field is defined by **ERR<n>PFGF.CE**.

This field is **RES0** if the node does not support this control.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**DE, bit [5]**

Deferred Error generation enable. Controls whether this type of error condition might be generated. It is **IMPLEMENTATION DEFINED** whether the error is generated if the data is not consumed.

<table>
<thead>
<tr>
<th>DE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No error of this type is generated.</td>
</tr>
<tr>
<td>0b1</td>
<td>An error of this type might be generated when the Error</td>
</tr>
<tr>
<td></td>
<td>Generation Counter decrements to zero.</td>
</tr>
</tbody>
</table>

This bit is **RES0** if the node does not support this control.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**UEO, bit [4]**

Latent or Restartable Error generation enable. Controls whether this type of error condition might be generated. It is **IMPLEMENTATION DEFINED** whether the error is generated if the data is not consumed.

<table>
<thead>
<tr>
<th>UEO</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No error of this type is generated.</td>
</tr>
<tr>
<td>0b1</td>
<td>An error of this type might be generated when the Error</td>
</tr>
<tr>
<td></td>
<td>Generation Counter decrements to zero.</td>
</tr>
</tbody>
</table>

This bit is **RES0** if the node does not support this control.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
UER, bit [3]

Signaled or Recoverable Error generation enable. Controls whether this type of error condition might be generated. It is IMPLEMENTATION DEFINED whether the error is generated if the data is not consumed.

<table>
<thead>
<tr>
<th>UER</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No error of this type is generated.</td>
</tr>
<tr>
<td>0b1</td>
<td>An error of this type might be generated when the Error Generation Counter decrements to zero.</td>
</tr>
</tbody>
</table>

This bit is RES0 if the node does not support this control.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

UEU, bit [2]

Unrecoverable Error generation enable. Controls whether this type of error condition might be generated. It is IMPLEMENTATION DEFINED whether the error is generated if the data is not consumed.

<table>
<thead>
<tr>
<th>UEU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No error of this type is generated.</td>
</tr>
<tr>
<td>0b1</td>
<td>An error of this type might be generated when the Error Generation Counter decrements to zero.</td>
</tr>
</tbody>
</table>

This bit is RES0 if the node does not support this control.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

UC, bit [1]

Uncontainable Error generation enable. Controls whether this type of error condition might be generated. It is IMPLEMENTATION DEFINED whether the error is generated if the data is not consumed.

<table>
<thead>
<tr>
<th>UC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No error of this type is generated.</td>
</tr>
<tr>
<td>0b1</td>
<td>An error of this type might be generated when the Error Generation Counter decrements to zero.</td>
</tr>
</tbody>
</table>

This bit is RES0 if the node does not support this control.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

OF, bit [0]

Overflow flag. The value that is written to ERR<n>STATUS.OF when an injected error is recorded.

<table>
<thead>
<tr>
<th>OF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERR&lt;n&gt;STATUS.OF is set to 0 when an injected error is recorded.</td>
</tr>
<tr>
<td>0b1</td>
<td>ERR&lt;n&gt;STATUS.OF is set to 1 when an injected error is recorded.</td>
</tr>
</tbody>
</table>

This bit is RES0 if the node does not support this control.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ERR<n>PFGCTL**

ERR<n>PFGCTL can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>

</table>

Accesses on this interface are RW.
ERR\(n\) PFGCTL, Pseudo-fault Generation Control Register, \(n = 0 - 65534\)
ERR<n>PFGF, Pseudo-fault Generation Feature Register, n = 0 - 65534

The ERR<n>PFGF characteristics are:

**Purpose**

Defines which common architecturally-defined fault generation features are implemented.

**Configuration**

This register is present only when ARMv8.4-RAS is implemented. Otherwise, direct accesses to ERR<n>PFGF are RES0.

Present only when the RAS Common Fault Injection Model Extension is implemented by this node so that ERR<n>FR.INJ != 0b00, error record <n> is implemented, and error record <n> is the first error record owned by a node. Otherwise, RES0.

ERR<n>FR describes the features implemented by the node.

**Attributes**

ERR<n>PFGF is a 64-bit register.

**Field descriptions**

The ERR<n>PFGF bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 - 31</td>
<td>Reserved, RES0.</td>
<td></td>
</tr>
<tr>

</tbody>
</table>

**Bits [63:31]**

Reserved, RES0.

**R, bit [30]**

Restartable. Support for Error Generation Counter restart mode.

<table>
<thead>
<tr>
<th>R</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The node does not support this feature.</td>
</tr>
<tr>
<td>0b1</td>
<td>Feature controllable.</td>
</tr>
</tbody>
</table>

**SYN, bit [29]**

Syndrome. Fault syndrome injection.

<table>
<thead>
<tr>
<th>SYN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When an injected error is recorded, the node sets</td>
</tr>
<tr>
<td></td>
<td>ERR&lt;n&gt;STATUS. {IERR, SERR} to IMPLEMENTATIONDEFINED values. ERR&lt;n&gt;STATUS. {IERR, SERR} are UNKNOWN when</td>
</tr>
<tr>
<td></td>
<td>ERR&lt;n&gt;STATUS.V == 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>When an injected error is recorded, the node does not update the</td>
</tr>
<tr>
<td></td>
<td>ERR&lt;n&gt;STATUS. {IERR, SERR} fields. ERR&lt;n&gt;STATUS. {IERR, SERR} are writable when ERR&lt;n&gt;STATUS.V == 0.</td>
</tr>
</tbody>
</table>
Note

If this bit is 1, software can write specific values into the \( \text{ERR}<n>\text{STATUS} \) \{IERR, SERR\} fields when setting up a fault injection event. The sets of values that can be written to these fields is \text{IMPLEMENTATION DEFINED}.

Bits [28:13]

Reserved, RES0.

MV, bit [12]

Miscellaneous syndrome.

Additional syndrome injection. Defines whether software can control all or part of the syndrome recorded in the \( \text{ERR}<n>\text{MISC}<m> \) registers when an injected error is recorded.

It is \text{IMPLEMENTATION DEFINED} which syndrome fields in \( \text{ERR}<n>\text{MISC}<m> \) this refers to, as some fields might always be recorded by an error. For example, a Corrected Error counter.

<table>
<thead>
<tr>
<th>MV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When an injected error is recorded, the node might record \text{IMPLEMENTATION DEFINED} additional syndrome in ( \text{ERR}&lt;n&gt;\text{MISC}&lt;m&gt; ). If any syndrome is recorded in ( \text{ERR}&lt;n&gt;\text{MISC}&lt;m&gt; ), ( \text{ERR}&lt;n&gt;\text{STATUS}.\text{MV} ) is set to 1.</td>
</tr>
</tbody>
</table>
| 0b1 | When an injected error is recorded, the node does not update all the syndrome fields in the \( \text{ERR}<n>\text{MISC}<m> \) and does one of:  
  • The node does not update any fields in \( \text{ERR}<n>\text{MISC}<m> \) and sets \( \text{ERR}<n>\text{STATUS}.\text{MV} \) to \( \text{ERR}<n>\text{PGFCTL}.\text{MV} \).  
  • The node records some syndrome in \( \text{ERR}<n>\text{MISC}<m> \) and sets \( \text{ERR}<n>\text{STATUS}.\text{MV} \) to 1. \( \text{ERR}<n>\text{PGFCTL}.\text{MV} \) is \text{RAO}.  
The syndrome fields that the node does not update are unchanged and must be writable when \( \text{ERR}<n>\text{STATUS}.\text{MV} \) is set to 0. |

Note

If this bit is 1, software can write specific values into the \( \text{ERR}<n>\text{MISC}<m> \) registers when setting up a fault injection event. The values that can be written to these registers are \text{IMPLEMENTATION DEFINED}.

AV, bit [11]

Address syndrome. Address syndrome injection.

<table>
<thead>
<tr>
<th>AV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When an injected error is recorded, the node either sets ( \text{ERR}&lt;n&gt;\text{ADDR} ) and ( \text{ERR}&lt;n&gt;\text{STATUS}.\text{AV} ) for the access, or leaves these unchanged.</td>
</tr>
</tbody>
</table>
| 0b1 | When an injected error is recorded, the node does not update \( \text{ERR}<n>\text{ADDR} \) and does one of:  
  • Sets \( \text{ERR}<n>\text{STATUS}.\text{AV} \) to \( \text{ERR}<n>\text{PGFCTL}.\text{AV} \).  
  • Sets \( \text{ERR}<n>\text{STATUS}.\text{AV} \) to 1. \( \text{ERR}<n>\text{PGFCTL}.\text{AV} \) is \text{RAO}. \( \text{ERR}<n>\text{ADDR} \) must be writable when \( \text{ERR}<n>\text{STATUS}.\text{AV} \) is set to 0. |

Note

If this bit is 1, software can write a specific value into \( \text{ERR}<n>\text{ADDR} \) when setting up a fault injection event.
PN, bit [10]

Poison flag. Describes how the fault generation feature of the node sets the $\text{ERR}_n\text{STATUS}.\text{PN}$ status flag.

<table>
<thead>
<tr>
<th>PN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When an injected error is recorded, it is IMPLEMENTATION DEFINED whether the node sets $\text{ERR}_n\text{STATUS}.\text{PN}$ to 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>When an injected error is recorded, $\text{ERR}_n\text{STATUS}.\text{PN}$ is set to $\text{ERR}_n\text{PFGCTL}.\text{PN}$.</td>
</tr>
</tbody>
</table>

This behavior replaces the architecture-defined rules for setting the PN bit.

This bit reads-as-zero if the node does not support this flag.

ER, bit [9]

Error Reported flag. Describes how the fault generation feature of the node sets the $\text{ERR}_n\text{STATUS}.\text{ER}$ status flag.

<table>
<thead>
<tr>
<th>ER</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When an injected error is recorded, the node sets $\text{ERR}_n\text{STATUS}.\text{ER}$ according to the architecture-defined rules for setting the ER bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>When an injected error is recorded, $\text{ERR}_n\text{STATUS}.\text{ER}$ is set to $\text{ERR}_n\text{PFGCTL}.\text{ER}$. This behavior replaces the architecture-defined rules for setting the ER bit.</td>
</tr>
</tbody>
</table>

This bit reads-as-zero if the node does not support this flag.

CI, bit [8]

Critical Error flag. Describes how the fault generation feature of the node sets the $\text{ERR}_n\text{STATUS}.\text{CI}$ status flag.

<table>
<thead>
<tr>
<th>CI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When an injected error is recorded, it is IMPLEMENTATION DEFINED whether the node sets $\text{ERR}_n\text{STATUS}.\text{CI}$ to 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>When an injected error is recorded, $\text{ERR}_n\text{STATUS}.\text{CI}$ is set to $\text{ERR}_n\text{PFGCTL}.\text{CI}$.</td>
</tr>
</tbody>
</table>

This behavior replaces the architecture-defined rules for setting the CI bit.

This bit reads-as-zero if the node does not support this flag.

CE, bits [7:6]

Corrected Error generation. Describes the types of Corrected Error that the fault generation feature of the node can generate.

<table>
<thead>
<tr>
<th>CE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The fault generation feature of the node cannot generate this type of error.</td>
</tr>
<tr>
<td>0b01</td>
<td>The fault generation feature of the node allows generation of a non-specific Corrected Error, that is, a Corrected Error that is recorded as $\text{ERR}_n\text{STATUS}.\text{CE} == 0b10$.</td>
</tr>
<tr>
<td>0b11</td>
<td>The fault generation feature of the node allows generation of transient or persistent Corrected Errors, that is, Corrected Errors that are recorded as $\text{ERR}_n\text{STATUS}.\text{CE} == 0b01$ and $0b11$.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This bit reads-as-zero if the node does not support this type of error.

DE, bit [5]

Deferred Error generation. Describes whether the fault generation feature of the node can generate this type of error.
### DE, bit [0]

Meaning

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The fault generation feature of the node cannot generate this type of error.</td>
</tr>
<tr>
<td>0b1</td>
<td>The fault generation feature of the node allows generation of this type of error.</td>
</tr>
</tbody>
</table>

This bit reads-as-zero if the node does not support this type of error.

### UEO, bit [4]

Latent or Restartable Error generation. Describes whether the fault generation feature of the node can generate this type of error.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The fault generation feature of the node cannot generate this type of error.</td>
</tr>
<tr>
<td>0b1</td>
<td>The fault generation feature of the node allows generation of this type of error.</td>
</tr>
</tbody>
</table>

This bit reads-as-zero if the node does not support this type of error.

### UER, bit [3]

Signaled or Recoverable Error generation. Describes whether the fault generation feature of the node can generate this type of error.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The fault generation feature of the node cannot generate this type of error.</td>
</tr>
<tr>
<td>0b1</td>
<td>The fault generation feature of the node allows generation of this type of error.</td>
</tr>
</tbody>
</table>

This bit reads-as-zero if the node does not support this type of error.

### UEU, bit [2]

Unrecoverable Error generation. Describes whether the fault generation feature of the node can generate this type of error.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The fault generation feature of the node cannot generate this type of error.</td>
</tr>
<tr>
<td>0b1</td>
<td>The fault generation feature of the node allows generation of this type of error.</td>
</tr>
</tbody>
</table>

This bit reads-as-zero if the node does not support this type of error.

### UC, bit [1]

Uncontainable Error generation. Describes whether the fault generation feature of the node can generate this type of error.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The fault generation feature of the node cannot generate this type of error.</td>
</tr>
<tr>
<td>0b1</td>
<td>The fault generation feature of the node allows generation of this type of error.</td>
</tr>
</tbody>
</table>

This bit reads-as-zero if the node does not support this type of error.

### OF, bit [0]

Overflow flag. Describes how the fault generation feature of the node sets the \texttt{ERR<n>STATUS} OF status flag.
<table>
<thead>
<tr>
<th>OF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When an injected error is recorded, the node sets <em>ERR&lt;n&gt;STATUS</em>.OF according to the architecture-defined rules for setting the OF bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>When an injected error is recorded, <em>ERR&lt;n&gt;STATUS</em>.OF is set to <em>ERR&lt;n&gt;PFGCTL</em>.OF. This behavior replaces the architecture-defined rules for setting the OF bit.</td>
</tr>
</tbody>
</table>

This bit reads-as-zero if the node does not support this flag.

### Accessing the ERR<n>PFGF

**ERR<n>PFGF can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x800 + 64n</td>
<td>ERR&lt;n&gt;PFGF</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.

---

Copyright © 2010-2019 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.
The ERR<n>STATUS characteristics are:

**Purpose**

Contains status information for the error record, including:

- Whether any error has been detected (valid).
- Whether any detected error was not corrected, and returned to a master.
- Whether any detected error was not corrected and deferred.
- Whether an error record has been discarded because additional errors have been detected before the first error was handled by software (overflow).
- Whether any error has been reported.
- Whether the other error record registers contain valid information.
- Whether the error was recorded because poison data was detected or because a corrupt value was detected by an error detection code.
- A primary error code.
- An IMPLEMENTATION DEFINED extended error code.

Within this register:

- The \{AV, V, MV\} bits are valid bits that define whether the error record registers are valid.
- The \{UE, OF, CE, DE, UET\} bits encode the type of error or errors recorded.
- The \{CI, ER, PN, IERR, SERR\} fields are syndrome fields.

**Configuration**

Some or all RW fields of this register have defined reset values.

This register is present only when RAS is implemented. Otherwise, direct accesses to ERR<n>STATUS are UNDEFINED.

The number of error records that are implemented is IMPLEMENTATION DEFINED.

If error record <n> is not implemented, ERR<n>STATUS is RES0.

ERR<q>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in this register, writing zero must always be supported to return the error record to an initial state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero and ignore writes are compliant with this requirement.

**Note**

Arm recommends that any IMPLEMENTATION DEFINED syndrome fields that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request are disabled at Cold reset and are enabled by
software writing an IMPLEMENTATION DEFINED non-zero value to an IMPLEMENTATION DEFINED field in ERR<q>CTRL, where q is the index of the first error record owned by the same node as error record n. If the node owns a single record then q = n.

**Attributes**

ERR<n>STATUS is a 64-bit register.

**Field descriptions**

The ERR<n>STATUS bit assignments are:

**When ARMv8.4-RAS is implemented:**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>32</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>31</td>
<td>Address Valid</td>
</tr>
<tr>
<td>30</td>
<td>Status Register Valid</td>
</tr>
<tr>
<td>29</td>
<td>Uncorrected error</td>
</tr>
<tr>
<td>28</td>
<td>Error Record Primary Status Register, n = 0 - 65534</td>
</tr>
</tbody>
</table>

**AV, bit [31]**

Address Valid.

<table>
<thead>
<tr>
<th>AV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERR&lt;n&gt;ADDR not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>ERR&lt;n&gt;ADDR contains an address associated with the highest priority error recorded by this record.</td>
</tr>
</tbody>
</table>

This bit is read/write-one-to-clear.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to 0.

**V, bit [30]**

Status Register Valid.

<table>
<thead>
<tr>
<th>V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERR&lt;n&gt;STATUS not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>ERR&lt;n&gt;STATUS valid. At least one error has been recorded.</td>
</tr>
</tbody>
</table>

This bit is read/write-one-to-clear.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to 0.

**UE, bit [29]**

Uncorrected error.
### ER, bit [28]

**Error Reported.**

<table>
<thead>
<tr>
<th>ER</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No in-band error (External abort) reported.</td>
</tr>
<tr>
<td>0b1</td>
<td>An External abort was signaled by the node to the master making the access or other transaction. This can be because any of the following are true:</td>
</tr>
<tr>
<td></td>
<td>* The applicable one of the $ERR&lt;q&gt;$CTRLR.{WUE,RUE,UE} bits is implemented, and was set to 1 when an Uncorrected error was detected.</td>
</tr>
<tr>
<td></td>
<td>* The applicable one of the $ERR&lt;q&gt;$CTRLR.{WUE,RUE,UE} bits is not implemented.</td>
</tr>
</tbody>
</table>

It is **IMPLEMENTATION DEFINED** whether this bit can be set to 1 by a Deferred error.

When clearing \$ERR<n>\$STATUS.V to 0, if this bit is nonzero, then software must write one to this bit to clear this bit to zero.

This bit is not valid and reads **UNKNOWN** if any of the following are true:

- \$ERR<n>\$STATUS.V is set to 0.
- \$ERR<n>\$STATUS.UE is set to 0 and this bit is never set to 1 by a Deferred error.
- \$ERR<n>\$STATUS.\{UE, DE\} are both set to 0, and this bit can be set to 1 by a Deferred error.

This bit is read/write-one-to-clear.

#### Note

An External abort signaled by the node might be masked and not generate any exception.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

### OF, bit [27]

**Overflow.**

Indicates that multiple errors have been detected. This bit is set to 1 when one of the following occurs:

- A Corrected error counter is implemented, an error is counted, and the counter overflows.
ERR<n>STATUS.V was previously set to 1, a Corrected error counter is not implemented, and a Corrected error is recorded.

ERR<n>STATUS.V was previously set to 1, and a type of error other than a Corrected error is recorded. Otherwise, this bit is unchanged when an error is recorded.

If a Corrected error counter is implemented:

• A direct write that modifies the counter overflow flag indirectly might set this bit to an UNKNOWN value.

• A direct write to this bit that clears this bit to zero might indirectly set the counter overflow flag to an UNKNOWN value.

<table>
<thead>
<tr>
<th>OF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Since this bit was last cleared to zero, no error syndrome has been discarded and, if a Corrected error counter is implemented, it has not overflowed.</td>
</tr>
<tr>
<td>0b1</td>
<td>Since this bit was last cleared to zero, at least one error syndrome has been discarded or, if a Corrected error counter is implemented, it might have overflowed.</td>
</tr>
</tbody>
</table>

If this bit is nonzero, then software must write 1 to this bit, to clear this bit to zero, when clearing ERR<n>STATUS.V to 0.

This bit is not valid and reads UNKNOWN if ERR<n>STATUS.V is set to 0.

This bit is read/write-one-to-clear.

The following resets apply:

• This bit is preserved on an Error Recovery reset.

• On a Cold reset, this field resets to an architecturally UNKNOWN value.

MV, bit [26]

Miscellaneous Registers Valid.

<table>
<thead>
<tr>
<th>MV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERR&lt;n&gt;MISC0, ERR&lt;n&gt;MISC1, ERR&lt;n&gt;MISC2, and ERR&lt;n&gt;MISC3 are not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The IMPLEMENTATION DEFINED contents of the ERR&lt;n&gt;MISC0, ERR&lt;n&gt;MISC1, ERR&lt;n&gt;MISC2, and ERR&lt;n&gt;MISC3 registers contain additional information for an error recorded by this record.</td>
</tr>
</tbody>
</table>

This bit is read/write-one-to-clear.

Note

If the ERR<n>MISC0, ERR<n>MISC1, ERR<n>MISC2, and ERR<n>MISC3 registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded.

The following resets apply:

• This bit is preserved on an Error Recovery reset.

• On a Cold reset, this field resets to 0.

CE, bits [25:24]

Corrected Error.
The mechanism by which a node detects whether a correctable error is transient or persistent is IMPLEMENTATION DEFINED. If no such mechanism is implemented, then the node sets this field to 0b10 when an error is corrected.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then software must write ones to this field to clear this field to zero.

If ERR<n>STATUS.V is set to 0, this field is not valid and reads UNKNOWN.

This field is read/write-one-to-clear. Writing a value other than all-zeros or all-ones sets this field to an UNKNOWN value.

The following resets apply:

- This field is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

DE, bit [23]

Deferred Error.

<table>
<thead>
<tr>
<th>DE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No errors were deferred.</td>
</tr>
<tr>
<td>0b1</td>
<td>At least one error was not corrected and deferred.</td>
</tr>
</tbody>
</table>

Support for deferring errors is IMPLEMENTATION DEFINED.

When clearing ERR<n>STATUS.V to 0, if this bit is nonzero, then software must write 1 to this bit to clear this bit to zero.

If ERR<n>STATUS.V is set to 0, this bit is not valid and reads UNKNOWN.

This bit is read/write-one-to-clear.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PN, bit [22]

Poison.

<table>
<thead>
<tr>
<th>PN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Uncorrected error or Deferred error recorded because a corrupt value was detected, for example, by an error detection code (EDC).</td>
</tr>
<tr>
<td>0b1</td>
<td>Uncorrected error or Deferred error recorded because a poison value was detected.</td>
</tr>
</tbody>
</table>

**Note**

- If a producer node detects a corrupt value and defers the error by producing a poison value, then this bit is set to 0 at the producer node.
- This might only be an indication of poison, because, in some EDC schemes, a poison value is encoded as an unlikely form of corrupt data, meaning it is possible to mistake a corrupt value as a poison value.
It is IMPLEMENTATION DEFINED whether a node can distinguish a poison value from a corrupt value.

When clearing ERR<
>STATUS.V to 0, if this bit is nonzero, then software must write 1 to this bit to clear this bit to zero.

This bit is not valid and reads UNKNOWN if any of the following are true:

- ERR<
>STATUS.V is set to 0.
- ERR<
>STATUS.{DE, UE} are both set to 0.

This bit is read/write-one-to-clear.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**UET, bits [21:20]**

Uncorrected Error Type.

Describes the state of the component after detecting or consuming an Uncorrected error.

<table>
<thead>
<tr>
<th>UET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Uncorrected error; Uncontainable error (UC).</td>
</tr>
<tr>
<td>0b01</td>
<td>Uncorrected error; Unrecoverable error (UEU).</td>
</tr>
<tr>
<td>0b10</td>
<td>Uncorrected error; Latent or Restartable error (UEO).</td>
</tr>
<tr>
<td>0b11</td>
<td>Uncorrected error; Signaled or Recoverable error (UER).</td>
</tr>
</tbody>
</table>

When clearing ERR<
>STATUS.V to 0, if this field is nonzero, then software must write ones to this field to clear this field to zero.

This field is not valid and reads UNKNOWN if any of the following are true:

- ERR<
>STATUS.V is set to 0.
- ERR<
>STATUS.UE is set to 0.

This field is read/write-one-to-clear. Writing a value other than all-zeros or all-ones sets this field to an UNKNOWN value.

The following resets apply:

- This field is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**CI, bit [19]**

Critical error.

Indicates whether a critical error condition has been recorded.

<table>
<thead>
<tr>
<th>CI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No critical error condition recorded.</td>
</tr>
<tr>
<td>0b1</td>
<td>Critical error condition recorded.</td>
</tr>
</tbody>
</table>

When clearing ERR<
>STATUS.V to 0, if this bit is nonzero, then software must write 1 to this bit to clear this bit to zero.

This bit is not valid and reads UNKNOWN if ERR<
>STATUS.V is set to 0.

This bit is read/write-one-to-clear.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
• On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [18:16]**

Reserved, RES0.

**IERR, bits [15:8]**

**IMPLEMENTATION DEFINED** error code.

Used with any primary error code SERR value. Further **IMPLEMENTATION DEFINED** information can be placed in the MISC registers.

This field is not valid and reads **UNKNOWN** if ERR<n>STATUS.V is set to 0.

The following resets apply:

• This field is preserved on an Error Recovery reset.

• On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**SERR, bits [7:0]**

Architecturally-defined primary error code.

Indicates the type of error. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry.
<table>
<thead>
<tr>
<th>SERR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

All other values are reserved. Reserved values might be defined in a future version of the architecture.

This field is not valid and reads UNKNOWN if ERR<n>STATUS.V is set to 0.

The following resets apply:

- This field is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

<table>
<thead>
<tr>
<th>Bits [63:32]</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
</table>
**AV, bit [31]**

Address Valid.

<table>
<thead>
<tr>
<th>AV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERR&lt;n&gt;ADDR not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>ERR&lt;n&gt;ADDR contains an address associated with the highest priority error recorded by this record.</td>
</tr>
</tbody>
</table>

This bit ignores writes if any of ERR<n>STATUS.{CE, DE, UE} are set to 1, and the highest priority of these is not being cleared to 0 in the same write.

This bit is read/write-one-to-clear.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to 0.

**V, bit [30]**

Status Register Valid.

<table>
<thead>
<tr>
<th>V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERR&lt;n&gt;STATUS not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>ERR&lt;n&gt;STATUS valid. At least one error has been recorded.</td>
</tr>
</tbody>
</table>

This bit ignores writes if any of ERR<n>STATUS.{CE, DE, UE} are set to 1, and is not being cleared to 0 in the same write.

This bit is read/write-one-to-clear.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to 0.

**UE, bit [29]**

Uncorrected error.

<table>
<thead>
<tr>
<th>UE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No errors have been detected, or all detected errors have been either corrected or deferred.</td>
</tr>
<tr>
<td>0b1</td>
<td>At least one detected error was not corrected and not deferred.</td>
</tr>
</tbody>
</table>

When clearing ERR<n>STATUS.V to 0, if this bit is nonzero, then software must write one to this bit to clear this bit to zero.

If ERR<n>STATUS.OF is set to 1 and is not being cleared to 0 in the same write, this bit ignores writes.

This bit is not valid and reads UNKNOWN if ERR<n>STATUS.V is set to 0.

This bit is read/write-one-to-clear.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**ER, bit [28]**

Error Reported.
### ER, bit [0]

<table>
<thead>
<tr>
<th>ER</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No in-band error (External abort) reported.</td>
</tr>
</tbody>
</table>
| 0b1 | An External abort was signaled by the node to the master making the access or other transaction. This can be because any of the following are true:  
  - The applicable one of the ERR<q>CTLR. {WUE, RUE, UE} bits is implemented, and was set to 1 when an Uncorrected error was detected.  
  - The applicable one of the ERR<q>CTLR. {WUE, RUE, UE} bits is not implemented. |

It is IMPLEMENTATION DEFINED whether this bit can be set to 1 by a Deferred error.

If this bit is nonzero, then software must write 1 to this bit, to clear this bit to zero, when:

- Clearing ERR<n>STATUS.V to 0.
- Clearing ERR<n>STATUS.UE to 0, if this bit is never set to 1 by a Deferred error.
- Clearing both ERR<n>STATUS.{UE, DE} to 0, if this bit can be set to 1 by a Deferred error.

This bit is not valid and reads UNKNOWN if any of the following are true:

- ERR<n>STATUS.V is set to 0.
- ERR<n>STATUS.UE is set to 0 and this bit is never set to 1 by a Deferred error.
- ERR<n>STATUS.{UE, DE} are both set to 0, and this bit can be set to 1 by a Deferred error.

This bit ignores writes if any of ERR<n>STATUS.{CE, DE, UE} are set to 1, and the highest priority of these is not being cleared to 0 in the same write.

This bit is read/write-one-to-clear.

#### Note

An External abort signaled by the node might be masked and not generate any exception.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

### OF, bit [27]

**Overflow.**

Indicates that multiple errors have been detected. This bit is set to 1 when one of the following occurs:

- An Uncorrected error is detected and ERR<n>STATUS.UE == 1.
- A Deferred error is detected, ERR<n>STATUS.UE == 0 and ERR<n>STATUS.DE == 1.
- A Corrected error is detected, no Corrected error counter is implemented, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and ERR<n>STATUS.CE != 0b00. ERR<n>STATUS.CE might be updated for the new Corrected error.
- A Corrected error counter is implemented, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and the counter overflows.

It is IMPLEMENTATION DEFINED whether this bit is set to 1 when one of the following occurs:

- A Deferred error is detected and ERR<n>STATUS.UE == 1.
- A Corrected error is detected, no Corrected error counter is implemented, and either or both the ERR<n>STATUS.UE or ERR<n>STATUS.DE bits are set to 1.
A Corrected error counter is implemented, either or both the ERR<n>STATUS.UE or ERR<n>STATUS.DE bits are set to 1, and the counter overflows.

It is IMPLEMENTATION DEFINED whether this bit is set to 0 when one of the following occurs:

- An Uncorrected error is detected and ERR<n>STATUS.UE == 0.
- A Deferred error is detected, ERR<n>STATUS.UE == 0 and ERR<n>STATUS.DE == 0.
- A Corrected error is detected, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0 and ERR<n>STATUS.CE == 0b00.

The IMPLEMENTATION DEFINED clearing of this bit might also depend on the value of the other error status bits.

If a Corrected error counter is implemented:

- A direct write that modifies the counter overflow flag indirectly might set this bit to an UNKNOWN value.
- A direct write to this bit that clears this bit to 0 might indirectly set the counter overflow flag to an UNKNOWN value.

<table>
<thead>
<tr>
<th>OF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If ERR&lt;n&gt;STATUS.UE == 1, then no error syndrome for an Uncorrected error has been discarded.</td>
</tr>
<tr>
<td></td>
<td>If ERR&lt;n&gt;STATUS.UE == 0 and ERR&lt;n&gt;STATUS.DE == 1, then no error syndrome for a Deferred error has been discarded.</td>
</tr>
<tr>
<td></td>
<td>If ERR&lt;n&gt;STATUS.UE == 0, ERR&lt;n&gt;STATUS.DE == 0, and a Corrected error counter is implemented, then the counter has not overflowed.</td>
</tr>
<tr>
<td></td>
<td>If ERR&lt;n&gt;STATUS.UE == 0, ERR&lt;n&gt;STATUS.DE == 0, ERR&lt;n&gt;STATUS.CE != 0b00, and no Corrected error counter is implemented, then no error syndrome for a Corrected error has been discarded.</td>
</tr>
</tbody>
</table>

**Note**

This bit might have been set to 1 when an error syndrome was discarded and later cleared to 0 when a higher priority syndrome was recorded.

| 0b1  | At least one error syndrome has been discarded or, if a Corrected error counter is implemented, it might have overflowed. |

If this bit is nonzero, then software must write 1 to this bit, to clear this bit to zero, when clearing ERR<n>STATUS.V to 0.

This bit is not valid and reads UNKNOWN if ERR<n>STATUS.V is set to 0.

This bit is read/write-one-to-clear.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**MV, bit [26]**

Miscellaneous Registers Valid.

<table>
<thead>
<tr>
<th>MV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERR&lt;n&gt;MISC0 and ERR&lt;n&gt;MISC1 not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The IMPLEMENTATION DEFINED contents of the ERR&lt;n&gt;MISC0 and ERR&lt;n&gt;MISC1 registers contains additional information for an error recorded by this record.</td>
</tr>
</tbody>
</table>

This bit ignores writes if any of ERR<n>STATUS.{CE, DE, UE} are set to 1, and the highest priority of these is not being cleared to 0 in the same write.

This bit is read/write-one-to-clear.
If the ERR<n>MISC0 and ERR<n>MISC1 registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to 0.

**CE, bits [25:24]**

Corrected Error.

<table>
<thead>
<tr>
<th>CE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>No errors were corrected.</td>
</tr>
<tr>
<td>0b01</td>
<td>At least one transient error was corrected.</td>
</tr>
<tr>
<td>0b10</td>
<td>At least one error was corrected.</td>
</tr>
<tr>
<td>0b11</td>
<td>At least one persistent error was corrected.</td>
</tr>
</tbody>
</table>

The mechanism by which a node detects whether a correctable error is transient or persistent is IMPLEMENTATION DEFINED. If no such mechanism is implemented, then the node sets this field to 0b10 when an error is corrected.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then software must write ones to this field to clear this field to zero.

If ERR<n>STATUS.OF is set to 1 and is not being cleared to 0 in the same write, this field ignores writes.

If ERR<n>STATUS.V is set to 0, this field is not valid and reads UNKNOWN.

This field is read/write-ones-to-clear. Writing a value other than all-zeros or all-ones sets this field to an UNKNOWN value.

The following resets apply:

- This field is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**DE, bit [23]**

Deferred Error.

<table>
<thead>
<tr>
<th>DE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No errors were deferred.</td>
</tr>
<tr>
<td>0b1</td>
<td>At least one error was not corrected and deferred.</td>
</tr>
</tbody>
</table>

Support for deferring errors is IMPLEMENTATION DEFINED.

When clearing ERR<n>STATUS.V to 0, if this bit is nonzero, then software must write 1 to this bit to clear this bit to zero.

If ERR<n>STATUS.OF is set to 1 and is not being cleared to 0 in the same write, this bit ignores writes.

If ERR<n>STATUS.V is set to 0, this bit is not valid and reads UNKNOWN.

This bit is read/write-one-to-clear.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.
**PN, bit [22]**

Poison.

<table>
<thead>
<tr>
<th>PN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Uncorrected error or Deferred error recorded because a corrupt value was detected, for example, by an error detection code (EDC).</td>
</tr>
</tbody>
</table>

**Note**
If a producer node detects a corrupt value and defers the error by producing a poison value, then this bit is set to 0 at the producer node.

<table>
<thead>
<tr>
<th>PN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>Uncorrected error or Deferred error recorded because a poison value was detected.</td>
</tr>
</tbody>
</table>

**Note**
This might only be an indication of poison, because, in some EDC schemes, a poison value is encoded as an unlikely form of corrupt data, meaning it is possible to mistake a corrupt value as a poison value.

It is IMPLEMENTATION DEFINED whether a node can distinguish a poison value from a corrupt value.

When clearing ERR<n>STATUS.V to 0, if this bit is nonzero, then software must write 1 to this bit to clear this bit to zero.

When clearing both ERR<n>STATUS.{DE, UE} to 0, if this bit is nonzero, then software must write 1 to this bit to clear this bit to zero.

This bit is not valid and reads UNKNOWN if any of the following are true:

- ERR<n>STATUS.V is set to 0.
- ERR<n>STATUS.{DE, UE} are both set to 0.

When any of ERR<n>STATUS.{CE, DE, UE} are set to 1, and the highest priority of these is not being cleared to 0 in the same write, this bit ignores writes.

This bit is read/write-one-to-clear.

The following resets apply:

- This bit is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**UET, bits [21:20]**

Uncorrected Error Type.

Describes the state of the component after detecting or consuming an Uncorrected error.

<table>
<thead>
<tr>
<th>UET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Uncorrected error; Uncontainable error (UC).</td>
</tr>
<tr>
<td>0b01</td>
<td>Uncorrected error; Unrecoverable error (UEU).</td>
</tr>
<tr>
<td>0b10</td>
<td>Uncorrected error; Latent or Restartable error (UEO).</td>
</tr>
<tr>
<td>0b11</td>
<td>Uncorrected error; Signaled or Recoverable error (UER).</td>
</tr>
</tbody>
</table>

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then software must write ones to this field to clear this field to zero.

When clearing ERR<n>STATUS.UE to 0, if this field is nonzero, then software must write ones to this field to clear this field to zero.

This field is not valid and reads UNKNOWN if any of the following are true:

- ERR<n>STATUS.V is set to 0.
• ERR<n>STATUS.UE is set to 0.

When any of ERR<n>STATUS.{CE, DE, UE} are set to 1, and the highest priority of these is not being cleared to 0 in the same write, this field ignores writes.

This field is read/write-ones-to-clear. Writing a value other than all-zeros or all-ones sets this field to an UNKNOWN value.

The following resets apply:

• This field is preserved on an Error Recovery reset.
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [19:16]**

Reserved, RES0.

**IERR, bits [15:8]**

IMPLEMENTATION DEFINED error code.

Used with any primary error code SERR value. Further IMPLEMENTATION DEFINED information can be placed in the MISC registers.

This field is not valid and reads UNKNOWN if ERR<n>STATUS.V is set to 0.

When any of ERR<n>STATUS.{CE, DE, UE} are set to 1, and the highest priority of these is not being cleared to 0 in the same write, this field ignores writes.

The following resets apply:

• This field is preserved on an Error Recovery reset.
• On a Cold reset, this field resets to an architecturally UNKNOWN value.

**SERR, bits [7:0]**

Architecturally-defined primary error code.

Indicates the type of error. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry.
<table>
<thead>
<tr>
<th>SERR</th>

<td>Deferred error from slave not supported at master. For example, poisoned data received from a slave by a master that cannot defer the error further.</td>
</tr>
</tbody>
</table>

All other values are reserved. Reserved values might be defined in a future version of the architecture.

This field is not valid and reads **UNKNOWN** if ERR<n>STATUS.V is set to 0.

When any of ERR<n>STATUS.{CE, DE, UE} are set to 1, and the highest priority of these is not being cleared to 0 in the same write, this field ignores writes.

The following resets apply:

- This field is preserved on an Error Recovery reset.
- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

## Accessing the ERR<n>STATUS

After reading the status register, software must clear the valid bits to allow new errors to be recorded.

Between reading the register and clearing the valid bits, a new error might have overwritten the register. To prevent this new error being lost:

- When ARMv8.4-RAS is not implemented, some control bits use a form of read/write-one-to-clear and ignore writes depending on the values of other bits and which bits are being cleared.
- When ARMv8.4-RAS is implemented, a write to ERR<n>STATUS is ignored if both:
  - Any of the ERR<n>STATUS.{V, UE, OF, CE, DE} fields are nonzero before the write.
The write does not clear the nonzero ERR<n>STATUS.V, UE, OF, CE, DE} field(s) to zero by writing one(s) to the applicable field(s).

Software must write ones to the {ER, PN, UET, CI} fields when clearing ERR<n>STATUS.V, UE, OF, CE, DE}.

**ERR<n>STATUS can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x010 + 64n</td>
<td>ERR&lt;n&gt;STATUS</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
The ERRPIDR0 characteristics are:

**Purpose**

Provides discovery information about the component.

For more information, see About the Peripheral identification scheme in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

Implementation of this register is OPTIONAL.

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRPIDR0 are RES0.

**Attributes**

ERRPIDR0 is a 32-bit register.

**Field descriptions**

The ERRPIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>29-10</td>
<td>PART_0</td>
</tr>
<tr>
<td>8</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PART_0, bits [7:0]**

Part number, bits [7:0].

The part number is selected by the designer of the component. The designer chooses whether to use a 12-bit or a 16-bit part number, and:

- If a 12-bit part number is used, it is stored in ERRPIDR1.PART_1 and this field.
- If a 16-bit part number is used, it is stored in ERRPIDR2.PART_2, ERRPIDR1.PART_1 and this field.

This field reads as an IMPLEMENTATION DEFINED value.

**Accessing the ERRPIDR0**

**ERRPIDR0 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFE0</td>
<td>ERRPIDR0</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
ERRPIDR1, Peripheral Identification Register 1

The ERRPIDR1 characteristics are:

**Purpose**

Provides discovery information about the component.

For more information, see About the Peripheral identification scheme in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

Implementation of this register is OPTIONAL.

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRPIDR1 are RES0.

**Attributes**

ERRPIDR1 is a 32-bit register.

**Field descriptions**

The ERRPIDR1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | DES_0 | PART_1 |

**Bits [31:8]**

Reserved, RES0.

**DES_0, bits [7:4]**

Designer JEP106 identification code, bits [3:0]. This field and ERRPIDR2.DES_1 together form the JEDEC-assigned JEP106 identification code for the designer of the component.

The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component.

**Note**

For a component designed by Arm Limited, the JEP106 identification code is 0x3B.

This field reads as an IMPLEMENTATION DEFINED value.

**PART_1, bits [3:0]**

Part number, bits [11:8]

The part number is selected by the designer of the component. The designer chooses whether to use a 12-bit or a 16-bit part number, and:

- If a 12-bit part number is used, it is stored in this field and ERRPIDR0.PART_0.
- If a 16-bit part number is used, it is stored in ERRPIDR2.PART_2, this field, and ERRPIDR0.PART_0.
This field reads as an IMPLEMENTATION DEFINED value.

**Accessing the ERRPIDR1**

**ERRPIDR1 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFE4</td>
<td>ERRPIDR1</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
The ERRPIDR2 characteristics are:

**Purpose**

Provides discovery information about the component.

For more information, see About the Peripheral identification scheme in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

Implementation of this register is **OPTIONAL**.

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRPIDR2 are **RES0**.

**Attributes**

ERRPIDR2 is a 32-bit register.

**Field descriptions**

The ERRPIDR2 bit assignments are:

**When the component uses a 12-bit part number:**

<table>
<thead>

</table>

**Note**
For a component designed by Arm Limited, the JEP106 identification code is 0x3B.

When the component uses a 16-bit part number:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>30-24</td>
<td>PART_2, bits [7:4]. Part number, bits [15:12]. The part number is selected by the designer of the component. It is stored in this field, <code>ERRPIDR1.PART_1</code> and <code>ERRPIDR0.PART_0</code>. This field reads as an IMPLEMENTATION DEFINED value.</td>
</tr>
<tr>
<td>23-20</td>
<td>JEDEC, bit [3]. JEDEC-assigned JEP106 implementer code is used. This bit is RAO.</td>
</tr>
<tr>
<td>19-16</td>
<td>DES_1, bits [2:0]. Designer, JEP106 identification code, bits [6:4]. <code>ERRPIDR1.DES_0</code> and this field together form the JEDEC-assigned JEP106 identification code for the designer of the component. This field reads as an IMPLEMENTATION DEFINED value.</td>
</tr>
</tbody>
</table>

Accessing the ERRPIDR2

**ERRPIDR2 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFE8</td>
<td>ERRPIDR2</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
ERRPIDR3, Peripheral Identification Register 3

The ERRPIDR3 characteristics are:

**Purpose**

Provides discovery information about the component.

For more information, see About the Peripheral identification scheme in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

Implementation of this register is **OPTIONAL**.

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRPIDR3 are **RES0**.

**Attributes**

ERRPIDR3 is a 32-bit register.

**Field descriptions**

The ERRPIDR3 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | REVAND | CMOD |

**Bits [31:8]**

Reserved, RES0.

**REVAND, bits [7:4]**

*When the component uses a 12-bit part number:*

Component minor revision. ERRPIDR2.REVISION and this field together form the revision number of the component, with REVISION being the most significant part and REVAND the least significant part.

This field reads as an **IMPLEMENTATION DEFINED** value.

*When the component uses a 16-bit part number:*

Component revision.

This field reads as an **IMPLEMENTATION DEFINED** value.

**Otherwise:**

Reserved, RES0.

**CMOD, bits [3:0]**

Customer Modified. If the value of this field is non-zero, then the component has **IMPLEMENTATION DEFINED** modifications.
<table>
<thead>
<tr>
<th>CMOD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The component is not modified from the original design.</td>
</tr>
</tbody>
</table>

For any two components with the same Unique Component Identifier:

- If the value of the CMOD fields of both components equals zero, the components are identical.
- If the value of the CMOD field of either of the two components is non-zero, they might not be identical, even though they have the same Unique Component Identifier.
- If the CMOD fields of both components have the same non-zero value, it does not necessarily mean that they have the same modifications.

This field reads as an IMPLEMENTATION DEFINED value.

**Accessing the ERRPIDR3**

**ERRPIDR3 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFEC</td>
<td>ERRPIDR3</td>
</tr>
</tbody>
</table>

Accesses on this interface are RO.
ERRPIDR4, Peripheral Identification Register 4

The ERRPIDR4 characteristics are:

**Purpose**

Provides discovery information about the component.

For more information, see About the Peripheral identification scheme in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

Implementation of this register is OPTIONAL.

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRPIDR4 are RES0.

**Attributes**

ERRPIDR4 is a 32-bit register.

**Field descriptions**

The ERRPIDR4 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:0</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>7:4</td>
<td>SIZE</td>
</tr>
<tr>
<td>3:0</td>
<td>DES_2</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SIZE, bits [7:4]**

Size of the component. The distance from the start of the address space used by this component to the end of the component identification registers.

If the value of this field is non-zero, then the component occupies $2^{\text{ERRPIDR4.SIZE}}$ 4KB blocks.

<table>
<thead>
<tr>
<th>SIZE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>One of the following is true:</td>
</tr>
<tr>
<td></td>
<td>• The component uses a single 4KB block.</td>
</tr>
<tr>
<td></td>
<td>• The component uses an IMPLEMENTATION DEFINED number of 4KB blocks.</td>
</tr>
</tbody>
</table>

Using this bit field to indicate the size of the component is deprecated. This bit field might not correctly indicate the size of the component.

Arm recommends that software determine the size of the component from the Unique Component Identifier fields, and other IMPLEMENTATION DEFINED registers in the component.

This register reads as an IMPLEMENTATION DEFINED value.

**DES_2, bits [3:0]**

Designer, JEP106 continuation code. This is the JEDEC-assigned JEP106 bank identifier for the designer of the component, minus 1.
The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component.

This field reads as an IMPLEMENTATION DEFINED value.

**Note**

For a component designed by Arm Limited, the JEP106 bank is 5, meaning this field has the value 0x4.

### Accessing the ERRPIDR4

**ERRPIDR4 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFD0</td>
<td>ERRPIDR4</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
GICC_ABPR, CPU Interface Aliased Binary Point Register

The GICC_ABPR characteristics are:

**Purpose**

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption.

**Configuration**

RW fields in this register reset to architecturally **UNKNOWN** values.

In systems that support two Security states:

- This register is an alias of the Non-secure copy of GICC_BPR.
- Non-secure accesses to this register return a shifted value of the binary point.
- If ICC_CTLR_EL3.CBPR_EL1NS == 1, Secure accesses to this register access ICC_BPR0_EL1.

**Attributes**

The reset value of this register is defined as (minimum GICC_BPR.Binary_Point + 1), resulting in a permitted range of 0x1-0x4.

**Field descriptions**

The GICC_ABPR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 |

**Bits [31:3]**

Reserved, RES0.

**Binary_Point, bits [2:0]**

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. The following list describes how this field determines the interrupt priority bits assigned to the group priority field:

- Priority grouping for Group 1 interrupts when CBPR==0, for the processing of Group 1 interrupts in a GIC implementation that supports interrupt grouping, when GICC_CTLR.CBPR == 0.
- Priority grouping for Group 0 interrupts, or Group 1 interrupts when CBPR==1, for all other cases.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the GICC_ABPR**

This register is used only when System register access is not enabled. When System register access is enabled, the System registers ICC_BPR0_EL1 and ICC_BPR1_EL1 provide equivalent functionality.

**GICC_ABPR can be accessed through the memory-mapped interfaces:**
This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
The GICC_AEOIR characteristics are:

**Purpose**

A write to this register performs priority drop for the specified Group 1 interrupt and, if the appropriate GICC_CTLR.EOImodeS or GICC_CTLR.EOImodeNS field == 0, also deactivates the interrupt.

**Configuration**

When GICD_CTLR.DS==0, this register is an alias of the Non-secure view of GICC_EOIR. A Secure access to this register is identical to a Non-secure access to GICC_EOIR.

**Attributes**

GICC_AEOIR is a 32-bit register.

**Field descriptions**

The GICC_AEOIR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | INTID |

**Bits [31:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID of the signaled interrupt.

**Note**

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

**Accessing the GICC_AEOIR**

A write to this register must correspond to the most recently acknowledged Group 1 interrupt. If a value other than the last value read from GICC_AIAR is written to this register, the effect is UNPREDICTABLE.

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_EOIR1 provides equivalent functionality.
- For AArch64 implementations, ICC_EOIR1_EL1 provides equivalent functionality.
When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

**GICC_AEOIR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC CPU interface</td>
<td>0x0024</td>
<td>GICC_AEOIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **WO**.
- When IsAccessSecure() accesses to this register are **WO**.
- When !IsAccessSecure() accesses to this register are **WO**.
The GICC_AHPPIR characteristics are:

**Purpose**

If the highest priority pending interrupt is in Group 1, this register provides the INTID of the highest priority pending interrupt on the CPU interface.

**Configuration**

If $\text{GICD\_CTLR}.\text{DS}==0$, this register is an alias of the Non-secure view of $\text{GICC\_HPPIR}$. A Secure access to this register is identical to a Non-secure access to $\text{GICC\_HPPIR}$.

**Attributes**

GICC_AHPPIR is a 32-bit register.

**Field descriptions**

The GICC_AHPPIR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | INTID |

**Bits [31:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID of the signaled interrupt.

**Note**

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

**Accessing the GICC_AHPPIR**

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, $\text{ICC\_HPPIR1}$ provides equivalent functionality.
- For AArch64 implementations, $\text{ICC\_HPPIR1\_EL1}$ provides equivalent functionality.

If the highest priority pending interrupt is in Group 0, a read of this register returns the special INTID 1023.

Interrupt identifiers corresponding to an interrupt group that is not enabled are ignored.
If the highest priority pending interrupt is a direct interrupt that is both individually enabled in the Distributor and part of an interrupt group that is enabled in the Distributor, and the interrupt group is disabled in the CPU interface for this PE, this register returns the special INTID 1023.

See Preemption for more information about pending interrupts that are not considered when determining the highest priority pending interrupt.

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

**GICC_AHPPIR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC CPU interface</td>
<td>0x0028</td>
<td>GICC_AHPPIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RO.
- When IsAccessSecure() accesses to this register are RO.
- When !IsAccessSecure() accesses to this register are RO.
The GICC_AIAR characteristics are:

**Purpose**

Provides the INTID of the signaled Group 1 interrupt. A read of this register by the PE acts as an acknowledge for the interrupt.

**Configuration**

When \texttt{GICD_CTLR.DS==0}, this register is an alias of the Non-secure view of \texttt{GICC_IAR}. A Secure access to this register is identical to a Non-secure access to \texttt{GICC_IAR}.

**Attributes**

GICC_AIAR is a 32-bit register.

**Field descriptions**

The GICC_AIAR bit assignments are:

<table>
<thead>
<tr>

</tbody>
</table>

**Bits [31:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID of the signaled interrupt.

**Note**

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

**Accessing the GICC_AIAR**

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

**GICC_AIAR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
GICC_AIAR, CPU Interface Aliased Interrupt Acknowledge Register

<table>
<thead>
<tr>
<th>GIC CPU interface</th>
<th>0x0020</th>
<th>GICC_AIAR</th>
</tr>
</thead>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RO**.
- When IsAccessSecure() accesses to this register are **RO**.
- When !IsAccessSecure() accesses to this register are **RO**.
The GICC_APR<n> characteristics are:

**Purpose**

Provides information about interrupt active priorities.

**Configuration**

Some or all RW fields of this register have defined reset values.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

When GICD_CTLR.DS == 0, these registers are Banked, and Non-secure accesses do not affect Secure operation. The Secure copies of these registers hold active priorities for Group 0 interrupts, and the Non-secure copies provide a Non-secure view of the active priorities for Group 1 interrupts.

GICC_APR1 is only implemented in implementations that support 6 or more bits of priority. GICC_APR2 and GICC_APR3 are only implemented in implementations that support 7 bits of priority.

When GICD_CTLR.DS==1, these registers hold the active priorities for Group 0 interrupts, and the active priorities for Group 1 interrupts are held by the GICC_NSAPR<n> registers.

**Attributes**

GICC_APR<n> is a 32-bit register.

**Field descriptions**

The GICC_APR<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| IMPLEMENTATION DEFINED |

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

This field resets to 0.

**Accessing the GICC_APR<n>**

These registers are used only when System register access is not enabled. When System register access is enabled the following registers provide equivalent functionality:

- In AArch64:
  - For Group 0, ICC_AP0R<n> EL1.
  - For Group 1, ICC_AP1R<n> EL1.
- In AArch32:
  - For Group 0, ICC_AP0R<n>.
  - For Group 1, ICC_AP1R<n>.
**GICC APR<\(n>\)** can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC CPU interface</td>
<td>0x0000 + 4(n)</td>
<td>GICC APR&lt;(n&gt;)</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
GICC_BPR, CPU Interface Binary Point Register

The GICC_BPR characteristics are:

**Purpose**

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field.

**Configuration**

RW fields in this register reset to architecturally **UNKNOWN** values.

In systems that support two Security states:

- This register is Banked.
- The Secure instance of this register determines Group 0 interrupt preemption.
- The Non-secure instance of this register determines Group 1 interrupt preemption.

In systems that support only one Security state, when **GICC_CTLR**.CBPR == 0, this register determines only Group 0 interrupt preemption.

When **GICC_CTLR**.CBPR == 1, this register determines interrupt preemption for both Group 0 and Group 1 interrupts.

**Attributes**

GICC_BPR is a 32-bit register.

**Field descriptions**

The GICC_BPR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td>Binary_Point</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**Binary_Point, bits [2:0]**

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. The following list describes how this field determines the interrupt priority bits assigned to the group priority field:

- Priority grouping for Group 1 interrupts when CBPR==0, for the processing of Group 1 interrupts in a GIC implementation that supports interrupt grouping, when **GICC_CTLR**.CBPR == 0.
- Priority grouping for Group 0 interrupts, or Group 1 interrupts when CBPR==1, for all other cases.

This field resets to an architecturally **UNKNOWN** value.

**Note**

Aliasing the Non-secure GICC_BPR as **GICC_ABPR** in a multiprocessor system permits a PE that can make only Secure accesses to configure the preemption setting for Group 1 interrupts by accessing **GICC_ABPR**.
Accessing the GICC_BPR

This register is used only when System register access is not enabled. When System register access is enabled this register is RAZ/WI, and the System registers ICC_BPR0_EL1 and ICC_BPR1_EL1 provide equivalent functionality.

GICC_BPR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC CPU interface</td>
<td>0x0008</td>
<td>GICC_BPR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
The GICC_CTLR characteristics are:

**Purpose**

Controls the CPU interface, including enabling of interrupt groups, interrupt signal bypass, binary point registers used, and separation of priority drop and interrupt deactivation.

**Note**

If the GIC implementation supports two Security states, independent EOI controls are provided for accesses from each Security state. Secure accesses handle both Group 0 and Group 1 interrupts, and Non-secure accesses handle Group 1 interrupts only.

**Configuration**

Some or all RW fields of this register have defined reset values.

In a GIC implementation that supports two Security states:

- This register is Banked.
- The register bit assignments are different in the Secure and Non-secure copies.

**Attributes**

GICC_CTLR is a 32-bit register.

**Field descriptions**

The GICC_CTLR bit assignments are:

**When GICD_CTLR.DS==0, Non-secure access:**

</tr>
<tr>
<td>0b1</td>
<td>GICC_EOIR and GICC_AEOIR provide priority drop functionality only. GICC_DIR provides interrupt deactivation functionality.</td>
</tr>
</tbody>
</table>

**Note**
An implementation is permitted to make this bit RAO/WI.

This field resets to 0.

Bits [8:7]

Reserved, RES0.

IRQBypDisGrp1, bit [6]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 1:

<table>
<thead>
<tr>
<th>IRQBypDisGrp1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The bypass IRQ signal is signaled to the PE.</td>
</tr>
<tr>
<td>0b1</td>
<td>The bypass IRQ signal is not signaled to the PE.</td>
</tr>
</tbody>
</table>

If System register access is enabled for EL3 and ICC_SRE_EL3.DIB == 1, this field is RAO/WI.
If System register access is enabled for EL1, this field is ignored.
If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.
See Interrupt signal bypass and bypass disable for more information.
This field resets to 0.

FIQBypDisGrp1, bit [5]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 1:

<table>
<thead>
<tr>
<th>FIQBypDisGrp1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The bypass FIQ signal is signaled to the PE.</td>
</tr>
<tr>
<td>0b1</td>
<td>The bypass FIQ signal is not signaled to the PE.</td>
</tr>
</tbody>
</table>

If System register access is enabled for EL3 and ICC_SRE_EL3.DFB == 1, this field is RAO/WI.
If System register access is enabled for EL1, this field is ignored.
If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.
See Interrupt signal bypass and bypass disable for more information.
This field resets to 0.

Bits [4:1]

Reserved, RES0.

EnableGrp1, bit [0]

This Non-secure field enables the signaling of Group 1 interrupts by the CPU interface to a target PE:

<table>
<thead>
<tr>
<th>EnableGrp1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 1 interrupt signaling is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 1 interrupt signaling is enabled.</td>
</tr>
</tbody>
</table>

This field resets to 0.
When GICD_CTLR.DS==0, Secure access:

<table>

<td>GICC_EOIR and GICC_AEOIR provide priority drop functionality only. GICC_DIR provides interrupt deactivation functionality.</td>
</tr>
</tbody>
</table>

Note

An implementation is permitted to make this bit RAO/WI.

This field shares state with GICC_CTLR.EOImode.

This field resets to 0.

IRQBypDisGrp1, bit [8]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 1:

<table>
<thead>
<tr>
<th>IRQBypDisGrp1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The bypass IRQ signal is signaled to the PE.</td>
</tr>
<tr>
<td>0b1</td>
<td>The bypass IRQ signal is not signaled to the PE.</td>
</tr>
</tbody>
</table>

If System register access is enabled for EL3 and ICC_SRE_EL3.DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

See Interrupt signal bypass and bypass disable for more information.
This field resets to 0.

FIQBypDisGrp1, bit [7]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 1:

<table>
<thead>
<tr>
<th>FIQBypDisGrp1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The bypass FIQ signal is signaled to the PE.</td>
</tr>
<tr>
<td>0b1</td>
<td>The bypass FIQ signal is not signaled to the PE.</td>
</tr>
</tbody>
</table>

If System register access is enabled for EL3 and ICC_SRE_EL3.DFB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

See Interrupt signal bypass and bypass disable for more information.

This field resets to 0.

IRQBypDisGrp0, bit [6]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 0:

<table>
<thead>
<tr>
<th>IRQBypDisGrp0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The bypass IRQ signal is signaled to the PE.</td>
</tr>
<tr>
<td>0b1</td>
<td>The bypass IRQ signal is not signaled to the PE.</td>
</tr>
</tbody>
</table>

If System register access is enabled for EL3 and ICC_SRE_EL3.DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

See Interrupt signal bypass and bypass disable for more information.

This field resets to 0.

FIQBypDisGrp0, bit [5]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 0:

<table>
<thead>
<tr>
<th>FIQBypDisGrp0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The bypass FIQ signal is signaled to the PE.</td>
</tr>
<tr>
<td>0b1</td>
<td>The bypass FIQ signal is not signaled to the PE.</td>
</tr>
</tbody>
</table>

If System register access is enabled for EL3 and ICC_SRE_EL3.DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

See Interrupt signal bypass and bypass disable for more information.

This field resets to 0.

CBPR, bit [4]

Controls whether GICC_BPR provides common control of preemption to Group 0 and Group 1 interrupts:
CBPR

<table>
<thead>
<tr>
<th>CBPR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>GICC_BPR determines preemption for Group 0 interrupts only.</td>
</tr>
<tr>
<td>0b1</td>
<td>GICC_BPR determines preemption for both Group 0 and Group 1 interrupts.</td>
</tr>
</tbody>
</table>

This field is an alias of ICC_CTLR_EL3.CBPR_EL1NS.

In a GIC that supports two Security states, when CBPR == 1:

- A Non-secure read of GICC_BPR returns the value of Secure GICC_BPR.BinaryPoint, incremented by 1, and saturated to 0b111.
- Non-secure writes of GICC_BPR are ignored.

This field resets to 0.

**FIQEn, bit [3]**

Controls whether the CPU interface signals Group 0 interrupts to a target PE using the FIQ or IRQ signal:

<table>
<thead>
<tr>
<th>FIQEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 0 interrupts are signaled using the IRQ signal.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 0 interrupts are signaled using the FIQ signal.</td>
</tr>
</tbody>
</table>

Group 1 interrupts are signaled using the IRQ signal only.

If an implementation supports two Security states, this bit is permitted to be RAO/WI.

This field resets to 0.

**Bit [2]**

Reserved, RES0.

**EnableGrp1, bit [1]**

This Non-secure field enables the signaling of Group 1 interrupts by the CPU interface to a target PE:

<table>
<thead>
<tr>
<th>EnableGrp1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 1 interrupt signaling is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 1 interrupt signaling is enabled.</td>
</tr>
</tbody>
</table>

This field resets to 0.

**EnableGrp0, bit [0]**

Enables the signaling of Group 0 interrupts by the CPU interface to a target PE:

<table>
<thead>
<tr>
<th>EnableGrp0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 0 interrupt signaling is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 0 interrupt signaling is enabled.</td>
</tr>
</tbody>
</table>

This field resets to 0.

**When GICD_CTLR.DS == 0b1:**

</tr>
<tr>
<td>0b1</td>
<td>Group 1 interrupt signaling is enabled.</td>
</tr>
</tbody>
</table>

This field resets to 0.

EnableGrp0, bit [0]

Enables the signaling of Group 0 interrupts by the CPU interface to a target PE:

<table>
<thead>
<tr>
<th>EnableGrp0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 0 interrupt signaling is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 0 interrupt signaling is enabled.</td>
</tr>
</tbody>
</table>

This field resets to 0.

Accessing the GICC_CTLR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_CTLR and ICC_MCTLR provide equivalent functionality.
- For AArch64 implementations, ICC_CTLR_EL1 and ICC_CTLR_EL3 provide equivalent functionality.

GICC_CTLR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC CPU interface</td>
<td>0x0000</td>
<td>GICC_CTLR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RW.
- When IsAccessSecure() accesses to this register are RW.
- When !IsAccessSecure() accesses to this register are RW.
GICC_DIR, CPU Interface Deactivate Interrupt Register

The GICC_DIR characteristics are:

**Purpose**

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified interrupt.

**Configuration**

**Attributes**

GICC_DIR is a 32-bit register.

**Field descriptions**

The GICC_DIR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>

<td>2</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>1</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>0</td>
<td>INTID</td>
</tr>
</tbody>
</table>

**Bits [31:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID of the signaled interrupt.

**Note**

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

**Accessing the GICC_DIR**

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_DIR provides equivalent functionality.
- For AArch64 implementations, ICC_DIR_EL1 provides equivalent functionality.

Writes to this register have an effect only in the following cases:

- When GICD_CTLR.DS == 1, if GICC_CTLR.EOImode == 1.
- In GIC implementations that support two Security states:
  - If the access is Secure and GICC_CTLR.EOImodeS == 1.
  - If the access is Non-secure and GICC_CTLR.EOImodeNS == 1.

The following writes must be ignored:
• Writes to this register when the corresponding EOImode field in \texttt{GICC_CTLR} == 0. In systems that support system error generation, an implementation might generate a system error.
• Writes to this register when the corresponding EOImode field in \texttt{GICC_CTLR} == 0 and the corresponding interrupt is not active. In systems that support system error generation, an implementation might generate a system error. In implementations using the GIC Stream Protocol Interface these writes correspond to a Deactivate packet for an interrupt that is not active.

If the corresponding EOImode field in \texttt{GICC_CTLR} is 1 and this register is written to without a corresponding write to \texttt{GICC_EOIR} or \texttt{GICC_AEOIR}, the interrupt is deactivated but the bit corresponding to it in the active priorities registers remains set.

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

\textbf{GICC\_DIR can be accessed through the memory-mapped interfaces:}

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC CPU interface</td>
<td>0x1000</td>
<td>GICC_DIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When GICD\_CTRL\_DS == 0b0 accesses to this register are \texttt{WO}.
• When IsAccessSecure() accesses to this register are \texttt{WO}.
• When !IsAccessSecure() accesses to this register are \texttt{WO}.

27/09/2019 18:23; 6134483bd14dc8c12a99c984cbfe3431cc1c9707

GICC_EOIR, CPU Interface End Of Interrupt Register

The GICC_EOIR characteristics are:

**Purpose**

A write to this register performs priority drop for the specified interrupt and, if the appropriate `GICC_CTLR.EOImodeS` or `GICC_CTLR.EOImodeNS` field == 0, also deactivates the interrupt.

**Configuration**

If `GICD_CTLR.DS==0`:

- This register is Common.
- `GICC_AEOIR` is an alias of the Non-secure view of this register.

For Secure writes when `GICD_CTLR.DS==0`, or for Secure and Non-secure writes when `GICD_CTLR.DS==1`, the register provides functionality for Group 0 interrupts.

For Non-secure writes when `GICD_CTLR.DS==1`, the register provides functionality for Group 1 interrupts.

**Attributes**

GICC_EOIR is a 32-bit register.

**Field descriptions**

The GICC_EOIR bit assignments are:

| Bit 31 | Bit 30 | Bit 29 | Bit 28 | Bit 27 | Bit 26 | Bit 25 | Bit 24 | Bit 23 | Bit 22 | Bit 21 | Bit 20 | Bit 19 | Bit 18 | Bit 17 | Bit 16 | Bit 15 | Bit 14 | Bit 13 | Bit 12 | Bit 11 | Bit 10 | Bit 9 | Bit 8 | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| RES0   | INTID  |

**Bits [31:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID of the signaled interrupt.

**Note**

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

For every read of a valid INTID from `GICC_IAR`, the connected PE must perform a matching write to GICC_EOIR. The value written to GICC_EOIR must be the INTID from `GICC_IAR`. Reads of INTIDs 1020-1023 do not require matching writes.

**Note**
Arm recommends that software preserves the entire register value read from GICC_IAR, and writes that value back to GICC_EOIR on completion of interrupt processing.

For nested interrupts, the order of writes to this register must be the reverse of the order of interrupt acknowledgement. Behavior is UNPREDICTABLE if:

- This ordering constraint is not maintained.
- The value written to this register does not match an active interrupt, or the ID of a spurious interrupt.
- The value written to this register does not match the last valid interrupt value read from GICC_IAR.

See Interrupt lifecycle for general information about the effect of writes to end of interrupt registers, and about the possible separation of the priority drop and interrupt deactivate operations.

If GICD_CTLR.DS==0:

- GICC_CTLR.EOImodeS controls the behavior of Secure accesses to GICC_EOIR and GICC_AEOIR.
- GICC_CTLR.EOImodeNS controls the behavior of Non-secure accesses to GICC_EOIR and GICC_AEOIR.

### Accessing the GICC_EOIR

The following writes must be ignored:

- Writes of INTIDs 1020-1023.
- Secure writes corresponding to Group 1 interrupts. In systems that support system error generation, an implementation might generate a system error. In this case, GIC behavior is predictable, and the highest Secure active priority (in the Secure copy of GICC_APR<n>) will be reset if the highest active priority is Secure. System behavior is UNPREDICTABLE.
- Non-secure writes corresponding to Group 0 interrupts when GICC_CTLR.EOImodeS == 1. In systems that support system error generation, an implementation might generate a system error. In this case, GIC behavior is predictable, and the highest Non-secure active priority (in the Non-secure copy of GICC_APR<n>) will be reset if the highest active priority is Non-secure. System behavior is UNPREDICTABLE.

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_EOIR0 and ICC_EOIR1 provide equivalent functionality.
- For AArch64 implementations, ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide equivalent functionality.

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

### GICC_EOIR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC CPU</td>
<td>0x0010</td>
<td>GICC_EOIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are WO.
- When IsAccessSecure() accesses to this register are WO.
- When !IsAccessSecure() accesses to this register are WO.
The GICC_HPPIR characteristics are:

**Purpose**

Provides the INTID of the highest priority pending interrupt on the CPU interface.

**Configuration**

If \( \text{GICD_CTLR.DS} = 0 \):
- This register is Common.
- \( \text{GICC_AHPPIR} \) is an alias of the Non-secure view of this register.

**Attributes**

GICC_HPPIR is a 32-bit register.

**Field descriptions**

The GICC_HPPIR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td></td>
</tr>
<tr>
<td>29</td>
<td></td>
</tr>
<tr>
<td>28</td>
<td></td>
</tr>
<tr>
<td>27</td>
<td></td>
</tr>
<tr>
<td>26</td>
<td></td>
</tr>
<tr>
<td>25</td>
<td></td>
</tr>
<tr>
<td>24</td>
<td></td>
</tr>
<tr>
<td>23</td>
<td>INTID</td>
</tr>
<tr>
<td>22</td>
<td></td>
</tr>
<tr>
<td>21</td>

</tr>
<tr>
<td>1</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID of the signaled interrupt.

**Note**

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:
- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

**Accessing the GICC_HPPIR**

This register is used only when System register access is not enabled. When System register access is enabled:
- For AArch32 implementations, \( \text{ICC_HPPIR0} \) and \( \text{ICC_HPPIR1} \) provide equivalent functionality.
- For AArch64 implementations, \( \text{ICC_HPPIR0_EL1} \) and \( \text{ICC_HPPIR1_EL1} \) provide equivalent functionality.

If the highest priority pending interrupt is in Group 0, a Non-secure read of this register returns the special INTID 1023.
For Secure reads when `GICD_CTLR.DS==0`, or for Secure and Non-secure reads when `GICD_CTLR.DS==1`, returns the special INTID 1022 if the highest priority pending interrupt is in Group 1.

If no interrupts are in the pending state, a read of this register returns the special INTID 1023.

Interrupt identifiers corresponding to an interrupt group that is not enabled are ignored.

If the highest priority pending interrupt is a direct interrupt that is both individually enabled in the Distributor and part of an interrupt group that is enabled in the Distributor, and the interrupt group is disabled in the CPU interface for this PE, this register returns the special INTID 1023.

See Preemption for more information about pending interrupts that are not considered when determining the highest priority pending interrupt.

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

**GICC_HPPIR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC CPU interface</td>
<td>0x0018</td>
<td>GICC_HPPIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `GICD_CTLR.DS == 0b0` accesses to this register are RO.
- When `IsAccessSecure()` accesses to this register are RO.
- When `!IsAccessSecure()` accesses to this register are RO.
The GICC_IAR characteristics are:

**Purpose**

Provides the INTID of the signaled interrupt. A read of this register by the PE acts as an acknowledge for the interrupt.

**Configuration**

This register is available in all configurations of the GIC. If `GICD_CTLR.DS==0`:

- This register is Common.
- `GICC_AIAR` is an alias of the Non-secure view of this register.

The format of the INTID is governed by whether affinity routing is enabled for a Security state.

**Attributes**

GICC_IAR is a 32-bit register.

**Field descriptions**

The GICC_IAR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>

<td>...</td>
</tr>
<tr>
<td>0</td>
<td>INTID</td>
</tr>
</tbody>
</table>

**Bits [31:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID of the signaled interrupt.

---

**Note**

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

---

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

A read of this register returns the INTID of the highest priority pending interrupt for the CPU interface. The read returns a spurious INTID of 1023 if any of the following apply:

- Forwarding of interrupts by the Distributor to the CPU interface is disabled.
- Signaling of interrupts by the CPU interface to the connected PE is disabled.
- There are no pending interrupts on the CPU interface with sufficient priority for the interface to signal it to the PE.
When the GIC returns a valid INTID to a read of this register it treats the read as an acknowledge of that interrupt. In addition, it changes the interrupt status from pending to active, or to active and pending if the pending state of the interrupt persists. Normally, the pending state of an interrupt persists only if the interrupt is level-sensitive and remains asserted.

For every read of a valid INTID from GICC_IAR, the connected PE must perform a matching write to GICC_EOIR.

**Note**
- Arm recommends that software preserves the entire register value read from this register, and writes that value back to GICC_EOIR on completion of interrupt processing.
- For SPIs, although multiple target PEs might attempt to read this register at any time, only one PE can obtain a valid INTID. See 'Interrupt acknowledgement', section 4.7.1 of the GICv3 Architecture Specification, for more information.

### Accessing the GICC_IAR

When GICD_CTLR.DS==1, if the highest priority pending interrupt is in Group 1, the special INTID 1022 is returned.

In GIC implementations that support two Security states, if the highest priority pending interrupt is in Group 0, Non-secure reads return the special INTID 1023.

In GIC implementations that support two Security states, if the highest priority pending interrupt is in Group 1, Secure reads return the special INTID 1022.

This register is used only when System register access is not enabled. When System register access is enabled:
- For AArch32 implementations, ICC_IAR0 and ICC_IAR1 provide equivalent functionality.
- For AArch64 implementations, ICC_IAR0_EL1 and ICC_IAR1_EL1 provide equivalent functionality.

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

**GICC_IAR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC CPU interface</td>
<td>0x000C</td>
<td>GICC_IAR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- When GICD_CTLR.DS == 0b0 accesses to this register are RO.
- When IsAccessSecure() accesses to this register are RO.
- When !IsAccessSecure() accesses to this register are RO.
GICC_IIDR, CPU Interface Identification Register

The GICC_IIDR characteristics are:

**Purpose**

Provides information about the implementer and revision of the CPU interface.

**Configuration**

**Attributes**

GICC_IIDR is a 32-bit register.

**Field descriptions**

The GICC_IIDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>ProductID</td>
<td>An implementation defined product identifier.</td>
</tr>
<tr>
<td>19</td>
<td>Architecture_version</td>
<td>The version of the GIC architecture that is implemented.</td>
</tr>
<tr>
<td>11</td>
<td>Revision</td>
<td>An implementation defined revision number for the CPU interface.</td>
</tr>
<tr>
<td>0</td>
<td>Implementer</td>
<td>Contains the JEP106 code of the company that implemented the CPU interface.</td>
</tr>
</tbody>
</table>

**ProductID, bits [31:20]**

An implementation defined product identifier.

**Architecture_version, bits [19:16]**

The version of the GIC architecture that is implemented.

<table>
<thead>
<tr>
<th>Architecture_version</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>GICv1.</td>
</tr>
<tr>
<td>0b0010</td>
<td>GICv2.</td>
</tr>
<tr>
<td>0b0011</td>
<td>GICv3 memory-mapped interface supported. Support for the System register interface is discoverable from PE registers ID_PFR1 and ID_AA64PFR0_EL1.</td>
</tr>
<tr>
<td>0b0100</td>
<td>GICv4 memory-mapped interface supported. Support for the System register interface is discoverable from PE registers ID_PFR1 and ID_AA64PFR0_EL1.</td>
</tr>
</tbody>
</table>

Other values are reserved.

**Revision, bits [15:12]**

An implementation defined revision number for the CPU interface.

**Implementer, bits [11:0]**

Contains the JEP106 code of the company that implemented the CPU interface.

- Bits [11:8] are the JEP106 continuation code of the implementer. For an Arm implementation, this field is 0x4.
- Bit [7] is always 0.
- Bits [6:0] are the JEP106 identity code of the implementer. For an Arm implementation, bits [7:0] are therefore 0x3B.
Accessing the GICC_IIDR

GICC_IIDR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC CPU interface</td>
<td>0x00FC</td>
<td>GICC_IIDR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTRL.RS == 0b0 accesses to this register are RO.
- When IsAccessSecure() accesses to this register are RO.
- When !IsAccessSecure() accesses to this register are RO.
The GICC_NSAPR<n> characteristics are:

**Purpose**

Provides information about Group 1 interrupt active priorities.

**Configuration**

Some or all RW fields of this register have defined reset values.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

When GICD_CTLR.DS==0, these registers are RAZ/WI to Non-secure accesses.

GICC_NSAPR1 is only implemented in implementations that support 6 or more bits of priority. GICC_NSAPR2 and GICC_NSAPR3 are only implemented in implementations that support 7 bits of priority.

**Attributes**

GICC_NSAPR<n> is a 32-bit register.

**Field descriptions**

The GICC_NSAPR<n> bit assignments are:

| Bit 31 | Bit 30 | Bit 29 | Bit 28 | Bit 27 | Bit 26 | Bit 25 | Bit 24 | Bit 23 | Bit 22 | Bit 21 | Bit 20 | Bit 19 | Bit 18 | Bit 17 | Bit 16 | Bit 15 | Bit 14 | Bit 13 | Bit 12 | Bit 11 | Bit 10 | Bit 9  | Bit 8  | Bit 7  | Bit 6  | Bit 5  | Bit 4  | Bit 3  | Bit 2  | Bit 1  | Bit 0  |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
|        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        | IMPLEMENTATION DEFINED |

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

This field resets to 0.

**Accessing the GICC_NSAPR<n>**

GICC_NSAPR<n> can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC CPU interface</td>
<td>0x00E0 + 4n</td>
<td>GICC_NSAPR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

GICC_PMR, CPU Interface Priority Mask Register

The GICC_PMR characteristics are:

Purpose

This register provides an interrupt priority filter. Only interrupts with a higher priority than the value in this register are signaled to the PE.

Note

Higher interrupt priority corresponds to a lower value of the Priority field.

Configuration

RW fields in this register reset to architecturally UNKNOWN values.

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states this register is Common.

Attributes

GICC_PMR is a 32-bit register.

Field descriptions

The GICC_PMR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | Priority |

Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The priority mask level for the CPU interface. If the priority of the interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

If the GIC implementation supports fewer than 256 priority levels some bits might be RAZ/WI, as follows:

- For 128 supported levels, bit [0] = 0b0.
- For 64 supported levels, bits [1:0] = 0b00.
- For 32 supported levels, bits [2:0] = 0b000.
- For 16 supported levels, bits [3:0] = 0b0000.

See Interrupt prioritization for more information.

This field resets to an architecturally UNKNOWN value.

Accessing the GICC_PMR

If the GIC implementation supports two Security states:

- Non-secure accesses to this register can only read or write values corresponding to the lower half of the priority range.
If a Secure write has programmed the register with a value that corresponds to a value in the upper half of the priority range then:

- Any Non-secure read of the register returns 0x00, regardless of the value held in the register.
- Non-secure writes are ignored.

See 'Priority control of Secure and Non-secure interrupts' in the GICv3 Architecture Specification for more information.

**GICC_PMR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC CPU interface</td>
<td>0x0004</td>
<td>GICC_PMR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

27/09/2019 18:23; 6134483bd14dc8c12a99c984cbfe3431cc1c9707

GICC_RPR, CPU Interface Running Priority Register

The GICC_RPR characteristics are:

**Purpose**

This register indicates the running priority of the CPU interface.

**Configuration**

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states this register is Common.

**Attributes**

GICC_RPR is a 32-bit register.

**Field descriptions**

The GICC_RPR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | Priority |

**Bits [31:8]**

Reserved, RES0.

**Priority, bits [7:0]**

The current running priority on the CPU interface. This is the group priority of the current active interrupt.

If there are no active interrupts on the CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

The priority returned is the group priority as if the BPR was set to the minimum value.

**Accessing the GICC_RPR**

If there is no active interrupt on the CPU interface, the idle priority value is returned.

If the GIC implementation supports two Security states, a Non-secure read of the Priority field returns:

- 0x00 if the field value is less than 0x80.
- The Non-secure view of the Priority value if the field value is 0x80 or more.

See 'Priority control of Secure and Non-secure interrupts' in the GICv3 Architecture Specification for more information.

**Note**

Software cannot determine the number of implemented priority bits from this register.
GICC_RPR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC CPU interface</td>
<td>0x0014</td>
<td>GICC_RPR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RO.
- When IsAccessSecure() accesses to this register are RO.
- When !IsAccessSecure() accesses to this register are RO.
GICC_STATUSR, CPU Interface Status Register

The GICC_STATUSR characteristics are:

**Purpose**

Provides software with a mechanism to detect:

- Accesses to reserved locations.
- Writes to read-only locations.
- Reads of write-only locations.

**Configuration**

If the GIC implementation supports two Security states this register is Banked to provide Secure and Non-secure copies.

This register is used only when System register access is not enabled. If System register access is enabled, this register is not updated. Equivalent functionality might be provided by appropriate traps and exceptions.

**Attributes**

GICC_STATUSR is a 32-bit register.

**Field descriptions**

The GICC_STATUSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-5</td>
<td>Reserved</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>4</td>
<td>ASV</td>
<td>Attempted security violation.</td>
</tr>
<tr>
<td>3</td>
<td>WROD</td>
<td>Write to an RO location.</td>
</tr>
<tr>
<td>2</td>
<td>RWOD</td>
<td>Read of write-only location.</td>
</tr>
<tr>
<td>1</td>
<td>RWDRD</td>
<td>Write of read-only location.</td>
</tr>
</tbody>
</table>

**Bits [31:5]**

Reserved, RES0.

**ASV, bit [4]**

Attempted security violation.

<table>
<thead>
<tr>
<th>ASV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Non-secure access to a Secure register has been detected.</td>
</tr>
</tbody>
</table>

**Note**

This bit is not set to 1 for registers where any of the fields are Non-secure.

**WROD, bit [3]**

Write to an RO location.

<table>
<thead>
<tr>
<th>WROD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A write to an RO location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.
**RWOD, bit [2]**

Read of a WO location.

<table>
<thead>
<tr>
<th>RWOD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A read of a WO location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.

**WRD, bit [1]**

Write to a reserved location.

<table>
<thead>
<tr>
<th>WRD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A write to a reserved location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.

**RRD, bit [0]**

Read of a reserved location.

<table>
<thead>
<tr>
<th>RRD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A read of a reserved location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.

**Accessing the GICC_STATUSR**

This is an optional register. If the register is not implemented, the location is RAZ/WI.

If this register is implemented, GICV_STATUSR must also be implemented.

**GICC_STATUSR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC CPU interface</td>
<td>0x002C</td>
<td>GICC_STATUSR</td>
</tr>
<tr>
<td>(S)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC CPU interface</td>
<td>0x002C</td>
<td>GICC_STATUSR</td>
</tr>
<tr>
<td>(NS)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
The GICD_CLRSPI_NSR characteristics are:

**Purpose**

Removes the pending state from a valid SPI if permitted by the Security state of the access and the \texttt{GICD_NSACR<n>} value for that SPI.

A write to this register changes the state of a pending SPI to inactive, and the state of an active and pending SPI to active.

**Configuration**

If \texttt{GICD_TYPER.MBIS == 0}, this register is reserved.

When \texttt{GICD_CTLR.DS==1}, this register provides functionality for all SPIs.

**Attributes**

GICD_CLRSPI_NSR is a 32-bit register.

**Field descriptions**

The GICD_CLRSPI_NSR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:13]**

Reserved, \texttt{RES0}.

**INTID, bits [12:0]**

The INTID of the SPI.

The function of this register depends on whether the targeted SPI is configured to be an edge-triggered or level-sensitive interrupt:

- For an edge-triggered interrupt, a write to \texttt{GICD_SETSPI_NSR} or \texttt{GICD_SETSPI_SR} adds the pending state to the targeted interrupt. It will stop being pending on activation, or if the pending state is removed by a write to GICD_CLRSPI_NSR, \texttt{GICD_CLRSPI_SR}, or \texttt{GICD_ICPENDR<n>}.
- For a level-sensitive interrupt, a write to \texttt{GICD_SETSPI_NSR} or \texttt{GICD_SETSPI_SR} adds the pending state to the targeted interrupt. It will remain pending until it is deasserted by a write to GICD_CLRSPI_NSR or \texttt{GICD_CLRSPI_SR}. If the interrupt is activated between having the pending state added and being deactivated, then the interrupt will be active and pending.

**Accessing the GICD_CLRSPI_NSR**

Writes to this register have no effect if:

- The value written specifies a Secure SPI, the value is written by a Non-secure access, and the value of the corresponding \texttt{GICD_NSACR<n>} register is less than \texttt{0b10}.
- The value written specifies an invalid SPI.
- The SPI is not pending.
16-bit accesses to bits [15:0] of this register must be supported.

**Note**

A Secure access to this register can clear the pending state of any valid SPI.

**GICD_CLRSPI_NSR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0048</td>
<td>GICD_CLRSPI_NSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTRLR.DS == 0b0 accesses to this register are **WO**.
- When IsAccessSecure() accesses to this register are **WO**.
- When !IsAccessSecure() accesses to this register are **WO**.

GICD_CLRSPI_SR, Clear Secure SPI Pending Register

The GICD_CLRSPI_SR characteristics are:

**Purpose**

Removes the pending state from a valid SPI.

A write to this register changes the state of a pending SPI to inactive, and the state of an active and pending SPI to active.

**Configuration**

If `GICD_TYPER.MBIS == 0`, this register is reserved.

When `GICD_CTLR.DS==1`, this register is WI.

**Attributes**

GICD_CLRSPI_SR is a 32-bit register.

**Field descriptions**

The GICD_CLRSPI_SR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| RES0 |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | INTID |

**Bits [31:13]**

Reserved, RES0.

**INTID, bits [12:0]**

The INTID of the SPI.

The function of this register depends on whether the targeted SPI is configured to be an edge-triggered or level-sensitive interrupt:

- For an edge-triggered interrupt, a write to `GICD_SETSPI_NSR` or `GICD_SETSPI_SR` adds the pending state to the targeted interrupt. It will stop being pending on activation, or if the pending state is removed by a write to `GICD_CLRSPAN_SR` or `GICD_ICPENDR<n>`, then the interrupt will be active and pending.
- For a level-sensitive interrupt, a write to `GICD_SETSPI_NSR` or `GICD_SETSPI_SR` adds the pending state to the targeted interrupt. It will remain pending until it is deasserted by a write to `GICD_CLRSPAN_NSR` or `GICD_CLRSPAN_SR`. If the interrupt is activated between having the pending state added and being deactivated, then the interrupt will be active and pending.

**Accessing the GICD_CLRSPI_SR**

 Writes to this register have no effect if:

- The value is written by a Non-secure access.
- The value written specifies an invalid SPI.
- The SPI is not pending.

16-bit accesses to bits [15:0] of this register must be supported.
GICD_CLRSPI_SR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0058</td>
<td>GICD_CLRSPI_SR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **WI**.
- When IsAccessSecure() accesses to this register are **WO**.
- When !IsAccessSecure() accesses to this register are **WI**.
GICD_CPENDSGIR\langle n \rangle, SGI Clear-Pending Registers, n = 0 - 3

The GICD_CPENDSGIR\langle n \rangle characteristics are:

**Purpose**

Removes the pending state from an SGI.

A write to this register changes the state of a pending SGI to inactive, and the state of an active and pending SGI to active.

**Configuration**

Some or all RW fields of this register have defined reset values.

Four SGI clear-pending registers are implemented. Each register contains eight clear-pending bits for each of four SGIs, for a total of 16 possible SGIs.

In multiprocessor implementations, each PE has a copy of these registers.

**Attributes**

GICD_CPENDSGIR\langle n \rangle is a 32-bit register.

**Field descriptions**

The GICD_CPENDSGIR\langle n \rangle bit assignments are:

\[
\begin{array}{cccccccccccccccccccccccccc}
\hline
\text{SGI-clear\_pending\_bits<\langle x \rangle>, bits [8\langle x \rangle+7:8\langle x \rangle], for x = 0 to 3} \\
\end{array}
\]

**SGI_clear_pending_bits<\langle x \rangle>, bits [8\langle x \rangle+7:8\langle x \rangle], for x = 0 to 3**

Removes the pending state from SGI number 4n + x for the PE corresponding to the bit number written to.

Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>SGI_clear_pending_bits&lt;\langle x \rangle&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x00</td>
<td>If read, indicates that the SGI from the corresponding PE is not pending and is not active and pending. If written, has no effect.</td>
</tr>
<tr>
<td>0x01</td>
<td>If read, indicates that the SGI from the corresponding PE is pending or is active and pending. If written, removes the pending state from the SGI for the corresponding PE.</td>
</tr>
</tbody>
</table>

This field resets to \(0\).

For SGI ID \(m\), generated by processing element \(C\) writing to the corresponding GICD_SGIR field, where DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_CPENDSGIR\langle n \rangle number is given by \(n = m \text{ DIV } 4\).
- The offset of the required register is \((0xF10 + (4n))\).
- The offset of the required field within the register GICD_CPENDSGIR\langle n \rangle is given by \(m \text{ MOD } 4\).
- The required bit in the 8-bit SGI clear-pending field \(m\) is bit \(C\).
Accessing the GICD_CPENDSGIR<n>

These registers are used only when affinity routing is not enabled. When affinity routing is enabled, this register is RES0. An implementation is permitted to make the register RAZ/WI in this case.

A register bit that corresponds to an unimplemented SGI is RAZ/WI.

These registers are byte-accessible.

If the GIC implementation supports two Security states:

- A register bit that corresponds to a Group 0 interrupt is RAZ/WI to Non-secure accesses.
- Register bits corresponding to unimplemented PEs are RAZ/WI.

**GICD_CPENDSGIR<n> can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0xF10 + 4n</td>
<td>GICD_CPENDSGIR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
GICD_CTLR, Distributor Control Register

The GICD_CTLR characteristics are:

**Purpose**

Enables interrupts and affinity routing.

**Configuration**

Some or all RW fields of this register have defined reset values.

The format of this register depends on the Security state of the access and the number of Security states supported, which is specified by GICD_CTLR.DS.

**Attributes**

GICD_CTLR is a 32-bit register.

**Field descriptions**

The GICD_CTLR bit assignments are:

**When access is Secure, in a system that supports two Security states:**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RWP</td>
</tr>
<tr>
<td>30</td>
<td>RES0</td>
</tr>
<tr>
<td>7-4</td>
<td>E1NWF, DS, ARE_NS, ARE_S, RES0, EnableGrp1S, EnableGrp1NS, EnableGrp2NS</td>
</tr>
</tbody>
</table>

**RWP, bit [31]**

Register Write Pending. Read only. Indicates whether a register write is in progress or not:

<table>
<thead>
<tr>
<th>RWP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No register write in progress. The effects of previous register writes to the affected register fields are visible to all logical components of the GIC architecture, including the CPU interfaces.</td>
</tr>
<tr>
<td>1</td>
<td>Register write in progress. The effects of previous register writes to the affected register fields are not guaranteed to be visible to all logical components of the GIC architecture, including the CPU interfaces, as the effects of the changes are still being propagated.</td>
</tr>
</tbody>
</table>

This field tracks writes to:

- GICD_CTLR[2:0], the Group Enables, for transitions from 1 to 0 only.
- GICD_CTLR[7:4], the ARE bits, E1NWF bit and DS bit.
- GICD_ICENABLER<n>.

Updates to other register fields are not tracked by this field.

This field resets to an architecturally UNKNOWN value.

**Bits [30:8]**

Reserved, RES0.
**E1NWF, bit [7]**

Enable 1 of N Wakeup Functionality.

It is **IMPLEMENTATION DEFINED** whether this bit is programmable, or RAZ/WI.

If it is implemented, then it has the following behavior:

<table>
<thead>
<tr>
<th>E1NWF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A PE that is asleep cannot be picked for 1 of N interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>A PE that is asleep can be picked for 1 of N interrupts as determined by <strong>IMPLEMENTATION DEFINED</strong> controls.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**DS, bit [6]**

Disable Security.

<table>
<thead>
<tr>
<th>DS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure accesses are not permitted to access and modify registers that control Group 0 interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure accesses are permitted to access and modify registers that control Group 0 interrupts.</td>
</tr>
</tbody>
</table>

If DS is written from 0 to 1 when GICD_CTLR.ARE_S == 1, then GICD_CTLR.ARE for the single Security state is RAO/WI.

If the Distributor only supports a single Security state, this bit is RAO/WI.

If the Distributor supports two Security states, it **IMPLEMENTATION DEFINED** whether this bit is programmable or implemented as RAZ/WI.

When this field is set to 1, all accesses to GICD_CTLR access the single Security state view, and all bits are accessible.

When set to 1, this field can only be cleared by a hardware reset.

Writing this bit from 0 to 1 is **UNPREDICTABLE** if any of the following is true:

- GICD_CTLR.EnableGrp0 == 1.
- GICD_CTLR.EnableGrp1S == 1.
- GICD_CTLR.EnableGrp1NS == 1.
- One or more INTID is in the Active or Active and Pending state.

This field resets to 0.

**ARE_NS, bit [5]**

Affinity Routing Enable, Non-secure state.

<table>
<thead>
<tr>
<th>ARE_NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Affinity routing disabled for Non-secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Affinity routing enabled for Non-secure state.</td>
</tr>
</tbody>
</table>

When affinity routing is enabled for the Secure state, this field is RAO/WI.

Changing the ARE_NS settings from 0 to 1 is **UNPREDICTABLE** except when GICD_CTLR.EnableGrp1 Non-secure == 0.

Changing the ARE_NS settings from 1 to 0 is **UNPREDICTABLE**.

If GICv2 backwards compatibility for Non-secure state is not implemented, this field is RAO/WI.

This field resets to 0.

**ARE_S, bit [4]**

Affinity Routing Enable, Secure state.
Changing the ARE_S setting from 0 to 1 is UNPREDICTABLE except when all of the following apply:

- GICD_CTLR.EnableGrp0==0.
- GICD_CTLR.EnableGrp1S==0.
- GICD_CTLR.EnableGrp1NS==0.

Changing the ARE_S settings from 1 to 0 is UNPREDICTABLE.

If GICv2 backwards compatibility for Secure state is not implemented, this field is RAO/WI.

This field resets to 0.

**Bit [3]**

Reserved, RES0.

**EnableGrp1S, bit [2]**

Enable Secure Group 1 interrupts.

<table>
<thead>
<tr>
<th>EnableGrp1S</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure Group 1 interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure Group 1 interrupts are enabled.</td>
</tr>
</tbody>
</table>

If GICD_CTLR.ARE_S == 0, this field is RES0.

This field resets to an architecturally UNKNOWN value.

**EnableGrp1NS, bit [1]**

Enable Non-secure Group 1 interrupts.

<table>
<thead>
<tr>
<th>EnableGrp1NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure Group 1 interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure Group 1 interrupts are enabled.</td>
</tr>
</tbody>
</table>

**Note**

This field also controls whether LPIs are forwarded to the PE.

This field resets to an architecturally UNKNOWN value.

**EnableGrp0, bit [0]**

Enable Group 0 interrupts.

<table>
<thead>
<tr>
<th>EnableGrp0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 0 interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 0 interrupts are enabled.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**When access is Non-secure, in a system that supports two Security states:**

<table>
<thead>
<tr>
<th>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RWP  RES0  ARE_NS  RES0 EnableGrp1A  EnableGrp1</td>
</tr>
</tbody>
</table>
RWP, bit [31]

This bit is a read-only alias of the Secure GICD_CTLR.RWP bit.

Bits [30:5]

Reserved, RES0.

ARE_NS, bit [4]

This bit is a read-write alias of the Secure GICD_CTLR.ARE_NS bit.

If GICv2 backwards compatibility for Non-secure state is not implemented, this field is RAO/WI.

Bits [3:2]

Reserved, RES0.

EnableGrp1A, bit [1]

If ARE_NS == 1, then this bit is a read-write alias of the Secure GICD_CTLR.EnableGrp1NS bit.

If ARE_NS == 0, then this bit is RES0.

EnableGrp1, bit [0]

If ARE_NS == 0, then this bit is a read-write alias of the Secure GICD_CTLR.EnableGrp1NS bit.

If ARE_NS == 1, then this bit is RES0.

When in a system that supports only a single Security state:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No register write in progress. The effects of previous register writes to the affected register fields are visible to all logical components of the GIC architecture, including the CPU interfaces.</td>
</tr>
<tr>
<td>0b1</td>
<td>Register write in progress. The effects of previous register writes to the affected register fields are not guaranteed to be visible to all logical components of the GIC architecture, including the CPU interfaces, as the effects of the changes are still being propagated.</td>
</tr>
</tbody>
</table>

This field tracks updates to:

- GICD_CTLR[2:0], the Group Enables, for transitions from 1 to 0 only.
- GICD_CTLR[7:4], the ARE bits, E1NWF bit and DS bit.
- GICD_ICENABLER<n>, the bits that allow disabling of SPIs.

Updates to other register fields are not tracked by this field.

This field resets to an architecturally UNKNOWN value.
Bits [30:8]

Reserved, RES0.

E1NWF, bit [7]

Enable 1 of N Wakeup Functionality.

It is IMPLEMENTATION DEFINED whether this bit is programmable, or RAZ/WI.

If it is implemented, then it has the following behavior:

<table>
<thead>
<tr>
<th>E1NWF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A PE that is asleep cannot be picked for 1 of N interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>A PE that is asleep can be picked for 1 of N interrupts as determined by IMPLEMENTATION DEFINED controls.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

DS, bit [6]

Disable Security. This field is RAO/WI.

Bit [5]

Reserved, RES0.

ARE, bit [4]

Affinity Routing Enable.

<table>
<thead>
<tr>
<th>ARE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Affinity routing disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Affinity routing enabled.</td>
</tr>
</tbody>
</table>

Changing the ARE settings from 0 to 1 is UNPREDICTABLE except when all of the following apply:

- GICD_CTLR.EnableGrp1==0.
- GICD_CTLR.EnableGrp0==0.

Changing ARE from 1 to 0 is UNPREDICTABLE.

If GICv2 backwards compatibility is not implemented, this field is RAO/WI.

This field resets to 0.

Bits [3:2]

Reserved, RES0.

EnableGrp1, bit [1]

Enable Group 1 interrupts.

<table>
<thead>
<tr>
<th>EnableGrp1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 1 interrupts disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 1 interrupts enabled.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

EnableGrp0, bit [0]

Enable Group 0 interrupts.
<table>
<thead>
<tr>
<th>EnableGrp0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 0 interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 0 interrupts are enabled.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

## Accessing the GICD_CTLR

If an interrupt is pending within a CPU interface when the corresponding GICD_CTLR.EnableGrpX bit is written from 1 to 0 the interrupt must be retrieved from the CPU interface.

### Note

This might have no effect on the forwarded interrupt if it has already been activated. When a write changes the value of ARE for a Security state or the value of the DS bit, the format used for interpreting the remaining bits provided in the write data is the format that applied before the write takes effect.

---

**GICD_CTLR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0000</td>
<td>GICD_CTLR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
GICD_ICACTIVER<n>, Interrupt Clear-Active Registers, n = 0 - 31

The GICD_ICACTIVER<n> characteristics are:

**Purpose**

Deactivates the corresponding interrupt. These registers are used when saving and restoring GIC state.

**Configuration**

Some or all RW fields of this register have defined reset values.

These registers are available in all GIC configurations. If GICD_CTLR.DS==0, these registers are Common.

The number of implemented GICD_ICACTIVER<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_ICACTIVER0 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_ICACTIVER0 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:
  - Register is RAZ/WI.
  - An UNKNOWN banked copy of the register is accessed.

**Attributes**

GICD_ICACTIVER<n> is a 32-bit register.

**Field descriptions**

The GICD_ICACTIVER<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Clear_active_bit<x>, bit [x], for x = 0 to 31 |

**Clear_active_bit<x>, bit [x], for x = 0 to 31**

Removes the active state from interrupt number 32n + x. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Clear_active_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that the corresponding interrupt is active, or is active and pending. If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect.</td>
</tr>
</tbody>
</table>

This field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:
  - The corresponding GICD_ICACTIVER<n> number, n, is given by n = m DIV 32.
  - The offset of the required GICD_ICACTIVER is (0x380 + (4*n)).
  - The bit number of the required group modifier bit in this register is m MOD 32.
Accessing the GICD_ICACTIVER<n>

When affinity routing is enabled for the Security state of an interrupt, the bits corresponding to SGIs and PPIs in that Security state are RAZ/WI, and equivalent functionality for SGIs and PPIs is provided by GICR_ICACTIVER0.

Bits corresponding to unimplemented interrupts are RAZ/WI.

If GICD_CTLR.DS==0, unless the GICD_NSACR<n> registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

GICD_ICACTIVER<n> can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0380 + 4n</td>
<td>GICD_ICACTIVER&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
The GICD_ICACTIVER<n>E characteristics are:

**Purpose**

Removes the active state from the corresponding SPI in the extended SPI range.

**Configuration**

Some or all RW fields of this register have defined reset values.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ICACTIVER<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

**Attributes**

GICD_ICACTIVER<n>E is a 32-bit register.

**Field descriptions**

The GICD_ICACTIVER<n>E bit assignments are:

<table>
<thead>
<tr>
<th>Clear_active_bit&lt;x&gt;, bit [x], for x = 0 to 31</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
</tr>
</tbody>
</table>

For the extended SPIs, removes the active state to interrupt number x. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Clear_active_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that the corresponding interrupt is active, or is active and pending. If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect.</td>
</tr>
</tbody>
</table>

This field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICACTIVER<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_ICACTIVER<n>E is (0x1C00 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

**Accessing the GICD_ICACTIVER<n>E**

When affinity routing is not enabled for the Security state of an interrupt in GICD_ICACTIVER<n>E, the corresponding bit is RES0.
When GICD_CTLR.DS==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

**GICD_ICACTIVER<n>E can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x1C00 + 4n</td>
<td>GICD_ICACTIVER&lt;n&gt;E</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
The GICD_ICENABLER\(<n>\) characteristics are:

**Purpose**

Disables forwarding of the corresponding interrupt to the CPU interfaces.

**Configuration**

RW fields in this register reset to architecturally **UNKNOWN** values.

These registers are available in all GIC configurations. If GICD_CTLR.DS==0, these registers are Common.

The number of implemented GICD_ICENABLER\(<n>\) registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_ICENABLER0 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_ICENABLER0 from a PE with GICR_TYPER.Processor_Number > 7 is **CONSTRAINED UNPREDICTABLE**:

- Register is RAZ/WI.
- An **UNKNOWN** banked copy of the register is accessed.

**Attributes**

GICD_ICENABLER\(<n>\) is a 32-bit register.

**Field descriptions**

The GICD_ICENABLER\(<n>\) bit assignments are:

| Clear_enable_bit\(<x>\), bit \([x]\), for \(x = 0 \text{ to } 31\) |
|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Clear_enable_bit\(<x>\), bit \([x]\), for \(x = 0 \text{ to } 31\) |

For SPIs and PPIs, controls the forwarding of interrupt number \(32n + x\) to the CPU interfaces. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Clear_enable_bit(&lt;x&gt;)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>(0b0)</td>
<td>If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.</td>
</tr>
<tr>
<td>(0b1)</td>
<td>If read, indicates that forwarding of the corresponding interrupt is enabled. If written, disables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 0.</td>
</tr>
</tbody>
</table>

For SGIs, the behavior of this bit is **IMPLEMENTATION DEFINED**.

This field resets to an architecturally **UNKNOWN** value.

For INTID \(m\), when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICENABLER\(<n>\) number, \(n\), is given by \(n = m \text{ DIV } 32\).
- The offset of the required GICD_ICENABLER is \((0x180 + (4*n))\).
The bit number of the required group modifier bit in this register is \( m \mod 32 \).

**Note**

Writing a 1 to a GICD_ICENABLER\(<n>\) bit only disables the forwarding of the corresponding interrupt from the Distributor to any CPU interface. It does not prevent the interrupt from changing state, for example becoming pending or active and pending if it is already active.

### Accessing the GICD_ICENABLER\(<n>\)

For SGIs and PPIs:

- When ARE is 1 for the Security state of an interrupt, the field for that interrupt is \( \text{RES0} \) and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR_ICENABLER0.

Bits corresponding to unimplemented interrupts are RAZ/WI.

When GICD_CTLR.DS==0, bits corresponding to Group 0 and Secure Group 1 interrupts are RAZ/WI to Non-secure accesses.

It is **IMPLEMENTATION DEFINED** whether implemented SGIs are permanently enabled, or can be enabled and disabled by writes to GICD_ISENABLER\(<n>\) and GICD_ICENABLER\(<n>\) where \( n=0 \).

Completion of a write to this register does not guarantee that the effects of the write are visible throughout the affinity hierarchy. To ensure an enable has been cleared, software must write to the register with bits set to 1 to clear the required enables. Software must then poll GICD_CTLR.RWP until it has the value zero.

GICD_ICENABLER\(<n>\) can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0180 + 4n</td>
<td>GICD_ICENABLER(&lt;n&gt;)</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
GICD_ICENABLER<n>E, Interrupt Clear-Enable Registers, n = 0 - 31

The GICD_ICENABLER<n>E characteristics are:

**Purpose**

Disables forwarding of the corresponding SPI in the extended SPI range to the CPU interfaces.

**Configuration**

Some or all RW fields of this register have defined reset values.

This register is present only when GIC, >=3.1 is implemented. Otherwise, direct accesses to GICD_ICENABLER<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ICENABLER<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

**Attributes**

GICD_ICENABLER<n>E is a 32-bit register.

**Field descriptions**

The GICD_ICENABLER<n>E bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 - 0</td>
<td>Clear_enable_bit&lt;x&gt;, bit [x], for x = 0 to 31</td>
</tr>
</tbody>
</table>

For the extended SPI range, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Clear_enable_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 0.</td>
</tr>
</tbody>
</table>

This field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICENABLER<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_ICENABLER<n>E is (0x1400 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.
Accessing the GICD_ICENABLER\textlt n\textgt E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ICENABLER\textlt n\textgt E, the corresponding bit is RES0.

When \texttt{GICD_CTLR.DS} = 0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

\textbf{GICD_ICENABLER\textlt n\textgt E can be accessed through the memory-mapped interfaces:}

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x1400  + 4n</td>
<td>GICD_ICENABLER\textlt n\textgt E</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When \texttt{GICD_CTLR.DS} == 0b0 accesses to this register are \textbf{RW}.
- When \texttt{IsAccessSecure()} accesses to this register are \textbf{RW}.
- When \texttt{!IsAccessSecure()} accesses to this register are \textbf{RW}.

**GICD_ICFGR<n>, Interrupt Configuration Registers, n = 0 - 63**

The GICD_ICFGR<n> characteristics are:

**Purpose**

Determines whether the corresponding interrupt is edge-triggered or level-sensitive.

**Configuration**

RW fields in this register reset to architecturally **UNKNOWN** values.

These registers are available in all GIC configurations. If the GIC implementation supports two Security states, these registers are **Common**.

GICD_ICFGR1 is Banked for each connected PE with **GICR_TYPER**.Processor_Number < 8.

Accessing GICD_ICFGR1 from a PE with **GICR_TYPER**.Processor_Number > 7 is **CONSTRAINED UNPREDICTABLE**:

- Register is RAZ/WI.
- An **UNKNOWN** banked copy of the register is accessed.

For SGIs and PPIs:

- When ARE is 1 for the Security state of an interrupt, the field for that interrupt is **RES0** and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR_ICFGR<n>

For each supported PPI, it is **IMPLEMENTATION DEFINED** whether software can program the corresponding Int_config field.

For SGIs, Int_config fields are RO, meaning that GICD_ICFGR0 is RO.

Changing Int_config when the interrupt is individually enabled is **UNPREDICTABLE**.

Changing the interrupt configuration between level-sensitive and edge-triggered (in either direction) at a time when there is a pending interrupt will leave the interrupt in an **UNKNOWN** pending state.

Fields corresponding to unimplemented interrupts are RAZ/WI.

**Attributes**

GICD_ICFGR<n> is a 32-bit register.

**Field descriptions**

The GICD_ICFGR<n> bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Int_config<x>, bits [2x+1:2x], for x = 0 to 15**

Indicates whether the interrupt with ID 16n + x is level-sensitive or edge-triggered.

Int_config[0] (bit [2x]) is **RES0**.

Possible values of Int_config[1] (bit [2x+1]) are:
### Int_config<x>

<table>
<thead>
<tr>
<th>Int_config&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Corresponding interrupt is level-sensitive.</td>
</tr>
<tr>
<td>0b01</td>
<td>Corresponding interrupt is edge-triggered.</td>
</tr>
</tbody>
</table>

For SGIs, Int_config[1] is RAO/WI.

For SPIs and PPIs, Int_config[1] is programmable unless the implementation supports two Security states and the bit corresponds to a Group 0 or Secure Group 1 interrupt, in which case the bit is RAZ/WI to Non-secure accesses.

This field resets to an architecturally **UNKNOWN** value.

## Accessing the GICD_ICFGR<n>

**GICD_ICFGR<n>** can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0xC00 + 4n</td>
<td>GICD_ICFGR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
GICD_ICFGR\(<n>E\), Interrupt Configuration Registers (Extended SPI Range), \(n = 0 - 63\)

The GICD_ICFGR\(<n>E\) characteristics are:

**Purpose**

Determines whether the corresponding SPI in the extended SPI range is edge-triggered or level-sensitive.

**Configuration**

RW fields in this register reset to architecturally **UNKNOWN** values.

This register is present only when GIC, \(\geq 3.1\) is implemented. Otherwise, direct accesses to GICD_ICFGR\(<n>E\) are **RES0**.

When GICD_TYPER.ESPI==0, these registers are **RES0**.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ICFGR\(<n>E\) registers is \(((GICD_TYPER.ESPI\_range+1)*2)\). Registers are numbered from 0.

**Attributes**

GICD_ICFGR\(<n>E\) is a 32-bit register.

**Field descriptions**

The GICD_ICFGR\(<n>E\) bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| **Int_config\(<x>, bits \([2x+1:2x]\), for \(x = 0\) to 15** |

**Int_config\(<x>, bits \([2x+1:2x]\), for \(x = 0\) to 15**

Indicates whether the interrupt with ID \(16n + x\) is level-sensitive or edge-triggered.

Int_config[0] (bit[2x]) is **RES0**.

Possible values of Int_config[1] (bit[2x+1]) are:

<table>
<thead>
<tr>
<th>Int_config(&lt;x&gt;)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Corresponding interrupt is level-sensitive.</td>
</tr>
<tr>
<td>0b01</td>
<td>Corresponding interrupt is edge-triggered.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**Accessing the GICD_ICFGR\(<n>E\)**

When affinity routing is not enabled for the Security state of an interrupt in GICD_ICFGR\(<n>E\), the corresponding bit is **RES0**.

When **GICD_CTLR.DS==0**, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.
GICD_ICFGR\<n\>E can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0×3000 + 4(n)</td>
<td>GICD_ICFGR&lt;n&gt;E</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
GICD_ICPENDR<n>, Interrupt Clear-Pending Registers, n = 0 - 31

The GICD_ICPENDR<n> characteristics are:

**Purpose**

Removes the pending state from the corresponding interrupt.

**Configuration**

Some or all RW fields of this register have defined reset values.

These registers are available in all GIC configurations. If GICD_CTLR.DS==0, these registers are Common.

The number of implemented GICD_ICPENDR<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_ICPENDR0 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_ICPENDR0 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

**Attributes**

GICD_ICPENDR<n> is a 32-bit register.

**Field descriptions**

The GICD_ICPENDR<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Clear_pending_bit<x>, bit [x], for x = 0 to 31 |

**Clear_pending_bit<x>, bit [x], for x = 0 to 31**

For SPIs and PPIs, removes the pending state from interrupt number 32n + x. Reads and writes have the following behavior:
### Clear_pending_bit<x>

<table>
<thead>
<tr>
<th>Clear_pending_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that the corresponding interrupt is not pending on any PE. If written, has no effect.</td>
</tr>
</tbody>
</table>
| 0b1                  | If read, indicates that the corresponding interrupt is pending, or active and pending:  
  - On this PE if the interrupt is an SGI or PPI.  
  - On at least one PE if the interrupt is an SPI.  
If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active. This has no effect in the following cases:  
  - If the interrupt is an SGI. In this case, the write is ignored. The pending state of an SGI can be cleared using GICD_CPENDSGIR<n>.  
  - If the interrupt is not pending and is not active and pending.  
  - If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to GICD_ISPENDR<n>. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending.  
This field resets to 0. |

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICPENDR<n> number, n, is given by n = m DIV 32.
- The offset of the required GICD_ICPENDR is (0x200 + (4*n)).
- The bit number of the required group modifier bit in this register is m MOD 32.

### Accessing the GICD_ICPENDR<n>

Clear-pending bits for SGIs are RO/WI.

When affinity routing is enabled for the Security state of an interrupt:

- Bits corresponding to SGIs and PPIs are RAZ/WI, and equivalent functionality for SGIs and PPIs is provided by GICR_ICPENDR0.
- Bits corresponding to Group 0 and Group 1 Secure interrupts can only be cleared by Secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

If GICD_CTLR.DS==0, unless the GICD_NSACR<n> registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

**GICD_ICPENDR<n> can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0280 + 4n</td>
<td>GICD_ICPENDR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RW.
- When IsAccessSecure() accesses to this register are RW.
- When !IsAccessSecure() accesses to this register are RW.

The GICD_ICPENDR\(n\)E characteristics are:

**Purpose**

Removes the pending state to the corresponding SPI in the extended SPI range.

**Configuration**

Some or all RW fields of this register have defined reset values.

This register is present only when GIC, \(>=3.1\) is implemented. Otherwise, direct accesses to GICD_ICPENDR\(n\)E are \(\text{RES}\)0.

When \(\text{GICD_TYPER}.\text{ESPI}==0\), these registers are \(\text{RES}\)0.

When \(\text{GICD_TYPER}.\text{ESPI}==1\), the number of implemented GICD_ICPENDR\(n\)E registers is \((\text{GICD_TYPER}.\text{ESPI}_\text{range}+1)\). Registers are numbered from 0.

**Attributes**

GICD_ICPENDR\(n\)E is a 32-bit register.

**Field descriptions**

The GICD_ICPENDR\(n\)E bit assignments are:

<table>
<thead>
<tr>
<th>Bit assignments</th>
<th>Clear_pending_bit(x), bit [x], for (x = 0) to (31)</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
<td></td>
</tr>
</tbody>
</table>

For the extended PPIs, removes the pending state to interrupt number \(x\). Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Clear_pending_bit(x)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that the corresponding interrupt is not pending. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that the corresponding interrupt is pending, or active and pending. If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active. This has no effect in the following cases:</td>
</tr>
<tr>
<td></td>
<td>• If the interrupt is not pending and is not active and pending.</td>
</tr>
<tr>
<td></td>
<td>• If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to GICD_ISPENDR(n)E. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending.</td>
</tr>
</tbody>
</table>

This field resets to 0.
For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICPENDR<n>E number, n, is given by \( n = (m - 4096) \div 32 \).
- The offset of the required GICD_ICPENDR<n>E is \( (0x1800 + (4n)) \).
- The bit number of the required group modifier bit in this register is \( (m - 4096) \mod 32 \).

**Accessing the GICD_ICPENDR<n>E**

When affinity routing is not enabled for the Security state of an interrupt in GICD_ICPENDR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS == 0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

**GICD_ICPENDR<n>E can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x1800 + 4n</td>
<td>GICD_ICPENDR&lt;n&gt;E</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RW.
- When IsAccessSecure() accesses to this register are RW.
- When !IsAccessSecure() accesses to this register are RW.
The GICD_IGROUPR<n> characteristics are:

**Purpose**

Controls whether the corresponding interrupt is in Group 0 or Group 1.

**Configuration**

GICD_IGROUPR0 resets to an IMPLEMENTATION DEFINED value, that might be UNKNOWN.

GICD_IGROUPR<n> where n is greater than 0 resets to 0x00000000.

These registers are available in all GIC configurations. If GICD_CTLR.DS==0, these registers are Secure.

The number of implemented GICD_IGROUPR<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_IGROUPR0 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_IGROUPR0 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

**Attributes**

GICD_IGROUPR<n> is a 32-bit register.

**Field descriptions**

The GICD_IGROUPR<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | Group_status_bit<x>, bit [x], for x = 0 to 31

**Group_status_bit<x>, bit [x], for x = 0 to 31**

Group status bit.

<table>
<thead>
<tr>
<th>Group_status_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When GICD_CTLR.DS==1, the corresponding interrupt is Group 0. When GICD_CTLR.DS==0, the corresponding interrupt is Secure.</td>
</tr>
<tr>
<td>0b1</td>
<td>When GICD_CTLR.DS==1, the corresponding interrupt is Group 1. When GICD_CTLR.DS==0, the corresponding interrupt is Non-secure Group 1.</td>
</tr>
</tbody>
</table>

If affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICD_IGRPMODR<n> to form a 2-bit field that defines an interrupt group. The encoding of this field is described in GICD_IGRPMODR<n>.

If affinity routing is disabled for the Security state of an interrupt, then:

- The corresponding GICD_IGRPMODR<n> bit is RES0.
- For Secure interrupts, the interrupt is Secure Group 0.
For Non-secure interrupts, the interrupt is Non-secure Group 1.

For INTID m, when DIV and MOD are the integer division and modulo operations:

• The corresponding GICD_IGROUP<n> number, n, is given by \( n = m \div 32 \).
• The offset of the required GICD_IGROUP is \((0x080 + (4^n))\).
• The bit number of the required group modifier bit in this register is \( m \mod 32 \).

## Accessing the GICD_IGROUPR<n>

For SGIs and PPIs:

- When ARE is 1 for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR_IGROUPR0.

When \( \text{GICD_CTLR.DS} = 0 \), the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

### Note

Accesses to GICD_IGROUPR0 when affinity routing is not enabled for a Security state access the same state as \( \text{GICR_IGROUPR0} \), and must update Redistributor state associated with the PE performing the accesses. Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

### GICD_IGROUPR<n> can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0080 + 4n</td>
<td>GICD_IGROUPR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RW.
- When IsAccessSecure() accesses to this register are RW.
GICD_IGROUPR<n>E, Interrupt Group Registers (extended SPI range), n = 0 - 31

The GICD_IGROUPR<n>E characteristics are:

**Purpose**

Controls whether the corresponding SPI in the extended SPI range is in Group 0 or Group 1.

**Configuration**

GICD_IGROUPR<n>E resets to 0x00000000.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1:

- The number of implemented GICD_IGROUPR<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.
- When GICD_CLTR.DS==0, this register is Secure.

**Attributes**

GICD_IGROUPR<n>E is a 32-bit register.

**Field descriptions**

The GICD_IGROUPR<n>E bit assignments are:

<table>
<thead>
<tr>
<th>Group_status_bit&lt;x&gt;, bit [x], for x = 0 to 31</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
</tr>
</tbody>
</table>

**Group_status_bit<x>, bit [x], for x = 0 to 31**

Group status bit.

<table>
<thead>
<tr>
<th>Group_status_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When GICD_CTLR.DS==1, the corresponding interrupt is Group 0.</td>
</tr>
<tr>
<td></td>
<td>When GICD_CTLR.DS==0, the corresponding interrupt is Secure.</td>
</tr>
<tr>
<td>0b1</td>
<td>When GICD_CTLR.DS==1, the corresponding interrupt is Group 1.</td>
</tr>
<tr>
<td></td>
<td>When GICD_CTLR.DS==0, the corresponding interrupt is Non-secure Group 1.</td>
</tr>
</tbody>
</table>

If affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICD_IGRPMODR<n>E to form a 2-bit field that defines an interrupt group. The encoding of this field is described in GICD_IGRPMODR<n>E.

If affinity routing is disabled for the Security state of an interrupt, the bit is RES0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IGROUPR<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_IGROUPR<n>E is (0x1000 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.
Accessing the GICD_IGROUPR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_IGROUPR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_IGROUPR<n>E can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x1000 + 4n</td>
<td>GICD_IGROUPR&lt;n&gt;E</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RW.
- When IsAccessSecure() accesses to this register are RW.
- When !IsAccessSecure() accesses to this register are RW.
The GICD_IGRPMODR<n> characteristics are:

**Purpose**

When GICD_CTLR.DS==0, this register together with the GICD_IGROUPR<n> registers, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- Secure Group 1.

**Configuration**

Some or all RW fields of this register have defined reset values.

When GICD_CLTR.DS==0, these registers are Secure.

The number of implemented GICD_IGROUPR<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

When GICD_CTLR.ARE_S==0 or GICD_CTLR.DS==1, the GICD_IGRPMODR<n> registers are RES0. An implementation can make these registers RAZ/WI in this case.

**Attributes**

GICD_IGRPMODR<n> is a 32-bit register.

**Field descriptions**

The GICD_IGRPMODR<n> bit assignments are:

```
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| Group_modifier_bit<x>, bit [x], for x = 0 to 31 |
```

**Group_modifier_bit<x>, bit [x], for x = 0 to 31**

Group modifier bit. When affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICD_IGROUPR<n> to form a 2-bit field that defines an interrupt group:

<table>
<thead>
<tr>
<th>Group modifier bit</th>
<th>Group status bit</th>
<th>Definition</th>
<th>Short name</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>0b0</td>
<td>Secure Group 0</td>
<td>G0S</td>
</tr>
<tr>
<td>0b0</td>
<td>0b1</td>
<td>Non-secure Group 1</td>
<td>G1NS</td>
</tr>
<tr>
<td>0b1</td>
<td>0b0</td>
<td>Secure Group 1</td>
<td>G1S</td>
</tr>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>Reserved, treated as Non-secure Group 1</td>
<td>-</td>
</tr>
</tbody>
</table>

This field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IGRPMODR<n> number, n, is given by n = m DIV 32.
- The offset of the required GICD_IGRPMODR is (0x080 + (4*n)).
- The bit number of the required group modifier bit in this register is m MOD 32.

See GICD_IGROUPR<n> for information about the GICD_IGRPMODR0 reset value.
Accessing the GICD_IGRPMODR<n>

When affinity routing is enabled for Secure state, GICD_IGRPMODR0 is RES0 and equivalent functionality is proved by GICR_IGRPMODR0.

When GICD_CTLR.DS==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

---

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

---

GICD_IGRPMODR<n> can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0D00 + 4n</td>
<td>GICD_IGRPMODR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RW.
- When IsAccessSecure() accesses to this register are RW.
GICD_IGRPMODR<n>E, Interrupt Group Modifier Registers (extended SPI range), n = 0 - 31

The GICD_IGRPMODR<n>E characteristics are:

**Purpose**

When GICD_CTLR.DS==0, this register together with the GICD_IGROUPR<n>E registers, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- When System register access is enabled, Secure Group 1.

**Configuration**

Some or all RW fields of this register have defined reset values.

GICD_IGRPMODR<n>E resets to 0x00000000.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1:

- The number of implemented GICD_IGRPMODR<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.
- When GICD_CLTR.DS==0, this register is Secure.

**Attributes**

GICD_IGRPMODR<n>E is a 32-bit register.

**Field descriptions**

The GICD_IGRPMODR<n>E bit assignments are:

<table>
<thead>
<tr>
<th>Bit position</th>
<th>Group modifier bit</th>
<th>Group status bit</th>
<th>Definition</th>
<th>Short name</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 - 24</td>
<td>0b0</td>
<td>0b0</td>
<td>Secure Group 0</td>
<td>G0S</td>
</tr>
<tr>
<td>24 - 16</td>
<td>0b0</td>
<td>0b1</td>
<td>Non-secure Group 1</td>
<td>G1NS</td>
</tr>
<tr>

<td>0b0</td>
<td>Secure Group 1</td>
<td>G1S</td>
</tr>
<tr>
<td>8 - 0</td>
<td>0b1</td>
<td>0b1</td>
<td>Reserved, treated as Non-secure Group 1</td>
<td>-</td>
</tr>
</tbody>
</table>

This field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IGRPMODR<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_IGRPMODR<n>E is (0x3400 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.
Accessing the GICD\_IGRPMODR\(<n>E\)

When affinity routing is not enabled for the Security state of an interrupt in GICD\_IGRPMODR\(<n>E\), the corresponding bit is RES0.

When GICD\_CTL\_RS == 0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD\_IGRPMODR\(<n>E\) can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x3400 + 4n</td>
<td>GICD_IGRPMODR(&lt;n&gt;E)</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD\_CTL\_DS == 0b0 accesses to this register are RW.
- When IsAccessSecure() accesses to this register are RW.
- When !IsAccessSecure() accesses to this register are RW.
The GICD_IIDR characteristics are:

**Purpose**

Provides information about the implementer and revision of the Distributor.

**Configuration**

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states, this register is Common.

**Attributes**

GICD_IIDR is a 32-bit register.

**Field descriptions**

The GICD_IIDR bit assignments are:

| Bit 31 | Bit 30 | Bit 29 | Bit 28 | Bit 27 | Bit 26 | Bit 25 | Bit 24 | Bit 23 | Bit 22 | Bit 21 | Bit 20 | Bit 19 | Bit 18 | Bit 17 | Bit 16 | Bit 15 | Bit 14 | Bit 13 | Bit 12 | Bit 11 | Bit 10 | Bit 9 | Bit 8 | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
|       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |

**ProductID**, bits [31:24]

An IMPLEMENTATION DEFINED product identifier.

**Bits [23:20]**

Reserved, RES0.

**Variant, bits [19:16]**

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish product variants, or major revisions of a product.

**Revision, bits [15:12]**

An IMPLEMENTATION DEFINED revision number. Typically, this field is used to distinguish minor revisions of a product.

**Implementer, bits [11:0]**

Contains the JEP106 code of the company that implemented the Distributor:

- Bits [11:8] are the JEP106 continuation code of the implementer. For an Arm implementation, this field is 0x4.
- Bit [7] is always 0.
- Bits [6:0] are the JEP106 identity code of the implementer. For an Arm implementation, bits [7:0] are therefore 0x38.
Accessing the GICD_IIDR

GICD_IIDR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0008</td>
<td>GICD_IIDR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTRL.RS == 0b0 accesses to this register are RO.
- When !IsAccessSecure() accesses to this register are RO.
- When !IsAccessSecure() accesses to this register are RO.
GICD_IPRIORITYR<n>, Interrupt Priority Registers, n = 0 - 254

The GICD_IPRIORITYR<n> characteristics are:

**Purpose**

Holds the priority of the corresponding interrupt.

**Configuration**

Some or all RW fields of this register have defined reset values.

These registers are available in all configurations of the GIC. When GICD_CTLR.DS==0, these registers are Common.

The number of implemented GICD_IPRIORITYR<n> registers is 8*(GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_IPRIORITYR0 to GICD_IPRIORITYR7 are Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_IPRIORITYR0 to GICD_IPRIORITYR7 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

**Attributes**

GICD_IPRIORITYR<n> is a 32-bit register.

**Field descriptions**

The GICD_IPRIORITYR<n> bit assignments are:

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Priority_offset_3B | Priority_offset_2B | Priority_offset_1B | Priority_offset_0B |

**Priority_offset_3B, bits [31:24]**

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt.

This field resets to 0.

**Priority_offset_2B, bits [23:16]**

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt.

This field resets to 0.

**Priority_offset_1B, bits [15:8]**

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt.

This field resets to 0.
Priority_offset_0B, bits [7:0]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 0. Lower priority values correspond to greater priority of the interrupt.

This field resets to 0.

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IPRIORITYR<n> number, n, is given by n = m DIV 4.
- The offset of the required GICD_IPRIORITYR<n> register is (0x400 + (4*n)).
- The byte offset of the required Priority field in this register is m MOD 4, where:
  - Byte offset 0 refers to register bits [7:0].
  - Byte offset 1 refers to register bits [15:8].
  - Byte offset 2 refers to register bits [23:16].
  - Byte offset 3 refers to register bits [31:24].

Accessing the GICD_IPRIORITYR<n>

These registers are always used when affinity routing is not enabled. When affinity routing is enabled for the Security state of an interrupt:

- GICR_IPRIORITYR<n> is used instead of GICD_IPRIORITYR<n> where n = 0 to 7 (that is, for SGIs and PPIs).
- GICD_IPRIORITYR<n> is RAZ/WI where n = 0 to 7.

These registers are byte-accessible.

A register field corresponding to an unimplemented interrupt is RAZ/WI.

A GIC might implement fewer than eight priority bits, but must implement at least bits [7:4] of each field. In each field, unimplemented bits are RAZ/WI, see Interrupt prioritization.

When GICD_CTLR.DS==0:

- A register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.
- A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in Software views of interrupt priority.

It is IMPLEMENTATION DEFINED whether changing the value of a priority field changes the priority of an active interrupt.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICD_IPRIORITYR<n> can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x400 + 4n</td>
<td>GICD_IPRIORITYR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GIC_DCTRL.DS == 0b0 accesses to this register are RW.
- When IsAccessSecure() accesses to this register are RW.
- When !IsAccessSecure() accesses to this register are RW.
GICD_IPRIORITYR<n>E, Holds the priority of the corresponding interrupt for each extended SPI supported by the GIC., n = 0 - 255

The GICD_IPRIORITYR<n>E characteristics are:

**Purpose**

Holds the priority of the corresponding interrupt for each extended SPI supported by the GIC.

**Configuration**

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when GIC, >=3.1 is implemented. Otherwise, direct accesses to GICD_IPRIORITYR<n>E are RES0.

When **GICD_TYPER**.ESPI==0, these registers are RES0.

When **GICD_TYPER**.ESPI==1, the number of implemented GICD_IPRIORITYR<n>E registers is ((**GICD_TYPER**.ESPI_range+1)*8). Registers are numbered from 0.

**Attributes**

GICD_IPRIORITYR<n>E is a 32-bit register.

**Field descriptions**

The GICD_IPRIORITYR<n>E bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Priority_offset_3B | Priority_offset_2B | Priority_offset_1B | Priority_offset_0B |

**Priority_offset_3B**, bits [31:24]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt.

This field resets to an architecturally UNKNOWN value.

**Priority_offset_2B**, bits [23:16]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt.

This field resets to an architecturally UNKNOWN value.

**Priority_offset_1B**, bits [15:8]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt.

This field resets to an architecturally UNKNOWN value.
Priority_offset_0B, bits [7:0]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 0. Lower priority values correspond to greater priority of the interrupt.

This field resets to an architecturally UNKNOWN value.

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IPRIORITYRₙE number, n, is given by \( n = (m-4096) \div 4 \).
- The offset of the required GICD_IPRIORITYRₙE register is \( 0x2000 + (4*n) \).
- The byte offset of the required Priority field in this register is \( m \mod 4 \), where:
  - Byte offset 0 refers to register bits [7:0].
  - Byte offset 1 refers to register bits [15:8].
  - Byte offset 2 refers to register bits [23:16].
  - Byte offset 3 refers to register bits [31:24].

Accessing the GICD_IPRIORITYRₙE

When affinity routing is not enabled for the Security state of an interrupt in GICD_ISACTIVERₙE, the corresponding bit is RES0.

When \texttt{GICD_CTLR.DS==0}:

- A field that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.
- A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in Software accesses of interrupt priority.

Bits corresponding to unimplemented interrupts are RAZ/WI.

\begin{center}
\textbf{Note}
\end{center}

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than once. The effect of the change must be visible in finite time.

GICD_IPRIORITYRₙE can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x2000 + 4n</td>
<td>GICD_IPRIORITYRₙE</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When \texttt{GICD_CTLR.DS == 0b0} accesses to this register are \texttt{RW}.
- When \texttt{IsAccessSecure()} accesses to this register are \texttt{RW}.
- When \texttt{!IsAccessSecure()} accesses to this register are \texttt{RW}.
The GICD_IROUTER<n> characteristics are:

**Purpose**

When affinity routing is enabled, provides routing information for the SPI with INTID n.

**Configuration**

RW fields in this register reset to architecturally UNKNOWN values.

These registers are available in all configurations of the GIC. If the GIC implementation supports two Security states, these registers are Common.

The maximum value of n is given by \((32*(GICD_TYPER.ITLinesNumber+1) - 1)\). GICD_IROUTER<n> registers where n=0 to 31 are reserved.

**Attributes**

GICD_IROUTER<n> is a 64-bit register.

**Field descriptions**

The GICD_IROUTER<n> bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>62</td>
<td>61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</td>
</tr>
<tr>
<td>31</td>
<td>Interrupt_Routing_Mode</td>
</tr>
<tr>
<td>30</td>
<td>29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
</tr>
</tbody>
</table>

**Bits [63:40]**

Reserved, RES0.

**Aff3, bits [39:32]**

Affinity level 3, the least significant affinity level field.

This field resets to an architecturally UNKNOWN value.

**Interrupt_Routing_Mode, bit [31]**

Interrupt Routing Mode. Defines how SPIs are routed in an affinity hierarchy:

<table>
<thead>
<tr>
<th>Interrupt_Routing_Mode</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Interrupts routed to the PE specified by a.b.c.d. In this routing, a, b, c, and d are the values of fields Aff3, Aff2, Aff1, and Aff0 respectively.</td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupts routed to any PE defined as a participating node.</td>
</tr>
</tbody>
</table>

If GICD_IROUTER<n>.IRM == 0 and the affinity path does not correspond to an implemented PE, then if the corresponding interrupt becomes pending it will not be forwarded to any PE and will remain pending.
In implementations that do not require 1 of N distribution of SPIs, this bit might be RAZ/WI.

When this bit is set to 1, GICD_IROUTER<n>.\{Aff3, Aff2, Aff1, Aff0\} are \textit{UNKNOWN}.

\textbf{Note}

An implementation might choose to make the Aff<n> fields RO when this field is 1.

This field resets to an architecturally \textit{UNKNOWN} value.

\textbf{Bits [30:24]}

Reserved, RES0.

\textbf{Aff2, bits [23:16]}

Affinity level 2, an intermediate affinity level field.

This field resets to an architecturally \textit{UNKNOWN} value.

\textbf{Aff1, bits [15:8]}

Affinity level 1, an intermediate affinity level field.

This field resets to an architecturally \textit{UNKNOWN} value.

\textbf{Aff0, bits [7:0]}

Affinity level 0, the most significant affinity level field.

This field resets to an architecturally \textit{UNKNOWN} value.

For an SPI with INTID m:

\begin{itemize}
  \item The corresponding GICD_IROUTER<n> register number, n, is given by n = m.
  \item The offset of the GICD_IROUTER<n> register is 0x6000 + 8n.
\end{itemize}

\textbf{Accessing the GICD_IROUTER<n>}

These registers are used only when affinity routing is enabled. When affinity routing is not enabled:

\begin{itemize}
  \item These registers are RES0. An implementation is permitted to make the register RAZ/WI in this case.
  \item The GICD_ITARGETSR<n> registers provide interrupt routing information.
\end{itemize}

\textbf{Note}

When affinity routing becomes enabled for a Security state (for example, following a reset or following a write to GICD_CTLR) the value of all writeable fields in this register is \textit{UNKNOWN} for that Security state. When the group of an interrupt changes so the ARE setting for the interrupt changes to 1, the value of this register is \textit{UNKNOWN} for that interrupt.

\textbf{Note}

If GICD_CTLR.DS==0, unless the GICD_NSACR<n> registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any GICD_IROUTER<n> registers that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

\textbf{Note}

For each interrupt, a GIC implementation might support fewer than 256 values for an affinity level. In this case, some bits of the corresponding affinity level field might be RO. Implementations must ensure that an interrupt that is
pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

**GICD_IROUTER<n>** can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x6000 + 8n</td>
<td>GICD_IROUTER&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
The GICD_IROUTER<n>E characteristics are:

**Purpose**

When affinity routing is enabled, provides routing information for the corresponding SPI in the extended SPI range.

**Configuration**

RW fields in this register reset to architecturally **UNKNOWN** values.

When `GICD_TYPER.ESPI==0`, these registers are **RES0**.

When `GICD_TYPER.ESPI==1`, the number of implemented GICD_IROUTER<n>E registers is `((GICD_TYPER.ESPI_range+1)*32)-1`). Registers are numbered from 0.

**Attributes**

GICD_IROUTER<n>E is a 32-bit register.

**Field descriptions**

The GICD_IROUTER<n>E bit assignments are:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>RES0</strong></td>
<td><strong>Aff3</strong></td>
<td><strong>Aff2</strong></td>
</tr>
<tr>
<td><strong>Aff1</strong></td>
<td></td>
<td><strong>Aff0</strong></td>
</tr>
</tbody>
</table>

**Interrupt_Routing_Mode**, bit [31]

Interrupt_Routing_Mode. Defines how SPIs are routed in an affinity hierarchy:

<table>
<thead>
<tr>
<th>Interrupt_Routing_Mode</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Interrupts routed to the PE specified by a.b.c.d. In this routing, a, b, c, and d are the values of fields Aff3, Aff2, Aff1, and Aff0 respectively.</td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupts routed to any PE defined as a participating node.</td>
</tr>
</tbody>
</table>

If GICD_IROUTER<n>E.IRM == 0 and the affinity path does not correspond to an implemented PE, then if the corresponding interrupt becomes pending it will not be forwarded to any PE and will remain pending.

In implementations that do not require 1 of N distribution of SPIs, this bit might be RAZ/WI.

When this bit is set to 1, GICD_IROUTER<n>E.{Aff3, Aff2, Aff1, Aff0} are **UNKNOWN**.
An implementation might choose to make the Aff<n> fields RO when this field is 1.

Bits [30:24]
Reserved, RES0.

Aff2, bits [23:16]
Affinity level 2, an intermediate affinity level field.

Aff1, bits [15:8]
Affinity level 1, an intermediate affinity level field.

Aff0, bits [7:0]
Affinity level 0, the most significant affinity level field.

For an SPI with INTID m:

- The corresponding GICD_IROUTER<n>E register number, n, is given by n = m.
- The offset of the GICD_IROUTER<n>E register is 0x6000 + 8n.

Accessing the GICD_IROUTER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_IROUTER<n>E, the register is RES0.

When GICD_CTLR.DS==0, a register that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_IROUTER<n>E can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x8000 + 8n</td>
<td>GICD_IROUTER&lt;n&gt;E</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RW.
- When IsAccessSecure() accesses to this register are RW.
- When !IsAccessSecure() accesses to this register are RW.
The GICD_ISACTIVER<n> characteristics are:

**Purpose**
Activates the corresponding interrupt. These registers are used when saving and restoring GIC state.

**Configuration**
Some or all RW fields of this register have defined reset values. These registers are available in all GIC configurations. If GICD_CTLR.DS==0, these registers are Common. The number of implemented GICD_ISACTIVER<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_ISACTIVER0 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8. Accessing GICD_ISACTIVER0 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

**Attributes**
GICD_ISACTIVER<n> is a 32-bit register.

**Field descriptions**
The GICD_ISACTIVER<n> bit assignments are:

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |
| Set_active_bit<x>, bit [x], for x = 0 to 31 |

**Set_active_bit<x>, bit [x], for x = 0 to 31**
Adds the active state to interrupt number 32n + x. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Set_active_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that the corresponding interrupt is active, or is active and pending. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1.</td>
</tr>
</tbody>
</table>

This field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISACTIVER<n> number, n, is given by n = m DIV 32.
- The offset of the required GICD_ISACTIVER is (0x300 + (4*n)).
- The bit number of the required group modifier bit in this register is m MOD 32.
Accessing the GICD_ISACTIVER<n>

When affinity routing is enabled for the Security state of an interrupt, bits corresponding to SGIs and PPIs are RAZ/WI, and equivalent functionality for SGIs and PPIs is provided by GICR_ISACTIVER0.

Bits corresponding to unimplemented interrupts are RAZ/WI.

If GICD_CTLR.DS==0, unless the GICD_NSACR<n> registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

The bit reads as one if the status of the interrupt is active or active and pending. GICD_ISPENDR<n> and GICD_ICPENDR<n> provide the pending status of the interrupt.

GICD ISACTIVER<n> can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0300 + 4n</td>
<td>GICD ISACTIVER&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RW.
- When IsAccessSecure() accesses to this register are RW.
- When !IsAccessSecure() accesses to this register are RW.
**GICD_ISACTIVER\(<n>E\), Interrupt Set-Active Registers (extended SPI range), n = 0 - 31**

The GICD_ISACTIVER\(<n>E\) characteristics are:

**Purpose**

Adds the active state to the corresponding SPI in the extended SPI range.

**Configuration**

Some or all RW fields of this register have defined reset values.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ISACTIVER\(<n>E\) registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

**Attributes**

GICD_ISACTIVER\(<n>E\) is a 32-bit register.

**Field descriptions**

The GICD_ISACTIVER\(<n>E\) bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | Set_active_bit<\(x\)>, bit [x], for x = 0 to 31 |

**Set_active_bit<\(x\)>, bit [x], for x = 0 to 31**

For the extended SPIs, adds the active state to interrupt number x. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Set_active_bit&lt;(x)&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that the corresponding interrupt is active, or active and pending on this PE. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1.</td>
</tr>
</tbody>
</table>

This field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISACTIVER\(<n>E\) number, n, is given by \(n = (m-4096) \text{ DIV } 32\).
- The offset of the required GICD_ISACTIVER\(<n>E\) is \((0x1A00 + (4*n))\).
- The bit number of the required group modifier bit in this register is \((m-4096) \text{ MOD } 32\).

**Accessing the GICD_ISACTIVER\(<n>E\)**

When affinity routing is not enabled for the Security state of an interrupt in GICD_ISACTIVER\(<n>E\), the corresponding bit is RES0.
When \texttt{GICD_CTLR.DS==0}, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

\textbf{\texttt{GICD_ISACTIVER}\textless{}\textgreater{}E can be accessed through the memory-mapped interfaces:}

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>$0x1A00 + 4n$</td>
<td>\texttt{GICD_ISACTIVER}\textless{}\textgreater{}E</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When \texttt{GICD_CTLR.DS == 0b0} accesses to this register are \textbf{RW}.
- When \texttt{IsAccessSecure()} accesses to this register are \textbf{RW}.
- When \texttt{!IsAccessSecure()} accesses to this register are \textbf{RW}.

The GICD_ISENABLER characteristics are:

**Purpose**

Enables forwarding of the corresponding interrupt to the CPU interfaces.

**Configuration**

RW fields in this register reset to architecturally **UNKNOWN** values.

These registers are available in all GIC configurations. If GICD_CTLR.DS==0, these registers are Common.

The number of implemented GICD_ISENABLER registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_ISENABLER0 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_ISENABLER0 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

**Attributes**

GICD_ISENABLER is a 32-bit register.

**Field descriptions**

The GICD_ISENABLER bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Set_enable_bit<x>, bit [x], for x = 0 to 31**

For SPIs and PPIs, controls the forwarding of interrupt number 32n + x to the CPU interfaces. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Set_enable_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 1.</td>
</tr>
</tbody>
</table>

For SGIs, the behavior of this bit is IMPLEMENTATION DEFINED.

This field resets to an architecturally **UNKNOWN** value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISENABLER number, n, is given by n = m DIV 32.
- The offset of the required GICD_ISENABLER is (0x100 + (4*n)).
The bit number of the required group modifier bit in this register is \( m \mod 32 \).

At start-up, and after a reset, a PE can use this register to discover which peripheral INTIDs the GIC supports. If \( \text{GICD_CTLR}.DS == 0 \) in a system that supports EL3, the PE must do this for the Secure view of the available interrupts, and Non-secure software running on the PE must do this discovery after the Secure software has configured interrupts as Group 0/Secure Group 1 and Non-secure Group 1.

### Accessing the GICD_ISENABLER\(<n>\)

For SGIs and PPIs:

- When \( \text{ARE} = 1 \) for the Security state of an interrupt, the field for that interrupt is \( \text{RES}0 \) and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by \( \text{GICR_ISENABLER0} \).

Bits corresponding to unimplemented interrupts are RAZ/WI.

When \( \text{GICD_CTLR}.DS == 0 \), bits corresponding to Group 0 or Secure Group 1 interrupts are RAZ/WI to Non-secure accesses.

It is IMPLEMENTATION DEFINED whether implemented SGIs are permanently enabled, or can be enabled and disabled by writes to \( \text{GICD_ISENABLER}<n> \) and \( \text{GICD_ICENABLER}<n> \) where \( n = 0 \).

For SPIs and PPIs, each bit controls the forwarding of the corresponding interrupt from the Distributor to the CPU interfaces.

**GICD_ISENABLER\(<n>\) can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x100 + 4n</td>
<td>GICD_ISENABLER(&lt;n&gt;)</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When \( \text{GICD_CTLR.DS} == 0b0 \) accesses to this register are \( \text{RW} \).
- When \( \text{IsAccessSecure()} \) accesses to this register are \( \text{RW} \).
- When \( \text{!IsAccessSecure()} \) accesses to this register are \( \text{RW} \).
GICD_ISENABLER\(<n\>)E, Interrupt Set-Enable Registers, \(n = 0 - 31\)

The GICD_ISENABLER\(<n\>)E characteristics are:

**Purpose**

Enables forwarding of the corresponding SPI in the extended SPI range to the CPU interfaces.

**Configuration**

Some or all RW fields of this register have defined reset values.

This register is present only when GIC, >=3.1 is implemented. Otherwise, direct accesses to GICD_ISENABLER\(<n\>)E are RES0.

When \(\text{GICD_TYPER.ESPI==0}\), these registers are RES0.

When \(\text{GICD_TYPER.ESPI==1}\), the number of implemented GICD_ISENABLER\(<n\>)E registers is \((\text{GICD_TYPER.ESPI_range+1})\). Registers are numbered from 0.

**Attributes**

GICD_ISENABLER\(<n\>)E is a 32-bit register.

**Field descriptions**

The GICD_ISENABLER\(<n\>)E bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Set_enable_bit\(<x\>)**, bit \([x]\), for \(x = 0\) to \(31\)

For the extended SPI range, controls the forwarding of interrupt number \(x\) to the CPU interface. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Set_enable_bit(&lt;x&gt;)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 1.</td>
</tr>
</tbody>
</table>

This field resets to 0.

For INTID \(m\), when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISENABLER\(<n\>)E number, \(n\), is given by \(n = (m-4096) \div 32\).
- The offset of the required GICD_ISENABLER\(<n\>)E is \((0\times1200 + (4\times n))\).
- The bit number of the required group modifier bit in this register is \((m-4096) \mod 32\).
**Accessing the GICD_ISENABLER\(<n>E**

When affinity routing is not enabled for the Security state of an interrupt in GICD_ISENABLER\(<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

**GICD_ISENABLER\(<n>E can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x1200 + 4n</td>
<td>GICD_ISENABLER(&lt;n&gt;E</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RW.
- When IsAccessSecure() accesses to this register are RW.
- When !IsAccessSecure() accesses to this register are RW.
The GICD_ISPENDR<n> characteristics are:

**Purpose**

Adds the pending state to the corresponding interrupt.

**Configuration**

Some or all RW fields of this register have defined reset values.

These registers are available in all GIC configurations. If GICD_CTLR.DS==0, these registers are Common.

The number of implemented GICD_ISPENDR<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_ISPENDR0 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_ISPENDR0 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

**Attributes**

GICD_ISPENDR<n> is a 32-bit register.

**Field descriptions**

The GICD_ISPENDR<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Set_pending_bit<x>, bit [x], for x = 0 to 31 |

For SPIs and PPIs, adds the pending state to interrupt number 32n + x. Reads and writes have the following behavior:
**Set_pending_bit<x>**

<table>
<thead>
<tr>
<th>Set_pending_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that the corresponding interrupt is not pending on any PE. If written, has no effect.</td>
</tr>
</tbody>
</table>
| 0b1                | If read, indicates that the corresponding interrupt is pending, or active and pending:  
|                    | • On this PE if the interrupt is an SGI or PPI.  
|                    | • On at least one PE if the interrupt is an SPI.  
|                    | If written, changes the state of the corresponding interrupt from inactive to pending, or from active to active and pending. This has no effect in the following cases:  
|                    | • If the interrupt is an SGI. The pending state of an SGI can be set using **GICD_SPENDSGIR<n>**.  
|                    | • If the interrupt is not inactive and is not active.  
|                    | • If the interrupt is already pending because of a write to **GICD_ISPENDR<n>**.  
|                    | • If the interrupt is already pending because the corresponding interrupt signal is asserted. In this case, the interrupt remains pending if the interrupt signal is deasserted.  
|                    | This field resets to 0. |

**Accessing the GICD_ISPENDR<n>**

Set-pending bits for SGIs are read-only and ignore writes. The Set-pending bits for SGIs are provided as **GICD_SPENDSGIR<n>**.

When affinity routing is enabled for the Security state of an interrupt:

- Bits corresponding to SGIs and PPIs are RAZ/WI, and equivalent functionality for SGIs and PPIs is provided by **GICR_ISPENDR0**.
- Bits corresponding to Group 0 and Group 1 Secure interrupts can only be set by Secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

If **GICD_CTLR.DS==0**, unless the **GICD_NSACR<n>** registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

**GICD_ISPENDR<n> can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0200 + 4n</td>
<td>GICD_ISPENDR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
GICD_ISPENDR<n>E, Interrupt Set-Pending Registers (extended SPI range), n = 0 - 31

The GICD_ISPENDR<n>E characteristics are:

**Purpose**

Adds the pending state to the corresponding SPI in the extended SPI range.

**Configuration**

Some or all RW fields of this register have defined reset values.

This register is present only when GIC, >=3.1 is implemented. Otherwise, direct accesses to GICD_ISPENDR<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ISPENDR<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

**Attributes**

GICD_ISPENDR<n>E is a 32-bit register.

**Field descriptions**

The GICD_ISPENDR<n>E bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | Set_pending_bit<x>, bit [x], for x = 0 to 31 |

**Set_pending_bit<x>, bit [x], for x = 0 to 31**

For the extended SPIs, adds the pending state to interrupt number x. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Set_pending_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that the corresponding interrupt is not pending. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that the corresponding interrupt is pending, or active and pending. If written, changes the state of the corresponding interrupt frominactive to pending, or from active to active and pending. This has no effect in the following cases:</td>
</tr>
<tr>
<td></td>
<td>• If the interrupt is already pending because of a write to GICD_ISPENDR&lt;n&gt;E.</td>
</tr>
<tr>
<td></td>
<td>• If the interrupt is already pending because the corresponding interrupt signal is asserted. In this case, the interrupt remains pending if the interrupt signal is deasserted.</td>
</tr>
</tbody>
</table>

This field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:
• The corresponding GICD_ISPENDR\langle n\rangle E number, n, is given by \( n = (m - 4096) \div 32 \).
• The offset of the required GICD_ISPENDR\langle n\rangle E is \( (0x1600 + (4*n)) \).
• The bit number of the required group modifier bit in this register is \( (m - 4096) \mod 32 \).

**Accessing the GICD_ISPENDR\langle n\rangle E**

When affinity routing is not enabled for the Security state of an interrupt in GICD_ISPENDR\langle n\rangle E, the corresponding bit is \texttt{RES0}.

When \texttt{GICD_CTLR.DS==0}, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

**GICD_ISPENDR\langle n\rangle E can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x1600 + 4n</td>
<td>GICD_ISPENDR\langle n\rangle E</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When \texttt{GICD_CTLR.DS == 0b0} accesses to this register are \texttt{RW}.
• When \texttt{IsAccessSecure()} accesses to this register are \texttt{RW}.
• When \texttt{!IsAccessSecure()} accesses to this register are \texttt{RW}.
**Purpose**

When affinity routing is not enabled, holds the list of target PEs for the interrupt. That is, it holds the list of CPU interfaces to which the Distributor forwards the interrupt if it is asserted and has sufficient priority.

**Configuration**

RW fields in this register reset to architecturally **UNKNOWN** values.

These registers are available in all configurations of the GIC. When **GICD_CTLR.DS==0**, these registers are Common.

The number of implemented **GICD_ITARGETSR<n>** registers is 8*(**GICD_TYPER.ITLinesNumber**+1). Registers are numbered from 0.

**GICD_ITARGETSR0** to **GICD_ITARGETSR7** are Banked for each connected PE with **GICR_TYPER.Processor_Number < 8**.

Accessing **GICD_ITARGETSR0** to **GICD_ITARGETSR7** from a PE with **GICR_TYPER.Processor_Number > 7** is **CONSTRAINED UNPREDICTABLE**:

- Register is RAZ/WI.
- An **UNKNOWN** banked copy of the register is accessed.

**Attributes**

**GICD_ITARGETSR<n>** is a 32-bit register.

**Field descriptions**

The **GICD_ITARGETSR<n>** bit assignments are:

<table>
<thead>
<tr>
<th>Bit Offset</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
<td>CPU_targets_offset_3B CPU_targets_offset_2B CPU_targets_offset_1B CPU_targets_offset_0B</td>
</tr>
</tbody>
</table>

PEs in the system number from 0, and each bit in a PE targets field refers to the corresponding PE. For example, a value of $0x3$ means that the Pending interrupt is sent to PEs 0 and 1. For **GICD_ITARGETSR0-GICD_ITARGETSR7**, a read of any targets field returns the number of the PE performing the read.

**CPU_targets_offset_3B**, bits [31:24]

PE targets for an interrupt, at byte offset 3.

This field resets to an architecturally **UNKNOWN** value.

**CPU_targets_offset_2B**, bits [23:16]

PE targets for an interrupt, at byte offset 2.

This field resets to an architecturally **UNKNOWN** value.

**CPU_targets_offset_1B**, bits [15:8]

PE targets for an interrupt, at byte offset 1.
This field resets to an architecturally **UNKNOWN** value.

**CPU_targets_offset_0B, bits [7:0]**

PE targets for an interrupt, at byte offset 0.

This field resets to an architecturally **UNKNOWN** value.

The bits that are set to 1 in the PE targets field determine which PEs are targeted:

<table>
<thead>
<tr>
<th>Value of PE targets field</th>
<th>Interrupt targets</th>
</tr>
</thead>
<tbody>
<tr>
<td>0bxxxxxxx1</td>
<td>CPU interface 0</td>
</tr>
<tr>
<td>0bxxxxxx1x</td>
<td>CPU interface 1</td>
</tr>
<tr>
<td>0bxxxxx1xx</td>
<td>CPU interface 2</td>
</tr>
<tr>
<td>0bxxxx1xxx</td>
<td>CPU interface 3</td>
</tr>
<tr>
<td>0bxxx1xxxx</td>
<td>CPU interface 4</td>
</tr>
<tr>
<td>0bxx1xxxxx</td>
<td>CPU interface 5</td>
</tr>
<tr>
<td>0bx1xxxxxx</td>
<td>CPU interface 6</td>
</tr>
<tr>
<td>0b1xxxxxxx</td>
<td>CPU interface 7</td>
</tr>
</tbody>
</table>

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD ITARGETSR<n> number, n, is given by n = m DIV 4.
- The offset of the required GICD_ITARGETSR<n> register is (0x800 + (4*n)).
- The byte offset of the required Priority field in this register is m MOD 4, where:
  - Byte offset 0 refers to register bits [7:0].
  - Byte offset 1 refers to register bits [15:8].
  - Byte offset 2 refers to register bits [23:16].
  - Byte offset 3 refers to register bits [31:24].

Software can write to these registers at any time. Any change to a targets field value:

- Has no effect on any active interrupt. This means that removing a CPU interface from a targets list does not cancel an active state for interrupts on that CPU interface. There is no effect on interrupts that are active and pending until the active status is cleared, at which time it is treated as a pending interrupt.
- Has an effect on any pending interrupts. This means:
  - Enables the CPU interface to be chosen as a target for the pending interrupt using an **IMPLEMENTATION DEFINED** mechanism.
  - Removing a CPU interface from the target list of a pending interrupt removes the pending state of the interrupt on that CPU interface.

**Accessing the GICD_ITARGETSR<n>**

These registers are used when affinity routing is not enabled. When affinity routing is enabled for the Security state of an interrupt, the target PEs for an interrupt are defined by GICD_IROUTER<n> and the associated byte in GICD_ITARGETSR<n> is RES0. An implementation is permitted to make the byte RAZ/WI in this case.

- These registers are byte-accessible.
- A register field corresponding to an unimplemented interrupt is RAZ/WI.
- A field bit corresponding to an unimplemented CPU interface is RAZ/WI.
- GICD_ITARGETSR0-GICD_ITARGETSR7 are read-only. Each field returns a value that corresponds only to the PE reading the register.
- It is **IMPLEMENTATION DEFINED** which, if any, SPIs are statically configured in hardware. The field for such an SPI is read-only, and returns a value that indicates the PE targets for the interrupt.
- If GICD_CTLR.DS==0, unless the GICD_NSACR<n> registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

In a single connected PE implementation, all interrupts target one PE, and these registers are RAZ/WI.

**Note**

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.
GICD_ITARGETSR<n> can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0000 + 4n</td>
<td>GICD_ITARGETSR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RW.
- When IsAccessSecure() accesses to this register are RW.
- When !IsAccessSecure() accesses to this register are RW.
GICD_NSACR<n>, Non-secure Access Control Registers, n = 0 - 63

The GICD_NSACR<n> characteristics are:

**Purpose**

Enables Secure software to permit Non-secure software on a particular PE to create and control Group 0 interrupts.

**Configuration**

Some or all RW fields of this register have defined reset values.

The concept of selective enabling of Non-secure access to Group 0 and Secure Group 1 interrupts applies to SGIs and SPIs.

GICD_NSACR0 is a Banked register used for SGIs. A copy is provided for every PE that has a CPU interface and that supports this feature.

**Attributes**

GICD_NSACR<n> is a 32-bit register.

**Field descriptions**

The GICD_NSACR<n> bit assignments are:

<table>
<thead>
<tr>
<th>Bit assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
<td><strong>NS_access&lt;x&gt;, bits [2x+1:2x], for x = 0 to 15</strong></td>
</tr>
</tbody>
</table>

**NS_access<x>, bits [2x+1:2x], for x = 0 to 15**

Controls Non-secure access of the interrupt with ID 16n + x.

If the corresponding interrupt does not support configurable Non-secure access, the field is RAZ/WI.

Otherwise, the field is RW and determines the level of Non-secure control permitted if the interrupt is a Secure interrupt. If the interrupt is a Non-secure interrupt, this field is ignored.

The possible values of each 2-bit field are:
**GICD_NSACR<n>, Non-secure Access Control Registers, n = 0 - 63**

<table>
<thead>
<tr>
<th>NS_access&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>No Non-secure access is permitted to fields associated with the corresponding interrupt.</td>
</tr>
<tr>
<td>0b01</td>
<td>Non-secure read and write access is permitted to set-pending bits in <strong>GICD_ISPENDR&lt;n&gt;</strong> associated with the corresponding interrupt. A Non-secure write access to <strong>GICD_SETSPI_NSR</strong> is permitted to set the pending state of the corresponding interrupt. A Non-secure write access to <strong>GICD_SGIR</strong> is permitted to generate a Secure SGI for the corresponding interrupt. An implementation might also provide read access to clear-pending bits in <strong>GICD_ICPENDR&lt;n&gt;</strong> associated with the corresponding interrupt.</td>
</tr>
<tr>
<td>0b10</td>
<td>As 0b01, but adds Non-secure read and write access permission to fields associated with the corresponding interrupt in the <strong>GICD_ICPENDR&lt;n&gt;</strong> registers. A Non-secure write access to <strong>GICD_CLRSPINSR</strong> is permitted to clear the pending state of the corresponding interrupt. Also adds Non-secure read access permission to fields associated with the corresponding interrupt in the <strong>GICD_ISACTIVER&lt;n&gt;</strong> and <strong>GICD_ICACTIVER&lt;n&gt;</strong> registers.</td>
</tr>
<tr>
<td>0b11</td>
<td>For GICD_NSACR0 this encoding is reserved and treated as 10. For all other GICD_NSACR&lt;n&gt; registers this encoding is treated as 0b10, but adds Non-secure read and write access permission to <strong>GICD_ITARGETSR&lt;n&gt;</strong> and <strong>GICD_IROUTER&lt;n&gt;</strong> fields associated with the corresponding interrupt.</td>
</tr>
</tbody>
</table>

This field resets to 0.

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_NSACR<n> number, n, is given by n = m DIV 16.
- The offset of the required GICD_NSACR<n> register is (0xE00 + (4*n)).

**Note**

Because each field in this register comprises two bits, GICD_NSACR0 controls access rights to SGI registers, GICD_NSACR1 controls access to PPI registers (and is always RAZ/WI), and all other GICD_NSACR<n> registers control access to SPI registers.

For compatibility with GICv2, writes to GICD_NSACR0 for a particular PE must be coordinated within the Distributor and must update **GICR_NSACR** for the Redistributor associated with that PE.

**Accessing the GICD_NSACR<n>**

When **GICD_CTLR.DS==1**, this register is RAZ/WI.

These registers are Secure, and are RAZ/WI to Non-secure accesses.

These registers are always used when affinity routing is not enabled. When affinity routing is enabled for the Secure state, GICD_NSACR0 is RES0 and **GICR_NSACR** provides equivalent functionality for SGIs.

These registers do not support PPIs, therefore GICD_NSACR1 is RAZ/WI.

**GICD_NSACR<n> can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0E00 + 4n</td>
<td>GICD_NSACR&lt;n&gt;</td>
</tr>
</tbody>
</table>

When When IsAccessSecure() access on this interface are **RW**.
GICD_NSACR\(n\)E, Non-secure Access Control Registers, \(n = 0 - 63\)

The GICD_NSACR\(n\)E characteristics are:

**Purpose**

Enables Secure software to permit Non-secure software on a particular PE to create and control Group 0 interrupts.

**Configuration**

Some or all RW fields of this register have defined reset values.

This register is present only when GIC, \(>=3.1\) is implemented. Otherwise, direct accesses to GICD_NSACR\(n\)E are

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
</tr>
</tbody>
</table>

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ICFGR\(n\)E registers is \(((GICD_TYPER.ESPI\_range+1)*2)\). Registers are numbered from 0.

**Attributes**

GICD_NSACR\(n\)E is a 32-bit register.

**Field descriptions**

The GICD_NSACR\(n\)E bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>NS_access(x), bits [2x+1:2x], for (x = 0) to (15)</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
<td></td>
</tr>
</tbody>
</table>

**NS_access\(x\), bits [2x+1:2x], for \(x = 0\) to \(15\)**

Controls Non-secure access of the interrupt with ID 16\(n\) + \(x\).

If the corresponding interrupt does not support configurable Non-secure access, the field is RAZ/WI.

Otherwise, the field is RW and determines the level of Non-secure control permitted if the interrupt is a Secure interrupt. If the interrupt is a Non-secure interrupt, this field is ignored.

The possible values of each 2-bit field are:
Meaning
0b00 No Non-secure access is permitted to fields associated with the corresponding interrupt.
0b01 Non-secure read and write access is permitted to set-pending bits in GICD_ISPENDR<n>E associated with the corresponding interrupt. A Non-secure write access to GICD_SETSPI_NS is permitted to set the pending state of the corresponding interrupt.
0b10 As 0b01, but adds Non-secure read and write access permission to fields associated with the corresponding interrupt in the GICD_ICPENDR<n>E registers. A Non-secure write access to GICD_CLR_SPI_NS is permitted to clear the pending state of the corresponding interrupt. Also adds Non-secure read access permission to fields associated with the corresponding interrupt in the GICD_ISACTIVER<n>E and GICD_ICACTIVER<n>E registers.
0b11 This encoding is treated as 0b10, but adds Non-secure read and write access permission to GICD_IROUTER<n>E fields associated with the corresponding interrupt.

This field resets to 0.

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_NSACR<n>E number, n, is given by n = (m - 4096) DIV 16.
- The offset of the required GICD_NSACR<n>E register is (0x3600 + (4*n)).

### Accessing the GICD_NSACR<n>E

**GICD_NSACR<n>E** can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x3600 + 4n</td>
<td>GICD_NSACR&lt;n&gt;E</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RAZ/WI.
- When IsAccessSecure() accesses to this register are RW.
- When !IsAccessSecure() accesses to this register are RAZ/WI.
**GICD_SETSPI_NSR, Set Non-secure SPI Pending Register**

The GICD_SETSPI_NSR characteristics are:

**Purpose**

Adds the pending state to a valid SPI if permitted by the Security state of the access and the GICD_NSACR<n> value for that SPI.

A write to this register changes the state of an inactive SPI to pending, and the state of an active SPI to active and pending.

**Configuration**

If GICD_TYPER.MBIS == 0, this register is reserved.

When GICD_CTLR.DS==1, this register provides functionality for all SPIs.

**Attributes**

GICD_SETSPI_NSR is a 32-bit register.

**Field descriptions**

The GICD_SETSPI_NSR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    | RES0|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|    |    |    |    |    |    |    | INTID|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [31:13]**

Reserved, RES0.

**INTID, bits [12:0]**

The INTID of the SPI.

The function of this register depends on whether the targeted SPI is configured to be an edge-triggered or level-sensitive interrupt:

- For an edge-triggered interrupt, a write to GICD_SETSPI_NSR or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will stop being pending on activation, or if the pending state is removed by a write to GICD_CLRSP1_NSR, GICD_CLRSP1_SR, or GICD_ICPENDR<n>.
- For a level-sensitive interrupt, a write to GICD_SETSPI_NSR or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will remain pending until it is deasserted by a write to GICD_CLRSP1_NSR or GICD_CLRSP1_SR. If the interrupt is activated between having the pending state added and being deactivated, then the interrupt will be active and pending.

**Accessing the GICD_SETSPI_NSR**

Writes to this register have no effect if:

- The value written specifies a Secure SPI, the value is written by a Non-secure access, and the value of the corresponding GICD_NSACR<n> register is 0.
- The value written specifies an invalid SPI.
- The SPI is already pending.
16-bit accesses to bits [15:0] of this register must be supported.

---

**Note**

A Secure access to this register can set the pending state of any valid SPI.

---

**GICD_SETSPI_NSR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0040</td>
<td>GICD_SETSPI_NSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **WO**.
- When IsAccessSecure() accesses to this register are **WO**.
- When !IsAccessSecure() accesses to this register are **WO**.
The GICD_SETSPI_SR characteristics are:

**Purpose**

Adds the pending state to a valid SPI. A write to this register changes the state of an inactive SPI to pending, and the state of an active SPI to active and pending.

**Configuration**

If `GICD_TYPER_MBIS` == 0, this register is reserved. When `GICD_CTLR_DS` == 1, this register is WI.

**Attributes**

GICD_SETSPI_SR is a 32-bit register.

**Field descriptions**

The GICD_SETSPI_SR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | INTID |

**Bits [31:13]**

Reserved, RES0.

**INTID, bits [12:0]**

The INTID of the SPI.

The function of this register depends on whether the targeted SPI is configured to be an edge-triggered or level-sensitive interrupt:

- For an edge-triggered interrupt, a write to `GICD_SETSPI_NSR` or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will stop being pending on activation, or if the pending state is removed by a write to `GICD_CLRSPI_NSR`, `GICD_CLRSPI_SR`, or `GICD_ICPENDR<n>`.
- For a level-sensitive interrupt, a write to `GICD_SETSPI_NSR` or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will remain pending until it is deasserted by a write to `GICD_CLRSPI_NSR` or `GICD_CLRSPI_SR`. If the interrupt is activated between having the pending state added and being deactivated, then the interrupt will be active and pending.

**Accessing the GICD_SETSPI_SR**

Writes to this register have no effect if:

- The value is written by a Non-secure access.
- The value written specifies an invalid SPI.
- The SPI is already pending.

16-bit accesses to bits [15:0] of this register must be supported.
GICD_SETSPI_SR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0050</td>
<td>GICD_SETSPI_SR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **WI**.
- When IsAccessSecure() accesses to this register are **WO**.
- When !IsAccessSecure() accesses to this register are **WI**.
The GICD_SGIR characteristics are:

**Purpose**

Controls the generation of SGIs.

**Configuration**

This register is available in all configurations of the GIC. If the GIC supports two Security states this register is Common.

**Attributes**

GICD_SGIR is a 32-bit register.

**Field descriptions**

The GICD_SGIR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | TargetListFilter | CPUTargetList | NSATT | RES0 | INTID |

**Bits [31:26]**

Reserved, RES0.

**TargetListFilter, bits [25:24]**

Determines how the Distributor processes the requested SGI.

<table>
<thead>
<tr>
<th>TargetListFilter</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Forward the interrupt to the CPU interfaces specified by GICD_SGIR.CPUTargetList.</td>
</tr>
<tr>
<td>0b01</td>
<td>Forward the interrupt to all CPU interfaces except that of the PE that requested the interrupt.</td>
</tr>
<tr>
<td>0b10</td>
<td>Forward the interrupt only to the CPU interface of the PE that requested the interrupt.</td>
</tr>
<tr>
<td>0b11</td>
<td>Reserved.</td>
</tr>
</tbody>
</table>

**CPUTargetList, bits [23:16]**

When GICD_SGIR.TargetListFilter is 0b00, this field defines the CPU interfaces to which the Distributor must forward the interrupt.

Each bit of the field refers to the corresponding CPU interface. For example, CPUTargetList[0] corresponds to interface 0. Setting a bit to 1 indicates that the interrupt must be forwarded to the corresponding interface.

If this field is 0b00000000 when GICD_SGIR.TargetListFilter is 0b00, the Distributor does not forward the interrupt to any CPU interface.

**NSATT, bit [15]**

Specifies the required group of the SGI.
<table>
<thead>
<tr>
<th>NSATT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Forward the SGI specified in the INTID field to a specified CPU interface only if the SGI is configured as Group 0 on that interface.</td>
</tr>
<tr>
<td>0b1</td>
<td>Forward the SGI specified in the INTID field to a specified CPU interface only if the SGI is configured as Group 1 on that interface.</td>
</tr>
</tbody>
</table>

This field is writable only by a Secure access. Non-secure accesses can also generate Group 0 interrupts, if allowed to do so by GICD_NSACR0. Otherwise, Non-secure writes to GICD_SGIR generate an SGI only if the specified SGI is programmed as Group 1, regardless of the value of bit [15] of the write.

### Bits [14:4]

Reserved, RES0.

### INTID, bits [3:0]

The INTID of the SGI to forward to the specified CPU interfaces.

### Accessing the GICD_SGIR

This register is used only when affinity routing is not enabled. When affinity routing is enabled, this register is RES0.

It is **IMPLEMENTATION DEFINED** whether this register has any effect when the forwarding of interrupts by the Distributor is disabled by GICD_CTLR.

**GICD_SGIR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0F00</td>
<td>GICD_SGIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **WO**.
- When IsAccessSecure() accesses to this register are **WO**.
- When !IsAccessSecure() accesses to this register are **WO**.
The GICD_SPENDSGIR<n> characteristics are:

**Purpose**

Adds the pending state to an SGI.

A write to this register changes the state of an inactive SGI to pending, and the state of an active SGI to active and pending.

**Configuration**

Some or all RW fields of this register have defined reset values.

Four SGI set-pending registers are implemented. Each register contains eight set-pending bits for each of four SGIs, for a total of 16 possible SGIs.

In multiprocessor implementations, each PE has a copy of these registers.

**Attributes**

GICD_SPENDSGIR<n> is a 32-bit register.

**Field descriptions**

The GICD_SPENDSGIR<n> bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>(0x0) If read, indicates that the SGI from the corresponding PE is not pending and is not active and pending. If written, has no effect.</td>
</tr>
<tr>
<td>0</td>
<td>(0x0) If read, indicates that the SGI from the corresponding PE is pending or is active and pending. If written, adds the pending state to the SGI for the corresponding PE.</td>
</tr>
</tbody>
</table>

This field resets to \(0\).

For SGI ID \(m\), generated by processing element \(C\) writing to the corresponding GICD_SGIR field, where DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_SPENDSGIR<n> number is given by \(n = m \text{ DIV } 4\).
- The offset of the required register is \((0xF20 + (4n))\).
- The offset of the required field within the register GICD_SPENDSGIR<n> is given by \(m \text{ MOD } 4\).
- The required bit in the 8-bit SGI set-pending field \(m\) is bit \(C\).
**Accessing the GICD_SPENDSGIR<n>**

These registers are used only when affinity routing is not enabled. When affinity routing is enabled for the Security state of an interrupt then the bit associated with SGI in that Security state is RES0. An implementation is permitted to make the register RAZ/WI in this case.

A register bit that corresponds to an unimplemented SGI is RAZ/WI.

These registers are byte-accessible.

If the GIC implementation supports two Security states:

- A register bit that corresponds to a Group 0 interrupt is RAZ/WI to Non-secure accesses.
- Register bits corresponding to unimplemented PEs are RAZ/WI.

**GICD_SPENDSGIR<n> can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0F20 + 4n</td>
<td>GICD_SPENDSGIR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
The GICD_STATUSR characteristics are:

**Purpose**

Provides software with a mechanism to detect:

- Accesses to reserved locations.
- Writes to read-only locations.
- Reads of write-only locations.

**Configuration**

If the GIC implementation supports two Security states this register is Banked to provide Secure and Non-secure copies.

**Attributes**

GICD_STATUSR is a 32-bit register.

**Field descriptions**

The GICD_STATUSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>

</tbody>
</table>

**Bits [31:4]**

Reserved, RES0.

**WROD, bit [3]**

Write to an RO location.

<table>
<thead>
<tr>
<th>WROD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A write to an RO location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.

**RWOD, bit [2]**

Read of a WO location.

<table>
<thead>
<tr>
<th>RWOD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A read of a WO location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.

**WRD, bit [1]**

Write to a reserved location.
<table>
<thead>
<tr>
<th>WRD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A write to a reserved location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.

**RRD, bit [0]**

Read of a reserved location.

<table>
<thead>
<tr>
<th>RRD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A read of a reserved location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.

**Accessing the GICD_STATUSR**

This is an optional register. If the register is not implemented, the location is RAZ/WI.

**GICD_STATUSR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0010</td>
<td>GICD_STATUSR(S)</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0010</td>
<td>GICD_STATUSR(NS)</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
GICD_TYPER, Interrupt Controller Type Register

The GICD_TYPER characteristics are:

### Purpose

Provides information about what features the GIC implementation supports. It indicates:

- Whether the GIC implementation supports two Security states.
- The maximum number of INTIDs that the GIC implementation supports.
- The number of PEs that can be used as interrupt targets.

### Configuration

This register is available in all configurations of the GIC. When `GICD_CTLR.DS==0`, this register is Common.

### Attributes

GICD_TYPER is a 32-bit register.

### Field descriptions

The GICD_TYPER bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Bit Assignments</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESPI_range</td>
<td>[31:27]</td>
</tr>
<tr>
<td>RSS</td>
<td>[26]</td>
</tr>
<tr>
<td>No1N</td>
<td>[25]</td>
</tr>
<tr>
<td>IDbits</td>
<td>[24]</td>
</tr>
<tr>
<td>DVIS</td>
<td>[23]</td>
</tr>
<tr>
<td>LPIS</td>
<td>[22]</td>
</tr>
<tr>
<td>MBIS</td>
<td>[21]</td>
</tr>
<tr>
<td>num_LPIs</td>
<td>[20]</td>
</tr>
<tr>
<td>SecurityExtn</td>
<td>[19]</td>
</tr>
<tr>
<td>RES0</td>
<td>[18]</td>
</tr>
<tr>
<td>ESP1</td>
<td>[17]</td>
</tr>
<tr>
<td>CPUNumber</td>
<td>[16]</td>
</tr>
<tr>
<td>ITLinesNumber</td>
<td>[15:0]</td>
</tr>
</tbody>
</table>

#### ESPI_range field, bits [31:27]

When GICD_TYPER.ESPI == 1:

Indicates the maximum INTID in the Extended SPI range.

- Maximum Extended SPI INTID is \((32 \times (\text{ESPI\_range} + 1) + 4095)\)

Otherwise:

Reserved, RES0.

#### RSS, bit [26]

Range Selector Support. Possible values are:

<table>
<thead>
<tr>
<th>RSS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The IRI supports targeted SGIs with affinity level 0 values of 0 - 15.</td>
</tr>
<tr>
<td>0b1</td>
<td>The IRI supports targeted SGIs with affinity level 0 values of 0 - 255.</td>
</tr>
</tbody>
</table>

#### No1N, bit [25]

Indicates whether 1 of N SPI interrupts are supported.

<table>
<thead>
<tr>
<th>No1N</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>1 of N SPI interrupts are supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>1 of N SPI interrupts are not supported.</td>
</tr>
</tbody>
</table>
A3V, bit [24]

Affinity 3 valid. Indicates whether the Distributor supports nonzero values of Affinity level 3. Possible values are:

<table>
<thead>
<tr>
<th>A3V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Distributor only supports zero values of Affinity level 3.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Distributor supports nonzero values of Affinity level 3.</td>
</tr>
</tbody>
</table>

IDbits, bits [23:19]

The number of interrupt identifier bits supported, minus one.

DVIS, bit [18]

Indicates whether the implementation supports Direct Virtual LPI injection.

<table>
<thead>
<tr>
<th>DVIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The implementation does not support Direct Virtual LPI injection.</td>
</tr>
<tr>
<td>0b1</td>
<td>The implementation supports Direct Virtual LPI injection.</td>
</tr>
</tbody>
</table>

For GICv3, this field is RES0.

LPIS, bit [17]

Indicates whether the implementation supports LPIs.

<table>
<thead>
<tr>
<th>LPIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The implementation does not support LPIs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The implementation supports LPIs.</td>
</tr>
</tbody>
</table>

MBIS, bit [16]

Indicates whether the implementation supports message-based interrupts by writing to Distributor registers.

<table>
<thead>
<tr>
<th>MBIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The implementation does not support message-based interrupts by writing to Distributor registers. The GICD_CLR_SPI_NSR, GICD_SET_SPI_NSR, GICD_CLR_SPI_SR, and GICD_SET_SPI_SR registers are reserved.</td>
</tr>
<tr>
<td>0b1</td>
<td>The implementation supports message-based interrupts by writing to the GICD_CLR_SPI_NSR, GICD_SET_SPI_NSR, GICD_CLR_SPI_SR, or GICD_SET_SPI_SR registers.</td>
</tr>
</tbody>
</table>

num_LPIs, bits [15:11]

Number of supported LPIs.

- 0b00000 Number of LPIs as indicated by GICD_TYPER.IDbits.
- All other values Number of LPIs supported is \( 2^{\text{num}_\text{LPIs}+1} \).
  - Available LPI INTIDs are 8192..(8192 + 2^{\text{num}_\text{LPIs}+1} - 1).
  - This field cannot indicate a maximum LPI INTID greater than that indicated by GICD_TYPER.IDbits.

When the supported INTID width is less than 14 bits, this field is RES0 and no LPIs are supported.

SecurityExtn, bit [10]

Indicates whether the GIC implementation supports two Security states:

When GICD_CTRLR.DS == 1, this field is RAZ.
<table>
<thead>
<tr>
<th>SecurityExtn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The GIC implementation supports only a single Security state.</td>
</tr>
<tr>
<td>0b1</td>
<td>The GIC implementation supports two Security states.</td>
</tr>
</tbody>
</table>

**Bit [9]**

Reserved, RES0.

**ESPI, bit [8]**

Extended SPI

<table>
<thead>
<tr>
<th>ESPI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Extended SPI range not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Extended SPI range implemented.</td>
</tr>
</tbody>
</table>

**CPUNumber, bits [7:5]**

Reports the number of PEs that can be used when affinity routing is not enabled, minus 1.

These PEs must be numbered contiguously from zero, but the relationship between this number and the affinity hierarchy from MPIDR is IMPLEMENTATION DEFINED. If the implementation does not support ARE being zero, this field is 000.

**ITLinesNumber, bits [4:0]**

Indicates the maximum SPI INTID that the GIC implementation supports. If the value of this field is N, the maximum SPI INTID is 32(N+1)-1. For example, 00011 specifies that the maximum SPI INTID is 127.

The maximum SPI INTID an implementation might support is 1019 (field value 11111). Regardless of the range of INTIDs defined by this field, interrupt IDs 1020-1023 are reserved for special purposes.

A value of 0 indicates no SPIs are support.

**Note**

The value derived from this field specifies the maximum number of SPIs that the GIC implementation might support. An implementation might not implement all SPIs up to this maximum.

The ITLinesNumber field only indicates the maximum number of SPIs that the GIC implementation might support. This value determines the number of instances of the following interrupt registers:

- GICD_IGROUPR<n>
- GICD_ISENABLER<n>
- GICD_ICENABLER<n>
- GICD_ISPENDR<n>
- GICD_ICPENDR<n>
- GICD_ISACTIVER<n>
- GICD_ICACTIVER<n>
- GICD_IPRIORITYR<n>
- GICD_ITARGETSR<n>
- GICD_ICFGR<n>

The GIC architecture does not require a GIC implementation to support a continuous range of SPI interrupt IDs. Software must check which SPI INTIDs are supported, up to the maximum value indicated by GICD_TYPER.ITLinesNumber.
Accessing the GICD_TYPER

GICD_TYPER can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Distributor</td>
<td>0x0004</td>
<td>GICD_TYPER</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RO.
- When !IsAccessSecure() accesses to this register are RO.
- When !IsAccessSecure() accesses to this register are RO.
The GICH_APR<n> characteristics are:

**Purpose**

These registers track which preemption levels are active in the virtual CPU interface, and indicate the current active priority. Corresponding bits are set to 1 in this register when an interrupt is acknowledged, based on GICH_LR<n>.Priority, and the least significant bit set is cleared on EOI.

**Configuration**

Some or all RW fields of this register have defined reset values.

This register is available when the GIC implementation supports interrupt virtualization.

The number of registers required depends on how many bits are implemented in GICH_LR<n>.Priority:

- When 5 priority bits are implemented, 1 register is required (GICH_APR0).
- When 6 priority bits are implemented, 2 registers are required (GICH_APR0, GICH_APR1).
- When 7 priority bits are implemented, 4 registers are required (GICH_APR0, GICH_APR1, GICH_APR2, GICH_APR3).

Unimplemented registers are RAZ/WI.

**Attributes**

GICH_APR<n> is a 32-bit register.

**Field descriptions**

The GICH_APR<n> bit assignments are:

<table>
<thead>
<tr>
<th>P&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>There is no interrupt active at the priority corresponding to that bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>There is an interrupt active at the priority corresponding to that bit.</td>
</tr>
</tbody>
</table>

Active priorities. Possible values of each bit are:

If 5 bits of priority are implemented (bits [7:3] of priority), then there are 32 priority groups, and the active state of these priorities are held in GICH_APR0 in the bits corresponding to Priority[7:3].

If 6 bits of priority are implemented (bits [7:2] of priority), then there are 64 priority groups, and:

- The active state of priorities 0 - 124 are held in GICH_APR0 in the bits corresponding to 0:Priority[6:2].
- The active state of priorities 128 - 252 are held in GICH_APR1 in the bits corresponding to 1:Priority[6:2].

If 7 bits of priority are implemented (bits [7:1] of priority), then there are 128 priority groups, and:

- The active state of priorities 0 - 62 are held in GICH_APR0 in the bits corresponding to 0:Priority[5:1].
- The active state of priorities 64 - 126 are held in GICH_APR1 in the bits corresponding to 01:Priority[5:1].
- The active state of priorities 128 - 190 are held in GICH_APR2 in the bits corresponding to 10:Priority[5:1].
The active state of priorities 192 - 254 are held in GICH_APR3 in the bits corresponding to 11:Priority[5:1]. This field resets to 0.

**Accessing the GICH_APR<n>**

These registers are used only when System register access is not enabled. When System register access is enabled the following registers provide equivalent functionality:

- **In AArch64:**
  - For Group 0, `ICH_AP0R<n>_EL2`.
  - For Group 1, `ICH_AP1R<n>_EL2`.
- **In AArch32:**
  - For Group 0, `ICH_AP0R<n>`.
  - For Group 1, `ICH_AP1R<n>`.

**GICH_APR<n> can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual interface control</td>
<td>0x00F0 + 4n</td>
<td>GICH_APR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
GICH_EISR, End Interrupt Status Register

The GICH_EISR characteristics are:

**Purpose**

Indicates which List registers have outstanding EOI maintenance interrupts.

**Configuration**

RW fields in this register reset to architecturally UNKNOWN values.

This register is available when the GIC implementation supports interrupt virtualization.

**Attributes**

GICH_EISR is a 32-bit register.

**Field descriptions**

The GICH_EISR bit assignments are:

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0 | Status<n>, bit [n], for n = 0 to 15 |

**Bits [31:16]**

Reserved, RES0.

**Status<n>, bit [n], for n = 0 to 15**

EOI maintenance interrupt status for List register <n>:

<table>
<thead>
<tr>
<th>Status&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>GICH_LR&lt;n&gt; does not have an EOI maintenance interrupt.</td>
</tr>
<tr>
<td>0b1</td>
<td>GICH_LR&lt;n&gt; has an EOI maintenance interrupt that has not been handled.</td>
</tr>
</tbody>
</table>

For any GICH_LR<n> register, the corresponding status bit is set to 1 if all of the following are true:

- GICH_LR<n>.State is 0b00.
- GICH_LR<n>.HW == 0.
- GICH_LR<n>.EOI == 1.

This field resets to an architecturally UNKNOWN value.

**Accessing the GICH_EISR**

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICH_EISR provides equivalent functionality.
- For AArch64 implementations, ICH_EISR_EL2 provides equivalent functionality.

Bits corresponding to unimplemented List registers are RAZ.
GICH_EISR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual interface control</td>
<td>0x0020</td>
<td>GICH_EISR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RO.
- When IsAccessSecure() accesses to this register are RO.
- When !IsAccessSecure() accesses to this register are RO.
The GICH_ELRSR characteristics are:

**Purpose**

Indicates which List registers contain valid interrupts.

**Configuration**

Some or all RW fields of this register have defined reset values.

This register is available when the GIC implementation supports interrupt virtualization.

**Attributes**

GICH_ELRSR is a 32-bit register.

**Field descriptions**

The GICH_ELRSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>RES0</td>
</tr>
<tr>
<td>31-15</td>
<td>Status&lt;n&gt;, bit [n], for n = 0 to 15</td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**Status<n>, bit [n], for n = 0 to 15**

Status bit for List register <n>:

<table>
<thead>
<tr>
<th>Status&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><strong>GICH_LR&lt;n&gt;</strong>, if implemented, contains a valid interrupt. Using this List register can result in overwriting a valid interrupt.</td>
</tr>
<tr>
<td>0b1</td>
<td><strong>GICH_LR&lt;n&gt;</strong> does not contain a valid interrupt. The List register is empty and can be used without overwriting a valid interrupt or losing an EOI maintenance interrupt.</td>
</tr>
</tbody>
</table>

For any **GICH_LR<n>** register, the corresponding status bit is set to 1 if **GICH_LR<n>**.State is 0b00 and either:

- **GICH_LR<n>**.HW == 1.
- **GICH_LR<n>**.EOI == 0.

This field resets to 1.

**Accessing the GICH_ELRSR**

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, **ICH_ELRSR** provides equivalent functionality.
- For AArch64 implementations, **ICH_ELRSR_EL2** provides equivalent functionality.

Bits corresponding to unimplemented List registers are RES0.
**GICH_ELRSR** can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual interface control</td>
<td>0x0030</td>
<td>GICH_ELRSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RO**.
- When IsAccessSecure() accesses to this register are **RO**.
- When !IsAccessSecure() accesses to this register are **RO**.
The GICH_HCR characteristics are:

**Purpose**

Controls the virtual CPU interface.

**Configuration**

RW fields in this register reset to architecturally \texttt{UNKNOWN} values.

This register is available when the GIC implementation supports interrupt virtualization.

**Attributes**

GICH_HCR is a 32-bit register.

**Field descriptions**

The GICH_HCR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-27</td>
<td>EOICount</td>
</tr>
<tr>
<td>26-8</td>
<td>Reserved, \texttt{RES0}</td>
</tr>
<tr>
<td>7</td>
<td>VGrp1DIE</td>
</tr>
<tr>
<td>6</td>
<td>VGrp1EIE</td>
</tr>
<tr>
<td>5</td>
<td>VGrp0DIE</td>
</tr>
<tr>
<td>4</td>
<td>VGrp0EIE</td>
</tr>
<tr>
<td>3</td>
<td>NPIE</td>
</tr>
<tr>
<td>2</td>
<td>LRENPIE</td>
</tr>
<tr>
<td>1</td>
<td>UIE</td>
</tr>
<tr>
<td>0</td>
<td>En</td>
</tr>
</tbody>
</table>

**EOICount, bits [31:27]**

Counts the number of EOs received that do not have a corresponding entry in the List registers. The virtual CPU interface increments this field automatically when a matching EOI is received. EOs that do not clear a bit in \texttt{GICH_APR<n>} do not cause an increment. If an EOI occurs when the value of this field is 31, then the field wraps to 0.

The maintenance interrupt is asserted whenever this field is nonzero and \texttt{GICH_HCR.LRENPIE == 1}.

This field resets to an architecturally \texttt{UNKNOWN} value.

**Bits [26:8]**

Reserved, \texttt{RES0}.

**VGrp1DIE, bit [7]**

VM Group 1 Disabled Interrupt Enable.

Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected virtual machine is disabled:

<table>
<thead>
<tr>
<th>VGrp1DIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled when \texttt{GICV_CTLR.EnableGrp1 == 0}.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally \texttt{UNKNOWN} value.

**VGrp1EIE, bit [6]**

VM Group 1 Enabled Interrupt Enable.
Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected virtual machine is enabled:

<table>
<thead>
<tr>
<th>VGrp1EIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled when</td>
</tr>
<tr>
<td></td>
<td>GICV_CTLR.EnableGrp1 == 1.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**VGrp0DIE, bit [5]**

VM Group 0 Disabled Interrupt Enable.

Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected virtual machine is disabled:

<table>
<thead>
<tr>
<th>VGrp0DIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled when</td>
</tr>
<tr>
<td></td>
<td>GICV_CTLR.EnableGrp0 == 0.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**VGrp0EIE, bit [4]**

VM Group 0 Enabled Interrupt Enable.

Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected virtual machine is enabled:

<table>
<thead>
<tr>
<th>VGrp0EIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled when</td>
</tr>
<tr>
<td></td>
<td>GICV_CTLR.EnableGrp0 == 1.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**NPIE, bit [3]**

No Pending Interrupt Enable.

Enables the signaling of a maintenance interrupt while no pending interrupts are present in the List registers:

<table>
<thead>
<tr>
<th>NPIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled while the List registers contain no interrupts in the pending state.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**LRENPIE, bit [2]**

List Register Entry Not Present Interrupt Enable.

Enables the signaling of a maintenance interrupt while the virtual CPU interface does not have a corresponding valid List register for an EOI request:

<table>
<thead>
<tr>
<th>LRENPIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled while GICV_HCR.EOICount is not 0.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.
UIE, bit [1]

Underflow Interrupt Enable.

Enables the signaling of a maintenance interrupt when the List registers are either empty or hold only one valid entry.

<table>
<thead>
<tr>
<th>UIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>A maintenance interrupt is signaled if zero or one of the List register entries are marked as a valid interrupt.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally `UNKNOWN` value.

En, bit [0]

Enable.

Global enable bit for the virtual CPU interface.

<table>
<thead>
<tr>
<th>En</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Virtual CPU interface operation is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Virtual CPU interface operation is enabled.</td>
</tr>
</tbody>
</table>

When this field is 0:

- The virtual CPU interface does not signal any maintenance interrupts.
- The virtual CPU interface does not signal any virtual interrupts.
- A read of `GICV_IAR` or `GICV_AIAR` returns a spurious interrupt ID.

This field resets to an architecturally `UNKNOWN` value.

The VGrp1DIE, VGrp1EIE, VGrp0DIE, and VGrp0EIE fields permit the hypervisor to track the virtual CPU interfaces that are enabled. The hypervisor can then route interrupts that have multiple targets correctly and efficiently, without having to read the virtual CPU interface status.

See Maintenance interrupts and `GICH_MISR` for more information.

**Accessing the GICH_HCR**

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, `ICH_HCR` provides equivalent functionality.
- For AArch64 implementations, `ICH_HCR_EL2` provides equivalent functionality.

GICH_HCR.En must be set to 1 for any virtual or maintenance interrupt to be asserted.

**GICH_HCR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual interface control</td>
<td>0x0000</td>
<td>GICH_HCR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RW.
- When IsAccessSecure() accesses to this register are RW.
- When !IsAccessSecure() accesses to this register are RW.
The GICH_LR<n> characteristics are:

**Purpose**

These registers provide context information for the virtual CPU interface.

**Configuration**

RW fields in this register reset to architecturally **UNKNOWN** values.

This register is available when the GIC implementation supports interrupt virtualization.

A maximum of 16 List registers can be provided. **GICH_VTR.ListRegs** defines the number implemented. Unimplemented List registers are RAZ/WI.

**Attributes**

GICH_LR<n> is a 32-bit register.

**Field descriptions**

The GICH_LR<n> bit assignments are:

<table>
<thead>
<tr>
<th>HW</th>
<th>Group</th>
<th>State</th>
<th>Priority</th>
<th>RES0</th>
<th>pINTID</th>
<th>vINTID</th>
</tr>
</thead>
</table>

**HW, bit [31]**

Indicates whether this virtual interrupt is a hardware interrupt, meaning that it corresponds to a physical interrupt. Deactivation of the virtual interrupt also causes the deactivation of the physical interrupt corresponding to the INTID:

<table>
<thead>
<tr>
<th>HW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This interrupt is triggered entirely in software. No notification is sent to the Distributor when the virtual interrupt is deactivated.</td>
</tr>
<tr>
<td>0b1</td>
<td>A hardware interrupt. A deactivate interrupt request is sent to the Distributor when the virtual interrupt is deactivated, using GICH_LR&lt;n&gt;.pINTID to indicate the physical interrupt identifier. If <strong>GICV_CTLR.EOlmode == 0</strong>, this request corresponds to a write to <strong>GICV_EOIR</strong> or <strong>GICV_AEOIR</strong>, otherwise it corresponds to a write to <strong>GICV_DIR</strong>.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**Group, bit [30]**

Indicates whether the interrupt is Group 0 or Group 1:

<table>
<thead>
<tr>
<th>Group</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 0 virtual interrupt. <strong>GICV_CTLR.FIQEn</strong> determines whether it is signaled as a virtual IRQ or as a virtual FIQ, and <strong>GICV_CTLR.EnableGrp0</strong> enables signaling of this interrupt to the virtual machine.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 1 virtual interrupt, signaled as a virtual IRQ. <strong>GICV_CTLR.EnableGrp1</strong> enables signaling of this interrupt to the virtual machine.</td>
</tr>
</tbody>
</table>

**Note**
CBPR controls whether GICV_BPR or GICV_ABPR determines if a pending Group 1 interrupt has sufficient priority to preempt current execution.

This field resets to an architecturally UNKNOWN value.

**State, bits [29:28]**

The state of the interrupt. This field has one of the following values:

<table>
<thead>
<tr>
<th>State</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Inactive</td>
</tr>
<tr>
<td>0b01</td>
<td>Pending</td>
</tr>
<tr>
<td>0b10</td>
<td>Active</td>
</tr>
<tr>
<td>0b11</td>
<td>Active and pending</td>
</tr>
</tbody>
</table>

The GIC updates these state bits as virtual interrupts proceed through the interrupt life cycle. Entries in the inactive state are ignored, except for the purpose of generating virtual maintenance interrupts.

Note

For hardware interrupts, the active and pending state is held in the Distributor rather than the virtual CPU interface. A hypervisor must only use the active and pending state for software originated interrupts, which are typically associated with virtual devices, or for SGIs.

This field resets to an architecturally UNKNOWN value.

**Priority, bits [27:23]**

The priority of this interrupt.

This field resets to an architecturally UNKNOWN value.

**Bits [22:20]**

Reserved, RES0.

**pINTID, bits [19:10]**

The function of this field depends on the value of GICH_LR<n>.HW.

When GICH_LR<n>.HW == 0:

- Bit [19] indicates whether the interrupt triggers an EOI maintenance interrupt. If this bit is 1, then when the interrupt identified by vINTID is deactivated, an EOI maintenance interrupt is asserted.
- Bits [18:13] are reserved, SBZ.
- If the vINTID field value corresponds to an SGI (that is, 0-15), bits [12:10] contain the number of the requesting PE. This appears in the corresponding field of GICV_IAR or GICV_AIAR. If the vINTID field value is not 0-15, this field must be cleared to 0.

When GICH_LR<n>.HW == 1:

- This field indicates the pINTID that the hypervisor forwards to the Distributor. This field is only required to implement enough bits to hold a valid value for the ID configuration. Any unused higher order bits are RAZ/WI.
- If the value of pINTID is 0-15 or 1020-1023, behavior is UNPREDICTABLE. If the value of pINTID is 16-31, this field applies to the PPI associated with this same PE as the virtual CPU interface requesting the deactivation.

This field resets to an architecturally UNKNOWN value.
vINTID, bits [9:0]

This INTID is returned to the VM when the interrupt is acknowledged through GICV_IAR. Each valid interrupt stored in the List registers must have a unique vINTID for that virtual CPU interface. If the value of vINTID is 1020-1023, behavior is UNPREDICTABLE.

This field resets to an architecturally UNKNOWN value.

Accessing the GICH_LR<n>

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICH_LR<n> provides equivalent functionality.
- For AArch64 implementations, ICH_LR<n>_EL2 provides equivalent functionality.

**GICH_LR<n> can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual interface control</td>
<td>0x0100 + 4n</td>
<td>GICH_LR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RW.
- When IsAccessSecure() accesses to this register are RW.
- When !IsAccessSecure() accesses to this register are RW.
The GICH_MISR characteristics are:

**Purpose**

Indicates which maintenance interrupts are asserted.

**Configuration**

Some or all RW fields of this register have defined reset values.

This register is available when the GIC implementation supports interrupt virtualization.

**Attributes**

GICH_MISR is a 32-bit register.

**Field descriptions**

The GICH_MISR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>VGrp1D</td>
</tr>
<tr>
<td>29</td>
<td>VGrp1E</td>
</tr>
<tr>
<td>28</td>
<td>VGrp0D</td>
</tr>
<tr>
<td>27</td>
<td>VGrp0E</td>
</tr>
<tr>
<td>26</td>
<td>NP</td>
</tr>
<tr>
<td>25</td>
<td>LRENP</td>
</tr>
<tr>
<td>24</td>
<td>U</td>
</tr>
<tr>
<td>23</td>
<td>EOI</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**VGrp1D, bit [7]**

vPE Group 1 Disabled.

<table>
<thead>
<tr>
<th>VGrp1D</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>vPE Group 1 Disabled maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>vPE Group 1 Disabled maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when GICH_HCR.VGrp1DIE == 1 and GICH_VMCR.VENG1 == 0.

This field resets to 0.

**VGrp1E, bit [6]**

vPE Group 1 Enabled.

<table>
<thead>
<tr>
<th>VGrp1E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>vPE Group 1 Enabled maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>vPE Group 1 Enabled maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when GICH_HCR.VGrp1EIE == 1 and GICH_VMCR.VENG1 == 1.

This field resets to 0.

**VGrp0D, bit [5]**

vPE Group 0 Disabled.
VGrp0D, bit [4]

vPE Group 0 Disabled maintenance interrupt not asserted.

This maintenance interrupt is asserted when GICH_HCR.VGrp0DIE == 1 and GICH_VMCR.VENG0 == 0.

This field resets to 0.

VGrp0E, bit [4]

vPE Group 0 Enabled maintenance interrupt not asserted.

This maintenance interrupt is asserted when GICH_HCR.VGrp0EIE == 1 and GICH_VMCR.VENG0 == 1.

This field resets to 0.

NP, bit [3]

No Pending maintenance interrupt not asserted.

This maintenance interrupt is asserted when GICH_HCR.NPIE == 1 and no List register is in the pending state.

This field resets to 0.

LRENP, bit [2]

List Register Entry Not Present maintenance interrupt not asserted.

This maintenance interrupt is asserted when GICH_HCR.LRENPIE == 1 and GICH_HCR.EOICount is nonzero.

This field resets to 0.

U, bit [1]

Underflow maintenance interrupt not asserted.

This maintenance interrupt is asserted when GICH_HCR.UIE == 1 and zero or one of the List register entries are marked as a valid interrupt.

This field resets to 0.

EOI, bit [0]

End Of Interrupt.
### EOI

<table>
<thead>
<tr>
<th>EOI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>End Of Interrupt maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>End Of Interrupt maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when at least one bit in `GICH_EISR` == 1.

This field resets to 0.

**Note**

A List register is in the pending state only if the corresponding `GICH_LR<n>` value is 0b01, that is, pending. The active and pending state is not included.

### Accessing the GICH_MISR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, `ICH_MISR` provides equivalent functionality.
- For AArch64 implementations, `ICH_MISR_EL2` provides equivalent functionality.

A maintenance interrupt is asserted only if at least one bit is set to 1 in this register and if `GICH_HCR.En` == 1.

**GICH_MISR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual interface control</td>
<td>0x0010</td>
<td>GICH_MISR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RO.
- When IsAccessSecure() accesses to this register are RO.
- When !IsAccessSecure() accesses to this register are RO.
GICH_VMCR, Virtual Machine Control Register

The GICH_VMCR characteristics are:

**Purpose**

Enables the hypervisor to save and restore the virtual machine view of the GIC state. This register is updated when a virtual machine updates the virtual CPU interface registers.

**Configuration**

RW fields in this register reset to architecturally UNKNOWN values.

This register is available when the GIC implementation supports interrupt virtualization.

**Attributes**

GICH_VMCR is a 32-bit register.

**Field descriptions**

The GICH_VMCR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Bit Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-24</td>
<td>VPMR</td>
<td>Virtual priority mask. The priority mask level for the CPU interface. If the priority of an interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE. This alias field is updated when a VM updates GICV_PMR.Priority. This field resets to an architecturally UNKNOWN value.</td>
</tr>
<tr>
<td>23-21</td>
<td>VBPR0</td>
<td>Virtual Binary Point Register, Group 0. Defines the point at which the priority value fields split into two parts, the Group priority field and the subpriority field. The Group priority field determines Group 0 interrupt preemption, and also determines Group 1 interrupt preemption if GICH_VMCR.VCBPR == 1. This alias field is updated when a VM updates GICV_BPR.Binary_Point. This field resets to an architecturally UNKNOWN value.</td>
</tr>
<tr>
<td>20-18</td>
<td>VBPR1</td>
<td>Virtual Binary Point Register, Group 1. Defines the point at which the priority value fields split into two parts, the Group priority field and the subpriority field. The Group priority field determines Group 1 interrupt preemption if GICH_VMCR.VCBPR == 0. This alias field is updated when a VM updates GICV_ABPR.Binary_Point. This field resets to an architecturally UNKNOWN value.</td>
</tr>
<tr>
<td>17-10</td>
<td>RES0</td>
<td>Reserved. RES0.</td>
</tr>
<tr>
<td>9-0</td>
<td>VEOIM</td>
<td></td>
</tr>
<tr>

<td>VCBPR</td>
<td></td>
</tr>
<tr>
<td></td>
<td>VFIQEn</td>
<td></td>
</tr>
<tr>
<td></td>
<td>VAckCtl</td>
<td></td>
</tr>
<tr>
<td></td>
<td>VENG0</td>
<td></td>
</tr>
<tr>
<td></td>
<td>VENG1</td>
<td></td>
</tr>
</tbody>
</table>

VPMR, bits [31:24]

Virtual priority mask. The priority mask level for the CPU interface. If the priority of an interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

This alias field is updated when a VM updates GICV_PMR.Priority.

This field resets to an architecturally UNKNOWN value.

VBPR0, bits [23:21]

Virtual Binary Point Register, Group 0. Defines the point at which the priority value fields split into two parts, the Group priority field and the subpriority field. The Group priority field determines Group 0 interrupt preemption, and also determines Group 1 interrupt preemption if GICH_VMCR.VCBPR == 1.

This alias field is updated when a VM updates GICV_BPR.Binary_Point.

This field resets to an architecturally UNKNOWN value.

VBPR1, bits [20:18]

Virtual Binary Point Register, Group 1. Defines the point at which the priority value fields split into two parts, the Group priority field and the subpriority field. The Group priority field determines Group 1 interrupt preemption if GICH_VMCR.VCBPR == 0.

This alias field is updated when a VM updates GICV_ABPR.Binary_Point.

This field resets to an architecturally UNKNOWN value.

Bits [17:10]

Reserved, RES0.
**VEOIM, bit [9]**

Virtual EOI mode. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VEOIM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A write of an INTID to GICV_EOIR or GICV_AEOIR drops the priority of the interrupt with that INTID, and also deactivates that interrupt.</td>
</tr>
<tr>
<td>0b1</td>
<td>A write of an INTID to GICV_EOIR or GICV_AEOIR only drops the priority of the interrupt with that INTID. Software must write to GICV_DIR to deactivate the interrupt.</td>
</tr>
</tbody>
</table>

This alias field is updated when a VM updates GICV_CTLR.EOImode.

This field resets to an architecturally UNKNOWN value.

**Bits [8:5]**

Reserved, RES0.

**VCBPR, bit [4]**

Virtual Common Binary Point Register. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VCBPR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>GICV_ABPR determines the preemption group for Group 1 interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>GICV_BPR determines the preemption group for Group 1 interrupts.</td>
</tr>
</tbody>
</table>

This alias field is updated when a VM updates GICV_CTLR.CBPR.

This field resets to an architecturally UNKNOWN value.

**VFIQEn, bit [3]**

Virtual FIQ enable. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VFIQEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 0 virtual interrupts are presented as virtual IRQs.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 0 virtual interrupts are presented as virtual FIQs.</td>
</tr>
</tbody>
</table>

This alias field is updated when a VM updates GICV_CTLR.FIQEn.

This field resets to an architecturally UNKNOWN value.

**VAckCtl, bit [2]**

Virtual AckCtl. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VAckCtl</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns an INTID of 1022.</td>
</tr>
<tr>
<td>0b1</td>
<td>If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns the INTID of the corresponding interrupt.</td>
</tr>
</tbody>
</table>

This alias field is updated when a VM updates GICV_CTLR.AckCtl.

This field is supported for backwards compatibility with GICv2. Arm deprecates the use of this field.

This field resets to an architecturally UNKNOWN value.
**VENG1, bit [1]**

Virtual interrupt enable, Group 1. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VENG1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 1 virtual interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 1 virtual interrupts are enabled.</td>
</tr>
</tbody>
</table>

This alias field is updated when a VM updates `GICV_CTLR.EnableGrp1`.

This field resets to an architecturally `UNKNOWN` value.

**VENG0, bit [0]**

Virtual interrupt enable, Group 0. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VENG0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 0 virtual interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 0 virtual interrupts are enabled.</td>
</tr>
</tbody>
</table>

This alias field is updated when a VM updates `GICV_CTLR.EnableGrp0`.

This field resets to an architecturally `UNKNOWN` value.

---

**Note**

A List register is in the pending state only if the corresponding `GICH_LR<n>` value is `0b01`, that is, pending. The active and pending state is not included.

**Accessing the GICH_VMCR**

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, `ICH_VMCR` provides equivalent functionality.
- For AArch64 implementations, `ICH_VMCR_EL2` provides equivalent functionality.

**GICH_VMCR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual interface control</td>
<td>0x0008</td>
<td>GICH_VMCR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `GICD_CTLR.DS == 0b0` accesses to this register are **RW**.
- When `IsAccessSecure()` accesses to this register are **RW**.
- When `!IsAccessSecure()` accesses to this register are **RW**.
GICH_VTR, Virtual Type Register

The GICH_VTR characteristics are:

**Purpose**

Indicates the number of implemented virtual priority bits and List registers.

**Configuration**

This register is available when the GIC implementation supports interrupt virtualization.

**Attributes**

GICH_VTR is a 32-bit register.

**Field descriptions**

The GICH_VTR bit assignments are:

<table>
<thead>
<tr>
<th></th>
<th>PRibits</th>
<th>PREbits</th>
<th>IDbits</th>
<th>SEIS</th>
<th>A3V</th>
<th>RES0</th>
<th>ListRegs</th>
</tr>

**PRIbits, bits [31:29]**

The number of virtual priority bits implemented, minus one.

An implementation must implement at least 32 levels of virtual priority (5 priority bits).

**PREbits, bits [28:26]**

The number of virtual preemption bits implemented, minus one.

An implementation must implement at least 32 levels of virtual preemption priority (5 preemption bits).

The value of this field must be less than or equal to the value of GICH_VTR.PRIbits.

**IDbits, bits [25:23]**

The number of virtual interrupt identifier bits supported:

<table>
<thead>
<tr>
<th>IDbits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>000</td>
<td>16 bits.</td>
</tr>
<tr>
<td>001</td>
<td>24 bits.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**SEIS, bit [22]**

SEI support. Indicates whether the virtual CPU interface supports generation of SEIs:

<table>
<thead>
<tr>
<th>SEIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>The virtual CPU interface logic does not support generation of SEIs.</td>
</tr>
<tr>
<td>1</td>
<td>The virtual CPU interface logic supports generation of SEIs.</td>
</tr>
</tbody>
</table>
A3V, bit [21]

Affinity 3 valid. Possible values are:

<table>
<thead>
<tr>
<th>A3V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The virtual CPU interface logic only supports zero values of the Aff3 field in <code>ICC_SGI0R_EL1</code>, <code>ICC_SGI1R_EL1</code>, and <code>ICC_ASGI1R_EL1</code>.</td>
</tr>
<tr>
<td>0b1</td>
<td>The virtual CPU interface logic supports nonzero values of the Aff3 field in <code>ICC_SGI0R_EL1</code>, <code>ICC_SGI1R_EL1</code>, and <code>ICC_ASGI1R_EL1</code>.</td>
</tr>
</tbody>
</table>

Bits [20:5]

Reserved, RES0.

ListRegs, bits [4:0]

The number of implemented List registers, minus one.

Accessing the GICH_VTR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, `ICH_VTR` provides equivalent functionality.
- For AArch64 implementations, `ICH_VTR_EL2` provides equivalent functionality.

GICH_VTR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual interface control</td>
<td>0x0004</td>
<td>GICH_VTR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `GICD_CTLR.DS == 0b0` accesses to this register are **RO**.
- When `IsAccessSecure()` accesses to this register are **RO**.
- When `!IsAccessSecure()` accesses to this register are **RO**.
GICR_CLRLPIR, Clear LPI Pending Register

The GICR_CLRLPIR characteristics are:

**Purpose**

Clears the pending state of the specified LPI.

**Configuration**

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_CLRLPIR is a 64-bit register.

**Field descriptions**

The GICR_CLRLPIR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>

</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**pINTID, bits [31:0]**

The INTID of the physical LPI.

**Note**

The size of this field is IMPLEMENTATION DEFINED, and is specified by the GICD_TYPER.Idbits field. Unimplemented bits are RES0.

**Accessing the GICR_CLRLPIR**

When written with a 32-bit write the data is zero-extended to 64 bits.

This register is mandatory in an implementation that supports LPIs and does not include an ITS. The functionality of this register is IMPLEMENTATION DEFINED in an implementation that does include an ITS.

Writes to this register have no effect if any of the following apply:

- GICR_CTLR.EnableLPIs == 0.
- The pINTID value specifies an unimplemented LPI.
- The pINTID value specifies an LPI that is not pending.

**GICR_CLRLPIR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **WO**.
- When IsAccessSecure() accesses to this register are **WO**.
- When !IsAccessSecure() accesses to this register are **WO**.
GICR_CTLR, Redistributor Control Register

The GICR_CTLR characteristics are:

**Purpose**

Controls the operation of a Redistributor, and enables the signaling of LPIs by the Redistributor to the connected PE.

**Configuration**

Some or all RW fields of this register have defined reset values.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_CTLR is a 32-bit register.

**Field descriptions**

The GICR_CTLR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>UWP</td>
</tr>
<tr>
<td>30</td>
<td>RES0</td>
</tr>
<tr>
<td>29</td>
<td>DPG1S</td>
</tr>
<tr>
<td>28</td>
<td>DPG1NS</td>
</tr>
<tr>
<td>27</td>
<td>DPG0</td>
</tr>
<tr>
<td>26</td>
<td>RES0</td>
</tr>
<tr>
<td>25</td>
<td>RWP</td>
</tr>
<tr>
<td>24</td>
<td>RES0</td>
</tr>
<tr>
<td>23</td>
<td>CES</td>
</tr>
<tr>
<td>22</td>
<td>EnableLPIs</td>
</tr>
</tbody>
</table>

**UWP, bit [31]**

Upstream Write Pending. Read-only. Indicates whether all upstream writes have been communicated to the Distributor.

<table>
<thead>
<tr>
<th>UWP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>The effects of all upstream writes have been communicated to the Distributor, including any Generate SGI packets.</td>
</tr>
<tr>
<td>1</td>
<td>Not all the effects of upstream writes, including any Generate SGI packets, have been communicated to the Distributor.</td>
</tr>
</tbody>
</table>

**Bits [30:27]**

Reserved, RES0.

**DPG1S, bit [26]**

Disable Processor selection for Group 1 Secure interrupts. When GICR_TYPER.DPGS == 1:

<table>
<thead>
<tr>
<th>DPG1S</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>A Group 1 Secure SPI configured to use the 1 of N distribution model can select this PE, if the PE is not asleep and if Secure Group 1 interrupts are enabled.</td>
</tr>
<tr>
<td>1</td>
<td>A Group 1 Secure SPI configured to use the 1 of N distribution model cannot select this PE.</td>
</tr>
</tbody>
</table>

When GICR_TYPER.DPGS == 0 this bit is RAZ/WI.

When GICD_CTLR.DS==1, this field is RAZ/WI. In GIC implementations that support two Security states, this field is only accessible by Secure accesses, and is RAZ/WI to Non-secure accesses.

It is IMPLEMENTATION DEFINED whether this bits affect the selection of PEs for interrupts using the 1 of N distribution model when GICD_CTLR.ARE_S==0.
This field resets to 0.

DPG1NS, bit [25]

Disable Processor selection for Group 1 Non-secure interrupts. When GICR_TYPER.DPGS == 1:

<table>
<thead>
<tr>
<th>DPG1NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A Group 1 Non-secure SPI configured to use the 1 of N distribution model can select this PE, if the PE is not asleep and if Non-secure Group 1 interrupts are enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Group 1 Non-secure SPI configured to use the 1 of N distribution model cannot select this PE.</td>
</tr>
</tbody>
</table>

When GICR_TYPER.DPGS == 0 this bit is RAZ/WI.

It is IMPLEMENTATION DEFINED whether this bits affect the selection of PEs for interrupts using the 1 of N distribution model when GICD_CTLR.ARE_NS==0.

This field resets to 0.

DPG0, bit [24]

Disable Processor selection for Group 0 interrupts. When GICR_TYPER.DPGS == 1:

<table>
<thead>
<tr>
<th>DPG0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A Group 0 SPI configured to use the 1 of N distribution model can select this PE, if the PE is not asleep and if Group 0 interrupts are enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Group 0 SPI configured to use the 1 of N distribution model cannot select this PE.</td>
</tr>
</tbody>
</table>

When GICR_TYPER.DPGS == 0 this bit is RAZ/WI.

When GICD_CTLR.DS==1, this field is always accessible. In GIC implementations that support two Security states, this field is RAZ/WI to Non-secure accesses.

It is IMPLEMENTATION DEFINED whether this bits affect the selection of PEs for interrupts using the 1 of N distribution model when GICD_CTLR.ARE_S==0.

This field resets to 0.

Bits [23:4]

Reserved, RES0.

RWP, bit [3]

Register Write Pending. This bit indicates whether a register write for the current Security state is in progress or not.

<table>
<thead>
<tr>
<th>RWP</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0   | The effect of all previous writes to the following registers are visible to all agents in the system:  
  • GICR_ICENABLER0  
  • GICR_CTLR DPG1S  
  • GICR_CTLR DPG1NS  
  • GICR_CTLR DPG0  
  • GICR_CTLR, which clears EnableLPIs from 1 to 0. |
| 0b1   | The effect of all previous writes to the following registers are not guaranteed by the architecture to be visible yet to the all agents in the system as the changes are still being propagated:  
  • GICR_ICENABLER0  
  • GICR_CTLR DPG1S  
  • GICR_CTLR DPG1NS  
  • GICR_CTLR DPG0  
  • GICR_CTLR, which clears EnableLPIs from 1 to 0. |

Bit [2]

Reserved, RES0.

CES, bit [1]

Clear Enable Supported.

This bit is read-only.

<table>
<thead>
<tr>
<th>CES</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The IRI does not indicate whether GICR_CTLR.EnableLPIs is RES1 once set.</td>
</tr>
<tr>
<td>0b1</td>
<td>GICR_CTLR.EnableLPIs is not RES1 once set.</td>
</tr>
</tbody>
</table>

Implementing GICR_CTLR.EnableLPIs as programmable and not reporting CES == 1 is deprecated.

Implementing GICR_CTLR.EnableLPIs as RES1 once set is deprecated.

When GICR_CLTR.CES == 0, software cannot assume that GICR_CTLR.EnableLPIs is programmable without observing the bit being cleared.

EnableLPIs, bit [0]

In implementations where affinity routing is enabled for the Security state:

<table>
<thead>
<tr>
<th>EnableLPIs</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>LPI support is disabled. Any doorbell interrupt generated as a result of a write to a virtual LPI register must be discarded, and any ITS translation requests or commands involving LPIs in this Redistributor are ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>LPI support is enabled.</td>
</tr>
</tbody>
</table>

Note

If GICR_TYPER.LPIS == 0, this field is RES0. If GICD_CTLR.ARE_NS is written from 1 to 0 when this bit is 1, behavior is an IMPLEMENTATION DEFINED choice between clearing GICR_CTLR.EnableLPIs to 0 or maintaining its current value.

When affinity routing is not enabled for the Non-secure state, this bit is RES0.

When written from 0 to 1, the Redistributor loads the LPI Pending table from memory to check for any pending interrupts.

After it has been written to 1, it is IMPLEMENTATION DEFINED whether the bit becomes RES1 or can be cleared by to 0.

Where the bit remains programmable:

- Software must observe GICR_CTLR.RWP==0 after clearing GICR_CTLR.EnableLPIs from 1 to 0 before writing GICR_PENDBASER or GICR_PROPBASER, otherwise behavior is UNPREDICTABLE.
- Software must observe GICR_CTLR.RWP==0 after clearing GICR_CTLR.EnableLPIs from 1 to 0 before setting GICR_CTLR.EnableLPIs to 1, otherwise behavior is UNPREDICTABLE.

Note

If one or more ITS is implemented, Arm strongly recommends that all LPIs are mapped to another Redistributor before GICR_CTLR.EnableLPIs is cleared to 0.

This field resets to 0.

The participation of a PE in the 1 of N distribution model for a given interrupt group is governed by the concatenation of GICR_WAKER.ProcessorSleep, the appropriate GICR_CTLR.DPG{1, 0} bit, and the PE interrupt group enable. The behavior options are:
The PE cannot be selected.

The PE can be selected.

The PE cannot be selected.

The PE cannot be selected when \texttt{GICD_CTLR.E1NWF} == 0. When \texttt{GICD_CTLR.E1NWF} == 1, the mechanism by which PEs are selected is \texttt{IMPLEMENTATION DEFINED}.

If an SPI using the 1 of N distribution model has been forwarded to the PE and a write to \texttt{GICR_CTLR} occurs that changes the DPG bit for the interrupt group of the SPI, the IRI must attempt to select a different target PE for the SPI. This might have no effect on the forwarded SPI if it has already been activated.

**Accessing the GICR_CTLR**

\texttt{GICR_CTLR} can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>RD_base</td>
<td>0x0000</td>
<td>GICR_CTLR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When \texttt{GICD_CTLR.DS} == 0b0 accesses to this register are \texttt{RW}.
- When \texttt{IsAccessSecure()} accesses to this register are \texttt{RW}.
- When \texttt{!IsAccessSecure()} accesses to this register are \texttt{RW}.

Copyright © 2010-2019 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.
GICR_ICACTIVER0, Interrupt Clear-Active Register 0

The GICR_ICACTIVER0 characteristics are:

Purpose

Deactivates the corresponding SGI or PPI. These registers are used when saving and restoring GIC state.

Configuration

RW fields in this register reset to architecturally **UNKNOWN** values.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICACTIVER0 is a 32-bit register.

Field descriptions

The GICR_ICACTIVER0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Clear_active_bit<x>, bit [x], for x = 0 to 31**

Removes the active state from interrupt number x. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th><strong>Clear_active_bit&lt;x&gt;</strong></th>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that the corresponding interrupt is active, or is active and pending. If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

Accessing the GICR_ICACTIVER0

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICACTIVER0, the corresponding bit is RAZ/WI and equivalent functionality is provided by **GICD_ICACTIVER<n>** with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by **GICD_ICACTIVER<n>**.

When **GICD_CTLR.DS == 0**, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

**GICR_ICACTIVER0 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
</table>

Page 3718
This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
The GICR_ICACTIVER\(<n>\)E characteristics are:

**Purpose**

Removes the active state from the corresponding PPI.

**Configuration**

RW fields in this register reset to architecturally **UNKNOWN** values.

This register is present only when GIC, \(\geq 3.1\) is implemented. Otherwise, direct accesses to GICR_ICACTIVER\(<n>\)E are **RES0**.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_ICACTIVER\(<n>\)E is a 32-bit register.

**Field descriptions**

The GICR_ICACTIVER\(<n>\)E bit assignments are:

<table>
<thead>
<tr>
<th>Bit assignments</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
<td>Clear_active_bit(&lt;x&gt;), bit [x], for x = 0 to 31</td>
</tr>
</tbody>
</table>

**Clear_active_bit\(<x>\), bit [x], for x = 0 to 31**

For the extended PPIs, removes the active state to interrupt number \(x\). Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Clear_active_bit(&lt;x&gt;)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that the corresponding interrupt is active, or is active and pending. If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

For INTID \(m\), when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ICACTIVER\(<n>\)E number, \(n\), is given by \(n = (m - 1024) \div 32\).
- The offset of the required GICR_ICACTIVER\(<n>\)E is \((0x200 + (4*n))\).
- The bit number of the required group modifier bit in this register is \((m - 1024) \mod 32\).

**Accessing the GICR_ICACTIVER\(<n>\)E**

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICACTIVER\(<n>\)E, the corresponding bit is **RES0**.
When \texttt{GICD_CTLR.DS==0}, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

\textbf{GICR\_ICACTIVER<}\textit{n>E can be accessed through the memory-mapped interfaces:}

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>SGI_base</td>
<td>0x0380</td>
<td>GICR_ICACTIVER&lt;\textit{n}&gt;E</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When \texttt{GICD\_CTRL.DS == 0b0} accesses to this register are \textbf{RW}.
- When \texttt{IsAccessSecure()} accesses to this register are \textbf{RW}.
- When \texttt{!IsAccessSecure()} accesses to this register are \textbf{RW}.

**GICR_ICENABLER0, Interrupt Clear-Enable Register 0**

The GICR_ICENABLER0 characteristics are:

**Purpose**

Disables forwarding of the corresponding SGI or PPI to the CPU interfaces.

**Configuration**

RW fields in this register reset to architecturally UNKNOWN values.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_ICENABLER0 is a 32-bit register.

**Field descriptions**

The GICR_ICENABLER0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Clear_enable_bit<x>, bit [x], for x = 0 to 31**

For PPIs and SGIs, controls the forwarding of interrupt number x to the CPU interfaces. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Clear_enable_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that forwarding of the corresponding interrupt is enabled. If written, disables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 0.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**Accessing the GICR_ICENABLER0**

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICENABLER0, the corresponding bit is RAZ/WI and equivalent functionality is provided by GICD_ICENABLER<n> with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by GICD_ICENABLER<n>.

When GICD_CTLR.DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

**GICR_ICENABLER0 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
</table>

Page 3722
This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
The GICR_ICENABLER<n>E characteristics are:

**Purpose**

Disables forwarding of the corresponding PPI to the CPU interfaces.

**Configuration**

Some or all RW fields of this register have defined reset values.

This register is present only when GIC, >=3.1 is implemented. Otherwise, direct accesses to GICR_ICENABLER<n>E are RES0.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_ICENABLER<n>E is a 32-bit register.

**Field descriptions**

The GICR_ICENABLER<n>E bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Clear_enable_bit<x>, bit [x], for x = 0 to 31 |

**Clear_enable_bit<x>, bit [x], for x = 0 to 31**

For the extended PPI range, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Clear_enable_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that forwarding of the corresponding interrupt is enabled. If written, disables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 0.</td>
</tr>
</tbody>
</table>

This field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ICENABLER<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_ICENABLER<n>E is (0x180 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-1024) MOD 32.

**Accessing the GICR_ICENABLER<n>E**

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICENABLER<n>E, the corresponding bit is RES0.
When `GICD_CTLR.DS==0`, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

**GICR_ICENABLER<n>E can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC</td>
<td>SGI_base</td>
<td>0x0180</td>
<td>GICR_ICENABLER&lt;n&gt;E</td>
</tr>
<tr>
<td></td>
<td></td>
<td>+ 4n</td>
<td></td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `GICD_CTLR.DS == 0b0` accesses to this register are **RW**.
- When `IsAccessSecure()` accesses to this register are **RW**.
- When `!IsAccessSecure()` accesses to this register are **RW**.
GICR_ICFGR0, Interrupt Configuration Register 0

The GICR_ICFGR0 characteristics are:

**Purpose**

Determines whether the corresponding SGI is edge-triggered or level-sensitive.

**Configuration**

RW fields in this register reset to architecturally **UNKNOWN** values.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_ICFGR0 is a 32-bit register.

**Field descriptions**

The GICR_ICFGR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Int_config&lt;x&gt;</strong>, bits [2x+1:2x], for x = 0 to 15</td>
<td>Indicates whether the interrupt with ID 16n + x is level-sensitive or edge-triggered.</td>
</tr>
</tbody>
</table>

**Int_config<x>**, bits [2x+1:2x], for x = 0 to 15

Indicates whether the interrupt with ID 16n + x is level-sensitive or edge-triggered.

**Int_config[0]** (bit [2x]) is **RES0**.

Possible values of **Int_config[1]** (bit [2x+1]) are:

<table>
<thead>
<tr>
<th><strong>Int_config&lt;1&gt;</strong></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Corresponding interrupt is level-sensitive.</td>
</tr>
<tr>
<td>0b01</td>
<td>Corresponding interrupt is edge-triggered.</td>
</tr>
</tbody>
</table>

For SGIs, **Int_config[1]** is RAO/WI.

A read of this bit always returns the correct value to indicate the interrupt triggering method.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the GICR_ICFGR0**

This register is used when affinity routing is enabled.

When affinity routing is disabled for the Security state of an interrupt, the field for that interrupt is **RES0** and an implementation is permitted to make the field RAZ/WI in this case. Equivalent functionality is provided by GICD_ICFGR<n> with n=0.

When **GICD_CTLR.DS==0**, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

**GICR_ICFGR0 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
</table>
This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
GICR_ICFGR1, Interrupt Configuration Register 1

The GICR_ICFGR1 characteristics are:

**Purpose**

Determines whether the corresponding PPI is edge-triggered or level-sensitive.

**Configuration**

RW fields in this register reset to architecturally **UNKNOWN** values.

A copy of this register is provided for each Redistributor.

For each supported PPI, it is **IMPLEMENTATION DEFINED** whether software can program the corresponding Int_config field.

Changing Int_config when the interrupt is individually enabled is **UNPREDICTABLE**.

Changing the interrupt configuration between level-sensitive and edge-triggered (in either direction) at a time when there is a pending interrupt will leave the interrupt in an **UNKNOWN** pending state.

**Attributes**

GICR_ICFGR1 is a 32-bit register.

**Field descriptions**

The GICR_ICFGR1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td><strong>Int_config&lt;x&gt;, bits [2x+1:2x], for x = 0 to 15</strong></td>
</tr>
<tr>
<td>30</td>
<td><strong>Int_config[x], bits [2x+1:2x], for x = 0 to 15</strong></td>
</tr>
</tbody>
</table>

Indicates whether the interrupt with ID 16n + x is level-sensitive or edge-triggered.

Int_config[0] (bit [2x]) is **RES0**.

Possible values of Int_config[1] (bit [2x+1]) are:

<table>
<thead>
<tr>
<th><strong>Int_config&lt;x&gt;</strong></th>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Corresponding interrupt is level-sensitive.</td>
</tr>
<tr>
<td>0b01</td>
<td>Corresponding interrupt is edge-triggered.</td>
</tr>
</tbody>
</table>

A read of this bit always returns the correct value to indicate the interrupt triggering method.

For PPIs, Int_config[1] is programmable unless the implementation supports two Security states and the bit corresponds to a Group 0 or Secure Group 1 interrupt, in which case the bit is RAZ/WI to Non-secure accesses.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the GICR_ICFGR1**

This register is used when affinity routing is enabled.

When affinity routing is disabled for the Security state of an interrupt, the field for that interrupt is **RES0** and an implementation is permitted to make the field RAZ/WI in this case. Equivalent functionality is provided by GICD_ICFGR<n> with n=1.
GICR_ICFGR1 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>SGI_base</td>
<td>0xC04</td>
<td>GICR_ICFGR1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
The GICR_ICFGR<n>E characteristics are:

**Purpose**

Determines whether the corresponding PPI in the extended PPI range is edge-triggered or level-sensitive.

**Configuration**

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when GIC, >=3.1 is implemented. Otherwise, direct accesses to GICR_ICFGR<n>E are RES0.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_ICFGR<n>E is a 32-bit register.

**Field descriptions**

The GICR_ICFGR<n>E bit assignments are:

<table>
<thead>
<tr>
<th>Int_config&lt;x&gt;, bit [x], for x = 0 to 31</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
</tr>
</tbody>
</table>

Indicates whether the interrupt with ID 16n + x is level-sensitive or edge-triggered.

Int_config[0] (bit [2x]) is RES0.

Possible values of Int_config[1] (bit [2x+1]) are:

<table>
<thead>
<tr>
<th>Int_config&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The corresponding interrupt is level-sensitive.</td>
</tr>
<tr>
<td>0b1</td>
<td>The corresponding interrupt is edge-triggered.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

For each supported extended PPI, it is IMPLEMENTATION DEFINED whether software can program the corresponding Int_config field.

**Accessing the GICR_ICFGR<n>E**

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICFGR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.
GICR_ICFGR\(n\)E can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>SGI_base</td>
<td>0x0C00 + 4n</td>
<td>GICR_ICFGR(n)E</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

GICR_ICPENDR0, Interrupt Clear-Pending Register 0

The GICR_ICPENDR0 characteristics are:

**Purpose**

Removes the pending state from the corresponding SGI or PPI.

**Configuration**

RW fields in this register reset to architecturally **UNKNOWN** values.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_ICPENDR0 is a 32-bit register.

**Field descriptions**

The GICR_ICPENDR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Clear_pending_bit&lt;x&gt;, bit [x], for x = 0 to 31</th>
</tr>
</thead>

</tbody>
</table>

Clear_pending_bit<x>, bit [x], for x = 0 to 31

Removes the pending state from interrupt number x. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Clear_pending_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that the corresponding interrupt is not pending. If written, has no effect.</td>
</tr>
</tbody>
</table>
| 0b1                  | If read, indicates that the corresponding interrupt is pending, or active and pending. If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active. This has no effect in the following cases:  
  - If the interrupt is not pending and is not active and pending.  
  - If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to GICD_ISPENDR<n>. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending. |

This field resets to an architecturally **UNKNOWN** value.

**Accessing the GICR_ICPENDR0**

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICPENDR0, the corresponding bit is RAZ/WI and equivalent functionality is provided by GICD_ICPENDR<n> with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by GICD_ICENABLER<n>. 
When `GICD_CTLR.DS == 0`, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

**GICR_ICPENDR0 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>SGI_base</td>
<td>0x0280</td>
<td>GICR_ICPENDR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `GICD_CTLR.DS == 0b0` accesses to this register are **RW**.
- When `IsAccessSecure()` accesses to this register are **RW**.
- When `!IsAccessSecure()` accesses to this register are **RW**.
The GICR_ICPENDR\(\langle n\rangle\)E characteristics are:

**Purpose**

Removes the pending state from the corresponding PPI.

**Configuration**

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when GIC, \(\geq 3.1\) is implemented. Otherwise, direct accesses to GICR_ICPENDR\(\langle n\rangle\)E are RES0.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_ICPENDR\(\langle n\rangle\)E is a 32-bit register.

**Field descriptions**

The GICR_ICPENDR\(\langle n\rangle\)E bit assignments are:

| Clear_pending_bit\(<x>\), bit \([x]\), for \(x = 0\) to \(31\) |
|---------------------|-----------------------------|
| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |

For the extended PPIs, removes the pending state to interrupt number \(x\). Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Clear_pending_bit(&lt;x&gt;)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that the corresponding interrupt is not pending on this PE. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that the corresponding interrupt is pending, or active and pending on this PE. If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active. This has no effect in the following cases:</td>
</tr>
<tr>
<td></td>
<td>• If the interrupt is not pending and is not active and pending.</td>
</tr>
<tr>
<td></td>
<td>• If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to GICR_ISPENDR(\langle n\rangle)E. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

For INTID \(m\), when DIV and MOD are the integer division and modulo operations:
The corresponding GICR_ICPENDR\(n\)E number, \(n\), is given by \(n = (m-1024) \div 32\).
- The offset of the required GICR_ICPENDR\(n\)E is \((0x200 + (4*n))\).
- The bit number of the required group modifier bit in this register is \((m-1024) \mod 32\).

## Accessing the GICR_ICPENDR\(n\)E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICPENDR\(n\)E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

\[\text{GICR_ICPENDR}\(n\)E can be accessed through the memory-mapped interfaces:}\]

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>SGI_base</td>
<td>0x0280 + 4n</td>
<td>GICR_ICPENDR(n)E</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RW.
- When IsAccessSecure() accesses to this register are RW.
- When !IsAccessSecure() accesses to this register are RW.
The GICR_IGROUPR0 characteristics are:

**Purpose**

Controls whether the corresponding SGI or PPI is in Group 0 or Group 1.

**Configuration**

RW fields in this register reset to architecturally **UNKNOWN** values.

This register is available in all GIC configurations. If the GIC implementation supports two Security states, this register is Secure.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_IGROUPR0 is a 32-bit register.

**Field descriptions**

The GICR_IGROUPR0 bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Redistributor_group_status_bit&lt;x&gt;, bit [x], for x = 0 to 31</strong></td>
<td><strong>Group status bit. In this register:</strong></td>
</tr>
<tr>
<td>0b0</td>
<td>Bits [31:16] are group status bits for PPIs.</td>
</tr>
<tr>
<td></td>
<td>Bits [15:0] are group status bits for SGIs.</td>
</tr>
<tr>
<td>0b1</td>
<td>When <strong>GICD_CTLR.DS==1</strong>, the corresponding interrupt is Group 0.</td>
</tr>
<tr>
<td></td>
<td>When <strong>GICD_CTLR.DS==0</strong>, the corresponding interrupt is Secure.</td>
</tr>
<tr>
<td></td>
<td>When <strong>GICD_CTLR.DS==1</strong>, the corresponding interrupt is Group 1.</td>
</tr>
<tr>
<td></td>
<td>When <strong>GICD_CTLR.DS==0</strong>, the corresponding interrupt is Non-secure Group 1.</td>
</tr>
</tbody>
</table>

When **GICD_CTLR.DS == 0**, the bit that corresponds to the interrupt is concatenated with the equivalent bit in **GICR_IGRPMODR0** to form a 2-bit field that defines an interrupt group. The encoding of this field is at **GICR_IGRPMODR0**.

This field resets to an architecturally **UNKNOWN** value.

The considerations for the reset value of this register are the same as those for **GICD_IGROUP<n>** with n=0.
Accessing the GICR_IGROUPR0

When affinity routing is not enabled for the Security state of an interrupt in GICR_IGROUPR0, the corresponding bit is RES0 and equivalent functionality is provided by GICD_IGROUPR<n> with n=0.

When GICD_CTLR_DS == 0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

---

**Note**

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

---

**GICR_IGROUPR0 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>SGI_base</td>
<td>0x0080</td>
<td>GICR_IGROUPR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR_DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
The GICR_IGROUPR<n>E characteristics are:

**Purpose**

Controls whether the corresponding PPI is in Group 0 or Group 1.

**Configuration**

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when GIC, >=3.1 is implemented. Otherwise, direct accesses to GICR_IGROUPR<n>E are RES0.

When GICD_CLTR.DS==0, this register is Secure.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_IGROUPR<n>E is a 32-bit register.

**Field descriptions**

The GICR_IGROUPR<n>E bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group_status_bit&lt;x&gt;, bit [x], for x = 0 to 31</td>
<td>When GICD_CTLR.DS==1, the corresponding interrupt is Group 0.</td>
</tr>
<tr>
<td></td>
<td>When GICD_CTLR.DS==0, the corresponding interrupt is Secure.</td>
</tr>
<tr>
<td>0b1</td>
<td>When GICD_CTLR.DS==1, the corresponding interrupt is Group 1.</td>
</tr>
<tr>
<td></td>
<td>When GICD_CTLR.DS==0, the corresponding interrupt is Non-secure Group 1.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

If affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICR_IGRPMODR<n>E to form a 2-bit field that defines an interrupt group. The encoding of this field is described in GICR_IGRPMODR<n>E.

If affinity routing is disabled for the Security state of an interrupt, the bit is RES0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_IGROUPR<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_IGROUPR<n>E is (0x800 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-1024) MOD 32.
Accessing the GICR_IGROUPR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_IGROUPR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_IGROUPR<n>E can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>SGI_base</td>
<td>0x0080 + 4n</td>
<td>GICR_IGROUPR&lt;n&gt;E</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

**GICR_IGRPMODR0, Interrupt Group Modifier Register 0**

The GICR_IGRPMODR0 characteristics are:

**Purpose**

When $\text{GICD_CTLR.DS}==0$, this register together with the $\text{GICR_IGROUPR0}$ register, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- When System register access is enabled, Secure Group 1.

**Configuration**

RW fields in this register reset to architecturally UNKNOWN values.

When GICD_CLTR.DS==0, this register is Secure.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_IGRPMODR0 is a 32-bit register.

**Field descriptions**

The GICR_IGRPMODR0 bit assignments are:

<table>
<thead>
<tr>
<th>Group modifier bit</th>
<th>Group status bit</th>
<th>Definition</th>
<th>Short name</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>

<td>0b1</td>
<td>0b0</td>
<td>Secure Group 1</td>
<td>G1S</td>
</tr>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>Reserved, treated as Non-secure Group 1</td>
<td>-</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**Accessing the GICR_IGRPMODR0**

When affinity routing is not enabled for the Security state of an interrupt in GICR_IGRPMODR0, the corresponding bit is RES0 and equivalent functionality is provided by $\text{GICD_IGRPMODR<n>}$ with $n=0$.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by $\text{GICD_IGRPMODR<n>}$.

When $\text{GICD_CTLR.ARE_S} == 0$ or $\text{GICD_CTLR.DS} == 1$, GICR_IGRPMODR0 is RES0. An implementation can make this register RAZ/WI in this case.
When `GICD_CTLR.DS==0`, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

---

**Note**

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

---

**GICR_IGRPMODR0 can be accessed through the memory-mapped interfaces:**

<table>

GICR_IGRPMODR<n>E, Interrupt Group Modifier Registers, n = 1 - 2

The GICR_IGRPMODR<n>E characteristics are:

**Purpose**

When GICD_CTLR.DS==0, this register together with the GICR_IGROUPR<n>E registers, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- When System register access is enabled, Secure Group 1.

**Configuration**

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when GIC, >=3.1 is implemented. Otherwise, direct accesses to GICR_IGRPMODR<n>E are RES0.

When GICD_CLTR.DS==0, this register is Secure.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_IGRPMODR<n>E is a 32-bit register.

**Field descriptions**

The GICR_IGRPMODR<n>E bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Group modifier bit&lt;x&gt;, bit [x], for x = 0 to 31</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Group Modifier Bit</td>
</tr>
<tr>
<td>30</td>
<td>Group Modifier Bit</td>
</tr>
<tr>
<td>29</td>
<td>Group Modifier Bit</td>
</tr>
<tr>
<td>28</td>
<td>Group Modifier Bit</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_IGRPMODR<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_IGRPMODR<n>E is (0x000 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-1024) MOD 32.
Accessing the GICR_IGRPMODR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_IGRPMODR<n>E, the corresponding bit is Res0.

When GICD_CTLR.DS==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

**GICR_IGRPMODR<n>E can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>SGI_base</td>
<td>0x0D00 + 4n</td>
<td>GICR_IGRPMODR&lt;n&gt;E</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
The GICR_IIDR characteristics are:

**Purpose**

Provides information about the implementer and revision of the Redistributor.

**Configuration**

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states, this register is Common.

**Attributes**

GICR_IIDR is a 32-bit register.

**Field descriptions**

The GICR_IIDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-24</td>
<td>ProductID</td>
</tr>
<tr>
<td>23-20</td>
<td>Reserved</td>
</tr>
<tr>
<td>19-16</td>
<td>Variant</td>
</tr>
<tr>
<td>15-12</td>
<td>Revision</td>
</tr>
<tr>
<td>11-0</td>
<td>Implementer</td>
</tr>
</tbody>
</table>

**ProductID, bits [31:24]**

An implementation-defined product identifier.

**Bits [23:20]**

Reserved, RES0.

**Variant, bits [19:16]**

An implementation-defined variant number. Typically, this field is used to distinguish product variants, or major revisions of a product.

**Revision, bits [15:12]**

An implementation-defined revision number. Typically, this field is used to distinguish minor revisions of a product.

**Implementer, bits [11:0]**

Contains the JEP106 code of the company that implemented the Redistributor:

- Bits [11:8] are the JEP106 continuation code of the implementer. For an Arm implementation, this field is 0x4.
- Bit [7] is always 0.
- Bits [6:0] are the JEP106 identity code of the implementer. For an Arm implementation, bits [7:0] are therefore 0x3B.
Accessing the GICR_IIDR

GICR_IIDR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>RD_base</td>
<td>0x0004</td>
<td>GICR_IIDR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTRLR.DS == 0b0 accesses to this register are RO.
- When IsAccessSecure() accesses to this register are RO.
- When !IsAccessSecure() accesses to this register are RO.
The GICR_INVALLR characteristics are:

**Purpose**

Invalidates any cached configuration data of all physical LPIs, causing the GIC to reload the interrupt configuration from the physical LPI Configuration table at the address specified by GICR_PROPBASER.

**Configuration**

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_INVALLR is a 64-bit register.

**Field descriptions**

The GICR_INVALLR bit assignments are:

</tbody>
</table>

**Bits [63:0]**

Reserved, RES0.

**Note**

If any LPI has been forwarded to the PE and a valid write to GICR_INVALLR is received, the Redistributor must ensure it reloads its properties from memory. This has no effect on the forwarded LPI if it has already been activated.

**Accessing the GICR_INVALLR**

This register is mandatory in an implementation that supports LPIs and does not include an ITS. The functionality is IMPLEMENTATION DEFINED in an implementation that does include an ITS.

Writes to this register have no effect if no physical LPIs are currently stored in the local Redistributor cache.

**GICR_INVALLR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>RD_base</td>
<td>0x0080</td>
<td>GICR_INVALLR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are WO.
- When IsAccessSecure() accesses to this register are WO.
- When !IsAccessSecure() accesses to this register are WO.
**GICR_INVLPiR, Redistributor Invalidate LPI Register**

The GICR_INVLPiR characteristics are:

**Purpose**

Invalidates the cached configuration data of a specified LPI, causing the GIC to reload the interrupt configuration from the physical LPI Configuration table at the address specified by `GICR_PROPBASER`.

**Configuration**

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_INVLPiR is a 64-bit register.

**Field descriptions**

The GICR_INVLPiR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>31</td>
<td>plINTID, bits [31:0]</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**plINTID, bits [31:0]**

The INTID of the physical LPI to be cleaned.

**Note**

The size of this field is IMPLEMENTATION DEFINED, and is specified by the `GICD_TYPEPER.IDbits` field. Unimplemented bits are RES0.

**Accessing the GICR_INVLPiR**

When written with a 32-bit write the data is zero-extended to 64 bits.

This register is mandatory in an implementation that supports LPIs and does not include an ITS. The functionality is IMPLEMENTATION DEFINED in an implementation that does include an ITS.

Writes to this register have no effect if either:

- The specified LPI is not currently stored in the local Redistributor.
The pINTID field corresponds to an unimplemented LPI.

**GICR_INVLPIR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>RD_base</td>
<td>0x00A0</td>
<td>GICR_INVLPIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **WO**.
- When IsAccessSecure() accesses to this register are **WO**.
- When !IsAccessSecure() accesses to this register are **WO**.
The GICR_IPRIORITYR\langle n\rangle characteristics are:

**Purpose**

Holds the priority of the corresponding interrupt for each SGI and PPI supported by the GIC.

**Configuration**

RW fields in this register reset to architecturally UNKNOWN values.

A copy of these registers is provided for each Redistributor.

These registers are configured as follows:

- GICR_IPRIORITYR0-GICR_IPRIORITYR3 store the priority of SGIs.
- GICR_IPRIORITYR4-GICR_IPRIORITYR7 store the priority of PPIs.

**Attributes**

GICR_IPRIORITYR\langle n\rangle is a 32-bit register.

**Field descriptions**

The GICR_IPRIORITYR\langle n\rangle bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Priority_offset_3B | Priority_offset_2B | Priority_offset_1B | Priority_offset_0B |

**Priority_offset_3B, bits [31:24]**

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt.

This field resets to an architecturally UNKNOWN value.

**Priority_offset_2B, bits [23:16]**

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt.

This field resets to an architecturally UNKNOWN value.

**Priority_offset_1B, bits [15:8]**

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt.

This field resets to an architecturally UNKNOWN value.

**Priority_offset_0B, bits [7:0]**

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 0. Lower priority values correspond to greater priority of the interrupt.
This field resets to an architecturally **UNKNOWN** value.

### Accessing the GICR_IPRIORITYR<n>

These registers are used when affinity routing is enabled for the Security state of the interrupt. When affinity routing is not enabled the bits corresponding to the interrupt are RAZ/WI and **GICD_IPRIORITYR<n>** provides equivalent functionality.

These registers are used for SGIs and PPIs only. Equivalent functionality for SPIs is provided by **GICD_IPRIORITYR<n>**.

These registers are byte-accessible.

When **GICD_CTLR**.DS == 0:

- A field that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.
- A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in Software accesses of interrupt priority.

**Note**

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

---

**GICR_IPRIORITYR<n>** can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC</td>
<td>SGI_base</td>
<td>0x0400 + 4n</td>
<td>GICR_IPRIORITYR&lt;n&gt;</td>

</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
The GICR_IPRIORITYR<n>E characteristics are:

**Purpose**

Holds the priority of the corresponding interrupt for each extended PPI supported by the GIC.

**Configuration**

RW fields in this register reset to architecturally **UNKNOWN** values.

This register is present only when GIC, >=3.1 is implemented. Otherwise, direct accesses to GICR_IPRIORITYR<n>E are **RES0**.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_IPRIORITYR<n>E is a 32-bit register.

**Field descriptions**

The GICR_IPRIORITYR<n>E bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| 31  | Priority_offset_3B | Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt. 
|     |               | This field resets to an architecturally **UNKNOWN** value.                    |
| 23  | Priority_offset_2B | Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt. 
|     |               | This field resets to an architecturally **UNKNOWN** value.                    |
| 15  | Priority_offset_1B | Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt. 
|     |               | This field resets to an architecturally **UNKNOWN** value.                    |
| 0   | Priority_offset_0B | Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 0. Lower priority values correspond to greater priority of the interrupt. 
|     |               | This field resets to an architecturally **UNKNOWN** value.                    |
For interrupt ID $m$, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR\_IPRIORITY\_{$n$} number, $n$, is given by $n = (m - 1024) \text{ DIV } 4$.
- The offset of the required GICR\_IPRIORITY\_{$n$} register is $(0x400 + (4*n))$.
- The byte offset of the required Priority field in this register is $m \text{ MOD } 4$, where:
  - Byte offset 0 refers to register bits [7:0].
  - Byte offset 1 refers to register bits [15:8].
  - Byte offset 2 refers to register bits [23:16].
  - Byte offset 3 refers to register bits [31:24].

### Accessing the GICR\_IPRIORITY\_{$n$}\_E

When affinity routing is not enabled for the Security state of an interrupt in GICR\_ISACTIVER\_{$n$}\_E, the corresponding bit is \texttt{RES0}.

When $\text{GICD\_CTL}_R.DS==0$:

- A field that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.
- A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in Software accesses of interrupt priority.

Bits corresponding to unimplemented interrupts are RAZ/WI.

---

**Note**

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than once. The effect of the change must be visible in finite time.

---

**GICR\_IPRIORITY\_{$n$}\_E can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>SGI_base</td>
<td>$0x400$</td>
<td>GICR_IPRIORITY_{$n$}_E + $4n$</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When $\text{GICD\_CTL}_R.DS == 0b0$ accesses to this register are \texttt{RW}.
- When $\text{IsAccessSecure()}$ accesses to this register are \texttt{RW}.
- When $\text{!IsAccessSecure()}$ accesses to this register are \texttt{RW}.
GICR_ISACTIVER0, Interrupt Set-Active Register 0

The GICR_ISACTIVER0 characteristics are:

**Purpose**

Activates the corresponding SGI or PPI. These registers are used when saving and restoring GIC state.

**Configuration**

RW fields in this register reset to architecturally **UNKNOWN** values.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_ISACTIVER0 is a 32-bit register.

**Field descriptions**

The GICR_ISACTIVER0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

Set_active_bit<x>, bit [x], for x = 0 to 31

Adds the active state to interrupt number x. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Set_active_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that the corresponding interrupt is active, or is active and pending. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**Accessing the GICR_ISACTIVER0**

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISACTIVER0, the corresponding bit is RAZ/WI and equivalent functionality is provided by GICD_ISACTIVER<n> with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by GICD_ISACTIVER<n>.

When GICD_CTLR.DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

GICR_ISACTIVER0 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
GICR_ISACTIVER<n>E, Interrupt Set-Active Registers, n = 1 - 2

The GICR_ISACTIVER<n>E characteristics are:

**Purpose**

Adds the active state to the corresponding PPI.

**Configuration**

RW fields in this register reset to architecturally **UNKNOWN** values.

This register is present only when GIC, >=3.1 is implemented. Otherwise, direct accesses to GICR_ISACTIVER<n>E are **RES0**.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_ISACTIVER<n>E is a 32-bit register.

**Field descriptions**

The GICR_ISACTIVER<n>E bit assignments are:

<table>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Set_active_bit<x>, bit [x], for x = 0 to 31**

For the extended PPIs, adds the active state to interrupt number x. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th><strong>Set_active_bit&lt;x&gt;</strong></th>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that the corresponding interrupt is active, or active and pending on this PE. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ISACTIVER<n>E number, n, is given by \( n = (m-1024) \div 32 \).
- The offset of the required GICR_ISACTIVER<n>E is \((0x200 + (4*n))\).
- The bit number of the required group modifier bit in this register is \((m-1024) \mod 32\).

**Accessing the GICR_ISACTIVER<n>E**

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISACTIVER<n>E, the corresponding bit is **RES0**.
When `GICD_CTLR.DS==0`, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses. Bits corresponding to unimplemented interrupts are RAZ/WI.

**GICR_ISACTIVER<n>E can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC</td>
<td>SGI_base</td>
<td>0x0300</td>
<td>GICR_ISACTIVER&lt;n&gt;E</td>
</tr>
<tr>
<td>Redistributor</td>
<td></td>
<td>+ 4n</td>
<td></td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `GICD_CTLR.DS == 0b0` accesses to this register are **RW**.
- When `IsAccessSecure()` accesses to this register are **RW**.
- When `!IsAccessSecure()` accesses to this register are **RW**.
GICR_ISENABLER0, Interrupt Set-Enable Register 0

The GICR_ISENABLER0 characteristics are:

**Purpose**

Enables forwarding of the corresponding SGI or PPI to the CPU interfaces.

**Configuration**

Some or all RW fields of this register have defined reset values.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_ISENABLER0 is a 32-bit register.

**Field descriptions**

The GICR_ISENABLER0 bit assignments are:

<table>
<thead>
<tr>
<th>Set_enable_bit&lt;x&gt;, bit [x], for x = 0 to 31</th>
</tr>
</thead>
<tbody>
<tr>
<td>31  30  29  28  27  26  25  24  23  22  21  20  19  18  17  16  15  14  13  12  11  10  9  8  7  6  5  4  3  2  1  0</td>
</tr>
</tbody>
</table>

For PPIs and SGIs, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Set_enable_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 1.</td>
</tr>
</tbody>
</table>

This field resets to 0.

**Accessing the GICR_ISENABLER0**

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISENABLER0, the corresponding bit is RAZ/WI and equivalent functionality is provided by GICD_ISENABLER<n> with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by GICD_ISENABLER<n>.

When GICD_CTLR.DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

GICR_ISENABLER0 can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
</table>
This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
The GICR_ISENABLER<n>E characteristics are:

### Purpose

Enables forwarding of the corresponding PPI to the CPU interfaces.

### Configuration

Some or all RW fields of this register have defined reset values.

This register is present only when GIC, >=3.1 is implemented. Otherwise, direct accesses to GICR_ISENABLER<n>E are RES0.

A copy of this register is provided for each Redistributor.

### Attributes

GICR_ISENABLER<n>E is a 32-bit register.

### Field descriptions

The GICR_ISENABLER<n>E bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Set_enable_bit<x>, bit [x], for x = 0 to 31

For the extended PPI range, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Set_enable_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 1.</td>
</tr>
</tbody>
</table>

This field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ISENABLER<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_ISENABLER<n>E is (0x100 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-1024) MOD 32.

### Accessing the GICR_ISENABLER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISENABLER<n>E, the corresponding bit is RES0.
When `GICD_CTLR.DS==0`, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

**GICR_ISENABLER<n>E** can be accessed through the memory-mapped interfaces:

*Set_pending_bit<\(x\)*, bit \([x]\), for \(x = 0\) to \(31\)

For PPIs and SGIs, adds the pending state to interrupt number \(x\). Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th><em>Set_pending_bit&lt;(x)&gt;</em></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that the corresponding interrupt is not pending on this PE. If written, has no effect.</td>
</tr>
</tbody>
</table>
| 0b1          | If read, indicates that the corresponding interrupt is pending, or active and pending on this PE. If written, changes the state of the corresponding interrupt from inactive to pending, or from active to active and pending. This has no effect in the following cases:  
  - If the interrupt is already pending because of a write to GICR_ISPENDR0.  
  - If the interrupt is already pending because the corresponding interrupt signal is asserted. In this case, the interrupt remains pending if the interrupt signal is deasserted. |

This field resets to an architecturally UNKNOWN value.

**Accessing the GICR_ISPENDR0**

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISPENDR0, the corresponding bit is RAZ/WI and equivalent functionality is provided by GICD_ISPENDR<\(n\)> with \(n=0\).

This register only applies to SGIs (bits \([15:0]\)) and PPIs (bits \([31:16]\)). For SPIs, this functionality is provided by GICD_ISPENDR<\(n\)>.

When GICD_CTLR.DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.
**GICR_ISPENDR0 can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>

<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>SGI_base</td>
<td>0x0200</td>
<td>GICR_ISPENDR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
GICR_ISPENDR<n>E, Interrupt Set-Pending Registers, n = 1 - 2

The GICR_ISPENDR<n>E characteristics are:

**Purpose**

Adds the pending state to the corresponding PPI.

**Configuration**

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when GIC, >=3.1 is implemented. Otherwise, direct accesses to GICR_ISPENDR<n>E are RES0.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_ISPENDR<n>E is a 32-bit register.

**Field descriptions**

The GICR_ISPENDR<n>E bit assignments are:

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
```

**Set_pending_bit<x>, bit [x], for x = 0 to 31**

For the extended PPIs, adds the pending state to interrupt number x. Reads and writes have the following behavior:

<table>
<thead>
<tr>
<th>Set_pending_bit&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If read, indicates that the corresponding interrupt is not pending on this PE. If written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>If read, indicates that the corresponding interrupt is pending, or active and pending on this PE. If written, changes the state of the corresponding interrupt from inactive to pending, or from active to active and pending. This has no effect in the following cases:</td>
</tr>
<tr>
<td></td>
<td>• If the interrupt is already pending because of a write to GICR_ISPENDR&lt;n&gt;E.</td>
</tr>
<tr>
<td></td>
<td>• If the interrupt is already pending because the corresponding interrupt signal is asserted. In this case, the interrupt remains pending if the interrupt signal is deasserted.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ISPENDR<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_ISPENDR<n>E is (0x200 + (4*n)).
• The bit number of the required group modifier bit in this register is \((m-1024) \mod 32\).

**Accessing the GICR\_ISPENDR\(_n\)_E**

When affinity routing is not enabled for the Security state of an interrupt in GICR\_ISPENDR\(_n\)_E, the corresponding bit is RES0.

When GICD\_CTLR.DS==0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

**GICR\_ISPENDR\(_n\)_E can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>

<td>GIC Redistributor</td>
<td>SGI_base</td>
<td>0x00200 + 4n</td>
<td>GICR_ISPENDR(_n)_E</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When GICD\_CTLR.DS == 0b0 accesses to this register are **RW**.
• When IsAccessSecure() accesses to this register are **RW**.
• When !IsAccessSecure() accesses to this register are **RW**.
GICR_MPAMIDR, Report maximum PARTID and PMG Register

The GICR_MPAMIDR characteristics are:

**Purpose**

Reports the maximum support PARTID and PMG values.

**Configuration**

This register is present only when GIC, >=3.1 is implemented. Otherwise, direct accesses to GICR_MPAMIDR are RES0.

A copy of this register is provided for each Redistributor.

When GICR_TYPER.MPAM==0, this register is RES0.

**Attributes**

GICR_MPAMIDR is a 32-bit register.

**Field descriptions**

The GICR_MPAMIDR bit assignments are:

```
<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:7</td>
<td>PMGmax, PARTIDmax</td>
</tr>
<tr>
<td>6:0</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>
```

**Bits [31:24]**

Reserved, RES0.

**PMGmax, bits [23:16]**

Maximum PMG value supported.

**PARTIDmax, bits [15:0]**

Maximum PARTID value supported.

**Accessing the GICR_MPAMIDR**

**GICR_MPAMIDR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>RD_base</td>
<td>0x0018</td>
<td>GICR_MPAMIDR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RO.
- When IsAccessSecure() accesses to this register are RO.
- When !IsAccessSecure() accesses to this register are RO.
The GICR_NSACR characteristics are:

**Purpose**

Enables Secure software to permit Non-secure software to create SGIs targeting the PE connected to this Redistributor by writing to ICC_SGI1R_EL1, ICC_ASGI1R_EL1 or ICC_SGI0R_EL1. See Forwarding an SGI to a target PE for more information.

**Configuration**

RW fields in this register reset to architecturally UNKNOWN values.

For a description on when a write to ICC_SGI0R_EL1, ICC_SGI1R_EL1 or ICC_ASGI1R_EL1 is permitted to generate an interrupt see Use of control registers for SGI forwarding.

**Attributes**

GICR_NSACR is a 32-bit register.

**Field descriptions**

The GICR_NSACR bit assignments are:

<table>
<thead>
<tr>
<th>NS_access&lt;x&gt;, bits [2x+1:2x], for x = 0 to 15</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
</tr>
<tr>
<td>0b01</td>
</tr>
<tr>
<td>0b10</td>
</tr>
<tr>
<td>0b11</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**Accessing the GICR_NSACR**

When GICD_CTLR.DS == 1, this register is RAZ/WI.
When `GICD_CTLR.DS == 0`, this register is Secure, and is RAZ/WI to Non-secure accesses.

This register is used when affinity routing is enabled. When affinity routing is not enabled for the Security state of the interrupt, `GICD_NSACR<n>` with n=0 provides equivalent functionality.

This register does not support PPIs.

**GICR_NSACR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>SGI_base</td>
<td>0x0E00</td>
<td>GICR_NSACR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `GICD_CTLR.DS == 0b0` accesses to this register are **RW**.
- When `IsAccessSecure()` accesses to this register are **RW**.
- When `!IsAccessSecure()` accesses to this register are **RW**.

GICR_PARTIDR, Set PARTID and PMG Register

The GICR_PARTIDR characteristics are:

**Purpose**

Sets the PARTID and PMG values used for memory accesses by the Redistributor.

**Configuration**

This register is present only when GIC, >=3.1 is implemented. Otherwise, direct accesses to GICR_PARTIDR are RES0. A copy of this register is provided for each Redistributor.

When GICR_TYPER.MPAM==0, this register is RES0.

**Attributes**

GICR_PARTIDR is a 32-bit register.

**Field descriptions**

The GICR_PARTIDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>PMG</td>
</tr>
<tr>
<td>29</td>
<td>PARTID</td>
</tr>
</tbody>
</table>

**Bits [31:24]**

Reserved, RES0.

**PMG, bits [23:16]**

PMG value used when Redistributor accesses memory.

It is IMPLEMENTATION DEFINED whether bits not needed to represent PMG values in the range 0 to PMG_MAX are stateful or RES0.

**PARTID, bits [15:0]**

PARTID value used when Redistributor accesses memory.

It is IMPLEMENTATION DEFINED whether bits not needed to represent PARTID values in the range 0 to PARTID_MAX are stateful or RES0.

**Accessing the GICR_PARTIDR**

GICR_PARTIDR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC</td>
<td>RD_base</td>
<td>0x001C</td>
<td>GICR_PARTIDR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GiCD_CTRLS.DS == 0b0 accesses to this register are RW.
• When IsAccessSecure() accesses to this register are **RW**.
• When !IsAccessSecure() accesses to this register are **RW**.
GICR_PENDBASER, Redistributor LPI Pending Table Base Address Register

The GICR_PENDBASER characteristics are:

**Purpose**

Specifies the base address of the LPI Pending table, and the Shareability and Cacheability of accesses to the LPI Pending table.

**Configuration**

RW fields in this register reset to architecturally UNKNOWN values.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_PENDBASER is a 64-bit register.

**Field descriptions**

The GICR_PENDBASER bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>
| 62  | PTZ, bit 62

Pending Table Zero. Indicates to the Redistributor whether the LPI Pending table is zero when GICR_CTLR.EnableLPIS == 1.

This field is WO, and reads as 0.

<table>
<thead>
<tr>
<th>PTZ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>The LPI Pending table is not zero, and contains live data.</td>
</tr>
<tr>
<td>1</td>
<td>The LPI Pending table is zero. Software must ensure the LPI</td>
</tr>
<tr>
<td></td>
<td>Pending table is zero before this value is written.</td>
</tr>
</tbody>
</table>

**Bits [61:59]**

Reserved, RES0.

**OuterCache, bits [58:56]**

Indicates the Outer Cacheability attributes of accesses to the LPI Pending table. The possible values of this field are:
OuterCache

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.</td>
</tr>
<tr>
<td>0b001</td>
<td>Normal Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b010</td>
<td>Normal Outer Cacheable Read-allocate, Write-through.</td>
</tr>
<tr>
<td>0b011</td>
<td>Normal Outer Cacheable Read-allocate, Write-back.</td>
</tr>
<tr>
<td>0b100</td>
<td>Normal Outer Cacheable Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b101</td>
<td>Normal Outer Cacheable Write-allocate, Write-back.</td>
</tr>
<tr>
<td>0b110</td>
<td>Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b111</td>
<td>Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.</td>
</tr>
</tbody>
</table>

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

This field resets to an architecturally UNKNOWN value.

Bits [55:52]

Reserved, RES0.

Physical_Address, bits [51:16]

Bits [51:16] of the physical address containing the LPI Pending table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

This field resets to an architecturally UNKNOWN value.

Bits [15:12]

Reserved, RES0.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the LPI Pending table. The possible values of this field are:

<table>
<thead>
<tr>
<th>Shareability</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b001</td>
<td>Inner Shareable.</td>
</tr>
<tr>
<td>0b110</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b111</td>
<td>Reserved. Treated as 0b00.</td>
</tr>
</tbody>
</table>

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

This field resets to an architecturally UNKNOWN value.

InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the LPI Pending table. The possible values of this field are:

<table>
<thead>
<tr>
<th>InnerCache</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Device-nGnRnE.</td>
</tr>
<tr>
<td>0b001</td>
<td>Normal Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b010</td>
<td>Normal Inner Cacheable Read-allocate, Write-through.</td>
</tr>
<tr>
<td>0b011</td>
<td>Normal Inner Cacheable Read-allocate, Write-back.</td>
</tr>
<tr>
<td>0b100</td>
<td>Normal Inner Cacheable Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b101</td>
<td>Normal Inner Cacheable Write-allocate, Write-back.</td>
</tr>
<tr>
<td>0b110</td>
<td>Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b111</td>
<td>Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.</td>
</tr>
</tbody>
</table>
This field resets to an architecturally **UNKNOWN** value.

**Bits [6:0]**

Reserved, **RES0**.

**Accessing the GICR_PENDBASER**

Having the GICR_PENDBASER OuterCache, Shareability or InnerCache fields programmed to different values on different Redistributors with **GICR_CTLR**.EnableLPIs == 1 in the system is **UNPREDICTABLE**.

Changing GICR_PENDBASER with **GICR_CTLR**.EnableLPIs == 1 is **UNPREDICTABLE**.

**GICR_PENDBASER can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>RD_base</td>
<td>0x0078</td>
<td>GICR_PENDBASER</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
GICR_PROPBASE, Redistributor Properties Base Address Register

The GICR_PROPBASE characteristics are:

**Purpose**

Specifies the base address of the LPI Configuration table, and the Shareability and Cacheability of accesses to the LPI Configuration table.

**Configuration**

RW fields in this register reset to architecturally **UNKNOWN** values.

A copy of this register is provided for each Redistributor.

An implementation might make this register RO, for example to correspond to an LPI Configuration table in read-only memory.

**Attributes**

GICR_PROPBASE is a 64-bit register.

**Field descriptions**

The GICR_PROPBASE bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:59</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

**OuterCache, bits [58:56]**

Indicates the Outer Cacheability attributes of accesses to the LPI Configuration table. The possible values of this field are:

<table>
<thead>
<tr>
<th>OuterCache</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.</td>
</tr>
<tr>
<td>0b001</td>
<td>Normal Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b010</td>
<td>Normal Outer Cacheable Read-allocate, Write-through.</td>
</tr>
<tr>
<td>0b011</td>
<td>Normal Outer Cacheable Read-allocate, Write-back.</td>
</tr>
<tr>
<td>0b100</td>
<td>Normal Outer Cacheable Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b101</td>
<td>Normal Outer Cacheable Write-allocate, Write-back.</td>
</tr>
<tr>
<td>0b110</td>
<td>Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b111</td>
<td>Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.</td>
</tr>
</tbody>
</table>

It is **IMPLEMENTATION DEFINED** whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.
This field resets to an architecturally **UNKNOWN** value.

**Bits [55:52]**

Reserved, RES0.

**Physical Address, bits [51:12]**

Bits [51:12] of the physical address containing the LPI Configuration table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

This field resets to an architecturally **UNKNOWN** value.

**Shareability, bits [11:10]**

Indicates the Shareability attributes of accesses to the LPI Configuration table. The possible values of this field are:

<table>
<thead>
<tr>
<th>Shareability</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Inner Shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Reserved. Treated as 0b00.</td>
</tr>
</tbody>
</table>

It is **IMPLEMENTATION DEFINED** whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

This field resets to an architecturally **UNKNOWN** value.

**InnerCache, bits [9:7]**

Indicates the Inner Cacheability attributes of accesses to the LPI Configuration table. The possible values of this field are:

<table>
<thead>
<tr>
<th>InnerCache</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Device-nGnRnE.</td>
</tr>
<tr>
<td>0b001</td>
<td>Normal Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b010</td>
<td>Normal Inner Cacheable Read-allocate, Write-through.</td>
</tr>
<tr>
<td>0b011</td>
<td>Normal Inner Cacheable Read-allocate, Write-back.</td>
</tr>
<tr>
<td>0b100</td>
<td>Normal Inner Cacheable Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b101</td>
<td>Normal Inner Cacheable Write-allocate, Write-back.</td>
</tr>
<tr>
<td>0b110</td>
<td>Normal Inner Cacheable Read-allocate, Write-allocate,</td>
</tr>
<tr>
<td></td>
<td>Write-through.</td>
</tr>
<tr>
<td>0b111</td>
<td>Normal Inner Cacheable Read-allocate, Write-allocate,</td>
</tr>
<tr>
<td></td>
<td>Write-back.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**Bits [6:5]**

Reserved, RES0.

**IDbits, bits [4:0]**

The number of bits of LPI INTID supported, minus one, by the LPI Configuration table starting at Physical Address.

If the value of this field is larger than the value of `GICD_TYPER.IDbits`, the `GICD_TYPER.IDbits` value applies.

If the value of this field is less than 0b1101, indicating that the largest INTID is less than 8192 (the smallest LPI interrupt ID), the GIC will behave as if all physical LPIs are out of range.

This field resets to an architecturally **UNKNOWN** value.
Accessing the GICR_PROPBASER

It is IMPLEMENTATION DEFINED whether GICR_PROPBASER can be set to different values on different Redistributors. GICR_TYPER.CommonLPIAff identifies the Redistributors that must have GICR_PROPBASER set to the same values whenever GICR_CTLR.EnableLPis == 1.

Setting different values in different copies of GICR_PROPBASER on Redistributors that are required to use a common LPI Configuration table when GICR_CTLR.EnableLPis == 1 leads to UNPREDICTABLE behavior.

Other restrictions apply when a Redistributor caches information from GICR_PROPBASER. See LPI Configuration tables for more information.

**GICR_PROPBASER can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>RD_base</td>
<td>0x0070</td>
<td>GICR_PROPBASER</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RW.
- When IsAccessSecure() accesses to this register are RW.
- When !IsAccessSecure() accesses to this register are RW.
GICR_SETLPIR, Set LPI Pending Register

The GICR_SETLPIR characteristics are:

**Purpose**

Generates an LPI by setting the pending state of the specified LPI.

**Configuration**

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_SETLPIR is a 64-bit register.

**Field descriptions**

The GICR_SETLPIR bit assignments are:

| Bit 63 | Bit 62 | Bit 61 | Bit 60 | Bit 59 | Bit 58 | Bit 57 | Bit 56 | Bit 55 | Bit 54 | Bit 53 | Bit 52 | Bit 51 | Bit 50 | Bit 49 | Bit 48 | Bit 47 | Bit 46 | Bit 45 | Bit 44 | Bit 43 | Bit 42 | Bit 41 | Bit 40 | Bit 39 | Bit 38 | Bit 37 | Bit 36 | Bit 35 | Bit 34 | Bit 33 | Bit 32 |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
|        |        |        |        |        | RES0   | pINTID |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |

**Bits [63:32]**

Reserved, RES0.

**pINTID, bits [31:0]**

The INTID of the physical LPI to be generated.

**Note**

The size of this field is IMPLEMENTATION DEFINED, and is specified by the GICD_TYPER.IDbits field. Unimplemented bits are RES0.

**Accessing the GICR_SETLPIR**

When written with a 32-bit write the data is zero-extended to 64 bits.

This register is mandatory in an implementation that supports LPIs and does not include an ITS. The functionality is IMPLEMENTATION DEFINED in an implementation that does include an ITS.

Writes to this register have no effect if either:

- The pINTID field corresponds to an LPI that is already pending.
- The pINTID field corresponds to an unimplemented LPI.
- GICR_CTLR_EnableLPIs == 0.

GICR_SETLPIR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GICR_SETLPIR</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Page 3778
This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are WO.
- When IsAccessSecure() accesses to this register are WO.
- When !IsAccessSecure() accesses to this register are WO.
The GICR_STATUSR characteristics are:

**Purpose**

Provides software with a mechanism to detect:

- **Accesses to reserved locations.**
- **Writes to read-only locations.**
- **Reads of write-only locations.**

**Configuration**

A copy of this register is provided for each Redistributor.

If the GIC implementation supports two Security states this register is Banked to provide Secure and Non-secure copies.

**Attributes**

GICR_STATUSR is a 32-bit register.

**Field descriptions**

The GICR_STATUSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-4</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>31</td>
<td>WROD, bit 3</td>
</tr>
<tr>
<td>2</td>
<td>RWOD, bit 2</td>
</tr>
<tr>
<td>1</td>
<td>WRD, bit 1</td>
</tr>
</tbody>
</table>

**WROD, bit [3]**

Write to an RO location.

<table>
<thead>
<tr>
<th>WROD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A write to an RO location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.

**RWOD, bit [2]**

Read of a WO location.

<table>
<thead>
<tr>
<th>RWOD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A read of a WO location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.

**WRD, bit [1]**

Write to a reserved location.
When a violation is detected, software must write 1 to this register to reset it.

**RRD, bit [0]**

Read of a reserved location.

<table>
<thead>
<tr>
<th>RRD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A read of a reserved location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.

**Accessing the GICR_STATUSR**

This is an optional register. If the register is not implemented, the location is RAZ/WI.

**GICR_STATUSR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>RD_base</td>
<td>0x0010</td>
<td>GICR_STATUSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>RD_base</td>
<td>0x0010</td>
<td>GICR_STATUSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
GICR_SYNCR, Redistributor Synchronize Register

The GICR_SYNCR characteristics are:

Purpose

Indicates completion of physical Redistributor operations.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_SYNCR is a 32-bit register.

Field descriptions

The GICR_SYNCR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>0</td>
<td>Busy</td>
<td>Indicates completion of any Redistributor operations as follows:</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Busy</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No operations are in progress.</td>
</tr>
<tr>
<td>0b1</td>
<td>A write is in progress to one or more of the following registers:</td>
</tr>
<tr>
<td></td>
<td>• <strong>GICR_CLRLPIR</strong>.</td>
</tr>
<tr>
<td></td>
<td>• <strong>GICR_INVLPPIR</strong>.</td>
</tr>
<tr>
<td></td>
<td>• <strong>GICR_INVALLR</strong>.</td>
</tr>
</tbody>
</table>

This field also indicates completion of any operations initiated by writes to **GICR_PENDBASER** or **GICR_PROPBASER**.

Accessing the GICR_SYNCR

Optionally, when this register is accessed, an implementation might wait until all operations are complete before returning a value, in which case GICR_SYNCR.Busy is always 0.

This register is mandatory in an implementation that supports LPIs and does not include an ITS. The functionality is IMPLEMENTATION DEFINED in an implementation that does include an ITS.

GICR_SYNCR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Redistributor</td>
<td>RD_base</td>
<td>0x00C0</td>
<td>GICR_SYNCR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- When GICD_CTRL.DS == 0b0 accesses to this register are **RO**.
- When IsAccessSecure() accesses to this register are **RO**.
- When !IsAccessSecure() accesses to this register are **RO**.
The GICR_TYPER characteristics are:

**Purpose**

Provides information about the configuration of this Redistributor.

**Configuration**

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_TYPER is a 64-bit register.

**Field descriptions**

The GICR_TYPER bit assignments are:

<table>
<thead>
<tr>
<th>Affinity_Value</th>
<th>PPInum</th>
<th>CommonLPIAff</th>
<th>Processor_Number</th>
<th>MPAM</th>
<th>DPGS</th>
<th>LastDirectLPI</th>
<th>Dirty</th>

</tbody>
</table>

**Affinity_Value, bits [63:32]**

The identity of the PE associated with this Redistributor.

- Bits [63:56] provide Aff3, the Affinity level 3 value for the Redistributor.
- Bits [55:48] provide Aff2, the Affinity level 2 value for the Redistributor.
- Bits [47:40] provide Aff1, the Affinity level 1 value for the Redistributor.
- Bits [39:32] provide Aff0, the Affinity level 0 value for the Redistributor.

**PPInum, bits [31:27]**

*When GIC, >=3.1 is implemented:*

The value derived from this field specifies the maximum PPI INTID that a GIC implementation might support. An implementation might not implement all PPIs up to this maximum.

<table>
<thead>
<tr>
<th>PPInum</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00000</td>
<td>Maximum PPI INTID is 31.</td>
</tr>
<tr>
<td>0b00001</td>
<td>Maximum PPI INTID is 1087.</td>
</tr>
<tr>
<td>0b00010</td>
<td>Maximum PPI INTID is 1119.</td>
</tr>
</tbody>
</table>

All other values are reserved.

*Otherwise:*

Reserved, RES0.
Bit [26]

Reserved, RES0.

CommonLPIAff, bits [25:24]

The affinity level at which Redistributors share a LPI Configuration table.

<table>
<thead>
<tr>
<th>CommonLPIAff</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>All Redistributors must share an LPI Configuration table.</td>
</tr>
<tr>
<td>0b01</td>
<td>All Redistributors with the same Aff3 value must share an LPI Configuration table.</td>
</tr>
<tr>
<td>0b10</td>
<td>All Redistributors with the same Aff3.Aff2 value must share an LPI Configuration table.</td>
</tr>
<tr>
<td>0b11</td>
<td>All Redistributors with the same Aff3.Aff2.Aff1 value must share an LPI Configuration table.</td>
</tr>
</tbody>
</table>

Processor_Number, bits [23:8]

A unique identifier for the PE. When GITS_TYPER.PTA == 0, an ITS uses this field to identify the interrupt target.

When affinity routing is disabled for a Security state, this field indicates which GICD_ITARGETSR<n> corresponds to this Redistributor.

Bit [7]

Reserved, RES0.

MPAM, bit [6]

When GIC, >=3.1 is implemented:

MPAM

<table>
<thead>
<tr>
<th>MPAM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MPAM not supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAM supported.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

DPGS, bit [5]

Sets support for GICR_CTLR.DPG* bits.

<table>
<thead>
<tr>
<th>DPGS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>GICR_CTLR.DPG* bits are not supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>GICR_CTLR.DPG* bits are supported.</td>
</tr>
</tbody>
</table>

Last, bit [4]

Indicates whether this Redistributor is the highest-numbered Redistributor in a series of contiguous Redistributor pages.

<table>
<thead>
<tr>
<th>Last</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This Redistributor is not the highest-numbered Redistributor in a series of contiguous Redistributor pages.</td>
</tr>
<tr>
<td>0b1</td>
<td>This Redistributor is the highest-numbered Redistributor in a series of contiguous Redistributor pages.</td>
</tr>
</tbody>
</table>
**DirectLPI, bit [3]**

Indicates whether this Redistributor supports direct injection of LPIs.

<table>
<thead>
<tr>
<th>DirectLPI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This Redistributor does not support direct injection of LPIs. The GICR_SETLPIR, GICR_CLRPLPIR, GICR_INVLPIR, GICR_INVALLR, and GICR_SYNCR registers are either not implemented, or have an IMPLEMENTATION_DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>This Redistributor supports direct injection of LPIs. The GICR_SETLPIR, GICR_CLRPLPIR, GICR_INVLPIR, GICR_INVALLR, and GICR_SYNCR registers are implemented.</td>
</tr>
</tbody>
</table>

**Dirty, bit [2]**

Controls the functionality of GICR_VPENDBASER.Dirty.

<table>
<thead>
<tr>
<th>Dirty</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>GICR_VPENDBASER.Dirty is UNKNOWN when GICR_VPENDBASER.Valid == 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>GICR_VPENDBASER.Dirty indicates when the Virtual Pending Table has been parsed when GICR_VPENDBASER.Valid is written from 0 to 1.</td>
</tr>
</tbody>
</table>

When GICR_TYPER.VLPIS == 0, this field is RES0.

**VLPIS, bit [1]**

Indicates whether the GIC implementation supports virtual LPIs and the direct injection of virtual LPIs.

<table>
<thead>
<tr>
<th>VLPIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The implementation does not support virtual LPIs or the direct injection of virtual LPIs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The implementation supports virtual LPIs and the direct injection of virtual LPIs.</td>
</tr>
</tbody>
</table>

**Note**

In GICv3 implementations this field is RES0.

**PLPIS, bit [0]**

Indicates whether the GIC implementation supports physical LPIs.

<table>
<thead>
<tr>
<th>PLPIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The implementation does not support physical LPIs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The implementation supports physical LPIs.</td>
</tr>
</tbody>
</table>

**Accessing the GICR_TYPER**

**GICR_TYPER can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>RD_base</td>
<td>0x0008</td>
<td>GICR_TYPER</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RO.
- When IsAccessSecure() accesses to this register are RO.
- When !IsAccessSecure() accesses to this register are RO.
GICR_VPENDBASER, Virtual Redistributor LPI Pending Table Base Address Register

The GICR_VPENDBASER characteristics are:

**Purpose**

Specifies the base address of the memory that holds the virtual LPI Pending table for the currently scheduled virtual machine.

**Configuration**

Some or all RW fields of this register have defined reset values.

This register is provided only in GICv4 implementations.

**Attributes**

GICR_VPENDBASER is a 64-bit register.

**Field descriptions**

The GICR_VPENDBASER bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Valid</th>
<th>IDAI</th>
<th>Pending Last</th>
<th>Dirty</th>
<th>RES0</th>
<th>OuterCache</th>
<th>Physical Address</th>
<th>RES0</th>
<th>Physical Address</th>
<th>RES0</th>
<th>Shareability</th>
<th>InnerCache</th>
<th>RES0</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Valid</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>62</td>
<td></td>
<td>IDAI</td>
<td></td>
<td>Dirty</td>
<td>RES0</td>
<td>OuterCache</td>
<td>Physical Address</td>
<td>RES0</td>
<td>Shareability</td>
<td>InnerCache</td>
<td>RES0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>31</td>
<td>Pending Last</td>
<td>29</td>
<td>28</td>
<td>27</td>
<td>26</td>
<td>25</td>
<td>24</td>
<td>23</td>
<td>22</td>
<td>21</td>
<td>20</td>
<td>19</td>
<td>18</td>
</tr>
</tbody>
</table>

This bit controls whether the virtual LPI Pending table is valid:

<table>
<thead>
<tr>
<th>Valid</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The virtual LPI Pending table is not valid. No vPE is scheduled.</td>
</tr>
<tr>
<td>0b1</td>
<td>The virtual LPI Pending table is valid. A vPE is scheduled.</td>
</tr>
</tbody>
</table>

Setting GICR_VPENDBASER.Valid == 1 when the associated CPU interface does not implement GICv4 is UNPREDICTABLE.

**Note**

Software can determine whether a PE supports GICv3 or GICv4 by reading ID_AA64PFR0_EL1.

Writing a new value to any bit of GICR_VPENDBASER, other than GICR_VPENDBASER.Valid, when GICR_VPENDBASER.Valid==1 is UNPREDICTABLE.

This field resets to 0.

**IDAI, bit [62]**

Implementation Defined Area Invalid. Indicates whether the IMPLEMENTATION DEFINED area in the virtual LPI Pending table is valid:
For more information, see LPI Pending tables and Virtual LPI Configuration tables and virtual LPI Pending tables.

This field resets to an architecturally UNKNOWN value.

**PendingLast, bit [61]**

Indicates whether there are pending and enabled interrupts for the last scheduled vPE.

This value is set by the implementation when GICR_VPENDBASER.Valid has been written from 1 to 0 and is otherwise UNKNOWN.

<table>
<thead>
<tr>
<th>PendingLast</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>There are no pending and enabled interrupts for the last scheduled vPE.</td>
</tr>
<tr>
<td>0b1</td>
<td>There is at least one pending interrupt for the last scheduled vPE. It is IMPLEMENTATION DEFINED whether this bit is set when the only pending interrupts for the last scheduled vPE are not enabled. Arm deprecates setting PendingLast to 1 when the only pending interrupts for the last scheduled virtual machine are not enabled.</td>
</tr>
</tbody>
</table>

When the GICR_VPENDBASER.Valid bit is written from 0 to 1, this bit is RES1.

This field resets to 0.

**Dirty, bit [60]**

*When GICR_VPENDBASER.Valid == 0b0:*

This is field is read-only. Indicates whether a de-scheduling operation is in process.

<table>
<thead>
<tr>
<th>Dirty</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No de-scheduling operation in process.</td>
</tr>
<tr>
<td>0b1</td>
<td>De-scheduling operation in process.</td>
</tr>
</tbody>
</table>

Writing 1 to GICR_VPENDBASER.Valid is UNPREDICTABLE while GICR_VPENDBASER.Dirty==1.

This field resets to 0.

*When GICR_VPENDBASER.Valid == 0b1 and GICR_TYPER.Dirty == 0b1:*

This field is read-only. Reports whether the Virtual Pending table has been parsed.

<table>
<thead>
<tr>
<th>Dirty</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Parsing of the Virtual Pending Table has completed.</td>
</tr>
<tr>
<td>0b1</td>
<td>Parsing of the Virtual Pending Table has not completed.</td>
</tr>
</tbody>
</table>

Writing 1 to GICR_VPENDBASER.Valid is UNPREDICTABLE while GICR_VPENDBASER.Dirty==1.

This field resets to 0.

**Otherwise:**

This field is read-only. This fields is UNKNOWN.

This field resets to 0.
Bit [59]
Reserved, RES0.

OuterCache, bits [58:56]
Indicates the Outer Cacheability attributes of accesses to virtual LPI Pending tables of vPEs targeting this Redistributor. The possible values of this field are:

<table>
<thead>
<tr>
<th>OuterCache</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.</td>
</tr>
<tr>
<td>0b001</td>
<td>Normal Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b010</td>
<td>Normal Outer Cacheable Read-allocate, Write-through.</td>
</tr>
<tr>
<td>0b011</td>
<td>Normal Outer Cacheable Read-allocate, Write-back.</td>
</tr>
<tr>
<td>0b100</td>
<td>Normal Outer Cacheable Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b101</td>
<td>Normal Outer Cacheable Write-allocate, Write-back.</td>
</tr>
<tr>
<td>0b110</td>
<td>Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b111</td>
<td>Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.</td>
</tr>
</tbody>
</table>

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The Cacheability, Outer Cacheability and Shareability fields are used for accesses to the virtual LPI Pending table of resident and non-resident vPEs.

If the OuterCacheability attribute of the virtual LPI Pending tables that are associated with vPEs targeting the same Redistributor are different, behavior is UNPREDICTABLE.

This field resets to an architecturally UNKNOWN value.

Bits [55:52]
Reserved, RES0.

Physical_Address, bits [51:16]

Bits [51:16] of the physical address containing the virtual LPI Pending table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

This field resets to an architecturally UNKNOWN value.

Bits [15:12]
Reserved, RES0.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the virtual LPI Pending table. The possible values of this field are:

<table>
<thead>
<tr>
<th>Shareability</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Inner Shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Reserved. Treated as 0b00.</td>
</tr>
</tbody>
</table>

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The Cacheability, Outer Cacheability and Shareability fields are used for accesses to the virtual LPI Pending table of resident and non-resident vPEs.
If the Shareability attribute of the virtual LPI Pending tables that are associated with vPEs targeting the same Redistributor are different, behavior is *UNPREDICTABLE*.

This field resets to an architecturally *UNKNOWN* value.

### InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the virtual LPI Pending table. The possible values of this field are:

<table>
<thead>
<tr>
<th>InnerCache</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Device-nGnRnE.</td>
</tr>
<tr>
<td>0b001</td>
<td>Normal Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b010</td>
<td>Normal Inner Cacheable Read-allocate, Write-through.</td>
</tr>
<tr>
<td>0b011</td>
<td>Normal Inner Cacheable Read-allocate, Write-back.</td>
</tr>
<tr>
<td>0b100</td>
<td>Normal Inner Cacheable Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b101</td>
<td>Normal Inner Cacheable Write-allocate, Write-back.</td>
</tr>
<tr>
<td>0b110</td>
<td>Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b111</td>
<td>Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.</td>
</tr>
</tbody>
</table>

The Cacheability, Outer Cacheability and Shareability fields are used for accesses to the virtual LPI Pending table of resident and non-resident vPEs.

If the InnerCacheability attribute of the virtual LPI Pending tables that are associated with vPEs targeting the same Redistributor are different, behavior is *UNPREDICTABLE*.

This field resets to an architecturally *UNKNOWN* value.

### Bits [6:0]

Reserved, RES0.

### Accessing the GICR_VPENDBASER

The effect of a write to this register is not guaranteed to be visible throughout the affinity hierarchy, as indicated by GICR_CTLR.RWP == 0.

**GICR_VPENDBASER** can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Redistributor</td>
<td>VLPI_base</td>
<td>0x0078</td>
<td>GICR_VPENDBASER</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

GICR_VPROPBASER, Virtual Redistributor Properties
Base Address Register

The GICR_VPROPBASER characteristics are:

**Purpose**

Specifies the base address of the memory that holds the virtual LPI Configuration table for the currently scheduled virtual machine.

**Configuration**

RW fields in this register reset to architecturally **UNKNOWN** values.

This register is provided in GICv4 implementations only.

**Attributes**

GICR_VPROPBASER is a 64-bit register.

**Field descriptions**

The GICR_VPROPBASER bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, <strong>RES0</strong></td>
</tr>
<tr>
<td>58-56</td>
<td>Indicates the Outer Cacheability attributes of accesses to the LPI Configuration table. The possible values of this field are:</td>
</tr>
<tr>
<td>31-20</td>
<td>Reserved, <strong>RES0</strong></td>
</tr>
<tr>
<td>19-12</td>
<td>Shareability, <strong>InnerCache</strong>, <strong>RES0</strong>, <strong>IDbits</strong></td>
</tr>
<tr>
<td>11-0</td>
<td><strong>Physical_Address</strong></td>
</tr>
</tbody>
</table>

**OuterCache, bits [58:56]**

Indicates the Outer Cacheability attributes of accesses to the LPI Configuration table. The possible values of this field are:

<table>
<thead>
<tr>
<th>OuterCache</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.</td>
</tr>
<tr>
<td>0b001</td>
<td>Normal Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b010</td>
<td>Normal Outer Cacheable Read-allocate, Write-through.</td>
</tr>
<tr>
<td>0b011</td>
<td>Normal Outer Cacheable Read-allocate, Write-back.</td>
</tr>
<tr>
<td>0b100</td>
<td>Normal Outer Cacheable Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b101</td>
<td>Normal Outer Cacheable Write-allocate, Write-back.</td>
</tr>
<tr>
<td>0b110</td>
<td>Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b111</td>
<td>Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.</td>
</tr>
</tbody>
</table>

It is **IMPLEMENTATION DEFINED** whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

This field resets to an architecturally **UNKNOWN** value.
Bits [55:52]

Reserved, RES0.

Physical_Address, bits [51:12]

Bits [51:12] of the physical address containing the virtual LPI Configuration table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

This field resets to an architecturally UNKNOWN value.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the LPI Configuration table. The possible values of this field are:

<table>
<thead>
<tr>
<th>Shareability</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Inner Shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Reserved. Treated as 0b00.</td>
</tr>
</tbody>
</table>

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

This field resets to an architecturally UNKNOWN value.

InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the LPI Configuration table. The possible values of this field are:

<table>
<thead>
<tr>
<th>InnerCache</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Device-nGnRnE.</td>
</tr>
<tr>
<td>0b001</td>
<td>Normal Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b010</td>
<td>Normal Inner Cacheable Read-allocate, Write-through.</td>
</tr>
<tr>
<td>0b011</td>
<td>Normal Inner Cacheable Read-allocate, Write-back.</td>
</tr>
<tr>
<td>0b100</td>
<td>Normal Inner Cacheable Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b101</td>
<td>Normal Inner Cacheable Write-allocate, Write-back.</td>
</tr>
<tr>
<td>0b110</td>
<td>Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b111</td>
<td>Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IDbits, bits [4:0]

The number of bits of virtual LPI INTID supported, minus one.

If the value of this field is less than 0b1101, indicating that the largest INTID is less than 8192 (the smallest LPI interrupt ID), the GIC will behave as if all virtual LPIs are out of range.

This field resets to an architecturally UNKNOWN value.
Accessing the **GICR_VPROPBASER**

**GICR_VPROPBASER** can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC</td>
<td>VLPI_base</td>
<td>0x0070</td>
<td>GICR_VPROPBASER</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

27/09/2019 18:23; 6134483bd14dc8c12a99c984cbfe3431cc1c9707

Copyright © 2010-2019 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.
The GICR_WAKER characteristics are:

**Purpose**

Permits software to control the behavior of the WakeRequest power management signal corresponding to the Redistributor. Power management operations follow the rules in Power management.

**Configuration**

Some or all RW fields of this register have defined reset values.

A copy of this register is provided for each Redistributor.

**Attributes**

GICR_WAKER is a 32-bit register.

**Field descriptions**

The GICR_WAKER bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
<tr>
<td>30:29</td>
<td>RES0</td>
</tr>
<tr>
<td>28</td>
<td>ChildrenAsleep</td>
</tr>
<tr>
<td>27</td>
<td>ProcessorSleep</td>
</tr>
<tr>
<td>26:0</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
</tbody>
</table>

**IMPLEMENTATION DEFINED, bit [31]**

IMPLEMENTATION DEFINED.

**Bits [30:3]**

Reserved, RES0.

**ChildrenAsleep, bit [2]**

Read-only. Indicates whether the connected PE is quiescent:

<table>
<thead>
<tr>
<th>ChildrenAsleep</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An interface to the connected PE might be active.</td>
</tr>
<tr>
<td>0b1</td>
<td>All interfaces to the connected PE are quiescent.</td>
</tr>
</tbody>
</table>

This field resets to 1.

**ProcessorSleep, bit [1]**

Indicates whether the Redistributor can assert the WakeRequest signal:
### ProcessorSleep

<table>
<thead>
<tr>
<th>ProcessorSleep</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This PE is not in, and is not entering, a low power state.</td>
</tr>
</tbody>
</table>
| 0b1            | The PE is either in, or is in the process of entering, a low power state. All interrupts that arrive at the Redistributor:  
  - Assert a WakeRequest signal.  
  - Are held in the pending state at the Redistributor, and are not communicated to the CPU interface. |

**Note**

When ProcessorSleep == 1, the Redistributor must ensure that any interrupts that are pending on the CPU interface are released.

For an implementation that is using the GIC Stream Protocol Interface:

- A Quiesce command can put the interface between the Redistributor and the CPU interface in a quiescent state.
- A Release command can release any interrupts that are pending on the CPU interface.

**Note**

Before powering down a PE, software must set this bit to 1 and wait until ChildrenAsleep == 1. After powering up a PE, or following a failed powerdown, software must set this bit to 0 and wait until ChildrenAsleep == 0.

Changing ProcessorSleep from 1 to 0 when ChildrenAsleep is not 1 results in **UNPREDICTABLE** behavior.

Changing ProcessorSleep from 0 to 1 when the Enable for each interrupt group in the associated CPU interface is not 0 results in **UNPREDICTABLE** behavior.

This field resets to 1.

**IMPLEMENTATION DEFINED, bit [0]**

**IMPLEMENTATION DEFINED.**

### Accessing the GICR_WAKER

When GICD_CTLR.DS==1, this register is always accessible.

When GICD_CTLR.DS==0, this is a Secure register. This register is RAZ/WI to Non-secure accesses.

To ensure a Redistributor is quiescent, software must write to GICR_WAKER with ProcessorSleep == 1, then poll the register until ChildrenAsleep == 1.

Resetting the connected PE when GICR_WAKER.ProcessorSleep==0 or GICR_WAKER.ChildrenAsleep==0, can lead to **UNPREDICTABLE** behaviour in the IRI.

Resetting the IRI when GICR_WAKER.ProcessorSleep==0 or GICR_WAKER.ChildrenAsleep==0 can lead to **UNPREDICTABLE** behaviour in the connected PE.

**GICR_WAKER can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Redistributor</td>
<td>RD_base</td>
<td>0x0014</td>
<td>GICR_WAKER</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
• When GICD_CTLR.DS == 0b0 accesses to this register are RW.
• When IsAccessSecure() accesses to this register are RW.
GICV_ABPR, Virtual Machine Aliased Binary Point Register

The GICV_ABPR characteristics are:

**Purpose**

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption.

This register corresponds to **GICC_ABPR** in the physical CPU interface.

---

**Note**

**GICH_LR<n>**.Group determines whether a virtual interrupt is Group 0 or Group 1.

---

**Configuration**

Some or all RW fields of this register have defined reset values.

This register is available when the GIC implementation supports interrupt virtualization.

---

**Attributes**

GICV_ABPR is a 32-bit register.

---

**Field descriptions**

The GICV_ABPR bit assignments are:

```
    31  30  29  28  27  26  25  24  23  22  21  20  19  18  17  16  15  14  13  12  11  10  9  8  7  6  5  4  3  2  1  0
```

**Bits [31:3]**

Reserved, RES0.

**Binary_Point, bits [2:0]**

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field.

For information about how this field determines the interrupt priority bits assigned to the group priority field, see Priority grouping.

This field resets to 0.

The Binary_Point field of this register is aliased to **GICH_VMCR.VBPR1**.

---

**Accessing the GICV_ABPR**

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, **ICC_BPR1** provides equivalent functionality.
- For AArch64 implementations, **ICC_BPR1_EL1** provides equivalent functionality.
The value contained in this register is one greater than the actual applied binary point value, as described in 'Priority grouping' in the GICv3 Architecture Specification.

This register is used for Group 1 interrupts when GICV_CTLR.CBPR == 0. GICV_BPR provides equivalent functionality for Group 0 interrupts, and for Group 1 interrupts when GICV_CTLR.CBPR == 1.

**GICV_ABPR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual CPU interface</td>
<td>0x001C</td>
<td>GICV_ABPR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
GICV_AEOIR, Virtual Machine Aliased End Of Interrupt Register

The GICV_AEOIR characteristics are:

**Purpose**

A write to this register performs a priority drop for the specified Group 1 virtual interrupt and, if GICV_CTLR.EOImode == 0, also deactivates the interrupt.

**Configuration**

This register is available when the GIC implementation supports interrupt virtualization.

**Attributes**

GICV_AEOIR is a 32-bit register.

**Field descriptions**

The GICV_AEOIR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>INTID</td>
</tr>
</tbody>
</table>

**Bits [31:25]**

Reserved, RES0.

**INTID, bits [24:0]**

The INTID of the signaled interrupt.

---

**Note**

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

---

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

A successful EOI request means that:

- The highest priority bit in GICH_APR<\text{n}> is cleared, causing the running priority to drop.
- If the appropriate GICV_CTLR EOImode bit == 0, the interrupt is deactivated in the corresponding List register. If the INTID corresponds to a hardware interrupt, the interrupt is also deactivated in the Distributor.

---

**Note**

Only Group 1 interrupts can target the hypervisor, and therefore only Group 1 interrupts are deactivated in the Distributor.
A write to this register is \textit{UNPREDICTABLE} if the INTID corresponds to a Group 0 interrupt. In addition, the following GICv2 \textit{UNPREDICTABLE} cases require specific actions:

- If highest active priority is Group 0 and the identified interrupt is in the List Registers and it matches the highest active priority. When EL2 is using System registers and \texttt{ICH_VTR_EL2.SEIS} is 1, an \textit{IMPLEMENTATION DEFINED} SEI might be generated, otherwise GICv3 implementations must ignore such writes.
- If the identified interrupt is in the List Registers, and the HW bit is 1, and the interrupt to be deactivated is an SGI (that is, the value of Physical ID is between 0 and 15). GICv3 implementations must perform the deactivate operation. This means that a GICv3 implementation in legacy operation must ensure only a single SGI is active for a PE.
- If the identified interrupt is in the List Registers, and the HW bit is 1, and the corresponding pINTID field value is between 1020 and 1023, indicating a special purpose INTID. GICv3 implementations must not perform a deactivate operation but must still change the state of the List register as appropriate. When EL2 is using System registers and \texttt{ICH_VTR_EL2.SEIS} is 1, an implementation might generate a system error.

### Accessing the GICV_AEOIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, \texttt{ICC_EOIR1} provides equivalent functionality.
- For AArch64 implementations, \texttt{ICC_EOIR1_EL1} provides equivalent functionality.

This register is used for Group 1 interrupts only. \texttt{GICV_EOIR} provides equivalent functionality for Group 0 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

### GICV_AEOIR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual CPU</td>
<td>0x0024</td>
<td>GICV_AEOIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When \texttt{GICD_CTLR.DS == 0b0} accesses to this register are \texttt{WO}.
- When \texttt{IsAccessSecure()} accesses to this register are \texttt{WO}.
- When \texttt{!IsAccessSecure()} accesses to this register are \texttt{WO}.

---

GICV_AHPPIR, Virtual Machine Aliased Highest Priority Pending Interrupt Register

The GICV_AHPPIR characteristics are:

**Purpose**

Provides the INTID of the highest priority pending Group 1 virtual interrupt in the List registers.

This register corresponds to the physical CPU interface register `GICC_AHPPIR`.

**Configuration**

This register is available when the GIC implementation supports interrupt virtualization.

**Attributes**

GICV_AHPPIR is a 32-bit register.

**Field descriptions**

The GICV_AHPPIR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved (RES0)</td>
</tr>
<tr>
<td>25-0</td>
<td>INTID</td>
</tr>
</tbody>
</table>

**Bits [31:25]**

Reserved, RES0.

**INTID, bits [24:0]**

The INTID of the signaled interrupt.

**Note**

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

A read of this register returns the spurious INTID 1023 if any of the following are true:

- There are no pending interrupts of sufficiently high priority value to be signaled to the PE.
- The highest priority pending interrupt is in Group 0.

**Accessing the GICV_AHPPIR**

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, `ICC_HPPIR1` provides equivalent functionality.
- For AArch64 implementations, `ICC_HPPIR1_EL1` provides equivalent functionality.
This register is used for Group 1 interrupts only. GICV_HPPIR provides equivalent functionality for Group 0 interrupts.

The register does not return the INTID of an interrupt that is active and pending.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

**GICV_AHPPIR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual CPU</td>
<td>0x0028</td>
<td>GICV_AHPPIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RO**.
- When IsAccessSecure() accesses to this register are **RO**.
- When !IsAccessSecure() accesses to this register are **RO**.
The GICV_AIAR characteristics are:

**Purpose**

Provides the INTID of the signaled Group 1 virtual interrupt. A read of this register by the PE acts as an acknowledge for the interrupt.

This register corresponds to the physical CPU interface register **GICC_AIAR**.

**Configuration**

This register is available when the GIC implementation supports interrupt virtualization.

**Attributes**

GICV_AIAR is a 32-bit register.

**Field descriptions**

The GICV_AIAR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>INTID</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:25]**

Reserved, RES0.

**INTID, bits [24:0]**

The INTID of the signaled interrupt.

**Note**

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

The operation of this register is similar to the operation of **GICV_IAR**. When a vPE reads this register, the corresponding **GICH_LR<n>**.Group field is checked to determine whether the interrupt is in Group 0 or Group 1:

- If the interrupt is Group 0, the spurious INTID 1023 is returned and the interrupt is not acknowledged.
- If the interrupt is Group 1, the INTID is returned. The List register entry is updated to active state, and the appropriate bit in **GICH_APR<n>** is set to 1.

A read of this register returns the spurious INTID 1023 if any of the following are true:

- When the virtual CPU interface is enabled and **GICH_HCR.En == 1**:
  - There are no pending interrupts of sufficiently high priority value to be signaled to the PE.
The highest priority pending interrupt is in Group 0.

- Interrupt signaling by the virtual CPU interface is disabled.

**Accessing the GICV_AIAR**

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_IAR1 provides equivalent functionality.
- For AArch64 implementations, ICC_IAR1_EL1 provides equivalent functionality.

This register is used for Group 1 interrupts only. GICV_IAR provides equivalent functionality for Group 0 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

**GICV_AIAR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual CPU</td>
<td>0x0020</td>
<td>GICV_AIAR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RO.
- When IsAccessSecure() accesses to this register are RO.
- When !IsAccessSecure() accesses to this register are RO.
**GICV_APR<n>, Virtual Machine Active Priorities Registers, n = 0 - 3**

The GICV_APR<n> characteristics are:

**Purpose**

Provides information about interrupt active priorities.

These registers correspond to the physical CPU interface registers GICC_APR<n>.

**Configuration**

When System register access is disabled for EL2, these registers access GICH_APR<n>, and all active priorities for virtual machines are held in GICH_APR<n> regardless of interrupt group.

When System register access is enabled for EL2, these registers access ICH_AP1R<n>_EL2, and all active priorities for virtual machines are held in ICH_AP1R<n>_EL2 regardless of interrupt group.

**Attributes**

GICV_APR<n> is a 32-bit register.

**Field descriptions**

The GICV_APR<n> bit assignments are:

```
```

P<x>, bit [x], for x = 0 to 31

Provides information about active priorities for the virtual machine.

See GICH_APR<n> and ICH_AP1R<n>_EL2 for the correspondence between priorities and bits.

**Accessing the GICV_APR<n>**

If System register access is not enabled for EL2, these registers access GICH_APR<n>. If System register access is enabled for EL2, these registers access ICH_AP1R<n>_EL2. All active priority mapped guests are held in the accessed registers, regardless of interrupt group.

**GICV_APR<n> can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual CPU interface</td>
<td>0x00D0 + 4n</td>
<td>GICV_APR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RW.
- When IsAccessSecure() accesses to this register are RW.
- When !IsAccessSecure() accesses to this register are RW.
The GICV_BPR characteristics are:

**Purpose**

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption.

This register corresponds to **GICC_BPR** in the physical CPU interface.

---

**Note**

GICH_LR<n> Group determines whether a virtual interrupt is Group 0 or Group 1.

---

**Configuration**

RW fields in this register reset to architecturally UNKNOWN values.

This register is available when the GIC implementation supports interrupt virtualization.

When **GICV_CTLR**.CBPR == 1, this register determines interrupt preemption for both Group 0 and Group 1 interrupts.

**Attributes**

GICV_BPR is a 32-bit register.

**Field descriptions**

The GICV_BPR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | Binary_Point |

**Bits [31:3]**

Reserved, RES0.

**Binary_Point, bits [2:0]**

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field.

For information about how this field determines the interrupt priority bits assigned to the group priority field, see Priority grouping for Group 0 interrupts, or Group 1 interrupts when CBPR==1

This field resets to an architecturally UNKNOWN value.

The Binary_Point field of this register is aliased to **GICH_VMCR**.VBPR0.

**Accessing the GICV_BPR**

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, **ICC_BPR0** provides equivalent functionality.
- For AArch64 implementations, **ICC_BPR0_EL1** provides equivalent functionality.
GICV_BPR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual CPU</td>
<td>0x0008</td>
<td>GICV_BPR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RW.
- When IsAccessSecure() accesses to this register are RW.
- When !IsAccessSecure() accesses to this register are RW.
GICV_CTLR, Virtual Machine Control Register

The GICV_CTLR characteristics are:

**Purpose**

Controls the behavior of virtual interrupts.

This register corresponds to the physical CPU interface register GICC_CTLR.

**Configuration**

RW fields in this register reset to architecturally UNKNOWN values.

This register is available when a GIC implementation supports interrupt virtualization.

**Attributes**

GICV_CTLR is a 32-bit register.

**Field descriptions**

The GICV_CTLR bit assignments are:

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
  RES0  EOImode  RES0  CBPR  FIQEn  AckCtl  EnableGrp1  EnableGrp0
```

**Bits [31:10]**

Reserved, RES0.

**EOImode, bit [9]**

Controls the behavior associated with the GICV_EOIR, GICV_AEOIR, and GICV_DIR registers:

<table>
<thead>
<tr>
<th>EOImode</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Writes to GICV_EOIR and GICV_AEOIR perform priority drop and deactivate interrupt operations simultaneously. Behavior on a write to GICV_DIR is unpredictable. When it has completed processing the interrupt, the virtual machine writes to GICV_EOIR or GICV_AEOIR to deactivate the interrupt. The write updates the List registers and causes the virtual CPU interface to signal the interrupt completion to the physical Distributor.</td>
</tr>
<tr>
<td>0b1</td>
<td>Writes to GICV_EOIR and GICV_AEOIR perform priority drop operation only. Writes to GICV_DIR perform deactivate interrupt operation only. When it has completed processing the interrupt, the virtual machine writes to GICV_DIR to deactivate the interrupt. The write updates the List registers and causes the virtual CPU interface to signal the interrupt completion to the Distributor.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**Bits [8:5]**

Reserved, RES0.
CBPR, bit [4]

Controls whether GICV_BPR affects both Group 0 and Group 1 interrupts:

<table>
<thead>
<tr>
<th>CBPR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>GICV_BPR affects Group 0 virtual interrupts only. GICV_ABPR affects Group 1 virtual interrupts only.</td>
</tr>
<tr>
<td>0b1</td>
<td>GICV_BPR affects both Group 0 and Group 1 virtual interrupts.</td>
</tr>
</tbody>
</table>

See Priority grouping for more information.

This field resets to an architecturally **UNKNOWN** value.

FIQEn, bit [3]

FIQ Enable. Controls whether Group 0 virtual interrupts are presented as virtual FIQs:

<table>
<thead>
<tr>
<th>FIQEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 0 virtual interrupts are presented as virtual IRQs.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 0 virtual interrupts are presented as virtual FIQs.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

AckCtl, bit [2]

Arm deprecates use of this bit. Arm strongly recommends that software is written to operate with this bit always cleared to 0.

Acknowledge control. When the highest priority interrupt is Group 1, determines whether GICV_IAR causes the CPU interface to acknowledge the interrupt or returns the spurious identifier 1022, and whether GICV_HPPIR returns the interrupt ID or the special identifier 1022.

<table>
<thead>
<tr>
<th>AckCtl</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns an interrupt ID of 1022.</td>
</tr>
<tr>
<td>0b1</td>
<td>If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns the interrupt ID of the corresponding interrupt.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

EnableGrp1, bit [1]

Enables the signaling of Group 1 virtual interrupts by the virtual CPU interface to the virtual machine:

<table>
<thead>
<tr>
<th>EnableGrp1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Signaling of Group 1 interrupts is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Signaling of Group 1 interrupts is enabled.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

EnableGrp0, bit [0]

Enables the signaling of Group 0 virtual interrupts by the virtual CPU interface to the virtual machine:

<table>
<thead>
<tr>
<th>EnableGrp0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Signaling of Group 0 interrupts is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Signaling of Group 0 interrupts is enabled.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

Accessing the GICV_CTLR

This register is used only when System register access is not enabled. When System register access is enabled:
• For AArch32 implementations, **ICC_CTLR** provides equivalent functionality.
• For AArch64 implementations, **ICC_CTLR_EL1** provides equivalent functionality.

**GICV_CTLR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual CPU</td>
<td>0x0000</td>
<td>GICV_CTLR</td>
</tr>
<tr>
<td>interface</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
• When IsAccessSecure() accesses to this register are **RW**.
• When !IsAccessSecure() accesses to this register are **RW**.
GICV_DIR, Virtual Machine Deactivate Interrupt Register

The GICV_DIR characteristics are:

**Purpose**

Deactivates a specified virtual interrupt in the GICH_LR<n> List registers.
This register corresponds to the physical CPU interface register GICC_DIR.

**Configuration**

This register is available when the GIC implementation supports interrupt virtualization.

**Attributes**

GICV_DIR is a 32-bit register.

**Field descriptions**

The GICV_DIR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | INTID |

**Bits [31:25]**

Reserved, RES0.

**INTID, bits [24:0]**

The INTID of the signaled interrupt.

**Note**

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

When the virtual machine writes to this register, the specified interrupt in the List registers is changed from active to inactive, or from active and pending to pending. If the specified interrupt is present in the List registers but is not in either the active or active and pending states, the effect is UNPREDICTABLE. If the specified interrupt is not present in the List registers, GIC_HCR.EOIcount is incremented, potentially generating a maintenance interrupt.

**Note**

If the specified interrupt is not present in the List registers, the virtual machine cannot recover the INTID. Therefore, the hypervisor must ensure that, when GICV_CTLR.EOImode == 1, no more than one active interrupt is transferred from the List registers into a software list. If more than one active
interrupt that is not stored in the List registers exists, the hypervisor must handle accesses to GICV_DIR in software, typically by trapping these accesses.

If the corresponding GICH_LR<n>.HW == 1, indicating a hardware interrupt, then a deactivate request is sent to the physical Distributor, identifying the physical INTID from the corresponding field in the List register. This effect is identical to a Non-secure write to GICC_DIR from the PE having that physical INTID. This means that if the corresponding physical interrupt is marked as Group 0, the request is ignored.

**Note**

Interrupt deactivation using this register is based on the provided INTID, with no requirement to deactivate interrupts in any particular order. A single register is therefore used to deactivate both Group 0 and Group 1 interrupts.

**Accessing the GICV_DIR**

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_DIR provides equivalent functionality.
- For AArch64 implementations, ICC_DIR_EL1 provides equivalent functionality.

Writes to this register are valid only when GICV_CTLR.EOImode == 1. Writes to this register are otherwise UNPREDICTABLE.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

**GICV_DIR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual CPU interface</td>
<td>0x1000</td>
<td>GICV_DIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **WO**.
- When IsAccessSecure() accesses to this register are **WO**.
- When !IsAccessSecure() accesses to this register are **WO**.
GICV_EOIR, Virtual Machine End Of Interrupt Register

The GICV_EOIR characteristics are:

Purpose

A write to this register performs a priority drop for the specified Group 0 virtual interrupt and, if GICV_CTLR.EOImode == 0, also deactivates the interrupt.

This register corresponds to the physical CPU interface register GICC_EOIR.

Configuration

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_EOIR is a 32-bit register.

Field descriptions

The GICV_EOIR bit assignments are:

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0 | INTID |

Bits [31:25]

Reserved, RES0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

The behavior of this register depends on the setting of GICV_CTLR.EOImode:

<table>
<thead>
<tr>
<th>GICV_CTLR.EOImode</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Both the priority drop and the deactivate interrupt effects occur</td>
</tr>
<tr>
<td>0b1</td>
<td>Only the priority drop effect occurs.</td>
</tr>
</tbody>
</table>

A successful EOI request means that:

- The highest priority bit in GICH_APR<n> is cleared, causing the running priority to drop.
- If the appropriate GICV_CTLR.EOImode bit == 0, the interrupt is deactivated in the corresponding List register GICH_LR<n>. If GICH_LR<n>.HW == 1, indicating the INTID corresponds to a hardware interrupt, a deactivate request is also sent to the physical Distributor, identifying the physical INTID from the
corresponding field in the List register. This effect is identical to a Non-secure write to GICC_DIR from the PE having that physical INTID. This means that if the corresponding physical interrupt is marked as Group 0, and GICD_CTLR.DS == 0, the deactivation request is ignored. See GICC_EOIR for more information.

**Note**

Only Group 1 interrupts can target the hypervisor, and therefore only Group 1 interrupts are deactivated in the Distributor.

### Accessing the GICV_EOIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_EOIR0 provides equivalent functionality.
- For AArch64 implementations, ICC_EOIR0_EL1 provides equivalent functionality.

This register is used for Group 0 interrupts only. GICV_AEOIR provides equivalent functionality for Group 1 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

**GICV_EOIR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual CPU interface</td>
<td>0x0010</td>
<td>GICV_EOIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **WO**.
- When IsAccessSecure() accesses to this register are **WO**.
- When !IsAccessSecure() accesses to this register are **WO**.
GICV_HPPIR, Virtual Machine Highest Priority Pending Interrupt Register

The GICV_HPPIR characteristics are:

**Purpose**

Provides the INTID of the highest priority pending Group 0 virtual interrupt in the List registers.

This register corresponds to the physical CPU interface register GICC_HPPIR.

**Configuration**

This register is available when the GIC implementation supports interrupt virtualization.

**Attributes**

GICV_HPPIR is a 32-bit register.

**Field descriptions**

The GICV_HPPIR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| INTID | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

**Bits [31:25]**

Reserved, RES0.

**INTID, bits [24:0]**

The INTID of the signaled interrupt.

---

**Note**

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

---

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Reads of the GICC_HPPIR that do not return a valid INTID return a spurious INTID, 1022 or 1023. See Special INTIDs.

<table>
<thead>
<tr>
<th>Highest priority pending interrupt Group</th>
<th>GICV_HPPIR read</th>
<th>GICV_CTRLR.AckCtl</th>
<th>Returned INTID</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Non-secure</td>
<td>x</td>
<td>1022</td>
</tr>
<tr>
<td>1</td>
<td>Secure</td>
<td>0</td>
<td>1023</td>
</tr>
<tr>
<td>0</td>
<td>Non-secure</td>
<td>x</td>
<td>1023</td>
</tr>
<tr>
<td>0</td>
<td>Secure</td>
<td>x</td>
<td></td>
</tr>
<tr>
<td>No pending interrupts</td>
<td>x</td>
<td>x</td>
<td>1023</td>
</tr>
</tbody>
</table>

If the CPU interface supports only a single Security state, the entries that apply to Secure reads describe the behavior.

### Accessing the GICV_HPPIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_HPPIR0 provides equivalent functionality.
- For AArch64 implementations, ICC_HPPIR0_EL1 provides equivalent functionality.

This register is used for Group 0 interrupts only. GICV_AHPPIR provides equivalent functionality for Group 1 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

**GICV_HPPIR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual CPU interface</td>
<td>0x0018</td>
<td>GICV_HPPIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RO**.
- When IsAccessSecure() accesses to this register are **RO**.
- When !IsAccessSecure() accesses to this register are **RO**.
The GICV_IAR characteristics are:

**Purpose**

Provides the INTID of the signaled Group 0 virtual interrupt. A read of this register by the PE acts as an acknowledge for the interrupt.

This register corresponds to the physical CPU interface register GICC_IAR.

**Configuration**

This register is available when the GIC implementation supports interrupt virtualization.

**Attributes**

GICV_IAR is a 32-bit register.

**Field descriptions**

The GICV_IAR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td></td>
</tr>
<tr>
<td>29</td>
<td></td>
</tr>
<tr>
<td>28</td>
<td></td>
</tr>
<tr>
<td>27</td>
<td></td>
</tr>
<tr>
<td>26</td>
<td></td>
</tr>
<tr>
<td>25</td>
<td></td>
</tr>
<tr>
<td>24</td>
<td></td>
</tr>
<tr>
<td>23</td>
<td></td>
</tr>
<tr>
<td>22</td>
<td></td>
</tr>
<tr>
<td>21</td>
<td></td>
</tr>
<tr>
<td>20</td>
<td></td>
</tr>
<tr>
<td>19</td>
<td></td>
</tr>
<tr>
<td>18</td>

</tr>
<tr>
<td>17</td>
<td></td>
</tr>
<tr>
<td>16</td>
<td></td>
</tr>
<tr>
<td>15</td>
<td></td>
</tr>
<tr>
<td>14</td>
<td></td>
</tr>
<tr>
<td>13</td>
<td></td>
</tr>
<tr>
<td>12</td>
<td></td>
</tr>
<tr>
<td>11</td>
<td></td>
</tr>
<tr>
<td>10</td>
<td></td>
</tr>
<tr>
<td>9</td>
<td></td>
</tr>
<tr>
<td>8</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td>INTID</td>
</tr>
</tbody>
</table>

**Bits [31:25]**

Reserved, RES0.

**INTID, bits [24:0]**

The INTID of the signaled interrupt.

**Note**

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

When the virtual machine writes to this register, the virtual CPU interface acknowledges the highest priority pending virtual interrupt and sets the state in the corresponding List register to active. The appropriate bit in the active priorities register GICH_APR<\n> is set to 1.

If GICH_LR<\n>.HW == 0, indicating that the interrupt is software-triggered, then bits [12:10] of GICH_LR<\n> are returned in bits [12:10] of GICV_IAR. Otherwise bits [12:10] are RES0.

A read of this register returns the spurious INTID 1023 if either of the following is true:

- There are no pending interrupts of sufficiently high priority value to be signaled to the PE with the virtual CPU interface enabled and GICH_HCR.En == 1.
Interrupt signaling by the virtual CPU interface is disabled.

A read of this register returns the spurious INTID 1022 if the highest priority pending interrupt is Group 1 and GICV_CTLR.AckCtl == 0.

Accessing the GICV_IAR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_IAR0 provides equivalent functionality.
- For AArch64 implementations, ICC_IAR0_EL1 provides equivalent functionality.

This register is used for Group 0 interrupts only. GICV_AIAR provides equivalent functionality for Group 1 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_IAR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual CPU interface</td>
<td>0x000C</td>
<td>GICV_IAR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RO.
- When IsAccessSecure() accesses to this register are RO.
- When !IsAccessSecure() accesses to this register are RO.
GICV_IIDR, Virtual Machine CPU Interface Identification Register

The GICV_IIDR characteristics are:

**Purpose**

Provides information about the implementer and revision of the virtual CPU interface.

**Configuration**

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states this register is Common.

**Attributes**

GICV_IIDR is a 32-bit register.

**Field descriptions**

The GICV_IIDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>ProductID</th>
<th>Architecture_version</th>
<th>Revision</th>
<th>Implementer</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-20</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**ProductID, bits [31:20]**

An *IMPLEMENTATION DEFINED* product identifier.

**Architecture_version, bits [19:16]**

The version of the GIC architecture that is implemented.

<table>
<thead>
<tr>
<th>Architecture_version</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>GICv1.</td>
</tr>
<tr>
<td>0b0010</td>
<td>GICv2.</td>
</tr>
<tr>
<td>0b0011</td>
<td>GICv3 memory-mapped interface supported. Support for the System register interface is discoverable from PE registers ID_PFR1 and ID_AA64PFR0_EL1.</td>
</tr>
<tr>
<td>0b0100</td>
<td>GICv4 memory-mapped interface supported. Support for the System register interface is discoverable from PE registers ID_PFR1 and ID_AA64PFR0_EL1.</td>
</tr>
</tbody>
</table>

Other values are reserved.

**Revision, bits [15:12]**

An *IMPLEMENTATION DEFINED* revision number for the CPU interface.

**Implementer, bits [11:0]**

Contains the JEP106 code of the company that implemented the CPU interface.

- Bits [11:8] are the JEP106 continuation code of the implementer. For an Arm implementation, this field is 0x4.
- Bit [7] is always 0.
- Bits [6:0] are the JEP106 identity code of the implementer. For an Arm implementation, bits [7:0] are therefore 0x3B.

**Accessing the GICV_IIDR**

**GICV_IIDR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual CPU interface</td>
<td>0x00FC</td>
<td>GICV_IIDR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- When GICD_CTLR.DS == 0b0 accesses to this register are **RO**.
- When IsAccessSecure() accesses to this register are **RO**.
- When !IsAccessSecure() accesses to this register are **RO**.

Copyright © 2010-2019 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.
The GICV_PMR characteristics are:

**Purpose**

This register provides a virtual interrupt priority filter. Only virtual interrupts with a higher priority than the value in this register are signaled to the PE.

**Note**

Higher interrupt priority corresponds to a lower value of the Priority field.

This register corresponds to the physical CPU interface register GICC_PMR.

**Configuration**

RW fields in this register reset to architecturally **UNKNOWN** values.

This register is available when the GIC implementation supports interrupt virtualization.

The Priority field of this register is aliased to GICH_VMCR.VMPR, to enable state to be switched easily between virtual machines during context-switching.

**Attributes**

GICV_PMR is a 32-bit register.

**Field descriptions**

The GICV_PMR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>Priority</td>
<td></td>
<td></td>
<td></td>
<td></td>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**Priority, bits [7:0]**

The priority mask level for the virtual CPU interface. If the priority of the interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

If the GIC implementation supports fewer than 256 priority levels some bits might be RAZ/WI, as follows:

- For 128 supported levels, bit [0] = 0b0.
- For 64 supported levels, bits [1:0] = 0b00.
- For 32 supported levels, bits [2:0] = 0b000.
- For 16 supported levels, bits [3:0] = 0b0000.

See Interrupt prioritization, section 4.8 of the GICv3 Architecture Specification for more information.

This field resets to an architecturally **UNKNOWN** value.
Accessing the GICV_PMR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_PMR provides equivalent functionality.
- For AArch64 implementations, ICC_PMR_EL1 provides equivalent functionality.

GICV_PMR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual CPU</td>
<td>0x0004</td>
<td>GICV_PMR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RW.
- When IsAccessSecure() accesses to this register are RW.
- When !IsAccessSecure() accesses to this register are RW.
GICV_RPR, Virtual Machine Running Priority Register

The GICV_RPR characteristics are:

**Purpose**

This register indicates the running priority of the virtual CPU interface.

This register corresponds to the physical CPU interface register GICC_RPR.

**Configuration**

This register is available when the GIC implementation supports interrupt virtualization.

**Attributes**

GICV_RPR is a 32-bit register.

**Field descriptions**

The GICV_RPR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | Priority |

**Bits [31:8]**

Reserved, RES0.

**Priority, bits [7:0]**

The current running priority on the virtual CPU interface. This is the group priority of the current active interrupt.

If there are no active interrupts on the CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

The priority returned is the group priority as if the BPR was set to the minimum value.

**Accessing the GICV_RPR**

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_RPR provides equivalent functionality.
- For AArch64 implementations, ICC_RPR_EL1 provides equivalent functionality.

Depending on the implementation, if no bits are set to 1 in GICH_APR<n>, indicating no active virtual interrupts in the virtual CPU interface, the priority reads as 0xFF or 0xF8 to reflect the number of supported interrupt priority bits defined by GICH_VTR_PRIbits.

**GICV_RPR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual CPU interface</td>
<td>0x0014</td>
<td>GICV_RPR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
• When GICD_CTLR.DS == 0b0 accesses to this register are \textbf{RO}.
• When IsAccessSecure() accesses to this register are \textbf{RO}.
• When \texttt{!IsAccessSecure()} accesses to this register are \textbf{RO}.
GICV_STATUSR, Virtual Machine Error Reporting Status Register

The GICV_STATUSR characteristics are:

**Purpose**

Provides software with a mechanism to detect:

- Accesses to reserved locations.
- Writes to read-only locations.
- Reads of write-only locations.

**Configuration**

In systems where this register is implemented, Arm expects that when a virtual machine is scheduled, the hypervisor ensures that this register is cleared to 0. The hypervisor might check for illegal accesses when the virtual machine is unscheduled.

**Attributes**

GICV_STATUSR is a 32-bit register.

**Field descriptions**

The GICV_STATUSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>

**WROD, bit [3]**

<table>
<thead>
<tr>
<th>WROD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>01</td>
<td>A write to an RO location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.

**RWOD, bit [2]**

<table>
<thead>
<tr>
<th>RWOD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>01</td>
<td>A read of a WO location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.
WRD, bit [1]

Write to a reserved location.

<table>
<thead>
<tr>
<th>WRD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A write to a reserved location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.

RRD, bit [0]

Read of a reserved location.

<table>
<thead>
<tr>
<th>RRD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>A read of a reserved location has been detected.</td>
</tr>
</tbody>
</table>

When a violation is detected, software must write 1 to this register to reset it.

Accessing the GICV_STATUSR

This is an optional register. If the register is implemented, GICC_STATUSR must also be implemented. If the register is not implemented, the location is RAZ/WI.

This register is used only when System register access is not enabled. If System register access is enabled, this register is not updated. Equivalent function might be provided by appropriate traps and exceptions.

GICV_STATUSR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC Virtual CPU interface</td>
<td>0x002C</td>
<td>GICV_STATUSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
The GITS_BASER<n> characteristics are:

**Purpose**

Specifies the base address and size of the ITS translation tables.

**Configuration**

Some or all RW fields of this register have defined reset values.

A copy of this register is provided for each ITS translation table.

Bits [63:32] and bits [31:0] are accessible independently.

A maximum of 8 GITS_BASER<n> registers can be provided. Unimplemented registers are RES0.

When GITS_CTLR Enabled == 1 or GITS_CTLR Quiescent == 0, writing this register is UNPREDICTABLE.

**Attributes**

GITS_BASER<n> is a 64-bit register.

**Field descriptions**

The GITS_BASER<n> bit assignments are:

<p>|       | 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  | 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|</p>
<table>
<thead>
<tr>
<th>Valid</th>
<th>Indirect</th>
<th>InnerCache</th>
<th>Type</th>
<th>OuterCache</th>
<th>Entry Size</th>
<th>Physical Address</th>
<th>Shareability</th>
<th>Page Size</th>
<th>Size</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>31</td>
<td>30</td>
<td>29</td>
<td>28</td>
</tr>
</tbody>
</table>

**Valid, bit [63]**

Indicates whether software has allocated memory for the translation table:

<table>
<thead>
<tr>
<th>Valid</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No memory is allocated for the translation table. The ITS discards any writes to the interrupt translation page when either:</td>
</tr>
<tr>
<td></td>
<td>• GITS_BASER&lt;n&gt;.Type specifies any valid table entry type other than interrupt collections, that is, any value other than 0b100.</td>
</tr>
<tr>
<td></td>
<td>• GITS_BASER&lt;n&gt;.Type specifies an interrupt collection and GITS_TYPER.HCC == 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Memory is allocated to the translation table.</td>
</tr>
</tbody>
</table>

This field resets to 0.

**Indirect, bit [62]**

This field indicates whether an implemented register specifies a single, flat table or a two-level table where the first level contains a list of descriptors.
Indirect

<table>
<thead>
<tr>
<th>Indirect</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Single Level. The Size field indicates the number of pages used by the ITS to store data associated with each table entry.</td>
</tr>
<tr>
<td>0b1</td>
<td>Two Level. The Size field indicates the number of pages which contain an array of 64-bit descriptors to pages that are used to store the data associated with each table entry. A little endian memory order model is used.</td>
</tr>
</tbody>
</table>

See The ITS tables for more information.

This field is RAZ/WI for GIC implementations that only support flat tables. If the maximum width of the scaling factor that is identified by GITS_BASER<n>.Type and the smallest page size that is supported result in a single level table that requires multiple pages, then implementing this bit as RAZ/WI is DEPRECATED.

This field resets to an architecturally UNKNOWN value.

**InnerCache, bits [61:59]**

Indicates the Inner Cacheability attributes of accesses to the table. The possible values of this field are:

<table>
<thead>
<tr>
<th>InnerCache</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Device-nGnRnE.</td>
</tr>
<tr>
<td>0b001</td>
<td>Normal Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b010</td>
<td>Normal Inner Cacheable Read-allocate, Write-through.</td>
</tr>
<tr>
<td>0b011</td>
<td>Normal Inner Cacheable Read-allocate, Write-back.</td>
</tr>
<tr>
<td>0b100</td>
<td>Normal Inner Cacheable Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b101</td>
<td>Normal Inner Cacheable Write-allocate, Write-back.</td>
</tr>
<tr>
<td>0b110</td>
<td>Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b111</td>
<td>Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**Type, bits [58:56]**

Read only. Specifies the type of entity that requires entries in the corresponding translation table. The possible values of the field are:

<table>
<thead>
<tr>
<th>Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Unimplemented. This register does not correspond to a translation table.</td>
</tr>
<tr>
<td>0b001</td>
<td>Devices. This register corresponds to a translation table that scales with the width of the DeviceID. Only a single GITS_BASER&lt;n&gt; register reports this type.</td>
</tr>
<tr>
<td>0b010</td>
<td>vPEs. GICv4 only. This register corresponds to a translation table that scales with the number of vPEs in the system. The translation table requires (ENTRY_SIZE * N) bytes of memory, where N is the number of vPEs in the system. Only a single GITS_BASER&lt;n&gt; register reports this type.</td>
</tr>
<tr>
<td>0b100</td>
<td>Interrupt collections. This register corresponds to a translation table that scales with the number of interrupt collections in the system. The translation table requires (ENTRY_SIZE * N) bytes of memory, where N is the number of interrupt collections. Not more than one GITS_BASER&lt;n&gt; register will report this type.</td>
</tr>
</tbody>
</table>

Other values are reserved.

**Note**

The minimum number of entries that an ITS must support is N+1, where N is the number of physical PEs in the system.

Arm recommends that the GITS_BASER<n> registers are allocated as follows:

- GITS_BASER0.Type is 0b001 (Device).
• GITS_BASER1.Type is either 0b100 (Collection Table) or 0b000 (Unimplemented).

• GITS_BASER2.Type is either 0b010 (vPE) or 0b000 (Unimplemented).

• GITS_BASER<n>.Type, where ‘n’ is in the range 3 to 7, is 0b000 (Unimplemented).

Other allocations of Type values are deprecated.

This field resets to an architecturally UNKNOWN value.

**OuterCache, bits [55:53]**

Indicates the Outer Cacheability attributes of accesses to the table. The possible values of this field are:

<table>
<thead>
<tr>
<th>OuterCache</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.</td>
</tr>
<tr>
<td>0b001</td>
<td>Normal Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b010</td>
<td>Normal Outer Cacheable Read-allocate, Write-through.</td>
</tr>
<tr>
<td>0b011</td>
<td>Normal Outer Cacheable Read-allocate, Write-back.</td>
</tr>
<tr>
<td>0b100</td>
<td>Normal Outer Cacheable Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b101</td>
<td>Normal Outer Cacheable Write-allocate, Write-back.</td>
</tr>
<tr>
<td>0b110</td>
<td>Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b111</td>
<td>Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.</td>
</tr>
</tbody>
</table>

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

This field resets to an architecturally UNKNOWN value.

**Entry_Size, bits [52:48]**

Read-only. Specifies the number of bytes per translation table entry, minus one.

**Physical_Address, bits [47:12]**

Physical Address. When Page_Size is 4KB or 16KB:

• Bits [51:48] of the base physical address are zero.
• This field provides bits[47:12] of the base physical address of the table.
• Bits[11:0] of the base physical address are zero.
• The address must be aligned to the size specified in the Page Size field. Otherwise the effect is CONSTRAINED UNPREDICTABLE, and can be one of the following:
  ◦ Bits[X:12], where X is derived from the page size, are treated as zero.
  ◦ The value of bits[X:12] are used when calculating the address of a table access.

When Page_Size is 64KB:

• Bits[47:16] of the register provide bits[47:16] of the base physical address of the table.
• Bits[15:12] of the register provide bits[51:48] of the base physical address of the table.
• Bits[15:0] of the base physical address are 0.

In implementations that support fewer than 52 bits of physical address, any unimplemented upper bits might be RAZ/WI.

This field resets to an architecturally UNKNOWN value.

**Shareability, bits [11:10]**

Indicates the Shareability attributes of accesses to the table. The possible values of this field are:
It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

This field resets to an architecturally UNKNOWN value.

**Page_Size, bits [9:8]**

The size of page that the translation table uses:

<table>
<thead>
<tr>
<th>Page_Size</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>4KB.</td>
</tr>
<tr>
<td>0b01</td>
<td>16KB.</td>
</tr>
<tr>
<td>0b10</td>
<td>64KB.</td>
</tr>
<tr>
<td>0b11</td>
<td>Reserved. Treated as 0b10.</td>
</tr>
</tbody>
</table>

Note

If the GIC implementation supports only a single, fixed page size, this field might be RO.

This field resets to an architecturally UNKNOWN value.

**Size, bits [7:0]**

The number of pages of physical memory allocated to the table, minus one. GITS_BASER<n>.Page_Size specifies the size of each page.

If GITS_BASER<n>.Type == 0, this field is RAZ/WI.

This field resets to an architecturally UNKNOWN value.

**Accessing the GITS_BASER<n>**

GITS_BASER<n> can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC ITS control</td>
<td>0x0100 + 8n</td>
<td>GITS_BASER&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTRL.DS == 0b0 accesses to this register are RW.
- When IsAccessSecure() accesses to this register are RW.
- When !IsAccessSecure() accesses to this register are RW.
The GITS_CBASER characteristics are:

**Purpose**

Specifies the base address and size of the ITS command queue.

**Configuration**

Some or all RW fields of this register have defined reset values.

Bits [63:32] and bits [31:0] are accessible separately.

**Attributes**

GITS_CBASER is a 64-bit register.

**Field descriptions**

The GITS_CBASER bit assignments are:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**Valid, bit [63]**

Indicates whether software has allocated memory for the command queue:

<table>
<thead>
<tr>
<th>Valid</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No memory is allocated for the command queue.</td>
</tr>
<tr>
<td>0b1</td>
<td>Memory is allocated to the command queue.</td>
</tr>
</tbody>
</table>

This field resets to 0.

**Bit [62]**

Reserved, RES0.

**InnerCache, bits [61:59]**

Indicates the Inner Cacheability attributes of accesses to the command queue. The possible values of this field are:

<table>
<thead>
<tr>
<th>InnerCache</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Device-nGnRnE.</td>
</tr>
<tr>
<td>0b001</td>
<td>Normal Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b010</td>
<td>Normal Inner Cacheable Read-allocate, Write-through.</td>
</tr>
<tr>
<td>0b011</td>
<td>Normal Inner Cacheable Read-allocate, Write-back.</td>
</tr>
<tr>
<td>0b100</td>
<td>Normal Inner Cacheable Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b101</td>
<td>Normal Inner Cacheable Write-allocate, Write-back.</td>
</tr>
<tr>
<td>0b110</td>
<td>Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b111</td>
<td>Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.
Bits [58:56]

Reserved, RES0.

OuterCache, bits [55:53]

Indicates the Outer Cacheability attributes of accesses to the command queue. The possible values of this field are:

<table>
<thead>
<tr>
<th>OuterCache</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.</td>
</tr>
<tr>
<td>0b001</td>
<td>Normal Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b010</td>
<td>Normal Outer Cacheable Read-allocate, Write-through.</td>
</tr>
<tr>
<td>0b011</td>
<td>Normal Outer Cacheable Read-allocate, Write-back.</td>
</tr>
<tr>
<td>0b100</td>
<td>Normal Outer Cacheable Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b101</td>
<td>Normal Outer Cacheable Write-allocate, Write-back.</td>
</tr>
<tr>
<td>0b110</td>
<td>Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.</td>
</tr>
<tr>
<td>0b111</td>
<td>Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.</td>
</tr>
</tbody>
</table>

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

This field resets to an architecturally UNKNOWN value.

Bit [52]

Reserved, RES0.

Physical_Address, bits [51:12]

Bits [51:12] of the base physical address of the command queue. Bits [11:0] of the base address are 0.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

If bits [15:12] are not all zeros, behavior is a CONSTRAINED UNPREDICTABLE choice:

- Bits [15:12] are treated as if all the bits are zero. The value read back from those bits is either the value written or zero.
- The result of the calculation of an address for a command queue read can be corrupted.

This field resets to an architecturally UNKNOWN value.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the command queue. The possible values of this field are:

<table>
<thead>
<tr>
<th>Shareability</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Inner Shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Reserved. Treated as 0b00.</td>
</tr>
</tbody>
</table>

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

This field resets to an architecturally UNKNOWN value.

Bits [9:8]

Reserved, RES0.
Size, bits [7:0]

The number of 4KB pages of physical memory allocated to the command queue, minus one.

This field resets to an architecturally UNKNOWN value.

The command queue is a circular buffer and wraps at Physical Address [47:0] + (4096 * (Size + 1)).

Note

When this register is successfully written, the value of GITS_CREADR is set to zero.

Accessing the GITS_CBASER

When GITS_CTLR. Enabled == 1 or GITS_CTLR. Quiescent == 0, writing this register is UNPREDICTABLE.

GITS_CBASER can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC ITS control</td>
<td>0x0080</td>
<td>GITS_CBASER</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RW.
- When IsAccessSecure() accesses to this register are RW.
- When !IsAccessSecure() accesses to this register are RW.
GITS_CREADR, ITS Read Register

The GITS_CREADR characteristics are:

Purpose

Specifies the offset from GITS_CBASER where the ITS reads the next ITS command.

Configuration

This register is cleared to 0 when a value is written to GITS_CBASER.

Bits [63:32] and bits [31:0] are accessible separately.

Attributes

GITS_CREADR is a 64-bit register.

Field descriptions

The GITS_CREADR bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    | RES0 |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

RES0

Offset

Stalled

Bits [63:20]  
Reserved, RES0.

Offset, bits [19:5]

Bits [4:1]

Reserved, RES0.

Stalled, bit [0]

Reports whether the processing of commands is stalled because of a command error.

<table>
<thead>
<tr>
<th>Stalled</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ITS command queue is not stalled because of a command error.</td>
</tr>
<tr>
<td>0b1</td>
<td>ITS command queue is stalled because of a command error.</td>
</tr>
</tbody>
</table>

See The ITS Command Interface for more information.

Accessing the GITS_CREADR

GITS_CREADR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RO**.
- When IsAccessSecure() accesses to this register are **RO**.
- When !IsAccessSecure() accesses to this register are **RO**.
GITS_CTLR, ITS Control Register

The GITS_CTLR characteristics are:

**Purpose**

Controls the operation of an ITS.

**Configuration**

Some or all RW fields of this register have defined reset values.

The ITS_Number (bits [7:4]) and bit [1] fields apply only in GICv4 implementations, and are RES0 in GICv3 implementations.

**Attributes**

GITS_CTLR is a 32-bit register.

**Field descriptions**

The GITS_CTLR bit assignments are:

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Quiescent | RES0 | ITS_Number | RES0 | ImDe | Enabled |

**Quiescent, bit [31]**

Read-only. Indicates completion of all ITS operations when GITS_CTLR.Enabled == 0.

<table>
<thead>
<tr>
<th>Quiescent</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The ITS is not quiescent and cannot be powered down.</td>
</tr>
<tr>
<td>0b1</td>
<td>The ITS is quiescent and can be powered down.</td>
</tr>
</tbody>
</table>

For the ITS to be quiescent, there must be no transactions in progress. In addition, all operations required to ensure that mapping data is consistent with external memory must be complete.

**Note**

In distributed GIC implementations, this bit is set to 1 only after the ITS forwards any operations that have not yet been completed to the Redistributors and receives confirmation that all such operations have reached the appropriate Distributor.

When GITS_CTLR.Enabled==1 the value of GITS_CTLR.Quiescent is UNKNOWN.

This field resets to 1.

**Bits [30:8]**

Reserved, RES0.

**ITS_Number, bits [7:4]**

In GICv3 implementations this is RES0.

In GICv4 implementations with more than one ITS instance, this field indicates the ITS number for use with VMOVP.
It is **IMPLEMENTATION DEFINED** whether this field is programmable or RO.

If this field is programmable, changing this field when GITS_CTLR.Quiescent==0 or GITS_CTLR.Enabled==1 is **UNPREDICTABLE**.

This field resets to an architecturally **UNKNOWN** value.

**Bits [3:2]**

Reserved, RES0.

**ImDe, bit [1]**

In GICv3 implementations this bit is RES0.

In GICv4 implementations this bit is **IMPLEMENTATION DEFINED**.

This field resets to 0.

**Enabled, bit [0]**

Controls whether the ITS is enabled:

<table>
<thead>
<tr>
<th>Enabled</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The ITS is not enabled. Writes to GITS_TRANSLATER are ignored and no further command queue entries are processed.</td>
</tr>
<tr>
<td>0b1</td>
<td>The ITS is enabled. Writes to GITS_TRANSLATER result in interrupt translations and the command queue is processed.</td>
</tr>
</tbody>
</table>

If a write to this register changes this field from 1 to 0, the ITS must ensure that both:

- Any caches containing mapping data are made consistent with external memory.
- GITS_CTLR.Quiescent == 0 until all caches are consistent with external memory.

Changing GITS_CTLR.Enabled from 0 to 1 when GITS_CTLR.Quiescent is 0 results in **UNPREDICTABLE** behavior.

This field resets to 0.

**Accessing the GITS_CTLR**

**GITS_CTLR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC ITS control</td>
<td>0x0000</td>
<td>GITS_CTLR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.
GITS_CWRITER, ITS Write Register

The GITS_CWRITER characteristics are:

**Purpose**

Specifies the offset from GITS_CBASER where software writes the next ITS command.

**Configuration**

RW fields in this register reset to architecturally UNKNOWN values.

Bits [63:32] and bits [31:0] are accessible separately.

**Attributes**

GITS_CWRITER is a 64-bit register.

**Field descriptions**

The GITS_CWRITER bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

**Bits [63:20]**

Reserved, RES0.

**Offset, bits [19:5]**

This field resets to an architecturally UNKNOWN value.

**Bits [4:1]**

Reserved, RES0.

**Retry, bit [0]**

Writing this bit has the following effects:

<table>
<thead>
<tr>
<th>Retry</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No effect on the processing commands by the ITS.</td>
</tr>
<tr>
<td>0b1</td>
<td>Restart the processing of commands by the ITS if it stalled because of a command error.</td>
</tr>
</tbody>
</table>

**Note**

If the processing of commands is not stalled because of a command error, writing 1 to this bit has no effect.

When read, this bit is RES0.
See The ITS Command Interface for more information.

If GITS_CWRITER is written with a value outside of the valid range specified by GITS_CBASER.Physical_Address and GITS_CBASER.Size, behavior is a CONSTRAINED UNPREDICTABLE choice, as follows:

- The command queue is considered invalid, and no further commands are processed until GITS_CWRITER is written with a value that is in the valid range.
- The value is treated as a valid UNKNOWN value.

An implementation might choose to report a system error in an IMPLEMENTATION DEFINED manner.

Accessing the GITS_CWRITER

GITS_CWRITER can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC ITS control</td>
<td>0x0088</td>
<td>GITS_CWRITER</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RW.
- When IsAccessSecure() accesses to this register are RW.
- When !IsAccessSecure() accesses to this register are RW.
GITS_IIDR, ITS Identification Register

The GITS_IIDR characteristics are:

**Purpose**

Provides information about the implementer and revision of the ITS.

**Configuration**

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states, this register is Common.

**Attributes**

GITS_IIDR is a 32-bit register.

**Field descriptions**

The GITS_IIDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-24</td>
<td>ProductID</td>
</tr>
<tr>
<td>23-20</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>19-16</td>
<td>Variant</td>
</tr>
<tr>
<td>15-12</td>
<td>Revision</td>
</tr>
<tr>
<td>11-0</td>
<td>Implementer</td>
</tr>
</tbody>
</table>

**ProductID, bits [31:24]**

An IMPLEMENTATION DEFINED product identifier.

**Bits [23:20]**

Reserved, RES0.

**Variant, bits [19:16]**

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish product variants, or major revisions of a product.

**Revision, bits [15:12]**

An IMPLEMENTATION DEFINED revision number. Typically, this field is used to distinguish minor revisions of a product.

**Implementer, bits [11:0]**

Contains the JEP106 code of the company that implemented the ITS:

- Bits [11:8] are the JEP106 continuation code of the implementer. For an Arm implementation, this field is 0x4.
- Bit [7] is always 0.
- Bits [6:0] are the JEP106 identity code of the implementer. For an Arm implementation, bits [7:0] are therefore 0x3B.
Accessing the GITS_IIDR

GITS_IIDR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC ITS control</td>
<td>0x0004</td>
<td>GITS_IIDR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RO.
- When IsAccessSecure() accesses to this register are RO.
- When !IsAccessSecure() accesses to this register are RO.
GITS_MPAMIDR, Report maximum PARTID and PMG Register

The GITS_MPAMIDR characteristics are:

**Purpose**

Reports the maximum support PARTID and PMG values.

**Configuration**

This register is present only when GIC, >=3.1 is implemented. Otherwise, direct accesses to GITS_MPAMIDR are RES0.

A copy of this register is provided for each ITS.

When GITS_TYPER.MPAM==0, this register is RES0.

**Attributes**

GITS_MPAMIDR is a 32-bit register.

**Field descriptions**

The GITS_MPAMIDR bit assignments are:

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |
|---------------------------------|---------------------------------|-------------------------------|
| RES0   PMGmax   PARTIDmax         |

**Bits [31:24]**

Reserved, RES0.

**PMGmax, bits [23:16]**

Maximum PMG value supported.

**PARTIDmax, bits [15:0]**

Maximum PARTID value supported.

**Accessing the GITS_MPAMIDR**

GITS_MPAMIDR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC ITS control</td>
<td>0x0010</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTRLR.DS == 0b0 accesses to this register are RO.
- When IsAccessSecure() accesses to this register are RO.
- When !IsAccessSecure() accesses to this register are RO.
GITS_PARTIDR, Set PARTID and PMG Register

The GITS_PARTIDR characteristics are:

**Purpose**

Sets the PARTID and PMG values used for memory accesses by the ITS.

**Configuration**

This register is present only when GIC, >=3.1 is implemented. Otherwise, direct accesses to GITS_PARTIDR are RES0. A copy of this register is provided for each ITS.

When GITS_TYPER.MPAM==0, this register is RES0.

**Attributes**

GITS_PARTIDR is a 32-bit register.

**Field descriptions**

The GITS_PARTIDR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | PMG | PARTID |

**Bits [31:24]**

Reserved, RES0.

**PMG, bits [23:16]**

PMG value used when ITS accesses memory.

It is IMPLEMENTATION DEFINED whether bits not needed to represent PMG values in the range 0 to PMG_MAX are stateful or RES0.

**PARTID, bits [15:0]**

PARTID value used when ITS accesses memory.

It is IMPLEMENTATION DEFINED whether bits not needed to represent PARTID values in the range 0 to PARTID_MAX are stateful or RES0.

**Accessing the GITS_PARTIDR**

GITS_PARTIDR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC ITS control</td>
<td>0x0014</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTRLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
• When !IsAccessSecure() accesses to this register are **RW**.
GITS_TRANSLATER, ITS Translation Register

The GITS_TRANSLATER characteristics are:

**Purpose**

Written by a requesting Device to signal an interrupt for translation by the ITS.

**Configuration**

This register is at the same offset as **GICD_SETSPI_NSR** in the Distributor, and is at the same offset as **GICR_SETLPIR** in the Redistributor.

**Attributes**

GITS_TRANSLATER is a 32-bit register.

**Field descriptions**

The GITS_TRANSLATER bit assignments are:

```
 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10  9  8  7  6  5  4  3  2  1  0
```

**EventID, bits [31:0]**

An identifier corresponding to the interrupt to be translated.

**Note**

The size of the EventID is DeviceID specific, and set when the DeviceID is mapped to an ITT (using **MAPD**).

The number of EventID bits implemented is reported by **GITS_TYPER_ID_bits**. If a write specifies non-zero identifiers bits outside this range behavior is a **CONSTRAINED UNPREDICTABLE** choice between:

- Non-zero identifier bits outside the supported range are ignored.
- The write is ignored.

The DeviceID presented to an ITS is used to index a device table. The device table maps the DeviceID to an interrupt translation table for that device.

**Accessing the GITS_TRANSLATER**

16-bit access to bits [15:0] of this register must be supported. When this register is written by a 16-bit transaction, bits [31:16] are written as zero.

Implementations must ensure that:

- A unique DeviceID is provided for each requesting device, and the DeviceID is presented to the ITS when a write to this register occurs in a manner that cannot be spoofed by any agent capable of performing writes.
- The DeviceID presented corresponds to the DeviceID field in the ITS commands.

Writes to this register are ignored if any of the following are true:

- **GITS_CTLR**.Enabled == 0.
- The presented DeviceID is not mapped to an Interrupt Translation Table.
- The DeviceID is larger than the supported size.
The DeviceID is mapped to an Interrupt Translation Table, but the EventID is outside the range specified by MAPD.

The EventID is mapped to an Interrupt Translation Table and the EventID is within the range specified by MAPD, but the EventID is unmapped.

Translation requests that result from writes to this register are subject to certain ordering rules. See Ordering of translations following writes to GITS_TRANSLATER for more information.

**GITS_TRANSLATER can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC ITS translation</td>
<td>0x0040</td>
<td>GITS_TRANSLATER</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **WO**.
- When IsAccessSecure() accesses to this register are **WO**.
- When !IsAccessSecure() accesses to this register are **WO**.
GITS_TYPER, ITS Type Register

The GITS_TYPER characteristics are:

**Purpose**

Specifies the features that an ITS supports.

**Configuration**

**Attributes**

GITS_TYPER is a 64-bit register.

**Field descriptions**

The GITS_TYPER bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:39]</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>MPAM, bit [38]</strong> When GIC, &gt;=3.1 is implemented:</td>
<td></td>
</tr>
<tr>
<td>MPAM</td>
<td>Meaning</td>
</tr>
<tr>
<td>0b0</td>
<td>MPAM not supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAM supported.</td>
</tr>
<tr>
<td>Otherwise:</td>
<td></td>
</tr>
<tr>
<td>Reserved, RES0.</td>
<td></td>
</tr>
<tr>
<td><strong>VMOVP, bit [37]</strong> Indicates the form of the VMOVP command.</td>
<td></td>
</tr>
<tr>
<td>VMOVP</td>
<td>Meaning</td>
</tr>
<tr>
<td>0b0</td>
<td>When moving a vPE, software must issue a VMOVP on all ITSs that have mappings for that vPE. The ITSList and Sequence Number fields in the VMOVP command must ensure synchronization, otherwise behavior is UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b1</td>
<td>When moving a vPE, software must only issue a VMOVP on one of the ITSs that has a mapping for that vPE. The ITSList and Sequence Number fields in the VMOVP command are RES0.</td>
</tr>
</tbody>
</table>
CIL, bit [36]

Collection ID Limit.

<table>
<thead>
<tr>
<th>CIL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ITS supports 16-bit Collection ID. GITS_TYPER.CIDbits is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>GITS_TYPER.CIDbits indicates supported Collection ID size</td>
</tr>
</tbody>
</table>

In implementations that do not support Collections in external memory, this bit is RES0 and the number of Collections supported is reported by GITS_TYPER.HCC.

CIDbits, bits [35:32]

Number of Collection ID bits.

- The number of bits of Collection ID - 1.
- When GITS_TYPER.CIL==0, this field is RES0.

HCC, bits [31:24]

Hardware Collection Count. The number of interrupt collections supported by the ITS without provisioning of external memory.

---

Note

Collections held in hardware are unmapped at reset.

Bits [23:20]

Reserved, RES0.

PTA, bit [19]

Physical Target Addresses. Indicates the format of the target address:

<table>
<thead>
<tr>
<th>PTA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The target address corresponds to the PE number specified by GICR_TYPER.Processor_Number.</td>
</tr>
<tr>
<td>0b1</td>
<td>The target address corresponds to the base physical address of the required Redistributor.</td>
</tr>
</tbody>
</table>

See Target addresses for more information.

SEIS, bit [18]

SEI support. Indicates whether the virtual CPU interface supports generation of SEIs:

<table>
<thead>
<tr>
<th>SEIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The ITS does not support local generation of SEIs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The ITS supports local generation of SEIs.</td>
</tr>
</tbody>
</table>

Devbits, bits [17:13]

The number of DeviceID bits implemented, minus one.

ID_bits, bits [12:8]

The number of EventID bits implemented, minus one.
**ITT_entry_size, bits [7:4]**

Read-only. Indicates the number of bytes per translation table entry, minus one.

See the ITS command 'MAPD' for more information.

**IMPLEMENTATION DEFINED, bit [3]**

IMPLEMENTATION DEFINED.

**CCT, bit [2]**

Cumulative Collection Tables.

<table>
<thead>
<tr>
<th>CCT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The total number of supported collections is determined by the number of collections held in memory only.</td>
</tr>
<tr>
<td>0b1</td>
<td>The total number of supported collections is determined by number of collections that are held in memory and the number indicated by GITS_TYPER.HCC.</td>
</tr>
</tbody>
</table>

If GITS_TYPER.HCC==0, or if memory backed collections are not supported (all GITS_BASER<n>_Type != 100), this bit is RES0.

**Virtual, bit [1]**

Indicates whether the ITS supports virtual LPIs and direct injection of virtual LPIs:

<table>
<thead>
<tr>
<th>Virtual</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The ITS does not support virtual LPIs or direct injection of virtual LPIs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The ITS supports virtual LPIs and direct injection of virtual LPIs.</td>
</tr>
</tbody>
</table>

This field is RES0 in GICv3 implementations.

**Physical, bit [0]**

Indicates whether the ITS supports physical LPIs:

<table>
<thead>
<tr>
<th>Physical</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The ITS does not support physical LPIs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The ITS supports physical LPIs.</td>
</tr>
</tbody>
</table>

This field is RES1, indicating that the ITS supports physical LPIs.

**Accessing the GITS_TYPER**

GITS_TYPER can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC ITS control</td>
<td>0x0008</td>
<td>GITS_TYPER</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are RO.
- When IsAccessSecure() accesses to this register are RO.
- When !IsAccessSecure() accesses to this register are RO.
The MIDR_EL1 characteristics are:

**Purpose**

Provides identification information for the PE, including an implementer code for the device and a device ID number.

**Configuration**

External register MIDR_EL1 bits [31:0] are architecturally mapped to AArch64 System register \texttt{MIDR[31:0]}.

External register MIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register \texttt{MIDR[31:0]}.

It is \texttt{IMPLEMENTATION DEFINED} whether MIDR_EL1 is implemented in the Core power domain or in the Debug power domain.

**Attributes**

MIDR_EL1 is a 32-bit register.

**Field descriptions**

The MIDR_EL1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Implementer | Variant | Architecture | PartNum | Revision |

**Implementer, bits [31:24]**

The Implementer bits [31:24] must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

<table>
<thead>
<tr>
<th>Hex representation</th>
<th>Implementer</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x00</td>
<td>Reserved for software use</td>
</tr>
<tr>
<td>0xC0</td>
<td>Ampere Computing</td>
</tr>
<tr>
<td>0x41</td>
<td>Arm Limited</td>
</tr>
<tr>
<td>0x42</td>
<td>Broadcom Corporation</td>
</tr>
<tr>
<td>0x43</td>
<td>Cavium Inc.</td>
</tr>
<tr>
<td>0x44</td>
<td>Digital Equipment Corporation</td>
</tr>
<tr>
<td>0x46</td>
<td>Fujitsu Ltd.</td>
</tr>
<tr>
<td>0x49</td>
<td>Infineon Technologies AG</td>
</tr>
<tr>
<td>0x40</td>
<td>Motorola or Freescale Semiconductor Inc.</td>
</tr>
<tr>
<td>0x4E</td>
<td>NVIDIA Corporation</td>
</tr>
<tr>
<td>0x58</td>
<td>Applied Micro Circuits Corporation</td>
</tr>
<tr>
<td>0x51</td>
<td>Qualcomm Inc.</td>
</tr>
<tr>
<td>0x56</td>
<td>Marvell International Ltd.</td>
</tr>
<tr>
<td>0x69</td>
<td>Intel Corporation</td>
</tr>
</tbody>
</table>

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

**Variant, bits [23:20]**

An \texttt{IMPLEMENTATION DEFINED} variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.
Architecture, bits [19:16]

The permitted values of this field are:

<table>
<thead>
<tr>
<th>Architecture</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>Armv4.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Armv4T.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Armv5 (obsolete).</td>
</tr>
<tr>
<td>0b0100</td>
<td>Armv5T.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Armv5TE.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Armv5TEJ.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Armv6.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Architectural features are individually identified in the ID_* registers, see ID registers in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile</td>
</tr>
</tbody>
</table>

All other values are reserved.

PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.

Accessing the MIDR_EL1

MIDR_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xD00</td>
<td>MIDR_EL1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are RO.
- Otherwise accesses to this register are IMPDEF.
The MPAMCFG_CMAX characteristics are:

**Purpose**

The MPAMCFG_CMAX is a 32-bit read-write register that controls the maximum fraction of the cache capacity that the PARTID selected by MPAMCFG_PART_SEL is permitted to allocate. MPAMCFG_CMAX_s controls cache maximum capacity for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_CMAX_ns controls the cache maximum capacity for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

**Configuration**

The power domain of MPAMCFG_CMAX is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_CCAP_PART == 1. Otherwise, direct accesses to MPAMCFG_CMAX are RES0.

**Attributes**

MPAMCFG_CMAX is a 32-bit register.

**Field descriptions**

The MPAMCFG_CMAX bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>CMAX</td>
<td></td>
<td></td>
<td></td>
<td></td>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**CMAX, bits [15:0]**

Maximum cache capacity usage in fixed-point fraction format by the partition selected by MPAMCFG_PART_SEL. The fraction represents the portion of the total cache capacity that the PARTID is permitted to allocate.

The implemented width of the fixed-point fraction is given in MPAMF_CCAP_IDR.CMAX WD. Unimplemented bits within the field are RAZ/WI. The implemented bits of the CMAX field are always the most-significant bits of the field.

The fixed-point fraction CMAX is less than 1. The implied binary point is between bits 15 and 16. This representation has as the largest fraction of the cache that can be represented in an implementation with w implemented bits is 1 - 1/ w.

**Accessing the MPAMCFG_CMAX**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_CMAX_s must be accessible from the Secure MPAM feature page. MPAMCFG_CMAX_ns must be accessible from the Non-secure MPAM feature page.
MPAMCFG_CMAX_s and MPAMCFG_CMAX_ns must be separate registers. The Secure instance (MPAMCFG_CMAX_s) accesses the cache capacity partitioning used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_CMAX_ns) accesses the cache capacity partitioning used for Non-secure PARTIDs.

**MPAMCFG_CMAX can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0108</td>
<td>MPAMCFG_CMAX_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0108</td>
<td>MPAMCFG_CMAX_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
The MPAMCFG_CPBM characteristics are:

**Purpose**

The MPAMCFG_CPBM register is a read-write register that configures the cache portions that a PARTID is allowed to allocate. After setting MPAMCFG_PART_SEL with a PARTID, software (usually a hypervisor) writes to the MPAMCFG_CPBM register to configure which cache portions the PARTID is allowed to allocate.

MPAMCFG_CPBM_s controls cache portions for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_CPBM_ns controls the cache portions for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

**Configuration**

The power domain of MPAMCFG_CPBM is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_CPOR == 1. Otherwise, direct accesses to MPAMCFG_CPBM are RES0.

**Attributes**

MPAMCFG_CPBM is a 32768-bit register.

**Field descriptions**

The MPAMCFG_CPBM bit assignments are:

**CPBM<n>, bit [n], for n = 0 to 32767**

Each bit, CPBM<n>, grants permission to the PARTID to allocate cache lines within cache portion n.

<table>
<thead>
<tr>
<th>CPBM&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The PARTID is not permitted to allocate into cache portion n.</td>
</tr>
<tr>
<td>0b1</td>
<td>The PARTID is permitted to allocate within cache portion n.</td>
</tr>
</tbody>
</table>

The number of bits in the cache portion partitioning bit map of this component is given in MPAMF_CPOR_IDR.CPBM_WD. CPBM_WD contains a value from 1 to $2^{15}$, inclusive. Values of CPBM_WD greater than 32 require a group of 32-bit registers to access the CPBM, up to 1024 registers.

Bits CPBM<n>, where n is greater than CPBM_WD, are not required to be implemented.

**Accessing the MPAMCFG_CPBM**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_CPBM_s must be accessible from the Secure MPAM feature page. MPAMCFG_CPBM_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_CPBM_s and MPAMCFG_CPBM_ns must be separate registers. The Secure instance (MPAMCFG_CPBM_s) accesses the cache portion bitmaps used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_CPBM_ns) accesses the cache portion bitmaps used for Non-secure PARTIDs.
MPAMCFG_CPBM can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x1000</td>
<td>MPAMCFG_CPBM_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x1000</td>
<td>MPAMCFG_CPBM_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
The MPAMCFG_INTPARTID characteristics are:

**Purpose**

MPAMCFG_INTPARTID is a 32-bit read-write register that controls the mapping of the PARTID selected by MPAMCFG_PART_SEL into a narrower internal PARTID (intPARTID).

MPAMCFG_INTPARTID_s controls the mapping for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_INTPARTID_ns controls the mapping for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

The MPAMCFG_INTPARTID register associates the request PARTID (reqPARTID) in the MPAMCFG_PART_SEL register with an internal PARTID (intPARTID) in this register. To set that association, store reqPARTID into the MPAMCFG_PART_SEL register and then store the intPARTID into the MPAMCFG_INTPARTID register. To read the association, store reqPARTID into the MPAMCFG_PART_SEL register and then read MPAMCFG_INTPARTID.

If the intPARTID stored into MPAMCFG_INTPARTID is out-of-range or does not have the INTERNAL bit set, the association of reqPARTID to intPARTID is not written and MPAMF_ESR is set to indicate an intPARTID_Range error.

If MPAMCFG_PART_SEL.INTERNAL is 1 when MPAMCFG_INTPARTID is read or written, MPAMF_ESR is set to indicate an Unexpected_INTERNAL error.

**Configuration**

The power domain of MPAMCFG_INTPARTID is IMPLEMENTATION_DEFINED.

This register is present only when MPAMF_IDR.HAS_PARTID_NRW == 1. Otherwise, direct accesses to MPAMCFG_INTPARTID are RES0.

**Attributes**

MPAMCFG_INTPARTID is a 32-bit register.

**Field descriptions**

The MPAMCFG_INTPARTID bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | INTERNAL | INTPARTID |

**Bits [31:17]**

Reserved, RES0.

**INTERNAL, bit [16]**

Internal PARTID flag.

This bit must be 1 when written to the register. If written as 0, the write will not update the reqPARTID to intPARTID association.

On a read of this register, the bit will always read the value last written.
**INTPARTID, bits [15:0]**

This field contains the intPARTID mapped to the reqPARTID in [MPAMCFG_PART_SEL](#). The maximum intPARTID supported is [MPAMF_PARTID_NRW_IDR, INTPARTID_MAX](#).

## Accessing the MPAMCFG_INTPARTID

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_INTPARTID_s must be accessible from the Secure MPAM feature page. MPAMCFG_INTPARTID_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_INTPARTID_s and MPAMCFG_INTPARTID_ns must be separate registers. The Secure instance (MPAMCFG_INTPARTID_s) accesses the PARTID narrowing used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_INTPARTID_ns) accesses the PARTID narrowing used for Non-secure PARTIDs.

**MPAMCFG_INTPARTID can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0600</td>
<td>MPAMCFG_INTPARTID_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0600</td>
<td>MPAMCFG_INTPARTID_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
**MPAMCFG_MBW_MAX, MPAM Memory Bandwidth Maximum Partition Configuration Register**

The MPAMCFG_MBW_MAX characteristics are:

**Purpose**

MPAMCFG_MBW_MAX is a 32-bit read-write register that controls the maximum fraction of memory bandwidth that the PARTID selected by `MPAMCFG_PART_SEL` is permitted to use. MPAMCFG_MBW_MAX controls maximum bandwidth for the Secure PARTID selected by the Secure instance of `MPAMCFG_PART_SEL`. MPAMCFG_MBW_MAX controls the maximum bandwidth for the Non-secure PARTID selected by the Non-secure instance of `MPAMCFG_PART_SEL`.

A PARTID that has used more than MAX is given no access to additional bandwidth if HARDLIM == 1 or is given additional bandwidth only if there are no requests from PARTIDs that have not exceeded their MAX if HARDLIM == 0.

**Configuration**

The power domain of MPAMCFG_MBW_MAX is **IMPLEMENTATION DEFINED**.

This register is present only when MPAMF_IDR.HAS_MBW_PART == 1 and MPAMF_MBW_IDR.HAS_MAX == 1. Otherwise, direct accesses to MPAMCFG_MBW_MAX are **RES0**.

**Attributes**

MPAMCFG_MBW_MAX is a 32-bit register.

**Field descriptions**

The MPAMCFG_MBW_MAX bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| HARDLIM | RES0 | MAX |

**HARDLIM, bit [31]**

Hard bandwidth limiting.

<table>
<thead>
<tr>
<th>HARDLIM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When MAX bandwidth is exceeded, the partition contends with a low preference for downstream bandwidth beyond MAX.</td>
</tr>
<tr>
<td>0b1</td>
<td>When MAX bandwidth is exceeded, the partition does not be use any more bandwidth until the memory bandwidth measurement for the partition falls below MAX.</td>
</tr>
</tbody>
</table>

**Bits [30:16]**

Reserved, RES0.

**MAX, bits [15:0]**

Memory maximum bandwidth allocated to the partition selected by `MPAMCFG_PART_SEL`. MAX is in fixed-point fraction format. The fraction represents the portion of the total memory bandwidth capacity through the controlled component that the PARTID is permitted to allocate.
The implemented width of the fixed-point fraction is given in MPAMF_MBW_IDR.BWA_WD. Unimplemented bits are RAZ/WI. The implemented bits of the MAX field are always to the left of the field. For example, if BWA_WD = 3, the implemented bits are MPAMCFG_MBW_MAX[15:13] and MPAMCFG_MBW_MAX[12:0] are unimplemented.

The fixed-point fraction MAX is less than 1. The implied binary point is between bits 15 and 16. This representation has as the largest fraction of the cache that can be represented in an implementation with w implemented bits is \(1 - \frac{1}{w}\).

**Accessing the MPAMCFG_MBW_MAX**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_MBW_MAX_s must be accessible from the Secure MPAM feature page. MPAMCFG_MBW_MAX_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_MBW_MAX_s and MPAMCFG_MBW_MAX_ns must be separate registers. The Secure instance (MPAMCFG_MBW_MAX_s) accesses the memory maximum bandwidth partitioning used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_MBW_MAX_ns) accesses the memory maximum bandwidth partitioning used for Non-secure PARTIDs.

**MPAMCFG_MBW_MAX can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0208</td>
<td>MPAMCFG_MBW_MAX_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0208</td>
<td>MPAMCFG_MBW_MAX_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
The MPAMCFG_MBW_MIN characteristics are:

**Purpose**

MPAMCFG_MBW_MIN is a 32-bit read-write register that controls the minimum fraction of memory bandwidth that the PARTID selected by MPAMCFG_PART_SEL is permitted to use. MPAMCFG_MBW_MIN_s controls the minimum bandwidth for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_MBW_MIN_ns controls the minimum bandwidth for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

A PARTID that has used less than MIN is given preferential access to bandwidth.

**Configuration**

The power domain of MPAMCFG_MBW_MIN is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_MBW_PART == 1 and MPAMF_MBW_IDR.HAS_MIN == 1. Otherwise, direct accesses to MPAMCFG_MBW_MIN are RES0.

**Attributes**

MPAMCFG_MBW_MIN is a 32-bit register.

**Field descriptions**

The MPAMCFG_MBW_MIN bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [31:16]**

Reserved, RES0.

**MIN, bits [15:0]**

Memory minimum bandwidth allocated to the partition selected by MPAMCFG_PART_SEL. MIN is in fixed-point fraction format. The fraction represents the portion of the total memory bandwidth capacity through the controlled component that the PARTID is permitted to allocate.

The implemented width of the fixed-point fraction is given in MPAMF_MBW_IDR.BWA_WD. Unimplemented bits are RAZ/WI. The implemented bits of the MIN field are always to the left of the field. For example, if BWA_WD = 4, the implemented bits are MPAMCFG_MBW_MIN[15:12] and MPAMCFG_MBW_MIN[11:0] are unimplemented.

The fixed-point fraction MIN is less than 1. The implied binary point is between bits 15 and 16. This representation has as the largest fraction of the cache that can be represented in an implementation with w implemented bits is 1 - 1/w.

**Accessing the MPAMCFG_MBW_MIN**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_MBW_MIN_s must be accessible from the Secure MPAM feature page. MPAMCFG_MBW_MIN_ns must be accessible from the Non-secure MPAM feature page.
MPAMCFG_MBW_MIN_s and MPAMCFG_MBW_MIN_ns must be separate registers. The Secure instance (MPAMCFG_MBW_MIN_s) accesses the memory minimum bandwidth partitioning used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_MBW_MIN_ns) accesses the memory minimum bandwidth partitioning used for Non-secure PARTIDs.

**MPAMCFG_MBW_MIN can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0200</td>
<td>MPAMCFG_MBW_MIN_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0200</td>
<td>MPAMCFG_MBW_MIN_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
The MPAMCFG_MBW_PBM characteristics are:

**Purpose**

The MPAMCFG_MBW_PBM register is a read-write register that configures the cache portions that a PARTID is allowed to allocate. MPAMCFG_MBW_PBM_s controls the bandwidth portion bitmap for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_MBW_PBM_ns controls the bandwidth portion bitmap for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

After setting MPAMCFG_PART_SEL with a PARTID, software writes to the MPAMCFG_CPBM register to configure which cache portions the PARTID is allowed to allocate.

**Configuration**

The power domain of MPAMCFG_MBW_PBM is IMPLEMENTATIONDEFINED.

This register is present only when MPAMF_IDR.HAS_MBW_PART == 1 and MPAMF_MBW_IDR.HAS_PBM == 1. Otherwise, direct accesses to MPAMCFG_MBW_PBM are RES0.

**Attributes**

MPAMCFG_MBW_PBM is a 4096-bit register.

**Field descriptions**

The MPAMCFG_MBW_PBM bit assignments are:

BWBM<n>, bit [n], for n = 0 to 4095

Each bit BWBM<n> grants permission to the PARTID to allocate bandwidth within bandwidth portion n.

<table>
<thead>
<tr>
<th>BWBM&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The PARTID is not permitted to allocate into bandwidth portion n.</td>
</tr>
<tr>
<td>0b1</td>
<td>The PARTID is permitted to allocate within bandwidth portion n.</td>
</tr>
</tbody>
</table>

The number of bits in the bandwidth portion partitioning bit map of this component is given in MPAMF_MBW_IDR.BWPBM_WD. BWPBM_WD contains a value from 1 to $2^{12}$, inclusive. Values of BWPBM_WD greater than 32 require a group of 32-bit registers to access the BWPBM, up to 128 32-bit registers.

Bits BWBM<n>, where n is greater than or equal to BWPBM_WD, are not required to be implemented.

**Accessing the MPAMCFG_MBW_PBM**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_MBW_PBM_s must be accessible from the Secure MPAM feature page. MPAMCFG_MBW_PBM_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_MBW_PBM_s and MPAMCFG_MBW_PBM_ns must be separate registers. The Secure instance (MPAMCFG_MBW_PBM_s) accesses the memory bandwidth portion bitmaps used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_MBW_PBM_ns) accesses the memory bandwidth portion bitmaps used for Non-secure PARTIDs.
**MPAMCFG_MBW_PBM** can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x2000</td>
<td>MPAMCFG_MBW_PBM_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>

<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x2000</td>
<td>MPAMCFG_MBW_PBM_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
The MPAMCFG_MBW_PROP characteristics are:

**Purpose**

Controls the proportional stride of memory bandwidth that the PARTID selected by MPAMCFG_PART_SEL uses. MPAMCFG_MBW_PROP_s controls the bandwidth proportional stride for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_MBW_PROP_ns controls the bandwidth proportional stride for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

Proportional stride is a relative cost of bandwidth requested by one PARTID in relation to the costs of the bandwidths requested by each other PARTID also competing to use the bandwidth.

**Configuration**

The power domain of MPAMCFG_MBW_PROP is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_MBW_PART == 1 and MPAMF_MBW_IDR.HAS_PROP == 1. Otherwise, direct accesses to MPAMCFG_MBW_PROP are RES0.

**Attributes**

MPAMCFG_MBW_PROP is a 32-bit register.

**Field descriptions**

The MPAMCFG_MBW_PROP bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>29</td>
<td>STRIDEM1</td>
<td>Memory bandwidth stride minus 1 allocated to the partition selected by MPAMCFG_PART_SEL. STRIDEM1 represents the normalized cost of bandwidth consumption by the partition.</td>
</tr>
</tbody>
</table>

Enable proportional stride bandwidth partitioning.

<table>
<thead>
<tr>
<th>EN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The selected partition is not regulated by proportional stride bandwidth partitioning.</td>
</tr>
<tr>
<td>0b1</td>
<td>The selected partition has bandwidth usage regulated by proportional stride bandwidth partitioning as controlled by STRIDEM1.</td>
</tr>
</tbody>
</table>

Reserved, RES0.

**STRIDEM1, bits [15:0]**

Memory bandwidth stride minus 1 allocated to the partition selected by MPAMCFG_PART_SEL. STRIDEM1 represents the normalized cost of bandwidth consumption by the partition.

The proportional stride partitioning control parameter is an unsigned integer representing the normalized cost to a partition for consuming bandwidth. Larger values have a larger cost and correspond to a lesser allocation of bandwidth while smaller values indicate a lesser cost and therefore a higher allocation of bandwidth.
The implemented width of STRIDEM1 is given in MPAMF_MBW_IDR_BWA_WD.

**Accessing the MPAMCFG_MBW_PROP**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_MBW_PROP_s must be accessible from the Secure MPAM feature page. MPAMCFG_MBW_PROP_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_MBW_PROP_s and MPAMCFG_MBW_PROP_ns must be separate registers. The Secure instance (MPAMCFG_MBW_PROP_s) accesses the memory proportional stride bandwidth partitioning used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_MBW_PROP_ns) accesses the memory proportional stride bandwidth partitioning used for Non-secure PARTIDs.

**MPAMCFG_MBW_PROP can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
MPAMCFG_MBW_WINWD, MPAM Memory Bandwidth Partitioning Window Width Configuration Register

The MPAMCFG_MBW_WINWD characteristics are:

**Purpose**

MPAMCFG_MBW_WINWD is a 32-bit register that shows and sets the value of the window width for the PARTID in MPAMCFG_PART_SEL. MPAMCFG_MBW_WINWD_s reads and controls the bandwidth control window width for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_MBW_WINWD_ns reads and controls the bandwidth control window for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

MPAMCFG_MBW_WINWD is read-only if MPAMF_MBW_IDR.WINDWR == 0, and the window width is set by the hardware, even if variable.

MPAMCFG_MBW_WINWD is read-write if MPAMF_MBW_IDR.WINDWR == 1, permitting configuration of the window width for each PARTID independently on hardware that supports this functionality.

**Configuration**

The power domain of MPAMCFG_MBW_WINWD is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_MBW_PART == 1. Otherwise, direct accesses to MPAMCFG_MBW_WINWD are RES0.

**Attributes**

MPAMCFG_MBW_WINWD is a 32-bit register.

**Field descriptions**

The MPAMCFG_MBW_WINWD bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:24</td>
<td>Reserved, RES0</td>
<td></td>
</tr>
<tr>
<td>23:8</td>
<td>Window width, integer microseconds.</td>
<td>US_INT</td>
</tr>
<tr>
<td>7:0</td>
<td>Window width, fractional microseconds.</td>
<td>US_FRAC</td>
</tr>
</tbody>
</table>

**Bits [31:24]**

Reserved, RES0.

**US_INT, bits [23:8]**

Window width, integer microseconds.

This field reads (and sets) the integer part of the window width in microseconds for the PARTID selected by MPAMCFG_PART_SEL.

**US_FRAC, bits [7:0]**

Window width, fractional microseconds.

This field reads (and sets) the fractional part of the window width in microseconds for the PARTID selected by MPAMCFG_PART_SEL.
Accessing the MPAMCFG_MBW_WINWD

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_MBW_WINWD_s must be accessible from the Secure MPAM feature page. MPAMCFG_MBW_WINWD_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_MBW_WINWD_s and MPAMCFG_MBW_WINWD_ns must be separate registers. The Secure instance (MPAMCFG_MBW_WINWD_s) accesses the window width used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_MBW_WINWD_ns) accesses the window width used for Non-secure PARTIDs.

**MPAMCFG_MBW_WINWD can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0220</td>
<td>MPAMCFG_MBW_WINWD_s</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When MPAMF_MBW_IDR.WINDWR == 0 accesses to this register are RO.
- Otherwise accesses to this register are RW.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0220</td>
<td>MPAMCFG_MBW_WINWD_ns</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When MPAMF_MBW_IDR.WINDWR == 0 accesses to this register are RO.
- Otherwise accesses to this register are RW.
MPAMCFG_PART_SEL, MPAM Partition Configuration Selection Register

The MPAMCFG_PART_SEL characteristics are:

**Purpose**

Selects a partition ID to configure. MPAMCFG_PART_SEL_s selects a Secure PARTID to configure. MPAMCFG_PART_SEL_ns selects a Non-secure PARTID to configure.

After setting this register with a PARTID, software (usually a hypervisor) can perform a series of accesses to MPAMCFG registers to configure parameters for MPAM resource controls to use when requests have that PARTID.

**Configuration**

The power domain of MPAMCFG_PART_SEL is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_CCAP_PART == 1, or MPAMF_IDR.HAS_CPOR_PART == 1, or MPAMF_IDR.HAS_MBW_PART == 1, or MPAMF_IDR.HAS_PRI_PART == 1, or MPAMF_IDR.HAS_PARTID_NRW == 1, or (MPAMF_IDR.EXT == 0 and MPAMF_IDR.HAS_IMPL_IDR == 1) or (MPAMF_IDR.EXT == 1, MPAMF_IDR.HAS_IMPL_IDR == 1 and MPAMF_IDR.NO_IMPL_PART == 0). Otherwise, direct accesses to MPAMCFG_PART_SEL are RES0.

**Attributes**

MPAMCFG_PART_SEL is a 32-bit register.

**Field descriptions**

The MPAMCFG_PART_SEL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RIS | RES0 | INTERNAL | PARTID_SEL |

**Bits [31:28]**

Reserved, RES0.

**RIS, bits [27:24]**

When ARMv8.6-MPAM is implemented, MPAMF_IDR.EXT == 1 and MAPMF_IDR.HAS_RIS == 1:

Resource Instance Selector. RIS selects one resource to configure through MPAMCFG registers and describe with MPAMF ID registers.

Otherwise:

Reserved, RES0.

**Bits [23:17]**

Reserved, RES0.
INTERNAL, bit [16]

Internal PARTID.

If MPAMF_IDR.HAS_PARTID_NRW = 0, this field is RAZ/WI.

If MPAMF_IDR.HAS_PARTID_NRW = 1:

<table>
<thead>
<tr>
<th>INTERNAL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PARTID_SEL is interpreted as a request PARTID and ignored except for use with MPAMCFG_INTPARTID register access.</td>
</tr>
<tr>
<td>0b1</td>
<td>PARTID_SEL is interpreted as an internal PARTID and used for access to MPAMCFG control settings except for MPAMCFG_INTPARTID.</td>
</tr>
</tbody>
</table>

If PARTID narrowing is implemented as indicated by MPAMF_IDR.HAS_PARTID_NRW = 1, when accessing other MPAMCFG registers the value of the MPAMCFG_PART_SEL.INTERNAL bit is checked for these conditions:

- When the MPAMCFG_INTPARTID register is read or written, if the value of MPAMCFG_PART_SEL.INTERNAL is not 0, an Unexpected_INTERNAL error is set in MPAMF_ESR.
- When an MPAMCFG register other than MPAMCFG_INTPARTID is read or written, if the value of MPAMCFG_PART_SEL.INTERNAL is not 1, MPAMF_ESR is set to indicate an intPARTID_Range error.

In either error case listed here, the value returned by a read operation is UNPREDICTABLE, and the control settings are not affected by a write.

PARTID_SEL, bits [15:0]

Selects the partition ID to configure.

Reads and writes to other MPAMCFG registers are indexed by PARTID_SEL and by the NS bit used to access MPAMCFG_PART_SEL to access the configuration for a single partition.

Accessing the MPAMCFG_PART_SEL

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_PART_SEL_s must be accessible from the Secure MPAM feature page. MPAMCFG_PART_SEL_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_PART_SEL_s and MPAMCFG PART_SEL_ns must be separate registers. The Secure instance (MPAMCFG_PART_SEL_s) accesses the PARTID selector used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_PART_SEL_ns) accesses the PARTID selector used for Non-secure PARTIDs.

MPAMCFG_PART_SEL can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0100</td>
<td>MPAMCFG_PART_SEL_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0100</td>
<td>MPAMCFG_PART_SEL_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
MPAMCFG_PRI, MPAM Priority Partition Configuration Register

The MPAMCFG_PRI characteristics are:

**Purpose**

MPAMCFG_PRI is a 32-bit read-write register that controls the internal and downstream priority of requests attributed to the PARTID selected by MPAMCFG_PART_SEL. MPAMCFG_PRI controls the priorities for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_PRI_ns controls the priorities for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

**Configuration**

The power domain of MPAMCFG_PRI is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_PRI_PART == 1. Otherwise, direct accesses to MPAMCFG_PRI are RES0.

**Attributes**

MPAMCFG_PRI is a 32-bit register.

**Field descriptions**

The MPAMCFG_PRI bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>DSPRI</td>
</tr>
<tr>
<td>15</td>
<td>INTPRI</td>
</tr>
</tbody>
</table>

**DSPRI, bits [31:16]**

Downstream priority.

If MPAMF_PRI_IDR.HAS_DSPRI == 0, bits of this field are RES0 as this field is not used.

If MPAMF_PRI_IDR.HAS_DSPRI == 1, this field is a priority value applied to downstream communications from this MSC for transactions of the partition selected by MPAMCFG_PART_SEL.

The implemented width of this field is MPAMF_PRI_IDR.DSPRI_WD bits.

The encoding of priority is 0-as-lowest or 0-as-highest priority according to the value of MPAMF_PRI_IDR.DSPRI_0_IS_LOW.

**INTPRI, bits [15:0]**

Internal priority.

If MPAMF_PRI_IDR.HAS_INTPRI == 0, bits of this field are RES0 as this field is not used.

If MPAMF_PRI_IDR.HAS_INTPRI == 1, this field is a priority value applied internally inside this MSC for transactions of the partition selected by Mext-PAMCFG_PART_SEL.

The implemented width of this field is MPAMF_PRI_IDR.INTPRI_WD bits.

The encoding of priority is 0-as-lowest or 0-as-highest priority according to the value of MPAMF_PRI_IDR.INTPRI_0_IS_LOW.
Accessing the MPAMCFG_PRI

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_PRI_s must be accessible from the Secure MPAM feature page. MPAMCFG_PRI_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_PRI_s and MPAMCFG_PRI_ns must be separate registers. The Secure instance (MPAMCFG_PRI_s) accesses the priority partitioning used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_PRI_ns) accesses the priority partitioning used for Non-secure PARTIDs.

MPAMCFG_PRI can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0400</td>
<td>MPAMCFG_PRI_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.

MPAMF_AIDR, MPAM Architecture Identification Register

The MPAMF_AIDR characteristics are:

**Purpose**

Identifies the version of the MPAM architecture that this MSC implements.

Note: The following values are defined for bits [7:0]:

- 0x01 == MPAM architecture v0.1
- 0x10 == MPAM architecture v1.0
- 0x11 == MPAM architecture v1.1

**Configuration**

The power domain of MPAMF_AIDR is **IMPLEMENTATION DEFINED**.

**Attributes**

MPAMF_AIDR is a 32-bit register.

**Field descriptions**

The MPAMF_AIDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>ArchMajorRev</td>
</tr>
<tr>
<td>29</td>
<td>ArchMinorRev</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**ArchMajorRev, bits [7:4]**

Major revision of the MPAM architecture implemented by the MSC.

This table shows the only valid combinations of MPAM version numbers in an MSC. FORCE_NS functionality is only available in MPAM v0.1.

<table>
<thead>
<tr>
<th>ArchMajorRev</th>
<th>ArchMinorRev</th>

</tr>
</tbody>
</table>

**ArchMinorRev, bits [3:0]**

Minor revision of the MPAM architecture implemented by the MSC.

See the table in the description of the ArchMajorRev field in this register.
Accessing the MPAMF_AIDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_AIDR is read-only.

MPAMF_AIDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_AIDR must have the same contents in the Secure and Non-secure MPAM feature pages.

**MPAMF_AIDR can be accessed through the memory-mapped interfaces:**

Accesses on this interface are RO.
MPAMF CCAP IDR, MPAM Features Cache Capacity Partitioning ID register

The MPAMF CCAP IDR characteristics are:

**Purpose**

The MPAMF CCAP IDR is a 32-bit read-only register that indicates the number of fractional bits in MPAMCFG CMAX for this MSC. MPAMF CCAP IDR s indicates the number of fractional bits in the Secure instance of MPAMCFG CMAX. MPAMF CCAP IDR ns indicates the number of fractional bits in the Non-secure instance of MPAMCFG CMAX.

**Configuration**

The power domain of MPAMF CCAP IDR is IMPLEMENTATION DEFINED.

This register is present only when MPAMF IDR HAS CCAP PART == 1. Otherwise, direct accesses to MPAMF CCAP IDR are RES0.

**Attributes**

MPAMF CCAP IDR is a 32-bit register.

**Field descriptions**

The MPAMF CCAP IDR bit assignments are:

<table>

</tbody>
</table>

**Bits [31:6]**

Reserved, RES0.

**CMAX WD, bits [5:0]**

Number of fractional bits implemented in the cache capacity partitioning control, MPAMCFG CMAX, of this device. See MPAMCFG CMAX.

This field must contain a value from 1 to 16, inclusive.

**Accessing the MPAMF CCAP IDR**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF CCAP IDR is read-only.

MPAMF CCAP IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF CCAP IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF CCAP IDR s) and Non-secure (MPAMF CCAP IDR ns) MPAM feature pages.
MPAMF_CCAP_IDR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0038</td>

</tbody>
</table>

Accesses on this interface are **RO**.
The MPAMF_CPOR_IDR characteristics are:

**Purpose**

The MPAMF_CPOR_IDR is a 32-bit read-only register that indicates the number of bits in MPAMCFG_CPBM for this MSC. MPAMF_CPOR_IDR_s indicates the number of bits in the Secure instance of MPAMCFG_CPBM. MPAMF_CPOR_IDR_ns indicates the number of bits in the Non-secure instance of MPAMCFG_CPBM.

**Configuration**

The power domain of MPAMF_CPOR_IDR is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_CPOR == 1. Otherwise, direct accesses to MPAMF_CPOR_IDR are RES0.

**Attributes**

MPAMF_CPOR_IDR is a 32-bit register.

**Field descriptions**

The MPAMF_CPOR_IDR bit assignments are:

</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**CPBM_WD, bits [15:0]**

Number of bits in the cache portion partitioning bit map of this device. See MPAMCFG_CPBM.

This field must contain a value from 1 to 32768, inclusive. Values greater than 32 require a group of 32-bit registers to access the CPBM, up to 1024 if CPBM_WD is the largest value.

**Accessing the MPAMF_CPOR_IDR**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_CPOR_IDR is read-only.

MPAMF_CPOR_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_CPOR_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF_CPOR_IDR_s) and Non-secure (MPAMF_CPOR_IDR_ns) MPAM feature pages.
MPAMF_CPOR_IDR can be accessed through the memory-mapped interfaces:

<table>

Accesses on this interface are RO.
### Purpose

The MPAMF_CSUMON_IDR is a 32-bit read-only register that indicates the number of cache storage usage monitors for this MSC. MPAMF_CSUMON_IDR_s indicates the number of Secure cache storage usage monitors. MPAMF_CSUMON_IDR_ns indicates the number of Non-secure cache storage usage monitors.

### Configuration

The power domain of MPAMF_CSUMON_IDR is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_CSU == 1. Otherwise, direct accesses to MPAMF_CSUMON_IDR are RES0.

### Attributes

MPAMF_CSUMON_IDR is a 32-bit register.

### Field descriptions

The MPAMF_CSUMON_IDR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| HAS_CAPTURE | RES0 | NUM_MON |

**HAS_CAPTURE, bit [31]**

The implementation of this MSC supports copying an MSMON_CSU to the corresponding MSMON_CSU_CAPTURE on a capture event.

<table>
<thead>
<tr>
<th>HAS_CAPTURE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MSMON_CSU_CAPTURE is not implemented and there is no support for capture events in the CSU monitor.</td>
</tr>
<tr>

<td>The MSMON_CSU_CAPTURE register is implemented and the CSU monitor supports the capture event behavior.</td>
</tr>
</tbody>
</table>

**Bits [30:16]**

Reserved, RES0.

**NUM_MON, bits [15:0]**

The number of cache storage usage monitors implemented in this MSC.

### Accessing the MPAMF_CSUMON_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_CSUMON_IDR is read-only.
MPAMF-CSUMON_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF-CSUMON_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF-CSUMON_IDR_s) and Non-secure (MPAMF-CSUMON_IDR_ns) MPAM feature pages.

**MPAMF-CSUMON_IDR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0088</td>

MPAMF_ECR, MPAM Error Control Register

The MPAMF_ECR characteristics are:

**Purpose**

MPAMF_ECR is a 32-bit read-write register that controls MPAM error interrupts for this MSC. MPAMF_ECR_s controls Secure MPAM error handling. MPAMF_ECR_ns controls Non-secure MPAM error handling.

**Configuration**

The power domain of MPAMF_ECR is IMPLEMENTATION DEFINED.

If a MSC cannot encounter any of the error conditions listed in section 15.1, both the MPAMF_ESR and MPAMF_ECR must be RAZ/WI.

**Attributes**

MPAMF_ECR is a 32-bit register.

**Field descriptions**

The MPAMF_ECR bit assignments are:

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
```

- **Reserved, RES0**
- **INTEN**, bit [0]

**INTEN, bit [0]**

Interrupt Enable.

<table>
<thead>
<tr>
<th>INTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MPAM error interrupts are not generated.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAM error interrupts are generated.</td>
</tr>
</tbody>
</table>

**Accessing the MPAMF_ECR**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_ECR_s must be accessible from the Secure MPAM feature page. MPAMF_ECR_ns must be accessible from the Non-secure MPAM feature page.

MPAMF_ECR_s and MPAMF_ECR_ns must be separate registers. The Secure instance (MPAMF_ECR_s) accesses the error interrupt controls used for Secure PARTIDs, and the Non-secure instance (MPAMF_ECR_ns) accesses the error interrupt controls used for Non-secure PARTIDs.

**MPAMF_ECR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x00F0</td>
<td>MPAMF_ECR_s</td>
</tr>
</tbody>
</table>
Accesses on this interface are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0xFF0</td>
<td>MPAMF_ECR_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
MPAMF_ESR, MPAM Error Status Register

The MPAMF_ESR characteristics are:

**Purpose**

Indicates MPAM error status for this MSC. MPAMF_ESR_s reports Secure MPAM errors. MPAMF_ESR_ns reports Non-secure MPAM errors.

Software should write this register after reading the status of an error to reset ERRCODE to 0x0000 and OVRWR to 0 so that future errors are not reported with OVRWR set.

**Configuration**

The power domain of MPAMF_ESR is IMPLEMENTATION DEFINED.

If a MSC cannot encounter any of the error conditions listed in Chapter 12 Errors in MSCs, both the MPAMF_ESR and MPAMF_ECR must be RAZ/WI.

**Attributes**

MAMPF_ESR is 64-bit register when ARMv8.6-MPAM is implemented and MPAMF_IDR.HAS_EXTD_ESR == 1.

Otherwise, MAMPF_ESR is a 32-bit register.

**Field descriptions**

The MPAMF_ESR bit assignments are:

When ARMv8.6-MPAM is implemented and MPAMF_IDR.HAS_EXTD_ESR == 1:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| OVRWR | RES0 | ERRCODE | PMG | PARTID_MON |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:36]**

Reserved, RES0.

**RIS, bits [35:32]**

When MPAMF_IDR.HAS_RIS == 1:

Resource Instance Selector. Where applicable to the ERRCODE, captures the RIS value for the error.

Otherwise:

Reserved, RES0.

**OVRWR, bit [31]**

Overwritten.

If 0 and ERRCODE == 0b0000, no errors have occurred.
If 0 and ERRCODE is non-zero, a single error has occurred and is recorded in this register.

If 1 and ERRCODE is non-zero, multiple errors have occurred and this register records the most recent error.

The state where this bit is 1 and ERRCODE is zero must not be produced by hardware and is only reached when software writes this combination into this register.

**Bits [30:28]**

Reserved, RES0.

**ERRCODE, bits [27:24]**

Error code.

<table>
<thead>
<tr>

**PMG, bits [23:16]**

Program monitoring group.

Set to the PMG on an error that captures PMG. Otherwise, set to 0x00 on an error that does not capture PMG.

**PARTID_MON, bits [15:0]**

PARTID or monitor.

Set to the PARTID on an error that captures PARTID.

Set to the monitor index on an error that captures MON.

On an error that captures neither PARTID nor MON, this field is set to 0x0000.

**Accessing the MPAMF_ESR**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_ESR_s must be accessible from the Secure MPAM feature page. MPAMF_ESR_ns must be accessible from the Non-secure MPAM feature page.

MPAMF_ESR_s and MPAMF_ESR_ns must be separate registers. The Secure instance (MPAMF_ESR_s) accesses the error status used for Secure PARTIDs, and the Non-secure instance (MPAMF_ESR_ns) accesses the error status used for Non-secure PARTIDs.

**MPAMF_ESR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x00F8</td>
<td>MPAMF_ESR_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x00F8</td>
<td>MPAMF_ESR_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
MPAMF_IDR, MPAM Features Identification Register

The MPAMF_IDR characteristics are:

Purpose

Indicates which memory partitioning and monitoring features are present on this MSC. MPAMF_IDR_s indicates the MPAM features accessed from the Secure MPAM feature page. MPAMF_IDR_ns indicates the MPAM features accessed from the Non-secure MPAM feature page.

Configuration

The power domain of MPAMF_IDR is IMPLEMENTATION DEFINED.

Attributes

MAMPF_IDR is 64-bit register when ARMv8.6-MPAM is implemented.

Otherwise, MAMPF_IDR is a 32-bit register.

Field descriptions

The MPAMF_IDR bit assignments are:

When ARMv8.6-MPAM is implemented:

<table>
<thead>
<tr>
<th>63</th>
<th>62</th>
<th>61</th>
<th>60</th>
<th>59</th>
<th>58</th>
<th>57</th>
<th>56</th>
<th>55</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>HAS_PARTITION_NR</td>
<td>HAS_MSMON</td>
<td>HAS_IMPL_IDR</td>
<td>EXT</td>
<td>HAS_PRI_PART</td>
<td>HAS_MBW_PART</td>
<td>HAS_CPOR_PART</td>
<td>HAS_CCAP_PART</td>
</tr>
</tbody>
</table>

Bits [63:60]

Reserved, RES0.

RIS_MAX, bits [59:56]

When MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_RIS == 1:

Maximum RIS value supported in MPAMCFG_PART_SEL. Must be 0b0000 if MPAMF_IDR.HAS_RIS == 0.

Otherwise:

Reserved, RES0.

Bits [55:40]

Reserved, RES0.

HAS_ESR, bit [39]

When MPAMF_IDR.EXT == 1:

MPAMF_ESR is implemented.
<table>
<thead>
<tr>
<th>HAS_ESR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MPAMF_ESR, MPAM_ECR and MPAM error handling are not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAMF_ESR, MPAM_ECR and MPAM error handling are implemented.</td>
</tr>
</tbody>
</table>

Otherwise:
Reserved, RES0.

**HAS_EXTD_ESR, bit [38]**

When MPAMF_IDR.EXT == 1:

MPAMF_ESR is 64 bits.

<table>
<thead>
<tr>
<th>HAS_EXTD_ESR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MPAMF_ESR is 32 bits.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAMF_ESR is 64 bits.</td>
</tr>
</tbody>
</table>

Otherwise:
Reserved, RES0.

**NO_IMPL_MSMON, bit [37]**

When MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_IMPL_IDR == 1:

MPAMF_IMPL_IDR defines no IMPLEMENTATION DEFINED resource monitors.

<table>
<thead>
<tr>
<th>NO_IMPL_MSMON</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MPAMF_IMPL_IDR defines at least one IMPLEMENTATION DEFINED resource monitor.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAMF_IMPL_IDR does not define any IMPLEMENTATION DEFINED resource monitors.</td>
</tr>
</tbody>
</table>

Otherwise:
Reserved, RES0.

**NO_IMPL_PART, bit [36]**

When MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_IMPL_IDR == 1:

MPAMF_IMPL_IDR defines no IMPLEMENTATION DEFINED resource controls.

<table>
<thead>
<tr>
<th>NO_IMPL_PART</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MPAMF_IMPL_IDR defines at least one IMPLEMENTATION DEFINED resource control.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAMF_IMPL_IDR does not define any IMPLEMENTATION DEFINED resource controls.</td>
</tr>
</tbody>
</table>

Otherwise:
Reserved, RES0.

**Bits [35:33]**

Reserved, RES0.
HAS_RIS, bit [32]

When MPAMF_IDR.EXT == 1:

Has resource instance selector. Indicates that MPAMCFG_PART_SEL contains the RIS field that selects a resource instance to control.

<table>
<thead>
<tr>
<th>HAS_RIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MPAMCFG_PART_SEL does not implement the MPAMFCFG_PART_SEL.RIS field or multiple resource instance support.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAMCFG_PART_SEL implements the MPAMFCFG_PART_SEL.RIS field and MPAM resource instance numbers up to MPAMF_IDR.RIS_MAX.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

HAS_PARTID_NRW, bit [31]

Has PARTID narrowing.

<table>
<thead>
<tr>
<th>HAS_PARTID_NRW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not have MPAMF_PARTID_NRW_IDR, MPAMCFG_INTPARTID or intPARTID mapping support.</td>
</tr>
<tr>
<td>0b1</td>
<td>Supports the MPAMF_PARTID_NRW_IDR, MPAMCFG_INTPARTID registers.</td>
</tr>
</tbody>
</table>

HAS_MSMON, bit [30]

Has resource monitors. Indicates whether this MSC has MPAM resource monitors.

<table>
<thead>
<tr>
<th>HAS_MSMON</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not support MPAM resource monitoring by groups or MPAMF_MSMON_IDR.</td>
</tr>
<tr>
<td>0b1</td>
<td>Supports resource monitoring by matching a combination of PARTID and PMG. See MPAMF_MSMON_IDR.</td>
</tr>
</tbody>
</table>

HAS_IMPL_IDR, bit [29]

Has MPAMF_IMPL_IDR. Indicates whether this MSC has the implementation-specific MPAM features register, MPAMF_IMPL_IDR.

<table>
<thead>
<tr>
<th>HAS_IMPL_IDR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not have MPAMF_IMPL_IDR.</td>
</tr>
<tr>
<td>0b1</td>
<td>Has MPAMF_IMPL_IDR.</td>
</tr>
</tbody>
</table>

EXT, bit [28]

Extended MPAMF_IDR.

<table>
<thead>
<tr>
<th>EXT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MPAMF_IDR has no defined bits in [63:32]. The register is effectively 32 bits.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAMF_IDR has bits defined in [63:32]. The register is 64-bits.</td>
</tr>
</tbody>
</table>

HAS_PRI_PART, bit [27]

Has priority partitioning. Indicates whether this MSC implements MPAM priority partitioning and MPAMF_PRI_IDR.
**HAS_PRI_PART**

- **[0b0]** Does not support priority partitioning or have MPAMF_PRI_IDR.
- **[0b1]** Has MPAMF_PRI_IDR.

**HAS_MBW_PART, bit [26]**

Has memory bandwidth partitioning. Indicates whether this MSC implements MPAM memory bandwidth partitioning and MPAMF_MBW_IDR.

- **[0b0]** Does not support memory bandwidth partitioning or have MPAMF_MBW_IDR register.
- **[0b1]** Has MPAMF_MBW_IDR register.

**HAS_CPOR_PART, bit [25]**

Has cache portion partitioning. Indicates whether this MSC implements MPAM cache portion partitioning and MPAMF_CPOR_IDR.

- **[0b0]** Does not support cache portion partitioning or have MPAMF_CPOR_IDR or MPAMCFG_CPBM registers.
- **[0b1]** Has MPAMF_CPOR_IDR and MPAMCFG_CPBM registers.

**HAS_CCAP_PART, bit [24]**

Has cache capacity partitioning. Indicates whether this MSC implements MPAM cache capacity partitioning and the MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.

- **[0b0]** Does not support cache capacity partitioning or have MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.
- **[0b1]** Has MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.

**PMG_MAX, bits [23:16]**

Maximum value of Non-secure PMG supported by this component.

**PARTID_MAX, bits [15:0]**

Maximum value of Non-secure PARTID supported by this component.

**Otherwise:**

**HAS_PARTID_NRW, bit [31]**

Has PARTID narrowing.

- **[0b0]** Does not have MPAMF_PARTID_NRW_IDR, MPAMCFG_INTPARTID or intPARTID mapping support.
- **[0b1]** Supports the MPAMF_PARTID_NRW_IDR, MPAMCFG_INTPARTID registers.
HAS_MSMON, bit [30]

Has resource monitors. Indicates whether this MSC has MPAM resource monitors.

<table>
<thead>
<tr>
<th>HAS_MSMON</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not support MPAM resource monitoring by groups or MPAMF_MSMON_IDR.</td>
</tr>
<tr>
<td>0b1</td>
<td>Supports resource monitoring by matching a combination of PARTID and PMG. See MPAMF_MSMON_IDR.</td>
</tr>
</tbody>
</table>

HAS_IMPL_IDR, bit [29]

Has MPAMF_IMPL_IDR. Indicates whether this MSC has the implementation-specific MPAM features register, MPAMF_IMPL_IDR.

<table>
<thead>
<tr>
<th>HAS_IMPL_IDR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not have MPAMF_IMPL_IDR.</td>
</tr>
<tr>
<td>0b1</td>
<td>Has MPAMF_IMPL_IDR.</td>
</tr>
</tbody>
</table>

EXT, bit [28]

From Armv8.6:

Extended MPAMF_IDR.

<table>
<thead>
<tr>
<th>EXT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MPAMF_IDR has no defined bits in [63:32]. The register is effectively 32 bits.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAMF_IDR has bits defined in [63:32]. The register is 64-bits.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

HAS_PRI_PART, bit [27]

Has priority partitioning. Indicates whether this MSC implements MPAM priority partitioning and MPAMF_PRI_IDR.

<table>
<thead>
<tr>
<th>HAS_PRI_PART</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not support priority partitioning or have MPAMF_PRI_IDR.</td>
</tr>
<tr>
<td>0b1</td>
<td>Has MPAMF_PRI_IDR.</td>
</tr>
</tbody>
</table>

HAS_MBW_PART, bit [26]

Has memory bandwidth partitioning. Indicates whether this MSC implements MPAM memory bandwidth partitioning and MPAMF_MBW_IDR.

<table>
<thead>
<tr>
<th>HAS_MBW_PART</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not support memory bandwidth partitioning or have MPAMF_MBW_IDR register.</td>
</tr>
<tr>
<td>0b1</td>
<td>Has MPAMF_MBW_IDR register.</td>
</tr>
</tbody>
</table>

HAS_CPOR_PART, bit [25]

Has cache portion partitioning. Indicates whether this MSC implements MPAM cache portion partitioning and MPAMF_CPOR_IDR.
**HAS_CPOR_PART**

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

**HAS_CCAP_PART**, bit [24]

Has cache capacity partitioning. Indicates whether this MSC implements MPAM cache capacity partitioning and the MPAM_CCAP_IDR and MPAMCFG_CMAX registers.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

**PMG_MAX**, bits [23:16]

Maximum value of Non-secure PMG supported by this component.

**PARTID_MAX**, bits [15:0]

Maximum value of Non-secure PARTID supported by this component.

**Accessing the MPAMF_IDR**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_IDR is read-only.

MPAMF_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF_IDR_s) and Non-secure (MPAMF_IDR_ns) MPAM feature pages.

**MPAMF_IDR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0000</td>
<td>MPAMF_IDR_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0000</td>
<td>MPAMF_IDR_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
The MPAM_IIDR characteristics are:

**Purpose**

Uniquely identifies the MSC implementation by the combination of implementer, product ID, variant and revision.

**Configuration**

The power domain of MPAM_IIDR is **IMPLEMENTATION DEFINED**.

**Attributes**

MPAM_IIDR is a 32-bit register.

**Field descriptions**

The MPAM_IIDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Bit Assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>ProductID</td>
<td>IMPLEMENTATION DEFINED.</td>
</tr>
<tr>
<td>20</td>
<td>Variant</td>
<td>IMPLEMENTATION DEFINED value used to distinguish product variants, or major revisions of the product.</td>
</tr>
<tr>
<td>11</td>
<td>Revision</td>
<td>IMPLEMENTATION DEFINED value used to distinguish minor revisions of the product.</td>
</tr>
</tbody>
</table>

**Note**

Implementations of ProductID with differing software interfaces are expected to have different values in the MPAM_IIDR.Variant field.

**Revision, bits [15:12]**

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED value used to distinguish minor revisions of the product.

**Note**

This field is intended to differentiate product revisions that are minor changes and are largely software compatible with previous revisions.
MPAMF_IIDR, MPAM Implementation Identification Register

**Implementer, bits [11:0]**

Contains the JEP106 code of the company that implemented the MPAM MSC.

[11:8] must contain the JEP106 continuation code of the implementer.

[7] must always be 0.

[6:0] must contain the JEP106 identity code of the implementer.

For an Arm implementation, bits[11:0] are 0x43B.

**Accessing the MPAMF_IIDR**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_IIDR is read-only.

MPAMF_IIDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_IIDR must have the same contents in the Secure and Non-secure MPAM feature pages.

**MPAMF_IIDR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0018</td>
<td>MPAMF_IIDR</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0018</td>
<td>MPAMF_IIDR</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
**MPAMF_IMPL_IDR, MPAM Implementation-Specific Partitioning Feature Identification Register**

The MPAMF_IMPL_IDR characteristics are:

**Purpose**

The MPAMF_IMPL_IDR is a 32-bit read-only register that indicates the implementation-defined partitioning and monitoring features and parameters of the MSC. MPAMF_IMPL_IDR_s indicates implementation-defined partitioning and monitoring features accessed from the Secure MPAM feature page. MPAMF_IMPL_IDR_ns indicates those accessed from the Non-secure MPAM feature page.

**Configuration**

The power domain of MPAMF_IMPL_IDR is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_IMPL_IDR == 1. Otherwise, direct accesses to MPAMF_IMPL_IDR are RES0.

**Attributes**

MPAMF_IMPL_IDR is a 32-bit register.

**Field descriptions**

The MPAMF_IMPL_IDR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | IMP DEF |

**IMP DEF, bits [31:0]**

IMPLEMENTATION DEFINED.

All 32 bits of this register are available to be used as the implementer sees fit to indicate the presence of implementation-defined MPAM features in this MSC and to give additional implementation-specific read-only information about the parameters of implementation-specific MPAM features to software.

**Accessing the MPAMF_IMPL_IDR**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_IMPL_IDR is read-only.

MPAMF_IMPL_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_IMPL_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF_IMPL_IDR_s) and Non-secure (MPAMF_IMPL_IDR_ns) MPAM feature pages.

**MPAMF_IMPL_IDR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0028</td>
<td>MPAMF_IMPL_IDR_s</td>
</tr>
</tbody>
</table>
Accesses on this interface are **RO**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0028</td>
<td>MPAMF_IMPL_IDR_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
MPAMF_MBW_IDR, MPAM Memory Bandwidth Partitioning Identification Register

The MPAMF_MBW_IDR characteristics are:

**Purpose**

The MPAMF_MBW_IDR is a 32-bit read-only register that indicates which MPAM bandwidth partitioning features are present on this MSC. MPAMF_MBW_IDR_s indicates bandwidth partitioning features accessed from the Secure MPAM feature page. MPAMF_MBW_IDR_ns indicates bandwidth partitioning features accessed from the Non-secure MPAM feature page.

**Configuration**

The power domain of MPAMF_MBW_IDR is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_MBW_PART == 1. Otherwise, direct accesses to MPAMF_MBW_IDR are RES0.

**Attributes**

MPAMF_MBW_IDR is a 32-bit register.

**Field descriptions**

The MPAMF_MBW_IDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-29</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>28-16</td>
<td>Bandwidth portion bitmap width.</td>
</tr>
<tr>
<td>15</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>14</td>
<td>Indicates the bandwidth accounting period register is writable.</td>
</tr>
</tbody>
</table>

**Bits [31:29]**

Reserved, RES0.

**BWPBM_WD, bits [28:16]**

Bandwidth portion bitmap width.

The number of bandwidth portion bits in MPAMCFG_MBW_PBM.BWPBM.

This field must contain a value from 1 to 4096, inclusive. Values greater than 32 require a group of 32-bit registers to access the BWPBM, up to 128 if BWPBM_WD is the largest value.

**Bit [15]**

Reserved, RES0.

**WINDWR, bit [14]**

Indicates the bandwidth accounting period register is writable.
### WINDWR

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The bandwidth accounting period is readable from MPAMCFG_MBW_WINWD which might be fixed or vary due to clock rate reconfiguration of the memory channel or memory controller.</td>
</tr>
<tr>
<td>0b1</td>
<td>The bandwidth accounting width is readable and writable per partition in MPAMCFG_MBW_WINWD.</td>
</tr>
</tbody>
</table>

### HAS_PROP, bit [13]

Indicates that this MSC implements proportional stride bandwidth partitioning and the MPAMCFG_MBW_PROP register.

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>There is no memory bandwidth proportional stride control and no MPAMCFG_MBW_PROP register.</td>
</tr>
<tr>
<td>0b1</td>
<td>The MPAMCFG_MBW_PROP register exists and the proportional stride memory bandwidth allocation scheme is supported.</td>
</tr>
</tbody>
</table>

### HAS_PBM, bit [12]

Indicates that this MSC implements bandwidth portion partitioning and the MPAMCFG_MBW_PBM register.

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>There is no memory bandwidth portion control and no MPAMCFG_MBW_PBM register.</td>
</tr>
<tr>
<td>0b1</td>
<td>The MPAMCFG_MBW_PBM register exists and the memory bandwidth portion allocation scheme exists.</td>
</tr>
</tbody>
</table>

### HAS_MAX, bit [11]

Indicates that this MSC implements maximum bandwidth partitioning and the MPAMCFG_MBW_MAX register.

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>There is no maximum memory bandwidth control and no MPAMCFG_MBW_MAX register.</td>
</tr>
<tr>
<td>0b1</td>
<td>The MPAMCFG_MBW_MAX register exists and the maximum memory bandwidth allocation scheme is supported.</td>
</tr>
</tbody>
</table>

### HAS_MIN, bit [10]

Indicates that this MSC implements minimum bandwidth partitioning.

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>There is no minimum memory bandwidth control and no MPAMCFG_MBW_MIN register.</td>
</tr>
<tr>
<td>0b1</td>
<td>The MPAMCFG_MBW_MIN register exists and the minimum memory bandwidth allocation scheme is supported.</td>
</tr>
</tbody>
</table>

### Bits [9:6]

Reserved, RES0.

### BWA_WD, bits [5:0]

Number of implemented bits in the bandwidth allocation fields: MIN, MAX and STRIDE. See MPAMCFG_MBW_MIN, MPAMCFG_MBW_MAX and MPAMCFG_MBW_PROP.

This field must have a value from 1 to 16, inclusive.
Accessing the MPAMF_MBW_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_MBW_IDR is read-only.

MPAMF_MBW_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_MBW_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF_MBW_IDR_s) and Non-secure (MPAMF_MBW_IDR_ns) MPAM feature pages.

**MPAMF_MBW_IDR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0040</td>
<td>MPAMF_MBW_IDR_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0040</td>
<td>MPAMF_MBW_IDR_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.
MPAMF_MBWUMON_IDR, MPAM Features Memory Bandwidth Usage Monitoring ID register

The MPAMF_MBWUMON_IDR characteristics are:

Purpose

The MPAMF_MBWUMON_IDR is a 32-bit read-only register that indicates the number of memory bandwidth usage monitors for this MSC. MPAMF_MBWUMON_IDR_s indicates the number of Secure memory bandwidth usage monitor instances. MPAMF_MBWUMON_IDR_ns indicates the number of Non-secure memory bandwidth usage monitor instances.

Configuration

The power domain of MPAMF_MBWUMON_IDR is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_MBWU == 1. Otherwise, direct accesses to MPAMF_MBWUMON_IDR are RES0.

Attributes

MPAMF_MBWUMON_IDR is a 32-bit register.

Field descriptions

The MPAMF_MBWUMON_IDR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| HAS_CAPTURE | HAS_LONG | LWD | RES0 | SCALE | NUM_MON |

HAS_CAPTURE, bit [31]

The implementation of this MSC supports copying an MSMON_MBWU to the corresponding MSMON_MBWU_CAPTURE on a capture event.

<table>
<thead>
<tr>
<th>HAS_CAPTURE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MSMON_MBWU_CAPTURE is not implemented and there is no support for capture events in the MBWU monitor.</td>
</tr>
<tr>
<td>0b1</td>
<td>The MSMON_MBWU_CAPTURE register is implemented and the MBWU monitor supports the capture event behavior.</td>
</tr>
</tbody>
</table>

HAS_LONG, bit [30]

When ARMv8.6-MPAM is implemented:

Indicates whether MSMON_MBWU_L is implemented.

If HAS_CAPTURE == 1, indicates whether MSMON_MBWU_L_CAPTURE is implemented.

<table>
<thead>
<tr>
<th>HAS_LONG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not implement MSMON_MBWU_L or MSMON_MBWU_L_CAPTURE.</td>
</tr>
<tr>
<td>0b1</td>
<td>Implements MSMON_MBWU_L. If HAS_CAPTURE == 1, MSMON_MBWU_L_CAPTURE is also implemented.</td>
</tr>
</tbody>
</table>
Otherwise:

Reserved, RES0.

**LWD, bit [29]**

When ARMv8.6-MPAM is implemented:

Long register VALUE width.

If MPAMF_MBWUMON_IDR.HAS_LONG == 0, MPAMF_MBWUMON_IDR.LWD must also be 0.

<table>
<thead>
<tr>
<th>LWD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If MPAMF_MBWUMON_IDR.HAS_LONG == 1, MSMON_MBWU_L has 44-bit VALUE field in bits [43:0]. Bits [62:44] are RES0. If HAS_LONG == 1 and MPAMF_MBWUMON_IDR.HAS_CAPTURE == 1, MSMON_MBWU_L_CAPTURE also has 44-bit VALUE field in bits [43:0].</td>
</tr>
<tr>
<td>0b1</td>
<td>MSMON_MBWU_L has 63-bit VALUE field in bits [62:0]. If MPAMF_MBWUMON_IDR.HAS_CAPTURE == 1, MSMON_MBWU_L_CAPTURE also has 63-bit VALUE field in bits [62:0].</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

**Bits [28:21]**

Reserved, RES0.

**SCALE, bits [20:16]**

Scaling of MSMON_MBWU.VALUE in bits. If scaling is enabled by MSMON_CFG_MBWU_CTL.SCLEN, the byte count in the VALUE field has been shifted by SCALE bits to the right.

<table>
<thead>
<tr>
<th>SCALE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>Scaling is not implemented.</td>
</tr>
<tr>
<td>0bxxxxxx</td>
<td>Other values are right shift count when scaling is enabled.</td>
</tr>
</tbody>
</table>

**NUM_MON, bits [15:0]**

The number of memory bandwidth usage monitors implemented in this MSC.

**Accessing the MPAMF_MBWUMON_IDR**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_MBWUMON_IDR is read-only.

MPAMF_MBWUMON_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_MBWUMON_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF_MBWUMON_IDR_s) and Non-secure (MPAMF_MBWUMON_IDR_ns) MPAM feature pages.
**MPAMF_MBWUMON_IDR** can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0090</td>
<td>MPAMF_MBWUMON_IDR_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RO**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>

Accesses on this interface are RO.
MPAMF_PARTID_NRW_IDR, MPAM PARTID Narrowing ID register

The MPAMF_PARTID_NRW_IDR characteristics are:

**Purpose**

The MPAMF_PARTID_NRW_IDR is a 32-bit read-only register that indicates the largest internal PARTID for this MSC. MPAMF_PARTID_NRW_IDR_s indicates the largest Secure internal PARTID. MPAMF_PARTID_NRW_IDR_ns indicates the largest Non-secure internal PARTID.

**Configuration**

The power domain of MPAMF_PARTID_NRW_IDR is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_PARTID_NRW == 1. Otherwise, direct accesses to MPAMF_PARTID_NRW_IDR are RES0.

**Attributes**

MPAMF_PARTID_NRW_IDR is a 32-bit register.

**Field descriptions**

The MPAMF_PARTID_NRW_IDR bit assignments are:

Accesses on this interface are **RO**.
MPAMF_SIDR, MPAM Features Secure Identification Register

The MPAMF_SIDR characteristics are:

**Purpose**

The MPAMF_SIDR is a 32-bit read-only register that indicates the maximum Secure PARTID and Secure PMG on this MSC.

**Configuration**

The power domain of MPAMF_SIDR is IMPLEMENTATION DEFINED.

**Attributes**

MPAMF_SIDR is a 32-bit register.

**Field descriptions**

The MPAMF_SIDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>23-16</td>
<td>S_PMG_MAX</td>
</tr>
<tr>
<td>15-0</td>
<td>S_PARTID_MAX</td>
</tr>
</tbody>
</table>

**Bits [31:24]**

Reserved, RES0.

**S_PMG_MAX, bits [23:16]**

Maximum value of Secure PMG supported by this component.

**S_PARTID_MAX, bits [15:0]**

Maximum value of Secure PARTID supported by this component.

**Accessing the MPAMF_SIDR**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_SIDR is read-only.

MPAMF_SIDR must only be readable from the Secure MPAM feature page. If the system or the MSC does not support the Secure address map, this register must not be accessible.

**MPAMF_SIDR can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE</td>
<td>0x0008</td>
<td>MPAMF_SIDR</td>

</tbody>
</table>

Accesses on this interface are RO.
MSMON_CAPT_EVNT, MPAM Capture Event Generation Register

The MSMON_CAPT_EVNT characteristics are:

**Purpose**

MSMON_CAPT_EVNT is a 32-bit read-write register that generates a local capture event when written with bit[0] as 1. MSMON_CAPT_EVNT_s generates local capture events for Secure monitors only or for Secure and Non-secure monitors. MSMON_CAPT_EVNT_ns generates local capture events for Non-secure monitors only.

**Configuration**

The power domain of MSMON_CAPT_EVNT is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.HAS_LOCAL_CAPT_EVNT == 1. Otherwise, direct accesses to MSMON_CAPT_EVNT are RES0.

**Attributes**

MSMON_CAPT_EVNT is a 32-bit register.

**Field descriptions**

The MSMON_CAPT_EVNT bit assignments are:

**Bits [31:2]**

Reserved, RES0.

**ALL, bit [1]**

In the Secure instance of this register, if ALL written as 1 and NOW is also written as 1, signal a capture event to Secure and Non-secure monitor instances in this MSC that are configured with CAPT_EVNT = 7.

If written as 0 and NOW is written as 1, signal a capture event to Secure monitor instances in this MSC that are configured with CAPT_EVNT = 7.

In the Non-secure instance of this register, this bit is RAZ/WI.

This bit always reads as zero.

<table>
<thead>
<tr>
<th>ALL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Send capture event to Secure monitors only.</td>
</tr>
<tr>
<td>0b1</td>
<td>Send capture event to both Secure and Non-secure monitors.</td>
</tr>
</tbody>
</table>

**NOW, bit [0]**

When written as 1, this bit causes an event to all monitors in this MSC with CAPT_EVNT set to the value of 7.

When this bit is written as 0, no event is signaled.

This bit always reads as zero.
**Accessing the MSMON\_CAPT\_EVNT**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON\_CAPT\_EVNT\_s must be accessible from the Secure MPAM feature page. MSMON\_CAPT\_EVENT\_ns must be accessible from the Non-secure MPAM feature page.

The two instances of MSMON\_CAPT\_EVNT must be separate registers. The Secure instance (MSMON\_CAPT\_EVNT\_s) can generate capture events for both Secure and Non-secure PARTID monitors, and the Non-secure instance (MSMON\_CAPT\_EVNT\_ns) can generate capture events for Non-secure PARTID monitors only.

**MSMON\_CAPT\_EVNT can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>

MSMON_CFG_CSU_CTL, MPAM Memory System Monitor Configure Cache Storage Usage Monitor Control Register

The MSMON_CFG_CSU_CTL characteristics are:

**Purpose**

MSMON_CFG_CSU_CTL is a 32-bit read-write register that controls the CSU monitor selected by MSMON_CFG_MON_SEL. MSMON_CFG_CSU_CTL controls the Secure cache storage usage monitor instance selected by the Secure instance of MSMON_CFG_MON_SEL. MSMON_CFG_CSU_CTL_ns controls Non-secure cache storage usage monitor instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.

**Configuration**

The power domain of MSMON_CFG_CSU_CTL is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_CSU == 1. Otherwise, direct accesses to MSMON_CFG_CSU_CTL are RES0.

**Attributes**

MSMON_CFG_CSU_CTL is a 32-bit register.

**Field descriptions**

The MSMON_CFG_CSU_CTL bit assignments are:

<table>
<thead>
<tr>
<th>EN</th>
<th>CAPT_EVNT</th>
<th>CAPT_RESET</th>
<th>OFLOW_STATUS</th>
<th>OFLOW_INTR</th>
<th>OFLOW_FRZ</th>
<th>SUBTYPE</th>
<th>RES0</th>
<th>MATCH_PMG</th>
<th>MATCH_PARTID</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>30</td>
<td>29</td>

</tr>
</tbody>
</table>

**EN, bit [31]**

Enabled.

<table>
<thead>
<tr>
<th>EN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The monitor instance is disabled and must not collect any information.</td>
</tr>
<tr>
<td>0b1</td>
<td>The monitor instance is enabled to collect information according to the configuration of the instance.</td>
</tr>
</tbody>
</table>

**CAPT_EVNT, bits [30:28]**

Capture event selector.

Select the event that triggers capture from the following:
<table>
<thead>
<tr>
<th>CAPT_EVNT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>No capture event is triggered.</td>
</tr>
<tr>
<td>0b001</td>
<td>External capture event 1 (optional but recommended)</td>
</tr>
<tr>
<td>0b010</td>
<td>External capture event 2 (optional)</td>
</tr>
<tr>
<td>0b011</td>
<td>External capture event 3 (optional)</td>
</tr>
<tr>
<td>0b100</td>
<td>External capture event 4 (optional)</td>
</tr>
<tr>
<td>0b101</td>
<td>External capture event 5 (optional)</td>
</tr>
<tr>
<td>0b110</td>
<td>External capture event 6 (optional)</td>
</tr>
<tr>
<td>0b111</td>
<td>Capture occurs when a MSMON_CAPT_EVNT register in this MSC is written and causes a capture event for the security state of this monitor. (optional)</td>
</tr>
</tbody>
</table>

The values marked as optional indicate capture event sources that can be omitted in an implementation. Those values representing non-implemented event sources should not trigger a capture event.

If capture is not implemented for the CSU monitor type as indicated by `MPAMF_CSUMON_IDR.HAS_CAPTURE = 0`, this field is RAZ/WI.

**CAPT_RESET, bit [27]**

Reset after capture.

Controls whether the value of `MSMON_CSU` is reset to zero immediately after being copied to `MSMON_CSU_CAPTURE`.

<table>
<thead>
<tr>
<th>CAPT_RESET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Monitor is not reset on capture.</td>
</tr>
<tr>
<td>0b1</td>
<td>Monitor is reset on capture.</td>
</tr>
</tbody>
</table>

If capture is not implemented for the CSU monitor type as indicated by `MPAMF_CSUMON_IDR.HAS_CAPTURE = 0`, this field is RAZ/WI.

Because the CSU monitor type produces a measurement rather than a count, it might not make sense to ever reset the value after a capture. If there is no reason to ever reset a CSU monitor, this field is RAZ/WI.

**OFLOW_STATUS, bit [26]**

Overflow status.

Indicates whether the value of `MSMON_CSU` has overflowed.

<table>
<thead>
<tr>
<th>OFLOW_STATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No overflow has occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>At least one overflow has occurred since this bit was last written to zero.</td>
</tr>
</tbody>
</table>

If overflow is not possible for a CSU monitor in the implementation, this field is RAZ/WI.

**OFLOW_INTR, bit [25]**

Overflow Interrupt.

Controls whether an overflow interrupt is generated when the value of `MSMON_CSU` has overflowed.

<table>
<thead>
<tr>
<th>OFLOW_INTR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No interrupt is signaled on an overflow of <code>MSMON_CSU</code>.</td>
</tr>
<tr>
<td>0b1</td>
<td>On overflow, an implementation-specific interrupt is signaled.</td>
</tr>
</tbody>
</table>

If OFLOW_INTR is not supported by the implementation, this field is RAZ/WI.

**OFLOW_FRZ, bit [24]**

Freeze Monitor on Overflow.
Controls whether the value of \texttt{MSMON\_CSU} freezes on an overflow.

<table>
<thead>
<tr>
<th>\texttt{OFLOW_FRZ}</th>
<th>\textbf{Meaning}</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Monitor count wraps on overflow.</td>
</tr>
<tr>
<td>0b1</td>
<td>Monitor count freezes on overflow. The frozen value might be 0 or another value if the monitor overflowed with an increment larger than 1.</td>
</tr>
</tbody>
</table>

If overflow is not possible for a CSU monitor in the implementation, this field is RAZ/WI.

\textbf{SUBTYPE, bits [23:20]}

Subtype.

A monitor can have other event matching criteria.

This field is not currently used for CSU monitors, but reserved for future use.

This field is RAZ/WI.

\textbf{Bits [19:18]}

Reserved, RES0.

\textbf{MATCH\_PMG, bit [17]}

Match PMG.

Controls whether the monitor measures only storage used with PMG matching \texttt{MSMON\_CFG\_CSU\_FLT.PMG}.

<table>
<thead>
<tr>
<th>\texttt{MATCH_PMG}</th>
<th>\textbf{Meaning}</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The monitor measures storage used with any PMG value.</td>
</tr>
<tr>
<td>0b1</td>
<td>The monitor only measures storage used with the PMG value matching \texttt{MSMON_CFG_CSU_FLT.PMG}.</td>
</tr>
</tbody>
</table>

If MATCH\_PMG == 1 and MATCH\_PARTID == 0, it is \texttt{CONSTRAINED\_UNPREDICTABLE} whether the monitor instance:

- Measures the storage used with matching PMG and with any PARTID.
- Measures no storage usage, that is, \texttt{MSMON\_CSU.VALUE} is zero.
- Measures the storage used with matching PMG and PARTID, that is, treats MATCH\_PARTID as == 1.

\textbf{MATCH\_PARTID, bit [16]}

Match PARTID.

Controls whether the monitor measures only storage used with PARTID matching \texttt{MSMON\_CFG\_CSU\_FLT.PARTID}.

<table>
<thead>
<tr>
<th>\texttt{MATCH_PARTID}</th>
<th>\textbf{Meaning}</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The monitor measures storage used with any PARTID value.</td>
</tr>
<tr>
<td>0b1</td>
<td>The monitor only measures storage used with the PARTID value matching \texttt{MSMON_CFG_CSU_FLT.PARTID}.</td>
</tr>
</tbody>
</table>

\textbf{Bits [15:8]}

Reserved, RES0.

\textbf{TYPE, bits [7:0]}

Monitor Type Code.

Constant type indicating the type of the monitor.
CSU monitor is $\text{TYPE} = 0x43$.

## Accessing the MSMON_CFG_CSU_CTL

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_CFG_CSU_CTL_s must be accessible from the Secure MPAM feature page. MSMON_CFG_CSU_CTL_ns must be accessible from the Non-secure MPAM feature page.

MSMON_CFG_CSU_CTL_s and MSMON_CFG_CSU_CTL_ns must be separate registers. The Secure instance (MSMON_CFG_CSU_CTL_s) accesses the cache storage usage monitor controls used for Secure PARTIDs, and the Non-secure instance (MSMON_CFG_CSU_CTL_ns) accesses the cache storage usage monitor controls used for Non-secure PARTIDs.

### MSMON_CFG_CSU_CTL can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0818</td>
<td>MSMON_CFG_CSU_CTL_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0818</td>
<td>MSMON_CFG_CSU_CTL_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
MSMON_CFG_CSU_FLT, MPAM Memory System Monitor Configure Cache Storage Usage Monitor Filter Register

The MSMON_CFG_CSU_FLT characteristics are:

**Purpose**

MSMON_CFG_CSU_FLT is a 32-bit read-write register that sets PARTID and PMG to measure or count in the CSU monitor selected by MSMON_CFG_MON_SEL. MSMON_CFG_CSU_FLT sets filter conditions for the Secure cache storage usage monitor instance selected by the Secure instance of MSMON_CFG_MON_SEL. MSMON_CFG_CSU_CTL sets filter conditions for the Non-secure cache storage usage monitor instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.

**Configuration**

The power domain of MSMON_CFG_CSU_FLT is IMPLEMENTATION DEFINED.

This register is present only when MPMF_IDR.HAS_MSMON == 1 and MPMF_MSMON_IDR.MSMON_CSU == 1. Otherwise, direct accesses to MSMON_CFG_CSU_FLT are RES0.

**Attributes**

MSMON_CFG_CSU_FLT is a 32-bit register.

**Field descriptions**

The MSMON_CFG_CSU_FLT bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>30</td>
<td>PMG</td>
</tr>
<tr>
<td>29</td>
<td>PARTID</td>
</tr>
</tbody>
</table>

**Bits [31:24]**

Reserved, RES0.

**PMG, bits [23:16]**

Performance monitoring group to filter cache storage usage monitoring.

If MSMON_CFG_CSU_CTL.MATCH_PMG == 0, this field is not used to match cache storage to a PMG and the contents of this field is ignored.

If MSMON_CFG_CSU_CTL.MATCH_PMG == 1 and MSMON_CFG_CSU_CTL.MATCH_PARTID == 1, the monitor instance selected by MSMON_CFG_MON_SEL measures or counts cache storage labeled with PMG equal to this field and PARTID equal to the PARTID field.

If MSMON_CFG_CSU_CTL.MATCH_PMG == 1 and MSMON_CFG_CSU_CTL.MATCH_PARTID == 0, the behavior of the monitor instance selected by MSMON_CFG_MON_SEL is CONSTRAINED UNPREDICTABLE. See MSMON_CFG_CSU_CTL.MATCH_PMG for more information.

**PARTID, bits [15:0]**

Partition ID to filter cache storage usage monitoring.

If MSMON_CFG_CSU_CTL.MATCH_PARTID == 0 and MSMON_CFG_CSU_CTL.MATCH_PMG == 0, the monitor measures all allocated cache storage.
If `MSMON_CFG_CSU_CTL.MATCH_PARTID == 0` and `MSMON_CFG_CSU_CTL.MATCH_PMG == 1`, the behavior of the monitor is **CONSTRAINED UNPREDICTABLE**. See the description of `MSMON_CFG_CSU_CTL.MATCH_PMG`.

If `MSMON_CFG_CSU_CTL.MATCH_PARTID == 1` and `MSMON_CFG_CSU_CTL.MATCH_PMG == 0`, the monitor selected by `MSMON_CFG_MON_SEL` measures or counts cache storage labeled with PARTID equal to this field.

If `MSMON_CFG_CSU_CTL.MATCH_PARTID == 1` and `MSMON_CFG_CSU_CTL.MATCH_PMG == 1`, the monitor selected by `MSMON_CFG_MON_SEL` measures or counts cache storage labeled with PARTID equal to this field and PMG equal to the PMG field.

### Accessing the MSMON_CFG_CSU_FLT

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

`MSMON_CFG_CSU_FLT_s` must be accessible from the Secure MPAM feature page. `MSMON_CFG_CSU_FLT_ns` must be accessible from the Non-secure MPAM feature page.

`MSMON_CFG_CSU_FLT_s` and `MSMON_CFG_CSU_FLT_ns` must be separate registers. The Secure instance (`MSMON_CFG_CSU_FLT_s`) accesses the PARTID and PMG matching for a cache storage usage monitor used for Secure PARTIDs, and the Non-secure instance (`MSMON_CFG_CSU_FLT_ns`) accesses the PARTID and PMG matching for a cache storage usage monitor used for Non-secure PARTIDs.

**MSMON_CFG_CSU_FLT can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0810</td>
<td>MSMON_CFG_CSU_FLT_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0810</td>
<td>MSMON_CFG_CSU_FLT_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
The MSMON_CFG_MBWU_CTL characteristics are:

**Purpose**

Controls the MBWU monitor selected by \texttt{MSMONCFG_MON_SEL}. \texttt{MSMONCFG_MBWU_CTL} controls the Secure memory bandwidth usage monitor instance selected by the Secure instance of \texttt{MSMONCFG_MON_SEL}. \texttt{MSMONCFG_MBWU_CTL}_{ns} controls Non-secure memory bandwidth usage monitor instance selected by the Non-secure instance of \texttt{MSMONCFG_MON_SEL}.

**Configuration**

The power domain of MSMON_CFG_MBWU_CTL is \texttt{IMPLEMENTATION DEFINED}.

This register is present only when \texttt{MPAMF_IDR.HAS_MSMON == 1} and \texttt{MPAMF_MSMON_IDR.MSMON_MBWU == 1}. Otherwise, direct accesses to MSMON_CFG_MBWU_CTL are \texttt{RES0}.

**Attributes**

MSMON_CFG_MBWU_CTL is a 32-bit register.

**Field descriptions**

The MSMON_CFG_MBWU_CTL bit assignments are:

<table>
<thead>
<tr>
<th>EN</th>
<th>CAPT_EVNT</th>
<th>CAPT_RESET</th>
<th>OFLOW_STATUS</th>
<th>OFLOW_INTR</th>
<th>OFLOW_FRZ</th>
<th>SUBTYPE</th>
<th>SCLEN</th>
<th>RES0</th>
<th>MATCH_PMG</th>
<th>MATCH_PART</th>
</tr>
</thead>
</table>

**EN, bit [31]**

Enabled.

<table>
<thead>
<tr>
<th>EN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The monitor instance is disabled and must not collect any information.</td>
</tr>
<tr>
<td>0b1</td>
<td>The monitor instance is enabled to collect information according to the configuration of the instance.</td>
</tr>
</tbody>
</table>

**CAPT_EVNT, bits [30:28]**

Capture event selector.

When the selected capture event occurs, \texttt{MSMON_MBWU} of the monitor instance is copied to \texttt{MSMON_MBWU_CAPTURE} of the same instance. If the long counter is also implemented, \texttt{MSMON_MBWU_L} is also copied to \texttt{MSMON_MBWU_L_CAPTURE}.

Select the event that triggers capture from the following:
The values marked as optional indicate capture event sources that can be omitted in an implementation. Those values representing non-implemented event sources should not trigger a capture event.

If capture is not implemented for the MBWU monitor type as indicated by MPAMF_MBWUMON_IDR.HAS_CAPTURE = 0, this field is RAZ/WI.

**CAPT_RESET, bit [27]**

Reset MSMON_MBWU.VALUE after capture.

Controls whether the VALUE field of the monitor instance is reset to zero immediately after being copied to the corresponding capture register.

<table>
<thead>
<tr>
<th>CAPT_RESET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MSMON_MBWU.VALUE field of the monitor instance is not reset on capture.</td>
</tr>
<tr>
<td>0b1</td>
<td>MSMON_MBWU.VALUE field of the monitor instance is reset on capture.</td>
</tr>
</tbody>
</table>

If capture is not implemented for the MBWU monitor type as indicated by MPAMF_MBWUMON_IDR.HAS_CAPTURE = 0, this field is RAZ/WI.

This control bit affects both MSMON_MBWU and MSMON_MBWU_L in implementations that include MSMON_MBWU_L.

**OFLOW_STATUS, bit [26]**

Overflow status.

Indicates whether the value of MSMON_MBWU has overflowed.

<table>
<thead>
<tr>
<th>OFLOW_STATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MSMON_MBWU has not overflowed.</td>
</tr>
<tr>
<td>0b1</td>
<td>MSMON_MBWU has overflowed at least once since this bit was last written to zero.</td>
</tr>
</tbody>
</table>

If overflow is not possible for a MBWU monitor in the implementation, this field is RA/Z/WI.

**OFLOW_INTR, bit [25]**

Overflow status of the MSMON_MBWU_L instance.

Indicates that the value of MSMON_MBWU overflow has overflowed.

<table>
<thead>
<tr>
<th>OFLOW_INTR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No interrupt is signaled on an overflow of MSMON_MBWU.</td>
</tr>
<tr>
<td>0b1</td>
<td>An implementation-specific interrupt is signaled on an overflow of MSMON_MBWU.</td>
</tr>
</tbody>
</table>

**OFLOW_FRZ, bit [24]**

Freeze monitor instance on overflow.
Controls whether \texttt{MSMON\_MBWU\_VALUE} field of the monitor instance freezes on an overflow.

<table>
<thead>
<tr>
<th>OFLOW_FRZ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>\texttt{MSMON_MBWU_VALUE} field of the monitor instance wraps on overflow.</td>
</tr>
<tr>
<td>0b1</td>
<td>\texttt{MSMON_MBWU_VALUE} field of the monitor instance freezes on overflow. If the increment that caused the overflow was 1, the frozen value is the post-increment value of 0. If the increment that caused the overflow was larger than 1, the frozen value of the monitor might be 0 or a larger value less than the final increment.</td>
</tr>
</tbody>
</table>

If overflow is not possible for the instance of the MBWU monitor in the implementation, this field is RAZ/WI.

This control bit affects both \texttt{MSMON\_MBWU} and \texttt{MSMON\_MBWU\_L} in implementations that include \texttt{MSMON\_MBWU\_L}.

**SUBTYPE, bits [23:20]**

Subtype.

A monitor can have other event matching criteria.

This field is not currently used for MBWU monitors, but reserved for future use.

This field is RAZ/WI.

**SCLEN, bit [19]**

\texttt{MSMON\_MBWU\_VALUE} Scaling Enable.

Enables scaling of \texttt{MSMON\_MBWU\_VALUE} by \texttt{MPAMF\_MBWUMON\_IDR\_SCALE}.

<table>
<thead>
<tr>
<th>SCLEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>\texttt{MSMON_MBWU_VALUE} has bytes counted by the monitor instance.</td>
</tr>
<tr>
<td>0b1</td>
<td>\texttt{MSMON_MBWU_VALUE} has bytes counted by the monitor instance, shifted right by \texttt{MPAMF_MBWUMON_IDR_SCALE}.</td>
</tr>
</tbody>
</table>

**Bit [18]**

Reserved, RES0.

**MATCH\_PMG, bit [17]**

Match PMG.

Controls whether the monitor instance only counts data transferred with PMG matching \texttt{MSMON\_CFG\_MBWU\_FLT\_PMG}.

<table>
<thead>
<tr>
<th>MATCH_PMG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The monitor instance counts data transferred with any PMG value.</td>
</tr>
<tr>
<td>0b1</td>
<td>The monitor instance only counts data transferred with the PMG value matching \texttt{MSMON_CFG_MBWU_FLT_PMG}.</td>
</tr>
</tbody>
</table>

**MATCH\_PARTID, bit [16]**

Match PARTID.

Controls whether the monitor instance counts only data transferred with PARTID matching \texttt{MSMON\_CFG\_MBWU\_FLT\_PARTID}. 
<table>
<thead>
<tr>
<th>MATCH_PARTID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The monitor instance counts data transferred with any PARTID value.</td>
</tr>
<tr>
<td>0b1</td>
<td>The monitor instance only counts data transferred with the PARTID value matching MSMON_CFG_MBWU_FLT.PARTID.</td>
</tr>
</tbody>
</table>

**OFLOW_STATUS_L, bit [15]**

When ARMv8.6-MPAM is implemented:

Overflow Status of the MSMON_MBWU_L instance.

Indicates whether an MPAM overflow interrupt is generated when the value of MSMON_MBWU_L has overflowed.

<table>
<thead>
<tr>
<th>OFLOW_STATUS_L</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MSMON_MBWU_L has not overflowed.</td>
</tr>
<tr>
<td>0b1</td>
<td>MSMON_MBWU_L has overflowed at least once since this bit was last written to zero.</td>
</tr>
</tbody>
</table>

If MPAMF_MBWUMON_IDR.HAS_LONG == 0, this bit is RES0.

Otherwise:

Reserved, RES0.

**OFLOW_INTR_L, bit [14]**

When ARMv8.6-MPAM is implemented:

Overflow Interrupt for MSMON_MBWU_L.

Controls whether an MPAM overflow interrupt is generated when the value of MSMON_MBWU_L overflows.

<table>
<thead>
<tr>
<th>OFLOW_INTR_L</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No interrupt is signaled on an overflow of MSMON_MBWU_L.</td>
</tr>
<tr>
<td>0b1</td>
<td>An implementation-specific interrupt is signalled on overflow of MSMON_MBWU_L.</td>
</tr>
</tbody>
</table>

If OFLOW_INTR is not supported by the implementation, this field is RAZ/WI.

If MPAMF_MBWUMON_IDR.HAS_LONG == 0, this bit is RES0.

Otherwise:

Reserved, RES0.

**Bits [13:8]**

Reserved, RES0.

**TYPE, bits [7:0]**

Monitor Type Code.

Constant type indicating the type of the monitor.

Read-only.

MBWU monitor is TYPE = 0x42.
## Accessing the MSMON_CFG_MBWU_CTL

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_CFG_MBWU_CTL_s must be accessible from the Secure MPAM feature page. MSMON_CFG_MBWU_CTL_ns must be accessible from the Non-secure MPAM feature page.

MSMON_CFG_MBWU_CTL_s and MSMON_CFG_MBWU_CTL_ns must be separate registers. The Secure instance (MSMON_CFG_MBWU_CTL_s) accesses the memory bandwidth usage monitor controls used for Secure PARTIDs, and the Non-secure instance (MSMON_CFG_MBWU_CTL_ns) accesses the memory bandwidth usage monitor controls used for Non-secure PARTIDs.

**MSMON_CFG_MBWU_CTL can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0828</td>
<td>MSMON_CFG_MBWU_CTL_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0828</td>
<td>MSMON_CFG_MBWU_CTL_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
The MSMON_CFG_MBWU_FLT characteristics are:

**Purpose**

MSMON_CFG_MBWU_FLT is a 32-bit read-write register that sets PARTID and PMG to measure or count in the MBWU monitor selected by MSMON_CFG_MON_SEL. MSMON_CFG_MBWU_FLT sets filter conditions for the Secure memory bandwidth usage monitor instance selected by the Secure instance of MSMON_CFG_MON_SEL. MSMON_CFG_MBWU_CTL sets filter conditions for the Non-secure memory bandwidth usage monitor instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.

**Configuration**

The power domain of MSMON_CFG_MBWU_FLT is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_MBWU == 1. Otherwise, direct accesses to MSMON_CFG_MBWU_FLT are RES0.

**Attributes**

MSMON_CFG_MBWU_FLT is a 32-bit register.

**Field descriptions**

The MSMON_CFG_MBWU_FLT bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | PMG | PARTID |

**Bits [31:24]**

Reserved, RES0.

**PMG, bits [23:16]**

Performance monitoring group to filter memory bandwidth usage monitoring.

If MSMON_CFG_MBWU_CTL.MATCH_PMG == 0, this field is not used to match memory bandwidth to a PMG and the contents of this field is ignored.

If MSMON_CFG_MBWU_CTL.MATCH_PMG == 1, the monitor selected by MSMON_CFG_MON_SEL measures or counts memory bandwidth labeled with PMG equal to this field.

**PARTID, bits [15:0]**

Partition ID to filter memory bandwidth usage monitoring.

If MSMON_CFG_MBWU_CTL.MATCH_PARTID == 0, this field is not used to match memory bandwidth to a PARTID and the contents of this field is ignored.

If MSMON_CFG_MBWU_CTL.MATCH_PARTID == 1, the monitor selected by MSMON_CFG_MON_SEL measures or counts memory bandwidth labeled with PARTID equal to this field.
Accessing the MSMON_CFG_MBWU_FLT

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_CFG_MBWU_FLT_s must be accessible from the Secure MPAM feature page. MSMON_CFG_MBWU_FLT_ns must be accessible from the Non-secure MPAM feature page.

MSMON_CFG_MBWU_FLT_s and MSMON_CFG_MBWU_FLT_ns must be separate registers. The Secure instance (MSMON_CFG_MBWU_FLT_s) accesses the PARTID and PMG matching for a memory bandwidth usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_CFG_MBWU_FLT_ns) accesses the PARTID and PMG matching for a memory bandwidth usage monitor used for Non-secure PARTIDs.

MSMON_CFG_MBWU_FLT can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0820</td>
<td>MSMON_CFG_MBWU_FLT_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0820</td>
<td>MSMON_CFG_MBWU_FLT_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are RW.
MSMON_CFG_MON_SEL, MPAM Monitor Instance Selection Register

The MSMON_CFG_MON_SEL characteristics are:

**Purpose**

Selects a monitor instance to access through the MSMON configuration and counter registers. MSMON_CFG_MON_SEL selects a Secure monitor instance to access via the Secure MPAM feature page. MSMON_CFG_MON_SEL_ns selects a Non-secure monitor instance to access via the Non-secure MPAM feature page.

**Note**

Different performance monitoring features within a MSC could have different numbers of monitor instances. See the NUM_MON field in the corresponding ID register. This means that a monitor out-of-bounds error might be signaled when an MSMON_CFG register is accessed because the value in MSMON_CFG_MON_SEL.MON_SEL is too large for the particular monitoring feature.

To configure a monitor, set MON_SEL in this register to the index of the monitor instance to configure, then write to the MSMON_CFG_x register to set the configuration of the monitor. At a later time, read the monitor register (for example MSMON_MBWU) to get the value of the monitor.

**Configuration**

The power domain of MSMON_CFG_MON_SEL is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_MSMON == 1, or (MPAMF_IDR.HAS_IMPL_IDR == 1 and MPAMF_IDR.EXT == 0) or (MPAMF_HAS_IMPL_IDR == 1, MPAMF_IDR.EXT == 1 and MPAMF_IDR.NO_IMPL_MSMON == 1). Otherwise, direct accesses to MSMON_CFG_MON_SEL are RES0.

**Attributes**

MSMON_CFG_MON_SEL is a 32-bit register.

**Field descriptions**

The MSMON_CFG_MON_SEL bit assignments are:

**Bits [31:28]**

Reserved, RES0.

**RIS, bits [27:24]**

When ARMv8.6-MPAM is implemented, MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_RIS == 1:

Resource Instance Selector. RIS selects one resource to configure through MSMON_CFG registers.

Otherwise:

Reserved, RES0.
Bits [23:16]

Reserved, RES0.

**MON_SEL, bits [15:0]**

Selects the monitor instance to configure or read.

Reads and writes to other MSMON registers are indexed by MON_SEL and by the NS bit used to access MSMON_CFG_MON_SEL to access the configuration for a single monitor.

**Accessing the MSMON_CFG_MON_SEL**

This register is part of the MPAMF_BASE memory frame. In a system that supports Secure and Non-secure memory maps, the MPAMF_BASE frame must be accessible in both Secure and Non-secure memory address maps.

MSMON_CFG_MON_SEL must be accessible from the Non-secure and Secure address maps.

MSMON_CFG_MON_SEL must be banked for the Secure and Non-secure address maps. The Secure instance is used with accesses to other MSMON registers to configure monitors for Secure PARTIDs, and the Non-secure instance is used with accesses to other MSMON registers to configure monitors for Non-secure PARTIDs.

**MSMON_CFG_MON_SEL can be accessed through the memory-mapped interfaces:**

MSMON_CSU_CAPTURE, MPAM Cache Storage Usage Monitor Capture Register

The MSMON_CSU_CAPTURE characteristics are:

Purpose

MSMON_CSU_CAPTURE is a 32-bit read-write register that accesses the captured MSMON_CSU monitor selected by MSMON_CFG_MON_SEL. MSMON_CSU_CAPTURE_s is the Secure cache storage usage monitor capture instance selected by the Secure instance of MSMON_CFG_MON_SEL. MSMON_CSU_CAPTURE_ns is the Non-secure cache storage usage monitor capture instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.

Configuration

The power domain of MSMON_CSU_CAPTURE is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_MSMON == 1, MPAMF_MSMON_IDR.MSMON_CSU == 1 and MPAMF_CSUMON_IDR.HAS_CAPTURE == 1. Otherwise, direct accesses to MSMON_CSU_CAPTURE are RES0.

Attributes

MSMON_CSU_CAPTURE is a 32-bit register.

Field descriptions

The MSMON_CSU_CAPTURE bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

<td>The captured monitor was ready and the VALUE fields is accurate.</td>
</tr>
</tbody>
</table>

VALUE, bits [30:0]

Captured cache storage usage value if NRDY == 0. Invalid if NRDY == 1.

VALUE is the captured cache storage usage in bytes meeting the criteria set in MSMON_CFG_CSU_FLT and MSMON_CFG_CSU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

Accessing the MSMON_CSU_CAPTURE

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_CSU_CAPTURE_s must be accessible from the Secure MPAM feature page. MSMON_CSU_CAPTURE_ns must be accessible from the Non-secure MPAM feature page.
MSMON_CSU_CAPTURE_s and MSMON_CSU_CAPTURE_ns must be separate registers. The Secure instance (MSMON_CSU_CAPTURE_s) accesses the captured cache storage usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_CSU_CAPTURE_ns) accesses the captured cache storage usage monitor used for Non-secure PARTIDs.

**MSMON_CSU_CAPTURE can be accessed through the memory-mapped interfaces:**

MSMON_MBWU, MPAM Memory Bandwidth Usage Monitor Register

The MSMON_MBWU characteristics are:

**Purpose**

MSMON_MBWU is a 32-bit read-write register that accesses the monitor instance selected by MSMON_CFG_MON_SEL. MSMON_MBWU_s is the Secure memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL_s. MSMON_MBWU_ns is the Non-secure memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL_ns.

**Configuration**

The power domain of MSMON_MBWU is implementation defined.

This register is present only when MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_MBWU == 1. Otherwise, direct accesses to MSMON_MBWU are RESET.

**Attributes**

MSMON_MBWU is a 32-bit register.

**Field descriptions**

The MSMON_MBWU bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| NRDY | VALUE |

**NRDY, bit [31]**

Not Ready. Indicates whether the monitor has possibly inaccurate data.

<table>
<thead>
<tr>
<th>NRDY</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The monitor is not ready and the contents of the VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.</td>
</tr>
<tr>
<td>0b1</td>
<td>The monitor is ready and the VALUE fields is accurate.</td>
</tr>
</tbody>
</table>

**VALUE, bits [30:0]**

Memory bandwidth usage counter value if NRDY == 0. Invalid if NRDY == 1.

VALUE is the scaled count of bytes transferred since the monitor was last reset that meet the criteria set in MSMON_CFG_MBWU_FLT and MSMON_CFG_MBWU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

If MSMON_CFG_MBWU_CTL.SCLEN == 1, the count in VALUE is the number of bytes shifted right by MPAMF_MBWUMON_IDR.SCALE bit positions and rounded.

**Accessing the MSMON_MBWU**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.
MSMON_MBWU_s must be accessible from the Secure MPAM feature page. MSMON_MBWU_ns must be accessible from the Non-secure MPAM feature page.

MSMON_MBWU_s and MSMON_MBWU_ns must be separate registers. The Secure instance (MSMON_MBWU_s) accesses the memory bandwidth usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_MBWU_ns) accesses the memory bandwidth usage monitor used for Non-secure PARTIDs.

**MSMON_MBWU can be accessed through the memory-mapped interfaces:**

Accesses on this interface are **RW**.
MSMON_MBWU__L_CAPTURE, MPAM Long Memory Bandwidth Usage Monitor Capture Register

The MSMON_MBWU__L_CAPTURE characteristics are:

**Purpose**

MSMON_MBWU__L_CAPTURE is a 64-bit read-write register that accesses the captured MSMON_MBWU instance selected by MSMON_CFG_MON_SEL.

MSMON_MBWU__L_CAPTURE_s is the Secure memory bandwidth usage monitor capture instance selected by the Secure instance of MSMON_CFG_MON_SEL.

MSMON_MBWU__L_CAPTURE_ns is the Non-secure memory bandwidth usage monitor capture instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.

**Configuration**

The power domain of MSMON_MBWU__L_CAPTURE is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_MSMON == 1, MPAMF_MSMON_IDR.MSMON_MBWU == 1, MPAMF_MBWUMON_IDR.HAS_CAPTURE == 1 and MPAMF_MBWUMON_IDR.HAS_LONG == 1. Otherwise, direct accesses to MSMON_MBWU__L_CAPTURE are IMPLEMENTATION DEFINED.

**Attributes**

MSMON_MBWU__L_CAPTURE is a 64-bit register.

**Field descriptions**

The MSMON_MBWU__L_CAPTURE bit assignments are:

**When MPAMF_MBWUMON_IDR.LWD == 0:**

NRDY, bit [63]

Not Ready. Indicates whether the monitor has possibly inaccurate data.

<table>
<thead>
<tr>
<th>NRDY</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The monitor is not ready and the contents of the \texttt{MSMON_MBWU_L_CAPTURE.VALUE} field might be inaccurate or otherwise not represent the actual memory bandwidth usage.</td>
</tr>
<tr>
<td>0b1</td>
<td>The monitor is ready and the \texttt{MSMON_MBWU_L_CAPTURE.VALUE} fields is accurate.</td>
</tr>
</tbody>
</table>

VALUE, bits [62:0]

Memory bandwidth usage counter value if \texttt{MSMON\_MBWU\_L\_CAPTURE.NRDY} == 0. Invalid if \texttt{MSMON\_MBWU\_L\_CAPTURE.NRDY} == 1.

\texttt{MSMON\_MBWU\_L\_CAPTURE.VALUE} is the 63-bit count of bytes transferred since the monitor was last reset that meet the criteria set in \texttt{MSMON\_CFG\_MBWU\_FLT} and \texttt{MSMON\_CFG\_MBWU\_CTL} for the monitor instance selected by \texttt{MSMON\_CFG\_MON\_SEL}.

Accessing the MSMON\_MBWU\_L\_CAPTURE

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

\texttt{MSMON\_MBWU\_L\_CAPTURE.s} must be accessible from the Secure MPAM feature page.
\texttt{MSMON\_MBWU\_L\_CAPTURE.ns} must be accessible from the Non-secure MPAM feature page.

\texttt{MSMON\_MBWU\_L\_CAPTURE.s} and \texttt{MSMON\_MBWU\_L\_CAPTURE.ns} must be separate registers. The Secure instance (\texttt{MSMON\_MBWU\_L\_CAPTURE.s}) accesses the captured long memory bandwidth usage monitor used for Secure PARTIDs, and the Non-secure instance (\texttt{MSMON\_MBWU\_L\_CAPTURE.ns}) accesses the captured long memory bandwidth usage monitor used for Non-secure PARTIDs.

\texttt{MSMON\_MBWU\_L\_CAPTURE} can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0890</td>
<td>MSMON_MBWU_CAPTURE_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are \texttt{RW}.

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0890</td>
<td>MSMON_MBWU_CAPTURE_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are \texttt{RW}. 

Page 3939
MSMON_MBWU_CAPTURE, MPAM Memory Bandwidth Usage Monitor Capture Register

The MSMON_MBWU_CAPTURE characteristics are:

**Purpose**

MSMON_MBWU_CAPTURE is a 32-bit read-write register that accesses the captured MSMON_MBWU monitor instance selected by MSMON_CFG_MON_SEL. MSMON_MBWU_CAPTURE_s is the Secure memory bandwidth usage monitor capture instance selected by the Secure instance of MSMON_CFG_MON_SEL. MSMON_MBWU_CAPTURE_ns is the Non-secure memory bandwidth usage monitor capture instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.

**Configuration**

The power domain of MSMON_MBWU_CAPTURE is implementation defined.

This register is present only when MPAMF_IDR.HAS_MSMON == 1, MPAMF_MSMON_IDR.MSMON_MBWU == 1 and MPAMF_MBWUMON_IDR.HAS_CAPTURE == 1. Otherwise, direct accesses to MSMON_MBWU_CAPTURE are RES0.

**Attributes**

MSMON_MBWU_CAPTURE is a 32-bit register.

**Field descriptions**

The MSMON_MBWU_CAPTURE bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NRDY</td>
<td>Not Ready. The captured NRDY bit from the corresponding instance of MSMON_MBWU. This bit indicates whether the captured monitor value has possibly inaccurate data.</td>
</tr>
<tr>
<td>VALUE</td>
<td>Captured memory bandwidth usage counter value if NRDY == 0. Invalid if NRDY == 1.</td>
</tr>
</tbody>
</table>

**NRDY, bit [31]**

<table>
<thead>
<tr>
<th>NRDY</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The captured monitor was not ready and the contents of the VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.</td>
</tr>
<tr>
<td>0b1</td>
<td>The captured monitor was ready and the VALUE fields is accurate.</td>
</tr>
</tbody>
</table>

**VALUE, bits [30:0]**

Captured memory bandwidth usage counter value if NRDY == 0. Invalid if NRDY == 1.

VALUE is the captured VALUE field from the corresponding instance of MSMON_MBWU, the count of bytes transferred since the monitor was last reset that meet the criteria set in MSMON_CFG_MBWU_FLT and MSMON_CFG_MBWU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

VALUE captures the MSMON_MBWU.VALUE and preserves any scaling that had been performed on the VALUE field in that register.
Accessing the MSMON_MBWU_CAPTURE

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_MBWU_CAPTURE_s must be accessible from the Secure MPAM feature page. MSMON_MBWU_CAPTURE_ns must be accessible from the Non-secure MPAM feature page.

MSMON_MBWU_CAPTURE_s and MSMON_MBWU_CAPTURE_ns must be separate registers. The Secure instance (MSMON_MBWU_CAPTURE_s) accesses the captured memory bandwidth usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_MBWU_CAPTURE_ns) accesses the captured memory bandwidth usage monitor used for Non-secure PARTIDs.

MSMON_MBWU_CAPTURE can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0868</td>
<td>MSMON_MBWU_CAPTURE_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are \textit{RW}.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>

MSMON_MBWU_L, MPAM Long Memory Bandwidth Usage Monitor Register

The MSMON_MBWU_L characteristics are:

**Purpose**

MSMON_MBWU_L is a 64-bit read-write register that accesses the monitor instance selected by 
MSMON_CFG_MON_SEL. MSMON_MBWU_L_s is the Secure memory bandwidth usage monitor instance selected by 
the Secure instance of MSMON_CFG_MON_SEL. MSMON_MBWU_L_ns is the Non-secure memory bandwidth usage 
monitor instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.

**Configuration**

The power domain of MSMON_mBWU_L is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_MSMON == 1, MPAMF_MSMON_IDR.MSMON_MBWU == 1 and 
MPAMF_MBWUMON_IDR.HAS_LONG == 1. Otherwise, direct accesses to MSMON_MBWU_L are IMPLEMENTATION 
DEFINED.

**Attributes**

MSMON_MBWU_L is a 64-bit register.

**Field descriptions**

The MSMON_MBWU_L bit assignments are:

When MPAMF_MBWUMON_IDR.LWD == 0:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>NRDY, not ready. Indicates whether the monitor has possibly inaccurate data.</td>
</tr>
<tr>
<td>62:44</td>
<td>The monitor is not ready and the contents of the VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.</td>
</tr>
<tr>
<td>43:0</td>
<td>VALUE, long (44-bit) memory bandwidth usage counter value if NRDY == 0. Invalid if NRDY == 1.</td>
</tr>
</tbody>
</table>

VALUE is the long count of bytes transferred since the monitor was last reset that meet the criteria set in 
MSMON_CFG_MBWU_FLT and MSMON_CFG_MBWU_CTL for the monitor instance selected by 
MSMON_CFG_MON_SEL.
When MPAMF_MBWUMON_IDR.LWD == 1:

| 63  | 62  | 61  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| NRDY | VALUE | VALUE |
| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |

NRDY, bit [63]

Not Ready. Indicates whether the monitor has possibly inaccurate data.

<table>
<thead>
<tr>
<th>NRDY</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The monitor is not ready and the contents of the VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.</td>
</tr>
<tr>
<td>0b1</td>
<td>The monitor is ready and the VALUE fields is accurate.</td>
</tr>
</tbody>
</table>

VALUE, bits [62:0]

Long (63-bit) memory bandwidth usage counter value if NRDY == 0. Invalid if NRDY == 1.

VALUE is the long count of bytes transferred since the monitor was last reset that meet the criteria set in MSMON_CFG_MBWU_FLT and MSMON_CFG_MBWU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

Accessing the MSMON_MBWU_L

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_MBWU_L_s must be accessible from the Secure MPAM feature page. MSMON_MBWU_L_ns must be accessible from the Non-secure MPAM feature page.

MSMON_MBWU_L_s and MSMON_MBWU_L_ns must be separate registers. The Secure instance (MSMON_MBWU_L_s) accesses the long memory bandwidth usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_MBWU_L_ns) accesses the long memory bandwidth usage monitor used for Non-secure PARTIDs.

**MSMON_MBWU_L can be accessed through the memory-mapped interfaces:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_s</td>
<td>0x0880</td>
<td>MSMON_MBWU_s</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPAM</td>
<td>MPAMF_BASE_ns</td>
<td>0x0880</td>
<td>MSMON_MBWU_ns</td>
</tr>
</tbody>
</table>

Accesses on this interface are **RW**.
OSLAR_EL1, OS Lock Access Register

The OSLAR_EL1 characteristics are:

**Purpose**

Used to lock or unlock the OS lock.

**Configuration**

External register OSLAR_EL1 bits [31:0] are architecturally mapped to AArch64 System register OSLAR_EL1[31:0].
External register OSLAR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGOSLAR[31:0].

OSLAR_EL1 is in the Core power domain.

If ARMv8.2-Debug is not implemented, it is IMPLEMENTATIONDEFINED whether external debug accesses to OSLAR_EL1 are ignored and return an error when AllowExternalDebugAccess() returns FALSE for the access.

If ARMv8.2-Debug is implemented, external debug accesses to OSLAR_EL1 are ignored and return an error when AllowExternalDebugAccess() returns FALSE for the access.

**Attributes**

OSLAR_EL1 is a 32-bit register.

**Field descriptions**

The OSLAR_EL1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | OSLK | Bits [31:1] |

Reserved, RES0.

**OSLK, bit [0]**

On writes to OSLAR_EL1, bit[0] is copied to the OS lock.

Use EDPRSR.OSLK to check the current status of the lock.

**Accessing the OSLAR_EL1**

**Note**

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

OSLAR_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x300</td>
<td>OSLAR_EL1</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()`, `AllowExternalDebugAccess()` and `SoftwareLockStatus()` accesses to this register are **WI**.
- When `IsCorePowered()`, `!DoubleLockStatus()`, `AllowExternalDebugAccess()` and `!SoftwareLockStatus()` accesses to this register are **WO**.
- When `IsCorePowered()`, `!DoubleLockStatus()`, `!AllowExternalDebugAccess()` and ARMv8.2-Debug is not implemented accesses to this register are **IMPDEF**.
- Otherwise accesses to this register generate an error response.
PMAUTHSTATUS, Performance Monitors Authentication Status register

The PMAUTHSTATUS characteristics are:

**Purpose**

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for Performance Monitors.

**Configuration**

It is IMPLEMENTATION DEFINED whether PMAUTHSTATUS is implemented in the Core power domain or in the Debug power domain.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

This register is OPTIONAL, and is required for CoreSight compliance. Arm recommends that this register is implemented.

**Attributes**

PMAUTHSTATUS is a 32-bit register.

**Field descriptions**

The PMAUTHSTATUS bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>SNID</td>
</tr>
<tr>
<td>29</td>
<td>SID</td>
</tr>
<tr>
<td>28</td>
<td>NSNID</td>
</tr>
<tr>
<td>27</td>
<td>NSID</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SNID, bits [7:6]**

Holds the same value as DBGAUTHSTATUS_EL1.SNID.

**SID, bits [5:4]**

Secure invasive debug. Possible values of this field are:

<table>
<thead>
<tr>
<th>SID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Not implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**NSNID, bits [3:2]**

Holds the same value as DBGAUTHSTATUS_EL1.NSNID.
NSID, bits [1:0]

Non-secure invasive debug. Possible values of this field are:

<table>
<thead>
<tr>
<th>NSID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Not implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Accessing the PMAUTHSTATUS

PMAUTHSTATUS can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFB8</td>
<td>PMAUTHSTATUS</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
PMCCFILTR_EL0, Performance Monitors Cycle Counter Filter Register

The PMCCFILTR_EL0 characteristics are:

**Purpose**

Determines the modes in which the Cycle Counter, PMCCNTR_EL0, increments.

**Configuration**

External register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMCCFILTR_EL0[31:0].

External register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCCFILTR[31:0].

PMCCFILTR_EL0 is in the Core power domain.

On a Warm or Cold reset RW fields in this register reset:

- To architecturally **UNKNOWN** values if the reset is to an Exception level that is using AArch64.
- To 0 if the reset is to an Exception level that is using AArch32.

The register is not affected by an External debug reset.

**Attributes**

PMCCFILTR_EL0 is a 32-bit register.

**Field descriptions**

The PMCCFILTR_EL0 bit assignments are:

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| P   | U   | NSK | NS  | M   | RES0 | SH  | RES0 |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

**P, bit [31]**

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR_EL0.NSK bit.

<table>
<thead>
<tr>
<th>P</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count cycles in EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count cycles in EL1.</td>
</tr>
</tbody>
</table>

**U, bit [30]**

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR_EL0.NSU bit.

<table>
<thead>
<tr>
<th>U</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count cycles in EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count cycles in EL0.</td>
</tr>
</tbody>
</table>
NSK, bit [29]

When HaveEL(EL3):

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Non-secure EL1 are counted. Otherwise, cycles in Non-secure EL1 are not counted.

Otherwise:

Reserved, RES0.

NSU, bit [28]

When HaveEL(EL3):

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Non-secure EL0 are counted. Otherwise, cycles in Non-secure EL0 are not counted.

Otherwise:

Reserved, RES0.

NSH, bit [27]

When HaveEL(EL2):

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If Secure EL2 is implemented, counting in Secure EL2 is further controlled by the PMCCFILTR_EL0.SH bit.

<table>
<thead>
<tr>
<th>NSH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not count cycles in EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Count cycles in EL2.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

M, bit [26]

When HaveEL(EL3):

Secure EL3 filtering bit.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Secure EL3 are counted. Otherwise, cycles in Secure EL3 are not counted.

Most applications can ignore this field and set its value to 0.

Note

This field is not visible in the AArch32 PMCCFILTR System register.
Otherwise:

Reserved, RES0.

**Bit [25]**

Reserved, RES0.

**SH, bit [24]**

When ARMv8.4-SecEL2 is implemented:

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Secure EL2 are counted.

Otherwise, cycles in Secure EL2 are not counted.

If Secure EL2 is not implemented or is disabled, this field is RES0.

---

**Note**

This field is not visible in the AArch32 PMCCFILTR System register.

---

Otherwise:

Reserved, RES0.

**Bits [23:0]**

Reserved, RES0.

**Accessing the PMCCFILTR_EL0**

---

**Note**

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

---

**PMCCFILTR_EL0 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x47C</td>
<td>PMCCFILTR_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
The PMCCNTR_EL0 characteristics are:

**Purpose**

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See 'Time as measured by the Performance Monitors cycle counter' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile for more information.

PMCCFILTR_EL0 determines the modes and states in which the PMCCNTR_EL0 can increment.

**Configuration**

External register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch64 System register PMCCNTR_EL0[63:0].

External register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch32 System register PMCCNTR[63:0].

PMCCNTR_EL0 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply on a Warm or Cold reset. The register is not affected by an External debug reset.

**Attributes**

PMCCNTR_EL0 is a 64-bit register.

**Field descriptions**

The PMCCNTR_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| CCNT |

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| CCNT |

**CCNT, bits [63:0]**

Cycle count. Depending on the values of PMCR_EL0.\{LC,D\}, the cycle count increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to PMCR_EL0.C sets this field to 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMCCNTR_EL0**

**Note**

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.
**PMCCNTR_EL0 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x0F8</td>
<td>PMCCNTR_EL0</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x0FC</td>
<td>PMCCNTR_EL0</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.
PMCEID0, Performance Monitors Common Event Identification register 0

The PMCEID0 characteristics are:

**Purpose**

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range `0x0000` to `0x001F`

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

For more information about the common events and the use of the PMCEIDn registers see The section describing 'Event numbers and common events' in chapter D5 'The Performance Monitors Extension' of the Arm Architecture Reference Manual, for Armv8-A architecture profile.

**Note**

- Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.
- This view of the register was previously called PMCEID0_EL0.

**Configuration**

External register PMCEID0 bits [31:0] are architecturally mapped to AArch64 System register PMCEID0_EL0[31:0].

External register PMCEID0 bits [31:0] are architecturally mapped to AArch32 System register PMCEID0[31:0].

PMCEID0 is in the Core power domain.

**Attributes**

PMCEID0 is a 32-bit register.

**Field descriptions**

The PMCEID0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|

**ID<\text{n}>, bit \text{[n]}, for n = 0 to 31**

ID[n] corresponds to common event n.

For each bit:

<table>
<thead>
<tr>
<th>ID&lt;\text{n}&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The common event is not implemented, or not counted.</td>
</tr>
<tr>
<td>0b1</td>
<td>The common event is implemented.</td>
</tr>
</tbody>
</table>

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

**Note**

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features.
and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

## Accessing the PMCEID0

### Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

### PMCEID0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE20</td>
<td>PMCEID0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
The PMCEID1 characteristics are:

**Purpose**

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x020 to 0x03F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

For more information about the common events and the use of the PMCEIDn registers see the section describing 'Event numbers and common events' in chapter D5 'The Performance Monitors Extension' of the Arm Architecture Reference Manual, for Armv8-A architecture profile.

**Note**

- Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.
- This view of the register was previously called PMCEID1_EL0.

**Configuration**

External register PMCEID1 bits [31:0] are architecturally mapped to AArch64 System register PMCEID1_EL0[31:0].

External register PMCEID1 bits [31:0] are architecturally mapped to AArch32 System register PMCEID1[31:0].

PMCEID1 is in the Core power domain.

**Attributes**

PMCEID1 is a 32-bit register.

**Field descriptions**

The PMCEID1 bit assignments are:

<table>
<thead>
<tr>
<th>ID[n]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The common event is not implemented, or not counted.</td>
</tr>
<tr>
<td>0b1</td>
<td>The common event is implemented.</td>
</tr>
</tbody>
</table>

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

**Note**

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features.
and has an event number that can be represented in the PMCEID\(<n>\) registers of that earlier version of the PMU architecture.

## Accessing the PMCEID1

**Note**

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

### PMCEID1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE24</td>
<td>PMCEID1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
PMCEID2, Performance Monitors Common Event Identification register 2

The PMCEID2 characteristics are:

**Purpose**

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x4000 to 0x401F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

---

**Note**

Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

---

For more information about the common events and the use of the PMCEIDn registers see The section describing 'Event numbers and common events' in chapter D5 'The Performance Monitors Extension' of the Arm Architecture Reference Manual, for Armv8-A architecture profile.

**Configuration**

External register PMCEID2 bits [31:0] are architecturally mapped to AArch64 System register PMCEID0_EL0[63:32].

External register PMCEID2 bits [63:32] are architecturally mapped to AArch32 System register PMCEID2[31:0].

PMCEID2 is in the Core power domain.

This register is present only when ARMv8.1-PMU is implemented. Otherwise, direct accesses to PMCEID2 are RES0.

**Attributes**

PMCEID2 is a 32-bit register.

**Field descriptions**

The PMCEID2 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**IDhi<n>**, bit [n], for n = 0 to 31

IDhi[n] corresponds to common event (0x4000 + n).

For each bit:

<table>
<thead>
<tr>
<th><strong>IDhi&lt;n&gt;</strong></th>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The common event is not implemented, or not counted.</td>
</tr>
<tr>
<td>0b1</td>
<td>The common event is implemented.</td>
</tr>
</tbody>
</table>

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

---

**Note**
Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

## Accessing the PMCEID2

### Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

### PMCEID2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE28</td>
<td>PMCEID2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
PMCEID3, Performance Monitors Common Event Identification register 3

The PMCEID3 characteristics are:

**Purpose**

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x4020 to 0x403F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

**Note**

Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEIDn registers see The section describing 'Event numbers and common events' in chapter D5 'The Performance Monitors Extension' of the Arm Architecture Reference Manual, for Armv8-A architecture profile.

**Configuration**

External register PMCEID3 bits [31:0] are architecturally mapped to AArch64 System register PMCEID1_EL0[63:32].

External register PMCEID3 bits [63:32] are architecturally mapped to AArch32 System register PMCEID3[31:0].

PMCEID3 is in the Core power domain.

This register is present only when ARMv8.1-PMU is implemented. Otherwise, direct accesses to PMCEID3 are reserved.

**Attributes**

PMCEID3 is a 32-bit register.

**Field descriptions**

The PMCEID3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td><strong>IDhi&lt;n&gt;</strong>, bit [n], for n = 0 to 31</td>
</tr>
</tbody>
</table>

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

**Note**
Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID\langle n\rangle registers of that earlier version of the PMU architecture.

**Accessing the PMCEID3**

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

**PMCEID3 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE2C</td>
<td>PMCEID3</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
The PMCFGR characteristics are:

**Purpose**

Contains PMU-specific configuration data.

**Configuration**

PMCFGR is in the Core power domain.

**Attributes**

PMCFGR is a 32-bit register.

**Field descriptions**

The PMCFGR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 30 29 28</td>
<td>NCG, bits [31:28]</td>
</tr>
<tr>
<td>27 26 25 24</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>23 22 21 20</td>
<td>UEN, bit [19]. User-mode Enable Register</td>
</tr>
<tr>
<td>19 18 17 16</td>
<td>PMUSERENR_EL0 is not visible in the external debug interface, so this bit is RAZ.</td>
</tr>
<tr>
<td>15 14 13 12 11</td>
<td>NA, bit [17]. This feature is not supported, so this bit is RAZ.</td>
</tr>
<tr>
<td>10 9 8 7 6 5 4</td>
<td>EX, bit [16]. Export supported. Value is IMPLEMENTATION DEFINED.</td>
</tr>
<tr>
<td>3 2 1 0</td>
<td>PMCR_EL0.X is RES0.</td>
</tr>
<tr>
<td></td>
<td>PMCR_EL0.X is read/write.</td>
</tr>
</tbody>
</table>

This feature is not supported, so this field is RAZ.

Reserved, RES0.

User-mode Enable Register supported. PMUSERENR_EL0 is not visible in the external debug interface, so this bit is RAZ.

This feature is not supported, so this bit is RAZ.

This feature is not supported, so this bit is RAZ.
CCD, bit [15]

Cycle counter has prescale. This is RES1 if AArch32 is supported at any EL, and RAZ otherwise.

<table>
<thead>
<tr>
<th>CCD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PMCR_EL0.D is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>PMCR_EL0.D is read/write.</td>
</tr>
</tbody>
</table>

CC, bit [14]

Dedicated cycle counter (counter 31) supported. This bit is RAO.

SIZE, bits [13:8]

Size of counters, minus one. This field defines the size of the largest counter implemented by the Performance Monitors Unit.

From Armv8, the largest counter is 64-bits, so the value of this field is 0b111111.

This field is used by software to determine the spacing of the counters in the memory-map. From Armv8, the counters are a doubleword-aligned addresses.

N, bits [7:0]

Number of counters implemented in addition to the cycle counter, PMCCNTR_EL0. The maximum number of event counters is 31.

<table>
<thead>
<tr>
<th>N</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x0</td>
<td>Only PMCCNTR_EL0 implemented.</td>
</tr>
<tr>
<td>0x1</td>
<td>PMCCNTR_EL0 plus one event counter implemented.</td>
</tr>
</tbody>
</table>

and so on up to 0b00011111, which indicates PMCCNTR_EL0 and 31 event counters implemented.

Accessing the PMCFGR

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCFGR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE00</td>
<td>PMCFGR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
**PMCID1SR, CONTEXTIDR_EL1 Sample Register**

The PMCID1SR characteristics are:

**Purpose**

Contains the sampled value of CONTEXTIDR_EL1, captured on reading PMPCSR[31:0].

**Configuration**

PMCID1SR is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

This register is present only when ARMv8.2-PCSample is implemented. Otherwise, direct accesses to PMCID1SR are RE0.

**Note**

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of EDDEVID.PCSample.

**Attributes**

PMCID1SR is a 32-bit register.

**Field descriptions**

The PMCID1SR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**CONTEXTIDR_EL1, bits [31:0]**

Context ID. The value of CONTEXTIDR that is associated with the most recent PMPCSR sample. When the most recent PMPCSR sample was generated:

- If EL1 is using AArch64, then the Context ID is sampled from CONTEXTIDR_EL1.
- If EL1 is using AArch32, then the Context ID is sampled from CONTEXTIDR. If EL3 is implemented and is using AArch32, then CONTEXTIDR is a banked register and PMCID1SR samples the current banked copy of CONTEXTIDR for the Security state that is associated with the most recent PMPCSR sample.

Because the value written to PMCID1SR is an indirect read of CONTEXTIDR, it is CONSTRAINED UNPREDICTABLE whether PMCID1SR is set to the original or new value if PMPCSR samples:

- An instruction that writes to CONTEXTIDR.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMCID1SR**

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
**PMCID1SR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x208</td>
<td>PMCID1SR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()` and `!OSLockStatus()` accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x228</td>
<td>PMCID1SR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()` and `!OSLockStatus()` accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
The PMCID2SR characteristics are:

**Purpose**

Contains the sampled value of CONTEXTIDR_EL2, captured on reading PMPCSR[31:0].

**Configuration**

PMCID2SR is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

This register is present only when ARMv8.2-PCSample is implemented and HaveEL(EL2). Otherwise, direct accesses to PMCID2SR are RES0.

**Note**

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of EDDEVID.PCSample.

**Attributes**

PMCID2SR is a 32-bit register.

**Field descriptions**

The PMCID2SR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

CONTEXTIDR_EL2, bits [31:0]

Context ID. The value of CONTEXTIDR_EL2 that is associated with the most recent PMPCSR sample. When the most recent PMPCSR sample was generated:

- If EL2 is using AArch64, then this field is set to the Context ID sampled from CONTEXTIDR_EL2.
- If EL2 is using AArch32, then this field is set to an UNKNOWN value.

Because the value written to PMCID2SR is an indirect read of CONTEXTIDR_EL2, it is CONSTRAINED UNPREDICTABLE whether PMCID2SR is set to the original or new value if PMPCSR samples:

- An instruction that writes to CONTEXTIDR_EL2.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMCID2SR**

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
PMCID2SR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x22C</td>
<td>PMCID2SR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
The PMCIDR0 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

For more information see 'About the Component identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

**Configuration**

It is IMPLEMENTATION DEFINED whether PMCIDR0 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMCIDR0 is a 32-bit register.

**Field descriptions**

The PMCIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit 31-8</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-24</td>
<td>Reserved (RES0)</td>
</tr>
<tr>
<td>23-8</td>
<td>Preamble (PRMBL_0)</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_0, bits [7:0]**

Preamble. Must read as 0x0D.

**Accessing the PMCIDR0**

**PMCIDR0 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFFF0</td>
<td>PMCIDR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
The PMCIDR1 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

For more information see 'About the Component identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

**Configuration**

It is IMPLEMENTATION DEFINED whether PMCIDR1 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMCIDR1 is a 32-bit register.

**Field descriptions**

The PMCIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>30</td>
<td>CLASS</td>
</tr>
<tr>
<td>29</td>
<td>PRMBL_1</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**CLASS, bits [7:4]**

Component class. Reads as 0x9, debug component.

**PRMBL_1, bits [3:0]**

Preamble. RAZ.

**Accessing the PMCIDR1**

**PMCIDR1 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFF4</td>
<td>PMCIDR1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
• When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are RO.
• Otherwise accesses to this register generate an error response.
PMCIDR2, Performance Monitors Component Identification Register 2

The PMCIDR2 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

For more information see 'About the Component identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

**Configuration**

It is **IMPLEMENTATION DEFINED** whether PMCIDR2 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is **OPTIONAL**.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMCIDR2 is a 32-bit register.

**Field descriptions**

The PMCIDR2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>PRMBL_2</td>
</tr>
<tr>
<td></td>
<td>Bit assignments are:</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_2, bits [7:0]**

Preamble. Must read as 0x05.

**Accessing the PMCIDR2**

**PMCIDR2 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFFF8</td>
<td>PMCIDR2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
The PMCIDR3 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

For more information see 'About the Component identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

**Configuration**

It is **IMPLEMENTATION DEFINED** whether PMCIDR3 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is **OPTIONAL**.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMCIDR3 is a 32-bit register.

**Field descriptions**

The PMCIDR3 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 |
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | PRMBL_3 |

**Bits [31:8]**

Reserved, RES0.

**PRMBL_3, bits [7:0]**

Preamble. Must read as 0x81.

**Accessing the PMCIDR3**

**PMCIDR3 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFFC</td>
<td>PMCIDR3</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
PMCNTENCLR_EL0, Performance Monitors Count Enable Clear register

The PMCNTENCLR_EL0 characteristics are:

**Purpose**

Disables the Cycle Count Register, PMCCNTR_EL0, and any implemented event counters PMEVCNTR<n>. Reading this register shows which counters are enabled.

**Configuration**

External register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMCNTENCLR_EL0[31:0].

External register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCNTENCLR[31:0].

PMCNTENCLR_EL0 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply on a Warm or Cold reset. The register is not affected by an External debug reset.

**Attributes**

PMCNTENCLR_EL0 is a 32-bit register.

**Field descriptions**

The PMCNTENCLR_EL0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| C  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**C, bit [31]**

PMCCNTR_EL0 disable bit. Disables the cycle counter register. Possible values are:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter is enabled. When written, disables the cycle counter.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P<n>, bit [n], for n = 0 to 30**

Event counter disable bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that PMEVCNTR&lt;n&gt;_EL0 is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that PMEVCNTR&lt;n&gt;_EL0 is enabled. When written, disables PMEVCNTR&lt;n&gt;_EL0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing the PMCNTENCLR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCNTENCLR_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xC20</td>
<td>PMCNTENCLR_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.
PMCNTENSET_EL0, Performance Monitors Count Enable Set register

The PMCNTENSET_EL0 characteristics are:

**Purpose**

Enables the Cycle Count Register, PMCCNTR_EL0, and any implemented event counters PMEVCNTR<n>. Reading this register shows which counters are enabled.

**Configuration**

External register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMCNTENSET_EL0[31:0].

External register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCNTENSET[31:0].

PMCNTENSET_EL0 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply on a Warm or Cold reset. The register is not affected by an External debug reset.

**Attributes**

PMCNTENSET_EL0 is a 32-bit register.

**Field descriptions**

The PMCNTENSET_EL0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| C  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

C, bit [31]

**PMCCNTR_EL0** enable bit. Enables the cycle counter register. Possible values are:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter is enabled. When written, enables the cycle counter.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P<n>, bit [n], for n = 0 to 30**

Event counter enable bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that PMEVCNTR&lt;n&gt;_EL0 is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that PMEVCNTR&lt;n&gt;_EL0 event counter is enabled. When written, enables PMEVCNTR&lt;n&gt;_EL0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing the PMCNTENSET_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCNTENSET_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xC00</td>
<td>PMCNTENSET_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.
PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

**Purpose**

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

**Configuration**

External register PMCR_EL0 bits [7:0] are architecturally mapped to AArch32 System register PMCR[7:0].

External register PMCR_EL0 bits [7:0] are architecturally mapped to AArch64 System register PMCR_EL0[7:0].

PMCR_EL0 is in the Core power domain. Some or all RW fields of this register have defined reset values. The field descriptions identify when the reset values apply.

This register is only partially mapped to the internal PMCR System register. An external agent must use other means to discover the information held in PMCR[31:11], such as accessing PMCFGR and the ID registers.

**Attributes**

PMCR_EL0 is a 32-bit register.

**Field descriptions**

The PMCR_EL0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RAZ/WI |    | RES0 | LP | LC | DP | X | D | C | P | E |

**Bits [31:11]**

Reserved, RAZ/WI.

Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.

**Bits [10:8]**

Reserved, RES0.

**LP, bit [7]**

When ARMv8.5-PMU is implemented:

Long event counter enable. Determines when unsigned overflow is recorded by a counter overflow bit.

<table>
<thead>
<tr>
<th>LP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counter overflow on increment that causes unsigned overflow of PMEVCNTR&lt;n&gt;_EL0[31:0].</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counter overflow on increment that causes unsigned overflow of PMEVCNTR&lt;n&gt;_EL0[63:0].</td>
</tr>
</tbody>
</table>

If EL2 is implemented and MDCR_EL2.HPMN or HDCR.HPMN is less than PMCR_EL0.N, this bit does not affect the operation of event counters in the range [HDCR.HPMN..(PMCR_EL0.N-1)] or [MDCR_EL2.HPMN:(PMCR_EL0.N-1)].
The effect of `MDCR_EL2.HPMN` or `HDCR.HPMN` on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state. For more information, see the description of `MDCR_EL2.HPMN` or `HDCR.HPMN`.

If the highest implemented Exception level is using AArch32, it is IMPLEMENTATION DEFINED whether this bit is RW or RAZ/WI.

**Otherwise:**

Reserved, RES0.

**LC, bit [6]**

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

<table>
<thead>
<tr>
<th>LC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counter overflow on increment that causes unsigned overflow of <code>PMCCNTR_EL0[31:0]</code>.</td>
</tr>
<tr>
<td>0b1</td>
<td>Cycle counter overflow on increment that causes unsigned overflow of <code>PMCCNTR_EL0[63:0]</code>.</td>
</tr>
</tbody>
</table>

Arm deprecates use of `PMCR_EL0.LC = 0`.

In an AArch64 only implementation, this field is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DP, bit [5]**

*When HaveEL(EL3) or (ARMv8.1-PMU is implemented and HaveEL(EL2)):*

Disable cycle counter when event counting is prohibited. The possible values of this bit are:

<table>
<thead>
<tr>
<th>DP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counting by <code>PMCCNTR_EL0</code> is not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>When event counting for counters in the range <code>[0..(MDCR_EL2.HPMN-1)]</code> is prohibited, cycle counting by <code>PMCCNTR_EL0</code> is disabled.</td>
</tr>
</tbody>
</table>

For more information about the interaction between the Performance Monitors and EL3, see ‘Effect of EL3 and EL2’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally UNKNOWN if the reset is into an Exception level that is using AArch64.
- 0 if the reset is into an Exception level that is using AArch32.

**Otherwise:**

Reserved, RES0.

**X, bit [4]**

*When the implementation includes a PMU event export bus:*

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.
### PMCR_EL0, Performance Monitors Control Register

<table>
<thead>
<tr>
<th>X</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not export events.</td>
</tr>
<tr>
<td>0b1</td>
<td>Export events where not prohibited.</td>
</tr>
</tbody>
</table>

This field enables the exporting of events over an **IMPLEMENTATION DEFINED** PMU event export bus to another device, for example to an **OPTIONAL** PE trace unit.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally **UNKNOWN** if the reset is into an Exception level that is using AArch64.
- 0 if the reset is into an Exception level that is using AArch32.

**Otherwise:**

Reserved, RAZ/WI.

### D, bit [3]

**When AArch32 is supported at any Exception level:**

Clock divider.

<table>
<thead>
<tr>
<th>D</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When enabled, ( \text{PMCCNTR_EL0} ) counts every clock cycle.</td>
</tr>
<tr>
<td>0b1</td>
<td>When enabled, ( \text{PMCCNTR_EL0} ) counts once every 64 clock cycles.</td>
</tr>
</tbody>
</table>

If PMCR_EL0.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR_EL0.D = 1.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally **UNKNOWN** if the reset is into an Exception level that is using AArch64.
- 0 if the reset is into an Exception level that is using AArch32.

**Otherwise:**

Reserved, RES0.

### C, bit [2]

Cycle counter reset. The effects of writing to this bit are:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reset ( \text{PMCCNTR_EL0} ) to zero.</td>
</tr>
</tbody>
</table>

This bit is always RAZ.

**Note**

Resetting \( \text{PMCCNTR_EL0} \) does not change the cycle counter overflow bit.

Access to this field is **WO**.

### P, bit [1]

Event counter reset. The effects of writing to this bit are:
Meaning

<table>
<thead>
<tr>
<th>P</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reset all event counters, not including PMCCNTR_EL0 to zero.</td>
</tr>
</tbody>
</table>

This bit is always RAZ.

Note

Resetting the event counters does not change the event counter overflow bits.

If ARMv8.5-PMU is implemented, the value of MDAR_EL2.HLP, or PMCR_EL0.LP is ignored and bits [63:0] of all event counters are reset.

Access to this field is WO.

E, bit [0]

Enable.

<table>
<thead>
<tr>
<th>E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All event counters in the range [0..(PMN-1)] and PMCCNTR_EL0 are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>All event counters in the range [0..(PMN-1)] and PMCCNTR_EL0 are enabled by PMCNTENSET_EL0.</td>
</tr>
</tbody>
</table>

If EL2 is implemented then:

- If EL2 is using AArch32, PMN is HDCR.HPMN.
- If EL2 is using AArch64, PMN is MDAR_EL2.HPMN.
- If PMN is less than PMCR_EL0.N, this bit does not affect the operation of event counters in the range [PMN..(PMCR_EL0.N-1)].

If EL2 is not implemented, PMN is PMCR_EL0.N.

Note

The effect of MDAR_EL2.HPMN or HDCR.HPMN on the operation of this bit applies if EL2 is implemented regardless of whether EL2 is enabled in the current Security state. For more information, see the description of MDAR_EL2.HPMN or HDCR.HPMN.

On a Warm reset, this field resets to 0.

Accessing the PMCR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCR_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE04</td>
<td>PMCR_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
• Otherwise accesses to this register generate an error response.
PMDEVAFF0, Performance Monitors Device Affinity register 0

The PMDEVAFF0 characteristics are:

**Purpose**

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

**Configuration**

It is **IMPLEMENTATION DEFINED** whether PMDEVAFF0 is implemented in the Core power domain or in the Debug power domain.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

This register is required if the external interface to the PMU is implemented.

**Attributes**

PMDEVAFF0 is a 32-bit register.

**Field descriptions**

The PMDEVAFF0 bit assignments are:

| Bit 31 | Bit 30 | Bit 29 | Bit 28 | Bit 27 | Bit 26 | Bit 25 | Bit 24 | Bit 23 | Bit 22 | Bit 21 | Bit 20 | Bit 19 | Bit 18 | Bit 17 | Bit 16 | Bit 15 | Bit 14 | Bit 13 | Bit 12 | Bit 11 | Bit 10 | Bit 9 | Bit 8 | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
|        |        | MPIDR_EL1 low half |

**MPIDR_EL1 low half, bits [31:0]**

MPIDR_EL1 low half. Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented Exception level.

**Accessing the PMDEVAFF0**

PMDEVAFF0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFA8</td>
<td>PMDEVAFF0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
PMDEVAFF1, Performance Monitors Device Affinity register 1

The PMDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

Configuration

It is IMPLEMENTATION DEFINED whether PMDEVAFF1 is implemented in the Core power domain or in the Debug power domain.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

This register is required if the external interface to the PMU is implemented.

Attributes

PMDEVAFF1 is a 32-bit register.

Field descriptions

The PMDEVAFF1 bit assignments are:

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     | MPIDR_EL1 high half |

MPIDR_EL1 high half, bits [31:0]

MPIDR_EL1 high half. Read-only copy of the high half of MPIDR_EL1, as seen from the highest implemented Exception level.

Accessing the PMDEVAFF1

PMDEVAFF1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFAC</td>
<td>PMDEVAFF1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
PMDEVARCH, Performance Monitors Device Architecture register

The PMDEVARCH characteristics are:

**Purpose**

Identifies the programmers' model architecture of the Performance Monitor component.

**Configuration**

It is implementation defined whether PMDEVARCH is implemented in the Core power domain or in the Debug power domain.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

PMDEVARCH is a 32-bit register.

**Field descriptions**

The PMDEVARCH bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>ARCHITECT</td>
<td>Defines the architecture of the component. For Performance Monitors, this is Arm Limited.</td>
</tr>
<tr>
<td>30</td>
<td>PRESENT</td>
<td>When set to 1, indicates that the DEVARCH is present.</td>
</tr>
<tr>
<td>29</td>
<td>REVISION</td>
<td>Defines the architecture revision. For architectures defined by Arm this is the minor revision. For Performance Monitors, the revision defined by Armv8 is 0x0.</td>
</tr>
<tr>
<td>28</td>
<td>ARCHID</td>
<td>Defines this part to be an Armv8 debug component. For architectures defined by Arm this is further subdivided. For Performance Monitors:</td>
</tr>
<tr>
<td>27</td>
<td></td>
<td>Bits [15:12] are the architecture version, 0x2.</td>
</tr>
</tbody>
</table>

ARCHITECT, bits [31:21]

Defines the architecture of the component. For Performance Monitors, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

PRESENT, bit [20]

When set to 1, indicates that the DEVARCH is present.

This field is 1 in Armv8.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

For Performance Monitors, the revision defined by Armv8 is 0x0.

All other values are reserved.

ARCHID, bits [15:0]

Defines this part to be an Armv8 debug component. For architectures defined by Arm this is further subdivided.

For Performance Monitors:

- Bits [15:12] are the architecture version, 0x2.
• Bits [11:0] are the architecture part number, 0xA16.

This corresponds to Performance Monitors architecture version PMUv3.

---

**Note**

The PMUv3 memory-mapped programmers' model can be used by devices other than Armv8 processors. Software must determine whether the PMU is attached to an Armv8 processor by using the `PMDEVAFF0` and `PMDEVAFF1` registers to discover the affinity of the PMU to any Armv8 processors.

---

### Accessing the PMDEVARCH

**PMDEVARCH can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFBC</td>
<td>PMDEVARCH</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
PMDEVID, Performance Monitors Device ID register

The PMDEVID characteristics are:

**Purpose**

Provides information about features of the Performance Monitors implementation.

**Configuration**

It is **IMPLEMENTATION DEFINED** whether PMDEVID is implemented in the Core power domain or in the Debug power domain.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

This register is required from Armv8.2 and in any implementation that includes ARMv8.2-PCSample. Otherwise, its location is **RES0**.

**Note**

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of **EDDEVID**.PCSample.

**Attributes**

PMDEVID is a 32-bit register.

**Field descriptions**

The PMDEVID bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td><strong>RES0</strong></td>
</tr>
<tr>
<td>30</td>
<td></td>
</tr>
<tr>
<td>29</td>
<td></td>
</tr>
<tr>
<td>28</td>
<td></td>
</tr>
<tr>
<td>27</td>
<td></td>
</tr>
<tr>
<td>26</td>
<td></td>
</tr>
<tr>
<td>25</td>
<td></td>
</tr>
<tr>
<td>24</td>
<td></td>
</tr>
<tr>
<td>23</td>

<tr>
<td>3</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td><strong>PCSample</strong></td>
</tr>
</tbody>
</table>

**Bits [31:4]**

Reserved, **RES0**.

**PCSample, bits [3:0]**

Indicates the level of PC Sample-based Profiling support using Performance Monitors registers. Permitted values of this field are:

<table>
<thead>
<tr>
<th><strong>PCSample</strong></th>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>PC Sample-based Profiling Extension is not implemented in the Performance Monitors register space.</td>
</tr>
<tr>
<td>0b0001</td>
<td>PC Sample-based Profiling Extension is implemented in the Performance Monitors register space.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.2-PCSample implements the functionality identified by the value 0b0001.
Accessing the PMDEVID

PMDEVID can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFC8</td>
<td>PMDEVID</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
PMDEVTYPE, Performance Monitors Device Type register

The PMDEVTYPE characteristics are:

**Purpose**

Indicates to a debugger that this component is part of a PEs performance monitor interface.

**Configuration**

It is `IMPLEMENTATION DEFINED` whether PMDEVTYPE is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is `OPTIONAL`.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

PMDEVTYPE is a 32-bit register.

**Field descriptions**

The PMDEVTYPE bit assignments are:

<table>
<thead>
<tr>
<th>Bit Width</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>Reserved</td>
<td>RES0</td>
</tr>
<tr>
<td>4</td>
<td>Subtype</td>
<td>SUB</td>
</tr>
<tr>
<td>3</td>
<td>Major Type</td>
<td>MAJOR</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SUB, bits [7:4]**

Subtype. Must read as 0x1 to indicate this is a component within a PE.

**MAJOR, bits [3:0]**

Major type. Must read as 0x6 to indicate this is a performance monitor component.

**Accessing the PMDEVTYPE**

**PMDEVTYPE can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFCC</td>
<td>PMDEVTYPE</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
PMEVCNTR\textless n\textgreater _EL0, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR\textless n\textgreater _EL0 characteristics are:

**Purpose**

Holds event counter n, which counts events, where n is 0 to 30.

**Configuration**

External register PMEVCNTR\textless n\textgreater _EL0 bits [31:0] are architecturally mapped to AArch64 System register PMEVCNTR\textless n\textgreater _EL0[31:0].

External register PMEVCNTR\textless n\textgreater _EL0 bits [31:0] are architecturally mapped to AArch32 System register PMEVCNTR\textless n\textgreater [31:0].

PMEVCNTR\textless n\textgreater _EL0 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. The field descriptions identify when the reset values apply.

**Attributes**

PMEVCNTR\textless n\textgreater _EL0 is a 64-bit register.

**Field descriptions**

The PMEVCNTR\textless n\textgreater _EL0 bit assignments are:

**When ARMv8.5-PMU is implemented:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [63:0]**

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

If the highest implemented Exception level is using AArch32, the optional external interface to the performance monitors is implemented, and the PMCR.LP and HDCR.HLP bits are RAZ/WI, then locations in the external interface to the performance monitors that map to PMEVCNTR\textless n\textgreater _EL0[63:32] return UNKNOWN values on reads.

If the implementation does not support AArch64 at any Exception level, bits [63:32] of the event counters are not required to be implemented.

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [31:0]**

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.
This field resets to an architecturally **UNKNOWN** value.

**Accessing the PMEVCNTR<\text{n}>_EL0**

External accesses to the performance monitors ignore **PMUSERENR_EL0** and, if implemented, **MDCR_EL2**, {TPM, TPMCR, HPMN} and **MDCR_EL3**. This means that all counters are accessible regardless of the current Exception level or privilege of the access.

If ARMv8.5-PMU is not implemented, when IsCorePowered(), DoubleLockStatus(), OSLockStatus() or !AllowExternalPMUAccess(), 32-bit accesses to **0x004+8×n** have a **CONSTRAINED UNPREDICTABLE** behavior.

---

**Note**

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

---

**PMEVCNTR<\text{n}>_EL0 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x000 + 8n</td>
<td>PMEVCNTR&lt;\text{n}&gt;_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.
PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>_EL0 characteristics are:

**Purpose**

Configures event counter n, where n is 0 to 30.

**Configuration**

External register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMEVTYPER<n>_EL0[31:0].

External register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMEVTYPER<n>[31:0].

PMEVTYPER<n>_EL0 is in the Core power domain. RW fields in this register reset to architecturally **UNKNOWN** values. These apply on a Warm or Cold reset. The register is not affected by an External debug reset.

If event counter n is not implemented then accesses to this register are:

- **RES0** when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalPMUAccess().
- A **CONSTRAINED UNPREDICTABLE** choice of **RES0** or ERROR otherwise.

**Attributes**

PMEVTYPER<n>_EL0 is a 32-bit register.

**Field descriptions**

The PMEVTYPER<n>_EL0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| P  | U  | NSK | NSU | NSH | M  | MT  | SH  | T  | RES0 | evtCount[15:10] | evtCount[9:0] |

**P, bit [31]**

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER<n>_EL0.NSK bit.

<table>
<thead>
<tr>
<th>P</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count events in EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count events in EL1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**U, bit [30]**

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER<n>_EL0.NSU bit.

<table>
<thead>
<tr>
<th>U</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count events in EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count events in EL0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
NSK, bit [29]

When HaveEL(EL3):

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in Non-secure EL1 are counted.
Otherwise, events in Non-secure EL1 are not counted.

On a Warm reset, this field resets to an architecturally \textit{UNKNOWN} value.

Otherwise:

Reserved, RES0.

NSU, bit [28]

When HaveEL(EL3):

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.U bit, events in Non-secure EL0 are counted.
Otherwise, events in Non-secure EL0 are not counted.

On a Warm reset, this field resets to an architecturally \textit{UNKNOWN} value.

Otherwise:

Reserved, RES0.

NSH, bit [27]

When HaveEL(EL2):

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If Secure EL2 is implemented, counting in Secure EL2 is further controlled by the PMEVTYPER<n>_EL0.SH bit.

<table>
<thead>
<tr>
<th>NSH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not count events in EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Count events in EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally \textit{UNKNOWN} value.

Otherwise:

Reserved, RES0.

M, bit [26]

When HaveEL(EL3):

Secure EL3 filtering bit.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in Secure EL3 are counted.
Otherwise, events in Secure EL3 are not counted.

Most applications can ignore this field and set its value to 0b0.

---

\textbf{Note}
This field is not visible in the AArch32 PMEVTYPER<n> System register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MT, bit [25]

When ARMv8.6-MTPMU is implemented or IMPLEMENTATION DEFINED multi-threaded PMU Extension is implemented:

Multithreading.

<table>
<thead>
<tr>
<th>MT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count events only on controlling PE.</td>
</tr>
<tr>
<td>0b1</td>
<td>Count events from any PE with the same affinity at level 1 and above as this PE.</td>
</tr>
</tbody>
</table>

Note

- When the lowest level of affinity consists of logical PEs that are implemented using a multi-threading type approach, an implementation is described as multi-threaded. That is, the performance of PEs at the lowest affinity level is highly interdependent.
- Events from a different thread of a multithreaded implementation are not Attributable to the thread counting the event.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SH, bit [24]

When ARMv8.4-SecEL2 is implemented:

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMEVTYPER<n>_EL0.NSH bit, events in Secure EL2 are counted.

Otherwise, events in Secure EL2 are not counted.

Note

This field is not visible in the AArch32 PMEVTYPER<n> System register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

T, bit [23]

When TME is implemented:

Transactional state filtering bit. Controls counting in Transactional state. The possible values of this bit are:
<table>
<thead>
<tr>
<th>T</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This bit has no effect on the filtering of events.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count events in Transactional state.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Bits [22:16]**

Reserved, RES0.

**evtCount[15:10], bits [15:10]**

*When ARMv8.1-PMU is implemented:*

Extension to evtCount[9:0]. See evtCount[9:0] for more details.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**evtCount[9:0], bits [9:0]**

Event to count. The event number of the event that is counted by event counter **PMEVCNTR<n>_EL0**.

Software must program this field with an event that is supported by the PE being programmed.

The ranges of event numbers allocated to each type of event are shown in Allocation of the PMU event number space.

If evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range **0x0000** to **0x003F**, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- If 16-bit evtCount is implemented, for the range **0x4000** to **0x403F**, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For **IMPLEMENTATION DEFINED** events, it is **UNPREDICTABLE** what event, if any, is counted, and the value returned by a direct or external read of the evtCount field is **UNKNOWN**.

**Note**

**UNPREDICTABLE** means the event must not expose privileged information.

Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include an event from a set of common **IMPLEMENTATION DEFINED** events, then no event is counted and the value read back on evtCount is the value written.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the PMEVTYPEPER<n>_EL0**

**Note**

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.
PMEVTPRER<n>_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x400 + 4n</td>
<td>PMEVTYPER&lt;n&gt;_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.
PMINTENCLR_EL1, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR_EL1 characteristics are:

**Purpose**

Disables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR_EL0, and the event counters PMEVCNTR<n>_EL0. Reading the register shows which overflow interrupt requests are enabled.

**Configuration**

External register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch64 System register PMINTENCLR_EL1[31:0].

External register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMINTENCLR[31:0].

PMINTENCLR_EL1 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply on a Warm or Cold reset. The register is not affected by an External debug reset.

**Attributes**

PMINTENCLR_EL1 is a 32-bit register.

**Field descriptions**

The PMINTENCLR_EL1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| C  | P<n>, bit [n] |

**C, bit [31]**

PMCCNTR_EL0 overflow interrupt request disable bit. Possible values are:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P<n>, bit [n], for n = 0 to 30**

Event counter overflow interrupt request disable bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that the PMEVCNTR&lt;n&gt;_EL0 event counter interrupt request is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that the PMEVCNTR&lt;n&gt;_EL0 event counter interrupt request is enabled. When written, disables the PMEVCNTR&lt;n&gt;_EL0 interrupt request.</td>
</tr>
</tbody>
</table>
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

## Accessing the PMINTENCLR_EL1

### Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMINTENCLR_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xC60</td>
<td>PMINTENCLR_EL1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.
PMINTENSET_EL1, Performance Monitors Interrupt Enable Set register

The PMINTENSET_EL1 characteristics are:

**Purpose**

Enables the generation of interrupt requests on overflows from the Cycle Count Register, `PMCCNTR_EL0`, and the event counters `PMEVCNTR<n>_EL0`. Reading the register shows which overflow interrupt requests are enabled.

**Configuration**

External register PMINTENSET_EL1 bits [31:0] are architecturally mapped to AArch64 System register `PMINTENSET_EL1[31:0]`.

External register PMINTENSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register `PMINTENSET[31:0]`.

PMINTENSET_EL1 is in the Core power domain. RW fields in this register reset to architecturally **UNKNOWN** values. These apply on a Warm or Cold reset. The register is not affected by an External debug reset.

**Attributes**

PMINTENSET_EL1 is a 32-bit register.

**Field descriptions**

The PMINTENSET_EL1 bit assignments are:

```
+-----------------+---+
<table>
<thead>
<tr>
<th>C</th>
<th>P&lt;n&gt;, bit [n]</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td></td>
</tr>
</tbody>
</table>
```

C, bit [31]

`PMCCNTR_EL0` overflow interrupt request enable bit. Possible values are:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter overflow interrupt request is</td>
</tr>
<tr>
<td></td>
<td>disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter overflow interrupt request is</td>
</tr>
<tr>
<td></td>
<td>enabled. When written, enables the cycle count overflow interrupt</td>
</tr>
<tr>
<td></td>
<td>request.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

P<n>, bit [n], for n = 0 to 30

Event counter overflow interrupt request enable bit for `PMEVCNTR<n>_EL0`.

If `PMCFGFR.N` is less than 31, bits [30:`PMCFGFR.N`] are RAZ/WI.

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that the <code>PMEVCNTR&lt;n&gt;_EL0</code> event counter</td>
</tr>
<tr>
<td></td>
<td>interrupt request is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that the <code>PMEVCNTR&lt;n&gt;_EL0</code> event counter</td>
</tr>
<tr>
<td></td>
<td>interrupt request is enabled. When written, enables the <code>PMEVCNTR&lt;n&gt;_EL0</code></td>
</tr>
<tr>
<td></td>
<td>interrupt request.</td>
</tr>
</tbody>
</table>
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the PMINTENSET_EL1**

**Note**

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

**PMINTENSET_EL1 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xC40</td>
<td>PMINTENSET_EL1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.
PMITCTRL, Performance Monitors Integration mode Control register

The PMITCTRL characteristics are:

**Purpose**

Enables the Performance Monitors to switch from default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

**Configuration**

It is implementation defined whether PMITCTRL is implemented in the Core power domain or in the Debug power domain. Some or all RW fields of this register have defined reset values, and:

- The register is not affected by a Warm reset.
- If the register is implemented in the Core power domain the reset values apply on a Cold reset, and the register is not affected by an External debug reset.
- If the register is implemented in the Debug power domain the reset values apply on an External debug reset, and the register is not affected by a Cold reset.

Implementation of this register is optional.

**Attributes**

PMITCTRL is a 32-bit register.

**Field descriptions**

The PMITCTRL bit assignments are:

<table>
<thead>
<tr>

<td>2</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>1</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>0</td>
<td>IME</td>
</tr>
</tbody>
</table>

**Bits [31:1]**

Reserved, RES0.

**IME, bit [0]**

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is implementation defined.

<table>
<thead>
<tr>
<th>IME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Integration mode enabled.</td>
</tr>
</tbody>
</table>

On a Implementation reset, this field resets to 0.

**Accessing the PMITCTRL**

PMITCTRL can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xF00</td>
<td>PMITCTRL</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register are **IMPDEF**.
PMLAR, Performance Monitors Lock Access Register

The PMLAR characteristics are:

**Purpose**

Allows or disallows access to the Performance Monitors registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

**Configuration**

It is IMPLEMENTATION DEFINED whether PMLAR is implemented in the Core power domain or in the Debug power domain.

If ARMv8.3-DoPD is implemented, then ARMv8.0-SoftwareLock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If ARMv8.3-DoPD is not implemented, then this register is in the Debug power domain.

Software uses PMLAR to set or clear the lock, and PMLSR to check the current status of the lock.

**Attributes**

PMLAR is a 32-bit register.

**Field descriptions**

The PMLAR bit assignments are:

**When the Software Lock is implemented:**

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**KEY, bits [31:0]**

Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component’s registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component’s registers through a memory-mapped interface.

**Otherwise:**

<table>
<thead>
<tr>
<th>31</th>

</tr>
</tbody>
</table>

**Otherwise**

**Bits [31:0]**

Reserved, RES0.
Accessing the PMLAR

PMLAR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFB0</td>
<td>PMLAR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **WO**.
- Otherwise accesses to this register generate an error response.
PMLSR, Performance Monitors Lock Status Register

The PMLSR characteristics are:

**Purpose**

Indicates the current status of the software lock for Performance Monitors registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

**Configuration**

It is IMPLEMENTATION DEFINED whether PMLSR is implemented in the Core power domain or in the Debug power domain. Some or all RW fields of this register have defined reset values, and:

- The register is not affected by a Warm reset.
- If the register is implemented in the Core power domain the reset values apply on a Cold reset, and the register is not affected by an External debug reset.
- If the register is implemented in the Debug power domain the reset values apply on an External debug reset, and the register is not affected by a Cold reset.

If ARMv8.3-DoPD is implemented, then ARMv8.0-SoftwareLock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If ARMv8.3-DoPD is not implemented, then this register is in the Debug power domain.

Software uses PMLAR to set or clear the lock, and PMLSR to check the current status of the lock.

**Attributes**

PMLSR is a 32-bit register.

**Field descriptions**

The PMLSR bit assignments are:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**nTT, bit [2]**

Not thirty-two bit access required. RAZ.

**SLK, bit [1]**

When the Software Lock is implemented:

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when the Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when the software lock is implemented, possible values of this field are:
SLK, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

<table>
<thead>
<tr>
<th>SLI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Software Lock not implemented or not memory-mapped access.</td>
</tr>
<tr>
<td>0b1</td>
<td>Software Lock implemented and memory-mapped access.</td>
</tr>
</tbody>
</table>

Accessing the PMLSR

PMLSR can be accessed through the memory-mapped interfaces:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFB4</td>
<td>PMLSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
PMMIR, Performance Monitors Machine Identification Register

The PMMIR characteristics are:

**Purpose**

Describes Performance Monitors parameters specific to the implementation.

**Configuration**

PMMIR is in the Core power domain.

This register is present only when ARMv8.4-PMU is implemented. Otherwise, direct accesses to PMMIR are RES0.

**Attributes**

PMMIR is a 32-bit register.

**Field descriptions**

The PMMIR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | SLOTS |

**Bits [31:8]**

Reserved, RES0.

**SLOTS, bits [7:0]**

Operation width. The largest value by which the STALL_SLOT event might increment by in a single cycle. If the STALL_SLOT event is implemented, this field must not be zero.

**Accessing the PMMIR**

If the Core power domain is off or in a low-power state, access on this interface returns an Error.

**PMMIR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE40</td>
<td>PMMIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsCorePowered(), or DoubleLockStatus(), or OSLockStatus() or !AllowExternalPMUAccess() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
**PMOVSCLR_EL0, Performance Monitors Overflow Flag Status Clear register**

The PMOVSCLR_EL0 characteristics are:

**Purpose**

Contains the state of the overflow bit for the Cycle Count Register, PMCCNTR_EL0, and each of the implemented event counters PMEVCNTR<

Writing to this register clears these bits.

**Configuration**

External register PMOVSCLR_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMOVSCLR_EL0[31:0].

External register PMOVSCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMOVSBR[31:0].

PMOVSCLR_EL0 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply on a Warm or Cold reset. The register is not affected by an External debug reset.

**Attributes**

PMOVSCLR_EL0 is a 32-bit register.

**Field descriptions**

The PMOVSCLR_EL0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| C  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | P<n>, bit [n] |

**C, bit [31]**

Cycle counter overflow clear bit.

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter has overflowed since this bit was last cleared. When written, clears the cycle counter overflow bit to 0.</td>
</tr>
</tbody>
</table>

PMCCNTR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P<n>, bit [n], for n = 0 to 30**

Event counter overflow clear bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.
<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that PMEVCNTR&lt;n&gt;_EL0 has not overflowed since this bit was last cleared. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that PMEVCNTR&lt;n&gt;_EL0 has overflowed since this bit was last cleared. When written, clears the PMEVCNTR&lt;n&gt;_EL0 overflow bit to 0.</td>
</tr>
</tbody>
</table>

If ARMv8.5-PMU is implemented, MDCR_EL2.HLP and PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<n>_EL0[31:0] or unsigned overflow of PMEVCNTR<n>_EL0[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Accessing the PMOVSCRL_EL0

**Note**

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMOVSCRL_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xC80</td>
<td>PMOVSCRL_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.
PMOVSSET_EL0, Performance Monitors Overflow Flag Status Set register

The PMOVSSET_EL0 characteristics are:

**Purpose**

Sets the state of the overflow bit for the Cycle Count Register, PMCCNTR_EL0, and each of the implemented event counters PMEVCNTR<n>.

**Configuration**

External register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMOVSSET_EL0[31:0].

External register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMOVSSET[31:0].

PMOVSSET_EL0 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply on a Warm or Cold reset. The register is not affected by an External debug reset.

**Attributes**

PMOVSSET_EL0 is a 32-bit register.

**Field descriptions**

The PMOVSSET_EL0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| C  | P<n>, bit [n] |

C, bit [31]

Cycle counter overflow set bit.

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter has overflowed since this bit was last cleared. When written, sets the cycle counter overflow bit to 1.</td>
</tr>
</tbody>
</table>

PMCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 0 to 30

Event counter overflow set bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.
PMOVSSET_EL0, Performance Monitors Overflow Flag Status Set register

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that PMEVCNTR&lt;n&gt;_EL0 has not overflowed since this bit was last cleared. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that PMEVCNTR&lt;n&gt;_EL0 has overflowed since this bit was last cleared. When written, sets the PMEVCNTR&lt;n&gt;_EL0 overflow bit to 1.</td>
</tr>
</tbody>
</table>

If ARMv8.5-PMU is implemented, MDCR_EL2.HLP and PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<n>_EL0[31:0] or unsigned overflow of PMEVCNTR<n>_EL0[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMOVSSET_EL0**

**Note**

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

**PMOVSSET_EL0 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xCC0</td>
<td>PMOVSSET_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2019 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.
The PMPCSR characteristics are:

**Purpose**

Holds a sampled instruction address value.

**Configuration**

PMPCSR is in the Core power domain. RW fields in this register reset to architecturally **UNKNOWN** values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

This register is present only when ARMv8.2-PCSample is implemented. Otherwise, direct accesses to PMPCSR are **RES0**.

**Note**

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of **EDDEVID.PCSample**.

Support for 64-bit atomic reads is IMPLEMENTATION DEFINED. If 64-bit atomic reads are implemented, a 64-bit read of PMPCSR has the same side-effect as a 32-bit read of PMCSR[31:0] followed by a 32-bit read of PMCSR[63:32], returning the combined value. For example, if the PE is in Debug state then a 64-bit atomic read returns bits[31:0] == 0xFFFFFFFF and bits[63:32] **UNKNOWN**.

**Attributes**

PMPCSR is a 64-bit register.

**Field descriptions**

The PMPCSR bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| **NS** | **EL** | **T** | **RES0** | PC Sample[55:32] |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| PC Sample[31:0] |

**NS, bit [63]**

Non-secure state sample. Indicates the Security state that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

<table>
<thead>
<tr>
<th><strong>NS</strong></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sample is from Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Sample is from Non-secure state.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**EL, bits [62:61]**

Exception level status sample. Indicates the Exception level that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.
<table>
<thead>
<tr>
<th>EL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Sample is from EL0.</td>
</tr>
<tr>
<td>0b01</td>
<td>Sample is from EL1.</td>
</tr>
<tr>
<td>0b10</td>
<td>Sample is from EL2.</td>
</tr>
<tr>
<td>0b11</td>
<td>Sample is from EL3.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**T, bit [60]**

When TME is implemented:

Transactional state of the sample. Indicates the Transactional state that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

<table>
<thead>
<tr>
<th>T</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sample is from Non-transactional state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Sample is from Transactional state.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**Bits [59:56]**

Reserved, RES0.

**PC Sample[55:32], bits [55:32]**

Bits[55:32] of the sampled instruction address value. The translation regime that PMPCSR samples can be determined from PMPCSR.(NS,EL).

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**PC Sample[31:0], bits [31:0]**

Bits[31:0] of the sampled instruction address value.

PMPCSR[31:0] reads as **0xffffffff** when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If an instruction has retired since the PE left Reset state, then the first read of PMPCSR[31:0] is permitted but not required to return **0xffffffff**.

PMPCSR[31:0] reads as an **UNKNOWN** value when any of the following are true:

- The PE is in Reset state.
- No instruction has retired since the PE left Reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No instruction has retired since the last read of PMPCSR[31:0].

For the cases where a read of PMPCSR[31:0] returns **0xffffffff** or an **UNKNOWN** value, the read has the side-effect of setting PMPCSR[63:32], **PMCID1SR**, **PMCID2SR**, and **PMVIDSR** to **UNKNOWN** values.

Otherwise, a read of PMPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to PMPCSR[63:32], **PMCID1SR**, **PMCID2SR**, and **PMVIDSR**. The translation regime that PMPCSR samples can be determined from PMPCSR.(NS,EL).

For a read of PMPCSR[31:0] from the memory-mapped interface, if PMLSR.SLK == 1, meaning the **OPTIONAL** Software Lock is locked, then the side-effect of the access does not occur and PMPCSR[63:32], **PMCID1SR**, **PMCID2SR**, and **PMVIDSR** are unchanged.
On a Cold reset, this field resets to an architecturally UNKNOWN value.

## Accessing the PMPCSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile

**PMPCSR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x200</td>
<td>PMPCSR</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x204</td>
<td>PMPCSR</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x220</td>
<td>PMPCSR</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x224</td>
<td>PMPCSR</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
The PMPIDR0 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

For more information see 'About the Peripheral identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

**Configuration**

It is **IMPLEMENTATION DEFINED** whether PMPIDR0 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is **OPTIONAL**.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMPIDR0 is a 32-bit register.

**Field descriptions**

The PMPIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>29</td>
<td>PART_0</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PART_0, bits [7:0]**

Part number, least significant byte.

**Accessing the PMPIDR0**

PMPIDR0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFE0</td>
<td>PMPIDR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
The PMPIDR1 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

For more information see 'About the Peripheral identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

**Configuration**

It is **IMPLEMENTATION DEFINED** whether PMPIDR1 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is **OPTIONAL**.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMPIDR1 is a 32-bit register.

**Field descriptions**

The PMPIDR1 bit assignments are:

| Bit 31 | Bit 30 | Bit 29 | Bit 28 | Bit 27 | Bit 26 | Bit 25 | Bit 24 | Bit 23 | Bit 22 | Bit 21 | Bit 20 | Bit 19 | Bit 18 | Bit 17 | Bit 16 | Bit 15 | Bit 14 | Bit 13 | Bit 12 | Bit 11 | Bit 10 | Bit 9  | Bit 8  | Bit 7  | Bit 6  | Bit 5  | Bit 4  | Bit 3  | Bit 2  | Bit 1  | Bit 0  |
|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| RES0  |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |
|       | DES_0 |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |
|       |       | PART_1|       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |

**Bits [31:8]**

Reserved, RES0.

**DES_0, bits [7:4]**

Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is 0b1011.

**PART_1, bits [3:0]**

Part number, most significant nibble.

**Accessing the PMPIDR1**

PMPIDR1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFE4</td>
<td>PMPIDR1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
• When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are RO.
• Otherwise accesses to this register generate an error response.
The PMPIDR2 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

For more information see 'About the Peripheral identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

**Configuration**

It is **IMPLEMENTATION** **DEFINED** whether PMPIDR2 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is **OPTIONAL**.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMPIDR2 is a 32-bit register.

**Field descriptions**

The PMPIDR2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Index</th>
<th>Bit Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-8</td>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>7-4</td>
<td>REVISION</td>
<td>Part major revision. Parts can also use this field to extend Part number to 16-bits.</td>
</tr>
<tr>
<td>3</td>
<td>JEDEC</td>
<td>RAO. Indicates a JEP106 identity code is used.</td>
</tr>
<tr>
<td>2-0</td>
<td>DES_1</td>
<td>Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is 0b011.</td>
</tr>
</tbody>
</table>
Accessing the PMPIDR2

PMPIDR2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFE8</td>
<td>PMPIDR2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
The PMPIDR3 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

For more information see 'About the Peripheral identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

**Configuration**

It is **IMPLEMENTATION DEFINED** whether PMPIDR3 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is **OPTIONAL**.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMPIDR3 is a 32-bit register.

**Field descriptions**

The PMPIDR3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>30</td>
<td>REVAND</td>
</tr>
<tr>
<td>29</td>
<td>CMOD</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**REVAND, bits [7:4]**

Part minor revision. Parts using PMPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.

**CMOD, bits [3:0]**

Customer modified. Indicates someone other than the Designer has modified the component.

**Accessing the PMPIDR3**

PMPIDR3 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFEC</td>
<td>PMPIDR3</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
The PMPIDR4 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

For more information see 'About the Peripheral identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

**Configuration**

It is implementation defined whether PMPIDR4 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is optional.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMPIDR4 is a 32-bit register.

**Field descriptions**

The PMPIDR4 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | SIZE | DES_2 |

**Bits [31:8]**

Reserved, RES0.

**SIZE, bits [7:4]**

Size of the component. RAZ. Log2 of the number of 4KB pages from the start of the component to the end of the component ID registers.

**DES_2, bits [3:0]**

Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is \(0b0100\).

**Accessing the PMPIDR4**

PMPIDR4 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFD0</td>
<td>PMPIDR4</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
The PMSWINC_EL0 characteristics are:

**Purpose**

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see ‘SW_INCR’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D5.

**Configuration**

External register PMSWINC_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMSWINC_EL0[31:0].

External register PMSWINC_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMSWINC[31:0].

PMSWINC_EL0 is in the Core power domain.

Implementation of this register is **OPTIONAL**.

If this register is implemented, use of it is deprecated.

If 1 is written to bit [n] from the external debug interface, it is **CONSTRAINED UNPREDICTABLE** whether or not a SW_INCR event is created for counter n. This is consistent with not implementing the register in the external debug interface.

**Attributes**

PMSWINC_EL0 is a 32-bit register.

**Field descriptions**

The PMSWINC_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td><strong>RES0</strong></td>
</tr>
<tr>
<td>30</td>
<td><strong>P&lt;n&gt;, bit [n]</strong></td>

</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

-P<n>, bit [n], for n = 0 to 30

Event counter software increment bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are WI.

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action. The write to this bit is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>It is <strong>CONSTRAINED UNPREDICTABLE</strong> whether a SW_INCR event is generated for event counter n.</td>
</tr>
</tbody>
</table>

**Accessing the PMSWINC_EL0**

**Note**
SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

**PMSWINC_EL0 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xCA0</td>
<td>PMSWINC_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **WI**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **WO**.
- Otherwise accesses to this register generate an error response.
PMVIDSR, VMID Sample Register

The PMVIDSR characteristics are:

**Purpose**

Contains the sampled VMID value that is captured on reading PMPCSR[31:0].

**Configuration**

PMVIDSR is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

This register is present only when ARMv8.2-PCSample is implemented and HaveEL(EL2). Otherwise, direct accesses to PMVIDSR are RES0.

---

**Note**

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of EDDEVID.PCSample.

---

**Attributes**

PMVIDSR is a 32-bit register.

**Field descriptions**

The PMVIDSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>VMID[15:8]</td>

</tr>
<tr>
<td>11</td>
<td>VMID</td>
</tr>
<tr>
<td>10</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>9</td>
<td>VMID</td>
</tr>
<tr>
<td>8</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>7</td>
<td>VMID</td>
</tr>
<tr>
<td>6</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>5</td>
<td>VMID</td>
</tr>
<tr>
<td>4</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>3</td>
<td>VMID</td>
</tr>
<tr>
<td>2</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>1</td>
<td>VMID</td>
</tr>
<tr>
<td>0</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**VMID[15:8], bits [15:8]**

When ARMv8.1-VMID16 is implemented:

Extension to VMID[7:0]. See VMID[7:0] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**VMID, bits [7:0]**

VMID sample. The VMID associated with the most recent PMPCSR sample. When the most recent PMPCSR sample was generated:

- This field is set to an UNKNOWN value if any of the following apply:
  - EL2 is disabled in the current Security state.
The PE is executing at EL2.
- EL2 is enabled in the current Security state, the PE is executing at EL0, EL2 is using AArch64, HCR_EL2.E2H == 1, and HCR_EL2.TGE == 1.

Otherwise:
- If EL2 is using AArch64 and either ARMv8.1-VMID16 is not implemented or VTCR_EL2.VS is 1, this field is set to VTTBR_EL2.VMID.
- If EL2 is using AArch64, ARMv8.1-VMID16 is implemented, and VTCR_EL2.VS is 0, PMVIDSR.VMID[7:0] is set to VTTBR_EL2.VMID[7:0] and PMVIDSR.VMID[15:8] is RES0.
- If EL2 is using AArch32, this field is set to VTTBR_VMID.

Because the value written to PMVIDR is an indirect read of the VMID value, it is constrained unpredictable whether PMVIDSR is set to the original or new value if PMPCSR samples:

- An instruction that writes to the VMID value.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

On a Cold reset, this field resets to an architecturally unknown value.

## Accessing the PMVDSR

Implementation defined extensions to external debug might make the value of this register unknown, see 'Permitted behavior that might make the PC Sample-based profiling registers unknown' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**PMVDSR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x20C</td>
<td>PMVDSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
TRCACATR<n>, Address Comparator Access Type Register <n>, n = 0 - 15

The TRCACATR<n> characteristics are:

**Purpose**

Defines the type of access for the corresponding TRCACVR<n> Register. This register configures the context type, Exception levels, alignment, masking that is applied by the Address Comparator, and how the Address Comparator behaves when it is one half of an Address Range Comparator.

**Configuration**

External register TRCACATR<n> bits [63:0] are architecturally mapped to AArch64 System register TRCACATR<n>[63:0].

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when ETE is implemented and TRCIDR4.NUMACPAIRS * 2 > n. Otherwise, direct accesses to TRCACATR<n> are RES0.

**Attributes**

TRCACATR<n> is a 64-bit register.

**Field descriptions**

The TRCACATR<n> bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

**Bits [63:15]**

Reserved, RES0.

**EXLEVEL_NS_EL2, bit [14]**

When Non-secure EL2 is implemented:

Non-secure EL2 address comparison control. Controls whether a comparison can occur at EL2 in Non-secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_NS_EL2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Address Comparator performs comparisons in Non-secure EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Address Comparator does not perform comparisons in Non-secure EL2.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.
# EXLEVEL_NS_EL1, bit [13]

When Non-secure EL1 is implemented:

Non-secure EL1 address comparison control. Controls whether a comparison can occur at EL1 in Non-secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_NS_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Address Comparator performs comparisons in Non-secure EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Address Comparator does not perform comparisons in Non-secure EL1.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

# EXLEVEL_NS_EL0, bit [12]

When Non-secure EL0 is implemented:

Non-secure EL0 address comparison control. Controls whether a comparison can occur at EL0 in Non-secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_NS_EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Address Comparator performs comparisons in Non-secure EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Address Comparator does not perform comparisons in Non-secure EL0.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

# EXLEVEL_S_EL3, bit [11]

When HaveEL(EL3):

Secure EL3 address comparison control. Controls whether a comparison can occur at EL3 in Secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Address Comparator performs comparisons in Secure EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Address Comparator does not perform comparisons in Secure EL3.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

# EXLEVEL_S_EL2, bit [10]

When HaveEL(EL2) and ARMv8.4-SecEL2 is implemented:

Secure EL2 address comparison control. Controls whether a comparison can occur at EL2 in Secure state.
The Address Comparator performs comparisons in Secure EL2.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**EXLEVEL_S_EL1, bit [9]**

When Secure EL1 is implemented:

Secure EL1 address comparison control. Controls whether a comparison can occur at EL1 in Secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Address Comparator performs comparisons in Secure EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Address Comparator does not perform comparisons in Secure EL1.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**EXLEVEL_S_EL0, bit [8]**

When Secure EL0 is implemented:

Secure EL0 address comparison control. Controls whether a comparison can occur at EL0 in Secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Address Comparator performs comparisons in Secure EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Address Comparator does not perform comparisons in Secure EL0.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Bit [7]**

Reserved, RES0.

**CONTEXT, bits [6:4]**

Selects a Context Identifier Comparator or Virtual Context Identifier Comparator:
The width of this field is dependent on the maximum number of Context Identifier Comparators or Virtual Context Identifier Comparators implemented. Unimplemented bits are RES0.

If TRCIDR4(NUMCIDC == 0b0000 and TRCIDR4(NUMVMIDC == 0b0000, then this field is RES0.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**CONTEXTTYPE, bits [3:2]**

Controls whether the Address Comparator is dependent on a Context Identifier Comparator, a Virtual Context Identifier Comparator, or both comparisons:

<table>
<thead>
<tr>
<th>CONTEXTTYPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The Address Comparator is not dependent on the Context Identifier Comparators or Virtual Context Identifier Comparators.</td>
</tr>
<tr>
<td>0b01</td>
<td>The Address Comparator is dependent on the Context Identifier Comparator that the CONTEXT field specifies. If both the Context Identifier Comparator and the address comparison match, the Address Comparator signals a match.</td>
</tr>
<tr>
<td>0b10</td>
<td>The Address Comparator is dependent on the Virtual Context Identifier Comparator that the CONTEXT field specifies. If both the Virtual Context Identifier Comparator and the address comparison match, the Address Comparator signals a match.</td>
</tr>
<tr>
<td>0b11</td>
<td>The Address Comparator is dependent on the Context Identifier Comparator and Virtual Context Identifier Comparator that the CONTEXT field specifies. If the Context Identifier Comparator, the Virtual Context Identifier Comparator and address comparison all match, the Address Comparator signals a match.</td>
</tr>
</tbody>
</table>

If TRCIDR4(NUMCIDC == 0b0000, then bit [2] is RES0.

If TRCIDR4(NUMVMIDC == 0b0000, then bit [3] is RES0.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Bits [1:0]**

Reserved, RES0.

**Accessing the TRCACATR<n>**

Must be programmed if any of the following are true:

- TRCBBCTRL.RANGE[n/2] == 0b1.
- TRCRSCTRL<a>.GROUP == 0b0100 and TRCRSCTRL<a>.SAC[n] == 0b1.
- TRCRSCTRL<a>.GROUP == 0b0101 and TRCRSCTRL<a>.ARC[n/2] == 0b1.
- TRCVIECTRL.EXCLUDE[n/2] == 0b1.
- TRCVIECTRL.INCLUDE[n/2] == 0b1.
• TRCVISSCTL, .START[n] == 0b1.
• TRCVISSCTL, .STOP[n] == 0b1.
• TRCSSCCR<>.ARC[n/2] == 0b1.
• TRCSSCCR<>.SAC[n] == 0b1.
• TRCOCTLR, .RANGE[n/2] == 0b1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

**TRCACATR<n> can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x480 + 8n</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
• Otherwise accesses to this register are **RW**.
The TRCACVR<n> characteristics are:

**Purpose**

Contains the address value.

**Configuration**

External register TRCACVR<n> bits [63:0] are architecturally mapped to AArch64 System register TRCACVR<n>[63:0].

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when ETE is implemented and TRCIDR4.NUMACPAIRS * 2 > n. Otherwise, direct accesses to TRCACVR<n> are RES0.

**Attributes**

TRCACVR<n> is a 64-bit register.

**Field descriptions**

The TRCACVR<n> bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ADDRESS |
| ADDRESS |

**ADDRESS, bits [63:0]**

Address Value.

The Address Comparators can support implementations that use multiple address widths. When the trace unit compares the ADDRESS field with an address that has a width less than this field, then the address must be zero-extended to the ADDRESS field width. The trace unit then compares all implemented bits. For example, in a system that supports both 32-bit and 64-bit addresses, when the PE is in AArch32 state the comparator must zero-extend the 32-bit address and compare against the full 64 bits that are stored in the TRCACVR<n>. This requires that the trace analyzer always programs all implemented bits of the TRCACVR<n>.

The result of writing a value other than all zeros or all ones to ADDRESS at bits[63:P] is an UNKNOWN value, where P is defined as the virtual address size supported by the PE.

The result of writing a value of all zeros or all ones to ADDRESS at bits[63:P] is the written value, and a read of the register returns the written value.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCACVR<n>**

Must be programmed if any of the following are true:

- TRCBBCTL.RANGE[n/2] == 0b1.
- TRCRSCTL<a>.GROUP == 0b0100 and TRCRSCTL<a>.SAC[n] == 0b1.
• TRCRSCTRL<a>.GROUP == 0b101 and TRCRSCTRL<a>.ARC[n/2] == 0b1.
• TRCVIIECTLR.EXCLUDE[n/2] == 0b1.
• TRCVIIECTLR.INCLUDE[n/2] == 0b1.
• TRCVISSCTLR.START[n] == 0b1.
• TRCVISSCTLR.STOP[n] == 0b1.
• TRCQCSSSCTR<>.ARC[n/2] == 0b1.
• TRCQCSSSCTR<>.SAC[n] == 0b1.
• TRCSSCTRL.RANGE[n/2] == 0b1.

Writes are constrained unpredictable if the trace unit is not in the Idle state.

**TRCACVR<n> can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x400 + 8n</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
• Otherwise accesses to this register are RW.
TRCAUTHSTATUS, Authentication Status Register

The TRCAUTHSTATUS characteristics are:

**Purpose**

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

For additional information see the CoreSight Architecture Specification.

**Configuration**

External register TRCAUTHSTATUS bits [31:0] are architecturally mapped to AArch64 System register TRCAUTHSTATUS[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCAUTHSTATUS are RES0.

**Attributes**

TRCAUTHSTATUS is a 32-bit register.

**Field descriptions**

The TRCAUTHSTATUS bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>

</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SNID, bits [7:6]**

Secure Non-invasive Debug. Indicates whether Secure non-invasive debug features are implemented and enabled.

<table>
<thead>
<tr>
<th>SNID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Secure non-invasive debug features not implemented.</td>
</tr>
<tr>
<td>0b10</td>
<td>Implemented and disabled.</td>
</tr>
<tr>
<td>0b11</td>
<td>Implemented and enabled.</td>
</tr>
</tbody>
</table>

All other values are reserved.

When EL3 is implemented, this field takes the value 0b10 or 0b11 depending whether Secure non-invasive debug is enabled.

When EL3 is not implemented and the PE is Non-secure, this field reads as 0b00.

When EL3 is not implemented and the PE is Secure, this field takes the value 0b10 or 0b11 depending whether Secure non-invasive debug is enabled.

**SID, bits [5:4]**

Secure Invasive Debug. Indicates whether Secure invasive debug features are implemented and enabled.
### SID, Meanings

<table>
<thead>
<tr>
<th>SID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Secure invasive debug features not implemented.</td>
</tr>
<tr>
<td>0b10</td>
<td>Implemented and disabled.</td>
</tr>
<tr>
<td>0b11</td>
<td>Implemented and enabled.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b00.

### NSNID, Bits [3:2]

Non-secure Non-invasive Debug. Indicates whether Non-secure non-invasive debug features are implemented and enabled.

<table>
<thead>
<tr>
<th>NSNID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-secure non-invasive debug features not implemented.</td>
</tr>
<tr>
<td>0b10</td>
<td>Implemented and disabled.</td>
</tr>
<tr>
<td>0b11</td>
<td>Implemented and enabled.</td>
</tr>
</tbody>
</table>

All other values are reserved.

When EL3 is implemented, this field reads as 0b11.

When EL3 is not implemented and the PE is Non-secure, this field reads as 0b11.

When EL3 is not implemented and the PE is Secure, this field reads as 0b00.

### NSID, Bits [1:0]

Non-secure Invasive Debug. Indicates whether Non-secure invasive debug features are implemented and enabled.

<table>
<thead>
<tr>
<th>NSID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-secure invasive debug features not implemented.</td>
</tr>
<tr>
<td>0b10</td>
<td>Implemented and disabled.</td>
</tr>
<tr>
<td>0b11</td>
<td>Implemented and enabled.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b00.

### Accessing the TRCAUTHSTATUS

For implementations that support multiple access mechanisms, different access mechanisms can return different values for reads of TRCAUTHSTATUS if the authentication signals have changed and that change has not yet been synchronized by a Context synchronization event. This scenario can happen if, for example, the external debugger view is implemented separately from the system instruction view to allow for separate power domains, and so observes changes on the signals differently.

External debugger accesses to this register are unaffected by the OS Lock.

**TRCAUTHSTATUS can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFB8</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
The TRCAUXCTLR characteristics are:

**Purpose**

The function of this register is **IMPLEMENTATION DEFINED**.

**Configuration**

External register TRCAUXCTLR bits [31:0] are architecturally mapped to AArch64 System register `TRCAUXCTLR[31:0]`.

Some or all RW fields of this register have defined reset values.

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCAUXCTLR are RES0.

**Attributes**

TRCAUXCTLR is a 32-bit register.

**Field descriptions**

The TRCAUXCTLR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
</tbody>
</table>

**IMPLEMENTATION DEFINED, bits [31:0]**

**IMPLEMENTATION DEFINED.**

This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

On a Trace unit reset, this field resets to 0.

**Accessing the TRCAUXCTLR**

If this register is set to nonzero then it might cause the behavior of a trace unit to contradict this architecture specification. See the documentation of the specific implementation for information about the IMPLEMENTATION DEFINED support for this register.

TRCAUXCTLR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x018</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
# TRCBBCTLR, Branch Broadcast Control Register

The TRCBBCTLR characteristics are:

## Purpose

Controls the regions in the memory map where branch broadcasting is active.

## Configuration

External register TRCBBCTLR bits [31:0] are architecturally mapped to AArch64 System register TRCBBCTLR[31:0]. RW fields in this register reset to architecturally **UNKNOWN** values.

This register is present only when ETE is implemented, TRCIDR0.TRCBB == 0b1 and TRCIDR4.NUMACPAIRS > 0b0000. Otherwise, direct accesses to TRCBBCTLR are **RES0**.

## Attributes

TRCBBCTLR is a 32-bit register.

## Field descriptions

The TRCBBCTLR bit assignments are:

<table>
<thead>
<tr>
<th>RES0</th>
<th>MODE</th>
<th>RANGE&lt;0..7&gt;</th>
<th>bit [m]</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:9]**

Reserved, **RES0**.

**MODE, bit [8]**

Mode.

<table>
<thead>
<tr>
<th>MODE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Exclude Mode. Branch broadcasting is not active for instructions in the address ranges defined by RANGE. If RANGE == 0x00 then branch broadcasting is active for all instructions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Include Mode. Branch broadcasting is active for instructions in the address ranges defined by RANGE. If RANGE == 0x00 then the behavior of the trace unit is <strong>CONSTRAINED UNPREDICTABLE</strong>. That is, the trace unit might or might not consider any instructions to be in a branch broadcasting region.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**RANGE<0..7>, bit [m], for m = 0 to 7**

Address range field.

Selects which Address Range Comparators are in use with branch broadcasting.
<table>
<thead>
<tr>
<th>RANGE&lt;\text{m}&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The address range that Address Range Comparator \text{m} defines, is not selected.</td>
</tr>
<tr>
<td>0b1</td>
<td>The address range that Address Range Comparator \text{m} defines, is selected.</td>
</tr>
</tbody>
</table>

This bit is \texttt{RES0} if \text{m} \geq \text{TRCIDR4.NUMACPAIRS}.

On a Trace unit reset, this field resets to an architecturally \texttt{UNKNOWN} value.

### Accessing the TRCBBCTL

Must be programmed if \text{TRCCONFIGR.BB} == 0b1.

Writes are \texttt{CONSTRAINED UNPREDICTABLE} if the trace unit is not in the Idle state.

**TRCBBCTL can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x03C</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When \text{!AllowExternalTraceAccess()}, or \text{OSLockStatus()} or \text{!IsTraceCorePowered()} accesses to this register generate an error response.
- Otherwise accesses to this register are \texttt{RW}.
TRCCCCTLR, Cycle Count Control Register

The TRCCCCTLR characteristics are:

**Purpose**

Set the threshold value for cycle counting.

**Configuration**

External register TRCCCCTLR bits [31:0] are architecturally mapped to AArch64 System register TRCCCCTLR[31:0].

RW fields in this register reset to architecturally **UNKNOWN** values.

This register is present only when ETE is implemented and TRCIDR0.TRCCCI == 0b1. Otherwise, direct accesses to TRCCCCTLR are **RES0**.

**Attributes**

TRCCCCTLR is a 32-bit register.

**Field descriptions**

The TRCCCCTLR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td></td>
</tr>
<tr>
<td>29</td>
<td></td>
</tr>
<tr>
<td>28</td>
<td></td>
</tr>
<tr>
<td>...</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td>THRESHOLD</td>
</tr>
</tbody>
</table>

**Bits [31:12]**

Reserved, RES0.

**THRESHOLD, bits [11:0]**

Sets the threshold value for instruction trace cycle counting.

The minimum threshold value that can be programmed into THRESHOLD is given in TRCIDR3.CCITMIN. If the THRESHOLD value is smaller than the value in TRCIDR3.CCITMIN then the behavior is **CONSTRAINED** **UNPREDICTABLE**. That is, cycle counts might or might not be included in the trace and the cycle count threshold is not known.

Writing a value of zero when TRCONFIGR.CCI is set to enable instruction trace cycle counting, results in **CONSTRAINED** **UNPREDICTABLE** behavior. That is, cycle counts might or might not be included in the trace and the cycle count threshold is not known.

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the TRCCCCTLR**

Must be programmed if TRCONFIGR.CCI == 0b1.

Writes are **CONSTRAINED** **UNPREDICTABLE** if the trace unit is not in the Idle state.

**TRCCCCTLR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x038</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.
The TRCCIDCCTRL0 characteristics are:

**Purpose**

Contains Context identifier mask values for the TRCCIDCVR<n> registers, for n = 0 to 3.

**Configuration**

External register TRCCIDCCTRL0 bits [31:0] are architecturally mapped to AArch64 System register TRCCIDCCTRL0[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when ETE is implemented, TRCIDR4.NUMCIDC > 0x0 and TRCIDR2.CIDSIZE > 0b00000. Otherwise, direct accesses to TRCCIDCCTRL0 are RES0.

**Attributes**

TRCCIDCCTRL0 is a 32-bit register.

**Field descriptions**

The TRCCIDCCTRL0 bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMP3&lt;m&gt;, bit</td>
<td>The trace unit includes TRCCIDCVR3[(m×8+7):(m×8)] when it performs the</td>
</tr>
<tr>
<td>[m+24]</td>
<td>Context identifier comparison.</td>
</tr>
<tr>
<td>COMP2&lt;m&gt;, bit</td>
<td>The trace unit ignores TRCCIDCVR3[(m×8+7):(m×8)] when it performs the</td>
</tr>
<tr>
<td>[m+16]</td>
<td>Context identifier comparison.</td>
</tr>
<tr>
<td>COMP1&lt;m&gt;, bit</td>
<td>The trace unit includes TRCCIDCVR3[(m×8+7):(m×8)] when it performs the</td>
</tr>
<tr>
<td>[m+8]</td>
<td>Context identifier comparison.</td>
</tr>
<tr>
<td>COMP0&lt;m&gt;, bit</td>
<td>The trace unit ignores TRCCIDCVR3[(m×8+7):(m×8)] when it performs the</td>
</tr>
<tr>
<td>[m]</td>
<td>Context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= TRCIDR2.CIDSIZE.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**COMP2<m>, bit [m+16], for m = 0 to 7**

When TRCIDR4.NUMCIDC > 2:

TRCCIDCVR2 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR2. Each bit in this field corresponds to a byte in TRCCIDCVR2.
TRCCIDCCTL0, Context Identifier Comparator Control Register 0

<table>
<thead>
<tr>
<th>COMP2&lt;\text{m}&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCCIDCVR2[(m×8+7):(m×8)] when it performs the Context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCCIDCVR2[(m×8+7):(m×8)] when it performs the Context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is \texttt{RES0} if \( m \geq \text{TRCIDR2.CIDSIZE} \).

On a Trace unit reset, this field resets to an architecturally \texttt{UNKNOWN} value.

Otherwise:

Reserved, \texttt{RES0}.

**COMP1<\text{m}>, bit [\text{m}+8], for \text{m} = 0 to 7**

When \text{TRCIDR4.NUMCIDC} > 1:

TRCCIDCVR1 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR1. Each bit in this field corresponds to a byte in TRCCIDCVR1.

<table>
<thead>
<tr>
<th>COMP1&lt;\text{m}&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCCIDCVR1[(m×8+7):(m×8)] when it performs the Context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCCIDCVR1[(m×8+7):(m×8)] when it performs the Context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is \texttt{RES0} if \( m \geq \text{TRCIDR2.CIDSIZE} \).

On a Trace unit reset, this field resets to an architecturally \texttt{UNKNOWN} value.

Otherwise:

Reserved, \texttt{RES0}.

**COMP0<\text{m}>, bit [\text{m}], for \text{m} = 0 to 7**

When \text{TRCIDR4.NUMCIDC} > 0:

TRCCIDCVR0 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR0. Each bit in this field corresponds to a byte in TRCCIDCVR0.

<table>
<thead>
<tr>
<th>COMP0&lt;\text{m}&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCCIDCVR0[(m×8+7):(m×8)] when it performs the Context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCCIDCVR0[(m×8+7):(m×8)] when it performs the Context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is \texttt{RES0} if \( m \geq \text{TRCIDR2.CIDSIZE} \).

On a Trace unit reset, this field resets to an architecturally \texttt{UNKNOWN} value.

Otherwise:

Reserved, \texttt{RES0}.

**Accessing the TRCCIDCCTL0**

If software uses the TRCCIDCVR<n> registers, for \( n = 0 \) to 3, then it must program this register.

If software sets a mask bit to 0b1 then it must program the relevant byte in TRCCIDCVR<n> to 0x00.
If any bit is 0b1 and the relevant byte in TRCCIDCVR<n> is not 0x00, the behavior of the Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

**TRCCIDCCTRLR0 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x680</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.
The TRCCIDCCTRL1 characteristics are:

**Purpose**
Contains Context identifier mask values for the TRCCIDCVR<n> registers, for n = 4 to 7.

**Configuration**
External register TRCCIDCCTRL1 bits [31:0] are architecturally mapped to AArch64 System register TRCCIDCCTRL1[31:0].
RW fields in this register reset to architecturally UNKNOWN values.
This register is present only when ETE is implemented, TRCIDR4.NUMCIDC > 0x4 and TRCIDR2.CIDSIZE > 0b00000. Otherwise, direct accesses to TRCCIDCCTRL1 are RES0.

**Attributes**
TRCCIDCCTRL1 is a 32-bit register.

**Field descriptions**
The TRCCIDCCTRL1 bit assignments are:

<table>
<thead>
<tr>
<th>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>
<th>COMP7&lt;m&gt;, bit [m+24]</th>
<th>COMP6&lt;m&gt;, bit [m+16]</th>
<th>COMP5&lt;m&gt;, bit [m+8]</th>
<th>COMP4&lt;m&gt;, bit [m]</th>
</tr>
</thead>
</table>

**COMP7<m>, bit [m+24], for m = 0 to 7**
When TRCIDR4.NUMCIDC > 7:
TRCCIDCVR7 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR7. Each bit in this field corresponds to a byte in TRCCIDCVR7.

<table>
<thead>
<tr>
<th>COMP7&lt;m&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCCIDCVR7[(m×8+7):(m×8)] when it performs the Context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCCIDCVR7[(m×8+7):(m×8)] when it performs the Context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= TRCIDR2.CIDSIZE.
On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

**COMP6<m>, bit [m+16], for m = 0 to 7**
When TRCIDR4.NUMCIDC > 6:
TRCCIDCVR6 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR6. Each bit in this field corresponds to a byte in TRCCIDCVR6.
<table>
<thead>
<tr>
<th>COMP6&lt;m&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCCIDCVR6[(m×8+7):(m×8)] when it performs the Context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCCIDCVR6[(m×8+7):(m×8)] when it performs the Context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= TRCIDR2.CIDSIZE.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**COMP5<m>, bit [m+8], for m = 0 to 7**

**When TRCIDR4.NUMCIDC > 5:**

TRCCIDCVR5 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR5. Each bit in this field corresponds to a byte in TRCCIDCVR5.

<table>
<thead>
<tr>
<th>COMP5&lt;m&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCCIDCVR5[(m×8+7):(m×8)] when it performs the Context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCCIDCVR5[(m×8+7):(m×8)] when it performs the Context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= TRCIDR2.CIDSIZE.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**COMP4<m>, bit [m], for m = 0 to 7**

**When TRCIDR4.NUMCIDC > 4:**

TRCCIDCVR4 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR4. Each bit in this field corresponds to a byte in TRCCIDCVR4.

<table>
<thead>
<tr>
<th>COMP4&lt;m&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCCIDCVR4[(m×8+7):(m×8)] when it performs the Context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCCIDCVR4[(m×8+7):(m×8)] when it performs the Context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= TRCIDR2.CIDSIZE.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Accessing the TRCCIDCCTRL1**

If software uses the TRCCIDCVR<n> registers, for n = 4 to 7, then it must program this register.

If software sets a mask bit to 0b1 then it must program the relevant byte in TRCCIDCVR<n> to 0x00.
If any bit is 0b1 and the relevant byte in TRCCIDCVR<n> is not 0x00, the behavior of the Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

**TRCCIDCCTRL1 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x684</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
The TRCCIDCVR\(n\) characteristics are:

**Purpose**

Contains a Context identifier value.

**Configuration**

External register TRCCIDCVR\(n\) bits [63:0] are architecturally mapped to AArch64 System register TRCCIDCVR\(n\)[63:0].

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when ETE is implemented and TRCIDR4.NUMCIDC > n. Otherwise, direct accesses to TRCCIDCVR\(n\) are RES0.

**Attributes**

TRCCIDCVR\(n\) is a 64-bit register.

**Field descriptions**

The TRCCIDCVR\(n\) bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>VALUE</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>62</td>
</tr>
<tr>

</tr>
<tr>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

**VALUE**, bits [63:0]

Context identifier value. The width of this field is indicated by TRCIDR2.CIDSIZE. Unimplemented bits are RES0. After a PE Reset, the trace unit assumes that the Context identifier is zero until the PE updates the Context identifier.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCCIDCVR\(n\)**

Must be programmed if any of the following are true:

- TRCRSCTLR\(a\).GROUP == \(0b110\) and TRCRSCTLR\(a\).CID\(n\) == \(0b1\).
- TRCACATR\(a\).CONTEXTTYPE == \(0b01\) or \(0b11\) and TRCACATR\(a\).CONTEXT == \(n\).

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

**TRCCIDCVR\(n\) can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x600 + (8n)</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- When `!AllowExternalTraceAccess()`, or `OSLockStatus()` or `!IsTraceCorePowered()` accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
The TRCCIDR0 characteristics are:

**Purpose**

Provides discovery information for the component.

For additional information see the CoreSight Architecture Specification.

**Configuration**

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCCIDR0 are RES0.

There are no configuration notes.

**Attributes**

TRCCIDR0 is a 32-bit register.

**Field descriptions**

The TRCCIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit positions</th>
<th>Bit assignments</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:8</td>
<td>RES0</td>
</tr>
<tr>
<td>7:0</td>
<td>PRMBL_0</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_0, bits [7:0]**

Component identification preamble, segment 0.

This field reads as 0x0D.

**Accessing the TRCCIDR0**

External debugger accesses to this register are unaffected by the OS Lock.

**TRCCIDR0 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFF0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
TRCCIDR1, Component Identification Register 1

The TRCCIDR1 characteristics are:

**Purpose**

Provides discovery information for the component.

For additional information see the CoreSight Architecture Specification.

**Configuration**

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCCIDR1 are RES0.

There are no configuration notes.

**Attributes**

TRCCIDR1 is a 32-bit register.

**Field descriptions**

The TRCCIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>

</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**CLASS, bits [7:4]**

Component class.

<table>
<thead>
<tr>
<th>CLASS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1001</td>
<td>CoreSight peripheral.</td>
</tr>
</tbody>
</table>

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

**PRMBL_1, bits [3:0]**

Component identification preamble, segment 1.

This field reads as 0x0.

**Accessing the TRCCIDR1**

External debugger accesses to this register are unaffected by the OS Lock.

**TRCCIDR1 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When `!IsTraceCorePowered()` accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.
The TRCCIDR2 characteristics are:

**Purpose**

Provides discovery information for the component.

For additional information see the CoreSight Architecture Specification.

**Configuration**

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCCIDR2 are RES0.

There are no configuration notes.

**Attributes**

TRCCIDR2 is a 32-bit register.

**Field descriptions**

The TRCCIDR2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>

</tbody>
</table>

- **Bits [31:8]**
  - Reserved, RES0.
- **PRMBL_2, bits [7:0]**
  - Component identification preamble, segment 2.
  - This field reads as 0x05.

**Accessing the TRCCIDR2**

External debugger accesses to this register are unaffected by the OS Lock.

**TRCCIDR2 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFF8</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
TRCCIDR3, Component Identification Register 3

The TRCCIDR3 characteristics are:

**Purpose**

Provides discovery information for the component.

For additional information see the CoreSight Architecture Specification.

**Configuration**

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCCIDR3 are RES0.

There are no configuration notes.

**Attributes**

TRCCIDR3 is a 32-bit register.

**Field descriptions**

The TRCCIDR3 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_3, bits [7:0]**

Component identification preamble, segment 3.

This field reads as 0xB1.

**Accessing the TRCCIDR3**

External debugger accesses to this register are unaffected by the OS Lock.

**TRCCIDR3 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFFC</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
The TRCCLAIMCLR characteristics are:

**Purpose**

In conjunction with TRCCLAIMSET, provides Claim Tag bits that can be separately set and cleared to indicate whether functionality is in use by a debug agent.

For additional information see the CoreSight Architecture Specification.

**Configuration**

External register TRCCLAIMCLR bits [31:0] are architecturally mapped to AArch64 System register TRCCLAIMCLR[31:0].

Some or all RW fields of this register have defined reset values.

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCCLAIMCLR are RES0.

**Attributes**

TRCCLAIMCLR is a 32-bit register.

**Field descriptions**

The TRCCLAIMCLR bit assignments are:

<table>
<thead>
<tr>
<th>CLR&lt;m&gt;, bit [m]</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
</tr>
</tbody>
</table>

**CLR<m>, bit [m], for m = 0 to 31**

Claim Tag Clear. Indicates the current status of the Claim Tag bit m, and is used to clear Claim Tag bit m to 0b0.

<table>
<thead>
<tr>
<th>CLR&lt;m&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>On a read: Claim Tag bit m is not set. On a write: Ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>On a read: Claim Tag bit m is set. On a write: Clear Claim tag bit m to 0b0.</td>
</tr>
</tbody>
</table>

The number of Claim Tag bits implemented is indicated in TRCCLAIMSET.

On a Trace unit reset, this field resets to 0.

### Accessing the TRCCLAIMCLR

TRCCLAIMCLR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFA4</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
TRCCLAIMSET, Claim Tag Set Register

The TRCCLAIMSET characteristics are:

**Purpose**

In conjunction with TRCCLAIMCLR, provides Claim Tag bits that can be separately set and cleared to indicate whether functionality is in use by a debug agent.

For additional information see the CoreSight Architecture Specification.

**Configuration**

External register TRCCLAIMSET bits [31:0] are architecturally mapped to AArch64 System register TRCCLAIMSET[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCCLAIMSET are RES0.

The number of claim tag bits implemented is IMPLEMENTATION DEFINED. Arm recommends that implementations support a minimum of four claim tag bits, that is, SET[3:0] reads as 0b1111.

**Attributes**

TRCCLAIMSET is a 32-bit register.

**Field descriptions**

The TRCCLAIMSET bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| **SET<m>**, bit [m] | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

SET<m>, bit [m], for m = 0 to 31

Claim Tag Set. Indicates whether Claim Tag bit m is implemented, and is used to set Claim Tag bit m to 0b1.

<table>
<thead>
<tr>
<th>SET&lt;m&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>On a read: Claim Tag bit m is not implemented. On a write: Ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>On a read: Claim Tag bit m is implemented. On a write: Set Claim Tag bit m to 0b1.</td>
</tr>
</tbody>
</table>

**Accessing the TRCCLAIMSET**

TRCCLAIMSET can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFA0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
TRCCNTCTLR<n>, Counter Control Register <n>, n = 0 - 3

The TRCCNTCTLR<n> characteristics are:

**Purpose**

Controls the operation of Counter <n>.

**Configuration**

External register TRCCNTCTLR<n> bits [31:0] are architecturally mapped to AArch64 System register TRCCNTCTLR<n>[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when ETE is implemented and TRCIDR5.NUMCNTR > n. Otherwise, direct accesses to TRCCNTCTLR<n> are RES0.

**Attributes**

TRCCNTCTLR<n> is a 32-bit register.

**Field descriptions**

The TRCCNTCTLR<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | CNTCHAIN | RLDSELF | RLDEVENT_TYPE | RES0 | RLDEVENT_SEL | CNTEVENT_TYPE | RES0 | CNTEVENT_SEL | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 |

**Bits [31:18]**

Reserved, RES0.

**CNTCHAIN, bit [17]**

For TRCCNTCTLR3 and TRCCNTCTLR1, this bit controls whether the Counter decrements when a reload event occurs for Counter <n-1>.

<table>
<thead>
<tr>
<th>CNTCHAIN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Counter does not decrement when a reload event for Counter &lt;n-1&gt; occurs.</td>
</tr>
<tr>
<td>0b1</td>
<td>Counter &lt;n&gt; decrements when a reload event for Counter &lt;n-1&gt; occurs. This concatenates Counter &lt;n&gt; and Counter &lt;n-1&gt;, to provide a larger count value.</td>
</tr>
</tbody>
</table>

CNTCHAIN is not implemented for TRCCNTCTLR0 and TRCCNTCTLR2.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**RLDSELF, bit [16]**

Controls whether a reload event occurs for the Counter, when the Counter reaches zero.
### RLDSEL
<table>
<thead>
<tr>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0 Normal mode.</td>
</tr>
<tr>
<td>The Counter is in Normal mode.</td>
</tr>
<tr>
<td>0b1 Self-reload mode.</td>
</tr>
<tr>
<td>The Counter is in Self-reload mode.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

### RLDEVENT_TYPE, bit [15]

Chooses the type of Resource Selector.

Selects an event, that when it occurs causes a reload event for Counter <n>.

<table>
<thead>
<tr>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0 A single Resource Selector:</td>
</tr>
<tr>
<td>TRCCNTCTLR&lt;n&gt;.RLDEVENT.SEL[4:0] selects</td>
</tr>
<tr>
<td>the single Resource Selector, from 0-31,</td>
</tr>
<tr>
<td>used to activate the resource event.</td>
</tr>
<tr>
<td>0b1 A Boolean-combined pair of Resource</td>
</tr>
<tr>
<td>Selectors. TRCCNTCTLR&lt;n&gt;.RLDEVENT.SEL[3:0]</td>
</tr>
<tr>
<td>selects the Resource Selector pair, from</td>
</tr>
<tr>
<td>0-15, that has a Boolean function that is</td>
</tr>
<tr>
<td>applied to it whose output is used to</td>
</tr>
<tr>
<td>activate the resource event.</td>
</tr>
<tr>
<td>TRCCNTCTLR&lt;n&gt;.RLDEVENT.SEL[4] is RES0.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

### Bits [14:13]

Reserved, RES0.

### RLDEVENT_SEL, bits [12:8]

Defines the selected Resource Selector or pair of Resource Selectors. TRCCNTCTLR<n>.RLDEVENT.TYPE controls whether TRCCNTCTLR<n>.RLDEVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Selects an event, that when it occurs causes a reload event for Counter <n>.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is **UNPREDICTABLE**, and the resource event might fire or might not fire.

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

### CNTEVENT_TYPE, bit [7]

Chooses the type of Resource Selector.

Selects an event, that when it occurs causes Counter <n> to decrement.

<table>
<thead>
<tr>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0 A single Resource Selector:</td>
</tr>
<tr>
<td>TRCCNTCTLR&lt;n&gt;.CNTEVENT.SEL[4:0] selects</td>
</tr>
<tr>
<td>the single Resource Selector, from 0-31,</td>
</tr>
<tr>
<td>used to activate the resource event.</td>
</tr>
<tr>
<td>0b1 A Boolean-combined pair of Resource</td>
</tr>
<tr>
<td>Selectors. TRCCNTCTLR&lt;n&gt;.CNTEVENT.SEL[3:0]</td>
</tr>
<tr>
<td>selects the Resource Selector pair, from</td>
</tr>
<tr>
<td>0-15, that has a Boolean function that is</td>
</tr>
<tr>
<td>applied to it whose output is used to</td>
</tr>
<tr>
<td>activate the resource event.</td>
</tr>
<tr>
<td>TRCCNTCTLR&lt;n&gt;.CNTEVENT.SEL[4] is RES0.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.
Bits [6:5]

Reserved, RES0.

CNTEVENT_SEL, bits [4:0]

Defines the selected Resource Selector or pair of Resource Selectors. TRCCNTCTRLR\textsubscript{n}.CNTEVENT.TYPE controls whether TRCCNTCTRLR\textsubscript{n}.CNTEVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Selects an event, that when it occurs causes Counter \textsubscript{n} to decrement.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing the TRCCNTCTRLR\textsubscript{n}

Must be programmed if TRCRSCTRLR\textsubscript{a}.GROUP == 0b0010 and TRCRSCTRLR\textsubscript{a}.COUNTERS\[n\] == 0b1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCNTCTRLR\textsubscript{n} can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x150 + 4n</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
TRCCNTRLDVR<n>, Counter Reload Value Register <n>, n = 0 - 3

The TRCCNTRLDVR<n> characteristics are:

**Purpose**

This sets or returns the reload count value for Counter <n>.

**Configuration**

External register TRCCNTRLDVR<n> bits [31:0] are architecturally mapped to AArch64 System register TRCCNTRLDVR<n>[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when ETE is implemented and TRCIDR5.NUMCNTR > n. Otherwise, direct accesses to TRCCNTRLDVR<n> are RES0.

**Attributes**

TRCCNTRLDVR<n> is a 32-bit register.

**Field descriptions**

The TRCCNTRLDVR<n> bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>VALUE</td>
<td></td>
<td></td>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**VALUE, bits [15:0]**

Contains the reload value for Counter <n>. When a reload event occurs for Counter <n> then the trace unit copies the VALUE<n> field into Counter <n>.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCCNTRLDVR<n>**

Must be programmed if TRCRSCTRLR<a>.GROUP == 0b0010 and TRCRSCTRLR<a>.COUNTERS[n] == 0b1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

**TRCCNTRLDVR<n> can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x140 + 4n</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
• When `!AllowExternalTraceAccess()`, or `OSLockStatus()` or `!IsTraceCorePowered()` accesses to this register generate an error response.
• Otherwise accesses to this register are **RW**.
The TRCCNTVR<n> characteristics are:

**Purpose**

This sets or returns the value of Counter <n>.

**Configuration**

External register TRCCNTVR<n> bits [31:0] are architecturally mapped to AArch64 System register TRCCNTVR<n>[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when ETE is implemented and TRCIDR5.NUMCNTR > n. Otherwise, direct accesses to TRCCNTVR<n> are RES0.

**Attributes**

TRCCNTVR<n> is a 32-bit register.

**Field descriptions**

The TRCCNTVR<n> bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-</td>
<td>RES0</td>
</tr>
<tr>
<td>15-</td>
<td>VALUE</td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**VALUE, bits [15:0]**

Contains the count value of Counter.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCCNTVR<n>**

Must be programmed if TRCRSCTLR<a>.GROUP == 0b0010 and TRCRSCTLR<a>.COUNTERS[n] == 0b1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

**TRCCNTVR<n> can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x160 + 4n</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
TRCCONFIGR, Trace Configuration Register

The TRCCONFIGR characteristics are:

**Purpose**

Controls the tracing options.

**Configuration**

External register TRCCONFIGR bits [31:0] are architecturally mapped to AArch64 System register TRCCONFIGR[31:0].

RW fields in this register reset to architecturally **UNKNOWN** values.

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCCONFIGR are **RES0**.

**Attributes**

TRCCONFIGR is a 32-bit register.

**Field descriptions**

The TRCCONFIGR bit assignments are:

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
```

<table>
<thead>
<tr>
<th></th>
<th>RES0</th>

<th>QE</th>
<th>RS</th>
<th>TS</th>
<th>RES0</th>
<th>VMID</th>
<th>CID</th>
<th>RES0</th>
<th>BB</th>
<th>RES0</th>
<th>RES1</th>
</tr>
</thead>
</table>

**Bits [31:16]**

Reserved, **RES0**.

**Bit [15]**

When TRCIDR2.VMIDOPT == 0b00:

Reserved, **RES0**.

Virtual context identifier selection control.

**VTBTR_EL2** VMID is used as the Virtual context identifier.

When TRCIDR2.VMIDOPT == 0b10:

Reserved, **RES1**.

Virtual context identifier selection control.

**CONTEXTIDR_EL2** PROCID is used as the Virtual context identifier.

When TRCIDR2.VMIDOPT == 0b01:

Virtual context identifier selection control.
### VMIDOPT

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>VTTBR_EL2: VMID is used as the Virtual context identifier.</td>
</tr>
<tr>
<td>0b1</td>
<td>CONTEXTIDR_EL2: PROCID is used as the Virtual context identifier.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

### QE, bits [14:13]

**When TRCIDR0.QSUPP == 0b01:**

Q element generation control.

<table>
<thead>
<tr>
<th>QE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Q elements are disabled.</td>
</tr>
<tr>
<td>0b01</td>
<td>Q elements with instruction counts are enabled.</td>
</tr>
<tr>
<td></td>
<td>Q elements without instruction counts are disabled.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**When TRCIDR0.QSUPP == 0b10:**

Q element generation control.

<table>
<thead>
<tr>
<th>QE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Q elements are disabled.</td>
</tr>
<tr>
<td>0b11</td>
<td>Q elements with instruction counts are enabled.</td>
</tr>
<tr>
<td></td>
<td>Q elements without instruction counts are enabled.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**When TRCIDR0.QSUPP == 0b11:**

Q element generation control.

<table>
<thead>
<tr>
<th>QE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Q elements are disabled.</td>
</tr>
<tr>
<td>0b01</td>
<td>Q elements with instruction counts are enabled.</td>
</tr>
<tr>
<td></td>
<td>Q elements without instruction counts are disabled.</td>
</tr>
<tr>
<td>0b11</td>
<td>Q elements with instruction counts are enabled.</td>
</tr>
<tr>
<td></td>
<td>Q elements without instruction counts are enabled.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Otherwise:

Reserved, RES0.

### RS, bit [12]

**When TRCIDR0.RETSTACK == 0b1:**

Return stack control.

<table>
<thead>
<tr>
<th>RS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Return stack is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Return stack is enabled.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**TS, bit [11]**

When TRCIDR0.TSSIZE != 0b00000:

Global timestamp tracing control.

<table>
<thead>
<tr>
<th>TS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Global timestamp tracing is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Global timestamp tracing is enabled.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Bits [10:8]**

Reserved, RES0.

**VMID, bit [7]**

When TRCIDR2.VMIDSIZE != 0b00000:

Virtual context identifier tracing control.

<table>
<thead>
<tr>
<th>VMID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Virtual context identifier tracing is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Virtual context identifier tracing is enabled.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**CID, bit [6]**

When TRCIDR2.CIDSIZE != 0b00000:

Context identifier tracing control.

<table>
<thead>
<tr>
<th>CID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Context identifier tracing is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Context identifier tracing is enabled.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Bit [5]**

Reserved, RES0.
CCI, bit [4]

When TRCIDR0.TRCCCI == 0b1:

Cycle counting instruction tracing control.

<table>
<thead>
<tr>
<th>CCI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counting instruction tracing is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Cycle counting instruction tracing is enabled.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BB, bit [3]

When TRCIDR0.TRCBB == 0b1:

Branch broadcasting control.

<table>
<thead>
<tr>
<th>BB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Branch broadcasting is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Branch broadcasting is enabled.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [2:1]

Reserved, RES0.

Bit [0]

Reserved, RES1.

Accessing the TRCCONFIGR

Must always be programmed.

TRCCONFIGR.QE must be set to 0b00 if TRCCONFIGR.BB is not 0b0.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCONFIGR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x010</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
TRCDEVAFF, Device Affinity Register

The TRCDEVAFF characteristics are:

**Purpose**

For additional information see the CoreSight Architecture Specification.

Reads the same value as the MPIDR_EL1 register for the PE that this trace unit has affinity with.

**Configuration**

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCDEVAFF are RES0.

There are no configuration notes.

**Attributes**

TRCDEVAFF is a 64-bit register.

**Field descriptions**

The TRCDEVAFF bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

MPIDR_EL1, bits [63:0]

Read-only copy of MPIDR_EL1, as seen from the highest implemented Exception level.

**Accessing the TRCDEVAFF**

External debugger accesses to this register are unaffected by the OS Lock.

**TRCDEVAFF can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFA8</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
TRCDEVARCH, Device Architecture Register

The TRCDEVARCH characteristics are:

**Purpose**

Provides discovery information for the component.

For additional information see the CoreSight Architecture Specification.

**Configuration**

External register TRCDEVARCH bits [31:0] are architecturally mapped to AArch64 System register TRCDEVARCH[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCDEVARCH are RES0.

**Attributes**

TRCDEVARCH is a 32-bit register.

**Field descriptions**

The TRCDEVARCH bit assignments are:

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     | ARCHITECT | PRESENT | REVISON | ARCHVER | ARCHPART |

**ARCHITECT, bits [31:21]**

Architect. Defines the architect of the component. Bits [31:28] are the JEP106 continuation code (JEP106 bank ID, minus 1) and bits [27:21] are the JEP106 ID code.

<table>
<thead>
<tr>
<th>ARCHITECT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1001111011</td>
<td>JEP106 continuation code 0x4, ID code 0x3B. Arm Limited.</td>
</tr>
</tbody>
</table>

Other values are defined by the JEDEC JEP106 standard.

This field reads as 0x23B.

**PRESENT, bit [20]**

DEVARCH Present. Defines that the DEVARCH register is present.

<table>
<thead>
<tr>
<th>PRESENT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Device Architecture information not present.</td>
</tr>
<tr>
<td>0b1</td>
<td>Device Architecture information present.</td>
</tr>
</tbody>
</table>

This bit reads as 0b1.

**REVISION, bits [19:16]**

Revision. Defines the architecture revision of the component.

<table>
<thead>
<tr>
<th>REVISION</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>ETE Version 1.0.</td>
</tr>
</tbody>
</table>
All other values are reserved.

**ARCHVER, bits [15:12]**

Architecture Version. Defines the architecture version of the component.

<table>
<thead>
<tr>
<th>ARCHVER</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0101</td>
<td>ETE Version 1.</td>
</tr>
</tbody>
</table>

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHVER is ARCHID[15:12]. This field reads as 0x5.

**ARCHPART, bits [11:0]**

Architecture Part. Defines the architecture of the component.

<table>
<thead>
<tr>
<th>ARCHPART</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0xA13</td>
<td>Arm PE trace architecture.</td>
</tr>
</tbody>
</table>

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHPART is ARCHID[11:0]. This field reads as 0xA13.

**Accessing the TRCDEVARCH**

External debugger accesses to this register are unaffected by the OS Lock.

**TRCDEVARCH can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFBC</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
TRCDEVID, Device Configuration Register

The TRCDEVID characteristics are:

**Purpose**

Provides discovery information for the component.

For additional information see the CoreSight Architecture Specification.

**Configuration**

External register TRCDEVID bits [31:0] are architecturally mapped to AArch64 System register TRCDEVID[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCDEVID are RES0.

**Attributes**

TRCDEVID is a 32-bit register.

**Field descriptions**

The TRCDEVID bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 |

**Bits [31:0]**

Reserved, RES0.

**Accessing the TRCDEVID**

External debugger accesses to this register are unaffected by the OS Lock.

**TRCDEVID can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFC8</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
TRCDEVID1, Device Configuration Register 1

The TRCDEVID1 characteristics are:

**Purpose**

Provides discovery information for the component.
For additional information see the CoreSight Architecture Specification.

**Configuration**

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCDEVID1 are \texttt{RES0}.
There are no configuration notes.

**Attributes**

TRCDEVID1 is a 32-bit register.

**Field descriptions**

The TRCDEVID1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, \texttt{RES0}</td>
</tr>
</tbody>
</table>

**Accessing the TRCDEVID1**

External debugger accesses to this register are unaffected by the OS Lock.

**TRCDEVID1 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFC4</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When \texttt{!IsTraceCorePowered()} accesses to this register generate an error response.
- Otherwise accesses to this register are \texttt{RO}.
TRCDEVID2, Device Configuration Register 2

The TRCDEVID2 characteristics are:

**Purpose**

Provides discovery information for the component.

For additional information see the CoreSight Architecture Specification.

**Configuration**

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCDEVID2 are *RES0*.

There are no configuration notes.

**Attributes**

TRCDEVID2 is a 32-bit register.

**Field descriptions**

The TRCDEVID2 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 |

**Bits [31:0]**

Reserved, RES0.

**Accessing the TRCDEVID2**

External debugger accesses to this register are unaffected by the OS Lock.

**TRCDEVID2 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFC0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
TRCDEVTYPE, Device Type Register

The TRCDEVTYPE characteristics are:

**Purpose**

Provides discovery information for the component. If the part number field is not recognised, a debugger can report the information that is provided by TRCDEVTYPE about the component instead.

For additional information see the CoreSight Architecture Specification.

**Configuration**

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCDEVTYPE are RES0.

There are no configuration notes.

**Attributes**

TRCDEVTYPE is a 32-bit register.

**Field descriptions**

The TRCDEVTYPE bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>

</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>When MAJOR == 0x3 (Trace source): Associated with a PE.</td>
</tr>
</tbody>
</table>

This field reads as 0x1.

**MAJOR, bits [3:0]**

Component major type.

<table>
<thead>
<tr>
<th>MAJOR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0011</td>
<td>Trace source.</td>
</tr>
</tbody>
</table>

Other values are defined by the CoreSight Architecture.

This field reads as 0x3.

**Accessing the TRCDEVTYPE**

External debugger accesses to this register are unaffected by the OS Lock.
TRCDEVTYPE can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFCC</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
TRCEVENTCTL0R, Event Control 0 Register

The TRCEVENTCTL0R characteristics are:

**Purpose**

Controls the generation of ETEEvents.

**Configuration**

External register TRCEVENTCTL0R bits [31:0] are architecturally mapped to AArch64 System register TRCEVENTCTL0R[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when ETE is implemented and TRCIDR4.NUMRSPAIR != 0b0000. Otherwise, direct accesses to TRCEVENTCTL0R are RES0.

**Attributes**

TRCEVENTCTL0R is a 32-bit register.

**Field descriptions**

The TRCEVENTCTL0R bit assignments are:

<table>
<thead>
<tr>
<th>EVENT3_TYPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A single Resource Selector. TRCEVENTCTL0R.EVENT3.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT3.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT3.SEL[4] is RES0.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Bits [30:29]**

Reserved, RES0.

**EVENT3_SEL**, bits [28:24]

Reserved, RES0.
When TRCIDR4.NUMRSPAIR != 0b0000 and TRCIDR0.NUMEVENT >= 0b11:

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT3.TYPE controls whether TRCEVENTCTL0R.EVENT3.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire.

When any of the selected resource events occurs and TRCEVENTCTL1R.INSTEN[3] == 0b1, then Event element 3 is generated in the instruction trace element stream.

On a Trace unit reset, this field resets to an architecturallyUNKNOWN value.

Otherwise:

Reserved, RES0.

**EVENT2_TYPE, bit [23]**

When TRCIDR4.NUMRSPAIR != 0b0000 and TRCIDR0.NUMEVENT >= 0b10:

Chooses the type of Resource Selector.

<table>
<thead>
<tr>
<th>EVENT2_TYPE</th>
<th>Meaning</th>

<tr>
<td>0b1</td>
<td>A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT0_SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT0_SEL[4] is RES0.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

### Otherwise:

Reserved, RES0.

### Bits [6:5]

Reserved, RES0.

### EVENT0_SEL, bits [4:0]

When TRCIDR4.NUMRSPAIR != 0b0000 and TRCIDR0.NUMEVENT >= 0b00:

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT0.TYPE controls whether TRCEVENTCTL0R.EVENT0_SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire.

When any of the selected resource events occurs and TRCEVENTCTL1R.INSTEN[0] == 0b1, then Event element 0 is generated in the instruction trace element stream.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

### Otherwise:

Reserved, RES0.

### Accessing the TRCEVENTCTL0R

Must be programmed if implemented.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

### TRCEVENTCTL0R can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x020</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
TRCEVENTCTL1R, Event Control 1 Register

The TRCEVENTCTL1R characteristics are:

**Purpose**

Controls the behavior of the ETEEvents that TRCEVENTCTL0R selects.

**Configuration**

External register TRCEVENTCTL1R bits [31:0] are architecturally mapped to AArch64 System register TRCEVENTCTL1R[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCEVENTCTL1R are RES0.

**Attributes**

TRCEVENTCTL1R is a 32-bit register.

**Field descriptions**

The TRCEVENTCTL1R bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>LPOVERRIDE</td>
</tr>
<tr>
<td>29</td>
<td>ATB</td>
</tr>
<tr>
<td>28</td>
<td>RES0</td>
</tr>
<tr>
<td>27</td>
<td>INSTEN&lt;m&gt;, bit [m]</td>
</tr>
</tbody>
</table>

**Bits [31:13]**

Reserved, RES0.

**LPOVERRIDE, bit [12]**

When TRCIDR5.LPOVERRIDE == 0b1:

Low-power Override Mode select.

<table>
<thead>
<tr>
<th>LPOVERRIDE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Trace unit Low-power Override Mode is not enabled. That is, the trace unit is permitted to enter low-power state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trace unit Low-power Override Mode is enabled. That is, entry to a low-power state does not affect the trace unit resources or trace generation.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

**ATB, bit [11]**

When TRCIDR5.ATBTRIG == 0b1:

AMBA Trace Bus (ATB) trigger enable.

If a CoreSight ATB interface is implemented then when ETEEvent 0 occurs the trace unit sets:
• ATID == 0x7D.
• ATDATA to the value of TRCTRACEIDR.

If the width of ATDATA is greater than the width of TRCTRACEIDR, TRACEID then the trace unit zeros the upper ATDATA bits.

If ETEEvent 0 is programmed to occur based on program execution, such as an Address Comparator, the ATB trigger might not be inserted into the ATB stream at the same time as any trace generated by that program execution is output by the trace unit. Typically, the generated trace might be buffered in a trace unit which means that the ATB trigger would be output before the associated trace is output.

If ETEEvent 0 is asserted multiple times in close succession, the trace unit is required to generate an ATB trigger for the first assertion, but might ignore one or more of the subsequent assertions. Arm recommends that the window in which ETEEvent 0 is ignored is limited only by the time taken to output an ATB trigger.

<table>
<thead>
<tr>
<th>ATB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ATB trigger is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>ATB trigger is enabled.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

**Bits [10:4]**

Reserved, RES0.

**INSTEN<m>, bit [m], for m = 0 to 3**

Event element control.

<table>
<thead>
<tr>
<th>INSTEN&lt;m&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit does not generate an Event element m.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit generates an Event element m.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= the number indicated by TRCIDR0.NUMEVENT.

**Accessing the TRCEVENTCTL1R**

Must be programmed.

Writes are **CONSTRAINED UNPREDICTABLE** if the trace unit is not in the Idle state.

**TRCEVENTCTL1R can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x024</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.
TRCEXTINSELR<n>, External Input Select Register <n>, n = 0 - 3

The TRCEXTINSELR<n> characteristics are:

**Purpose**

Use this to set, or read, which External Inputs are resources to the trace unit.

**Configuration**

External register TRCEXTINSELR<n> bits [31:0] are architecturally mapped to AArch64 System register TRCEXTINSELR<n>[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when ETE is implemented and TRCIDR5.NUMEXTINSEL > n. Otherwise, direct accesses to TRCEXTINSELR<n> are RES0.

**Attributes**

TRCEXTINSELR<n> is a 32-bit register.

**Field descriptions**

The TRCEXTINSELR<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | evtCount |

**Bits [31:16]**

Reserved, RES0.

**evtCount, bits [15:0]**

PMU event to select.

The event number as defined by the Arm ARM.

Software must program this field with a PMU event that is supported by the PE being programmed.

There are three ranges of PMU event numbers:

- PMU event numbers in the range 0x0000 to 0x003F are common architectural and microarchitectural events.
- PMU event numbers in the range 0x0040 to 0x00BF are Arm recommended common architectural and microarchitectural PMU events.
- PMU event numbers in the range 0x00C0 to 0x3FF are IMPLEMENTATION DEFINED PMU events.

If evtCount is programmed to a PMU event that is reserved or not supported by the PE, the behavior depends on the PMU event type:

- For the range 0x0000 to 0x003F, then the PMU event is not active, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED PMU events, it is UNPREDICTABLE what PMU event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

UNPREDICTABLE means the PMU event must not expose privileged information.
Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include a PMU event from a set of common IMPLEMENTATION DEFINED PMU events, then no PMU event is counted and the value read back on evtCount is the value written.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCEXTINSELR<n>**

Must be programmed if any of the following is true: TRCRSCTLR<a>.GROUP == 0b0000 and TRCRSCTLR<a>.EXTIN[n] == 0b1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

**TRCEXTINSELR<n> can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x120 + 4n</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
TRCIDR0, ID Register 0

The TRCIDR0 characteristics are:

**Purpose**

Returns the tracing capabilities of the trace unit.

**Configuration**

External register TRCIDR0 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR0[31:0]. This register is present only when ETE is implemented. Otherwise, direct accesses to TRCIDR0 are reserved.

**Attributes**

TRCIDR0 is a 32-bit register.

**Field descriptions**

The TRCIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit (31)</th>
<th>Bit (30)</th>
<th>Bit (29)</th>
<th>Bit (28:24)</th>
<th>Bit (17:10)</th>
<th>Bit (9:8)</th>

**Bit [31]**

Reserved, RES0.

**COMMTRANS, bit [30]**

Transaction Start element behavior.

<table>
<thead>
<tr>
<th>COMMTRANS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Transaction Start elements are P0 elements.</td>
</tr>
<tr>
<td>0b1</td>
<td>Transaction Start elements are not P0 elements.</td>
</tr>
</tbody>
</table>

**COMMOPT, bit [29]**

Indicates how the commit field in Cycle count packets is interpreted.

<table>
<thead>
<tr>
<th>COMMOPT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Commit mode 0. Cycle count packets includes the Commit element to which the Cycle Count element is attached.</td>
</tr>
<tr>
<td>0b1</td>
<td>Commit mode 1. Cycle count packets do not include Commit elements. The Cycle Count element is attached to the most recent Commit element.</td>
</tr>
</tbody>
</table>

This bit reads-as-one if TRCIDR0.TRCCCI == 0b1 and TRCIDR8.MAXSPEC == 0x0. This bit reads-as-zero if TRCIDR0.TRCCCI == 0b0.

**TSIZE, bits [28:24]**

Indicates that the trace unit implements Global timestamping and the size of the timestamp value.
<table>
<thead>
<tr>
<th>TSSIZE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00000</td>
<td>Global timestamping not implemented.</td>

<td>The trace unit supports 3 ETEEvents.</td>
</tr>
<tr>
<td>0b11</td>
<td>The trace unit supports 4 ETEEvents.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

RETSTACK, bit [9]

Indicates if the trace unit supports the return stack.

<table>
<thead>
<tr>
<th>RETSTACK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Return stack not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Return stack implemented.</td>
</tr>
</tbody>
</table>

Bit [8]

Reserved, RES0.

TRCCCI, bit [7]

Indicates if the trace unit implements cycle counting.
<table>
<thead>
<tr>
<th>TRCCCI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counting not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Cycle counting implemented.</td>
</tr>
</tbody>
</table>

This bit reads as 0b1.

**TRCOND, bit [6]**

Indicates if the trace unit implements conditional instruction tracing. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures.

<table>
<thead>
<tr>
<th>TRCOND</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Conditional instruction tracing not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Conditional instruction tracing implemented.</td>

</tr>
<tr>
<td>0b11</td>
<td>Load and store instructions are P0 instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b00.

**Bit [0]**

Reserved, RES1.

**Accessing the TRCIDR0**

TRCIDR0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x1E0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.
The TRCIDR1 characteristics are:

**Purpose**

Returns the tracing capabilities of the trace unit.

**Configuration**

External register TRCIDR1 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR1[31:0]. This register is present only when ETE is implemented. Otherwise, direct accesses to TRCIDR1 are RES0.

**Attributes**

TRCIDR1 is a 32-bit register.

**Field descriptions**

The TRCIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>

<td></td>
<td></td>
</tr>
</tbody>
</table>

**DESIGNER, bits [31:24]**

Indicates which company designed the trace unit. The permitted values of this field are the same as MIDR_EL1. Implementer.

**Bits [23:16]**

Reserved, RES0.

**Bits [15:12]**

Reserved, RES1.

**TRCARCHMAJ, bits [11:8]**

Major architecture version.

<table>
<thead>
<tr>
<th>TRCARCHMAJ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>If both TRCARCHMAJ and TRCARCHMIN == 0xF then refer to TRCDEVARCH.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b1111.

**TRCARCHMIN, bits [7:4]**

Minor architecture version.
Meaning

<table>
<thead>
<tr>
<th>TRCARCHMIN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>If both TRCARCHMAJ and TRCARCHMIN == 0xF then refer to TRCDEVARCH.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b1111.

**REVISION, bits [3:0]**

Implementation revision.

Returns an IMPLEMENTATION DEFINED value that identifies the revision of:

- The trace registers.
- The OS Lock registers.

Arm recommends that the initial implementation sets REVISION == 0x0 and the field then increments for any subsequent implementations. However, it is acceptable to omit some values or use another scheme to identify the revision number.

Arm recommends that TRCPIDR2.REVISION == TRCIDR1.REVISION. However, in situations where it is difficult to align these fields, such as with a metal layer fix then it is acceptable to change the REVISION fields independently.

**Accessing the TRCIDR1**

**TRCIDR1 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x1E4</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
TRCIDR10, ID Register 10

The TRCIDR10 characteristics are:

**Purpose**

Returns the tracing capabilities of the trace unit.

**Configuration**

External register TRCIDR10 bits [31:0] are architecturally mapped to AArch64 System register `TRCIDR10[31:0]`.

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCIDR10 are `RES0`.

**Attributes**

TRCIDR10 is a 32-bit register.

**Field descriptions**

The TRCIDR10 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| NUMP1KEY, bits [31:0] |

When TRCIDR0.TRCDATA != 0b00:

Indicates the number of P1 right-hand keys. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

Otherwise:

Reserved, `RES0`.

**Accessing the TRCIDR10**

**TRCIDR10 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x188</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.
TRCIDR11, ID Register 11

The TRCIDR11 characteristics are:

**Purpose**

Returns the tracing capabilities of the trace unit.

**Configuration**

External register TRCIDR11 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR11[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCIDR11 are RES0.

**Attributes**

TRCIDR11 is a 32-bit register.

**Field descriptions**

The TRCIDR11 bit assignments are:

```
    31  30  29  28  27  26  25  24  23  22  21  20  19  18  17  16  15  14  13  12  11  10  9  8  7  6  5  4  3  2  1  0
```

<table>
<thead>
<tr>
<th>NUMP1SPC</th>
</tr>
</thead>
</table>

**NUMP1SPC, bits [31:0]**

When TRCIDR0.TRCDATA != 0b00:

Indicates the number of special P1 right-hand keys. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

Otherwise:

Reserved, RES0.

**Accessing the TRCIDR11**

TRCIDR11 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x18C</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
TRCIDR12, ID Register 12

The TRCIDR12 characteristics are:

**Purpose**

Returns the tracing capabilities of the trace unit.

**Configuration**

External register TRCIDR12 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR12[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCIDR12 are RES0.

**Attributes**

TRCIDR12 is a 32-bit register.

**Field descriptions**

The TRCIDR12 bit assignments are:

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
```

**NUMCONDKEY, bits [31:0]**

When TRCIDR0.TRCCOND == 0b1:

Indicates the number of conditional instruction right-hand keys. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

Otherwise:

Reserved, RES0.

**Accessing the TRCIDR12**

TRCIDR12 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x190</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
**TRCIDR13, ID Register 13**

The TRCIDR13 characteristics are:

**Purpose**

Returns the tracing capabilities of the trace unit.

**Configuration**

External register TRCIDR13 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR13[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCIDR13 are RES0.

**Attributes**

TRCIDR13 is a 32-bit register.

**Field descriptions**

The TRCIDR13 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | NUMCONDSPC |

**NUMCONDSPC, bits [31:0]**

When TRCIDR0.TRCCOND == 0b1:

Indicates the number of special conditional instruction right-hand keys. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures. Otherwise:

Reserved, RES0.

**Accessing the TRCIDR13**

**TRCIDR13 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x194</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
TRCIDR2, ID Register 2

The TRCIDR2 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR2 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR2[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCIDR2 are RES0.

Attributes

TRCIDR2 is a 32-bit register.

Field descriptions

The TRCIDR2 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>WFXMODE</td>
<td>VMIDOPT</td>
<td>CCSIZE</td>
<td>DVSIZE</td>
<td>DASIZE</td>
<td>VMIDSIZE</td>
<td>CIDSIZE</td>
<td>IASIZE</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

WFXMODE, bit [31]

Indicates whether WFI and WFE instructions are classified as P0 instructions:

<table>
<thead>
<tr>
<th>WFXMODE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>WFI and WFE instructions are not classified as P0 instructions.</td>
</tr>
<tr>
<td>0b1</td>
<td>WFI and WFE instructions are classified as P0 instructions.</td>
</tr>
</tbody>
</table>

VMIDOPT, bits [30:29]

When TRCIDR2.VMIDSIZE != 0b00000:

Indicates the options for Virtual context identifier selection.

<table>
<thead>
<tr>
<th>VMIDOPT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Virtual context identifier selection not supported. TRCCONFIGR.VMIDOPT is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Virtual context identifier selection supported. TRCCONFIGR.VMIDOPT is implemented.</td>
</tr>
<tr>
<td>0b10</td>
<td>Virtual context identifier selection not supported. TRCCONFIGR.VMIDOPT is RES1.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b10.

Otherwise:

Reserved, RES0.
**CCSIZE, bits [28:25]**

When TRCIDR0.TRCCCI == 0b1:

Indicates the size of the cycle counter.

<table>
<thead>
<tr>
<th>CCSIZE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The cycle counter is 12 bits in length.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The cycle counter is 13 bits in length.</td>
</tr>
<tr>
<td>0b0010</td>
<td>The cycle counter is 14 bits in length.</td>
</tr>
<tr>
<td>0b0011</td>
<td>The cycle counter is 15 bits in length.</td>
</tr>
<tr>
<td>0b0100</td>
<td>The cycle counter is 16 bits in length.</td>
</tr>
<tr>
<td>0b0101</td>
<td>The cycle counter is 17 bits in length.</td>
</tr>
<tr>
<td>0b0110</td>
<td>The cycle counter is 18 bits in length.</td>
</tr>
<tr>
<td>0b0111</td>
<td>The cycle counter is 19 bits in length.</td>
</tr>
<tr>
<td>0b1000</td>
<td>The cycle counter is 20 bits in length.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Otherwise:

Reserved, RES0.

**DVSIZE, bits [24:20]**

When TRCIDR0.TRCDATA != 0b00:

Indicates the data value size in bytes. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

<table>
<thead>
<tr>
<th>DVSIZE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Data value tracing not implemented.</td>
</tr>
<tr>
<td>0b0100</td>
<td>Data value tracing has a maximum of 32-bit data values.</td>
</tr>
<tr>
<td>0b1000</td>
<td>Data value tracing has a maximum of 64-bit data values.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Otherwise:

Reserved, RES0.

**DASIZE, bits [19:15]**

When TRCIDR0.TRCDATA != 0b00:

Indicates the data address size in bytes. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

<table>
<thead>
<tr>
<th>DASIZE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Data address tracing not implemented.</td>
</tr>
<tr>
<td>0b0100</td>
<td>Data address tracing has a maximum of 32-bit data addresses.</td>
</tr>
<tr>
<td>0b1000</td>
<td>Data address tracing has a maximum of 64-bit data addresses.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Otherwise:

Reserved, RES0.
VMIDSIZE, bits [14:10]

When HaveEL(EL2):

Indicates the trace unit Virtual context identifier size.

<table>
<thead>
<tr>
<th>VMIDSIZE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00000</td>
<td>Virtual context identifier tracing is not supported.</td>
</tr>
<tr>
<td>0b00001</td>
<td>8-bit Virtual context identifier size.</td>
</tr>
<tr>
<td>0b00010</td>
<td>16-bit Virtual context identifier size.</td>
</tr>
<tr>
<td>0b00100</td>
<td>32-bit Virtual context identifier size.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b00100.

Otherwise:

Reserved, RES0.

CIDSIZE, bits [9:5]

Indicates the Context identifier size.

<table>
<thead>
<tr>
<th>CIDSIZE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00000</td>
<td>Context identifier tracing is not supported.</td>
</tr>
<tr>
<td>0b00100</td>
<td>32-bit Context identifier size.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b00100.

IASIZE, bits [4:0]

Virtual instruction address size.

<table>
<thead>
<tr>
<th>IASIZE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00000</td>
<td>Maximum of 32-bit instruction address size.</td>
</tr>
<tr>
<td>0b01000</td>
<td>Maximum of 64-bit instruction address size.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b01000.

Accessing the TRCIDR2

TRCIDR2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x1E8</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
TRCIDR3, ID Register 3

The TRCIDR3 characteristics are:

**Purpose**

Returns the base architecture of the trace unit.

**Configuration**

External register TRCIDR3 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR3[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCIDR3 are RES0.

**Attributes**

TRCIDR3 is a 32-bit register.

**Field descriptions**

The TRCIDR3 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOOVERFLOW</td>
<td>NUMPROC[2:0]</td>
<td>SYSSTALL</td>
<td>STALLCTL</td>
<td>SYNCPTR</td>
<td>TRCERR</td>
<td>RES0</td>
<td>EXLEVEL_NS_EL2</td>
<td>EXLEVEL_NS_EL1</td>
<td>EXLEVEL_S_EL3</td>
<td>EXLEVEL_S_EL2</td>
<td>EXLEVEL_S_EL1</td>
</tr>
</tbody>
</table>

**NOOVERFLOW, bit [31]**

Indicates if overflow prevention is implemented.

<table>
<thead>
<tr>
<th>NOOVERFLOW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Overflow prevention is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Overflow prevention is implemented.</td>
</tr>
</tbody>
</table>

**NUMPROC[2:0], bits [30:28]**

This field is bits[2:0] of NUMPROC[4:0].

Indicates the number of PEs available for tracing.

<table>
<thead>
<tr>
<th>NUMPROC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>The trace unit can trace one PE.</td>
</tr>
</tbody>
</table>

This field reads as 0b000000.

The NUMPROC field is split as follows:

- NUMPROC[2:0] is TRCIDR3[30:28].
- NUMPROC[4:3] is TRCIDR3[13:12].

**SYSSTALL, bit [27]**

When TRCIDR3.STALLCTL == 0b1:

Indicates if stalling of the PE is permitted.

<table>
<thead>
<tr>
<th>SYSSTALL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stalling of the PE is not permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stalling of the PE is permitted.</td>
</tr>
</tbody>
</table>
The value of this field might be dynamic and change based on system conditions.

Otherwise:

Reserved, RES0.

**STALLCTL, bit [26]**

Indicates if trace unit implements stalling of the PE.

<table>
<thead>
<tr>
<th>STALLCTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stalling of the PE is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stalling of the PE is implemented.</td>
</tr>
</tbody>
</table>

**SYNCPR, bit [25]**

Indicates if an implementation has a fixed synchronization period.

<table>
<thead>
<tr>
<th>SYNCPR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TRCSYNCPR is read-write so software can change the synchronization period.</td>
</tr>
<tr>
<td>0b1</td>
<td>TRCSYNCPR is read-only so the synchronization period is fixed.</td>
</tr>
</tbody>
</table>

This bit reads as 0b0.

**TRCERR, bit [24]**

Indicates forced tracing of System Error exceptions is implemented.

<table>
<thead>
<tr>
<th>TRCERR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Forced tracing of System Error exceptions is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Forced tracing of System Error exceptions is implemented.</td>
</tr>
</tbody>
</table>

This bit reads as 0b1.

**Bit [23]**

Reserved, RES0.

**EXLEVEL_NS_EL2, bit [22]**

Indicates if Non-secure EL2 implemented.

<table>
<thead>
<tr>
<th>EXLEVEL_NS_EL2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL2 is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL2 is implemented.</td>
</tr>
</tbody>
</table>

**EXLEVEL_NS_EL1, bit [21]**

Indicates if Non-secure EL1 implemented.

<table>
<thead>
<tr>
<th>EXLEVEL_NS_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL1 is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 is implemented.</td>
</tr>
</tbody>
</table>

**EXLEVEL_NS_EL0, bit [20]**

Indicates if Non-secure EL0 implemented.
<table>
<thead>
<tr>
<th>EXLEVEL_NS_EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL0 is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL0 is implemented.</td>
</tr>
</tbody>
</table>

**EXLEVEL_S_EL3, bit [19]**
Indicates if Secure EL3 implemented.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure EL3 is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure EL3 is implemented.</td>
</tr>
</tbody>
</table>

**EXLEVEL_S_EL2, bit [18]**
Indicates if Secure EL2 implemented.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure EL2 is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure EL2 is implemented.</td>
</tr>
</tbody>
</table>

**EXLEVEL_S_EL1, bit [17]**
Indicates if Secure EL1 implemented.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure EL1 is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure EL1 is implemented.</td>
</tr>
</tbody>
</table>

**EXLEVEL_S_EL0, bit [16]**
Indicates if Secure EL0 implemented.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure EL0 is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure EL0 is implemented.</td>
</tr>
</tbody>
</table>

**Bits [15:14]**
Reserved, RES0.

**NUMPROC[4:3], bits [13:12]**
This field is bits[4:3] of NUMPROC[4:0].
See NUMPROC[2:0] for the field description.

**CCITMIN, bits [11:0]**

When TRCIDR0.TRCCCI == 0b1:
Indicates the minimum value that can be programmed in TRCCCTL.TR.THRESHOLD.
When cycle counting in the instruction trace is supported, that is TRCIDR0.TRCCCI == 0b1, then the minimum value of this field is 0x001.

Otherwise:
Reserved, RES0.
Accessing the TRCIDR3

TRCIDR3 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x1EC</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
TRCIDR4, ID Register 4

The TRCIDR4 characteristics are:

**Purpose**

Returns the tracing capabilities of the trace unit.

**Configuration**

External register TRCIDR4 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR4[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCIDR4 are RES0.

**Attributes**

TRCIDR4 is a 32-bit register.

**Field descriptions**

The TRCIDR4 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>NUMVMIDC</td>
<td>NUMCIDC</td>
<td>NUMSSCC</td>

<td>0b0110</td>
</tr>
<tr>
<td>The implementation has seven PE Comparator Inputs.</td>
<td>0b0111</td>
</tr>
<tr>
<td>The implementation has eight PE Comparator Inputs.</td>
<td>0b1000</td>
</tr>
</tbody>
</table>

All other values are reserved.

### Bits [11:9]

Reserved, RES0.

### SUPPDAC, bit [8]

**When TRCIDR4.NUMACPAIRS \(!= \text{0b}0000\):**

Indicates whether data address comparisons are implemented. Data address comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>( \text{0b}x )</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data address comparisons not implemented.</td>
<td>0b0</td>
</tr>
<tr>
<td>Data address comparisons implemented.</td>
<td>0b1</td>
</tr>
</tbody>
</table>

This bit reads as \( \text{0b}0 \).

**Otherwise:**

Reserved, RES0.

### NUMDVC, bits [7:4]

Indicates the number of data value comparators. Data value comparators are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.
### NUMDVC, bits [5:0]

This field reads as 0b0000.

Indicates the number of data value comparators that are available for tracing.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>No data value comparators implemented.</td>
<td>0b0000</td>
</tr>
<tr>
<td>One data value comparator implemented.</td>
<td>0b0001</td>
</tr>
<tr>
<td>Two data value comparators implemented.</td>
<td>0b0010</td>
</tr>
<tr>
<td>Three data value comparators implemented.</td>
<td>0b0011</td>
</tr>
<tr>
<td>Four data value comparators implemented.</td>
<td>0b0100</td>
</tr>
<tr>
<td>Five data value comparators implemented.</td>
<td>0b0101</td>
</tr>
<tr>
<td>Six data value comparators implemented.</td>
<td>0b0110</td>
</tr>
<tr>
<td>Seven data value comparators implemented.</td>
<td>0b0111</td>
</tr>
<tr>
<td>Eight data value comparators implemented.</td>
<td>0b1000</td>
</tr>
</tbody>
</table>

All other values are reserved.

### NUMACPAIRS, bits [3:0]

Indicates the number of Address Comparator pairs that are available for tracing.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>No Address Comparator pairs are available.</td>
<td>0b0000</td>
</tr>
<tr>
<td>The implementation has one Address Comparator pair.</td>
<td>0b0001</td>
</tr>
<tr>
<td>The implementation has two Address Comparator pairs.</td>
<td>0b0010</td>
</tr>
<tr>
<td>The implementation has three Address Comparator pairs.</td>
<td>0b0011</td>
</tr>
<tr>
<td>The implementation has four Address Comparator pairs.</td>
<td>0b0100</td>
</tr>
<tr>
<td>The implementation has five Address Comparator pairs.</td>
<td>0b0101</td>
</tr>
<tr>
<td>The implementation has six Address Comparator pairs.</td>
<td>0b0110</td>
</tr>
<tr>
<td>The implementation has seven Address Comparator pairs.</td>
<td>0b0111</td>
</tr>
<tr>
<td>The implementation has eight Address Comparator pairs.</td>
<td>0b1000</td>
</tr>
</tbody>
</table>

All other values are reserved.

### Accessing the TRCIDR4

**TRCIDR4 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x1F0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.
TRCIDR5, ID Register 5

The TRCIDR5 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR5 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR5[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCIDR5 are RES0.

Attributes

TRCIDR5 is a 32-bit register.

Field descriptions

The TRCIDR5 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>30</td>

<td></td>
</tr>
<tr>
<td>2</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

Bit [31]

Reserved, RES0.

NUMCNTR, bits [30:28]

Indicates the number of Counters that are available for tracing.

<table>
<thead>
<tr>
<th>NUMCNTR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>No Counters are available.</td>
</tr>
<tr>
<td>0b001</td>
<td>One Counter implemented.</td>
</tr>
<tr>
<td>0b010</td>
<td>Two Counters implemented.</td>
</tr>
<tr>
<td>0b011</td>
<td>Three Counters implemented.</td>
</tr>
<tr>
<td>0b100</td>
<td>Four Counters implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field is RES0 if TRCIDR4.NUMRSPAIR == 0b0000.

NUMSEQSTATE, bits [27:25]

Indicates if the Sequencer is implemented and the number of Sequencer states that are implemented.

<table>
<thead>
<tr>
<th>NUMSEQSTATE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>The Sequencer is not implemented.</td>
</tr>
<tr>
<td>0b100</td>
<td>Four Sequencer states are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field is RES0 if TRCIDR4.NUMRSPAIR == 0b0000.
Bit [24]

Reserved, RES0.

LPOVERRIDE, bit [23]

Indicates support for Low-power Override Mode.

<table>
<thead>
<tr>
<th>LPOVERRIDE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit does not support Low-power Override Mode.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit support Low-power Override Mode.</td>
</tr>
</tbody>
</table>

ATBTRIG, bit [22]

Indicates if the implementation can support ATB triggers.

<table>
<thead>
<tr>
<th>ATBTRIG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The implementation does not support ATB triggers.</td>
</tr>
<tr>
<td>0b1</td>
<td>The implementation supports ATB triggers.</td>
</tr>
</tbody>
</table>

This bit is res0 if TRCIDR4.NUMRSPAIR == 0b0000.

TRACEIDSIZE, bits [21:16]

Indicates the trace ID width.

<table>
<thead>
<tr>
<th>TRACEIDSIZE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00000000</td>
<td>The external trace interface is not implemented.</td>
</tr>
<tr>
<td>0b000111</td>
<td>The implementation supports a 7-bit trace ID.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Note that AMBA ATB requires a 7-bit trace ID width.

Bits [15:12]

Reserved, RES0.

NUMEXTINSEL, bits [11:9]

Indicates how many External Input Selector resources are implemented.

<table>
<thead>
<tr>
<th>NUMEXTINSEL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>No External Input Selector resources are available.</td>
</tr>
<tr>
<td>0b01</td>
<td>1 External Input Selector resource is available.</td>
</tr>
<tr>
<td>0b10</td>
<td>2 External Input Selector resources are available.</td>
</tr>
<tr>
<td>0b11</td>
<td>3 External Input Selector resources are available.</td>
</tr>
<tr>
<td>0b100</td>
<td>4 External Input Selector resources are available.</td>
</tr>
</tbody>
</table>

All other values are reserved.

NUMEXTIN, bits [8:0]

Indicates how many External Inputs are implemented.

<table>
<thead>
<tr>
<th>NUMEXTIN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11111111</td>
<td>Unified PMU event selection.</td>
</tr>
</tbody>
</table>

All other values are reserved.
Accessing the TRCIDR5

TRCIDR5 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x1F4</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
TRCIDR6, ID Register 6

The TRCIDR6 characteristics are:

**Purpose**

Returns the tracing capabilities of the trace unit.

**Configuration**

External register TRCIDR6 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR6[31:0]. This register is present only when ETE is implemented. Otherwise, direct accesses to TRCIDR6 are RES0.

**Attributes**

TRCIDR6 is a 32-bit register.

**Field descriptions**

The TRCIDR6 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 |

**Bits [31:0]**

Reserved, RES0.

**Accessing the TRCIDR6**

TRCIDR6 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x1F8</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
TRCIDR7, ID Register 7

The TRCIDR7 characteristics are:

**Purpose**

Returns the tracing capabilities of the trace unit.

**Configuration**

External register TRCIDR7 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR7[31:0]. This register is present only when ETE is implemented. Otherwise, direct accesses to TRCIDR7 are RES0.

**Attributes**

TRCIDR7 is a 32-bit register.

**Field descriptions**

The TRCIDR7 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

**Accessing the TRCIDR7**

TRCIDR7 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x1FC</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
The TRCIDR8 characteristics are:

**Purpose**

Returns the maximum speculation depth of the instruction trace element stream.

**Configuration**

External register TRCIDR8 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR8[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCIDR8 are RES0.

**Attributes**

TRCIDR8 is a 32-bit register.

**Field descriptions**

The TRCIDR8 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | MAXSPEC |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**MAXSPEC, bits [31:0]**

Indicates the maximum speculation depth of the instruction trace element stream. This is the maximum number of P0 elements in the trace element stream that can be speculative at any time.

**Accessing the TRCIDR8**

TRCIDR8 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x180</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
TRCIDR9, ID Register 9

The TRCIDR9 characteristics are:

**Purpose**

Returns the tracing capabilities of the trace unit.

**Configuration**

External register TRCIDR9 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR9[31:0]. This register is present only when ETE is implemented. Otherwise, direct accesses to TRCIDR9 are RES0.

**Attributes**

TRCIDR9 is a 32-bit register.

**Field descriptions**

The TRCIDR9 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**NUMP0KEY, bits [31:0]**

When TRCIDR0.TRCDATA != 0b00:

Indicates the number of P0 right-hand keys. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

Otherwise:

Reserved, RES0.

**Accessing the TRCIDR9**

TRCIDR9 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x184</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
TRCIMSPEC0, IMP DEF Register 0

The TRCIMSPEC0 characteristics are:

**Purpose**

TRCIMSPEC0 shows the presence of any IMPLEMENTATION DEFINED features, and provides an interface to enable the features that are provided.

**Configuration**

External register TRCIMSPEC0 bits [31:0] are architecturally mapped to AArch64 System register TRCIMSPEC0[31:0].

Some or all RW fields of this register have defined reset values.

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCIMSPEC0 are RES0.

**Attributes**

TRCIMSPEC0 is a 32-bit register.

**Field descriptions**

The TRCIMSPEC0 bit assignments are:

| Bit 31 | Bit 30 | Bit 29 | Bit 28 | Bit 27 | Bit 26 | Bit 25 | Bit 24 | Bit 23 | Bit 22 | Bit 21 | Bit 20 | Bit 19 | Bit 18 | Bit 17 | Bit 16 | Bit 15 | Bit 14 | Bit 13 | Bit 12 | Bit 11 | Bit 10 | Bit 9 | Bit 8 | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |

<td>The trace unit behavior is IMPLEMENTATION DEFINED.</td>
</tr>
<tr>
<td>0b1110</td>
<td>The trace unit behavior is IMPLEMENTATION DEFINED.</td>
</tr>
<tr>
<td>0b1111</td>
<td>The trace unit behavior is IMPLEMENTATION DEFINED.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to 0.
Otherwise:

Reserved, RES0.

**SUPPORT, bits [3:0]**

Indicates whether the implementation supports IMPLEMENTATION DEFINED features.

<table>
<thead>
<tr>
<th>SUPPORT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No IMPLEMENTATION DEFINED features are supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>IMPLEMENTATION DEFINED features are supported.</td>

</tr>
<tr>
<td>0b1111</td>
<td>IMPLEMENTATION DEFINED features are supported.</td>
</tr>
</tbody>
</table>

Use of nonzero values requires written permission from Arm.

Access to this field is **RO**.

**Accessing the TRCIMSPEC0**

**TRCIMSPEC0 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x1C0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.
TRCIMSPEC<n>, IMP DEF Register <n>, n = 1 - 7

The TRCIMSPEC<n> characteristics are:

**Purpose**

These registers might return information that is specific to an implementation, or enable features specific to an implementation to be programmed. The product Technical Reference Manual describes these registers.

**Configuration**

External register TRCIMSPEC<n> bits [31:0] are architecturally mapped to AArch64 System register TRCIMSPEC<n>[31:0].

This register is present only when the trace unit implements this OPTIONAL register and ETE is implemented. Otherwise, direct accesses to TRCIMSPEC<n> are RES0.

**Attributes**

TRCIMSPEC<n> is a 32-bit register.

**Field descriptions**

The TRCIMSPEC<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | | | | |

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED, IMPLEMENTATION_DEFINED.

This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

**Accessing the TRCIMSPEC<n>**

TRCIMSPEC<n> can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x1C0 + 4n</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
The TRCITCTRL characteristics are:

**Purpose**

A component can use TRCITCTRL to dynamically switch between functional mode and integration mode. In integration mode, topology detection is enabled. After switching to integration mode and performing integration tests or topology detection, reset the system to ensure correct behavior of CoreSight and other connected system components.

For additional information see the CoreSight Architecture Specification.

**Configuration**

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCITCTRL are **RES0**.

There are no configuration notes.

**Attributes**

TRCITCTRL is a 32-bit register.

**Field descriptions**

The TRCITCTRL bit assignments are:

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
   RES0 IME
```

**Bits [31:1]**

Reserved, **RES0**.

**IME, bit [0]**

Integration Mode Enable.

<table>
<thead>
<tr>
<th>IME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The component must enter functional mode.</td>
</tr>
<tr>
<td>0b1</td>
<td>The component must enter integration mode, and enable support for topology detection and integration testing.</td>
</tr>
</tbody>
</table>

This bit is **RES0** if no topology detection or integration functionality is implemented.

**Accessing the TRCITCTRL**

External debugger accesses to this register are **IMPLEMENTATION DEFINED** when the trace unit is not in the Idle state.

**TRCITCTRL can be accessed through the external debug interface:**

```
<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xF00</td>
</tr>
</tbody>
</table>
```

This interface is accessible as follows:
• When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
• Otherwise accesses to this register are RW.
TRCLAR, Lock Access Register

The TRCLAR characteristics are:

Purpose

Used to lock and unlock the Software Lock.

Note that ETE does not implement the Software Lock.

For additional information see the CoreSight Architecture Specification.

Configuration

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCLAR are RES0.

There are no configuration notes.

Attributes

TRCLAR is a 32-bit register.

Field descriptions

The TRCLAR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| KEY |

KEY, bits [31:0]

When the Software Lock is implemented:

Software Lock Key.

A value of 0xC5ACCE55 unlocks the Software Lock.

Any other value locks the Software Lock.

Otherwise:

Reserved, RES0.

Accessing the TRCLAR

External debugger accesses to this register are unaffected by the OS Lock.

TRCLAR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFB0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are WO.
TRCLSR, Lock Status Register

The TRCLSR characteristics are:

**Purpose**

Indicates whether the Software Lock is implemented, and the current status of the Software Lock.

For additional information see the CoreSight Architecture Specification.

**Configuration**

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCLSR are RES0.

There are no configuration notes.

**Attributes**

TRCLSR is a 32-bit register.

**Field descriptions**

The TRCLSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>30</td>
<td>nTT</td>
<td>Software lock size.</td>
</tr>
<tr>
<td>29</td>
<td>SLK</td>
<td>The current Software Lock status.</td>
</tr>
<tr>
<td>28</td>
<td>0</td>
<td>0b0: Software Lock is unlocked. Writes to the other registers in this component, except for the TRCLAR, are ignored.</td>
</tr>
<tr>
<td>27</td>
<td>1</td>
<td>0b1: Software Lock is locked.</td>
</tr>
<tr>
<td>26</td>
<td>SLI</td>
<td>Indicates whether the Software Lock is implemented.</td>
</tr>
<tr>
<td>25</td>
<td>0</td>
<td>0b0: Software Lock is not implemented. Writes to the TRCLAR are ignored.</td>
</tr>
<tr>
<td>24</td>
<td>1</td>
<td>0b1: Software Lock is implemented.</td>
</tr>
</tbody>
</table>

This bit reads as zero.
This bit reads as zero.

**Accessing the TRCLSR**

External debugger accesses to this register are unaffected by the OS Lock.

**TRCLSR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFB4</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `!IsTraceCorePowered()` accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.
TRCOSLSR, Trace OS Lock Status Register

The TRCOSLSR characteristics are:

**Purpose**

Returns the status of the Trace OS Lock.

**Configuration**

External register TRCOSLSR bits [31:0] are architecturally mapped to AArch64 System register TRCOSLSR[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCOSLSR are RES0.

**Attributes**

TRCOSLSR is a 32-bit register.

**Field descriptions**

The TRCOSLSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>OSLM[2:1]</td>
</tr>
<tr>
<td>29</td>
<td>RES0</td>
</tr>
<tr>
<td>28</td>
<td>OSLK</td>
</tr>
<tr>
<td>27</td>
<td>RES0</td>
</tr>
<tr>
<td>26</td>
<td>OSLM[0]</td>
</tr>
</tbody>
</table>

**Bits [31:5]**

Reserved, RES0.

**OSLM[2:1], bits [4:3]**

This field is bits[2:1] of OSLM[2:0].

OS Lock model.

<table>
<thead>
<tr>
<th>OSLM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Trace OS Lock is not implemented.</td>
</tr>
<tr>
<td>0b010</td>
<td>Trace OS Lock is implemented.</td>
</tr>
<tr>
<td>0b100</td>
<td>Trace OS Lock is not implemented, and the trace unit is controlled by the PE OS Lock.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b100.

The OSLM field is split as follows:

- OSLM[2:1] is TRCOSLSR[4:3].
- OSLM[0] is TRCOSLSR[0].

**Bit [2]**

Reserved, RES0.

**OSLK, bit [1]**

OS Lock status.
<table>
<thead>
<tr>
<th>OSLK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The OS Lock is unlocked.</td>
</tr>
<tr>
<td>0b1</td>
<td>The OS Lock is locked.</td>
</tr>
</tbody>
</table>

Note that this field indicates the state of the PE OS Lock.

**OSLM[0], bit [0]**

This field is bit[0] of OSLM[2:0].

See OSLM[2:1] for the field description.

**Accessing the TRCOSLSR**

External debugger accesses to this register are unaffected by the OS Lock.

**TRCOSLSR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x304</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
TRCPDCR, PowerDown Control Register

The TRCPDCR characteristics are:

**Purpose**

Requests the system to provide power to the trace unit.

**Configuration**

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCPDCR are RES0.

There are no configuration notes.

**Attributes**

TRCPDCR is a 32-bit register.

**Field descriptions**

The TRCPDCR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>

</tbody>
</table>

**PU, bit [3]**

Power Up Request.

<table>
<thead>
<tr>
<th>PU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The system can remove power from the trace unit core power domain, or requests for power to the trace unit core power domain are implemented outside of the trace unit.</td>
</tr>
<tr>
<td>0b1</td>
<td>The system must provide power to the trace unit core power domain.</td>
</tr>
</tbody>
</table>

This bit is RES0.

**Bits [2:0]**

Reserved, RES0.

**Accessing the TRCPDCR**

External debugger accesses to this register are unaffected by the OS Lock.

**TRCPDCR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x310</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When `!IsTraceCorePowered()` accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.
TRCPDSR, PowerDown Status Register

The TRCPDSR characteristics are:

**Purpose**

Indicates the power status of the trace unit.

**Configuration**

Some or all RW fields of this register have defined reset values.

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCPDSR are RES0.

There are no configuration notes.

**Attributes**

TRCPDSR is a 32-bit register.

**Field descriptions**

The TRCPDSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RES0</td>
</tr>
</tbody>
</table>

**Bits [31:6]**

Reserved, RES0.

**OSLK, bit [5]**

OS Lock Status.

<table>
<thead>
<tr>
<th>OSLK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The OS Lock is unlocked.</td>
</tr>
<tr>
<td>0b1</td>
<td>The OS Lock is locked.</td>
</tr>
</tbody>
</table>

Note that this field indicates the state of the PE OS Lock.

**Bits [4:2]**

Reserved, RES0.

**STICKYPD, bit [1]**

Sticky powerdown status. Indicates whether the trace register state is valid.

<table>
<thead>
<tr>
<th>STICKYPD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The state of TRCOSLSR and the trace registers are valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The state of TRCOSLSR and the trace registers might not be valid.</td>
</tr>
</tbody>
</table>

This field is set to 0b1 if the power to the trace unit core power domain is removed and the trace unit register state is not valid.
The STICKYPD field is read-sensitive. On a read of the TRCPDSR, this field is cleared to 0b0 after the register has been read.

On a Trace unit reset, this field resets to 1.

**POWER, bit [0]**

Power Status.

<table>
<thead>
<tr>
<th>POWER</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit core power domain is not powered. All trace unit registers are not accessible and they all return an error response.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit core power domain is powered. Trace unit registers are accessible.</td>
</tr>
</tbody>
</table>

Access to this field is RAO.

### Accessing the TRCPDSR

External debugger accesses to this register are unaffected by the OS Lock.

**TRCPDSR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x314</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
TRCPIDR0, Peripheral Identification Register 0

The TRCPIDR0 characteristics are:

**Purpose**

Provides discovery information for the component.

For additional information see the CoreSight Architecture Specification.

**Configuration**

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCPIDR0 are RES0.

There are no configuration notes.

**Attributes**

TRCPIDR0 is a 32-bit register.

**Field descriptions**

The TRCPIDR0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**RES0**

**PART_0**

**Bits [31:8]**

Reserved, RES0.

**PART_0, bits [7:0]**

IMPLEMENTATION DEFINED.

Part number, bits [7:0].

The part number is selected by the designer of the component, and is stored in TRCPIDR1 PART_1 and TRCPIDR0 PART_0.

This field reads as an IMPLEMENTATION DEFINED value.

**Accessing the TRCPIDR0**

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFE0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
The TRCPIDR1 characteristics are:

**Purpose**

Provides discovery information for the component.
For additional information see the CoreSight Architecture Specification.

**Configuration**

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCPIDR1 are RES0.
There are no configuration notes.

**Attributes**

TRCPIDR1 is a 32-bit register.

**Field descriptions**

The TRCPIDR1 bit assignments are:

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |
| DES_0|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |
| PART_1|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

**Bits [31:8]**

Reserved, RES0.

**DES_0, bits [7:4]**

IMPLEMENTATION DEFINED.

Designer, JEP106 identification code, bits [3:0]. TRCPIDR1.DES_0 and TRCPIDR2.DES_1 together form the JEDEC-assigned JEP106 identification code for the designer of the component. The parity bit in the JEP106 identification code is not included. The code identifies the designer of the component, which might not be not the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

Note that for a component designed by Arm Limited, the JEP106 identification code is 0x3B.

This field reads as an IMPLEMENTATION DEFINED value.

**PART_1, bits [3:0]**

IMPLEMENTATION DEFINED.

Part number, bits [11:8].

This field reads as an IMPLEMENTATION DEFINED value.

**Accessing the TRCPIDR1**

External debugger accesses to this register are unaffected by the OS Lock.
TRCPIDR1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFE4</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `!IsTraceCorePowered()` accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
TRCPIDR2, Peripheral Identification Register 2

The TRCPIDR2 characteristics are:

**Purpose**

Provides discovery information for the component.

For additional information see the CoreSight Architecture Specification.

**Configuration**

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCPIDR2 are RES0.

There are no configuration notes.

**Attributes**

TRCPIDR2 is a 32-bit register.

**Field descriptions**

The TRCPIDR2 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | REVISION | JEDEC | DES_1 |

**Bits [31:8]**

Reserved, RES0.

**REVISION, bits [7:4]**

IMPLEMENTATION DEFINED.

Component major revision. TRCPIDR2.REVISION and TRCPIDR3.REVAND together form the revision number of the component, with REVISION being the most significant part and REVAND the least significant part. When a component is changed, REVISION or REVAND must be increased to ensure that software can differentiate the different revisions of the component. If REVISION is increased then REVAND should be set to 0.

This field reads as an IMPLEMENTATION DEFINED value.

**JEDEC, bit [3]**

JEDEC-assigned JEP106 implementer code is used.

This bit reads as one.

**DES_1, bits [2:0]**

IMPLEMENTATION DEFINED.

Designer, JEP106 identification code, bits [6:4]. TRCPIDR1.DES_0 and TRCPIDR2.DES_1 together form the JEDEC-assigned JEP106 identification code for the designer of the component. The parity bit in the JEP106 identification code is not included. The code identifies the designer of the component, which might not be not the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.
Note that for a component designed by Arm Limited, the JEP106 identification code is 0x3B. This field reads as an IMPLEMENTATION DEFINED value.

## Accessing the TRCPIDR2

External debugger accesses to this register are unaffected by the OS Lock.

**TRCPIDR2 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFE8</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.
TRCPIDR3, Peripheral Identification Register 3

The TRCPIDR3 characteristics are:

**Purpose**

Provides discovery information for the component.

For additional information see the CoreSight Architecture Specification.

**Configuration**

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCPIDR3 are 
RES0.

There are no configuration notes.

**Attributes**

TRCPIDR3 is a 32-bit register.

**Field descriptions**

The TRCPIDR3 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**RES0**

Reserved, RES0.

**REVAND, bits [7:4]**

IMPLEMENTATION DEFINED.

Component minor revision. TRCPIDR2.REVISION and TRCPIDR3.REVAND together form the revision number of the component, with REVISION being the most significant part and REVAND the least significant part. When a component is changed, REVISION or REVAND must be increased to ensure that software can differentiate the different revisions of the component. If REVISION is increased then REVAND should be set to 0.

This field reads as an IMPLEMENTATION DEFINED value.

**CMOD, bits [3:0]**

IMPLEMENTATION DEFINED.

Customer Modified.

Indicates the component has been modified.

A value of 0b0000 means the component is not modified from the original design.

Any other value means the component has been modified in an IMPLEMENTATION DEFINED way.

For any two components with the same Unique Component Identifier:

- If the value of the CMOD fields of both components equals zero, the components are identical.
- If the CMOD fields of both components have the same non-zero value, it does not necessarily mean that they have the same modifications.
If the value of the CMOD field of either of the two components is non-zero, they might not be identical, even though they have the same Unique Component Identifier.

This field reads as an IMPLEMENTATION DEFINED value.

Accessing the TRCPIDR3

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR3 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>$0xFEC</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
TRCPIDR4, Peripheral Identification Register 4

The TRCPIDR4 characteristics are:

**Purpose**

Provides discovery information for the component.

For additional information see the CoreSight Architecture Specification.

**Configuration**

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCPIDR4 are RES0.

There are no configuration notes.

**Attributes**

TRCPIDR4 is a 32-bit register.

**Field descriptions**

The TRCPIDR4 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | SIZE | DES_2 |

**Bits [31:8]**

Reserved, RES0.

**SIZE, bits [7:4]**

IMPLEMENTATION DEFINED.

Size of the component.

The distance from the start of the address space used by this component to the end of the component identification registers.

A value of 0b0000 means one of the following is true:

- The component uses a single 4KB block.
- The component uses an IMPLEMENTATION DEFINED number of 4KB blocks.

Any other value means the component occupies \(2^{\text{SIZE}}\) 4KB blocks.

Using this field to indicate the size of the component is deprecated. This field might not correctly indicate the size of the component. Arm recommends that software determine the size of the component from the Unique Component Identifier fields, and other IMPLEMENTATION DEFINED registers in the component.

This field reads as 0b0000.

**DES_2, bits [3:0]**

IMPLEMENTATION DEFINED.

Designer, JEP106 continuation code. This is the JEDEC-assigned JEP106 bank identifier for the designer of the component, minus 1. The code identifies the designer of the component, which might not be not the same as the
implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

Note that for a component designed by Arm Limited, the JEP106 bank is 5, meaning this field has the value 0x4. This field reads as an IMPLEMENTATION DEFINED value.

**Accessing the TRCPIDR4**

External debugger accesses to this register are unaffected by the OS Lock.

**TRCPIDR4 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFD0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
The TRCPIDR5 characteristics are:

**Purpose**

Provides discovery information for the component.

For additional information see the CoreSight Architecture Specification.

**Configuration**

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCPIDR5 are RES0.

There are no configuration notes.

**Attributes**

TRCPIDR5 is a 32-bit register.

**Field descriptions**

The TRCPIDR5 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td></td>
</tr>

<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Reserved, RES0.

**Accessing the TRCPIDR5**

External debugger accesses to this register are unaffected by the OS Lock.

**TRCPIDR5 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFD4</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
**TRCPIDR6, Peripheral Identification Register 6**

The TRCPIDR6 characteristics are:

**Purpose**

Provides discovery information for the component.

For additional information see the CoreSight Architecture Specification.

**Configuration**

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCPIDR6 are RES0.

There are no configuration notes.

**Attributes**

TRCPIDR6 is a 32-bit register.

**Field descriptions**

The TRCPIDR6 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:0]</th>
<th>RES0</th>
</tr>
</thead>
</table>

Reserved, RES0.

**Accessing the TRCPIDR6**

External debugger accesses to this register are unaffected by the OS Lock.

**TRCPIDR6 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFD8</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
TRCPIDR7, Peripheral Identification Register 7

The TRCPIDR7 characteristics are:

**Purpose**

Provides discovery information for the component.

For additional information see the CoreSight Architecture Specification.

**Configuration**

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCPIDR7 are RES0.

There are no configuration notes.

**Attributes**

TRCPIDR7 is a 32-bit register.

**Field descriptions**

The TRCPIDR7 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 |

**Bits [31:0]**

Reserved, RES0.

**Accessing the TRCPIDR7**

External debugger accesses to this register are unaffected by the OS Lock.

**TRCPIDR7 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0xFD0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
TRCPRGCTRLR, Programming Control Register

The TRCPRGCTRLR characteristics are:

Purpose

Enables the trace unit.

Configuration

External register TRCPRGCTRLR bits [31:0] are architecturally mapped to AArch64 System register TRCPRGCTRLR[31:0].

Some or all RW fields of this register have defined reset values.

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCPRGCTRLR are RES0.

Attributes

TRCPRGCTRLR is a 32-bit register.

Field descriptions

The TRCPRGCTRLR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>29</td>
<td>EN, bit [0]</td>
</tr>
<tr>
<td>28</td>
<td>Trace unit enable</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>EN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit is enabled.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to 0.

Accessing the TRCPRGCTRLR

Must be programmed.

TRCPRGCTRLR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x004</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
TRCQCTLR, Q Element Control Register

The TRCQCTLR characteristics are:

Purpose

Controls when Q elements are enabled.

Configuration

External register TRCQCTLR bits [31:0] are architecturally mapped to AArch64 System register TRCQCTLR[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when ETE is implemented and TRCIDR0.QFILT == 0b1. Otherwise, direct accesses to TRCQCTLR are RES0.

Attributes

TRCQCTLR is a 32-bit register.

Field descriptions

The TRCQCTLR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved,RES0</td>
</tr>
<tr>
<td>30</td>
<td>MODE</td>
</tr>
<tr>
<td>29</td>
<td>RANGE&lt;m&gt;, bit [m]</td>
</tr>
</tbody>
</table>

Bits [31:9]

Reserved, RES0.

MODE, bit [8]

Selects whether the Address Range Comparators selected by the RANGE field indicate address ranges where the trace unit is permitted to generate Q elements or address ranges where the trace unit is not permitted to generate Q elements:

<table>
<thead>
<tr>
<th>MODE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Exclude mode. The Address Range Comparators selected by the RANGE field indicate address ranges where the trace unit must not generate Q elements. If no ranges are selected, Q elements are permitted across the entire memory map.</td>
</tr>
<tr>
<td>0b1</td>
<td>Include Mode. The Address Range Comparators selected by the RANGE field indicate address ranges where the trace unit can generate Q elements. If all the implemented bits in RANGE are set to 0b0 then Q elements are disabled.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RANGE<m>, bit [m], for m = 0 to 7

Specifies the Address Range Comparators to be used for controlling Q elements.
<table>
<thead>
<tr>
<th>RANGE&lt;\textit{m}&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0\texttt{b0}</td>
<td>The address range that Address Range Comparator \textit{m} defines, is not selected.</td>
</tr>
<tr>
<td>0\texttt{b1}</td>
<td>The address range that Address Range Comparator \textit{m} defines, is selected.</td>
</tr>
</tbody>
</table>

This bit is \texttt{RES0} if \textit{m} \geq \texttt{TRCIDR4.NUMACPAIRS}.

On a Trace unit reset, this field resets to an architecturally \texttt{UNKNOWN} value.

**Accessing the TRCQCTRL**

Must be programmed if \texttt{TRCCONFIGR. QE} \neq \texttt{0b00}.

Writes are \texttt{CONSTRAINED UNPREDICTABLE} if the trace unit is not in the Idle state.

**TRCQCTRL can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x044</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When \texttt{!AllowExternalTraceAccess()}, or \texttt{OSLockStatus()} or \texttt{!IsTraceCorePowered()} accesses to this register generate an error response.
- Otherwise accesses to this register are \texttt{RW}.
The TRCRSCTRL<n> characteristics are:

**Purpose**

Controls the selection of the resources in the trace unit.

**Configuration**

External register TRCRSCTRL<n> bits [31:0] are architecturally mapped to AArch64 System register TRCRSCTRL<n>[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when ETE is implemented and ( ( ext-TRCIDR4.NUMRSPAIR + 1 ) * 2 ) > n. Otherwise, direct accesses to TRCRSCTRL<n> are RES0.

Resource selector 0 always returns FALSE.

Resource selector 1 always returns TRUE.

Resource selectors are implemented in pairs. Each odd numbered resource selector is part of a pair with the even numbered resource selector that is numbered as one less than it. For example, resource selectors 2 and 3 form a pair.

**Attributes**

TRCRSCTRL<n> is a 32-bit register.

**Field descriptions**

The TRCRSCTRL<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | PAIRINV | INV | GROUP | SELECT |

**Bits [31:22]**

Reserved, RES0.

**PAIRINV, bit [21]**

For TRCRSCTRL<n>, where n is even, controls whether the combined result from a resource selector pair is inverted.

<table>
<thead>
<tr>
<th>PAIRINV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not invert the combined output of the 2 resource selectors.</td>
</tr>
<tr>
<td>0b1</td>
<td>Invert the combined output of the 2 resource selectors.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**INV, bit [20]**

Controls whether the resource, that GROUP and SELECT selects, is inverted.
**INV**

<table>
<thead>
<tr>
<th><strong>Meaning</strong></th>
<th><strong>INV</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Do not invert the output of this selector.</td>
<td>0b0</td>
</tr>
<tr>
<td>Invert the output of this selector.</td>
<td>0b1</td>
</tr>
</tbody>
</table>

If:

- A is the register TRCRSCTLR<m> where m is even.
- B is the register TRCRSCTLR<m+1>.

Then the combined output of the 2 resource selectors A and B depends on the value of (A.PAIRINV, A.INV, B.INV) as follows:

- 0b000 -> A and B.
- 0b001 -> RESERVED.
- 0b010 -> not(A) and B.
- 0b011 -> not(A) and not(B).
- 0b100 -> not(A) or not(B).
- 0b101 -> not(A) or B.
- 0b110 -> RESERVED.
- 0b111 -> A or B.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**GROUP, bits [19:16]**

Selects a group of resources.

<table>
<thead>
<tr>
<th><strong>GROUP</strong></th>
<th><strong>Meaning</strong></th>
<th><strong>SELECT</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>External Input Selectors.</td>
<td>SELECT encoding for External Input Selectors</td>
</tr>
<tr>
<td>0b0001</td>
<td>PE Comparator Inputs.</td>
<td>SELECT encoding for PE Comparator Inputs</td>
</tr>
<tr>
<td>0b0010</td>
<td>Counters and Sequencer.</td>
<td>SELECT encoding for Counters and Sequencer</td>
</tr>
<tr>
<td>0b0011</td>
<td>Single-shot Comparator Controls.</td>
<td>SELECT encoding for Single Comparator Controls</td>
</tr>
<tr>
<td>0b0100</td>
<td>Single Address Comparators.</td>
<td>SELECT encoding for Single Address Comparators</td>
</tr>
<tr>
<td>0b0101</td>
<td>Address Range Comparators.</td>
<td>SELECT encoding for Address Range Comparators</td>
</tr>
<tr>
<td>0b0110</td>
<td>Context Identifier Comparators.</td>
<td>SELECT encoding for Context Identifier Comparators</td>
</tr>
<tr>
<td>0b0111</td>
<td>Virtual Context Identifier Comparators.</td>
<td>SELECT encoding for Virtual Context Identifier Comparators</td>
</tr>
</tbody>
</table>

All other values are reserved.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**SELECT, bits [15:0]**

Resource Specific Controls. Contains the controls specific to the resource group selected by GROUP, described in the following sections.

**SELECT encoding for External Input Selectors**

<table>
<thead>
<tr>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>

**Accessing the TRCRSCTLR\(<n>\)**

Must be programmed if any of the following are true:

- TRCCNTCTRL\(<a>\).RLDEVENT.TYPE == 0b0 and TRCCNTCTRL\(<a>\).RLDEVENT.SEL == n.
- TRCCNTCTRL\(<a>\).RLDEVENT.TYPE == 0b1 and TRCCNTCTRL\(<a>\).RLDEVENT.SEL == n/2.
- TRCCNTCTRL\(<a>\).CNTEVENT.TYPE == 0b0 and TRCCNTCTRL\(<a>\).CNTEVENT.SEL == n.
- TRCCNTCTRL\(<a>\).CNTEVENT.TYPE == 0b1 and TRCCNTCTRL\(<a>\).CNTEVENT.SEL == n/2.
- TRCEVENTCTL0R.EVENT0.TYPE == 0b0 and TRCEVENTCTL0R.EVENT0.SEL == n.
- TRCEVENTCTL0R.EVENT0.TYPE == 0b1 and TRCEVENTCTL0R.EVENT0.SEL == n/2.
- TRCEVENTCTL0R.EVENT1.TYPE == 0b0 and TRCEVENTCTL0R.EVENT1.SEL == n.
- TRCEVENTCTL0R.EVENT1.TYPE == 0b1 and TRCEVENTCTL0R.EVENT1.SEL == n/2.
- TRCEVENTCTL0R.EVENT2.TYPE == 0b0 and TRCEVENTCTL0R.EVENT2.SEL == n.
- TRCEVENTCTL0R.EVENT2.TYPE == 0b1 and TRCEVENTCTL0R.EVENT2.SEL == n/2.
- TRCEVENTCTL0R.EVENT3.TYPE == 0b0 and TRCEVENTCTL0R.EVENT3.SEL == n.
- TRCEVENTCTL0R.EVENT3.TYPE == 0b1 and TRCEVENTCTL0R.EVENT3.SEL == n/2.
- TRCSEQEV\(<a>\).B.TYPE == 0b0 and TRCSEQEVR\(<a>\).B.SEL = n.
- TRCSEQEV\(<a>\).B.TYPE == 0b1 and TRCSEQEVR\(<a>\).B.SEL = n/2.
- TRCSEQEV\(<a>\).F.TYPE == 0b0 and TRCSEQEVR\(<a>\).F.SEL = n.
- TRCSEQEV\(<a>\).F.TYPE == 0b1 and TRCSEQEVR\(<a>\).F.SEL = n/2.
- TRCSEQRSTCTL0R.RST.TYPE == 0b0 and TRCSEQRSTEV\(<a>\).RST.SEL == n.
• **TRCSEQRSTEV**.RST.TYPE == 0b1 and **TRCSEQRSTEV**.RST.SEL == n/2.
• **TRCTSCTLR**.EVENT.TYPE == 0b0 and **TRCTSCTLR**.EVENT.SEL == n.
• **TRCTSCTLR**.EVENT.TYPE == 0b1 and **TRCTSCTLR**.EVENT.SEL == n/2.
• **TRCVICTLR**.EVENT.TYPE == 0b0 and **TRCVICTLR**.EVENT.SEL == n.
• **TRCVICTLR**.EVENT.TYPE == 0b1 and **TRCVICTLR**.EVENT.SEL == n/2.

Writes are **CONSTRAINED UNPREDICTABLE** if the trace unit is not in the Idle state.

****TRCRSCTLR<n> can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x200 + 4n</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
• Otherwise accesses to this register are **RW**.
The TRCRSR characteristics are:

**Purpose**

Use this to set, or read, the status of the resources.

**Configuration**

External register TRCRSR bits [31:0] are architecturally mapped to AArch64 System register TRCRSR[31:0]. RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCRSR are RES0.

**Attributes**

TRCRSR is a 32-bit register.

**Field descriptions**

The TRCRSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>TA</td>
</tr>
<tr>
<td>29</td>
<td>EVENT&lt;m&gt;, bit [m+8]</td>
</tr>
<tr>
<td>28</td>
<td>RES0</td>
</tr>
<tr>
<td>27</td>
<td>EXTIN&lt;m&gt;, bit [m]</td>
</tr>
</tbody>
</table>

**Bits [31:13]**

Reserved, RES0.

**TA, bit [12]**

Tracing active.

<table>
<thead>
<tr>
<th>TA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Tracing is not active.</td>
</tr>
<tr>
<td>0b1</td>
<td>Tracing is active.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**EVENT<m>, bit [m+8], for m = 0 to 3**

Untraced status of ETEEEvents.

<table>
<thead>
<tr>
<th>EVENT&lt;m&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An ETEEEvent[n] has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>An ETEEEvent[n] has occurred while the resources were in the Paused state.</td>
</tr>
</tbody>
</table>

This bit is RES0 if TRCIDR4.NUMRSPAIR == 0 || m > TRCIDR0.NUMEVENT.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
Reserved, RES0.

EXTIN<m>, bit [m], for m = 0 to 3

The sticky status of the External Input Selectors.

<table>
<thead>
<tr>
<th>EXTIN&lt;m&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An event selected by External Input Selector[n] has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>At least one event selected by External Input Selector[n] has occurred while the resources were in the Paused state.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= TRCIDR5.NUMEXTINSEL.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing the TRCRSR

Must always be programmed.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

TRCRSR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x028</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
TRCSEQEVR<n>, Sequencer State Transition Control Register <n>, n = 0 - 2

The TRCSEQEVR<n> characteristics are:

**Purpose**

Moves the Sequencer state:

- Backwards, from state n+1 to state n when a programmed resource event occurs.
- Forwards, from state n to state n+1 when a programmed resource event occurs.

**Configuration**

External register TRCSEQEVR<n> bits [31:0] are architecturally mapped to AArch64 System register TRCSEQEVR<n>[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when ETE is implemented and TRCIDR5.NUMSEQSTATE != 0b000. Otherwise, direct accesses to TRCSEQEVR<n> are RES0.

**Attributes**

TRCSEQEVR<n> is a 32-bit register.

**Field descriptions**

The TRCSEQEVR<n> bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>B_TYPE[RES0]</td>
</tr>
<tr>
<td>29</td>
<td>B_SEL</td>
</tr>
<tr>
<td>28</td>
<td>F_TYPE[RES0]</td>
</tr>
<tr>
<td>27</td>
<td>F_SEL</td>
</tr>
<tr>
<td>26</td>
<td>Bits [31:16] Reserved, RES0.</td>
</tr>
</tbody>
</table>

**B_TYPE, bit [15]**

Chooses the type of Resource Selector.

Backward field. Defines whether the backward resource event is a single Resource Selector or a Resource Selector pair. When the resource event occurs then the Sequencer state moves from state n+1 to state n. For example, if TRCSEQEVR2.B.SEL == 0x14 then when event 0x14 occurs, the Sequencer moves from state 3 to state 2.

<table>
<thead>
<tr>
<th>B_TYPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A single Resource Selector. TRCSEQEVR&lt;n&gt;.B.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Boolean-combined pair of Resource Selectors. TRCSEQEVR&lt;n&gt;.B.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQEVR&lt;n&gt;.B.SEL[4] is RES0.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
**Bits [14:13]**

Reserved, RES0.

**B_SEL, bits [12:8]**

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQEVR<n>.B.TYPE controls whether TRCSEQEVR<n>.B.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Backward field. Selects the single Resource Selector or Resource Selector pair.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**F_TYPE, bit [7]**

Chooses the type of Resource Selector.

Backward field. Defines whether the forward resource event is a single Resource Selector or a Resource Selector pair.

When the resource event occurs then the Sequencer state moves from state n to state n+1. For example, if TRCSEQEVR1.F.SEL == 0x12 then when event 0x12 occurs, the Sequencer moves from state 1 to state 2.

<table>
<thead>
<tr>
<th>F_TYPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A single Resource Selector. TRCSEQEVR&lt;n&gt;.F.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Boolean-combined pair of Resource Selectors. TRCSEQEVR&lt;n&gt;.F.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQEVR&lt;n&gt;.F.SEL[4] is RES0.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Bits [6:5]**

Reserved, RES0.

**F_SEL, bits [4:0]**

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQEVR<n>.F.TYPE controls whether TRCSEQEVR<n>.F.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Forward field. Selects the single Resource Selector or Resource Selector pair.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCSEQEVR<n>**

Must be programmed if TRCRSCTLR<a>.GROUP == 0b0010 and TRCRSCTLR<a>.SEQUENCER != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

**TRCSEQEVR<n> can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x100 + 4n</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When `!AllowExternalTraceAccess()`, or `OSLockStatus()` or `!IsTraceCorePowered()` accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
The TRCSEQRSTEV register characteristics are:

**Purpose**

Moves the Sequencer to state 0 when a programmed resource event occurs.

**Configuration**

External register TRCSEQRSTEV bits [31:0] are architecturally mapped to AArch64 System register TRCSEQRSTEV[31:0].

RW fields in this register reset to architecturally unknown values.

This register is present only when ETE is implemented and TRCIDR5.NUMSEQSTATE != 0b000. Otherwise, direct accesses to TRCSEQRSTEV are 0.

**Attributes**

TRCSEQRSTEV is a 32-bit register.

**Field descriptions**

The TRCSEQRSTEV bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>7</td>
<td>RST_TYPE</td>
<td>Chooses the type of Resource Selector.</td>
</tr>
<tr>
<td>6:5</td>
<td>Reserved</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>4:0</td>
<td>RST_SEL</td>
<td>Defines the selected Resource Selector or pair of Resource Selectors.</td>
</tr>
</tbody>
</table>

- **RST_TYPE, bit [7]**
  - Choose the type of Resource Selector.
  - 
    - **0b0**: A single Resource Selector.
      - TRCSEQRSTEV.RST.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
    - **0b1**: A Boolean-combined pair of Resource Selectors.
      - TRCSEQRSTEV.RST.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQRSTEV.RST.SEL[4] is RES0.

  On a Trace unit reset, this field resets to an architecturally unknown value.

- **RST_SEL, bits [4:0]**
  - Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQRSTEV.RST.TYPE controls whether TRCSEQRSTEV.RST_SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.
If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing the TRCSEQRSTEV

Must be programmed if TCRSCTLRI<GROUP == 0b0010 and TCRSCTLRI<SEQUENCER != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCSEQRSTEV can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x118</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
TRCSEQSTR, Sequencer State Register

The TRCSEQSTR characteristics are:

**Purpose**

Use this to set, or read, the Sequencer state.

**Configuration**

External register TRCSEQSTR bits [31:0] are architecturally mapped to AArch64 System register TRCSEQSTR[31:0]. RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when ETE is implemented and TRCIDR5.NUMSEQSTATE != 0b000. Otherwise, direct accesses to TRCSEQSTR are RES0.

**Attributes**

TRCSEQSTR is a 32-bit register.

**Field descriptions**

The TRCSEQSTR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-2</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>1-0</td>
<td>STATE</td>
</tr>
</tbody>
</table>

- **STATE, bits [1:0]**
  - Set or returns the state of the Sequencer.
  - 0b00: State 0.
  - 0b01: State 1.
  - 0b10: State 2.
  - 0b11: State 3.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCSEQSTR**

Must be programmed if TRCRSCtrlR<a>.GROUP == 0b0010 and TRCRSCtrlR<a>.SEQUENCER != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

TRCSEQSTR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x11C</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When `!AllowExternalTraceAccess()`, or `OSLockStatus()` or `!IsTraceCorePowered()` accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.
TRCSSCCR<\n>, Single-shot Comparator Control Register \n, \n = 0 - 7

The TRCSSCCR<\n> characteristics are:

**Purpose**

Controls the corresponding Single-shot Comparator Control resource.

**Configuration**

External register TRCSSCCR<\n> bits [31:0] are architecturally mapped to AArch64 System register TRCSSCCR<\n>[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when ETE is implemented and TRCIDR4.NUMSSCC > \n. Otherwise, direct accesses to TRCSSCCR<\n> are RES0.

**Attributes**

TRCSSCCR<\n> is a 32-bit register.

**Field descriptions**

The TRCSSCCR<\n> bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>30</td>
<td>RST</td>
<td>Selects the Single-shot Comparator Control mode.</td>
</tr>
<tr>
<td>29</td>
<td>ARC&lt;m&gt;, bit [m+16]</td>
<td>Selects one or more Address Range Comparators for Single-shot control.</td>
</tr>
<tr>
<td>28</td>
<td>SAC&lt;m&gt;, bit [m]</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:25]**

Reserved, RES0.

**RST, bit [24]**

Selects the Single-shot Comparator Control mode.

<table>
<thead>
<tr>
<th>RST</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Single-shot Comparator Control is in single-shot mode.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Single-shot Comparator Control is in multi-shot mode.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**ARC<m>, bit [m+16], for \m = 0 to 7**

Selects one or more Address Range Comparators for Single-shot control.

<table>
<thead>
<tr>
<th>ARC&lt;m&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Address Range Comparator \m is not selected for Single-shot control.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Address Range Comparator \m is selected for Single-shot control.</td>
</tr>
</tbody>
</table>

This bit is RES0 if \m >= TRCIDR4.NUMACPAIRS.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
SAC<\textit{m}>, \textit{bit} \ [\textit{m}], \text{ for } \textit{m} = 0 \text{ to } 15

Selects one or more Single Address Comparators for Single-shot control.

<table>
<thead>
<tr>
<th>SAC&lt;\textit{m}&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Single Address Comparator \textit{m}, is not selected for Single-shot control.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Single Address Comparator \textit{m}, is selected for Single-shot control.</td>
</tr>
</tbody>
</table>

This bit is \textit{RES}0 if \textit{m} >= 2 \times \text{TRCIDR4.NUMACPAIRS}.

On a Trace unit reset, this field resets to an architecturally \textit{UNKNOWN} value.

**Accessing the TRCSSCCR<\textit{n}>**

Must be programmed if any TRCRSCTL<\textit{a}>.GROUP == 0b0011 and TRCRSCTL<\textit{a}>.SINGLE_SHOT<\textit{n}> == 0b1.

Writes are \textit{CONSTRAINED UNPREDICTABLE} if the trace unit is not in the Idle state.

**TRCSSCCR<\textit{n}> can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x280 + 4\textit{n}</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are \textit{RW}.

TRCSSCSR<n>, Single-shot Comparator Control Status Register <n>, n = 0 - 7

The TRCSSCSR<n> characteristics are:

**Purpose**

Returns the status of the corresponding Single-shot Comparator Control.

**Configuration**

External register TRCSSCSR<n> bits [31:0] are architecturally mapped to AArch64 System register TRCSSCSR<n>[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when ETE is implemented and TRCIDR4.NUMSSCC > n. Otherwise, direct accesses to TRCSSCSR<n> are RES0.

**Attributes**

TRCSSCSR<n> is a 32-bit register.

**Field descriptions**

The TRCSSCSR<n> bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>STATUS</td>
</tr>
<tr>
<td>30</td>
<td>PENDING</td>
</tr>

</tr>
<tr>
<td>27</td>
<td>DV</td>
</tr>
<tr>
<td>26</td>
<td>DA</td>
</tr>
<tr>
<td>25</td>
<td>INST</td>
</tr>
</tbody>
</table>

**STATUS, bit [31]**

Single-shot Comparator Control status. Indicates if any of the comparators selected by this Single-shot Comparator control have matched. The selected comparators are defined by TRCSSCCR<n>.ARC, TRCSSCCR<n>.SAC, and TRCSSPCICR<n>.PC.

<table>
<thead>
<tr>
<th>STATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No match has occurred. When the first match occurs, this field takes a value of 0b1. It remains at 0b1 until explicitly modified by a write to this register.</td>
</tr>
<tr>
<td>0b1</td>
<td>One or more matches has occurred. If TRCSSCCR&lt;n&gt;.RST == 0b0 then:</td>
</tr>
<tr>
<td></td>
<td>• There is only one match and no more matches are possible.</td>
</tr>
<tr>
<td></td>
<td>• Software must reset this bit to 0b0 to re-enable the Single-shot Comparator Control.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**PENDING, bit [30]**

Single-shot pending status. The Single-shot Comparator Control fired while the resources were in the Paused state.

<table>
<thead>
<tr>
<th>PENDING</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No match has occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>One or more matches has occurred.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
**Bits [29:4]**

Reserved, RES0.

**PC, bit [3]**

PE Comparator Input support. Indicates if the Single-shot Comparator Control supports PE Comparator Inputs.

<table>
<thead>
<tr>
<th>PC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This Single-shot Comparator Control does not support PE Comparator Inputs. Selecting any PE Comparator Inputs using the associated TRCSSPCICR&lt;n&gt; results in CONSTRAINED UNPREDICTABLE behavior of the Single-shot Comparator Control resource. The Single-shot Comparator Control might match unexpectedly or might not match.</td>
</tr>
<tr>
<td>0b1</td>
<td>This Single-shot Comparator Control supports PE Comparator Inputs.</td>
</tr>
</tbody>
</table>

Access to this field is **RO**.

**DV, bit [2]**

Data value comparator support. Data value comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

<table>
<thead>
<tr>
<th>DV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This Single-shot Comparator Control does not support data value comparisons.</td>
</tr>
<tr>
<td>0b1</td>
<td>This Single-shot Comparator Control supports data value comparisons.</td>
</tr>
</tbody>
</table>

This bit reads as 0b0.

Access to this field is **RO**.

**DA, bit [1]**

Data Address Comparator support. Data address comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

<table>
<thead>
<tr>
<th>DA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This Single-shot Comparator Control does not support data address comparisons.</td>
</tr>
<tr>
<td>0b1</td>
<td>This Single-shot Comparator Control supports data address comparisons.</td>
</tr>
</tbody>
</table>

This bit reads as 0b0.

Access to this field is **RO**.

**INST, bit [0]**

Instruction Address Comparator support. Indicates if the Single-shot Comparator Control supports instruction address comparisons.

<table>
<thead>
<tr>
<th>INST</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This Single-shot Comparator Control does not support instruction address comparisons.</td>
</tr>
<tr>
<td>0b1</td>
<td>This Single-shot Comparator Control supports instruction address comparisons.</td>
</tr>
</tbody>
</table>

This bit reads as 0b1.

Access to this field is **RO**.
**Accessing the TRCSSCSR<n>**

Must be programmed if TRCRSCTRL<n>.GROUP == 0b0011 and TRCRSCTRL<n>.SINGLE_SHOT[n] == 0b1.

Writes are **CONSTRAINED UNPREDICTABLE** if the trace unit is not in the Idle state.

Reads from this register might return an **UNKNOWN** value if the trace unit is not in either of the Idle or Stable states.

**TRCSSCSR<n> can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x2A0 + 4n</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.
The TRCSSPCICR<n> characteristics are:

**Purpose**

Returns the status of the corresponding Single-shot Comparator Control.

**Configuration**

External register TRCSSPCICR<n> bits [31:0] are architecturally mapped to AArch64 System register TRCSSPCICR<n>[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when ETE is implemented, TRCIDR4.NUMSSCC > n, TRCIDR4.NUMPC > 0b0000 and TRCSSCSR<n>.PC == 0b1. Otherwise, direct accesses to TRCSSPCICR<n> are RES0.

**Attributes**

TRCSSPCICR<n> is a 32-bit register.

**Field descriptions**

The TRCSSPCICR<n> bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>

<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PC<0>, bit [0], for m = 0 to 7**

Selects one or more PE Comparator Inputs for Single-shot control.

<table>
<thead>
<tr>
<th>PC&lt;0&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The single PE Comparator Input m, is not selected as for Single-shot control.</td>
</tr>
<tr>
<td>0b1</td>
<td>The single PE Comparator Input m, is selected as for Single-shot control.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= TRCIDR4.NUMPC.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCSSPCICR<n>**

Must be programmed if implemented and any TRCRSCTRL<a>.GROUP == 0b0011 and TRCRSCTRL<a>.SINGLE_SHOT[n] == 0b1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.
TRCSSPCICR<\n>, Single-shot Processing Element Comparator Input Control Register <\n>, \n = 0 - 7

TRCSSPCICR<\n> can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x2C0 + 4\n</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
TRCSTALLCTRL, Stall Control Register

The TRCSTALLCTRL characteristics are:

**Purpose**

Enables trace unit functionality that prevents trace unit buffer overflows.

**Configuration**

External register TRCSTALLCTRL bits [31:0] are architecturally mapped to AArch64 System register TRCSTALLCTRL[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when ETE is implemented and TRCIDR3.STALLCTL == 0b1. Otherwise, direct accesses to TRCSTALLCTRL are RES0.

**Attributes**

TRCSTALLCTRL is a 32-bit register.

**Field descriptions**

The TRCSTALLCTRL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | NOOVERFLOW | RES0 | [STALL] | RES0 | LEVEL |

**Bits [31:14]**

Reserved, RES0.

**NOOVERFLOW, bit [13]**

When TRCIDR3.NOOVERFLOW == 0b1:

Trace overflow prevention.

<table>
<thead>
<tr>
<th>NOOVERFLOW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Trace unit buffer overflow prevention is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trace unit buffer overflow prevention is enabled.</td>
</tr>
</tbody>
</table>

Note that enabling this feature might cause a significant performance impact.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [12:9]**

Reserved, RES0.
ISTALL, bit [8]

Instruction stall control. Controls if a trace unit can stall the PE when the trace buffer space is less than LEVEL.

<table>
<thead>
<tr>
<th>ISTALL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit must not stall the PE.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit can stall the PE.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally unknown value.

Bits [7:4]

Reserved, RES0.

LEVEL, bits [3:0]

Threshold level field. The field can support 16 monotonic levels from 0b0000 to 0b1111.

<table>
<thead>
<tr>
<th>LEVEL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Minimal invasion. This setting has a greater risk of a trace unit buffer overflow.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Maximum invasion. Reduced risk of a trace unit buffer overflow.</td>
</tr>
</tbody>
</table>

Note that for some implementations, invasion might occur at the minimal invasion level.

It is implementation defined whether some of the least significant bits are supported. Arm recommends that bits[3:2] are supported.

On a Trace unit reset, this field resets to an architecturally unknown value.

Accessing the TRCSTALLCTLR

Must be programmed if implemented.

Writes are constrained unpredictable if the trace unit is not in the Idle state.

TRCSTALLCTLR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x02C</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
The TRCSTATR characteristics are:

**Purpose**

Returns the trace unit status.

**Configuration**

External register TRCSTATR bits [31:0] are architecturally mapped to AArch64 System register TRCSTATR[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCSTATR are RES0.

**Attributes**

TRCSTATR is a 32-bit register.

**Field descriptions**

The TRCSTATR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved (RES0)</td>
</tr>
<tr>
<td>30</td>
<td>Reserved (RES0)</td>
</tr>
<tr>

<td>Reserved (RES0)</td>
</tr>
<tr>
<td>24</td>
<td>Reserved (RES0)</td>
</tr>
<tr>
<td>23</td>
<td>Reserved (RES0)</td>
</tr>
<tr>
<td>22</td>
<td>PMSTABLE</td>
</tr>
<tr>
<td>21</td>
<td>Idle status (IDLE)</td>
</tr>
</tbody>
</table>

**PMSTABLE, bit [1]**

Programmers' model stable.

<table>
<thead>
<tr>
<th>PMSTABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The programmers' model is not stable.</td>
</tr>
<tr>
<td>0b1</td>
<td>The programmers' model is stable.</td>
</tr>
</tbody>
</table>

This bit is **UNKNOWN** while the trace unit is enabled.

**IDLE, bit [0]**

Idle status.

<table>
<thead>
<tr>
<th>IDLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit is not idle.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit is idle.</td>
</tr>
</tbody>
</table>

**Accessing the TRCSTATR**

TRCSTATR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x00C</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
Otherwise accesses to this register are RO.
TRCSYNCPR, Synchronization Period Register

The TRCSYNCPR characteristics are:

**Purpose**

Controls how often trace protocol synchronization requests occur.

**Configuration**

External register TRCSYNCPR bits [31:0] are architecturally mapped to AArch64 System register `TRCSYNCPR[31:0]`. RW fields in this register reset to architecturally **UNKNOWN** values.

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCSYNCPR are res0.

**Attributes**

TRCSYNCPR is a 32-bit register.

**Field descriptions**

The TRCSYNCPR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| RES0 | PERIOD |

**Bits [31:5]**

Reserved, RES0.

**PERIOD, bits [4:0]**

Defines the number of bytes of trace between each periodic trace protocol synchronization request.
**PERIOD** | Meaning
---|---
0b00000 | Trace protocol synchronization is disabled.
0b01000 | Trace protocol synchronization request occurs after $2^8$ bytes of trace.
0b01001 | Trace protocol synchronization request occurs after $2^9$ bytes of trace.
0b01010 | Trace protocol synchronization request occurs after $2^{10}$ bytes of trace.
0b01011 | Trace protocol synchronization request occurs after $2^{11}$ bytes of trace.
0b01100 | Trace protocol synchronization request occurs after $2^{12}$ bytes of trace.
0b01101 | Trace protocol synchronization request occurs after $2^{13}$ bytes of trace.
0b01110 | Trace protocol synchronization request occurs after $2^{14}$ bytes of trace.
0b01111 | Trace protocol synchronization request occurs after $2^{15}$ bytes of trace.
0b10000 | Trace protocol synchronization request occurs after $2^{16}$ bytes of trace.
0b10001 | Trace protocol synchronization request occurs after $2^{17}$ bytes of trace.
0b10010 | Trace protocol synchronization request occurs after $2^{18}$ bytes of trace.
0b10011 | Trace protocol synchronization request occurs after $2^{19}$ bytes of trace.
0b10100 | Trace protocol synchronization request occurs after $2^{20}$ bytes of trace.

Other values are reserved. If a reserved value is programmed into PERIOD, then the behavior of the synchronization period counter is CONSTRAINED UNPREDICTABLE and one of the following behaviors occurs:

- No trace protocol synchronization requests are generated by this counter.
- Trace protocol synchronization requests occur at the specified period.
- Trace protocol synchronization requests occur at some other UNKNOWN period which can vary.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCSYNCPR**

Must be programmed if TRC1DR3.SYNCPR == 0b0.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

**TRCSYNCPR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x034</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.
TRCTRACEIDR, Trace ID Register

The TRCTRACEIDR characteristics are:

**Purpose**

Sets the trace ID for instruction trace.

**Configuration**

External register TRCTRACEIDR bits [31:0] are architecturally mapped to AArch64 System register TRCTRACEIDR[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when ETE is implemented and TRCIDR5.TRACEIDSIZE != 0x00. Otherwise, direct accesses to TRCTRACEIDR are RES0.

**Attributes**

TRCTRACEIDR is a 32-bit register.

**Field descriptions**

The TRCTRACEIDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
</tr>
</tbody>
</table>

**Bits [31:7]**

Reserved, RES0.

**TRACEID, bits [6:0]**

Trace ID field. Sets the trace ID value for instruction trace. The width of the field is indicated by the value of TRCIDR5.TRACEIDSIZE. Unimplemented bits are RES0.

If an implementation supports AMBA ATB, then:

- The width of the field is 7 bits.
- Writing a reserved trace ID value does not affect behavior of the trace unit but it might cause UNPREDICTABLE behavior of the trace capture infrastructure.

See the AMBA ATB Protocol Specification for information about which ATID values are reserved.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCTRACEIDR**

Must be programmed if implemented.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCTRACEIDR can be accessed through the external debug interface:
This interface is accessible as follows:

- When `!AllowExternalTraceAccess()`, or `OSLockStatus()` or `!IsTraceCorePowered()` accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.
The TRCTSCTRL characteristics are:

**Purpose**

Controls the insertion of global timestamps in the trace stream.

**Configuration**

External register TRCTSCTRL bits [31:0] are architecturally mapped to AArch64 System register TRCTSCTRL[31:0]. RW fields in this register reset to architecturally **UNKNOWN** values.

This register is present only when ETE is implemented and TRCIDR0.TSIZE != 0b00000. Otherwise, direct accesses to TRCTSCTRL are **RES0**.

**Attributes**

TRCTSCTRL is a 32-bit register.

**Field descriptions**

The TRCTSCTRL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>EVENT_TYPE</td>
</tr>
<tr>

</tr>
<tr>
<td>8</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>7</td>
<td>EVENT_TYPE, bit [7]</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**EVENT_TYPE, bit [7]**

Chooses the type of Resource Selector.

<table>
<thead>
<tr>
<th>EVENT_TYPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A single Resource Selector. TRCTSCTRL.EVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Boolean-combined pair of Resource Selectors. TRCTSCTRL.EVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCTSCTRL.EVENT.SEL[4] is RES0.</td>
</tr>
</tbody>
</table>

This bit is RES0 if TRCIDR4.NUMRSPAIR == 0b00000.

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [6:5]**

Reserved, RES0.
EVENT_SEL, bits [4:0]

Defines the selected Resource Selector or pair of Resource Selectors. TRCTSCTLR.EVENT.TYPE controls whether TRCTSCTLR.EVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire.

This field is RES0 if TRCIDR4.NUMRSPAIR == 0b0000.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing the TRCTSCTLR

Must be programmed if TRCCONFIGR.TS == 0b1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCTSCTLR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x030</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
TRCVICTLR, ViewInst Main Control Register

The TRCVICTLR characteristics are:

**Purpose**

Controls instruction trace filtering.

**Configuration**

External register TRCVICTLR bits [31:0] are architecturally mapped to AArch64 System register TRCVICTLR[31:0]. RW fields in this register reset to architecturally unknown values.

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCVICTLR are res0.

**Attributes**

TRCVICTLR is a 32-bit register.

**Field descriptions**

The TRCVICTLR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>

<td>EXLEVEL_S_EL0</td>
<td>RES0</td>
<td>TRCERR</td>
<td>SSSTATUS</td>
<td>RES0</td>
<td>EVENT_TYPE</td>
<td>RES0</td>
<td>EVENT_SEL</td>
</tr>
</tbody>
</table>

**Bits [31:23]**

Reserved, RES0.

**EXLEVEL_NS_EL2, bit [22]**

**When Non-secure EL2 is implemented:**

Filter instruction trace for EL2 in Non-secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_NS_EL2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>The trace unit generates instruction trace for EL2 in Non-secure state.</td>
</tr>
<tr>
<td>01</td>
<td>The trace unit does not generate instruction trace for EL2 in Non-secure state.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally unknown value.

**Otherwise:**

Reserved, RES0.

**EXLEVEL_NS_EL1, bit [21]**

**When Non-secure EL1 is implemented:**

Filter instruction trace for EL1 in Non-secure state.
Meaning

0b0  The trace unit generates instruction trace for EL1 in Non-secure state.
0b1  The trace unit does not generate instruction trace for EL1 in Non-secure state.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL0, bit [20]

When Non-secure EL0 is implemented:

Filter instruction trace for EL0 in Non-secure state.

Meaning

0b0  The trace unit generates instruction trace for EL0 in Non-secure state.
0b1  The trace unit does not generate instruction trace for EL0 in Non-secure state.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL3, bit [19]

When HaveEL(EL3):

Filter instruction trace for EL3 in Secure state.

Meaning

0b0  The trace unit generates instruction trace for EL3 in Secure state.
0b1  The trace unit does not generate instruction trace for EL3 in Secure state.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL2, bit [18]

When HaveEL(EL2) and ARMv8.4-SecEL2 is implemented:

Filter instruction trace for EL2 in Secure state.

Meaning

0b0  The trace unit generates instruction trace for EL2 in Secure state.
0b1  The trace unit does not generate instruction trace for EL2 in Secure state.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

**EXLEVEL_S_EL1, bit [17]**

When Secure EL1 is implemented:

Filter instruction trace for EL1 in Secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit generates instruction trace for EL1 in Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit does not generate instruction trace for EL1 in Secure state.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

**EXLEVEL_S_EL0, bit [16]**

When Secure EL0 is implemented:

Filter instruction trace for EL0 in Secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit generates instruction trace for EL0 in Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit does not generate instruction trace for EL0 in Secure state.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

**Bits [15:12]**

Reserved, RES0.

**TRCERR, bit [11]**

When TRCIDR3.TRCERR == 0b1:

Controls the forced tracing of System Error exceptions.

<table>
<thead>
<tr>
<th>TRCERR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Forced tracing of System Error exceptions is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Forced tracing of System Error exceptions is enabled.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.
TRCRESET, bit [10]

Controls the forced tracing of PE Resets.

<table>
<thead>
<tr>
<th>TRCRESET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Forced tracing of PE Resets is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Forced tracing of PE Resets is enabled.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SSSTATUS, bit [9]

ViewInst start/stop function status.

<table>
<thead>
<tr>
<th>SSSTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stopped State.</td>
</tr>
<tr>
<td></td>
<td>The ViewInst start/stop function is in the stopped state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Started State.</td>
</tr>
<tr>
<td></td>
<td>The ViewInst start/stop function is in the started state.</td>
</tr>
</tbody>
</table>

Before software enables the trace unit, it must write to this bit to set the initial state of the ViewInst start/stop function. If the ViewInst start/stop function is not used then set this bit to 0b1. Arm recommends that the value of this bit is set before each trace session begins.

If the trace unit becomes disabled while a start point or stop point is still speculative, then the value of TRCVICTLR_SSSTATUS is UNKNOWN and might represent the result of a speculative start point or stop point.

If software which is running on the PE being traced disables the trace unit, either by clearing TRCPGCTRL.EN or locking the OS Lock, Arm recommends that a DSB and an ISB instruction are executed before disabling the trace unit to prevent any start points or stop points being speculative at the point of disabling the trace unit. This procedure assumes that all start points or stop points occur before the barrier instructions are executed. The procedure does not guarantee that there are no speculative start points or stop points when disabling, although it helps minimize the probability.

This bit is res1 if TRCIDR4.NUMACPAIRS == 0b0000 and TRCIDR4.NUMPC == 0b0000.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, res0.

EVENT_TYPE, bit [7]

When TRCIDR4.NUMRSPAIR != 0b0000:

Chooses the type of Resource Selector.

<table>
<thead>
<tr>
<th>EVENT_TYPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A single Resource Selector. TRCVICTLR.EVENT_SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Boolean-combined pair of Resource Selectors. TRCVICTLR.EVENT_SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCVICTLR.EVENT_SEL[4] is res0.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, res0.
Bits [6:5]

Reserved, RES0.

**EVENT_SEL, bits [4:0]**

When TRCIDR4.NUMRSPAIR != 0b0000:

Defines the selected Resource Selector or pair of Resource Selectors. TRCVICTLR.EVENT.TYPE controls whether TRCVICTLR.EVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

When TRCIDR4.NUMRSPAIR == 0b0000:

This field is reserved:

- Bits [4:1] are RES0.
- Bit [0] is RES1.

Otherwise:

Reserved, RES0.

**Accessing the TRCVICTLR**

Must be programmed.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

**TRCVICTLR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x080</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
TRCVIIECTLR, ViewInst Include/Exclude Control Register

The TRCVIIECTLR characteristics are:

**Purpose**

Use this to select, or read, the Address Range Comparators for the ViewInst include/exclude function.

**Configuration**

External register TRCVIIECTLR bits [31:0] are architecturally mapped to AArch64 System register TRCVIIECTLR[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when ETE is implemented and TRCIDR4.NUMACPAIRS > 0b0000. Otherwise, direct accesses to TRCVIIECTLR are RES0.

**Attributes**

TRCVIIECTLR is a 32-bit register.

**Field descriptions**

The TRCVIIECTLR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | EXCLUDE<m>, bit [m+16] | RES0 | INCLUDE<m>, bit [m] |

**Bits [31:24]**

Reserved, RES0.

**EXCLUDE<m>, bit [m+16], for m = 0 to 7**

Selects which Address Range Comparators are in use with the ViewInst exclude function.

Each bit represents an Address Range Comparator, so bit[m] controls the selection of Address Range Comparator m.

<table>
<thead>
<tr>
<th>EXCLUDE&lt;m&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The address range that Address Range Comparator m defines, is not selected for the ViewInst exclude function.</td>
</tr>
<tr>
<td>0b1</td>
<td>The address range that Address Range Comparator m defines, is selected for the ViewInst exclude function.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= TRCIDR4.NUMACPAIRS.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Bits [15:8]**

Reserved, RES0.
**INCLUDE\(<m>\), bit [m], for m = 0 to 7**

Selects which Address Range Comparators are in use with the ViewInst include function.

Each bit represents an Address Range Comparator, so bit[m] controls the selection of Address Range Comparator m.

Selecting no comparators for the ViewInst include function indicates that all instructions are included by default.

The ViewInst exclude function then indicates which ranges are excluded.

<table>
<thead>
<tr>
<th>INCLUDE(&lt;m&gt;)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The address range that Address Range Comparator m defines, is not selected for the ViewInst include function.</td>
</tr>
<tr>
<td>0b1</td>
<td>The address range that Address Range Comparator m defines, is selected for the ViewInst include function.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m \(\geq\) TRCIDR4.NUMACPAIRS.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCVIIECTLR**

Must be programmed if TRCIDR4.NUMACPAIRS > 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

**TRCVIIECTLR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x084</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
TRCVIPCSSCTLR, ViewInst Start/Stop PE Comparator Control Register

The TRCVIPCSSCTLR characteristics are:

Purpose

Use this to select, or read, which PE Comparator Inputs can control the ViewInst start/stop function.

Configuration

External register TRCVIPCSSCTLR bits [31:0] are architecturally mapped to AArch64 System register TRCVIPCSSCTLR[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when ETE is implemented and TRCIDR4.NUMPC > 0b0000. Otherwise, direct accesses to TRCVIPCSSCTLR are RES0.

Attributes

TRCVIPCSSCTLR is a 32-bit register.

Field descriptions

The TRCVIPCSSCTLR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | STOP\langle m\rangle, \text{ bit } [m+16] | RES0 | START\langle m\rangle, \text{ bit } [m] |

Bits [31:24]

Reserved, RES0.

STOP\langle m\rangle, \text{ bit } [m+16], for \( m = 0 \) to 7

Selects which PE Comparator Inputs are in use with ViewInst start/stop function, for the purpose of stopping trace.

<table>
<thead>
<tr>
<th>STOP\langle m\rangle</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0\text{b}0</td>
<td>The PE Comparator Input ( m ), is not selected as a stop resource.</td>
</tr>
<tr>
<td>0\text{b}1</td>
<td>The PE Comparator Input ( m ), is selected as a stop resource.</td>
</tr>
</tbody>
</table>

This bit is RES0 if \( m \geq \text{ TRCIDR4}.\text{NUMPC} \).

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [15:8]

Reserved, RES0.

START\langle m\rangle, \text{ bit } [m], for \( m = 0 \) to 7

Selects which PE Comparator Inputs are in use with ViewInst start/stop function, for the purpose of starting trace.
Meaning

<table>
<thead>
<tr>
<th>START&lt;m&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The PE Comparator Input m, is not selected as a start resource.</td>
</tr>
<tr>
<td>0b1</td>
<td>The PE Comparator Input m, is selected as a start resource.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m ≥ TRCIDR4.NUMPC.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCVIPCSSCTRLR**

Must be programmed if TRCIDR4.NUMPC != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

**TRCVIPCSSCTRLR can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x08C</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
**TRCVISSCTLR, ViewInst Start/Stop Control Register**

The TRCVISSCTLR characteristics are:

**Purpose**

Use this to select, or read, the Single Address Comparators for the ViewInst start/stop function.

**Configuration**

External register TRCVISSCTLR bits [31:0] are architecturally mapped to AArch64 System register TRCVISSCTLR[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when ETE is implemented and TRCIDR4.NUMACPAIRS > 0b0000. Otherwise, direct accesses to TRCVISSCTLR are RES0.

**Attributes**

TRCVISSCTLR is a 32-bit register.

**Field descriptions**

The TRCVISSCTLR bit assignments are:

<table>
<thead>

<tr>
<td>0</td>
<td>STOP&lt;&gt;&lt; m&gt;, bit [m+16]</td>
<td>START&lt;&gt;&lt; m&gt;, bit [m]</td>
</tr>
</tbody>
</table>

**STOP<>< m>, bit [m+16], for m = 0 to 15**

Selects which Single Address Comparators are in use with ViewInst start/stop function, for the purpose of stopping trace.

<table>
<thead>
<tr>
<th>STOP&lt;&gt;&lt; m&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Single Address Comparator m, is not selected as a stop resource.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Single Address Comparator m, is selected as a stop resource.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= 2 × TRCIDR4.NUMACPAIRS.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**START<>< m>, bit [m], for m = 0 to 15**

Selects which Single Address Comparators are in use with ViewInst start/stop function, for the purpose of starting trace.

<table>
<thead>
<tr>
<th>START&lt;&gt;&lt; m&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Single Address Comparator m, is not selected as a start resource.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Single Address Comparator m, is selected as a start resource.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= 2 × TRCIDR4.NUMACPAIRS.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
Accessing the TRCVISSCTLR

Must be programmed if TRCIDR4.NUMACPAIRS > 0b0000.

For any 2 comparators selected for the ViewInst start/stop function, the comparator containing the lower address must be a lower numbered comparator.

Writes are constrained unpredictable if the trace unit is not in the Idle state.

TRCVISSCTLR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x088</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
TRCVMIDCCTLR0, Virtual Context Identifier Comparator Control Register 0

The TRCVMIDCCTLR0 characteristics are:

**Purpose**

Virtual Context Identifier Comparator mask values for the TRCVMIDCVR<\text{n}> registers, where \text{n}=0-3.

**Configuration**

External register TRCVMIDCCTLR0 bits [31:0] are architecturally mapped to AArch64 System register TRCVMIDCCTLR0[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when ETE is implemented, TRCIDR4.NUMVMIDC > 0x0 and TRCIDR2.VMIDSIZE > 0b00000. Otherwise, direct accesses to TRCVMIDCCTLR0 are RES0.

**Attributes**

TRCVMIDCCTLR0 is a 32-bit register.

**Field descriptions**

The TRCVMIDCCTLR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit assignment</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMP3&lt;m&gt;, bit [m+24]</td>
<td>When TRCIDR4.NUMVMIDC &gt; 3:</td>
</tr>
<tr>
<td>COMP2&lt;m&gt;, bit [m+16]</td>
<td>The trace unit includes TRCVMIDCVR3[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.</td>
</tr>
<tr>
<td>COMP1&lt;m&gt;, bit [m+8]</td>
<td>The trace unit ignores TRCVMIDCVR3[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.</td>
</tr>
<tr>
<td>COMP0&lt;m&gt;, bit [m]</td>
<td>This bit is RES0 if m &gt;= TRCIDR2.VMIDSIZE.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.
When TRCIDR4.NUMVMIDC > 2:

TRCVMIDCVR2 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR2. Each bit in this field corresponds to a byte in TRCVMIDCVR2.

<table>
<thead>
<tr>
<th>COMP2&lt;(m)&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCVMIDCVR2([(m\times8+7):(m\times8)]) when it performs the Virtual context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCVMIDCVR2([(m\times8+7):(m\times8)]) when it performs the Virtual context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is res0 if \(m \geq \text{TRCIDR2.VMIDSIZE}\).

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, res0.

When TRCIDR4.NUMVMIDC > 1:

TRCVMIDCVR1 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR1. Each bit in this field corresponds to a byte in TRCVMIDCVR1.

<table>
<thead>
<tr>
<th>COMP1&lt;(m)&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCVMIDCVR1([(m\times8+7):(m\times8)]) when it performs the Virtual context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCVMIDCVR1([(m\times8+7):(m\times8)]) when it performs the Virtual context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is res0 if \(m \geq \text{TRCIDR2.VMIDSIZE}\).

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, res0.

When TRCIDR4.NUMVMIDC > 0:

TRCVMIDCVR0 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR0. Each bit in this field corresponds to a byte in TRCVMIDCVR0.

<table>
<thead>
<tr>
<th>COMP0&lt;(m)&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCVMIDCVR0([(m\times8+7):(m\times8)]) when it performs the Virtual context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCVMIDCVR0([(m\times8+7):(m\times8)]) when it performs the Virtual context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is res0 if \(m \geq \text{TRCIDR2.VMIDSIZE}\).

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

Accessing the TRCVMIDCCTRL0

If software uses the TRCVMIDCVR<n> registers, where n=0-3, then it must program this register.

If software sets a mask bit to 0b1 then it must program the relevant byte in TRCVMIDCVR<n> to 0x00.

If any bit is 0b1 and the relevant byte in TRCVMIDCVR<n> is not 0x00, the behavior of the Virtual Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCVMIDCCTRL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x688</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
TRCVMIDCCTLR1, Virtual Context Identifier Comparator Control Register 1

The TRCVMIDCCTLR1 characteristics are:

**Purpose**

Virtual Context Identifier Comparator mask values for the TRCVMIDCVR<n> registers, where n=4-7.

**Configuration**

External register TRCVMIDCCTLR1 bits [31:0] are architecturally mapped to AArch64 System register TRCVMIDCCTLR1[31:0].

RW fields in this register reset to architecturally **UNKNOWN** values.

This register is present only when ETE is implemented, TRCIDR4.NUMVMIDC > 0x4 and TRCIDR2.VMIDSIZE > 0b00000. Otherwise, direct accesses to TRCVMIDCCTLR1 are **RES0**.

**Attributes**

TRCVMIDCCTLR1 is a 32-bit register.

**Field descriptions**

The TRCVMIDCCTLR1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>

</tbody>
</table>

**COMP7<m>, bit [m+24], for m = 0 to 7**

When TRCIDR4.NUMVMIDC > 7:

TRCVMIDCVR7 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR7. Each bit in this field corresponds to a byte in TRCVMIDCVR7.

<table>
<thead>
<tr>
<th>COMP7&lt;m&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCVMIDCVR7[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCVMIDCVR7[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is **RES0** if m >= TRCIDR2.VMIDSIZE.

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.
COMP6<\texttt{m}>, bit \([\texttt{m+16}]\), for \(\texttt{m} = 0\) to \(7\)

When \texttt{TRCIDR4.NUMVMIDC} > 6:

TRCVMIDCVR6 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR6. Each bit in this field corresponds to a byte in TRCVMIDCVR6.

<table>
<thead>
<tr>
<th>COMP6&lt;\texttt{m}&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0}</td>
<td>The trace unit includes TRCVMIDCVR6((\texttt{m}×8+7):(\texttt{m}×8)) when it performs the Virtual context identifier comparison.</td>
</tr>
<tr>
<td>\texttt{0b1}</td>
<td>The trace unit ignores TRCVMIDCVR6((\texttt{m}×8+7):(\texttt{m}×8)) when it performs the Virtual context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is \texttt{RES0} if \(\texttt{m} \geq \texttt{TRCIDR2.VMIDSIZE}\).

On a Trace unit reset, this field resets to an architecturally \texttt{UNKNOWN} value.

Otherwise:

Reserved, \texttt{RES0}.

COMP5<\texttt{m}>, bit \([\texttt{m+8}]\), for \(\texttt{m} = 0\) to \(7\)

When \texttt{TRCIDR4.NUMVMIDC} > 5:

TRCVMIDCVR5 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR5. Each bit in this field corresponds to a byte in TRCVMIDCVR5.

<table>
<thead>
<tr>
<th>COMP5&lt;\texttt{m}&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0}</td>
<td>The trace unit includes TRCVMIDCVR5((\texttt{m}×8+7):(\texttt{m}×8)) when it performs the Virtual context identifier comparison.</td>
</tr>
<tr>
<td>\texttt{0b1}</td>
<td>The trace unit ignores TRCVMIDCVR5((\texttt{m}×8+7):(\texttt{m}×8)) when it performs the Virtual context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is \texttt{RES0} if \(\texttt{m} \geq \texttt{TRCIDR2.VMIDSIZE}\).

On a Trace unit reset, this field resets to an architecturally \texttt{UNKNOWN} value.

Otherwise:

Reserved, \texttt{RES0}.

COMP4<\texttt{m}>, bit \([\texttt{m}]\), for \(\texttt{m} = 0\) to \(7\)

When \texttt{TRCIDR4.NUMVMIDC} > 4:

TRCVMIDCVR4 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR4. Each bit in this field corresponds to a byte in TRCVMIDCVR4.

<table>
<thead>
<tr>
<th>COMP4&lt;\texttt{m}&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0}</td>
<td>The trace unit includes TRCVMIDCVR4((\texttt{m}×8+7):(\texttt{m}×8)) when it performs the Virtual context identifier comparison.</td>
</tr>
<tr>
<td>\texttt{0b1}</td>
<td>The trace unit ignores TRCVMIDCVR4((\texttt{m}×8+7):(\texttt{m}×8)) when it performs the Virtual context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is \texttt{RES0} if \(\texttt{m} \geq \texttt{TRCIDR2.VMIDSIZE}\).

On a Trace unit reset, this field resets to an architecturally \texttt{UNKNOWN} value.
Otherwise:

Reserved, RES0.

### Accessing the TRCVMIDCCTRLR1

If software uses the TRCVMIDCVR<\text{n}> registers, where n=4-7, then it must program this register.

If software sets a mask bit to \text{0b1} then it must program the relevant byte in TRCVMIDCVR<\text{n}> to \text{0x00}.

If any bit is \text{0b1} and the relevant byte in TRCVMIDCVR<\text{n}> is not \text{0x00}, the behavior of the Virtual Context Identifier Comparator is CONSTRANGED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRANGED UNPREDICTABLE if the trace unit is not in the Idle state.

**TRCVMIDCCTRLR1 can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x68C</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are RW.
The TRCVMIDCVR\(<n>\) characteristics are:

**Purpose**

Contains the Virtual Context Identifier Comparator value.

**Configuration**

External register TRCVMIDCVR\(<n>\) bits [63:0] are architecturally mapped to AArch64 System register TRCVMIDCVR\(<n>\)[63:0].

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when ETE is implemented and TRCIDR4.NUMVMIDC > \(n\). Otherwise, direct accesses to TRCVMIDCVR\(<n>\) are RES0.

**Attributes**

TRCVMIDCVR\(<n>\) is a 64-bit register.

**Field descriptions**

The TRCVMIDCVR\(<n>\) bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE | VALUE |

**VALUE, bits [63:0]**

Virtual context identifier value. The width of this field is indicated by TRCIDR2.VMIDSIZE. Unimplemented bits are RES0. After a PE Reset, the trace unit assumes that the Virtual context identifier is zero until the PE updates the Virtual context identifier.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCVMIDCVR\(<n>\)**

Must be programmed if any of the following are true:

- TRCRSCTL\(<a>\).GROUP == \(0b0111\) and TRCRSCTL\(<a>\).VMID[\(n\)] == 0b1.
- TRCACAT\(<a>\).CONTEXT TYPE == \(0b1\) or \(0b11\) and TRCACAT\(<a>\).CONTEXT == \(n\).

**TRCVMIDCVR\(<n>\) can be accessed through the external debug interface:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETE</td>
<td>0x640 + 8(n)</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
• When !AllowExternalTraceAccess(), or OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
• Otherwise accesses to this register are RW.
