Level 1 cache Test and Clean. Indicates the supported Level 1 data cache test and clean operations, for Harvard or unified cache implementations. Defined values are:

<table>
<thead>
<tr>
<th>L1TstCln</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
</tbody>
</table>
| 0b0001  | Supported Level 1 data cache test and clean operations are:  
          | • Test and clean data cache. |
| 0b0010  | As for 0001, and adds:  
          | • Test, clean, and invalidate data cache. |

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

### L1Uni, bits [23:20]

Level 1 Unified cache. Indicates the supported entire Level 1 cache maintenance operations for a unified cache implementation. Defined values are:

<table>
<thead>
<tr>
<th>L1Uni</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
</tbody>
</table>
| 0b0001 | Supported entire Level 1 cache operations are:  
          | • Invalidate cache, including branch predictor if appropriate.  
          | • Invalidate branch predictor, if appropriate. |
| 0b0010 | As for 0001, and adds:  
          | • Clean cache, using a recursive model that uses the cache dirty status bit.  
          | • Clean and invalidate cache, using a recursive model that uses the cache dirty status bit. |

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.
L1Hvd, bits [19:16]

Level 1 Harvard cache. Indicates the supported entire Level 1 cache maintenance operations for a Harvard cache implementation. Defined values are:

<table>
<thead>
<tr>
<th>L1Hvd</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
</tbody>
</table>
| 0b0001 | Supported entire Level 1 cache operations are:  
• Invalidate instruction cache, including branch predictor if appropriate.  
• Invalidate branch predictor, if appropriate. |
| 0b0010 | As for 0001, and adds:  
• Invalidate data cache.  
• Invalidate data cache and instruction cache, including branch predictor if appropriate. |
| 0b0011 | As for 0010, and adds:  
• Clean data cache, using a recursive model that uses the cache dirty status bit.  
• Clean and invalidate data cache, using a recursive model that uses the cache dirty status bit. |

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

L1UniSW, bits [15:12]

Level 1 Unified cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a unified cache implementation. Defined values are:

<table>
<thead>
<tr>
<th>L1UniSW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
</tbody>
</table>
| 0b0001 | Supported Level 1 unified cache line maintenance operations by set/way are:  
• Clean cache line by set/way. |
| 0b0010 | As for 0001, and adds:  
• Clean and invalidate cache line by set/way. |
| 0b0011 | As for 0010, and adds:  
• Invalidate cache line by set/way. |

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

L1HvdSW, bits [11:8]

Level 1 Harvard cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a Harvard cache implementation. Defined values are:

<table>
<thead>
<tr>
<th>L1HvdSW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
</tbody>
</table>
| 0b0001 | Supported Level 1 Harvard cache line maintenance operations by set/way are:  
• Clean data cache line by set/way.  
• Clean and invalidate data cache line by set/way. |
| 0b0010 | As for 0001, and adds:  
• Invalidate data cache line by set/way. |
| 0b0011 | As for 0010, and adds:  
• Invalidate instruction cache line by set/way. |

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.
L1UniVA, bits [7:4]

Level 1 Unified cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a unified cache implementation. Defined values are:

<table>
<thead>
<tr>
<th>L1UniVA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported Level 1 unified cache line maintenance operations by VA are:</td>
</tr>
<tr>
<td></td>
<td>• Clean cache line by VA.</td>
</tr>
<tr>
<td></td>
<td>• Invalidate cache line by VA.</td>
</tr>
<tr>
<td></td>
<td>• Clean and invalidate cache line by VA.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0001, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate branch predictor by VA, if branch predictor is</td>
</tr>
<tr>
<td></td>
<td>implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

L1HvdVA, bits [3:0]

Level 1 Harvard cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a Harvard cache implementation. Defined values are:

<table>
<thead>
<tr>
<th>L1HvdVA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported Level 1 Harvard cache line maintenance operations by VA are:</td>
</tr>
<tr>
<td></td>
<td>• Clean data cache line by VA.</td>
</tr>
<tr>
<td></td>
<td>• Invalidate data cache line by VA.</td>
</tr>
<tr>
<td></td>
<td>• Clean and invalidate data cache line by VA.</td>
</tr>
<tr>
<td></td>
<td>• Clean instruction cache line by VA.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0001, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate branch predictor by VA, if branch predictor is</td>
</tr>
<tr>
<td></td>
<td>implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

Accessing the ID_MMFR1_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ID_MMFR1_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>
<td>0b0000</td>
<td>0b0001</td>
<td>0b101</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    if IsFeatureImplemented("ARMv8.4-IDST") then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_MMFR1_EL1;
elsif PSTATE.EL == EL2 then
    return ID_MMFR1_EL1;
elif PSTATE.EL == EL3 then
    return ID_MMFR1_EL1;
The ID_MMFR2_EL1 characteristics are:

### Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with ID_MMFR0_EL1, ID_MMFR1_EL1, ID_MMFR3_EL1, and ID_MMFR4_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

### Configuration

AArch64 System register ID_MMFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR2[31:0].

In an implementation that supports only AArch64 state, this register is UNKNOWN.

### Attributes

ID_MMFR2_EL1 is a 64-bit register.

### Field descriptions

The ID_MMFR2_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
<td>Reserved</td>
</tr>
<tr>
<td>62</td>
<td>HWAccFlg</td>
<td>Hardware Access Flag. In earlier versions of the Arm Architecture, this field indicates support for a Hardware Access flag, as part of the VMSAv7 implementation. Defined values are:</td>
</tr>
<tr>
<td>61</td>
<td>WFIStall</td>
<td>Wait For Interrupt Stall. Indicates the support for Wait For Interrupt (WFI) stalling. Defined values are:</td>
</tr>
<tr>
<td>60</td>
<td>MemBarr</td>
<td></td>
</tr>
<tr>
<td>59</td>
<td>UniTLB</td>
<td></td>
</tr>
<tr>
<td>58</td>
<td>HvdTLB</td>
<td></td>
</tr>
<tr>
<td>57</td>
<td>L1HvdRng</td>
<td></td>
</tr>
<tr>
<td>56</td>
<td>L1HvdBG</td>
<td></td>
</tr>
<tr>
<td>55</td>
<td>L1HvdFG</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**HWAccFlg, bits [31:28]**

Hardware Access Flag. In earlier versions of the Arm Architecture, this field indicates support for a Hardware Access flag, as part of the VMSAv7 implementation. Defined values are:

<table>
<thead>
<tr>
<th>HWAccFlg</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for VMSAv7 Access flag, updated in hardware.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the only permitted value is 0b0000.

**WFIStall, bits [27:24]**

Wait For Interrupt Stall. Indicates the support for Wait For Interrupt (WFI) stalling. Defined values are:
### WFISnall

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for WFI stalling.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the permitted values are 0b0000 and 0b0001.

### MemBarr, bits [23:20]

Memory Barrier. Indicates the supported memory barrier System instructions in the (coproc==0b1111) encoding space:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported memory barrier System instructions are:</td>
</tr>
<tr>
<td></td>
<td>• Data Synchronization Barrier (DSB).</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0001, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Instruction Synchronization Barrier (ISB).</td>
</tr>
<tr>
<td></td>
<td>• Data Memory Barrier (DMB).</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the only permitted value is 0b0010.

Arm deprecates the use of these operations. ID_ISAR4.Barrier_instrs indicates the level of support for the preferred barrier instructions.

### UniTLB, bits [19:16]

Unified TLB. Indicates the supported TLB maintenance operations, for a unified TLB implementation. Defined values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported unified TLB maintenance operations are:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate all entries in the TLB.</td>
</tr>
<tr>
<td></td>
<td>• Invalidate TLB entry by VA.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0001, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate TLB entries by ASID match.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0010, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate instruction TLB and data TLB entries by VA All ASID.</td>
</tr>
<tr>
<td></td>
<td>This is a shared unified TLB operation.</td>
</tr>
<tr>
<td>0b0100</td>
<td>As for 0011, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate Hyp mode unified TLB entry by VA.</td>
</tr>
<tr>
<td></td>
<td>• Invalidate entire Non-secure PL1&amp;0 unified TLB.</td>
</tr>
<tr>
<td></td>
<td>• Invalidate entire Hyp mode unified TLB.</td>
</tr>
<tr>
<td>0b0101</td>
<td>As for 0b0100, and adds the following operations:</td>
</tr>
<tr>
<td></td>
<td>TLBIMVALIS, TLBIMVAALIS, TLBIMVALHIS, TLBIMVAL, TLBIMVAAL, TLBIMVALH.</td>
</tr>
<tr>
<td>0b0110</td>
<td>As for 0b0101, and adds the following operations:</td>
</tr>
<tr>
<td></td>
<td>TLBIIIPAS2IS, TLBIIIPAS2LIS, TLBIIIPAS2, TLBIIIPAS2L.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0110.

### HvdTLB, bits [15:12]

If the Unified TLB field (UniTLB, bits [19:16]) is not 0000, then the meaning of this field is IMPLEMENTATION DEFINED. Arm deprecates the use of this field by software.

### L1HvdRng, bits [11:8]

Level 1 Harvard cache Range. Indicates the supported Level 1 cache maintenance range operations, for a Harvard cache implementation. Defined values are:
### L1HvdRng

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported Level 1 Harvard cache maintenance range operations are:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate data cache range by VA.</td>
</tr>
<tr>
<td></td>
<td>• Invalidate instruction cache range by VA.</td>
</tr>
<tr>
<td></td>
<td>• Clean data cache range by VA.</td>
</tr>
<tr>
<td></td>
<td>• Clean and invalidate data cache range by VA.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the only permitted value is 0b0000.

### L1HvdBG, bits [7:4]

Level 1 Harvard cache Background fetch. Indicates the supported Level 1 cache background fetch operations, for a Harvard cache implementation. When supported, background fetch operations are non-blocking operations. Defined values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported Level 1 Harvard cache background fetch operations are:</td>
</tr>
<tr>
<td></td>
<td>• Fetch instruction cache range by VA.</td>
</tr>
<tr>
<td></td>
<td>• Fetch data cache range by VA.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the only permitted value is 0b0000.

### L1HvdFG, bits [3:0]

Level 1 Harvard cache Foreground fetch. Indicates the supported Level 1 cache foreground fetch operations, for a Harvard cache implementation. When supported, foreground fetch operations are blocking operations. Defined values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported Level 1 Harvard cache foreground fetch operations are:</td>
</tr>
<tr>
<td></td>
<td>• Fetch instruction cache range by VA.</td>
</tr>
<tr>
<td></td>
<td>• Fetch data cache range by VA.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the only permitted value is 0b0000.

### Accessing the ID.MMFR2_EL1

Accesses to this register use the following encodings:

**MRS <Xt>, ID.MMFR2_EL1**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b00</td>
<td>0b0000</td>
<td>0b0001</td>
<td>0b110</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    if IsFeatureImplemented("ARMv8.4-IDST") then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_MMFR2_EL1;
elsif PSTATE.EL == EL2 then
    return ID_MMFR2_EL1;
elsif PSTATE.EL == EL3 then
    return ID_MMFR2_EL1;
ID.MMFR3_EL1, AArch32 Memory Model Feature Register 3

The ID.MMFR3_EL1 characteristics are:

### Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with ID.MMFR0_EL1, ID.MMFR1_EL1, ID.MMFR2_EL1, and ID.MMFR4_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

### Configuration

AArch64 System register ID.MMFR3_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID.MMFR3[31:0].

In an implementation that supports only AArch64 state, this register is UNKNOWN.

### Attributes

ID.MMFR3_EL1 is a 64-bit register.

### Field descriptions

The ID.MMFR3_EL1 bit assignments are:

<table>
<thead>
<tr>

<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [63:32]

Reserved, RES0.

**Supersec, bits [31:28]**

Supersections. On a VMSA implementation, indicates whether Supersections are supported. Defined values are:

<table>
<thead>
<tr>
<th>Supersec</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Supersections supported.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Supersections not supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b1111.

**CMemSz, bits [27:24]**

Cached Memory Size. Indicates the physical memory size supported by the caches. Defined values are:
CMemSz

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>4GB, corresponding to a 32-bit physical address range.</td>
</tr>
<tr>
<td>0b0001</td>
<td>64GB, corresponding to a 36-bit physical address range.</td>
</tr>
<tr>
<td>0b0010</td>
<td>1TB or more, corresponding to a 40-bit or larger physical address range.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000, 0b0001, and 0b0010.

CohWalk, bits [23:20]

Coherent Walk. Indicates whether Translation table updates require a clean to the Point of Unification. Defined values are:

<table>
<thead>
<tr>
<th>CohWalk</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Updates to the translation tables require a clean to the Point</td>
</tr>
<tr>
<td></td>
<td>of Unification to ensure visibility by subsequent translation</td>
</tr>
<tr>
<td></td>
<td>table walks.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Updates to the translation tables do not require a clean to</td>
</tr>
<tr>
<td></td>
<td>the Point of Unification to ensure visibility by subsequent</td>
</tr>
<tr>
<td></td>
<td>translation table walks.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

PAN, bits [19:16]

From Armv8.1:

Privileged Access Never. Indicates support for the PAN bit in CPSR, SPSR, and DSPSR in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>PAN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>PAN not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>PAN supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>PAN supported and ATS1CPRP and ATS1CPWP instructions supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.1-PAN implements the functionality identified by the value 0b0001.

ARMv8.2-ATS1E1 implements the functionality added by the value 0b0010.

In Armv8.1 the value 0b0000 is not permitted.

From Armv8.2, the only permitted value is 0b0010.

Otherwise:

Reserved, RES0.

MaintBcst, bits [15:12]

Maintenance Broadcast. Indicates whether Cache, TLB, and branch predictor operations are broadcast. Defined values are:
MaintBcst

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Cache, TLB, and branch predictor operations only affect local structures.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Cache and branch predictor operations affect structures according to shareability and defined behavior of instructions. TLB operations only affect local structures.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Cache, TLB, and branch predictor operations affect structures according to shareability and defined behavior of instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0010.

**BPMaint, bits [11:8]**

Branch Predictor Maintenance. Indicates the supported branch predictor maintenance operations in an implementation with hierarchical cache maintenance operations. Defined values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported branch predictor maintenance operations are:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate all branch predictors.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0001, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate branch predictors by VA.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0010.

**CMaintSW, bits [7:4]**

Cache Maintenance by Set/Way. Indicates the supported cache maintenance operations by set/way, in an implementation with hierarchical caches. Defined values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported hierarchical cache maintenance instructions by set/way are:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate data cache by set/way.</td>
</tr>
<tr>
<td></td>
<td>• Clean data cache by set/way.</td>
</tr>
<tr>
<td></td>
<td>• Clean and invalidate data cache by set/way.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

In a unified cache implementation, the data cache maintenance operations apply to the unified caches.

**CMaintVA, bits [3:0]**

Cache Maintenance by Virtual Address. Indicates the supported cache maintenance operations by VA, in an implementation with hierarchical caches. Defined values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported hierarchical cache maintenance operations by VA are:</td>
</tr>
<tr>
<td></td>

\[
\text{return ID_MMFR3_EL1;}
\]
ID_MMFR4_EL1, AArch32 Memory Model Feature Register 4

The ID_MMFR4_EL1 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with ID_MMFR0_EL1, ID_MMFR1_EL1, ID_MMFR2_EL1, and ID_MMFR3_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

**Configuration**

AArch64 System register ID_MMFR4_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR4[31:0].

In an implementation that supports only AArch64 state, this register is **UNKNOWN**.

**Attributes**

ID_MMFR4_EL1 is a 64-bit register.

**Field descriptions**

The ID_MMFR4_EL1 bit assignments are:

<table>

**Bits [63:32]**

Reserved, RES0.

**EVT, bits [31:28]**

When ARMv8.2-EVT is implemented:

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the HCR2.\{TTLBIS, TOCU, TICAB, TID4\} traps. Defined values are:

<table>
<thead>
<tr>
<th>EVT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>HCR2.{TTLBIS, TOCU, TICAB, TID4} traps are not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>HCR2.{TOCU, TICAB, TID4} traps are supported.</td>
</tr>
<tr>
<td></td>
<td>HCR2.TTLBIS trap is not supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>HCR2.{TTLBIS, TOCU, TICAB, TID4} traps are supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8.0, the only permitted value is 0b0000.

From Armv8.1, the permitted values are 0b0000, 0b0001, and 0b0010.

From Armv8.5 the permitted values are:
• 0b0000 when EL2 is not implemented.
• 0b0001 when EL2 is implemented. This feature is identified as ARMv8.2-EVT.

Otherwise:
Reserved, RES0.

CCIDX, bits [27:24]
From Armv8.3:
Support for use of the revised CCSIDR format and the presence of the CCSIDR2 is indicated. Defined values are:

<table>
<thead>
<tr>
<th>CCIDX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>32-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>64-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8.3, the permitted values are 0b0000 and 0b0001. This feature is identified as ARMv8.3-CCIDX.

Otherwise:
Reserved, RAZ.

LSM, bits [23:20]
From Armv8.2:
Indicates support for LSMAOE and nTLSMD bits in HSCTRL and SCTLR. Defined values are:

<table>
<thead>
<tr>
<th>LSM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>LSMAOE and nTLSMD bits not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>LSMAOE and nTLSMD bits supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.2-LSMAOC implements the functionality identified by the value 0b0001.

Otherwise:
Reserved, RAZ.

HPDS, bits [19:16]
From Armv8.2:
Hierarchical permission disables bits in translation tables. Defined values are:

<table>
<thead>
<tr>
<th>HPDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Disabling of hierarchical controls not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supports disabling of hierarchical controls using the TTBCR2.HPD0, TTBCR2.HPD1, and HTCR.HPD bits.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for value 0b0001, and adds possible hardware allocation of bits[62:59] of the translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.2-AA32HPD implements the functionality identified by the value 0b0001.
ARMv8.2-TTPBHA implements the functionality added by the value 0b0010.

---

**Note**

The value 0b0000 implies that the encoding for TTBCR2 is UNDEFINED.

---

**Otherwise:**

Reserved, RAZ.

**CnP, bits [15:12]**

**From Armv8.2:**

Common not Private translations. Defined values are:

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Common not Private translations not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Common not Private translations supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.2-TTCNP implements the functionality identified by the value 0b0001.

From Armv8.2 the only permitted value is 0b0001.

**Otherwise:**

Reserved, RAZ.

**XNX, bits [11:8]**

**From Armv8.2:**

Support for execute-never control distinction by Exception level at stage 2. Defined values are:

<table>
<thead>
<tr>
<th>XNX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Distinction between EL0 and EL1 execute-never control at stage 2 not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Distinction between EL0 and EL1 execute-never control at stage 2 supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.2-TTS2UXN implements the functionality identified by the value 0b0001.

When ARMv8.2-TTS2UXN is implemented:

- If all of the following conditions are true it is IMPLEMENTATION DEFINED whether the value of ID_MMFR4_EL1.XNX is 0b0000 or 0b0001:
  - ID_AA64MMFR1_EL1.XNX == 1.
  - EL2 cannot use AArch32.
  - EL1 can use AArch32.
- If EL2 can use AArch32 then the only permitted value is 0b0001.

**Otherwise:**

Reserved, RAZ.

**AC2, bits [7:4]**

Indicates the extension of the ACTLR and HACTLR registers using ACTLR2 and HACTLR2. Defined values are:
Meaning

0b0000  ACTLR2 and HACTLR2 are not implemented.
0b0001  ACTLR2 and HACTLR2 are implemented.

All other values are reserved.

In Armv8.0 and Armv8.1 the permitted values are 0b0000 and 0b0001.

From Armv8.2, the only permitted value is 0b0001.

SpecSEI, bits [3:0]

When RAS is implemented:

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:

<table>
<thead>
<tr>
<th>SpecSEI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The PE never generates an SError interrupt due to an External abort on a speculative read.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The PE might generate an SError interrupt due to an External abort on a speculative read.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Otherwise:

Reserved, RES0. This provides no information about whether the PE generates a speculative SError interrupt.

Accessing the ID_MMFR4_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ID_MMFR4_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>
<td>0b0000</td>
<td>0b0010</td>
<td>0b110</td>
</tr>
</tbody>
</table>

```c
if PSTATE.EL == EL0 then
  if IsFeatureImplemented("ARMv8.4-IDST") then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
      AArch64.SystemAccessTrap(EL2, 0x18);
    else
      AArch64.SystemAccessTrap(EL1, 0x18);
  else
    UNDEFINED;
else
  if PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && (!IsZero(ID_MMFR4_EL1) || boolean IMPLEMENTATION_DEFINED "ID_MMFR4_EL1 trapped by HCR_EL2.TID3") && HCR_EL2.TID3 == '1' then

    else
      return ID_MMFR4_EL1;
  elsif PSTATE.EL == EL2 then
    return ID_MMFR4_EL1;
  elsif PSTATE.EL == EL3 then
    return ID_MMFR4_EL1;
```
The ID_MMFR5_EL1 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

**Configuration**

AArch64 System register ID_MMFR5_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR5[31:0].

In an implementation that supports only AArch64 state, this register is UNKNOWN.

**Attributes**

ID_MMFR5_EL1 is a 64-bit register.

**Field descriptions**

The ID_MMFR5_EL1 bit assignments are:

ID_PFR0_EL1, AArch32 Processor Feature Register 0

The ID_PFR0_EL1 characteristics are:

**Purpose**

Gives top-level information about the instruction sets supported by the PE in AArch32 state.

Must be interpreted with ID_PFR1_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

**Configuration**

AArch64 System register ID_PFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_PFR0[31:0].

In an implementation that supports only AArch64 state, this register is UNKNOWN.

**Attributes**

ID_PFR0_EL1 is a 64-bit register.

**Field descriptions**

All other values are reserved.

In Armv8-A the only permitted value is 0b0011.

**State0, bits [3:0]**

A32 instruction set support. Defined values are:

<table>
<thead>
<tr>
<th>State0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>A32 instruction set not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>A32 instruction set implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.
Accessing the ID_PFR0_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ID_PFR0_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

elsif PSTATE.EL == EL2 then
  return ID_PFR0_EL1;
elsif PSTATE.EL == EL3 then
  return ID_PFR0_EL1;
The ID_PFR1_EL1 characteristics are:

Purpose

Gives information about the AArch32 programmers' model.

Must be interpreted with ID_PFR0_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

Configuration

AArch64 System register ID_PFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_PFR1[31:0].

In an implementation that supports only AArch64 state, this register is UNKNOWN.

Attributes

ID_PFR1_EL1 is a 64-bit register.

Field descriptions

The ID_PFR1_EL1 bit assignments are:

<p>| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|</p>
<table>
<thead>
<tr>

<td>31</td>
<td>30</td>
<td>29</td>
<td>28</td>
<td>27</td>
<td>26</td>
<td>25</td>
<td>24</td>
</tr>
</tbody>
</table>

Bits [63:32]

Reserved, RES0.

GIC, bits [31:28]

System register GIC CPU interface. Defined values are:

<table>
<thead>
<tr>
<th>GIC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>GIC CPU interface system registers not implemented.</td>
</tr>
<tr>
<td>0001</td>
<td>System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.</td>
</tr>
<tr>
<td>0011</td>
<td>System register interface to version 4.1 of the GIC CPU interface is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Virt_frac, bits [27:24]

Virtualization fractional field. When the Virtualization field is 0b0000, determines the support for features from the ARMv7 Virtualization Extensions. Defined values are:
Virt_frac

<table>
<thead>
<tr>
<th>Meaning</th>
<th>0b0000</th>
<th>The following features of the ARMv7 Virtualization Extensions are implemented:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>• The SCR.SIF bit, if EL3 is implemented.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The modifications to the SCR.AW and SCR.FW bits described in the Virtualization Extensions, if EL3 is implemented.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The MSR (banked register) and MRS (banked register) instructions.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The ERET instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are:
- 0b0000 when EL2 is implemented.
- 0b0001 when EL2 is not implemented.

This field is only valid when the value of ID_PFR1_EL1.Virtualization is 0,otherwise it holds the value 0b0000.

Note

The ID_ISAR registers do not identify whether the instructions added by the ARMv7 Virtualization Extensions are implemented.

---

Sec_frac, bits [23:20]

Security fractional field. When the Security field is 0b0000, determines the support for features from the ARMv7 Security Extensions. Defined values are:

<table>
<thead>
<tr>
<th>Meaning</th>
<th>0b0000</th>
<th>No features from the ARMv7 Security Extensions are implemented.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0b0001</td>
<td>The following features from the ARMv7 Security Extensions are implemented:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The VBAR register.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The TTBCR.PD0 and TTBCR.PD1 bits.</td>
</tr>
<tr>
<td></td>
<td>0b0010</td>
<td>As for 0b0001, plus the ability to access Secure or Non-secure physical memory is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are:
- 0b0000 when EL3 is implemented.
- 0b0001 or 0b0010 when EL3 is not implemented.

This field is only valid when the value of ID_PFR1_EL1.Security is 0,otherwise it holds the value 0b0000.

GenTimer, bits [19:16]

Generic Timer support. Defined values are:

<table>
<thead>
<tr>
<th>Meaning</th>
<th>0b0000</th>
<th>Generic Timer is not implemented.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0b0001</td>
<td>Generic Timer is implemented.</td>
</tr>
<tr>
<td></td>
<td>0b0010</td>
<td>Generic Timer is implemented, and also includes support for CNTHCTL.EVTNIS and CNTKCTL.EVTNIS fields, and CNTPTCSS and CNTVCVSS counter views.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.6-ECV implements the functionality identified by the value 0b0010.

In Armv8.0, Armv8.1, Armv8.2, Armv8.3, Armv8.4, and Armv8.5, the only permitted value is 0b0001.
From Armv8.6, the only permitted value is **0b0010**.

**Virtualization, bits [15:12]**

Virtualization support. Defined values are:

<table>
<thead>
<tr>
<th>Virtualization</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL2, Hyp mode, and the HVC instruction not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EL2, Hyp mode, the HVC instruction, and all the features described by Virt_frac == 0b0001 implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0001 when EL2 is implemented.

In an implementation that includes EL2, if EL2 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

If EL1 cannot use AArch32 then this field has the value 0b0000.

**Note**

The ID_ISARs do not identify whether the HVC instruction is implemented.

**MProgMod, bits [11:8]**

M profile programmers’ model support. Defined values are:

<table>
<thead>
<tr>
<th>MProgMod</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Support for two-stack programmers' model.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

**Security, bits [7:4]**

Security support. Defined values are:

<table>
<thead>
<tr>
<th>Security</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL3, Monitor mode, and the SMC instruction not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EL3, Monitor mode, the SMC instruction, and all the features described by Sec_frac == 0b0001 implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the ability to set the NSACR.RFR bit. Not permitted in Armv8 as the NSACR.RFR bit is RES0.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are:

- 0b0000 when EL3 is not implemented.
- 0b0001 when EL3 is implemented.

In an implementation that includes EL3, if EL3 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

If EL1 cannot use AArch32 then this field has the value 0b0000.
ProgMod, bits [3:0]

Support for the standard programmers' model for Armv4 and later. Model must support User, FIQ, IRQ, Supervisor, Abort, Undefined, and System modes. Defined values are:

<table>
<thead>
<tr>
<th>ProgMod</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0001 and 0b0000.

If EL1 cannot use AArch32 then this field has the value 0b0000.

Accessing the ID_PFR1_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ID_PFR1_EL1

```plaintext
<table>
<thead>
<tr>
<th>op0</th>

elsif PSTATE.EL == EL2 then
  return ID_PFR1_EL1;
elsif PSTATE.EL == EL3 then
  return ID_PFR1_EL1;
```
The ID_PFR2_EL1 characteristics are:

**Purpose**

Gives information about the AArch32 programmers' model.

Must be interpreted with ID_PFR0_EL1 and ID_PFR1_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

**Configuration**

AArch64 System register ID_PFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_PFR2[31:0].

In an implementation that supports only AArch64 state, this register is **UNKNOWN**.

**Attributes**

ID_PFR2_EL1 is a 64-bit register.

**Field descriptions**

The ID_PFR2_EL1 bit assignments are:

<td>This Device does not disclose whether data loaded under speculation with a permission or domain fault can be used to form an address or generate condition codes or SVE predicate values to be used by instructions newer than the load in the speculative sequence</td>
</tr>
<tr>
<td>0b0001</td>
<td>Data loaded under speculation with a permission or domain fault cannot be used to form an address or generate condition codes or SVE predicate values to be used by instructions newer than the load in the speculative sequence</td>
</tr>
</tbody>
</table>

From Armv8.0, the permitted values are 0b0000 and 0b0001.
From Armv8.5, the only permitted value is 0b0001.
All other values are reserved.

Otherwise:
Reserved, RES0.

**Accessing the ID_PFR2_EL1**

Accesses to this register use the following encodings:

\[
\begin{array}{cccccc}
\text{op0} & \text{op1} & \text{CRn} & \text{CRm} & \text{op2} \\
0b11 & 0b000 & 0b0000 & 0b0011 & 0b100 \\
\end{array}
\]
if PSTATE.EL == EL0 then
  if IsFeatureImplemented("ARMv8.4-IDST") then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
      AArch64.SystemAccessTrap(EL2, 0x18);
    else
      AArch64.SystemAccessTrap(EL1, 0x18);
  else
    UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    return ID_PFR2_EL1;
elsif PSTATE.EL == EL2 then
  return ID_PFR2_EL1;
elsif PSTATE.EL == EL3 then
  return ID_PFR2_EL1;
IFS32_EL2, Instruction Fault Status Register (EL2)

The IFS32_EL2 characteristics are:

**Purpose**

Allows access to the AArch32 IFSR register from AArch64 state only. Its value has no effect on execution in AArch64 state.

**Configuration**

AArch64 System register IFS32_EL2 bits [31:0] are architecturally mapped to AArch32 System register IFSR[31:0].

If EL1 is AArch64 only, this register is **UNDEFINED**.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not **RES0**.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

IFS32_EL2 is a 64-bit register.

**Field descriptions**

The IFS32_EL2 bit assignments are:

**When TTBCR.EAE == 0:**

| 63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32 | RES0 |
| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 | FnV RES0 ExTR RES0 FS[4] LPAE RES0 FS[3:0] |

**Bits [63:17]**

Reserved, RES0.

**FnV, bit [16]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<table>
<thead>
<tr>
<th>FnV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IFAR is valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>IFAR is not valid, and holds an <strong>UNKNOWN</strong> value.</td>
</tr>
</tbody>
</table>

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is **RES0** for all other Prefetch Abort exceptions.

This field resets to an architecturally **UNKNOWN** value.

**Bits [15:13]**

Reserved, RES0.
**ExT, bit [12]**

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

This field resets to an architecturally UNKNOWN value.

**Bit [11]**

Reserved, RES0.

**FS[4], bit [10]**

This field is bit[4] of FS[4:0].

<table>
<thead>
<tr>
<th>FS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000001</td>
<td>PC alignment fault.</td>
</tr>
<tr>
<td>0b00010</td>
<td>Debug exception.</td>

<tr>
<td>0b11100</td>
<td>Synchronous parity or ECC error on translation table walk, level 1.</td>
</tr>
<tr>
<td>0b11110</td>
<td>Synchronous parity or ECC error on translation table walk, level 2.</td>
</tr>
</tbody>
</table>

All other values are reserved.

When the RAS Extension is implemented, 0b11001, 0b11100, and 0b11110 are reserved.

The FS field is split as follows:

- FS[4] is IFSR32_EL2[10].
- FS[3:0] is IFSR32_EL2[3:0].

This field resets to an architecturally UNKNOWN value.

**LPAE, bit [9]**

On taking a Data Abort exception, this bit is set as follows:

<table>
<thead>
<tr>
<th>LPAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Using the Short-descriptor translation table formats.</td>
</tr>
<tr>
<td>0b1</td>
<td>Using the Long-descriptor translation table formats.</td>
</tr>
</tbody>
</table>

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

This field resets to an architecturally UNKNOWN value.
Bits [8:4]

Reserved, RES0.

FS[3:0], bits [3:0]

This field is bits[3:0] of FS[4:0].

<tr>
<td>0b1</td>
<td>IFAR is not valid, and holds an UNKNOWN value.</td>
</tr>
</tbody>
</table>

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

This field resets to an architecturally UNKNOWN value.

Bits [15:13]

Reserved, RES0.

ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

This field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

<table>
<thead>
<tr>
<th>LPAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Using the Short-descriptor translation table formats.</td>
</tr>
<tr>
<td>0b1</td>
<td>Using the Long-descriptor translation table formats.</td>
</tr>
</tbody>
</table>

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.
This field resets to an architecturally \textit{UNKNOWN} value.

\textbf{Bits [8:6]}

Reserved, RES0.

\textbf{STATUS, bits [5:0]}

Fault status bits. All encodings not shown below are reserved:

<table>

</table>

All other values are reserved.

When the RAS Extension is implemented, 0b011000, 0b011101, 0b011110, and 0b011111, are reserved.

The lookup level associated with a fault is:

- For a fault generated on a translation table walk, the lookup level of the walk being performed.
- For a Translation fault, the lookup level of the translation table that gave the fault. If a fault occurs because a stage of address translation is disabled, or because the input address is outside the range specified by the appropriate base address register or registers, the fault is reported as a fault at level 1.
- For an Access flag fault, the lookup level of the translation table that gave the fault.
- For a Permission fault, including a Permission fault caused by hierarchical permissions, the lookup level of the final level of translation table accessed for the translation. That is, the lookup level of the translation table that returned a Block or Page descriptor.

This field resets to an architecturally \textit{UNKNOWN} value.

\textbf{Accessing the IFSR32_EL2}

Accesses to this register use the following encodings:

elsif PSTATE.EL == EL3 then
  IFSR32_EL2 = X[t];
The ISR_EL1 characteristics are:

**Purpose**

Shows the pending status of the IRQ, FIQ, or SError interrupt.

When executing at EL2, EL3 or Secure EL1 when `SCR_EL3.EEL2 == 0b0`, this shows the pending status of the physical IRQ, FIQ, or SError interrupts.

When executing at either Non-secure EL1 or at Secure EL1 when `SCR_EL3.EEL2 == 0b1`:

- If the `HCR_EL2.{IMO,FMO,AMO}` bit has a value of 1, the corresponding `ISR_EL1.{I,F,A}` bit shows the pending status of the virtual IRQ, FIQ, or SError.
- If the `HCR_EL2.{IMO,FMO,AMO}` bit has a value of 0, the corresponding `ISR_EL1.{I,F,A}` bit shows the pending status of the physical IRQ, FIQ, or SError.

**Configuration**

AArch64 System register ISR_EL1 bits [31:0] are architecturally mapped to AArch32 System register `ISR[31:0]`.

**Attributes**

ISR_EL1 is a 64-bit register.

**Field descriptions**

The ISR_EL1 bit assignments are:

    endif
endif
The LORC_EL1 characteristics are:

**Purpose**

Enables and disables LORegions, and selects the current LORegion descriptor.

**Configuration**

This register is present only when ARMv8.1-LOR is implemented. Otherwise, direct accesses to LORC_EL1 are UNDEFINED.

If no LORegion descriptors are supported by the PE, then this register is RES0.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

LORC_EL1 is a 64-bit register.

**Field descriptions**

The LORC_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:10</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>9:2</td>
<td>Descriptor Select. Selects the current LORegion descriptor accessed by LORSA_EL1, LOREA_EL1, and LORN_EL1. The number of LORegion descriptors in IMPLEMENTATION DEFINED. The maximum number of LORegion descriptors supported is 256. If the number is less than 256, then bits[63:M+2] are RES0, where M is Log2(Number of LORegion descriptors supported by the implementation). If this field points to an LORegion descriptor that is not supported by an implementation, then the registers LORN_EL1, LOREA_EL1, and LORSA_EL1 are RES0. This field resets to an architecturally UNKNOWN value.</td>

  endif
elsif PSTATE.EL == EL3 then
  if SCR_EL3.NS == '0' then
    UNDEFINED;
  else
    LORC_EL1 = X[t];
  endif
The LOREA_EL1 characteristics are:

**Purpose**

Holds the physical address of the end of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

**Configuration**

This register is present only when ARMv8.1-LOR is implemented. Otherwise, direct accesses to LOREA_EL1 are UNDEFINED.

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- LORC_EL1.DS points to a LORegion that is not supported by the PE.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

LOREA_EL1 is a 64-bit register.

**Field descriptions**

The LOREA_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | EA[51:48] | EA[47:16] |
| EA[47:16] | RES0 |

Any of the fields in this register are permitted to be cached in a TLB.

**Bits [63:52]**

Reserved, RES0.

**EA[51:48], bits [51:48]**

When ARMv8.2-LPA is implemented:

- This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EA[47:16], bits [47:16]**

Bits [47:16] of the end physical address of an LORegion described in the current LORegion descriptor selected by LORC_EL1.DS. Bits[15:0] of this address are defined to be 0xFFFF. For implementations with fewer than 48 bits, the upper bits of this field are RES0.
When ARMv8.2-LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, EA[51:48] form the upper part of the address value. Otherwise, for implementations with fewer than 52 physical address bits, EA[51:48] are RES0.

This field resets to an architecturally UNKNOWN value.

**Bits [15:0]**

Reserved, RES0.

## Accessing the LOREA_EL1

Any of the fields in this register are permitted to be cached in a TLB.

**Bits [63:8]**

Reserved, **RES0**.

**Num, bits [7:0]**

Number of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

The maximum number of LORegions supported by the PE is 256. If the maximum number is less than 256, then bits[8:N] are **RES0**, where N is \(\log_2(\text{Number of LORegions supported by the PE})\).

If this field points to a LORegion that is not supported by the PE, then the current LORegion descriptor does not match any LORegion.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the LORN_EL1**

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if SCR_EL3.NS == '0' then
        UNDEFINED;
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TLOR == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
        HFGWTR_EL2.LORN_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif HaveEL(EL3) && !ELUsingAArch32(EL3) && SCR_EL3.TLOR == '1' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        return LORN_EL1;
    end if;
elsif PSTATE.EL == EL2 then
    if SCR_EL3.NS == '0' then
        UNDEFINED;
    elsif HaveEL(EL3) && !ELUsingAArch32(EL3) && SCR_EL3.TLOR == '1' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        return LORN_EL1;
    end if;
elsif PSTATE.EL == EL3 then
    if SCR_EL3.NS == '0' then
        UNDEFINED;
    else
        LORN_EL1 = X[t];
    end if;
else
    LORN_EL1 = X[t];
end if;

MSR LORN_EL1, <Xt>
LORSA_EL1, LORegion Start Address (EL1)

The LORSA_EL1 characteristics are:

**Purpose**

Indicates whether the current LORegion descriptor selected by LORC_EL1.DS is enabled, and holds the physical address of the start of the LORegion.

**Configuration**

This register is present only when ARMv8.1-LOR is implemented. Otherwise, direct accesses to LORSA_EL1 are UNDEFINED.

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- LORC_EL1.DS points to a LORegion that is not supported by the PE.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

LORSA_EL1 is a 64-bit register.

**Field descriptions**

The LORSA_EL1 bit assignments are:

<table>

Any of the fields in this register are permitted to be cached in a TLB.

**Bits [63:52]**

Reserved, RES0.

**SA[51:48], bits [51:48]**

*When ARMv8.2-LPA is implemented:*

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.
**SA[47:16], bits [47:16]**

Bits [47:16] of the start physical address of the LORegion described in the current LORegion descriptor selected by LORC_EL1. Bits[15:0] of this address are defined to be 0x0000. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When ARMv8.2-LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, SA[51:48] form the upper part of the address value. Otherwise, for implementations with fewer than 52 physical address bits, SA[51:48] are RES0.

This field resets to an architecturally **UNKNOWN** value.

**Bits [15:1]**

Reserved, RES0.

**Valid, bit [0]**

Indicates whether the current LORegion Descriptor is enabled.

<table>

MAIR_EL1, Memory Attribute Indirection Register (EL1)

The MAIR_EL1 characteristics are:

**Purpose**

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL1.

**Configuration**

AArch64 System register MAIR_EL1 bits [31:0] are architecturally mapped to AArch32 System register PRRR[31:0] when TTBCR.EAE == 0.

AArch64 System register MAIR_EL1 bits [31:0] are architecturally mapped to AArch32 System register MAIR0[31:0] when TTBCR.EAE == 1.

AArch64 System register MAIR_EL1 bits [63:32] are architecturally mapped to AArch32 System register NMRR[31:0] when TTBCR.EAE == 0.

AArch64 System register MAIR_EL1 bits [63:32] are architecturally mapped to AArch32 System register MAIR1[31:0] when TTBCR.EAE == 1.

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

MAIR_EL1 is a 64-bit register.

**Field descriptions**

The MAIR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

MAIR_EL2, Memory Attribute Indirection Register (EL2)

The MAIR_EL2 characteristics are:

**Purpose**

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL2.

**Configuration**

AArch64 System register MAIR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HMAIR0[31:0].

AArch64 System register MAIR_EL2 bits [63:32] are architecturally mapped to AArch32 System register HMAIR1[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

MAIR_EL2 is a 64-bit register.

**Field descriptions**

The MAIR_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

| Attr7 | Attr6 | Attr5 | Attr4 |
| Attr3 | Attr2 | Attr1 | Attr0 |

MAIR_EL2 is permitted to be cached in a TLB.

Attr<n>, bits [8n+7:8n], for n = 0 to 7

Attr is encoded as follows:
### Attrib | Meaning
--- | ---
0b0000dd00 | Device memory. See encoding of 'dd' for the type of Device memory.
0b0000ddxx, (xx != 00) | UNPREDICTABLE
0b0000iii, (oooo != 0000 and iii != 0000) | Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal Memory.
0b11110000 | Tagged Normal Memory. Inner+Outer Write-Back Non-Transient memory, Inner+Outer Read-Allocate, Inner+Outer Write-Allocate.
0bxxxx0000, (xxxx != 0000 and xxxx != 1111) | UNPREDICTABLE

'dd' is encoded as follows:

| dd | Meaning |
--- | ---|
0b00 | Device-nGnRnE memory
0b01 | Device-nGnRE memory
0b10 | Device-nGRE memory
0b11 | Device-GRE memory

'oooo' is encoded as follows:

| 'oooo' | Meaning |
--- | ---|
0b0000 | See encoding of Attr
0b00RW, RW not | Normal memory, Outer Write-Through Transient
0b00 | Normal memory, Outer Non-cacheable
0b01RW, RW not | Normal memory, Outer Write-Back Transient
0b00 | Normal memory, Outer Write-Through Non-transient
0b01RW | Normal memory, Outer Write-Back Non-transient

'R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

'iiii' is encoded as follows:

| 'iiii' | Meaning |
--- | ---|
0b0000 | See encoding of Attr
0b00RW, RW not | Normal memory, Inner Write-Through Transient
0b00 | Normal memory, Inner Non-cacheable
0b01RW, RW not | Normal memory, Inner Write-Back Transient
0b00 | Normal memory, Inner Write-Through Non-transient
0b01RW | Normal memory, Inner Write-Back Non-transient

'R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'oooo' and 'iiii' fields have the following meanings:

| R or W | Meaning |
--- | ---|
0b0 | No Allocate
0b1 | Allocate

This field resets to an architecturally UNKNOWN value.

### Accessing the MAIR_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic MAIR_EL2 or MAIR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MAIR_EL3, Memory Attribute Indirection Register (EL3)

The MAIR_EL3 characteristics are:

**Purpose**

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL3.

**Configuration**

This register is present only when HaveEL(EL3). Otherwise, direct accesses to MAIR_EL3 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

MAIR_EL3 is a 64-bit register.

**Field descriptions**

The MAIR_EL3 bit assignments are:

<table>
<thead>
<tr>
<th></th>
<th>Attr7</th>
<th>Attr6</th>
<th>Attr5</th>
<th>Attr4</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Attr3</td>
<td>Attr2</td>
<td>Attr1</td>
<td></td>
</tr>
<tr>
<td>31</td>
<td>Attr0</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

MAIR_EL3 is permitted to be cached in a TLB.

**Attr,<n>, bits [8n+7:8n], for n = 0 to 7**

Attr is encoded as follows:

<table>
<thead>
<tr>
<th>Attr</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000dd00</td>
<td>Device memory. See encoding of 'dd' for the type of Device memory.</td>
</tr>
<tr>
<td>0b0000ddxx, (xx != 00)</td>
<td>UNPREDICTABLE</td>
</tr>
<tr>
<td>0b0000iiii, (oooo != 0000 and iiii != 0000)</td>
<td>Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal Memory.</td>
</tr>
<tr>
<td>0b11110000</td>
<td>Tagged Normal Memory. Inner+Outer Write-Back Non-Transient memory, Inner+Outer Read-Allocate, Inner+Outer Write-Allocate.</td>
</tr>
<tr>
<td>0bxxxx0000, (xxxx != 0000 and xxxx != 1111)</td>
<td>UNPREDICTABLE</td>
</tr>
</tbody>
</table>

'dd' is encoded as follows:
MAIR_EL3, Memory Attribute Indirection Register (EL3)

---

<table>
<thead>
<tr>
<th>dd</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Device-nGnRnE memory</td>
</tr>
<tr>
<td>0b01</td>
<td>Device-nGnRE memory</td>
</tr>
<tr>
<td>0b10</td>
<td>Device-nGRE memory</td>
</tr>
<tr>
<td>0b11</td>
<td>Device-GRE memory</td>
</tr>
</tbody>
</table>

'o000' is encoded as follows:

<table>
<thead>
<tr>
<th>'oooo'</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>See encoding of Attr</td>
</tr>
<tr>
<td>0b00RW, RW not</td>
<td>Normal memory, Outer Write-Through Transient</td>
</tr>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable</td>
</tr>
<tr>
<td>0b01RW, RW not</td>
<td>Normal memory, Outer Write-Back Transient</td>
</tr>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Write-Through Non-transient</td>
</tr>
<tr>
<td>0b10RW</td>
<td>Normal memory, Outer Write-Back Non-transient</td>
</tr>
</tbody>
</table>

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

'iiii' is encoded as follows:

<table>
<thead>
<tr>
<th>'iiii'</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>See encoding of Attr</td>
</tr>
<tr>
<td>0b00RW, RW not</td>
<td>Normal memory, Inner Write-Through Transient</td>
</tr>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable</td>
</tr>
<tr>
<td>0b01RW, RW not</td>
<td>Normal memory, Inner Write-Back Transient</td>
</tr>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Write-Through Non-transient</td>
</tr>
<tr>
<td>0b10RW</td>
<td>Normal memory, Inner Write-Back Non-transient</td>
</tr>
</tbody>
</table>

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'oooo' and 'iiii' fields have the following meanings:

<table>
<thead>
<tr>
<th>R or W</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No Allocate</td>
</tr>
<tr>
<td>0b1</td>
<td>Allocate</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

MDCCINT_EL1, Monitor DCC Interrupt Enable Register

The MDCCINT_EL1 characteristics are:

**Purpose**

Enables interrupt requests to be signaled based on the DCC status flags.

**Configuration**

AArch64 System register MDCCINT_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGDCCINT[31:0].

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

MDCCINT_EL1 is a 64-bit register.

**Field descriptions**

The MDCCINT_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit (63:31)</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 62 61 60</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>59 58 57 56</td>
<td>Reserved, RES0</td>

<tr>
<td>39 38 37 36</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>35 34 33 32</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

**Bits [63:31]**

Reserved, RES0.

**RX, bit [30]**

DCC interrupt request enable control for DTRRX. Enables a common **COMMIRQ** interrupt request to be signaled based on the DCC status flags.

<table>
<thead>
<tr>
<th>RX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No interrupt request generated by DTRRX.</td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupt request will be generated on RXfull == 1.</td>
</tr>
</tbody>
</table>

If legacy **COMMRX** and **COMMTX** signals are implemented, then these are not affected by the value of this bit.

On a Warm reset, this field resets to 0.

**TX, bit [29]**

DCC interrupt request enable control for DTRTX. Enables a common **COMMIRQ** interrupt request to be signaled based on the DCC status flags.

<table>
<thead>
<tr>
<th>TX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No interrupt request generated by DTRTX.</td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupt request will be generated on TXfull == 0.</td>
</tr>
</tbody>
</table>

If legacy **COMMRX** and **COMMTX** signals are implemented, then these are not affected by the value of this bit.

On a Warm reset, this field resets to 0.

    else
      return MDCCSR_EL0;
  elsif PSTATE.EL == EL3 then
    return MDCCSR_EL0;
The MDCR_EL2 characteristics are:

**Purpose**

Provides EL2 configuration options for self-hosted debug and the Performance Monitors Extension.

**Configuration**

AArch64 System register MDCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register \( \text{HDCR}[31:0] \).

If EL2 is not implemented, this register is \( \text{RES0} \) from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally \( \text{UNKNOWN} \) values.

**Attributes**

MDCR_EL2 is a 64-bit register.

**Field descriptions**

The MDCR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:29</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

**MTPME, bit [28]**

When \( \text{ARMv8.6-MTPMU} \) is implemented and \( \texttt{!HaveEL(EL3)} \):

Multi-threaded PMU Enable. Enables use of the \( \text{PMEVTYPE}<n>_{\text{EL0}}.\text{MT} \) bits.

<table>
<thead>
<tr>
<th>MTPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ARMv8.6-MTPMU is disabled. The Effective value of ( \text{PMEVTYPE}&lt;n&gt;_{\text{EL0}}.\text{MT} ) is zero.</td>
</tr>
<tr>
<td>0b1</td>
<td>( \text{PMEVTYPE}&lt;n&gt;_{\text{EL0}}.\text{MT} ) bits not affected by this bit.</td>
</tr>
</tbody>
</table>

If ARMv8.6-MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is \( \text{IMPLEMENTATION DEFINED} \) whether the PE behaves as if this bit is 0.

On a Cold reset, this field resets to 1.

**Otherwise:**

Reserved, RES0.
**TDCC, bit [27]**

When ARMv8.6-FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel at EL1 and EL0 to EL2.

<table>
<thead>
<tr>
<th>TDCC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any register accesses to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state, accesses to the DCC registers at EL1 and EL0 generate a Trap exception to EL2, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.</td>
</tr>
</tbody>
</table>

The DCC registers trapped by this control are:

AArch64: **OSDTRRX_EL1**, **OSDTRTX_EL1**, **MDCCSR_EL0**, **MDCCINT_EL1**, and, when the PE is in Non-debug state, **DBGDTR_EL0**, **DBGDTRRX_EL0**, and **DBGDTRTX_EL0**.

AArch32: **DBGDTRRXtext**, **DBGDTRTXtext**, **DBGDSRInt**, **DBGDCINT**, and, when the PE is in Non-debug state, **DBGDTRRXint** and **DBGDTRTXint**.

The traps are reported with EC syndrome value:

- 0x05 for trapped AArch32 MRC and MCR accesses with coproc == 0b1110.
- 0x06 for trapped AArch32 LDC to **DBGDTRTXint** and STC from **DBGDTRRXint**.
- 0x18 for trapped AArch64 MRS and MSR accesses.

When the PE is in Debug state, MDCR_EL2.TDCC does not trap any accesses to:

AArch64: **DBGDTR_EL0**, **DBGDTRRX_EL0**, and **DBGDTRTX_EL0**.

AArch32: **DBGDTRRXint** and **DBGDTRTXint**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**HLP, bit [26]**

When ARMv8.5-PMU is implemented:

Hypervisor Long event counter enable. Determines when unsigned overflow is recorded by a counter overflow bit.

<table>
<thead>
<tr>
<th>HLP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counter overflow on increment that causes unsigned overflow of <strong>PMEVCNTR&lt;n&gt;_EL0[31:0]</strong>.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counter overflow on increment that causes unsigned overflow of <strong>PMEVCNTR&lt;n&gt;_EL0[63:0]</strong>.</td>
</tr>
</tbody>
</table>

If MDCR_EL2.HPMN is less than **PMCR_EL0.N** or **PMCR.N**, this bit affects the operation of event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)] or [MDCR_EL2.HPMN..(PMCR.N-1)]. Otherwise this bit has no effect on the operation of the event counters.

**Note**

The effect of MDCR_EL2.HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state.

For more information see the description of the MDCR_EL2.HPMN field.
On a Warm reset, this field resets to an architecturally `UNKNOWN` value.

Otherwise:

Reserved, RES0.

**E2TB, bits [25:24]**

When TRBE is implemented:

EL2 Trace Buffer. If EL2 is implemented and enabled in the current Security state, controls the owning translation regime and access to Trace Buffer control registers from EL1.

<table>
<thead>
<tr>
<th>E2TB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>If EL2 is implemented and enabled in the current Security state, Trace Buffer owning Exception level is EL2. Accesses to Trace Buffer controls at EL1 generate a Trap exception to EL2.</td>
</tr>
<tr>
<td>0b10</td>
<td>Trace Buffer owning Exception level is EL1. If TraceBufferEnabled() == TRUE, tracing is prohibited at EL2. If EL2 is implemented and enabled in the current Security state, accesses to Trace Buffer controls at EL1 generate a Trap exception to EL2.</td>
</tr>
<tr>
<td>0b11</td>
<td>Trace Buffer owning Exception level is EL1. If TraceBufferEnabled() == TRUE, tracing is prohibited at EL2.</td>
</tr>
</tbody>
</table>

The Trace Buffer control registers trapped by this control are: TRBBASER_EL1, TRBLIMITR_EL1, TRBMAR_EL1, TRBPTR_EL1, TRBSR_EL1, and TRBTRG_EL1.

If EL2 is not implemented or is disabled, the PE behaves as if this field is 0b11, other than for a direct read of the register.

On a Warm reset, this field resets to an architecturally `UNKNOWN` value.

Otherwise:

Reserved, RES0.

**HCCD, bit [23]**

When ARMv8.5-PMU is implemented:

Hypervisor Cycle Counter Disable. Prohibits PMCCNTR_EL0 from counting at EL2.

<table>
<thead>
<tr>
<th>HCCD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counting by PMCCNTR_EL0 is not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Cycle counting by PMCCNTR_EL0 is prohibited at EL2.</td>
</tr>
</tbody>
</table>

This bit does not affect the CPU_CYCLES event or any other event that counts cycles.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

**Bits [22:20]**

Reserved, RES0.
**TTRF, bit [19]**

When ARMv8.4-Trace is implemented:

Traps use of the Trace Filter Control registers at EL1 to EL2, as follows:

- Access to TRFCR_EL1 is trapped to EL2, reported using EC syndrome value 0x18.
- Access to TRFCR is trapped to EL2, reported using EC syndrome value 0x03.

<table>
<thead>
<tr>
<th>TTRF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to TRFCR_EL1 and TRFCR at EL1 are not affected by this control.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to TRFCR_EL1 and TRFCR at EL1 generate a trap exception to EL2 when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

**Bit [18]**

Reserved, RES0.

**HPMD, bit [17]**

When ARMv8.1-PMU is implemented:

Guest Performance Monitors Disable. This control prohibits event counting at EL2.

<table>
<thead>
<tr>
<th>HPMD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counting allowed at EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counting prohibited at EL2.</td>
</tr>
</tbody>
</table>

If ARMv8.2-Debug is not implemented, event counting is prohibited unless enabled by the IMPLEMENTATION DEFINED authentication interface `ExternalSecureNoninvasiveDebugEnabled()`.

This control applies only to:

- The event counters in the range [0..(MDCR_EL2.HPMN-1)].
- If PMCR_EL0.DP is set to 1, PMCCNTR_EL0.

The other event counters are unaffected, and when PMCR_EL0.DP is set to 0, PMCCNTR_EL0 is unaffected.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

**Bits [16:15]**

Reserved, RES0.

**TPMS, bit [14]**

When SPE is implemented:

Trap Performance Monitor Sampling. When EL2 is enabled in the current Security state, this field controls access to Statistical Profiling control registers from EL1.
<table>
<thead>
<tr>
<th>TPMS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not trap Statistical Profiling controls to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to Statistical Profiling controls at EL1 generate a Trap exception to EL2 when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

The Statistical Profiling control registers trapped by this control are: `PMSCR_EL1`, `PMSEVFR_EL1`, `PMSFCR_EL1`, `PMSICR_EL1`, `PMSIDR_EL1`, `PMSIRR_EL1`, and `PMSLATFR_EL1`.

Otherwise:

Reserved, RES0.

**E2PB, bits [13:12]**

When SPE is implemented:

EL2 Profiling Buffer. If EL2 is implemented and enabled in the Profiling Buffer owning Security state, this field controls the owning translation regime. If EL2 is implemented and enabled in the current Security state, this field controls access to Profiling Buffer control registers from EL1.

<table>
<thead>
<tr>
<th>E2PB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>If EL2 is implemented and enabled in the Profiling Buffer owning Security state, the Profiling Buffer uses the EL2 or EL2&amp;0 stage 1 translation regime. Otherwise the Profiling Buffer uses the EL1&amp;0 stage 1 translation regime. If EL2 is implemented and enabled in the current Security state, accesses to Profiling Buffer control registers at EL1 generate a Trap exception to EL2.</td>
</tr>
<tr>
<td>0b10</td>
<td>Profiling Buffer uses the EL1&amp;0 stage 1 translation regime. If EL2 is implemented and enabled in the current Security state, accesses to Profiling Buffer control registers at EL1 generate a Trap exception to EL2.</td>
</tr>
<tr>
<td>0b11</td>
<td>Profiling Buffer uses the EL1&amp;0 stage 1 translation regime. Accesses to Profiling Buffer control registers at EL1 are not trapped to EL2.</td>
</tr>
</tbody>
</table>

All other values are reserved.

The Profiling Buffer control registers trapped by this control are: `PMBLIMITR_EL1`, `PMBPTR_EL1`, and `PMBSR_EL1`.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**TDRA, bit [11]**

Trap Debug ROM Address register access. Traps System register accesses to the Debug ROM registers to EL2 when EL2 is enabled in the current Security state as follows:

- If EL1 is using AArch64 state, accesses to `MDRAR_EL1` are trapped to EL2, reported using EC syndrome value 0x18.
- If EL0 or EL1 is using AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05 and MRRC or MCRR accesses are trapped to EL2, reported using EC syndrome value 0x0C:
  - `DBGDRAR`, `DBGDSAR`.

<table>
<thead>
<tr>
<th>TDRA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 and EL1 System register accesses to the Debug ROM registers are trapped to EL2 when EL2 is enabled in the current Security state, unless it is trapped by <code>DBGDSCRext</code>, UDCCdis or <code>MDSCR_EL1</code>.TDCC.</td>
</tr>
</tbody>
</table>
This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- `MDCR_EL2.TDE == 1`.
- `HCR_EL2.TGE == 1`.

## Note

EL2 does not provide traps on debug register accesses through the optional memory-mapped external debug interfaces.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

On a Warm reset, this field resets to an architecturally `UNKNOWN` value.

### TDOSA, bit [10]

**When ARMv8.0-DoubleLock is implemented:**

Trap debug OS-related register access. Traps EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value `0x18`:
  - `OSLAR_EL1`, `OSLSR_EL1`, `OSDLR_EL1`, and `DBGPRCR_EL1`.
  - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value `0x05`:
  - `DBGOSLSR`, `DBGOSLAR`, `DBGOSDLR`, and `DBGPRCR`.
  - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

<table>
<thead>
<tr>
<th>TDOSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 System register accesses to the powerdown debug registers are trapped to EL2 when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

## Note

These registers are not accessible at EL0.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- `MDCR_EL2.TDE == 1`.
- `HCR_EL2.TGE == 1`.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

On a Warm reset, this field resets to an architecturally `UNKNOWN` value.

**Otherwise:**

Trap debug OS-related register access. Traps EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value `0x18`:
  - `OSLAR_EL1`, `OSLSR_EL1`, and `DBGPRCR_EL1`.
  - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
In AArch32 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05:

- DBGOSLSR, DBGOSLAR, and DBGPRCR.
- Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

It is IMPLEMENTATION DEFINED whether accesses to OSDLR_EL1 are trapped and DBGOSDLR are trapped.

<table>
<thead>
<tr>
<th>TDOSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 System register accesses to the powerdown debug registers are trapped to EL2 when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

**Note**

These registers are not accessible at EL0.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- MDCR_EL2.TDE == 1.
- HCR_EL2.TGE == 1.

**Note**

EL2 does not provide traps on debug register accesses through the optional memory-mapped external debug interfaces.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TDA, bit [9]**

Trap Debug Access. Traps EL0 and EL1 System register accesses to debug System registers that are not trapped by MDCR_EL2.TDRA or MDCR_EL2.TDOSA, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2 reported using EC syndrome value 0x18:
  - MDCCSR_EL0, MDCCINT_EL1, OSDTRRX_EL1, MDSCR_EL1, OSDTRTX_EL1, OSECER_EL1, DBGVR<n>_EL1, DBGBCR<n>_EL1, DBGWVR<n>_EL1, DBGWCR<n>_EL1, DBGCLAIMSET_EL1, DBGCLAIMCLR_EL1, DBGAUTHSTATUS_EL1.
  - When not in Debug state, DBGDTR_EL0, DBGDTRRX_EL0, DBGDTRTX_EL0.
- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05:
  - DBGDIR, DBGDCRint, DBGDCINT, DBGWAFAR, DBGVCRC, DBGDCRext, DBGDTRXext, DBGVR<n>, DBGBCR<n>, DBGBXVR<n>, DBGWCR<n>, DBGWVR<n>, DBGCLAIMSET, DBGCLAIMCLR, DBGAUTHSTATUS, DBGDEVID, DBGDEVID1, DBGDEVID2, DBGOSERRCR.
  - When not in Debug state, DBGDTRRXint and DBGDTRTXint.
- In AArch32 state, STC accesses to DBGDTRRXint and LDC accesses to DBGDTRTXint are trapped to EL2, reported using EC syndrome value 0x06.

<table>
<thead>
<tr>
<th>TDA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 or EL1 System register accesses to the debug registers are trapped from both Execution states to EL2 when EL2 is enabled in the current Security state, unless the access generates a higher priority exception.</td>
</tr>
</tbody>
</table>

Traps of AArch32 accesses to DBGDTRRXint and DBGDTRTXint are ignored in Debug state.

Traps of AArch64 accesses to DBGDT_ELO, DBGDTRRX_ELO, and DBGDTRTX_ELO are ignored in Debug state.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:
• **MDCR_EL2.TDE == 1**
• **HCR_EL2.TGE == 1**

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### TDE, bit [8]

**Trap Debug exceptions.**

<table>
<thead>
<tr>
<th>TDE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on the routing of debug exceptions, and has no effect on accesses to debug registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>Debug exceptions generated at EL1 or EL0 are routed to EL2 when EL2 is enabled in the current Security state. The MDCR_EL2.(TDRA, TDOSA, TDA) fields are treated as being 1 for all purposes other than returning the result of a direct read of the register.</td>
</tr>
</tbody>
</table>

This field is treated as being 1 for all purposes other than a direct read when **HCR_EL2.TGE == 1**.

### HPME, bit [7]

When PMUv3 is implemented:

**[MDCR_EL2.HPMN..(N-1)] event counters enable.**

<table>
<thead>
<tr>
<th>HPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)] are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)] are enabled by PMCNTENSET_EL0.</td>
</tr>
</tbody>
</table>

If MDCR_EL2.HPMN is less than PMCR_EL0.N or PMCR.N, the event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)] or [HDCR.HPMN..(PMCR.N-1)], are enabled and disabled by this bit. Otherwise this bit has no effect on the operation of the event counters.

**Note**

The effect of MDCR_EL2.HPMN on the operation of this bit applies regardless of whether EL2 is enabled in the current Security state.

For more information see the description of the HPMN field.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Otherwise:

Reserved, RES0.

### TPM, bit [6]

When PMUv3 is implemented:

**Trap Performance Monitors accesses.** Traps EL0 and EL1 accesses to all Performance Monitor registers to EL2 when EL2 is enabled in the current Security state, from both Execution states, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - **PMCR_EL0**, **PMCNTENSET_EL0**, **PMCNTENCLR_EL0**, **PMOVSCLR_EL0**, **PMSWINC_EL0**, **PMSERL_EL0**, **PMCEID0_EL0**, **PMCEID1_EL0**, **PMCCNTR_EL0**, **PMXEVTYPEP_EL0**.
PMXEVCNTR_EL0, PMUSERENR_EL0, PMINTENSET_EL1, PMINTENCLR_EL1, PMOVSSET_EL0, PMEVCNTR<n>_EL0, PMEVTYPER<n>_EL0, PMEZEVNTR_EL0, PMCCFILTR_EL0.

- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2 and reported using EC syndrome value 0x03, MRRC or MCRR accesses are trapped to EL2 and reported using EC syndrome value 0x04:
  - PMCR, PMCNTENSET, PMCNTENCLR, PMOVSR, PMSWINC, PMSELR, PMCEID0, PMCEID1, PMCCNTR, PMXEVTPER, PMXENVTR, PMUSERENR, PMINTENSET, PMINTENCLR, PMOVSSET, PMEVCNTR<n>, PMEVTYPER<n>, PMCCFILTR.

- If ARMv8.4-PMU is implemented, in AArch64 state, PMMIR_EL1, and in AArch32 state, PMMIR.

- If ARMv8.1-PMU is implemented, in AArch32 state, PMCEID2, and PMCEID3.

<table>
<thead>
<tr>
<th>TPM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 and EL1 accesses to all Performance Monitor registers are trapped to EL2 when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

**Note**

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TPMCR, bit [5]**

*When PMUv3 is implemented:*

Trap PMCR_EL0 or PMCR accesses. Traps EL0 and EL1 accesses to EL2, when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to PMCR_EL0 are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, accesses to PMCR are trapped to EL2, reported using EC syndrome value 0x03.

<table>
<thead>
<tr>
<th>TPMCR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 and EL1 accesses to the PMCR_EL0 or PMCR are trapped to EL2 when EL2 is enabled in the current Security state, unless it is trapped by PMUSERENR.EN or PMUSERENR_EL0.EN.</td>
</tr>
</tbody>
</table>

**Note**

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.
HPMN, bits [4:0]

When PMUv3 is implemented:

Defines the number of event counters that are accessible from EL3, EL2, EL1, and from EL0 if permitted.

If HPMN is less than \( \text{PMCR\_EL0}\_N \), HPMN divides the Performance Monitors into two ranges: \( 0..(\text{HPMN}-1) \) and \( \text{HPMN..(PMCR\_EL0\_N)-1} \).

For an event counter in the range \( 0..(\text{HPMN}-1) \):

- The counter is accessible from EL3, EL2, and EL1, and from EL0 if permitted by \( \text{PMUSERENR\_EL0} \) or \( \text{PMUSERENR} \).
- If Armv8.5-PMU is implemented, \( \text{PMCR\_EL0}\_LP \) or \( \text{PMCR\_LP} \) determines whether the counter overflow flag is set on unsigned overflow of \( \text{PMEVCNTR}<n>\_\text{EL0}[31:0] \) or \( \text{PMEVCNTR}<n>\_\text{EL0}[63:0] \).
- The counter is enabled by \( \text{PMCR\_EL0}\_E \) or \( \text{PMCR\_E} \) and bit \( <n> \) of \( \text{PMCNTENSET\_EL0} \).

**Note**

If HPMN is equal to \( \text{PMCR\_EL0}\_N \), this applies to all event counters.

If HPMN is less than \( \text{PMCR\_EL0}\_N \), for an event counter in the range \( \text{HPMN..(PMCR\_EL0\_N)-1} \):

- The counter is accessible from EL2 and EL3.
- If Armv8.4-SecEL2 is disabled or is not implemented, the counter is also accessible from Secure EL1, and from Secure EL0 if permitted by \( \text{PMUSERENR\_EL0} \).
- If Armv8.5-PMU is implemented, MDCR\_EL2.HLP or \( \text{HDCR\_HLP} \) determines whether the counter overflow flag is set on unsigned overflow of \( \text{PMEVCNTR}<n>\_\text{EL0}[31:0] \) or \( \text{PMEVCNTR}<n>\_\text{EL0}[63:0] \).
- The counter is enabled by MDCR\_EL2.HPME or \( \text{HDCR\_HPME} \) and bit \( <n> \) of \( \text{PMCNTENSET\_EL0} \).

If this field is set to 0, or to a value larger than \( \text{PMCR\_EL0}\_N \), then the following \text{CONSTRAINED UNPREDICTABLE} behaviors apply:

- The value returned by a direct read of MDCR\_EL2.HPMN is \text{UNKNOWN}.
- Either:
  - An \text{UNKNOWN} number of counters are reserved for EL2 and EL3 use. That is, the PE behaves as if MDCR\_EL2.HPMN is set to an \text{UNKNOWN} non-zero value less than or equal to \( \text{PMCR\_EL0}\_N \).
  - All counters are reserved for EL2 and EL3 use, meaning no counters are accessible from EL1 and EL0.

On a Warm reset, this field resets to the value in \( \text{PMCR\_EL0}\_N \).

**Otherwise:**

Reserved, RES0.

### Accessing the MDCR\_EL2

Accesses to this register use the following encodings:

\[
\begin{array}{|c|c|c|c|}
\hline
\text{op0} & \text{op1} & \text{CRn} & \text{CRm} & \text{op2} \\
0b11 & 0b100 & 0b0001 & 0b0001 & 0b001 \\
\hline
\end{array}
\]

elsif PSTATE.EL == EL3 then
    MDCR_EL2 = X[t];
The MDCR_EL3 characteristics are:

**Purpose**

Provides EL3 configuration options for self-hosted debug and the Performance Monitors Extension.

**Configuration**

AArch64 System register MDCR_EL3 bits [31:0] can be mapped to AArch32 System register SDCR[31:0], but this is not architecturally mandated.

This register is present only when HaveEL(EL3). Otherwise, direct accesses to MDCR_EL3 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

MDCR_EL3 is a 64-bit register.

**Field descriptions**

The MDCR_EL3 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:29]</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
<tbody>
<tr>
<td>MTPME, bit [28]</td>
<td>When ARMv8.6-MTPMU is implemented:</td>
</tr>
<tr>
<td>Multi-threaded PMU Enable. Enables use of the PMEVTYPER&lt;n&gt;_EL0.MT bits.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>MTPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ARMv8.6-MTPMU is disabled. The Effective value of PMEVTYPER&lt;n&gt;_EL0.MT is zero.</td>
</tr>
<tr>
<td>0b1</td>
<td>PMEVTYPER&lt;n&gt;_EL0.MT bits not affected by this bit.</td>
</tr>
</tbody>
</table>

If ARMv8.6-MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this bit is 0.

On a Cold reset, this field resets to 1.

**Otherwise:**

Reserved, RES0.
TDCC, bit [27]

When ARMv8.6-FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel at EL2, EL1, and EL0 to EL3.

<table>
<thead>
<tr>
<th>TDCC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any register accesses to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to the DCC registers at EL2, EL1, and EL0 generate a Trap exception to EL3, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.</td>
</tr>
</tbody>
</table>

The DCC registers trapped by this control are:

AArch64: **OSDTRRX EL1, OSDTRTX EL1, MDCCSR EL0, MDCCINT EL1**, and, when the PE is in Non-debug state, **DBGDTR EL0, DBGDTRRX EL0, and DBGDTRTX EL0**.

AArch32: **DBGDTRRXext, DBGDTRTXext, DBGDSCRint, DBGDCCINT**, and, when the PE is in Non-debug state, **DBGDTRRXint and DBGDTRTXint**.

The traps are reported with EC syndrome value:

- 0x05 for trapped AArch32 MRC and MCR accesses with coproc == 0b1110.
- 0x06 for trapped AArch32 LDC to **DBGDTRTXint** and STC from **DBGDTRRXint**.
- 0x18 for trapped AArch64 MRS and MSR accesses.

When the PE is in Debug state, MDCR_EL3.TDCC does not trap any accesses to:

AArch64: **DBGDTR EL0, DBGDTRRX EL0**, and **DBGDTRTX EL0**.

AArch32: **DBGDTRRXint** and **DBGDTRTXint**.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Reserved, RES0.

NSTB, bits [25:24]

When TRBE is implemented:

Non-secure Trace Buffer. Controls the owning translation regime and accesses to Trace Buffer control registers from EL2 and EL1.
Trace Buffer owning security state is Secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Non-secure state. Accesses to Trace Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3.

Trace Buffer owning security state is Secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Non-secure state. Accesses to Trace Buffer control registers at EL2 and EL1 in Non-secure state generate Trap exceptions to EL3.

Trace Buffer owning security state is Non-secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Secure state. Accesses to Trace Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3.

Trace Buffer owning security state is Non-secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Secure state. Accesses to Trace Buffer control registers at EL2 and EL1 in Secure state generate Trap exceptions to EL3.

The Trace Buffer control registers trapped by this control are: TRBBASER_EL1, TRBLIMITR_EL1, TRBMAP_EL1, TRBPTR_EL1, TRBSR_EL1, and TRBTRG_EL1.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b1, the PE behaves as if this field is 0b11. If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, the PE behaves as if this field is 0b01.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SCCD, bit [23]

When ARMv8.5-PMU is implemented:

Secure Cycle Counter Disable. Prohibits PMCCNTR_EL0 from counting in Secure state.

This bit does not affect the CPU_CYCLES event or any other event that counts cycles.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

ETAD, bit [22]

When TRBE is implemented:

External Trace Non-secure Access Disable. Controls Non-secure access to PE Trace Unit registers by an external debugger.

If the Trace Extension does not support external debug interface accesses this bit is RES0.

Otherwise, if EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this field is 0b1.
On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

**EPMAD, bit [21]**

*When ARMv8.4-Debug is implemented and PMUv3 is implemented:*

External Performance Monitors Non-secure Access Disable. Controls Non-secure access to Performance Monitor registers by an external debugger.

<table>
<thead>
<tr>
<th>EPMAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure access to Performance Monitor registers from external debugger is permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure access to Performance Monitor registers from external debugger is not permitted.</td>
</tr>
</tbody>
</table>

If the Performance Monitors Extension does not support external debug interface accesses this bit is RES0.

Otherwise, if EL3 is not implemented and the Effective value of SCR_EL3, NS is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

*When PMUv3 is implemented:*

External Performance Monitors Access Disable. Controls access to Performance Monitor registers by an external debugger.

<table>
<thead>
<tr>
<th>EPMAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to Performance Monitor registers from external debugger is permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access to Performance Monitor registers from external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.</td>
</tr>
</tbody>
</table>

If the Performance Monitors Extension does not support external debug interface accesses this bit is RES0.

Otherwise, if EL3 is not implemented and the Effective value of SCR_EL3, NS is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

**EDAD, bit [20]**

*When ARMv8.4-Debug is implemented:*

External Debug Non-secure Access Disable. Controls Non-secure access to breakpoint, watchpoint, and OSLAR_EL1 registers by an external debugger.

<table>
<thead>
<tr>
<th>EDAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure access to debug registers from external debugger is permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure access to breakpoint and watchpoint registers, and OSLAR_EL1 from external debugger is not permitted.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the Effective value of SCR_EL3, NS is 0b0, then the Effective value of this field is 0b1.
On a Warm reset, this field resets to 0.

When ARMv8.2-Debug is implemented:

External Debug Access Disable. Controls access to breakpoint, watchpoint, and OSLAR_EL1 registers by an external debugger.

<table>
<thead>
<tr>
<th>EDAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to debug registers, and to OSLAR_EL1 from external debugger is permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access to breakpoint and watchpoint registers, and to OSLAR_EL1 from external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this field is 0b1.

On a Warm reset, this field resets to 0.

Otherwise:

External Debug Access disable. Controls access to breakpoint, watchpoint, and optionally OSLAR_EL1 registers by an external debugger.

<table>
<thead>
<tr>
<th>EDAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to debug registers from external debugger is permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access to breakpoint and watchpoint registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface. It is IMPLEMENTATION DEFINED whether access to the OSLAR_EL1 register from an external debugger is permitted or not permitted.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this field is 0b1.

On a Warm reset, this field resets to 0.

TTRF, bit [19]

When ARMv8.4-Trace is implemented:

Trap Trace Filter controls. Traps use of the Trace Filter control registers at EL2 and EL1 to EL3.

The Trace Filter registers trapped by this control are:

- TRFCR_EL2, TRFCR_EL12, TRFCR_EL1, reported using EC syndrome value 0x18.
- HTRFCR and TRFCR, reported using EC syndrome value 0x03.

<table>
<thead>
<tr>
<th>TTRF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to Trace Filter registers at EL2 and EL1 are not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to Trace Filter registers at EL2 and EL1 generate a Trap exception to EL3, unless the access generates a higher priority exception.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.
**STE, bit [18]**

**When ARMv8.4-Trace is implemented:**

Secure Trace enable. Enables tracing in Secure state.

<table>
<thead>
<tr>
<th>STE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Trace prohibited in Secure state unless overridden by the [IMPLEMENTATION DEFINED] authentication interface.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trace in Secure state is not affected by this bit.</td>
</tr>
</tbody>
</table>

This bit also controls the level of authentication required by an external debugger to enable external tracing. See 'Register controls to enable self-hosted trace' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

If EL3 is not implemented the Effective value of `SCR_EL3.NS` is 0b0, the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**SPME, bit [17]**

**When ARMv8.2-Debug is implemented and PMUv3 is implemented:**

Secure Performance Monitors enable. This allows event counting in Secure state.

<table>
<thead>
<tr>
<th>SPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counting prohibited in Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counting in Secure state not affected by this bit.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented the Effective value of `SCR_EL3.NS` is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

**When PMUv3 is implemented:**

Secure Performance Monitors enable. This allows event counting in Secure state.

<table>
<thead>
<tr>
<th>SPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counting prohibited in Secure state, unless <code>ExternalSecureNoninvasiveDebugEnabled()</code> is TRUE.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counting in Secure state not affected by this bit.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented the Effective value of `SCR_EL3.NS` is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**SDD, bit [16]**

AArch64 Secure Self-hosted invasive debug disable. Disables Software debug exceptions in Secure state, other than Breakpoint Instruction exceptions.

<table>
<thead>
<tr>
<th>SDD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Debug exceptions in Secure state are not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Debug exceptions, other than Breakpoint Instruction exceptions, are disabled from all Exception levels in Secure state.</td>
</tr>
</tbody>
</table>
The SDD bit is ignored unless both of the following are true:

- The PE is in Secure state.
- The Effective value of SCR_EL3.RW is 0b1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SPD32, bits [15:14]**

AArch32 Secure self-hosted privileged debug. Enables or disables debug exceptions from Secure EL1 using AArch32, other than Breakpoint Instruction exceptions.

<table>
<thead>
<tr>
<th>SPD32</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Legacy mode. Debug exceptions from Secure EL1 are enabled by the IMPLEMENTATION DEFINED authentication interface.</td>
</tr>
<tr>
<td>0b10</td>
<td>Secure privileged debug disabled. Debug exceptions from Secure EL1 are disabled.</td>
</tr>
<tr>
<td>0b11</td>
<td>Secure privileged debug enabled. Debug exceptions from Secure EL1 are enabled.</td>
</tr>
</tbody>
</table>

Other values are reserved, and have the CONSTRAINED UNPREDICTABLE behavior that they must have the same behavior as 0b00. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field has no effect on Breakpoint Instruction exceptions. These are always enabled.

This field is:

- Ignored if the PE is either:
  - In Non-secure state.
  - In Secure state and Secure EL1 is using AArch64.
- RES0 if the implementation does not support EL1 using AArch32.

If Secure EL1 is using AArch32 then:

- If debug exceptions from Secure EL1 are enabled, then debug exceptions from Secure EL0 are also enabled.
- Otherwise, debug exceptions from Secure EL0 are enabled only if the value of SDER32_EL3.SUIDEN is 0b1.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this field is 0b11.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**NSPB, bits [13:12]**

When SPE is implemented:

Non-secure Profiling Buffer. This field controls the owning translation regime and accesses to Statistical Profiling and Profiling Buffer control registers.
NSPB

<table>
<thead>
<tr>
<th>Meaning</th>
<th>NSPB</th>
</tr>
</thead>
<tbody>
<tr>
<td>Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in both security states generate Trap exceptions to EL3.</td>
<td>0b00</td>
</tr>
<tr>
<td>Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Non-secure state generate Trap exceptions to EL3.</td>
<td>0b01</td>
</tr>
<tr>
<td>Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in both security states generate Trap exceptions to EL3.</td>
<td>0b10</td>
</tr>
<tr>
<td>Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Secure state generate Trap exceptions to EL3.</td>
<td>0b11</td>
</tr>
</tbody>
</table>

The Statistical Profiling and Profiling Buffer control registers trapped by this control are: **PMBLIMITR_EL1**, **PMBPTR_EL1**, **PMBSR_EL1**, **PMSRCR_EL1**, **PMEVFR_EL1**, **PMSFCR_EL1**, **PMSICR_EL1**, **PMSIDR_EL1**, **PMSIRR_EL1**, and **PMSLATR_EL1**.

If EL3 is not implemented and the Effective value of **SCR_EL3.NS** is 0b1, the Effective value of this field is 0b11. If EL3 is not implemented and the Effective value of **SCR_EL3.NS** is 0b0, the Effective value of this field is 0b01.

On a Warm reset, this field resets to an **UNKNOWN** value.

Otherwise:

Reserved, RES0.

Bit [11]

Reserved, RES0.

TDOSA, bit [10]

When ARMv8.0-DoubleLock is implemented:

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

Accesses to the registers are trapped as follows:

- Accesses from AArch64 state, **OSLR_EL1**, **OSLRSR_EL1**, **OSDLR_EL1**, **DBGPRCR_EL1** and any **IMPLEMENTATION DEFINED** register with similar functionality that the implementation specifies as trapped by this bit, are trapped to EL3 and reported using EC syndrome value 0x18.
- Accesses using MCR or MRC to **DBGOSLAR**, **DBGOSLRSR**, **DBGOSDLR**, and **DBGPRCR**, are trapped to EL3 and reported using EC syndrome value 0x05.
- Accesses to any **IMPLEMENTATION DEFINED** register with similar functionality that the implementation specifies as trapped by this bit.

<table>
<thead>
<tr>
<th>TDOSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by <strong>HDCR.TDOSA</strong> or <strong>MDCR_EL2.TDOSA</strong>.</td>
</tr>
</tbody>
</table>

Note

The powerdown debug registers are not accessible at EL0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Otherwise:

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

The following registers are affected by this trap:

- **AArch64**: OSLAR_EL1, OSLSR_EL1, and DBGPRCR_EL1.
- **AArch32**: DBGOSLAR, DBGOSLSR, and DBGPRCR.
- **AArch64 and AArch32**: Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- It is IMPLEMENTATION DEFINED whether accesses to OSDLR_EL1 and DBGOSDLR are trapped.

<table>
<thead>
<tr>
<th>TDOSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by HDCR.TDOSA or MDCR_EL2.TDOSA.</td>
</tr>
</tbody>
</table>

Note

The powerdown debug registers are not accessible at EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TDA, bit [9]**

Trap Debug Access. Traps EL2, EL1, and EL0 System register accesses to those debug System registers that cannot be trapped using the MDCR_EL3.TDOSA field.

Accesses to the debug registers are trapped as follows:

- In AArch64 state, the following registers are trapped to EL3 and reported using EC syndrome value 0x18:
  - DBGBRV<n>_EL1, DBGBCR<n>_EL1, DBGWVR<n>_EL1, DBGWCR<n>_EL1, DBGCLAIMSET_EL1, DBGCLAIMCLR_EL1, DBGAUTHSTATUS_EL1, DBGVR<n>_EL1.
  - AArch64: MDCR_EL2, MDRAR_EL1, MDCCSR_EL0, MDCCINT_EL1, MDSCR_EL1, OSDTRRX_EL1, OSDTRTX_EL1.
- In AArch32 state, SDER is trapped to EL3 and reported using EC syndrome value 0x03.
- In AArch32 state, accesses using MCR or MRC to the following registers are reported using EC syndrome value 0x05, accesses using MCRR or MRRC are reported using EC syndrome value 0x0C:
  - HDCR, DBGDRAR, DBGDSAR, DBGDRAR, DBGDCCINT, DBGWPAR, DBGVCR, DBGVR<n>, DBGBCR<n>, DBGWCR<n>, DBGWVR<n>.
  - DBGCLAIMSET, DBGCLAIMCLR, DBGAUTHSTATUS, DBGDEVID, DBGDEVID1, DBGDEVID2, DBGSECCR.
- In AArch32 state, STC accesses to DBGDTRRXint and LDC accesses to DBGDTRTXint are reported using EC syndrome value 0x06.
- When not in Debug state, the following registers are also trapped to EL3:
  - AArch64 accesses to DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0, reported using EC syndrome value 0x18.
  - AArch32 accesses using MCR or MRC to DBGDTRXint and DBGDTRTXint, reported using EC syndrome value 0x05.

<table>
<thead>
<tr>
<th>TDA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0, EL1, and EL2 accesses to the debug registers, other than the registers that can be trapped by MDCR_EL3.TDOSA, are trapped to EL3, from both Security states and both Execution states, unless it is trapped by DBGDSCRx, UDCCdies, MDSCR_EL1.TDCC, HDCR.TDA or MDCR_EL2.TDOSA.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [8:7]**

Reserved, RES0.

**TPM, bit [6]**
When PMUv3 is implemented:

Trap Performance Monitor register accesses. Accesses to all Performance Monitor registers from EL0, EL1 and EL2 to EL3, from both Security states and both Execution states are trapped as follows:

- In AArch64 state, accesses to the following registers are trapped to EL3 and are reported using EC syndrome value 0x18:
  - PMCR_EL0, PMCNTENSET_EL0, PMCNTENCLR_EL0, PMOVSCLR_EL0, PMSWINC_EL0, PMSELR_EL0, PMCEID0_EL0, PMCEID1_EL0, PMCCNTR_EL0, PMXEVTYPER_EL0, PMXEVCNTR_EL0, PMUSERENR_EL0, PMINTENSET_EL1, PMINTENCLR_EL1, PMOVSSET_EL0, PMEVNCNTR<\text{n}>_EL0, PMEVTPYPER<\text{n}>_EL0.

- In AArch32 state, accesses using MCR or MRC to the following registers are reported using EC syndrome value 0x03, accesses using MCRR or MRRC are reported using EC syndrome value 0x04:
  - PMCR, PMCNTENSET, PMCNTENCLR, PMOVS, PMSWINC, PMSELR, PMCEID0, PMCEID1, PMCCNTR, PMXEVTYPER, PMXEVCNTR, PMUSERENR, PMINTENSET, PMINTENCLR, PMOVSSET, PMEVNCNTR<\text{n}>, PMEVTPYPER<\text{n}>, PMCFILTR.

- If ARMv8.4-PMU is implemented, in AArch64 state, PMMIR_EL1, and in AArch32 state, PMMIR.
- If ARMv8.1-PMU is implemented, in AArch32 state, PMCEID2, and PMCEID3.

<table>

The MDRAR_EL1 characteristics are:

**Purpose**

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system. Armv8 deprecates any use of this register.

**Configuration**

AArch64 System register MDRAR_EL1 bits [63:0] are architecturally mapped to AArch32 System register DBGDRAR[63:0].

**Attributes**

MDRAR_EL1 is a 64-bit register.

**Field descriptions**

The MDRAR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:52</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>51:48</td>
<td>ROMADDR[51:48], bits [51:48]</td>
</tr>
<tr>
<td>47:12</td>
<td>ROMADDR[47:12], bits [47:12]</td>
</tr>
<tr>
<td></td>
<td>Bits [47:12] of the ROM table physical address.</td>
</tr>
</tbody>
</table>

**Bits [63:52]**

Reserved, RES0.

**ROMADDR[51:48], bits [51:48]**

When Armv8.2-LPA is implemented:

Otherwise:

Reserved, RES0.

**ROMADDR[47:12], bits [47:12]**

Bits[47:12] of the ROM table physical address.

When Armv8.2-LPA is implemented, ROMADDR[51:48] forms the upper part of the address value. Otherwise, ROMADDR[51:48] is RES0.

If the physical address size in bits (PAsize) is less than 52, then the register bits corresponding to ROMADDR [51:PAsize] are RES0.

Bits [11:0] of the ROM table physical address are zero.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.
In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

Bits [11:2]

Reserved, RES0.

Valid, bits [1:0]

This field indicates whether the ROM Table address is valid. The permitted values of this field are:

<table>
<thead>
<tr>
<th>Valid</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>ROM Table address is not valid. Software must ignore ROMADDR.</td>
</tr>
<tr>
<td>0b11</td>
<td>ROM Table address is valid.</td>
</tr>
</tbody>
</table>

Other values are reserved.

The MDSCR_EL1 characteristics are:

**Purpose**

Main control register for the debug implementation.

**Configuration**

AArch64 System register MDSCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGDSRext[31:0].

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

MDSCR_EL1 is a 64-bit register.

**Field descriptions**

The MDSCR_EL1 bit assignments are:

**Bits [63:32]**

Reserved, RES0.

**TFO, bit [31]**

When ARMv8.4-Trace is implemented:

Trace Filter override. Used for save/restore of EDSCR.TFO.

When OLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.TFO. Reads and writes of this bit are indirect accesses to EDSCR.TFO.

Accessing this field has the following behavior:

- When OLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OLSR_EL1.OSLK == 0, access to this field is **RO**.

**Otherwise:**

Reserved, RES0.

**RXfull, bit [30]**

Used for save/restore of EDSCR.RXfull.
When $\text{OSLSR}_{\text{EL1}}.\text{OSLK} == 0$, software must treat this bit as UNK/SBZP.

When $\text{OSLSR}_{\text{EL1}}.\text{OSLK} == 1$, this bit holds the value of $\text{EDSCR}.\text{RXfull}$. Reads and writes of this bit are indirect accesses to $\text{EDSCR}.\text{RXfull}$.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When $\text{OSLSR}_{\text{EL1}}.\text{OSLK} == 1$, access to this field is RW.
- When $\text{OSLSR}_{\text{EL1}}.\text{OSLK} == 0$, access to this field is RO.

$\text{TXfull}$, bit [29]

Used for save/restore of $\text{EDSCR}.\text{TXfull}$.

When $\text{OSLSR}_{\text{EL1}}.\text{OSLK} == 0$, software must treat this bit as UNK/SBZP.

When $\text{OSLSR}_{\text{EL1}}.\text{OSLK} == 1$, this bit holds the value of $\text{EDSCR}.\text{TXfull}$. Reads and writes of this bit are indirect accesses to $\text{EDSCR}.\text{TXfull}$.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When $\text{OSLSR}_{\text{EL1}}.\text{OSLK} == 1$, access to this field is RW.
- When $\text{OSLSR}_{\text{EL1}}.\text{OSLK} == 0$, access to this field is RO.

$\text{Bit [28]}$

Reserved, RES0.

$\text{RXO}$, bit [27]

Used for save/restore of $\text{EDSCR}.\text{RXO}$.

When $\text{OSLSR}_{\text{EL1}}.\text{OSLK} == 0$, software must treat this bit as UNK/SBZP.

When $\text{OSLSR}_{\text{EL1}}.\text{OSLK} == 1$, this bit holds the value of $\text{EDSCR}.\text{RXO}$. Reads and writes of this bit are indirect accesses to $\text{EDSCR}.\text{RXO}$.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When $\text{OSLSR}_{\text{EL1}}.\text{OSLK} == 1$, access to this field is RW.
- When $\text{OSLSR}_{\text{EL1}}.\text{OSLK} == 0$, access to this field is RO.

$\text{TXU}$, bit [26]

Used for save/restore of $\text{EDSCR}.\text{TXU}$.

When $\text{OSLSR}_{\text{EL1}}.\text{OSLK} == 0$, software must treat this bit as UNK/SBZP.

When $\text{OSLSR}_{\text{EL1}}.\text{OSLK} == 1$, this bit holds the value of $\text{EDSCR}.\text{TXU}$. Reads and writes of this bit are indirect accesses to $\text{EDSCR}.\text{TXU}$.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When $\text{OSLSR}_{\text{EL1}}.\text{OSLK} == 1$, access to this field is RW.
- When $\text{OSLSR}_{\text{EL1}}.\text{OSLK} == 0$, access to this field is RO.
**Bits [25:24]**

Reserved, RES0.

**INTdis, bits [23:22]**

Used for save/restore of EDSCR.INTdis.

When OSLSR_EL1.OSLK == 0, and software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this field holds the value of EDSCR.INTdis. Reads and writes of this field are indirect accesses to EDSCR.INTdis.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

**TDA, bit [21]**

Used for save/restore of EDSCR.TDA.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.TDA. Reads and writes of this bit are indirect accesses to EDSCR.TDA.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

**Bit [20]**

Reserved, RES0.

**SC2, bit [19]**

When ARMv8.0-PCS is implemented, ARMv8.1-VHE is implemented and ARMv8.2-PCS is not implemented:

Used for save/restore of EDSCR.SC2.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.SC2. Reads and writes of this bit are indirect accesses to EDSCR.SC2.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

Otherwise:

Reserved, RES0.

**Bits [18:16]**

Reserved, RAZ/WI.
Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a
read-modify-write sequence to write to the register.

**MDE, bit [15]**

Monitor debug events. Enable Breakpoint, Watchpoint, and Vector Catch exceptions.

<table>
<thead>
<tr>
<th>MDE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Breakpoint, Watchpoint, and Vector Catch exceptions disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Breakpoint, Watchpoint, and Vector Catch exceptions enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**HDE, bit [14]**

Used for save/restore of EDSCR.HDE.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.HDE. Reads and writes of this bit are indirect
accesses to EDSCR.HDE.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is RW.
- When OSLSR_EL1.OSLK == 0, access to this field is RO.

**KDE, bit [13]**

Local (kernel) debug enable. If EL_D is using AArch64, enable debug exceptions within EL_D. Permitted values are:

<table>
<thead>
<tr>
<th>KDE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Debug exceptions, other than Breakpoint Instruction exceptions,</td>
</tr>
<tr>
<td></td>
<td>disabled within EL_D.</td>
</tr>
<tr>
<td>0b1</td>
<td>All debug exceptions enabled within EL_D.</td>
</tr>
</tbody>
</table>

RES0 if EL_D is using AArch32.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TDCC, bit [12]**

Traps EL0 accesses to the Debug Communication Channel (DCC) registers to EL1, or to EL2 when it is implemented
and enabled for the current Security state and HCR_EL2.TGE is 1, from both Execution states, as follows:

- In AArch64 state, MRS or MSR accesses to the following DCC registers are trapped, reported using EC
  syndrome value 0x18:
  - MDCCSR_EL0.
  - If not in Debug state, DBGDTR_EL0, DBGDTRTX_EL0, and DBGDTRRX_EL0.
- In AArch32 state, MRC or MCR accesses to the following registers are trapped, reported using EC syndrome
  value 0x05:
  - DBGDSCRint, DBGDIDR, DBGDSAR, DBGDRAR.
  - If not in Debug state, DBGDTRRXint, and DBGDTRTXint.
- In AArch32 state, LDC access to DBGDTRRXint and STC access to DBGDTRTXint are trapped, reported using
  EC syndrome value 0x06.
- In AArch32 state, MRRC accesses to DBGDSAR and DBGDRAR are trapped, reported using EC syndrome
  value 0x0C.

<table>
<thead>
<tr>
<th>TDCC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>
| 0b1   | EL0 using AArch64: EL0 accesses to the AArch64 DCC registers are trapped.
EL0 using AArch32: EL0 accesses to the AArch32 DCC registers are trapped. |
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [11:7]**

Reserved, RES0.

**ERR, bit [6]**

Used for save/restore of **EDSCR**.ERR.

When **OSLSR_EL1**.OSLK == 0, software must treat this bit as UNK/SBZP.

When **OSLSR_EL1**.OSLK == 1, this bit holds the value of **EDSCR**.ERR. Reads and writes of this bit are indirect accesses to **EDSCR**.ERR.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When **OSLSR_EL1**.OSLK == 1, access to this field is **RW**.
- When **OSLSR_EL1**.OSLK == 0, access to this field is **RO**.

**Bits [5:1]**

Reserved, RES0.

**SS, bit [0]**

Software step control bit. If ELD is using AArch64, enable Software step. Permitted values are:

<table>
<thead>
<tr>
<th>SS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Software step disabled</td>
</tr>
<tr>
<td>0b1</td>
<td>Software step enabled</td>
</tr>
</tbody>
</table>

RES0 if ELD is using AArch32.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the MDSCR_EL1**

Individual fields within this register might have restricted accessibility when **OSLSR_EL1**.OSLK == 0 (the OS lock is unlocked). See the field descriptions for more detail.

Accesses to this register use the following encodings:

**MRS <Xt>, MDSCR_EL1**

<table>
<thead>

**MIDR_EL1, Main ID Register**

The MIDR_EL1 characteristics are:

**Purpose**

Provides identification information for the PE, including an implementer code for the device and a device ID number.

**Configuration**

AArch64 System register MIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register MIDR[31:0].

AArch64 System register MIDR_EL1 bits [31:0] are architecturally mapped to External register MIDR_EL1[31:0].

**Attributes**

MIDR_EL1 is a 64-bit register.

**Field descriptions**

The MIDR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

Bits [63:32]

Reserved, RES0.

**Implementer, bits [31:24]**

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

<table>
<thead>
<tr>
<th>Hex representation</th>
<th>Implementer</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x00</td>
<td>Reserved for software use</td>
</tr>
<tr>
<td>0xC0</td>
<td>Ampere Computing</td>
</tr>
<tr>
<td>0x41</td>
<td>Arm Limited</td>
</tr>
<tr>
<td>0x42</td>
<td>Broadcom Corporation</td>
</tr>
<tr>
<td>0x43</td>
<td>Cavium Inc.</td>
</tr>
<tr>
<td>0x44</td>
<td>Digital Equipment Corporation</td>
</tr>
<tr>
<td>0x46</td>
<td>Fujitsu Ltd.</td>
</tr>
<tr>
<td>0x49</td>
<td>Infineon Technologies AG</td>
</tr>
<tr>
<td>0x4D</td>
<td>Motorola or Freescale Semiconductor Inc.</td>
</tr>
<tr>
<td>0x4E</td>
<td>NVIDIA Corporation</td>
</tr>
<tr>
<td>0x50</td>
<td>Applied Micro Circuits Corporation</td>
</tr>
<tr>
<td>0x51</td>
<td>Qualcomm Inc.</td>
</tr>
<tr>
<td>0x56</td>
<td>Marvell International Ltd.</td>
</tr>
<tr>
<td>0x69</td>
<td>Intel Corporation</td>
</tr>
</tbody>
</table>

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.
**Variant, bits [23:20]**

An implementation defined variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

**Architecture, bits [19:16]**

The permitted values of this field are:

<table>
<thead>
<tr>
<th>Architecture</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>Armv4.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Armv4T.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Armv5 (obsolete).</td>
</tr>
<tr>
<td>0b0100</td>
<td>Armv5T.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Armv5TE.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Armv5TEJ.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Armv6.</td>
</tr>
</tbody>
</table>
| 0b1111       | Architectural features are individually identified in the ID_* registers, see 'ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section K12.3.3. All other values are reserved.

**PartNum, bits [15:4]**

An implementation defined primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

**Revision, bits [3:0]**

An implementation defined revision number for the device.

**Accessing the MIDR_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, MIDR_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b00</td>
<td>0b000</td>
<td>0b000</td>
<td>0b00</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
  if IsFeatureImplemented("ARMv8.4-IDST") then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
      AArch64.SystemAccessTrap(EL2, 0x18);
    else
      AArch64.SystemAccessTrap(EL1, 0x18);
    else
      UNDEFINED;
  elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
    HFGTR_EL2.MIDR_EL1 == '1' then
      AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) then
      return VPIDR_EL2;
    else
      return MIDR_EL1;
  elsif PSTATE.EL == EL2 then
    return MIDR_EL1;
  elsif PSTATE.EL == EL3 then
    return MIDR_EL1;
The MPAM0_EL1 characteristics are:

**Purpose**

Holds information to generate MPAM labels for memory requests when executing at EL0. When EL2 is present and enabled, the MPAM virtualization option is present, MPAMHCR_EL2.GSTAPP.PLK == 1 and HCR_EL2.TGE == 0, MPAM1_EL1 is used instead of MPAM0_EL1 to generate MPAM information to label memory requests.

If EL2 is present and enabled, and HCR_EL2.E2H == 0 or HCR_EL2.TGE == 0, the MPAM virtualization option is present and MPAMHCR_EL2.EL0.VPMEN == 1, then MPAM PARTIDs in MPAM0_EL1 are virtual and mapped into physical PARTIDs for the current Security state.

**Configuration**

This register is present only when MPAM is implemented. Otherwise, direct accesses to MPAM0_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

MPAM0_EL1 is a 64-bit register.

**Field descriptions**

The MPAM0_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | PMG_D | PMG_I | PARTID_D | PARTID_I |

**Bits [63:48]**

Reserved, RES0.

**PMG_D, bits [47:40]**

Performance monitoring group property for PARTID_D.

This field resets to an architecturally UNKNOWN value.

**PMG_I, bits [39:32]**

Performance monitoring group property for PARTID_I.

This field resets to an architecturally UNKNOWN value.

**PARTID_D, bits [31:16]**

Partition ID for data accesses, including load and store accesses, made from EL0.

This field resets to an architecturally UNKNOWN value.
PARTID_I, bits [15:0]

Partition ID for instruction accesses made from EL0.

This field resets to an architecturally UNKNOWN value.

Accessing the MPAM0_EL1

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings:

MRS <Xt>, MPAM0_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>

The MPAM1_EL1 characteristics are:

**Purpose**

Holds information to generate MPAM labels for memory requests when executing at EL1.

When EL2 is present and enabled, the MPAM virtualization option is present. MPAMHCR_EL2, GSTAPP PLK == 1 and HCR_EL2, TGE == 0, MPAM1_EL1 is used instead of MPAM0_EL1 to generate MPAM labels for memory requests when executing at EL0.

MPAM1_EL1 is an alias for MPAM2_EL2 when executing at EL2 with HCR_EL2, E2H == 1.

MPAM1_EL12 is an alias for MPAM1_EL1 when executing at EL2 or EL3 with HCR_EL2, E2H == 1.

If EL2 is present and enabled, the MPAM virtualization option is present and MPAMHCR_EL2, EL1_VPMEN == 1, MPAM PARTIDs in MPAM1_EL1 are virtual and mapped into physical PARTIDs for the current Security state. This mapping of MPAM1_EL1 virtual PARTIDs to physical PARTIDs when EL1_VPMEN is 1 also applies when MPAM1_EL1 is used at EL0 due to MPAMHCR_EL2, GSTAPP PLK.

**Configuration**

AArch64 System register MPAM1_EL1 bit [63] is architecturally mapped to AArch64 System register MPAM3_EL3[63] when HaveEL(EL3).

AArch64 System register MPAM1_EL1 bit [63] is architecturally mapped to AArch64 System register MPAM2_EL2[63] when !HaveEL(EL3) and HaveEL(EL2).

This register is present only when MPAM is implemented. Otherwise, direct accesses to MPAM1_EL1 are **UNDEFINED**.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

MPAM1_EL1 is a 64-bit register.

**Field descriptions**

The MPAM1_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>MPAMEN, bit [63] MPAM Enable</td>
<td>0b0</td>
<td>The default PARTID and default PMG are output in MPAM information.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0b1</td>
<td>MPAM information is output based on the MPAMn_ELx register for ELn according the MPAM configuration.</td>
</tr>
</tbody>
</table>

If neither EL3 nor EL2 is implemented, this field is read/write.
If EL3 is implemented, this field is read-only and reads the current value of the read/write bit MPAM3_EL3.MPAMEN.

If EL3 is not implemented and EL2 is implemented, this field is read-only and reads the current value of the read/write bit MPAM2_EL2.MPAMEN.

This field resets to 0.

Accessing this field has the following behavior:

- When !HaveEL(EL3) and !HaveEL(EL2), access to this field is RW.
- Otherwise, access to this field is RO.

Bits [62:61]

Reserved, RES0.

FORCED_NS, bit [60]

When ARMv8.6-MPAM is implemented:

In the Secure state, FORCED_NS Secure state indicates the state of MPAM3_EL3.FORCE_NS.

<table>
<thead>
<tr>
<th>FORCED_NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>In the Non-secure state, always reads as 0. In the Secure state, indicates that MPAM3_EL3.FORCE_NS == 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Indicate that MPAM3_EL3.FORCE_NS == 1.</td>
</tr>
</tbody>
</table>

Reads as 0 in the Non-secure state.

Writes are ignored.

Otherwise:

Reserved, RES0.

Bits [59:48]

Reserved, RES0.

PMG_D, bits [47:40]

Performance monitoring group property for PARTID_D.

This field resets to an architecturally UNKNOWN value.

PMG_I, bits [39:32]

Performance monitoring group property for PARTID_I.

This field resets to an architecturally UNKNOWN value.

PARTID_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL1.

This field resets to an architecturally UNKNOWN value.

PARTID_I, bits [15:0]

Partition ID for instruction accesses made from EL1.

This field resets to an architecturally UNKNOWN value.
Accessing the MPAM1_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the mnemonic MPAM1_EL1 or MPAM1_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings:

MRS <Xt>, MPAM1_EL1

The MPAM2_EL2 characteristics are:

**Purpose**

Holds information to generate MPAM labels for memory requests when executing at EL2.

**Configuration**

AArch64 System register MPAM2_EL2 bit [63] is architecturally mapped to AArch64 System register MPAM3_EL3[63] when HaveEL(EL3).

AArch64 System register MPAM2_EL2 bit [63] is architecturally mapped to AArch64 System register MPAM1_EL1[63].

This register is present only when MPAM is implemented. Otherwise, direct accesses to MPAM2_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

MPAM2_EL2 is a 64-bit register.

**Field descriptions**

The MPAM2_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>MPAMEN</th>
<th>RES0</th>
<th>TIDR</th>
<th>RES0</th>
<th>TRAPMPAM0EL1</th>
<th>TRAPMPAM1EL1</th>
<th>PMG_D</th>
<th>PMG_I</th>
<th>PARTID_D</th>
<th>PARTID_I</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>62</td>

<td>27</td>
<td>26</td>
<td>25</td>
<td>24</td>
<td>23</td>
<td>22</td>
</tr>
</tbody>
</table>

**MPAMEN, bit [63]**

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

Values of this field are:

<table>
<thead>
<tr>
<th>MPAMEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The default PARTID and default PMG are output in MPAM information from all Exception levels.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAM information is output based on the MPAMn_ELx register for ELn according the MPAM configuration.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented, this field is read/write.

If EL3 is implemented, this field is read-only and reads the current value of the read/write MPAM3_EL3.MPAMEN bit.

This field resets to 0.

Accessing this field has the following behavior:

- When !HaveEL(EL3), access to this field is RW.
- Otherwise, access to this field is RO.
Bits [62:59]

Reserved, RES0.

**TIDR, bit [58]**

When ARMv8.6-MPAM is implemented and MPAMIDR_EL1.HAS_TIDR == 1:

TIDR traps accesses to MPAMIDR_EL1 from EL1 to EL2.

<table>
<thead>
<tr>
<th>TIDR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trap accesses to <strong>MPAMIDR_EL1</strong> from EL1 to EL2.</td>
</tr>
</tbody>
</table>

MPAMHCR_EL2.TRAP_MPAMIDR_EL1 == 1 also traps **MPAMIDR_EL1** accesses from EL1 to EL2. If either TIDR or TRAP_MPAMIDR_EL1 are 1, accesses are trapped.

Otherwise:

Reserved, RES0.

Bits [57:50]

Reserved, RES0.

**TRAPMPAM0EL1, bit [49]**

TRAPMPAM0EL1: Trap accesses from EL1 to the **MPAM0_EL1** register trap to EL2.

<table>
<thead>
<tr>
<th>TRAPMPAM0EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>

</tr>
<tr>
<td>0b1</td>
<td>Accesses to <strong>MPAM0_EL1</strong> from EL1 are trapped to EL2.</td>
</tr>
</tbody>
</table>

When EL3 is not implemented, this field resets to 1. When EL3 is implemented, this field resets to **UNKNOWN**.

**TRAPMPAM1EL1, bit [48]**

TRAPMPAM1EL1: Trap accesses from EL1 to the **MPAM1_EL1** register trap to EL2.

<table>
<thead>
<tr>
<th>TRAPMPAM1EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to <strong>MPAM1_EL1</strong> from EL1 are not trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to <strong>MPAM1_EL1</strong> from EL1 are trapped to EL2.</td>
</tr>
</tbody>
</table>

When EL3 is not implemented, this field resets to 1. When EL3 is implemented, this field resets to **UNKNOWN**.

**PMG_D, bits [47:40]**

Performance monitoring group for data accesses.

This field resets to an architecturally **UNKNOWN** value.

**PMG_I, bits [39:32]**

Performance monitoring group for instruction accesses.

This field resets to an architecturally **UNKNOWN** value.
PARTID_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL2.
This field resets to an architecturally *UNKNOWN* value.

PARTID_I, bits [15:0]

Partition ID for instruction accesses made from EL2.
This field resets to an architecturally *UNKNOWN* value.

**Accessing the MPAM2_EL2**

The MPAM_EL3 characteristics are:

**Purpose**

Holds information to generate MPAM labels for memory requests when executing at EL3.

**Configuration**

AArch64 System register MPAM3_EL3 bit [63] is architecturally mapped to AArch64 System register `MPAM2_EL2[63]` when HaveEL(EL2).

AArch64 System register MPAM3_EL3 bit [63] is architecturally mapped to AArch64 System register `MPAM1_EL1[63]`.

This register is present only when MPAM is implemented. Otherwise, direct accesses to MPAM3_EL3 are **UNDEFINED**.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

MPAM3_EL3 is a 64-bit register.

**Field descriptions**

The MPAM_EL3 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| MPAMEN | TRAPLOWER | SDEFLT | FORCE_NS | RES0 | PMG_D | PMG_I | PARTID_D | PARTID_I |
| 0b0 | The default PARTID and default PMG are output in MPAM information when executing at any ELn. |
| 0b1 | MPAM information is output based on the MPAn_ELx register for ELn according the MPAM configuration. |

This field is always read/write in MPAM3_EL3.

This field resets to 0.

**MPAMEN, bit [63]**

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

Values of this field are:

<table>
<thead>
<tr>
<th>MPAMEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The default PARTID and default PMG are output in MPAM information when executing at any ELn.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAM information is output based on the MPAMn_ELx register for ELn according the MPAM configuration.</td>
</tr>
</tbody>
</table>

This field is always read/write in MPAM3_EL3.

**TRAPLOWER, bit [62]**

Trap direct accesses to any MPAM system registers that are not **UNDEFINED** from all ELn lower than EL3.
**TRAPLOWER**

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not force trapping of direct accesses of MPAM system registers to EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>Force all direct accesses of MPAM system registers to trap to EL3.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 1.

**SDEFLT, bit [61]**

When ARMv8.6-MPAM is implemented and MPAMIDR_EL1.HAS_SDEFLT == 1:

SDEFLT overrides the PARTID with the default PARTID when executing in the Secure state.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The PARTID is determined normally in the Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>The PARTID is always PARTID 0 when executing in the Secure state.</td>
</tr>
</tbody>
</table>

This field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

**FORCE_NS, bit [60]**

When ARMv8.6-MPAM is implemented and MPAMIDR_EL1.HAS_FORCE_NS == 1:

FORCE_NS forces MPAM_NS to always be 1 in the Secure state.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MPAM_NS is 0 when executing in the Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAM_NS is 1 when executing in the Secure state.</td>
</tr>
</tbody>
</table>

This field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

**Bits [59:48]**

Reserved, RES0.

**PMG_D, bits [47:40]**

Performance monitoring group for data accesses.

This field resets to an architecturally UNKNOWN value.

**PMG_I, bits [39:32]**

Performance monitoring group for instruction accesses.

**PARTID_D, bits [31:16]**

Partition ID for data accesses, including load and store accesses, made from EL3.

This field resets to an architecturally UNKNOWN value.
PARTID_I, bits [15:0]

Partition ID for instruction accesses made from EL3.
This field resets to an architecturally **UNKNOWN** value.

**Accessing the MPAM3_EL3**

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings:

MRS <Xt>, MPAM3_EL3

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>

    UNDEFINED;
elsif PSTATE.EL == EL3 then
    MPAM3_EL3 = X[t];
The MPAMHCR_EL2 characteristics are:

**Purpose**

Controls the PARTID virtualization features of MPAM. It controls the mapping of virtual PARTIDs into physical PARTIDs in MPAM0_EL1 when EL0_VPMEN == 1 and in MPAM1_EL1 when EL1_VPMEN == 1.

**Configuration**

This register is present only when MPAM is implemented and MPAMIDR_EL1.HAS_HCR == 1. Otherwise, direct accesses to MPAMHCR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

MPAMHCR_EL2 is a 64-bit register.

**Field descriptions**

The MPAMHCR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>

</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**TRAP_MPAMIDR_EL1, bit [31]**

Trap accesses from EL1 to MPAMIDR_EL1 to EL2.

<table>
<thead>
<tr>
<th>TRAP_MPAMIDR_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Direct accesses to MPAMIDR_EL1 from EL1 are trapped to EL2.</td>
</tr>
</tbody>
</table>

When EL3 is not implemented, this field is reset to 1. When EL3 is implemented, this field resets to UNKNOWN.

**Bits [30:9]**

Reserved, RES0.
GSTAPP_PLK, bit [8]

Make the PARTIDs at EL0 the same as the PARTIDs at EL1. When executing at EL0, EL2 is enabled, HCR_EL2.TGE == 0 and GSTAPP_PLK = 1, MPAM1_EL1 is used instead of MPAM0_EL1 to generate MPAM labels for memory requests.

<table>
<thead>
<tr>
<th>GSTAPP_PLK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MPAM0_EL1 is used to generate MPAM labels when executing at EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAM1_EL1 is used to generate MPAM labels when executing at EL0 with EL2 enabled and HCR_EL2.TGE == 0. Otherwise MPAM0_EL1 is used.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Bits [7:2]

Reserved, RES0.

EL1_VPMEN, bit [1]

Enable the virtual PARTID mapping of the PARTID fields in MPAM1_EL1 when executing at EL1. This bit also enables virtual PARTID mapping when MPAM1_EL1 is used to generate MPAM labels for memory requests at EL0 due to GSTAPP_PLK == 1.

<table>
<thead>
<tr>
<th>EL1_VPMEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MPAM1_EL1.PARTID_I and MPAM1_EL1.PARTID_D are physical PARTIDs that are used to label memory system requests.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAM1_EL1.PARTID_I and MPAM1_EL1.PARTID_D are virtual PARTIDs that are used to index the PhyPARTID fields of MPAMVPM0_EL2 to MPAMVPM7_EL2 registers to map the virtual PARTID into a physical PARTID to label memory system requests.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

EL0_VPMEN, bit [0]

Enable the virtual PARTID mapping of the PARTID fields of MPAM0_EL1 unless HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1.

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1, EL0_VPMEN is ignored and MPAM0_EL1 PARTID fields are not mapped.

When MPAMCHR_EL2, GSTAPP_PLK == 1 and HCR_EL2.TGE == 0, MPAM1_EL1 is used as the source of PARTIDs and the virtual PARTID mapping of MPAM1_EL1 PARTIDs is controlled by MPAMCHR_EL2.EL1_VPMEN.

<table>
<thead>
<tr>
<th>EL0_VPMEN</th>
<th>Meaning</th>
</tr>

MPAMIDR_EL1, MPAM ID Register (EL1)

The MPAMIDR_EL1 characteristics are:

**Purpose**

Indicates the presence and maximum PARTID and PMG values supported in the implementation. It also indicates whether the implementation supports MPAM virtualization.

**Configuration**

This register is present only when MPAM is implemented. Otherwise, direct accesses to MPAMIDR_EL1 are **UNDEFINED**.

**Attributes**

MPAMIDR_EL1 is a 64-bit register.

**Field descriptions**

The MPAMIDR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:62</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>61</td>
<td>HAS_SDEFLT, bit [61]</td>
</tr>
<tr>
<td>60:59</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>58</td>
<td>VPMR_MAX</td>
</tr>
<tr>
<td>57</td>
<td>HAS_HCR</td>
</tr>
<tr>
<td>56:52</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>51:48</td>
<td>PARTID_MAX</td>
</tr>
<tr>
<td>47:4</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

MPAMIDR_EL1 indicates the MPAM implementation parameters of the PE.

**Bits [63:62]**

Reserved, RES0.

**HAS_SDEFLT, bit [61]**

From Armv8.6:

HAS_SDEFLT indicates support for MPAM3_EL3.SDEFLT bit.

<table>
<thead>
<tr>
<th>HAS_SDEFLT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The SDEFLT bit is not implemented in MPAM3_EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>The SDEFLT bit is implemented in MPAM3_EL3.</td>
</tr>
</tbody>
</table>

When MPAM3_EL3.SDEFLT == 1, accesses from the Secure execution state use the default PARTID, PARTID == 0.

**Otherwise:**

Reserved, RES0.

**HAS_FORCE_NS, bit [60]**

From Armv8.6:

HAS_FORCE_NS indicates support for MPAM3_EL3.Force_NS bit.
### HAS_FORCE_NS

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0  The FORCE_NS bit is not implemented in <strong>MPAM3_EL3</strong>.</td>
</tr>
<tr>
<td>0b1  The FORCE_NS bit is implemented in <strong>MPAM3_EL3</strong>.</td>
</tr>
</tbody>
</table>

When **MPAM3_EL3**.FORCE_NS == 1, accesses from the Secure execution state have MPAM_NS == 1.

Otherwise:

Reserved, RES0.

### Bit [59]

Reserved, RES0.

### HAS_TIDR, bit [58]

*From Armv8.6:*

HAS_TIDR indicates support for **MPAM2_EL2**.TIDR bit.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0  The TIDR bit is not implemented in <strong>MPAM2_EL2</strong>.</td>
</tr>
<tr>
<td>0b1  The TIDR bit is implemented in <strong>MPAM2_EL2</strong>.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

### Bits [57:40]

Reserved, RES0.

### PMG_MAX, bits [39:32]

The largest value of PMG that the implementation can generate. The PMG_I and PMG_D fields of every MPAMn_ELx must implement at least enough bits to represent PMG_MAX.

### Bits [31:21]

Reserved, RES0.

### VPMR_MAX, bits [20:18]

If HAS_HCR == 0, VPMR_MAX must be 0b000. Otherwise, it indicates the maximum register index n for the MPAMVPM<n>_EL2 registers.

### HAS_HCR, bit [17]

HAS_HCR indicates that the PE implementation supports MPAM virtualization, including **MPAMHCR_EL2**, **MPAMVPMV_EL2** and **MPAMVPM<n>_EL2** with n in the range 0 to VPMR_MAX. Must be 0 if EL2 is not implemented in either security state.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0  MPAM virtualization is not supported.</td>
</tr>
<tr>
<td>0b1  MPAM virtualization is supported.</td>
</tr>
</tbody>
</table>
**Bit [16]**

Reserved, RES0.

**PARTID_MAX, bits [15:0]**

The largest value of PARTID that the implementation can generate. The PARTID_I and PARTID_D fields of every MPAMn_ELx must implement at least enough bits to represent PARTID_MAX.

**Accessing the MPAMIDR_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, MPAMIDR_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

MPAMVPM0_EL2, MPAM Virtual PARTID Mapping Register 0

The MPAMVPM0_EL2 characteristics are:

**Purpose**

MPAMVPM0_EL2 provides mappings from virtual PARTIDs 0 - 3 to physical PARTIDs.

The **MPAMIDR_EL1.VPMR_MAX** field gives the index of the highest implemented MPAMVPM<n>_EL2 register. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If MPAMIDR_EL1.VPMR_MAX == 0, there is only a single MPAMVPM<n>_EL2 register, **MPAMVPM0_EL2**.

Virtual PARTID mapping is enabled by **MPAMHCR_EL2.EL1_VPMEN** for PARTIDs in **MPAM1_EL1** and by **MPAMHCR_EL2.EL0_VPMEN** for PARTIDs in **MPAM0_EL1**.

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is only valid when the **MPAMVPMV_EL2.VPM_V** bit in bit position n is set to 1.

**Configuration**

This register is present only when MPAM is implemented and MPAMIDR_EL1.HAS_HCR == 1. Otherwise, direct accesses to MPAMVPM0_EL2 are **UNDEFINED**.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

MPAMVPM0_EL2 is a 64-bit register.

**Field descriptions**

The MPAMVPM0_EL2 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40 | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| PhyPARTID3 |
| PhyPARTID2 |
| PhyPARTID1 |
| PhyPARTID0 |

**PhyPARTID3, bits [63:48]**

Virtual PARTID Mapping Entry for virtual PARTID 3. PhyPARTID3 gives the mapping of virtual PARTID 3 to a physical PARTID.

This field resets to an architecturally **UNKNOWN** value.

**PhyPARTID2, bits [47:32]**

Virtual PARTID Mapping Entry for virtual PARTID 2. PhyPARTID2 gives the mapping of virtual PARTID 2 to a physical PARTID.

This field resets to an architecturally **UNKNOWN** value.
**PhyPARTID1, bits [31:16]**

Virtual PARTID Mapping Entry for virtual PARTID 1. PhyPARTID1 gives the mapping of virtual PARTID 1 to a physical PARTID.

This field resets to an architecturally **UNKNOWN** value.

**PhyPARTID0, bits [15:0]**

Virtual PARTID Mapping Entry for virtual PARTID 0. PhyPARTID0 gives the mapping of virtual PARTID 0 to a physical PARTID.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the MPAMVPM0_EL2**

Accesses to this register use the following encodings:

\[
\text{MRS } <Xt>, \text{ MPAMVPM0_EL2}
\]

The MPAMVPM1_EL2 characteristics are:

### Purpose

MPAMVPM1_EL2 provides mappings from virtual PARTIDs 4 - 7 to physical PARTIDs.

MPAMIDR_EL1.VPMR_MAX field gives the index of the highest implemented MPAMVPM0_EL2 to MPAMVPM7_EL2 registers. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If MPAMIDR_EL1.VPMR_MAX == 0, there is only a single MPAMVPM<n>_EL2 register, MPAMVPM0_EL2.

Virtual PARTID mapping is enabled by MPAMHCR_EL2.EL1_VPMEN for PARTIDs in MPAM1_EL1 and by MPAMHCR_EL2.EL0_VPMEN for PARTIDs in MPAM0_EL1.

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is only valid when the MPAMVPMV_EL2.VPM_V bit in bit position n is set to 1.

### Configuration

This register is present only when MPAM is implemented, MPAMIDR_EL1.HAS_HCR == 1 and MPAMIDR_EL1.VPMR_MAX > 0. Otherwise, direct accesses to MPAMVPM1_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

MPAMVPM1_EL2 is a 64-bit register.

MPAMVPM5_EL2, MPAM Virtual PARTID Mapping Register 5

The MPAMVPM5_EL2 characteristics are:

**Purpose**

MPAMVPM5_EL2 provides mappings from virtual PARTIDs 20 - 23 to physical PARTIDs.

**MPAMIDR_EL1**.VPMR_MAX field gives the index of the highest implemented MPAMVPM<n>_EL2 registers. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If **MPAMIDR_EL1**.VPMR_MAX == 0, there is only a single MPAMVPM<n>_EL2 register, **MPAMVPM0_EL2**.

Virtual PARTID mapping is enabled by **MPAMHCR_EL2**.EL1_VPMEN for PARTIDs in **MPAM1_EL1** and by **MPAMHCR_EL2**.EL0_VPMEN for PARTIDs in **MPAM0_EL1**.

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is only valid when the **MPAMVPMV_EL2**.VPM_V bit in bit position n is set to 1.

**Configuration**

This register is present only when MPAM is implemented, **MPAMIDR_EL1**.HAS_HCR == 1 and **MPAMIDR_EL1**.VPMR_MAX > 4. Otherwise, direct accesses to MPAMVPM5_EL2 are **UNDEFINED**.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

MPAMVPM5_EL2 is a 64-bit register.

**Field descriptions**

The MPAMVPM5_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

**PhyPARTID23**, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 23. PhyPARTID23 gives the mapping of virtual PARTID 23 to a physical PARTID.

This field resets to an architecturally **UNKNOWN** value.

**PhyPARTID22**, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 22. PhyPARTID22 gives the mapping of virtual PARTID 22 to a physical PARTID.

This field resets to an architecturally **UNKNOWN** value.
**PhyPARTID21, bits [31:16]**

Virtual PARTID Mapping Entry for virtual PARTID 21. PhyPARTID21 gives the mapping of virtual PARTID 21 to a physical PARTID.

This field resets to an architecturally **UNKNOWN** value.

**PhyPARTID20, bits [15:0]**

Virtual PARTID Mapping Entry for virtual PARTID 20. PhyPARTID20 gives the mapping of virtual PARTID 20 to a physical PARTID.

This field resets to an architecturally **UNKNOWN** value.

MPAMVPM6_EL2, MPAM Virtual PARTID Mapping Register 6

The MPAMVPM6_EL2 characteristics are:

**Purpose**

MPAMVPM6_EL2 provides mappings from virtual PARTIDs 24 - 27 to physical PARTIDs.

The **MPAMIDR_EL1**.VPMR_MAX field gives the index of the highest implemented MPAMVPM<n>_EL2 registers. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If **MPAMIDR_EL1**.VPMR_MAX == 0, there is only a single MPAMVPM<n>_EL2 register, **MPAMVPM0_EL2**.

Virtual PARTID mapping is enabled by **MPAMHCR_EL2**.EL1_VPMEN for PARTIDs in **MPAM1_EL1** and by **MPAMHCR_EL2**.EL0_VPMEN for PARTIDs in **MPAM0_EL1**.

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is only valid when the **MPAMVPMV_EL2**.VPM_V bit in bit position n is set to 1.

**Configuration**

This register is present only when MPAM is implemented, **MPAMIDR_EL1**.HAS_HCR == 1 and **MPAMIDR_EL1**.VPMR_MAX > 5. Otherwise, direct accesses to MPAMVPM6_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

MPAMVPM6_EL2 is a 64-bit register.

**Field descriptions**

The MPAMVPM6_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

**Bits [63:40]**

Reserved, RES0.

**Aff3, bits [39:32]**

Affinity level 3. See the description of Aff0 for more information.

Aff3 is not supported in AArch32 state.

**Bit [31]**

Reserved, RES1.

**U, bit [30]**

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. The possible values of this bit are:

<table>
<thead>
<tr>
<th>U</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Processor is part of a multiprocessor system.</td>
</tr>
<tr>
<td>0b1</td>
<td>Processor is part of a uniprocessor system.</td>
</tr>
</tbody>
</table>

**Bits [29:25]**

Reserved, RES0.
MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of Aff0 for more information about affinity levels. The possible values of this bit are:

<table>
<thead>
<tr>
<th>MT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Performance of PEs at the lowest affinity level, or PEs with MPIDR_EL1.MT set to 1, different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent.</td>
</tr>
<tr>
<td>0b1</td>
<td>Performance of PEs at the lowest affinity level, or PEs with MPIDR_EL1.MT set to 1, different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.</td>
</tr>
</tbody>
</table>

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

Aff0, bits [7:0]

Affinity level 0. This is the affinity level that is most significant for determining PE behavior. Higher affinity levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

Accessing the MPIDR_EL1

Accesses to this register use the following encodings:

MRS <Xt>, MPIDR_EL1

The MVFR0_EL1 characteristics are:

**Purpose**

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with MVFR1_EL1 and MVFR2_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

**Configuration**

AArch64 System register MVFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register MVFR0[31:0].

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

In an AArch64 only implementation, this register is **UNKNOWN**.

**Attributes**

MVFR0_EL1 is a 64-bit register.

**Field descriptions**

The MVFR0_EL1 bit assignments are:

</table>

**Bits [63:32]**

Reserved, RES0.

**FPRound, bits [31:28]**

Floating-Point Rounding modes. Indicates whether the floating-point implementation provides support for rounding modes. Defined values are:

<table>
<thead>
<tr>
<th>FPRound</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented, or only Round to Nearest mode supported, except that Round towards Zero mode is supported for VCVT instructions that always use that rounding mode regardless of the <strong>FPSCR</strong> setting.</td>
</tr>
<tr>
<td>0b0001</td>
<td>All rounding modes supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.
FPShVec, bits [27:24]

Short Vectors. Indicates whether the floating-point implementation provides support for the use of short vectors. Defined values are:

<table>
<thead>
<tr>
<th>FPShVec</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Short vectors not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Short vector operation supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

FPSqrt, bits [23:20]

Square Root. Indicates whether the floating-point implementation provides support for the ARMv6 VFP square root operations. Defined values are:

<table>
<thead>
<tr>
<th>FPSqrt</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported in hardware.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

The VSQRT.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VSQRT.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

FPDivide, bits [19:16]

Indicates whether the floating-point implementation provides support for VFP divide operations. Defined values are:

<table>
<thead>
<tr>
<th>FPDivide</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported in hardware.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

The VDIV.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VDIV.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

FPTrap, bits [15:12]

Floating Point Exception Trapping. Indicates whether the floating-point implementation provides support for exception trapping. Defined values are:

<table>
<thead>
<tr>
<th>FPTrap</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

A value of 0b0001 indicates that, when the corresponding trap is enabled, a floating-point exception generates an exception.

FPDP, bits [11:8]

Double Precision. Indicates whether the floating-point implementation provides support for double-precision operations. Defined values are:
FPDP, bits [7:4]

Single Precision. Indicates whether the floating-point implementation provides support for single-precision operations. Defined values are:

<table>
<thead>
<tr>
<th>FPDP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported in hardware.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported, VFPv2.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Supported, VFPv3, VFPv4, or Armv8. VFPv3 and Armv8 add an instruction to load a double-precision floating-point constant, and conversions between double-precision and fixed-point values.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP double-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F64 is only available if the Square root field is 0b0001.
- VDIV.F64 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the single-precision field is nonzero.

FPSP, bits [7:4]

Single Precision. Indicates whether the floating-point implementation provides support for single-precision operations. Defined values are:

<table>
<thead>
<tr>
<th>FPSP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported in hardware.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported, VFPv2.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Supported, VFPv3 or VFPv4. VFPv3 adds an instruction to load a single-precision floating-point constant, and conversions between single-precision and fixed-point values.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP single-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F32 is only available if the Square root field is 0b0001.
- VDIV.F32 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the double-precision field is nonzero.

SIMDReg, bits [3:0]

Advanced SIMD registers. Indicates whether the Advanced SIMD and floating-point implementation provides support for the Advanced SIMD and floating-point register bank. Defined values are:

<table>
<thead>
<tr>
<th>SIMDReg</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The implementation has no Advanced SIMD and floating-point support.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The implementation includes floating-point support with 16 x 64-bit registers.</td>
</tr>
<tr>
<td>0b0010</td>
<td>The implementation includes Advanced SIMD and floating-point support with 32 x 64-bit registers.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

Accessing the MVFR0_EL1

Accesses to this register use the following encodings:
MRS <Xt>, MVFR0_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>

      AArch64.SystemAccessTrap(EL2, 0x18);
    else
      return MVFR0_EL1;
  elsif PSTATE.EL == EL2 then
    return MVFR0_EL1;
  elsif PSTATE.EL == EL3 then
    return MVFR0_EL1;
The MVFR1_EL1 characteristics are:

**Purpose**

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with MVFR0_EL1 and MVFR2_EL1.

For general information about the interpretation of the ID registers see ‘Principles of the ID scheme for fields in ID registers’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

**Configuration**

AArch64 System register MVFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register MVFR1[31:0].

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

In an AArch64 only implementation, this register is UNKNOWN.

**Attributes**

MVFR1_EL1 is a 64-bit register.

**Field descriptions**

The MVFR1_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:32]</th>
<th>Reserved, RES0</th>
</tr>
</thead>
<tbody>
<tr>
<td>SIMDFMAC</td>
<td>FPHP</td>
</tr>
<tr>
<td>SIMDHP</td>
<td>SIMDSP</td>
</tr>
<tr>
<td>SIMDInt</td>
<td>SIMDLS</td>
</tr>
<tr>
<td>FPDNaN</td>
<td>FPFTZ</td>
</tr>
</tbody>
</table>

**SIMDFMAC, bits [31:28]**

Advanced SIMD Fused Multiply-Accumulate. Indicates whether the Advanced SIMD implementation provides fused multiply accumulate instructions. Defined values are:

<table>
<thead>
<tr>
<th>SIMDFMAC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

The Advanced SIMD and floating-point implementations must provide the same level of support for these instructions.
**FPHP, bits [27:24]**

Floating Point Half Precision. Indicates the level of half-precision floating-point support. Defined values are:

<table>
<thead>
<tr>
<th>FPHP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Floating-point half-precision conversion instructions are supported for conversion between single-precision and half-precision.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds instructions for conversion between double-precision and half-precision.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0010, and adds support for half-precision floating-point arithmetic.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are:

- 0b0000 in an implementation without floating-point support.
- 0b0010 in an implementation with floating-point support that does not include the ARMv8.2-FP16 extension.
- 0b0011 in an implementation with floating-point support that includes the ARMv8.2-FP16 extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the SIMDHP field, meaning the permitted values are:

<table>
<thead>
<tr>
<th>Half Precision instructions supported</th>
<th>FPHP</th>
<th>SIMDHP</th>
</tr>
</thead>
<tbody>
<tr>
<td>No support</td>
<td>0b0000</td>
<td>0b0000</td>
</tr>
<tr>
<td>Conversions only</td>
<td>0b0010</td>
<td>0b0001</td>
</tr>
<tr>
<td>Conversions and arithmetic</td>
<td>0b0011</td>
<td>0b0010</td>
</tr>
</tbody>
</table>

**SIMDHP, bits [23:20]**

Advanced SIMD Half Precision. Indicates the level of half-precision floating-point support. Defined values are:

<table>
<thead>
<tr>
<th>SIMDHP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SIMD half-precision conversion instructions are supported for conversion between single-precision and half-precision.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds support for half-precision floating-point arithmetic.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are:

- 0b0000 in an implementation without SIMD floating-point support.
- 0b0010 in an implementation with SIMD floating-point support that does not include the ARMv8.2-FP16 extension.
- 0b0011 in an implementation with SIMD floating-point support that includes the ARMv8.2-FP16 extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the FPHP field, meaning the permitted values are:

<table>
<thead>
<tr>
<th>Half Precision instructions supported</th>
<th>FPHP</th>
<th>SIMDHP</th>
</tr>
</thead>
<tbody>
<tr>
<td>No support</td>
<td>0b0000</td>
<td>0b0000</td>
</tr>
<tr>
<td>Conversions only</td>
<td>0b0010</td>
<td>0b0001</td>
</tr>
<tr>
<td>Conversions and arithmetic</td>
<td>0b0011</td>
<td>0b0010</td>
</tr>
</tbody>
</table>

**SIMDSP, bits [19:16]**

Advanced SIMD Single Precision. Indicates whether the Advanced SIMD and floating-point implementation provides single-precision floating-point instructions. Defined values are:

<table>
<thead>
<tr>
<th>SIMDSP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Implemented. This value is permitted only if the SIMDiInt field is 0b0001.</td>
</tr>
</tbody>
</table>
All other values are reserved.

In Armv8-A, the permitted values are \texttt{0b0000} and \texttt{0b0001}.

**SIMDInt, bits [15:12]**

Advanced SIMD Integer. Indicates whether the Advanced SIMD and floating-point implementation provides integer instructions. Defined values are:

<table>
<thead>
<tr>
<th>SIMDInt</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0000}</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>\texttt{0b0001}</td>
<td>Implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are \texttt{0b0000} and \texttt{0b0001}.

**SIMDLS, bits [11:8]**

Advanced SIMD Load/Store. Indicates whether the Advanced SIMD and floating-point implementation provides load/store instructions. Defined values are:

<table>
<thead>
<tr>
<th>SIMDLS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0000}</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>\texttt{0b0001}</td>
<td>Implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are \texttt{0b0000} and \texttt{0b0001}.

**FPDNaN, bits [7:4]**

Default NaN mode. Indicates whether the floating-point implementation provides support only for the Default NaN mode. Defined values are:

<table>
<thead>
<tr>
<th>FPDNaN</th>
<th>Meaning</th>
<th>Meanings</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0000}</td>
<td>Not implemented, or hardware supports only the Default NaN mode.</td>
<td></td>
</tr>
<tr>
<td>\texttt{0b0001}</td>
<td>Hardware supports propagation of NaN values.</td>
<td></td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are \texttt{0b0000} and \texttt{0b0001}.

**FPFtZ, bits [3:0]**

Flush to Zero mode. Indicates whether the floating-point implementation provides support only for the Flush-to-Zero mode of operation. Defined values are:

<table>
<thead>
<tr>
<th>FPFtZ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0000}</td>
<td>Not implemented, or hardware supports only the Flush-to-Zero mode of operation.</td>
</tr>
<tr>
<td>\texttt{0b0001}</td>
<td>Hardware supports full denormalized number arithmetic.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are \texttt{0b0000} and \texttt{0b0001}.

**Accessing the MVFR1_EL1**

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
    if IsFeatureImplemented("ARMv8.4-IDST") then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        end if
    else
        UNDEFINED;
    end if
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return MVFR1_EL1;
    end if
elsif PSTATE.EL == EL2 then
    return MVFR1_EL1;
elsif PSTATE.EL == EL3 then
    return MVFR1_EL1;
The MVFR2_EL1 characteristics are:

**Purpose**

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with MVFR0_EL1 and MVFR1_EL1.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D7.1.3.

**Configuration**

AArch64 System register MVFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register MVFR2[31:0].

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

In an AArch64 only implementation, this register is UNKNOWN.

**Attributes**

MVFR2_EL1 is a 64-bit register.

**Field descriptions**

The MVFR2_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

OSDLR_EL1, OS Double Lock Register

The OSDLR_EL1 characteristics are:

**Purpose**

Used to control the OS Double Lock.

**Configuration**

AArch64 System register OSDLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGOSDLR[31:0].

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

OSDLR_EL1 is a 64-bit register.

**Field descriptions**

The OSDLR_EL1 bit assignments are:

<table>

elsif PSTATE.EL == EL3 then
  OSDTRTX_EL1 = X[t];
OSECCR_EL1, OS Lock Exception Catch Control Register

The OSECCR_EL1 characteristics are:

**Purpose**

Provides a mechanism for an operating system to access the contents of EDECCR that are otherwise invisible to software, so it can save/restore the contents of EDECCR over powerdown on behalf of the external debugger.

**Configuration**

AArch64 System register OSECCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGOOSECCR[31:0].

AArch64 System register OSECCR_EL1 bits [31:0] are architecturally mapped to External register EDECCR[31:0].

If OSLSR_EL1.OSLK == 0, then OSECCR_EL1 returns an UNKNOWN value on reads and ignores writes.

**Attributes**

OSECCR_EL1 is a 64-bit register.

**Field descriptions**

The OSECCR_EL1 bit assignments are:

**When DBGOSLSR.OSLK == 1:**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
<td>Reserved</td>
</tr>
<tr>
<td>31</td>
<td>EDECCR</td>
<td>Used for save/restore to EDECCR over powerdown.</td>
</tr>
</tbody>
</table>

Bits [63:32]:

Reserved, RES0.

**EDECCR, bits [31:0]**

Used for save/restore to EDECCR over powerdown.

Reads or writes to this field are indirect accesses to EDECCR.

**Accessing the OSECCR_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, OSECCR_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

OSLAR_EL1, OS Lock Access Register

The OSLAR_EL1 characteristics are:

**Purpose**

Used to lock or unlock the OS Lock.

**Configuration**

AArch64 System register OSLAR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGOSLAR[31:0].

AArch64 System register OSLAR_EL1 bits [31:0] are architecturally mapped to External register OSLAR_EL1[31:0].

**Attributes**

OSLAR_EL1 is a 64-bit register.

**Field descriptions**

The OSLAR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
</tr>
<tr>
<td>62</td>
<td>RES0</td>

OSLSR_EL1, OS Lock Status Register

The OSLSR_EL1 characteristics are:

**Purpose**

Provides the status of the OS Lock.

**Configuration**

AArch64 System register OSLSR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGOSLSR[31:0].

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

OSLSR_EL1 is a 64-bit register.

**Field descriptions**

The OSLSR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Bit Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-3</td>
<td>Reserved</td>
</tr>
<tr>
<td>2</td>
<td>nTT</td>
</tr>
<tr>
<td>1</td>
<td>OSLM[1]</td>
</tr>
<tr>
<td>0</td>
<td>OSLM[0]</td>
</tr>
</tbody>
</table>

**Bits [63:4]**

Reserved, RES0.

**OSLM[1], bit [3]**

This field is bit[1] of OSLM[1:0].

OS lock model implemented. Identifies the form of OS save and restore mechanism implemented.

<table>
<thead>
<tr>
<th>OSLM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>OS Lock not implemented.</td>
</tr>
<tr>
<td>10</td>
<td>OS Lock implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved. In an Armv8 implementation the value 0b00 is not permitted.

The OSLM field is split as follows:

- OSLM[1] is OSLSR_EL1[3].
- OSLM[0] is OSLSR_EL1[0].

**nTT, bit [2]**

Not 32-bit access. This bit is always RAZ. It indicates that a 32-bit access is needed to write the key to the OS Lock Access Register.
OSLK, bit [1]

OS Lock Status.

<table>
<thead>
<tr>
<th>OSLK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>OS Lock unlocked.</td>
</tr>
<tr>
<td>0b1</td>
<td>OS Lock locked.</td>
</tr>
</tbody>
</table>

The OS Lock is locked and unlocked by writing to the OS Lock Access Register.

The following resets apply:

- On a Cold reset, this field resets to 1.
- On a Warm reset, the value of this field is unchanged.

OSLM[0], bit [0]

This field is bit[0] of OSLM[1:0].

See OSLM[1] for the field description.

Accessing the OSLSR_EL1

Accesses to this register use the following encodings:

MRS <Xt>, OSLSR_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>

  elsif EL2Enabled() && !ELUsingAArch32(EL2) && MDCR_EL2.<TDE,TDOSA> != '00' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  elsif HaveEL(EL3) && !ELUsingAArch32(EL3) && MDCR_EL3.TDOSA == '1' then
    AArch64.SystemAccessTrap(EL3, 0x18);
  else
    return OSLSR_EL1;
  elsif PSTATE.EL == EL2 then
    if HaveEL(EL3) && !ELUsingAArch32(EL3) && MDCR_EL3.TDOSA == '1' then
      AArch64.SystemAccessTrap(EL3, 0x18);
    else
      return OSLSR_EL3;
  elsif PSTATE.EL == EL3 then
    return OSLSR_EL1;
```
PAN, Privileged Access Never

The PAN characteristics are:

**Purpose**

Allows access to the Privileged Access Never bit.

**Configuration**

This register is present only when ARMv8.1-PAN is implemented. Otherwise, direct accesses to PAN are **UNDEFINED**.

**Attributes**

PAN is a 64-bit register.

**Field descriptions**

The PAN bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

| RES0 |  RES0 | PAN | RES0 | RES0 |

**Bits [63:23]**

Reserved, RES0.

**PAN, bit [22]**

Privileged Access Never.

<table>
<thead>
<tr>
<th>PAN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Privileged reads and write are not disabled by this mechanism.</td>
</tr>
<tr>
<td>0b1</td>
<td>Disables privileged read and write accesses to addresses accessible at EL0 for an enabled stage 1 translation regime that defines the EL0 permissions.</td>
</tr>
</tbody>
</table>

The value of this bit is usually preserved on taking an exception, except in the following situations:

- When the target of the exception is EL1, and the value of the SCTLR_EL1.SPAN bit is 0, this bit is set to 1.
- When the target of the exception is EL2, HCR_EL2.{E2H, TGE} is {1, 1}, and the value of the SCTLR_EL2.SPAN bit is 0, this bit is set to 1.

**Bits [21:0]**

Reserved, RES0.

**Accessing the PAN**

For details on the operation of the MSR (immediate) accessor, see MSR (immediate) in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Accesses to this register use the following encodings:
MRS `<Xt>`, PAN

<table>
<thead>
<tr>

PAR_EL1, Physical Address Register

The PAR_EL1 characteristics are:

**Purpose**

Returns the output address (OA) from an Address translation instruction that executed successfully, or fault information if the instruction did not execute successfully.

**Configuration**

AArch64 System register PAR_EL1 bits [63:0] are architecturally mapped to AArch32 System register PAR[63:0].

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PAR_EL1 is a 64-bit register.

**Field descriptions**

The PAR_EL1 bit assignments are:

**When PAR_EL1.F == 0b0:**

<table>

</tr>
</tbody>
</table>

This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR_EL1 can return a value that indicates the resulting attributes, rather than the values that appear in the translation table descriptors. More precisely:

- The PAR_EL1.{ATTR, SH} fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the translation table descriptors.
- See the PAR_EL1.NS bit description for constraints on the value it returns.

**ATTR, bits [63:56]**

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in MAIR_EL1, MAIR_EL2, and MAIR_EL3.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

This field resets to an architecturally UNKNOWN value.

**Bits [55:52]**

Reserved, RES0.

**PA[51:48], bits [51:48]**
When ARMv8.2-LPA is implemented:

Extension to PA[47:12]. See PA[47:12] for more details.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PA[47:12], bits [47:12]

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[47:12].

When ARMv8.2-LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, the PA[51:48] bits form the upper part of the address value. Otherwise the PA[51:48] bits are RES0.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

This field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES1.

IMPLEMENTATION DEFINED, bit [10]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

NS, bit [9]

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, when SCR_EL3.EEL2 is 1, this bit reflects the Security state of the intermediate physical address space of the translation for the instructions:

- In AArch64 state: AT S1E1R, AT S1E1W, AT S1E1RP, AT S1E1WP, AT S1E0R, and AT S1E0W.
- In AArch32 state: ATS1CPR, ATS1CPW, ATS1CPRP, ATS1CPWP, ATS1CUR, and ATS1CUW.

Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

SH, bits [8:7]

Shareability attribute, for the returned output address. Permitted values are:

<table>
<thead>
<tr>
<th>SH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

The value 0b01 is reserved.

Note
This field returns the value 0b10 for:

- Any type of Device memory.
- Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

This field resets to an architecturally **UNKNOWN** value.

**Bits [6:1]**

Reserved, RES0.

**F, bit [0]**

Indicates whether the instruction performed a successful address translation.

<table>
<thead>
<tr>
<th>F</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Address translation completed successfully.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**When PAR_EL1.F == 0b1:**

<table>
<thead>
<tr>
<th>63  62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</th>
<th>IMPLEMENTATION DEFINED</th>
<th>IMPLEMENTATION DEFINED</th>
<th>IMPLEMENTATION DEFINED</th>
<th>RES0</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
<td>RES0</td>
<td>RES1</td>
<td>RES0</td>
<td>S</td>
</tr>
</tbody>
</table>

This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

**IMPLEMENTATION DEFINED, bits [63:56]**

IMPLEMENTATION DEFINED.

This field resets to an architecturally **UNKNOWN** value.

**IMPLEMENTATION DEFINED, bits [55:52]**

IMPLEMENTATION DEFINED.

This field resets to an architecturally **UNKNOWN** value.

**IMPLEMENTATION DEFINED, bits [51:48]**

IMPLEMENTATION DEFINED.

This field resets to an architecturally **UNKNOWN** value.

**Bits [47:12]**

Reserved, RES0.

**Bit [11]**

Reserved, RES1.
Bit [10]

Reserved, RES0.

S, bit [9]

Indicates the translation stage at which the translation aborted:

<table>
<thead>
<tr>
<th>S</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Translation aborted because of a fault in the stage 1 translation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Translation aborted because of a fault in the stage 2 translation.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

PTW, bit [8]

If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

This field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

FST, bits [6:1]

Fault status code, as shown in the Data Abort ESR encoding.

This field resets to an architecturally UNKNOWN value.

F, bit [0]

Indicates whether the instruction performed a successful address translation.

<table>
<thead>
<tr>
<th>F</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>Address translation aborted.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Accessing the PAR_EL1

Accesses to this register use the following encodings:

MRS <Xt>, PAR_EL1

<table>
<thead>
<tr>

PMBIDR_EL1, Profiling Buffer ID Register

The PMBIDR_EL1 characteristics are:

**Purpose**

Provides information to software as to whether the buffer can be programmed at the current Exception level.

**Configuration**

This register is present only when SPE is implemented. Otherwise, direct accesses to PMBIDR_EL1 are **UNDEFINED**.

**Attributes**

PMBIDR_EL1 is a 64-bit register.

**Field descriptions**

The PMBIDR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-6</td>
<td>RES0</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>5</td>
<td>F</td>
<td>Flag updates. Defines whether the address translation performed by the Profiling Buffer manages the Access Flag and dirty state.</td>
</tr>
<tr>
<td>4</td>
<td>P</td>
<td>Programming not allowed. The Profiling Buffer is owned by a higher Exception level or the other Security state.</td>
</tr>
</tbody>
</table>

**Bits [63:6]**

Reserved, RES0.

**F, bit [5]**

Flag updates. Defines whether the address translation performed by the Profiling Buffer manages the Access Flag and dirty state.

<table>
<thead>
<tr>
<th>F</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hardware management of the Access Flag and dirty state for accesses made by the Statistical Profiling Extension is always disabled for all translation stages.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hardware management for the Access Flag and dirty state for accesses made by the Statistical Profiling Extension is controlled in the same way as explicit memory accesses in the owning translation regime.</td>
</tr>
</tbody>
</table>

If hardware management of the Access Flag is disabled for a stage of translation, an access to Page or Block with the Access flag bit not set in the descriptor will generate an Access Flag fault.

If hardware management of the dirty state is disabled for a stage of translation, an access to a Page or Block will ignore the Dirty Bit Modifier in the descriptor might generate a Permission fault, depending on the values of the access permission bits in the descriptor.

**P, bit [4]**

Programming not allowed. The Profiling Buffer is owned by a higher Exception level or the other Security state.
The value read from this field depends on the current Exception level and the Effective values of `MDCR_EL3.NSPB` and `MDCR_EL2.E2PB`:

- If EL3 is implemented, and either `MDCR_EL3.NSPB == 0b00` or `MDCR_EL3.NSPB == 0b01`, this bit reads as one from:
  - Non-secure EL1.
  - Non-secure EL2.
  - If Secure EL2 is implemented and enabled, and `MDCR_EL2.E2PB == 0b00`, Secure EL1.

- If EL3 is implemented, and either `MDCR_EL3.NSPB == 0b10` or `MDCR_EL3.NSPB == 0b11`, this bit reads as one from:
  - Secure EL1.
  - If Secure EL2 is implemented, Secure EL2.
  - If EL2 is implemented and `MDCR_EL2.E2PB == 0b00`, Non-secure EL1.
  - If EL3 is not implemented, EL2 is implemented, and `MDCR_EL2.E2PB == 0b00`, this bit reads as one from EL1.
  - Otherwise, this bit reads as zero.

### Align, bits [3:0]

Defines the minimum alignment constraint for `PMBPTR_EL1`. If this field is non-zero, then the PE must pad every record up to a multiple of this size.

<table>
<thead>
<tr>
<th>Align</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Byte</td>
</tr>
<tr>
<td>0b0001</td>
<td>Halfword.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Word.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Doubleword.</td>
</tr>
<tr>
<td>0b0100</td>
<td>16 Bytes.</td>
</tr>
<tr>
<td>0b0101</td>
<td>32 Bytes.</td>
</tr>
<tr>
<td>0b0110</td>
<td>64 Bytes.</td>
</tr>
<tr>
<td>0b0111</td>
<td>128 Bytes.</td>
</tr>
<tr>
<td>0b1000</td>
<td>256 Bytes.</td>
</tr>
<tr>
<td>0b1001</td>
<td>512 Bytes.</td>
</tr>
<tr>
<td>0b1010</td>
<td>1KB.</td>
</tr>
<tr>
<td>0b1011</td>
<td>2KB.</td>
</tr>
</tbody>
</table>

For more information, see Restrictions on the current write pointer.

### Accessing the PMBIDR_EL1

Accesses to this register use the following encodings:

```assembly
MRS <Xt>, PMBIDR_EL1
```

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>
<td>0b1001</td>
<td>0b1010</td>
<td>0b111</td>
</tr>
</tbody>
</table>

```assembly
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  return PMBIDR_EL1;
elsif PSTATE.EL == EL2 then
  return PMBIDR_EL1;
elsif PSTATE.EL == EL3 then
  return PMBIDR_EL1;
```
The PMBLIMITR_EL1 characteristics are:

**Purpose**

Defines the upper limit for the profiling buffer, and enables the profiling buffer

**Configuration**

This register is present only when SPE is implemented. Otherwise, direct accesses to PMBLIMITR_EL1 are undefined.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally unknown values.

**Attributes**

PMBLIMITR_EL1 is a 64-bit register.

**Field descriptions**

The PMBLIMITR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:12</td>
<td>LIMIT</td>
<td>Limit address. PMBLIMITR_EL1.LIMIT:Zeros(12) is the address of the first byte in memory after the last byte in the profiling buffer. If the smallest implemented translation granule is not 4KB, then bits[N-1:12] are RES0, where N is the implementation defined value, Log2(smallest implemented translation granule). This field resets to an architecturally unknown value.</td>
</tr>
<tr>
<td>11:3</td>
<td>Reserved, RES0.</td>
<td></td>
</tr>
<tr>
<td>2:1</td>
<td>Fill mode</td>
<td></td>
</tr>
</tbody>
</table>

**LIMIT, bits [63:12]**

Limit address. PMBLIMITR_EL1.LIMIT:Zeros(12) is the address of the first byte in memory after the last byte in the profiling buffer. If the smallest implemented translation granule is not 4KB, then bits[N-1:12] are RES0, where N is the implementation defined value, Log2(smallest implemented translation granule).

This field resets to an architecturally unknown value.

**Bits [11:3]**

Reserved, RES0.

**FM, bits [2:1]**

Fill mode

<table>
<thead>
<tr>
<th>FM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>000</td>
<td>Stop collection and raise maintenance interrupt on buffer fill.</td>
</tr>
</tbody>
</table>

All other values are reserved. If this field is programmed with a reserved value, the PE behaves as if this field has a defined value, other than for a direct read of the register. Software must not rely on the behavior of reserved values, as they might change in a future version of the architecture.

This field resets to an architecturally unknown value.
E, bit [0]

Profiling Buffer enable

<table>
<thead>
<tr>
<th>E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All output is discarded.</td>
</tr>
<tr>
<td>0b1</td>
<td>Profiling buffer enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**PTR, bits [63:0]**

Current write address. Defines the virtual address of the next entry to be written to the buffer.

The architecture places restrictions on the values software can write to the pointer. For more information see 'Restrictions on the current write pointer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D6.3.5.

**Note**

As a result, an implementation might treat some of bits[M:0], where M is defined by PMBIDR_EL1.Align, as **RES0**.

On a management interrupt, PMBPTR_EL1 is frozen.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Bits [63:32]

Reserved, RES0.

EC, bits [31:26]

Exception class

Top-level description of the cause of the buffer management event

<table>
<thead>
<tr>
<th>EC</th>
<th>Meaning</th>
<th>MSS</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>Other buffer management event. All buffer management events other than</td>
<td>MSS encoding for other buffer management</td>
</tr>
<tr>
<td></td>
<td>those described by other defined Exception class codes.</td>
<td>events</td>
</tr>
<tr>
<td>0b100100</td>
<td>Stage 1 Data Abort on write to Profiling Buffer.</td>
<td>MSS encoding for stage 1 or stage 2 Data Aborts on write to buffer</td>
</tr>
<tr>
<td>0b100101</td>
<td>Stage 2 Data Abort on write to Profiling Buffer.</td>
<td>MSS encoding for stage 1 or stage 2 Data Aborts on write to buffer</td>
</tr>
</tbody>
</table>

All other values are reserved. Reserved values might be defined in a future version of the architecture.

Writing a reserved value to this field will make the value of this field UNKNOWN. Values that are not supported act as reserved values when writing to this register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
### Bits [25:20]

Reserved, RES0.

### DL, bit [19]

Partial record lost.

Following a buffer management event other than an asynchronous External abort, indicates whether the last record written to the Profiling Buffer is complete.

<table>
<thead>
<tr>
<th>DL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PMBPTR_EL1 points to the first byte after the last complete record written to the Profiling Buffer.</td>
</tr>
<tr>
<td>0b1</td>
<td>Part of a record was lost because of a buffer management event or synchronous External abort. PMBPTR_EL1 might not point to the first byte after the last complete record written to the buffer, and so restarting collection might result in a data record stream that software cannot parse. All records prior to the last record have been written to the buffer.</td>
</tr>
</tbody>
</table>

When the buffer management event was because of an asynchronous external abort, this bit is set to 1 and software must not assume that any valid data has been written to the Profiling Buffer.

This bit is RES0 if the PE never sets this bit as a result of a buffer management event caused by an asynchronous External abort.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### EA, bit [18]

External abort.

<table>
<thead>
<tr>
<th>EA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An external abort has not been asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>An external abort has been asserted and detected by the Statistical Profiling Extension.</td>
</tr>
</tbody>
</table>

This bit is RES0 if the PE never sets this bit as the result of an External abort.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### S, bit [17]

Service

<table>
<thead>
<tr>
<th>S</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PMBIRQ is not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>PMBIRQ is asserted. All profiling data has either been written to the buffer or discarded.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### COLL, bit [16]

Collision detected.

<table>
<thead>
<tr>
<th>COLL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No collision events detected.</td>
</tr>
<tr>
<td>0b1</td>
<td>At least one collision event was recorded.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.
MSS, bits [15:0]

Management Event Specific Syndrome.

Contains syndrome specific to the management event.

The syndrome contents for each management event are described in the following sections.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### MSS encoding for stage 1 or stage 2 Data Aborts on write to buffer

<table>
<thead>
<tr>

<tr>
<td>0b110001</td>
<td>Unsupported atomic hardware update fault. When ARMv8.1-TTHM is implemented</td>
</tr>
</tbody>
</table>

All other values are reserved. Reserved values might be defined in a future version of the architecture.

Writing a reserved value to this field will make the value of this field UNKNOWN. Values that are not supported act as reserved values when writing to this register.

It is IMPLEMENTATION DEFINED whether each of the Access Flag fault, asynchronous External abort and synchronous External abort, Alignment fault, and TLB Conflict abort values can be generated by the PE. For more information see Faults and Watchpoints.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### MSS encoding for other buffer management events

PMCCFILTR_EL0, Performance Monitors Cycle Count Filter Register

The PMCCFILTR_EL0 characteristics are:

**Purpose**
Determines the modes in which the Cycle Counter, PMCCNTR_EL0, increments.

**Configuration**
AArch64 System register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCCFILTR[31:0].

AArch64 System register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to External register PMCCFILTR_EL0[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMCCFILTR_EL0 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**
PMCCFILTR_EL0 is a 64-bit register.

**Field descriptions**
The PMCCFILTR_EL0 bit assignments are:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Reserved, RES0.

**P, bit [31]**
Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR_EL0.NSK bit.

<table>
<thead>
<tr>
<th>P</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count cycles in EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count cycles in EL1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**U, bit [30]**
User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR_EL0.NSU bit.
PMCCFILTR_EL0, Performance Monitors Cycle Count Filter Register

<table>
<thead>
<tr>
<th>U</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count cycles in EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count cycles in EL0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**NSK, bit [29]**

**When HaveEL(EL3):**

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Non-secure EL1 are counted.

Otherwise, cycles in Non-secure EL1 are not counted.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**NSU, bit [28]**

**When HaveEL(EL3):**

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**NSH, bit [27]**

**When HaveEL(EL2):**

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If Secure EL2 is implemented, counting in Secure EL2 is further controlled by the PMCCFILTR_EL0.SH bit.

<table>
<thead>
<tr>
<th>NSH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not count cycles in EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Count cycles in EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**M, bit [26]**

**When HaveEL(EL3):**

Secure EL3 filtering bit.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Secure EL3 are counted.
Otherwise, cycles in Secure EL3 are not counted.

Most applications can ignore this field and set its value to 0.

---

**Note**

This field is not visible in the AArch32 PMCCFILTR System register.

---

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Bit [25]**

Reserved, RES0.

**SH, bit [24]**

*When ARMv8.4-SecEL2 is implemented:*

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Secure EL2 are counted.

Otherwise, cycles in Secure EL2 are not counted.

If Secure EL2 is not implemented or is disabled, this field is RES0.

---

**Note**

This field is not visible in the AArch32 PMCCFILTR System register.

---

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**T, bit [23]**

*When TME is implemented:*

Non-transactional state filtering bit.

<table>
<thead>
<tr>
<th>T</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This bit has no effect on filtering of cycles.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count cycles in Non-transactional state.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Bits [22:0]**

Reserved, RES0.

PMCCNTR_EL0, Performance Monitors Cycle Count Register

The PMCCNTR_EL0 characteristics are:

**Purpose**

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See 'Time as measured by the Performance Monitors cycle counter' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile for more information.

PMCCFILTR_EL0 determines the modes and states in which the PMCCNTR_EL0 can increment.

**Configuration**

AArch64 System register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch32 System register PMCCNTR[63:0].

AArch64 System register PMCCNTR_EL0 bits [63:0] are architecturally mapped to External register PMCCNTR_EL0[63:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMCCNTR_EL0 are UNDEFINED.

All counters are subject to any changes in clock frequency, including clock stopping caused by the WFI and WFE instructions. This means that it is CONSTRAINED UNPREDICTABLE whether or not PMCCNTR_EL0 continues to increment when clocks are stopped by WFI and WFE instructions.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMCCNTR_EL0 is a 64-bit register.

**Field descriptions**

The PMCCNTR_EL0 bit assignments are:

<table>
<thead>

**CCNT, bits [63:0]**

Cycle count. Depending on the values of PMCR_EL0.c{LC,D}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to PMCR_EL0.C sets this field to 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMCCNTR_EL0**

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
    if !ELUsingAArch32(EL1) && PMUSERENR_EL0.<CR,EN> == '00' then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    elseif EL2Enabled() && !ELUsingAArch32(EL1) && HCR_EL2.<E2HTGE> != '1' && (!HaveEL(EL3) ||
        SCR_EL3.FGTEn == '1') && HDFGRTR_EL2.PMCCNTR_EL0 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
    elseif EL2Enabled() && !ELUsingAArch32(EL2) && MDCR_EL2.TPM == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);

PMCEID0_EL0, Performance Monitors Common Event Identification register 0

The PMCEID0_EL0 characteristics are:

### Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the ranges 0x0000 to 0x001F and 0x4000 to 0x401F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

---

**Note**

Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

---

For more information about the common events and the use of the PMCEID<n>_EL0 registers see the section describing 'Event numbers and common events' in chapter D5 'The Performance Monitors Extension' of the Arm Architecture Reference Manual, for Armv8-A architecture profile.

### Configuration

AArch64 System register PMCEID0_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCEID0[31:0].

AArch64 System register PMCEID0_EL0 bits [63:32] are architecturally mapped to AArch32 System register PMCEID2[31:0].

AArch64 System register PMCEID0_EL0 bits [31:0] are architecturally mapped to External register PMCEID0[31:0].

AArch64 System register PMCEID0_EL0 bits [63:32] are architecturally mapped to External register PMCEID2[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMCEID0_EL0 are UNDEFINED.

### Attributes

PMCEID0_EL0 is a 64-bit register.

### Field descriptions

The PMCEID0_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>62</th>
<th>61</th>
<th>60</th>
<th>59</th>
<th>58</th>
<th>57</th>
<th>56</th>
<th>55</th>
<th>54</th>
<th>53</th>
<th>52</th>
<th>51</th>
<th>50</th>
<th>49</th>
<th>48</th>
<th>47</th>
<th>46</th>
<th>45</th>
<th>44</th>
<th>43</th>
<th>42</th>
<th>41</th>
<th>40</th>
<th>39</th>
<th>38</th>
<th>37</th>
<th>36</th>
<th>35</th>
<th>34</th>
<th>33</th>
<th>32</th>
</tr>
</thead>
<tbody>
<tr>
<td>IDhi&lt;n&gt;, bit [n+32], for n = 0 to 31</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

When ARMv8.1-PMU is implemented:

IDhi[n] corresponds to common event (0x4000 + n).

For each bit:
A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

**Note**

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

**Otherwise:**

Reserved, RES0.

**ID<n>, bit [n], for n = 0 to 31**

ID[n] corresponds to common event n.

For each bit:

<table>
<thead>
<tr>
<th>ID&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The common event is not implemented, or not counted.</td>
</tr>
<tr>
<td>0b1</td>
<td>The common event is implemented.</td>
</tr>
</tbody>
</table>

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

**Note**

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

**Accessing the PMCEID0_EL0**

Accesses to this register use the following encodings:

**MRS <Xt>, PMCEID0_EL0**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>

PMCEID1_EL0, Performance Monitors Common Event Identification register 1

The PMCEID1_EL0 characteristics are:

**Purpose**

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the ranges $0x0020$ to $0x003F$ and $0x4020$ to $0x403F$.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

**Note**

Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEID<n>_EL0 registers see The section describing 'Event numbers and common events' in chapter D5 'The Performance Monitors Extension' of the Arm Architecture Reference Manual, for Armv8-A architecture profile.

**Configuration**

AArch64 System register PMCEID1_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCEID1[31:0].

AArch64 System register PMCEID1_EL0 bits [63:32] are architecturally mapped to AArch32 System register PMCEID3[31:0].

AArch64 System register PMCEID1_EL0 bits [31:0] are architecturally mapped to External register PMCEID1[31:0].

AArch64 System register PMCEID1_EL0 bits [63:32] are architecturally mapped to External register PMCEID3[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMCEID1_EL0 are UNDEFINED.

**Attributes**

PMCEID1_EL0 is a 64-bit register.

**Field descriptions**

The PMCEID1_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

    AArch64.SystemAccessTrap(EL3, 0x18);
  else
    return PMCEID1_EL0;
elseif PSTATE.EL == EL3 then
  return PMCEID1_EL0;
PMCNTENCLR_EL0, Performance Monitors Count Enable Clear register

The PMCNTENCLR_EL0 characteristics are:

**Purpose**

Disables the Cycle Count Register, PMCCNTR_EL0, and any implemented event counters PMEVCNTR<n>. Reading this register shows which counters are enabled.

**Configuration**

AArch64 System register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCNTENCLR[31:0].

AArch64 System register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to External register PMCNTENCLR_EL0[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMCNTENCLR_EL0 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMCNTENCLR_EL0 is a 64-bit register.

**Field descriptions**

The PMCNTENCLR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>62</td>
</tr>
<tr>
<td>31</td>
<td>30</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**C, bit [31]**

PMCCNTR_EL0 disable bit. Disables the cycle counter register. Possible values are:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter is enabled. When written, disables the cycle counter.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P<n>, bit [n], for n = 0 to 30**

Event counter disable bit for PMEVCNTR<n> EL0.
If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in MDCR_EL2.HPMN. Otherwise, N is the value in PMCR_EL0.N.

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that PMEVCNTR&lt;n&gt;_EL0 is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that PMEVCNTR&lt;n&gt;_EL0 is enabled. When written, disables PMEVCNTR&lt;n&gt;_EL0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Accessing the PMCNTENCLR_EL0

PMCNTENSET_EL0, Performance Monitors Count Enable Set register

The PMCNTENSET_EL0 characteristics are:

Purpose

Enables the Cycle Count Register, PMCCNTR_EL0, and any implemented event counters PMEVCNTR<n>. Reading this register shows which counters are enabled.

Configuration

AArch64 System register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCNTENSET[31:0].

AArch64 System register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to External register PMCNTENSET_EL0[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMCNTENSET_EL0 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMCNTENSET_EL0 is a 64-bit register.

Field descriptions

The PMCNTENSET_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| C  | RES0 | P<n>, bit [n] |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

C, bit [31]

PMCCNTR_EL0 enable bit. Enables the cycle counter register. Possible values are:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter is enabled. When written, enables the cycle counter.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 0 to 30

Event counter enable bit for PMEVCNTR<n>_EL0.
If \( N \) is less than 31, then bits [30\( :N \)] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, \( N \) is the value in \( \text{MDCR}_{EL2}.\text{HPMN} \). Otherwise, \( N \) is the value in \( \text{PMCR}_{EL0}.\text{N} \).

<table>
<thead>
<tr>
<th>( Pn )</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that ( \text{PMEVCNTR}<em>n</em>{EL0} ) is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that ( \text{PMEVCNTR}<em>n</em>{EL0} ) event counter is enabled. When written, enables ( \text{PMEVCNTR}<em>n</em>{EL0} ).</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally unknown value.

### Accessing the PMCNTENSET_EL0

Accesses to this register use the following encodings:

\[ \text{MRS <Xt>, PMCNTENSET_EL0} \]

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>0b011</td>
<td>0b1001</td>
<td>0b1100</td>
<td>0b001</td>
</tr>
</tbody>
</table>

if \( \text{PSTATE.EL} == \text{EL0} \) then
  if \( \text{!ELUsingAArch32(EL1)} \&\& \text{PMUSERENR EL0.EN} == '0' \) then

PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

**Purpose**

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

**Configuration**

AArch64 System register PMCR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCR[31:0].

AArch64 System register PMCR_EL0 bits [7:0] are architecturally mapped to External register PMCR_EL0[7:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMCR_EL0 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMCR_EL0 is a 64-bit register.

**Field descriptions**

The PMCR_EL0 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     | IMP | IDCODE | N | RES0 |     | LP | LC | DP | X | D | C | P | E |
| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

**Bits [63:32]**

Reserved, RES0.

**IMP, bits [31:24]**

Implementer code. This field has an IMPLEMENTATION DEFINED value.

If this field is zero, then PMCR_EL0.IDCODE is RES0 and software must use the MIDR_EL1 to identify the PE.

Otherwise, this field and PMCR_EL0.IDCODE identifies the PMU implementation to software. The implementer codes are allocated by Arm. A non-zero value has the same interpretation as MIDR_EL1.Implementer.

Access to this field is RO.

**IDCODE, bits [23:16]**

When PMCR_EL0.IMP != 0x00:

Identification code. This field has an IMPLEMENTATION DEFINED value.

Each implementer must maintain a list of identification codes that are specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.

Access to this field is RO.
Otherwise:

Reserved, RES0.

\textbf{N, bits [15:11]}

Indicates the number of event counters implemented. This value is in the range of 0b00000-0b11111. If the value is 0b00000 then only \texttt{PMCCNTR_EL0} is implemented. If the value is 0b11111 \texttt{PMCCNTR_EL0} and 31 event counters are implemented.

When EL2 is implemented and enabled for the current Security state, reads of this field from EL1 and EL0 return the value of \texttt{MDCR_EL2.HPMN}.

Access to this field is \textbf{RO}.

\textbf{Bits [10:8]}

Reserved, RES0.

\textbf{LP, bit [7]}

When ARMv8.5-PMU is implemented:

Long event counter enable. Determines when unsigned overflow is recorded by a counter overflow bit.

<table>
<thead>
<tr>
<th>LP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counter overflow on increment that causes unsigned overflow of PMEVCNTR(&lt;n&gt;)_EL0{31:0}.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counter overflow on increment that causes unsigned</td>
</tr>
<tr>
<td></td>
<td>overflow of PMEVCNTR(&lt;n&gt;)_EL0{63:0}.</td>
</tr>
</tbody>
</table>

If EL2 is implemented and \texttt{MDCR_EL2.HPMN} or \texttt{HDCR.HPMN} is less than \texttt{PMCR_EL0.N}, this bit does not affect the operation of event counters in the range [HDCR.HPMN..(PMCR_EL0.N-1)] or [MDCR_EL2.HPMN..(PMCR_EL0.N-1)].

\textbf{Note}

The effect of \texttt{MDCR_EL2.HPMN} or \texttt{HDCR.HPMN} on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state. For more information, see the description of \texttt{MDCR_EL2.HPMN} or \texttt{HDCR.HPMN}.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

\textbf{LC, bit [6]}

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

<table>
<thead>
<tr>
<th>LC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0{31:0}.</td>
</tr>
<tr>
<td>0b1</td>
<td>Cycle counter overflow on increment that causes unsigned</td>
</tr>
<tr>
<td></td>
<td>overflow of PMCCNTR_EL0{63:0}.</td>
</tr>
</tbody>
</table>

Arm deprecates use of \texttt{PMCR_EL0.LC} = 0.

In an AArch64 only implementation, this field is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
DP, bit [5]

When HaveEL(EL3) or (ARMv8.1-PMU is implemented and HaveEL(EL2)):

Disable cycle counter when event counting is prohibited.

<table>
<thead>
<tr>
<th>DP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counting by PMCCNTR_EL0 is not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>When event counting for counters in the range [0..(MDCR_EL2.HPMN-1)] is prohibited, cycle counting by PMCCNTR_EL0 is disabled.</td>
</tr>
</tbody>
</table>

For more information about the interaction between the Performance Monitors and EL3, see ‘Effect of EL3 and EL2’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

X, bit [4]

When the implementation includes an PMU event export bus:

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

<table>
<thead>
<tr>
<th>X</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not export events.</td>
</tr>
<tr>
<td>0b1</td>
<td>Export events where not prohibited.</td>
</tr>
</tbody>
</table>

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL PE trace unit.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

D, bit [3]

When AArch32 is supported at any Exception level:

Clock divider.

<table>
<thead>
<tr>
<th>D</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When enabled, PMCCNTR_EL0 counts every clock cycle.</td>
</tr>
<tr>
<td>0b1</td>
<td>When enabled, PMCCNTR_EL0 counts once every 64 clock cycles.</td>
</tr>
</tbody>
</table>

If PMCR_EL0.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR_EL0.D = 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
C, bit [2]

Cycle counter reset. The effects of writing to this bit are:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reset PMCCNTR_EL0 to zero.</td>
</tr>
</tbody>
</table>

This bit is always RAZ.

Note

Resetting PMCCNTR_EL0 does not change the cycle counter overflow bit.

The value of PMCR_EL0.LC is ignored, and bits [63:0] of all affected event counters are reset.

Access to this field is WO.

P, bit [1]

Event counter reset. The effects of writing to this bit are:

<table>
<thead>
<tr>
<th>P</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reset all event counters accessible in the current Exception level, not including PMCCNTR_EL0, to zero.</td>
</tr>
</tbody>
</table>

This bit is always RAZ.

In EL0 and EL1:

- If EL2 is implemented and enabled in the current Security state, and MDCR_EL2.HPMN is less than PMCR_EL0.N, a write of 1 to this bit does not reset event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)].
- If EL2 is not implemented, EL2 is disabled in the current Security state, or MDCR_EL2.HPMN equals PMCR_EL0.N, a write of 1 to this bit resets all the event counters.

In EL2 and EL3, a write of 1 to this bit resets all the event counters.

Note

Resetting the event counters does not change the event counter overflow bits.

If ARMv8.5-PMU is implemented, the values of MDCR_EL2.HLP and PMCR_EL0.LP are ignored, and bits [63:0] of all affected event counters are reset.

Access to this field is WO.

E, bit [0]

Enable.

<table>
<thead>
<tr>
<th>E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All event counters in the range [0..(PMN-1)] and PMCCNTR_EL0 are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>All event counters in the range [0..(PMN-1)] and PMCCNTR_EL0, are enabled by PMCNTENSET_EL0.</td>
</tr>
</tbody>
</table>

If EL2 is implemented then:

- If EL2 is using AArch32, PMN is HDCR.HPMN.
- If EL2 is using AArch64, PMN is MDCR_EL2.HPMN.
• If PMN is less than PMCR_EL0.N, this bit does not affect the operation of event counters in the range [PMN..(PMCR_EL0.N-1)].

If EL2 is not implemented, PMN is PMCR_EL0.N.

Note

The effect of MDCR_EL2.HPMN or HDCR.HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state. For more information, see the description of MDCR_EL2.HPMN or HDCR.HPMN.

On a Warm reset, this field resets to 0.

Accessing the PMCR_EL0

Accesses to this register use the following encodings:

MRS <Xt>, PMCR_EL0

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>

PMEVCNTR<n>_EL0, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n>_EL0 characteristics are:

**Purpose**

Holds event counter n, which counts events, where n is 0 to 30.

**Configuration**

AArch64 System register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMEVCNTR<n>[31:0].

AArch64 System register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to External register PMEVCNTR<n>_EL0[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMEVCNTR<n>_EL0 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMEVCNTR<n>_EL0 is a 64-bit register.

**Field descriptions**

The PMEVCNTR<n>_EL0 bit assignments are:

**When ARMv8.5-PMU is implemented:**

| 63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32 | Event counter n |
| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 | Event counter n |

**Bits [63:0]**

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

| 63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32 | RES0 |
| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 | Event counter n |

**Bits [63:32]**

Reserved, RES0.
Bits [31:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMEVCNTR<n>_EL0

PMEVCNTR<n>_EL0 can also be accessed by using PMXEVCNTR_EL0 with PMSELR_EL0 SEL set to the value of <n>.

If ARMv8.6-FGT is implemented, and EL2 is implemented and enabled in the current Security state, for reads and writes at EL1 and permitted reads and writes at EL0:

- If <n> is an unimplemented event counter, the access is UNDEFINED.
- Otherwise, if <n> is greater than or equal to MDCR_EL2.HPMN, the access is trapped to EL2.

If ARMv8.6-FGT is not implemented, or the above behaviors do not apply:

If <n> is greater than or equal to the number of accessible counters, reads and writes of PMEVCNTR<n>_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR_EL0.{ER,EN}.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, MDCR_EL2.HPMN identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters. See MDCR_EL2.HPMN for more details.

Accesses to this register use the following encodings:

MRS <Xt>, PMEVCNTR<n>_EL0

The PMEVTYPER<n>_EL0 characteristics are:

**Purpose**

Configures event counter n, where n is 0 to 30.

**Configuration**

AArch64 System register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMEVTYPER<n>[31:0].

AArch64 System register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to External register PMEVTYPER<n>_EL0[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMEVTYPER<n>_EL0 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMEVTYPER<n>_EL0 is a 64-bit register.

**Field descriptions**

The PMEVTYPER<n>_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| P  | U  | NSK | NSK | NSH | M  | MT | SH | T  | RES0 | evtCount[15:10] | evtCount[9:0] |

**Bits [63:32]**

Reserved, RES0.

**P, bit [31]**

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER<n>_EL0.NSK bit.

<table>
<thead>
<tr>
<th>P</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count events in EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count events in EL1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**U, bit [30]**

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER<n>_EL0.NSU bit.
### NSK, bit [29]

**When HaveEL(EL3):**

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

- If the value of this bit is equal to the value of the PMEVTYPER<\(n\)>_EL0.P bit, events in Non-secure EL1 are counted.
- Otherwise, events in Non-secure EL1 are not counted.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

### NSU, bit [28]

**When HaveEL(EL3):**

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

- If the value of this bit is equal to the value of the PMEVTYPER<\(n\)>_EL0.U bit, events in Non-secure EL0 are counted.
- Otherwise, events in Non-secure EL0 are not counted.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

### NSH, bit [27]

**When HaveEL(EL2):**

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

- If Secure EL2 is implemented, counting in Secure EL2 is further controlled by the PMEVTYPER<\(n\)>_EL0.SH bit.

<table>
<thead>
<tr>
<th>NSH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not count events in EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Count events in EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

### M, bit [26]

**When HaveEL(EL3):**

Secure EL3 filtering bit.

- If the value of this bit is equal to the value of the PMEVTYPER<\(n\)>_EL0.P bit, events in Secure EL3 are counted.
Otherwise, events in Secure EL3 are not counted.

Most applications can ignore this field and set its value to 0b0.

Note
This field is not visible in the AArch32 PMEVTYPER<n> System register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

MT, bit [25]
When ARMv8.6-MTPMU is implemented or IMPLEMENTATION DEFINED multi-threaded PMU Extension is implemented:

Multithreading.

<table>
<thead>
<tr>
<th>MT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count events only on controlling PE.</td>
</tr>
<tr>
<td>0b1</td>
<td>Count events from any PE with the same affinity at level 1 and above as this PE.</td>
</tr>
</tbody>
</table>

Note
- When the lowest level of affinity consists of logical PEs that are implemented using a multi-threading type approach, an implementation is described as multi-threaded. That is, the performance of PEs at the lowest affinity level is highly interdependent.
- Events from a different thread of a multithreaded implementation are not attributable to the thread counting the event.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

SH, bit [24]
When ARMv8.4-SecEL2 is implemented:

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMEVTYPER<n>_EL0.NSH bit, events in Secure EL2 are counted.

Otherwise, events in Secure EL2 are not counted.

Note
This field is not visible in the AArch32 PMEVTYPER<n> System register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

T, bit [23]
When TME is implemented:

Transactional state filtering bit. Controls counting in Transactional state. The possible values of this bit are:

<table>
<thead>
<tr>
<th>T</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This bit has no effect on the filtering of events.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count events in Transactional state.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Bits [22:16]**

Reserved, RES0.

**evtCount[15:10], bits [15:10]**

When ARMv8.1-PMU is implemented:

Extension to evtCount[9:0]. See evtCount[9:0] for more details.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**evtCount[9:0], bits [9:0]**

Event to count. The event number of the event that is counted by event counter `PMEVCNTR<n>_EL0`.

Software must program this field with an event that is supported by the PE being programmed.

The ranges of event numbers allocated to each type of event are shown in Allocation of the PMU event number space.

If evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range 0x0000 to 0x003F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- If 16-bit evtCount is implemented, for the range 0x4000 to 0x403F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED events, it is UNPREDICTABLE what event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

**Note**

UNPREDICTABLE means the event must not expose privileged information.

Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include an event from a set of common IMPLEMENTATION DEFINED events, then no event is counted and the value read back on evtCount is the value written.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMEVTYPER<n>_EL0**

PMEVTYPER<n>_EL0 can also be accessed by using `PMXEVTPTER_EL0` with `PMSELR_EL0` SEL set to n.
If ARMv8.6-FGT is implemented, and EL2 is implemented and enabled in the current Security state, for reads and writes at EL1 and permitted reads and writes at EL0:

- If <n> is an unimplemented event counter, the access is **UNDEFINED**.
- Otherwise, if <n> is greater than or equal to **MDCR_EL2.HPMN**, the access is trapped to EL2.

If ARMv8.6-FGT is not implemented, or the above behaviors do not apply:

If <n> is greater than or equal to the number of accessible counters, reads and writes of PMEVTYPER<n> _EL0 are **CONSTRAINED UNPREDICTABLE**, and the following behaviors are permitted:

- Accesses to the register are **UNDEFINED**.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

**Note**

In EL0, an access is permitted if it is enabled by **PMUSERENR_EL0.EN**.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, **MDCR_EL2.HPMN** identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters. See **MDCR_EL2.HPMN** for more details.

Accesses to this register use the following encodings:

**MRS <Xt>, PMEVTYPER<n> _EL0**

PMINTENCLR_EL1, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR_EL1 characteristics are:

**Purpose**

Disables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR_EL0, and the event counters PMEVCNTR<n>_EL0. Reading the register shows which overflow interrupt requests are enabled.

**Configuration**

AArch64 System register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMINTENCLR[31:0].

AArch64 System register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to External register PMINTENCLR_EL1[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMINTENCLR_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMINTENCLR_EL1 is a 64-bit register.

**Field descriptions**

The PMINTENCLR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>62</td>
<td>C, bit [31]</td>
</tr>
<tr>
<td>61</td>
<td>PMCCNTR_EL0 overflow interrupt request disable bit. Possible values are:</td>
</tr>
<tr>
<td>60</td>
<td>0b0</td>
</tr>
<tr>
<td>59</td>
<td>0b1</td>
</tr>
<tr>
<td>58</td>
<td>P&lt;n&gt;, bit [n], for n = 0 to 30</td>
</tr>
</tbody>
</table>

**C, bit [31]**

PMCCNTR_EL0 overflow interrupt request disable bit. Possible values are:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.</td>
</tr>
</tbody>
</table>

**P<n>, bit [n], for n = 0 to 30**

Event counter overflow interrupt request disable bit for PMEVCNTR<n>_EL0.

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1, N is the value in MDCR_EL2.HPMN. Otherwise, N is the value in PMCR_EL0.N.
<table>

PMMIR_EL1, Performance Monitors Machine Identification Register

The PMMIR_EL1 characteristics are:

**Purpose**

Describes Performance Monitors parameters specific to the implementation to software.

**Configuration**

This register is present only when ARMv8.4-PMU is implemented. Otherwise, direct accesses to PMMIR_EL1 are UNDEFINED.

**Attributes**

PMMIR_EL1 is a 64-bit register.

**Field descriptions**

The PMMIR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [63:8]**

Reserved, RES0.

**SLOTS, bits [7:0]**

Operation width. The largest value by which the STALL_SLOT event might increment by in a single cycle. If the STALL_SLOT event is not implemented, this field might read as zero.

**Accessing the PMMIR_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, PMMIR_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>
<td>0b1001</td>
<td>0b1110</td>
<td>0b110</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&

    AArch64.SystemAccessTrap(EL3, 0x18);
  else
    return PMMIR_EL1;
elsif PSTATE.EL == EL2 then
  if HaveEL(EL3) && !ELUsingAArch32(EL3) && MDCR_EL3.TPM == '1' then
    AArch64.SystemAccessTrap(EL3, 0x18);
  else
    return PMMIR_EL1;
elsif PSTATE.EL == EL3 then
  return PMMIR_EL1;
The PMOVSCLR_EL0 characteristics are:

**Purpose**

Contains the state of the overflow bit for the Cycle Count Register, `PMCCNTR_EL0`, and each of the implemented event counters `PMEVCNTR<n>`. Writing to this register clears these bits.

**Configuration**

AArch64 System register PMOVSCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register `PMOVSR[31:0]`.

AArch64 System register PMOVSCLR_EL0 bits [31:0] are architecturally mapped to External register `PMOVSLR_EL0[31:0]`.

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMOVSCLR_EL0 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMOVSCLR_EL0 is a 64-bit register.

**Field descriptions**

The PMOVSCLR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
</tr>
<tr>
<td>62</td>
<td>C</td>
</tr>
<tr>
<td>61</td>
<td>P&lt;n&gt;, bit [n]</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**C, bit [31]**

Cycle counter overflow clear bit.

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter has overflowed since this bit was last cleared. When written, clears the cycle counter overflow bit to 0.</td>
</tr>
</tbody>
</table>

`PMCR_EL0.LC` controls whether an overflow is detected from unsigned overflow of `PMCCNTR_EL0[31:0]` or unsigned overflow of `PMCCNTR_EL0[63:0]`.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
P<n>, bit [n], for n = 0 to 30

Event counter overflow clear bit for PMEVCNTR<n>_EL0.

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in MDCR_EL2.HPMN. Otherwise, N is the value in PMCR_EL0.N.

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that PMEVCNTR&lt;n&gt;_EL0 has not overflowed since this bit was last cleared. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that PMEVCNTR&lt;n&gt;_EL0 has overflowed since this bit was last cleared. When written, clears the PMEVCNTR&lt;n&gt;_EL0 overflow bit to 0.</td>
</tr>
</tbody>
</table>

If ARMv8.5-PMU is implemented, MDCR_EL2.HLP and PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<n>_EL0[31:0] or unsigned overflow of PMEVCNTR<n>_EL0[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMOVSLER_EL0

        PMOVSCLR_EL0 = X[t];
      else if PSTATE.EL == EL3 then
        PMOVSCLR_EL0 = X[t];
The PMOVSSET_EL0 characteristics are:

**Purpose**

Sets the state of the overflow bit for the Cycle Count Register, PMCCNTR_EL0, and each of the implemented event counters PMEVCNTR<n>.

**Configuration**

AArch64 System register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMOVSSET[31:0].

AArch64 System register PMOVSSET_EL0 bits [31:0] are architecturally mapped to External register PMOVSSET_EL0[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMOVSSET_EL0 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMOVSSET_EL0 is a 64-bit register.

**Field descriptions**

The PMOVSSET_EL0 bit assignments are:

<table>
<thead>
<tr>

<td>4</td>
<td>3</td>
<td>2</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**C, bit [31]**

Cycle counter overflow set bit.

<table>
<thead>
<tr>
<th>0b0</th>
<th>0b1</th>
</tr>
</thead>
<tbody>
<tr>
<td>When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.</td>
<td>When read, means the cycle counter has overflowed since this bit was last cleared. When written, sets the cycle counter overflow bit to 1.</td>
</tr>
</tbody>
</table>

PMCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**P<n>, bit [n], for n = 0 to 30**

Event counter overflow set bit for **PMEVCNTR<n>_EL0**.

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in **MDCR_EL2**. HPMN. Otherwise, N is the value in **PMCR_EL0**.N.

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that <strong>PMEVCNTR&lt;n&gt;_EL0</strong> has not overflowed since this bit was last cleared. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that <strong>PMEVCNTR&lt;n&gt;_EL0</strong> has overflowed since this bit was last cleared. When written, sets the <strong>PMEVCNTR&lt;n&gt;_EL0</strong> overflow bit to 1.</td>
</tr>
</tbody>
</table>

If ARMv8.5-PMU is implemented, **MDCR_EL2**.HLp and **PMCR_EL0**.LP control whether an overflow is detected from unsigned overflow of **PMEVCNTR<n>_EL0[31:0]** or unsigned overflow of **PMEVCNTR<n>_EL0[63:0]**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the PMOVSSET_EL0**

PMSCR_EL1, Statistical Profiling Control Register (EL1)

The PMSCR_EL1 characteristics are:

**Purpose**

Provides EL1 controls for Statistical Profiling

**Configuration**

This register is present only when SPE is implemented. Otherwise, direct accesses to PMSCR_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMSCR_EL1 is a 64-bit register.

**Field descriptions**

The PMSCR_EL1 bit assignments are:

<table>

</tbody>
</table>

**Bits [63:8]**

Reserved, RES0.

**PCT, bits [7:6]**

When HaveEL(EL2):

Physical Timestamp. If timestamp sampling is enabled and the Profiling Buffer is owned by EL1, requests which timestamp counter value is collected.

If ARMv8.6-ECV is implemented, this is a two bit field as shown. Otherwise, bit[7] is RES0.

<table>
<thead>
<tr>
<th>PCT</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Virtual counter; CNTVCT_EL0 is</td>
<td></td>
</tr>
<tr>
<td></td>
<td>collected.</td>
<td></td>
</tr>
<tr>
<td>0b01</td>
<td>Physical counter; CNTPCT_EL0 is</td>
<td></td>
</tr>
<tr>
<td></td>
<td>collected.</td>
<td></td>
</tr>
<tr>
<td>0b11</td>
<td>Physical counter, CNTPCT_EL0,</td>
<td>When ARMv8.6-ECV is</td>
</tr>
<tr>
<td></td>
<td>minus CNTPCT_EL2 is collected.</td>
<td>implemented</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

If the Profiling Buffer owning Exception level is EL2, this field is ignored.

If the Profiling Buffer owning Exception level is EL1, this field is combined with PMSCR_EL2.PCT to determine which timestamp counter value is collected. For more information, see 'Controlling the data that is collected' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

When EL2 is implemented and enabled in the current Security state, the physical counter uses a fixed physical offset of zero if either of the following are true:

- **Cnthctl_EL2.ECV** is 0.
• **SCR_EL3**.ECVEn is 0.
• **HCR_EL2**.E2H, TGE) is (1, 1).

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Physical Timestamp. Reserved. This field reads as 0b01 and ignores writes. Software should treat this field as UNK/ SBZP.

When EL2 is not implemented, the Effective values of **CNTVOFF_EL2** and **CNTPOFF_EL2** are zero, meaning the virtual counter and physical counter have the same value.

**TS, bit [5]**

Timestamp enable.

<table>
<thead>
<tr>
<th>TS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timestamp sampling disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timestamp sampling enabled.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE if EL2 is implemented and the Profiling Buffer is owned by EL2. For more information, see 'Controlling the data that is collected' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**PA, bit [4]**

Physical Address sample enable.

<table>
<thead>
<tr>
<th>PA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Physical addresses are not collected.</td>
</tr>
<tr>
<td>0b1</td>
<td>Physical addresses are collected.</td>
</tr>
</tbody>
</table>

If EL2 is implemented:

• If the Profiling Buffer is owned by EL1, this bit is combined with **PMSCR_EL2**.PA to determine which address is collected. For more information, see 'Controlling the data that is collected' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
• If the Profiling Buffer is owned by EL2, this bit is ignored by the PE.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**CX, bit [3]**

**CONTEXTIDR_EL1** sample enable.

<table>
<thead>
<tr>
<th>CX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><strong>CONTEXTIDR_EL1</strong> is not collected.</td>
</tr>
<tr>
<td>0b1</td>
<td><strong>CONTEXTIDR_EL1</strong> is collected.</td>
</tr>
</tbody>
</table>

If EL2 is implemented and enabled in the current Security state when an operation is sampled:

• If the PE is at EL2, this bit is ignored by the PE.
• If **HCR_EL2**.TGE == 1, this bit is ignored by the PE.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [2]**

Reserved, RES0.
E1SPE, bit [1]

EL1 Statistical Profiling Enable.

<table>
<thead>
<tr>
<th>E1SPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sampling disabled at EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Sampling enabled at EL1.</td>
</tr>
</tbody>
</table>

If EL2 is implemented and enabled in the current Security state, this bit is ignored by the PE when $\text{HCR\_EL2.TGE == \text{1}}$.

On a Warm reset, this field resets to an architecturally \text{UNKNOWN} value.

E0SPE, bit [0]

EL0 Statistical Profiling Enable. Controls sampling at EL0 when $\text{HCR\_EL2.TGE == \text{0}}$ or if EL2 is disabled or not implemented.

<table>
<thead>
<tr>
<th>E0SPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sampling disabled at EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Sampling enabled at EL0.</td>
</tr>
</tbody>
</table>

If EL2 is implemented and enabled in the current Security state, this bit is ignored by the PE when $\text{HCR\_EL2.TGE == \text{1}}$.

On a Warm reset, this field resets to an architecturally \text{UNKNOWN} value.

PMSCR_EL2, Statistical Profiling Control Register (EL2)

The PMSCR_EL2 characteristics are:

Purpose

Provides EL2 controls for Statistical Profiling

Configuration

This register is present only when SPE is implemented. Otherwise, direct accesses to PMSCR_EL2 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMSCR_EL2 is a 64-bit register.

Field descriptions

The PMSCR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [63:8]</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>PCT, bits [7:6]</td>
<td>Physical Timestamp. If timestamp sampling is enabled, determines which counter is collected. The behavior depends on the Profiling Buffer owning Exception level.</td>
</tr>
</tbody>
</table>

If ARMv8.6-ECV is implemented, this is a two bit field as shown. Otherwise, bit[7] is RES0.

<table>
<thead>
<tr>
<th>PCT</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Virtual counter, CNTVCT_EL0, is collected.</td>
<td></td>
</tr>
<tr>
<td>0b01</td>
<td>If the Profiling Buffer owning Exception level is EL2: Physical counter, CNTPCT_EL0, is collected. If the Profiling Buffer owning Exception level is EL1: Timestamp value is selected by PMSCR_EL1.PCT.</td>
<td></td>
</tr>
<tr>
<td>0b11</td>
<td>If the Profiling Buffer owning Exception level is EL2: Physical counter, CNTPCT_EL0, minus CNTPOFF_EL2 is collected. If the Profiling Buffer owning Exception level is EL1: If PMSCR_EL1.PCT == 0b00, the virtual counter, CNTVCT_EL0, is collected. Otherwise, the physical counter, CNTPCT_EL0, minus CNTPOFF_EL2 is collected.</td>
<td>When ARMv8.6-ECV is implemented</td>
</tr>
</tbody>
</table>
When EL2 is implemented and enabled in the current Security state, the physical counter uses a fixed physical offset of zero if either of the following are true:

- **CNTHCTL_EL2**.ECV is 0.
- **SCR_EL3**.ECVEn is 0.
- **HCR_EL2**.({E2H, TGE}) is {1, 1}.

If EL2 is not implemented or EL2 is disabled in the current Security state, the PE behaves as if this field is set to 0b01, other than for a direct read of the register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TS, bit [5]**

Timestamp Enable.

<table>
<thead>
<tr>
<th>TS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timestamp sampling disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timestamp sampling enabled.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when any of the following are true:

- The Profiling Buffer owning Exception level is EL1.
- In Secure state, and either ARMv8.4-SecEL2 is not implemented or Secure EL2 is disabled.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**PA, bit [4]**

Physical Address Sample Enable.

<table>
<thead>
<tr>
<th>PA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Physical addresses are not collected.</td>
</tr>
<tr>
<td>0b1</td>
<td>Physical addresses are collected.</td>
</tr>
</tbody>
</table>

If the Profiling Buffer owning Exception level is EL1, and EL2 is enabled in the current Security state, this bit is combined with **PMSCR_EL1**.PA to determine which address is collected.

If EL2 is not implemented or EL2 is disabled in the current Security state, the PE ignores the value of this bit and behaves as if this bit is set to 1, other than for a direct read of the register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CX, bit [3]**

**CONTEXTIDR_EL2** Sample Enable.

<table>
<thead>
<tr>
<th>CX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><strong>CONTEXTIDR_EL2</strong> is not collected.</td>
</tr>
<tr>
<td>0b1</td>
<td><strong>CONTEXTIDR_EL2</strong> is collected.</td>
</tr>
</tbody>
</table>

If EL2 is not implemented or EL2 is disabled in the current Security state, the PE ignores the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [2]**

Reserved, RES0.

**E2SPE, bit [1]**

EL2 Statistical Profiling Enable.
E2SPE, Meaning

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sampling disabled at EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Sampling enabled at EL2.</td>
</tr>
</tbody>
</table>

This bit is res0 if MDCR_EL2.E2PB != 0b00.

If EL2 is disabled in the current Security state, this bit is ignored by the PE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E0HSPE, bit [0]

EL0 Statistical Profiling Enable.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sampling disabled at EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Sampling enabled at EL0.</td>
</tr>
</tbody>
</table>

If MDCR_EL2.E2PB != 0b00, this bit is res0.

If EL2 is implemented and enabled in the current Security state, this bit is ignored by the PE when HCR_EL2.TGE == 0.

On a Warm reset, this field resets to an architectually UNKNOWN value.

PMSELR_EL0, Performance Monitors Event Counter Selection Register

The PMSELR_EL0 characteristics are:

**Purpose**

Selects the current event counter `PMEVCNTR<n>_EL0` or the cycle counter, CCNT.

PMSELR_EL0 is used in conjunction with `PMXEVTYPER_EL0` to determine the event that increments a selected event counter, and the modes and states in which the selected counter increments.

It is also used in conjunction with `PMXEV CNTR_EL0` to determine the value of a selected event counter.

**Configuration**

AArch64 System register PMSELR_EL0 bits [31:0] are architecturally mapped to AArch32 System register `PMSEL[31:0]`.

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMSELR_EL0 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMSELR_EL0 is a 64-bit register.

**Field descriptions**

The PMSELR_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

RES0

RES0

SEL

**Bits [63:5]**

Reserved, RES0.

**SEL, bits [4:0]**

Selects event counter, `PMEVCNTR<n>_EL0`, where n is the value held in this field. This value identifies which event counter is accessed when a subsequent access to `PMXEVTYPER_EL0` or `PMXEV CNTR_EL0` occurs.

This field can take any value from 0 (0b00000) to (PMCR.N)-1, or 31 (0b11111).

When PMSELR_EL0.SEL is 0b11111, it selects the cycle counter and:

- A read of the `PMXEVTYPER_EL0` returns the value of `PMCCFILTR_EL0`.
- A write of the `PMXEVTYPER_EL0` writes to `PMCCFILTR_EL0`.
- A read or write of `PMXEV CNTR_EL0` has CONSTRAINED UNPREDICTABLE effects. See `PMXEV CNTR_EL0` for more details.

For details of the results of accesses to the event counters, see `PMXEVTYPER_EL0` and `PMXEV CNTR_EL0`.

For information about the number of counters accessible at each Exception level, see `MDCR_EL2_HPMN`.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing the PMSELR_EL0

PMSEVFR_EL1, Sampling Event Filter Register

The PMSEVFR_EL1 characteristics are:

**Purpose**

Controls sample filtering by events. The overall filter is the logical AND of these filters. For example, if E[3] and E[5] are both set to 1, only samples that have both event 3 (Level 1 unified or data cache refill) and event 5 set (TLB walk) are recorded.

**Configuration**

This register is present only when SPE is implemented. Otherwise, direct accesses to PMSEVFR_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMSEVFR_EL1 is a 64-bit register.

**Field descriptions**

The PMSEVFR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Event $&lt;z&gt;$ is ignored.</td>
</tr>
<tr>
<td>62</td>
<td>Do not record samples that have event $&lt;z&gt; == 0.$</td>
</tr>
</tbody>
</table>

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [47:32]**

Reserved, RAZ/WI.

**E[$<y>$], bit [y], for y = 24 to 31**

E[$<y>$] is the event filter for event $<y>$. If event $<y>$ is not implemented, or filtering on event $<y>$ is not supported, the corresponding bit is RAZ/WI.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Event $&lt;y&gt;$ is ignored.</td>
</tr>
<tr>
<td>30</td>
<td>Do not record samples that have event $&lt;y&gt; == 0.$</td>
</tr>
</tbody>
</table>

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.
An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:19]

Reserved, RAZ/WI.

E[18], bit [18]

When ARMv8.3-SPE is implemented and SVE is implemented:

Empty predicate.

<table>
<thead>
<tr>
<th>E[18]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Empty predicate event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Empty predicate event == 0.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[17], bit [17]

When ARMv8.3-SPE is implemented and SVE is implemented:

Partial predicate.

<table>
<thead>
<tr>
<th>E[17]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Partial predicate event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Partial predicate event == 0.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[16], bit [16]

When TME is implemented:

Transactional

<table>
<thead>
<tr>
<th>E[16]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Transactional event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Transactional event == 0.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RAZ/WI.

**E[<x>], bit [x], for x = 12 to 15**

E[<x>] is the event filter for event <x>. If event <x> is not implemented, or filtering on event <x> is not supported, the corresponding bit is RAZ/WI.

<table>
<thead>
<tr>
<th>E[&lt;x&gt;]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event &lt;x&gt; is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have event &lt;x&gt; == 0.</td>
</tr>
</tbody>
</table>

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSEVFR_EL1.FE == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**E[11], bit [11]**

**When ARMv8.3-SPE is implemented:**

Alignment.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Alignment event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Alignment event == 0.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSEVFR_EL1.FE == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RAZ/WI.

**Bits [10:8]**

Reserved, RAZ/WI.

**E[7], bit [7]**

Mispredicted.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Mispredicted event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Mispredicted event == 0.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSEVFR_EL1.FE == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [6]**

Reserved, RAZ/WI.

**E[5], bit [5]**

TLB walk.
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TLB walk event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the TLB walk event == 0.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [4]**

Reserved, RAZ/WI.

**E[3], bit [3]**

Level 1 data or unified cache refill.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Level 1 data or unified cache refill event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Level 1 data or unified cache refill event == 0.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [2]**

Reserved, RAZ/WI.

**E[1], bit [1]**

*When the PE supports sampling of speculative instructions:*

Architecturally retired.

When the PE supports sampling of speculative instructions:

<table>
<thead>
<tr>
<th>E[1]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Architecturally retired event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Architecturally retired event == 0.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

If the PE does not support the sampling of speculative instructions, or always discards the sample record for speculative instructions, this bit reads as an UNKNOWN value and the PE ignores its value.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, UNKNOWN.

**Bit [0]**

Reserved, RAZ/WI.

PMSFCR_EL1, Sampling Filter Control Register

The PMSFCR_EL1 characteristics are:

**Purpose**

Controls sample filtering. The filter is the logical AND of the FL, FT and FE bits. For example, if FE == 1 and FT == 1 only samples including the selected operation types and the selected events will be recorded.

**Configuration**

This register is present only when SPE is implemented. Otherwise, direct accesses to PMSFCR_EL1 are undefined. RW fields in this register reset to architecturally unknown values.

**Attributes**

PMSFCR_EL1 is a 64-bit register.

**Field descriptions**

The PMSFCR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>18</td>
<td>ST</td>
<td>Store filter enable</td>
</tr>
<tr>
<td>17</td>
<td>LD</td>
<td>Load filter enable</td>
</tr>
</tbody>
</table>

**Bits [63:19]**

Reserved, RES0.

**ST, bit [18]**

Store filter enable

<table>
<thead>
<tr>
<th>ST</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not record store operations</td>
</tr>
<tr>
<td>0b1</td>
<td>Record all store operations, including vector stores and all atomic operations</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FT == 0.

On a Warm reset, this field resets to an architecturally unknown value.

**LD, bit [17]**

Load filter enable

<table>
<thead>
<tr>
<th>LD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not record load operations</td>
</tr>
<tr>
<td>0b1</td>
<td>Record all load operations, including vector loads and atomic operations that return data</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FT == 0.

On a Warm reset, this field resets to an architecturally unknown value.
**B, bit [16]**

Branch filter enable

<table>
<thead>
<tr>
<th>B</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not record branch and exception return operations</td>
</tr>
<tr>
<td>0b1</td>
<td>Record all branch and exception return operations</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FT == 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [15:3]**

Reserved, **RES0**.

**FL, bit [2]**

Filter by latency

<table>
<thead>
<tr>
<th>FL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Latency filtering disabled</td>
</tr>
<tr>
<td>0b1</td>
<td>Latency filtering enabled. Samples with a total latency less than PMSLATFR_EL1.MINLAT will not be recorded</td>
</tr>
</tbody>
</table>

If this field is set to 1 and PMSLATFR_EL1.MINLAT is set to zero, it is **CONSTRAINED UNPREDICTABLE** whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FL is set to 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**FT, bit [1]**

Filter by operation type. The filter is the logical OR of the ST, LD and B bits. For example, if LD and ST are both set, both load and store operations are recorded

<table>
<thead>
<tr>
<th>FT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Type filtering disabled</td>
</tr>
<tr>
<td>0b1</td>
<td>Type filtering enabled. Samples not one of the selected operation types will not be recorded</td>
</tr>
</tbody>
</table>

If this field is set to 1 and the PMSFCR_EL1.{ST, LD, B} bits are all set to zero, it is **CONSTRAINED UNPREDICTABLE** whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FT is set to 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**FE, bit [0]**

Filter by event

<table>
<thead>
<tr>
<th>FE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event filtering disabled</td>
</tr>
<tr>
<td>0b1</td>
<td>Event filtering enabled. Samples not including the events selected by PMSEVFR_EL1 will not be recorded</td>
</tr>
</tbody>
</table>

If this field is set to 1 and PMSEVFR_EL1 is set to zero, it is **CONSTRAINED UNPREDICTABLE** whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FE is set to 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the PMSFCR_EL1**

Accesses to this register use the following encodings:

    elsif PSTATE.EL == EL3 then
        PMSFCR_EL1 = X[t];
PMSICR_EL1, Sampling Interval Counter Register

The PMSICR_EL1 characteristics are:

**Purpose**

Software must write zero to PMSICR_EL1 before enabling sample profiling for a sampling session. Software must then treat PMSICR_EL1 as an opaque, 64-bit, read/write register used for context switches only.

**Configuration**

This register is present only when SPE is implemented. Otherwise, direct accesses to PMSICR_EL1 are undefined. RW fields in this register reset to architecturally unknown values.

**Attributes**

The value of PMSICR_EL1 does not change whilst profiling is disabled.

**Field descriptions**

The PMSICR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Bit Positions</th>
</tr>
</thead>
<tbody>
<tr>
<td>ECOUNT</td>
<td>[63:56]</td>
</tr>
<tr>
<td>COUNT</td>
<td>[31:0]</td>
</tr>
</tbody>
</table>

**ECOUNT, bits [63:56]**

When \( \text{PMSIDR_EL1.ERand} = 0b1 \):

Secondary sample interval counter.

When \( \text{PMSIDR_EL1.ERand} \) is 1, this field provides the secondary counter used after the primary counter reaches zero. Whilst the secondary counter is nonzero and profiling is enabled, the secondary counter decrements by 1 for each member of the sample population. The primary counter also continues to decrement since it is also nonzero. When the secondary counter reaches zero, a member of the sampling population is selected for sampling.

When \( \text{PMSIDR_EL1.ERand} \) is 0, this field is RES1.

On a Warm reset, this field resets to an architecturally unknown value.

**Otherwise:**

Reserved, RES0.

**Bits [55:32]**

Reserved, RES0.

**COUNT, bits [31:0]**

Primary sample interval counter

Provides the primary counter used for sampling.
The primary counter is reloaded when the value of this register is zero and the PE moves from a state or Exception level where profiling is disabled to a state or Exception level where profiling is enabled.

Whilst the primary counter is nonzero and sampling is enabled, the primary counter decrements by 1 for each member of the sample population.

When the counter reaches zero, the behavior depends on the values of PMSIDR_EL1.ERnd and PMSIRR_EL1.RND:

- If $\text{PMSIRR\_EL1.RND} == 0$ or $\text{PMSIDR\_EL1.ERnd} == 0$:
  - A member of the sampling population is selected for sampling
  - The primary counter is reloaded

- If $\text{PMSIRR\_EL1.RND} == 1$ and $\text{PMSIDR\_EL1.ERnd} == 1$:
  - The secondary counter is set to a random or pseudorandom value in the range $0x00$ to $0xFF$
  - The primary counter is reloaded

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Accessing the PMSICR_EL1

Accesses to this register use the following encodings:

**Bits [63:20]**

Reserved, RES0.

**CountSize, bits [19:16]**

Defines the size of the counters

<table>
<thead>
<tr>
<th>CountSize</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0010</td>
<td>12-bit saturating counters</td>
</tr>
</tbody>
</table>

All other values are reserved. Reserved values might be defined in a future version of the architecture.

**MaxSize, bits [15:12]**

Defines the largest size for a single record, rounded up to a power-of-two. If this is the same as the minimum alignment (PMBIDR_EL1.Align), then each record is exactly this size

<table>
<thead>
<tr>
<th>MaxSize</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0100</td>
<td>16 bytes</td>
</tr>
<tr>
<td>0b0101</td>
<td>32 bytes</td>
</tr>
<tr>
<td>0b0110</td>
<td>64 bytes</td>
</tr>
<tr>
<td>0b0111</td>
<td>128 bytes</td>
</tr>
<tr>
<td>0b1000</td>
<td>256 bytes</td>
</tr>
<tr>
<td>0b1001</td>
<td>512 bytes</td>
</tr>
<tr>
<td>0b1010</td>
<td>1024 bytes</td>
</tr>
<tr>
<td>0b1011</td>
<td>2KB</td>
</tr>
</tbody>
</table>

All other values are reserved. Reserved values might be defined in a future version of the architecture.
**Interval, bits [11:8]**

Recommended minimum sampling interval. This provides guidance from the implementer to the smallest minimum sampling interval, N.

<table>
<thead>
<tr>
<th>Interval</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>256</td>
</tr>
<tr>
<td>0b0010</td>
<td>512</td>
</tr>
<tr>
<td>0b0011</td>
<td>768</td>
</tr>
<tr>
<td>0b0100</td>
<td>1,024</td>
</tr>
<tr>
<td>0b0101</td>
<td>1,536</td>
</tr>
<tr>
<td>0b0110</td>
<td>2,048</td>
</tr>
<tr>
<td>0b0111</td>
<td>3,072</td>
</tr>
<tr>
<td>0b1000</td>
<td>4,096</td>
</tr>
</tbody>
</table>

All other values are reserved. Reserved values might be defined in a future version of the architecture.

**Bits [7:6]**

Reserved, RES0.

**ERnd, bit [5]**

Defines how the random number generator is used in determining the interval between samples, when enabled by PMSIRR_EL1.RND.

<table>
<thead>
<tr>
<th>ERnd</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The random number is added at the start of the interval, and the sample is taken and a new interval started when the combined interval expires.</td>
</tr>
<tr>
<td>0b1</td>
<td>The random number is added and the new interval started after the interval programmed in PMSIRR_EL1.INTERVAL expires, and the sample is taken when the random interval expires.</td>
</tr>
</tbody>
</table>

**LDS, bit [4]**

Data source indicator for sampled load instructions

<table>
<thead>
<tr>
<th>LDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Loaded data source not implemented</td>
</tr>
<tr>
<td>0b1</td>
<td>Loaded data source implemented</td>
</tr>
</tbody>
</table>

**ArchInst, bit [3]**

Architectural instruction profiling

<table>
<thead>
<tr>
<th>ArchInst</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Micro-op sampling implemented</td>
</tr>
<tr>
<td>0b1</td>
<td>Architecture instruction sampling implemented</td>
</tr>
</tbody>
</table>

**FL, bit [2]**

Filtering by latency. This bit is RAO.

**FT, bit [1]**

Filtering by operation type. This bit is RAO.

**FE, bit [0]**

Filtering by events. This bit is RAO.

**Bits [63:32]**

Reserved, RES0.

**INTERVAL, bits [31:8]**

Bits [31:8] of the PMSICR_EL1 interval counter reload value. Software must set this to a non-zero value. If software sets this to zero, an **UNKNOWN** sampling interval is used. Software should set this to a value greater than the minimum indicated by PMSIDR_EL1.Interval

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [7:1]**

Reserved, RES0.

**RND, bit [0]**

Controls randomization of the sampling interval

<table>
<thead>
<tr>
<th>RND</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disable randomization of sampling interval</td>
</tr>
<tr>
<td>0b1</td>
<td>Add (pseudo-)random jitter to sampling interval</td>
</tr>
</tbody>
</table>

The random number generator is not architected.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

PMSWINC_EL0, Performance Monitors Software Increment register

The PMSWINC_EL0 characteristics are:

Purpose

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see ‘SW_INCR’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D5.

Configuration

AArch64 System register PMSWINC_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMSWINC[31:0].

AArch64 System register PMSWINC_EL0 bits [31:0] are architecturally mapped to External register PMSWINC_EL0[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMSWINC_EL0 are UNDEFINED.

Attributes

PMSWINC_EL0 is a 64-bit register.

Field descriptions

The PMSWINC_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:31]</th>
<th>RES0</th>
<th>P&lt;n&gt;, bit [n]</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</td>
<td>RES0</td>
<td>P&lt;n&gt;, bit [n]</td>
</tr>
</tbody>
</table>

Bits [63:31]

Reserved, RES0.

P<n>, bit [n], for n = 0 to 30

Event counter software increment bit for PMEVCNTR<n>_EL0.

If N is less than 31, then bits [30:N] are WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in MDCR_EL2.HPMN. Otherwise, N is the value in PMCR_EL0.N.

PMUSERENR_EL0, Performance Monitors User Enable Register

The PMUSERENR_EL0 characteristics are:

Purpose

Enables or disables EL0 access to the Performance Monitors.

Configuration

AArch64 System register PMUSERENR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMUSERENR[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMUSERENR_EL0 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMUSERENR_EL0 is a 64-bit register.

Field descriptions

The PMUSERENR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>62</td>
<td>ER, bit [3]</td>
</tr>
<tr>
<td>61</td>
<td>Event counter Read. Traps EL0 access to event counters to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1.</td>

<tr>
<td>60</td>
<td>In AArch64 state, trapped accesses are reported using EC syndrome value 0x18.</td>
</tr>
<tr>
<td>59</td>
<td>In AArch64 state, trapped accesses are reported using EC syndrome value 0x03.</td>
</tr>
</tbody>
</table>

ER, bit [3]

Event counter Read. Traps EL0 access to event counters to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1.

In AArch64 state, trapped accesses are reported using EC syndrome value 0x18.

In AArch64 state, trapped accesses are reported using EC syndrome value 0x03.

<table>
<thead>
<tr>
<th>ER</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 using AArch64: EL0 reads of the PMXEVCNTR_EL0 and PMEVCTR&lt;n&gt;.EL0, and EL0 read/write accesses to the PMSEL_R_EL0, are trapped if PMUSERENR_EL0.EN is also 0. EL0 using AArch32: EL0 reads of the PMXEVCNTR and PMEVCTR&lt;n&gt;, and EL0 read/write accesses to the PMSEL_R, are trapped if PMUSERENR_EL0.EN is also 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Overrides PMUSERENR_EL0.EN and enables RO access to PMXEVCTR_EL0 and PMEVCTR&lt;n&gt;.EL0, and RW access to PMSEL_R_EL0 and PMSEL_R at EL0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.
CR, bit [2]

Cycle counter Read. Traps EL0 access to cycle counter reads to EL1, or to EL2 when it is implemented and enabled for
the current Security state and HCR_EL2.TGE is 1.

In AArch64 state, trapped accesses are reported using EC syndrome value 0x18.

In AArch32 state, trapped MRC accesses are reported using EC syndrome value 0x03, trapped MRRC accesses are
reported using EC syndrome value 0x04.

<table>
<thead>
<tr>
<th>CR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 using AArch64: EL0 read accesses to the PMCCNTR_EL0 are trapped if PMUSERENR_EL0.EN is also 0. EL0 using AArch32: EL0 read accesses to the PMCCNTR are trapped if PMUSERENR_EL0.EN is also 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Overrides PMUSERENR_EL0.EN and enables access to PMCCNTR_EL0 and PMCCNTR at EL0.</td>
</tr>
</tbody>
</table>

SW, bit [1]

Traps Software Increment writes to EL1, or to EL2 when it is implemented and enabled for the current Security state
and HCR_EL2.TGE is 1.

In AArch64 state, trapped accesses are reported using EC syndrome value 0x18.

In AArch32 state, trapped accesses are reported using EC syndrome value 0x03.

<table>
<thead>
<tr>
<th>SW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 using AArch64: EL0 writes to the PMSWINC_EL0 are trapped if PMUSERENR_EL0.EN is also 0. EL0 using AArch32: EL0 writes to the PMSWINC are trapped if PMUSERENR_EL0.EN is also 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Overrides PMUSERENR_EL0.EN and enables access to PMSWINC_EL0 and PMSWINC at EL0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EN, bit [0]

Traps EL0 accesses to the Performance Monitor registers to EL1, or to EL2 when it is implemented and enabled for
the current Security state and HCR_EL2.TGE is 1, from both Execution states as follows:

- In AArch64 state, MRS or MSR accesses to the following registers are reported using EC syndrome value 0x18:
  - PMCR_EL0, PMOVSCMR_EL0, PMSELR_EL0, PMCEID0_EL0, PMCEID1_EL0, PMCCNTR_EL0, PMXEVTPR_EL0, PMXEVNTR_EL0, PMUSERENR_EL0, PMCNTENSET_EL0, PMCNTENCLR_EL0, PMOVSSET_EL0, PMXEVTYPER<n>_EL0, PMEVTYPER<n>_EL0, PMCCFILTER_EL0.
  - PMSWINC_EL0, MSR accesses only.
- In AArch32 state, MRC or MCR accesses to the following registers are reported using EC syndrome value 0x03, MRRC or MCRR accesses are trapped to EL2 and reported using EC syndrome value 0x04:
  - PMCR, PMOVSR, PMSELR, PMCEID0, PMCEID1, PMCCNTR, PMXEVTPR, PMXEVNTR, PMUSERENR, PMCNTENSET, PMCNTENCLR, PMOVSSET, PMEVNTR<n>, PMEVTYPER<n>, PMCCFILTER.
  - PMSWINC, MCR accesses only.
- In AArch32 state, MRRC or MCRR accesses to PMCCNTR are reported using EC syndrome value 0x04.
- If ARMv8.4-PMU is implemented, in AArch64 state, PMMIR_EL1 and in AArch32 state, PMMIR.
- If ARMv8.1-PMU is implemented, in AArch32 state, PMCEID2, and PMCEID3.
### PMUSERENR_EL0, Performance Monitors User Enable Register

<table>
<thead>
<tr>
<th>EN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>While at EL0, Accesses to the specified registers at EL0 are trapped, unless overridden by one of PMUSERENR_EL0.{ER, CR, SW}.</td>
</tr>
<tr>
<td>0b1</td>
<td>While at EL0, software can access all of the specified registers.</td>
</tr>
</tbody>
</table>

#### Note

The EL0 access is trapped only if the corresponding EL1 access is permitted. If PMUSERENR_EL0.EN is 0, write access to PMSWINC_EL0 and PMSWINC from EL0 are trapped, but read access is UNDEFINED.

The affected registers do not include PMINTENSET_EL1, PMINTENCLR_EL1, PMINTENSET and PMINTENCLR.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Accessing the PMUSERENR_EL0

else
    PMUSERENR_EL0 = X[t];
PMXEVCNTR_EL0, Performance Monitors Selected Event Count Register

The PMXEVCNTR_EL0 characteristics are:

**Purpose**

Reads or writes the value of the selected event counter, \( \text{PMEVCNTR}<n> \_\text{EL0} \). \( \text{PMSELR}_\text{EL0} \). SEL determines which event counter is selected.

**Configuration**

AArch64 System register PMXEVCNTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMXEVCNTR[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMXEVCNTR_EL0 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMXEVCNTR_EL0 is a 64-bit register.

**Field descriptions**

The PMXEVCNTR_EL0 bit assignments are:

When ARMv8.5-PMU is implemented:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>PMEVCNTR&lt;n&gt;</td>
<td>Value of the selected event counter, ( \text{PMEVCNTR}&lt;n&gt; _\text{EL0} ), where n is the value stored in ( \text{PMSELR}_\text{EL0} ). SEL.</td>
</tr>
<tr>
<td>31</td>
<td>PMEVCNTR&lt;n&gt;</td>
<td>Value of the selected event counter, ( \text{PMEVCNTR}&lt;n&gt; _\text{EL0} ), where n is the value stored in ( \text{PMSELR}_\text{EL0} ). SEL.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>30</td>
<td>PMEVCNTR&lt;n&gt;</td>
<td>Value of the selected event counter, ( \text{PMEVCNTR}&lt;n&gt; _\text{EL0} ), where n is the value stored in ( \text{PMSELR}_\text{EL0} ). SEL.</td>
</tr>
</tbody>
</table>
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

# Accessing the PMXEVCNTR_EL0

If ARMv8.6-FGT is implemented, and EL2 is implemented and enabled in the current Security state, for reads and writes at EL1 and permitted reads and writes at EL0:

- If **PMSELR_EL0**.SEL is an unimplemented event counter, the access is **UNDEFINED**.
- Otherwise, if **PMSELR_EL0**.SEL is greater than or equal to **MDCR_EL2**.HPMN, the access is trapped to EL2.

If ARMv8.6-FGT is not implemented, or the above behaviors do not apply:

If **PMSELR_EL0**.SEL is greater than or equal to the number of accessible counters then reads and writes of **PMXEVCNTR_EL0** are **CONSTRAINED UNPREDICTABLE**, and the following behaviors are permitted:

- Accesses to the register are **UNDEFINED**.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if **PMSELR_EL0**.SEL has an **UNKNOWN** value less than the number of counters accessible at the current Exception level and Security state.
- If EL2 is implemented and enabled in the current Security state, and **PMSELR_EL0**.SEL is less than the number of implemented counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

## Note

In EL0, an access is permitted if it is enabled by **PMUSERENR_EL0**.{ER,EN}.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, **MDCR_EL2**.HPMN identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters. See **MDCR_EL2**.HPMN for more details.

Accesses to this register use the following encodings:

**MRS <Xt>, PMXEVCNTR_EL0**

PMXEVTYPER_EL0, Performance Monitors Selected Event Type Register

The PMXEVTYPER_EL0 characteristics are:

**Purpose**

When PMSELR_EL0 SEL selects an event counter, this accesses a PMEVTYPER<n>_EL0 register. When PMSELR_EL0SEL selects the cycle counter, this accesses PMCCFILTR_EL0.

**Configuration**

AArch64 System register PMXEVTYPER_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMXEVTYPER[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMXEVTYPER_EL0 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMXEVTYPER_EL0 is a 64-bit register.

**Field descriptions**

The PMXEVTYPER_EL0 bit assignments are:

**Bits [63:32]**

Reserved, RES0.

**Event type register or PMCCFILTR_EL0, bits [31:0]**

When PMSELR_EL0 SEL == 31, this register accesses PMCCFILTR_EL0.

Otherwise, this register accesses PMEVTYPER<n>_EL0 where n is the value in PMSELR_EL0.SEL.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMXEVTYPER_EL0**

If ARMv8.6-FGT is implemented, and EL2 is implemented and enabled in the current Security state, for reads and writes at EL1 and permitted reads and writes at EL0:

- If PMSELR_EL0.SEL is an unimplemented event counter, the access is UNDEFINED.
- Otherwise, if PMSELR_EL0.SEL is not 31 and greater than or equal to MDCR_EL2.HPMN, the access is trapped to EL2.

If ARMv8.6-FGT is not implemented, or the above behaviors do not apply:
If PMSEL_EL0.SEL is not 31 and greater than or equal to the number of accessible counters then reads and writes of PMXEVTYPER_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP
- Accesses to the register behave as if PMSEL_EL0.SEL has an UNKNOWN value less than the number of counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if PMSEL_EL0.SEL is 31.
- If EL2 is implemented and enabled in the current Security state, PMSEL_EL0 is less than the number of implemented counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

**Note**

In EL0, an access is permitted if it is enabled by PMUSERENR_EL0.EN.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, MDCR_EL2.HPMN identifies the number of accessible counters.
Otherwise, the number of accessible counters is the number of implemented counters. See MDCR_EL2.HPMN for more details.

Accesses to this register use the following encodings:

REVIDR_EL1, Revision ID Register

The REVIDR_EL1 characteristics are:

**Purpose**

Provides implementation-specific minor revision information.

**Configuration**

AArch64 System register REVIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register MIDR_EL1.

If REVIDR_EL1 has the same value as MIDR_EL1, then its contents have no significance.

**Attributes**

REVIDR_EL1 is a 64-bit register.

**Field descriptions**

The REVIDR_EL1 bit assignments are:

RGSR_EL1, Random Allocation Tag Seed Register.

The RGSR_EL1 characteristics are:

**Purpose**

Random Allocation Tag Seed Register.

**Configuration**

This register is present only when ARMv8.5-MemTag is implemented and ID_AA64PFR1_EL1.MTE != 0b0001. Otherwise, direct accesses to RGSR_EL1 are **UNDEFINED**.

When GCR_EL1.RRND==0b1, the value of RGSR_EL1 is **UNKNOWN**.

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

RGSR_EL1 is a 64-bit register.

**Field descriptions**

The RGSR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

**Bits [63:24]**

Reserved, **RES0**.

**SEED, bits [23:8]**

Seed register used for generating values returned by RandomAllocationTag().

This field resets to an architecturally **UNKNOWN** value.

**Bits [7:4]**

Reserved, **RES0**.

**TAG, bits [3:0]**

Tag generated by the most recent IRG instruction.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the RGSR_EL1**

Accesses to this register use the following encodings:
MRS <Xt>, RGSR_EL1

RMR_EL1, Reset Management Register (EL1)

The RMR_EL1 characteristics are:

Purpose

If EL1 is the highest implemented Exception level and this register is implemented:

- A write to the register at EL1 can request a Warm reset.
- If EL1 can use AArch32 and AArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

Configuration

AArch64 System register RMR_EL1 bits [31:0] are architecturally mapped to AArch32 System register RMR[31:0] when IsHighestEL(EL1).

Only implemented if EL1 is the highest implemented Exception level. In this case:

- If EL1 can use AArch32 and AArch64 then this register must be implemented.
- If EL1 cannot use AArch32 then it is IMPLEMENTATION DEFINED whether the register is implemented.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

RMR_EL1 is a 64-bit register.

Field descriptions

The RMR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 | RR | AA64 |

Bits [63:2]

Reserved, RES0.

RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

This field resets to 0.

AA64, bit [0]

When EL1 can use AArch32, determines which Execution state the PE boots into after a Warm reset:

<table>
<thead>
<tr>
<th>AA64</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>AArch32.</td>
</tr>
<tr>
<td>0b1</td>
<td>AArch64.</td>
</tr>
</tbody>
</table>

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.
If EL1 cannot use AArch32 this bit is RAO/WI.
When implemented as a RW field, this field resets to 1 on a Cold reset.

**Accessing the RMR_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, RMR_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>
<td>0b1100</td>
<td>0b0000</td>
<td>0b010</td>
</tr>
</tbody>
</table>

```java
if PSTATE.EL == EL1 && IsHighestEL(EL1) then
    return RMR_EL1;
else
    UNDEFINED;
```

MSR RMR_EL1, <Xt>

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>
<td>0b1100</td>
<td>0b0000</td>
<td>0b010</td>
</tr>
</tbody>
</table>

```java
if PSTATE.EL == EL1 && IsHighestEL(EL1) then
    RMR_EL1 = X[t];
else
    UNDEFINED;
```
The RMR_EL2 characteristics are:

**Purpose**

If EL2 is the highest implemented Exception level and this register is implemented:

- A write to the register at EL2 can request a Warm reset.
- If EL2 can use AArch32 and AArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

**Configuration**

AArch64 System register RMR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HRMR[31:0] when IsHighestEL(EL2).

Only implemented if EL2 is the highest implemented Exception level. In this case:

- If EL2 can use AArch32 and AArch64 then this register must be implemented.
- If EL2 cannot use AArch32 then it is IMPLEMENTATION DEFINED whether the register is implemented.

This register has no effect if EL2 is not enabled in the current Security state.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

RMR_EL2 is a 64-bit register.

**Field descriptions**

The RMR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-2</td>
<td>Reserved, RES0.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>Reset Request. Setting this bit to 1 requests a Warm reset.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>0</td>
<td>When EL2 can use AArch32, determines which Execution state the PE boots into after a Warm reset:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>0b0</td>
<td>AArch32.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>0b1</td>
<td>AArch64.</td>
<td></td>
</tr>
</tbody>
</table>
On coming out of the Warm reset, execution starts at the implementation-defined reset vector address of the specified Execution state.

If EL2 cannot use AArch32 this bit is RAO/WI.

When implemented as a RW field, this field resets to 1 on a Cold reset.

**Accessing the RMR_EL2**

Accesses to this register use the following encodings:

**MRS <Xt>, RMR_EL2**

```markdown

```
RMR_EL3, Reset Management Register (EL3)

The RMR_EL3 characteristics are:

**Purpose**

If EL3 is the implemented and this register is implemented:

- A write to the register at EL3 can request a Warm reset.
- If EL3 can use AArch32 and AArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

**Configuration**

AArch64 System register RMR_EL3 bits [31:0] are architecturally mapped to AArch32 System register RMR[31:0] when HaveEL(EL3).

When EL3 is implemented:

- If EL3 can use AArch32 and AArch64, then this register must be implemented.
- If EL3 cannot use AArch32, then it is IMPLEMENTATION DEFINED whether the register is implemented.

Otherwise, direct accesses to RMR_EL3 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

RMR_EL3 is a 64-bit register.

**Field descriptions**

The RMR_EL3 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RES0 | \_ | \_ | \_ | \_ | \_ | \_ | \_ | \_ | \_ | \_ | \_ | \_ | \_ | \_ | \_ | \_ | \_ | \_ | \_ | \_ | \_ | \_ | \_ | \_ | \_ | \_ | \_ |

**Bits [63:2]**

Reserved, RES0.

**RR, bit [1]**

Reset Request. Setting this bit to 1 requests a Warm reset.

This field resets to 0.

**AA64, bit [0]**

When EL3 can use AArch32, determines which Execution state the PE boots into after a Warm reset:

<table>
<thead>
<tr>
<th>AA64</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>AArch32.</td>
</tr>
<tr>
<td>0b1</td>
<td>AArch64.</td>
</tr>
</tbody>
</table>
On coming out of the Warm reset, execution starts at the implementation defined reset vector address of the specified execution state.

If EL3 cannot use AArch32 this bit is RAO/WI.

When implemented as a RW field, this field resets to 1 on a Cold reset.

**Accessing the RMR_EL3**

Accesses to this register use the following encodings:

**MRS <Xt>, RMR_EL3**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b110</td>
<td>0b1100</td>
<td>0b0000</td>
<td>0b010</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL3 && IsHighestEL(EL3) then
    return RMR_EL3;
else
    UNDEFINED;

**MSR RMR_EL3, <Xt>**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b110</td>
<td>0b1100</td>
<td>0b0000</td>
<td>0b010</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL3 && IsHighestEL(EL3) then
    RMR_EL3 = X[t];
else
    UNDEFINED;
RNDR, Random Number

The RNDR characteristics are:

**Purpose**

Random Number. Returns a 64-bit random number which is reseeded from the True Random Number source at an IMPLEMENTATION DEFINED rate.

If the hardware returns a genuine random number, PSTATE.NZCV is set to 0b0000.

If the instruction cannot return a genuine random number in a reasonable period of time, PSTATE.NZCV is set to 0b0100 and the data value returned in UNKNOWN.

RNDR is a read-only register.

**Configuration**

This register is present only when ARMv8.5-RNG is implemented. Otherwise, direct accesses to RNDR are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

RNDR is a 64-bit register.

**Field descriptions**

The RNDR bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

RNDR, bits [63:0]

Random Number. Returns a 64-bit Random Number which is reseeded from the True Random Number source at an IMPLEMENTATION DEFINED rate.

This field resets to an architecturally UNKNOWN value.

**Accessing the RNDR**

Accesses to this register use the following encodings:

\[
\text{MRS} \ <Xt>, \ \text{RNDR}
\]

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

elsif PSTATE.EL == EL1 then
    return RNDR;
elsif PSTATE.EL == EL2 then
    return RNDR;
elsif PSTATE.EL == EL3 then
    return RNDR;
RNDRRS, Reseeded Random Number

The RNDRRS characteristics are:

**Purpose**

Reseeded Random Number. Returns a 64-bit random number which is reseeded from the True Random Number source at an IMPLEMENTATION DEFINED rate.

If the hardware returns a genuine random number, PSTATE.NZCV is set to 0b0000.

If the instruction cannot return a genuine random number in a reasonable period of time, PSTATE.NZCV is set to 0b0100 and the data value returned is UNKNOWN.

RNDRRS is a read-only register.

**Configuration**

This register is present only when ARMv8.5-RNG is implemented. Otherwise, direct accesses to RNDRRS are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

RNDRRS is a 64-bit register.

**Field descriptions**

The RNDRRS bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |

RNDRRS, bits [63:0]

Reseeded Random Number. Returns a 64-bit Random Number which is reseeded from the True Random Number source immediately before this read.

This field resets to an architecturally UNKNOWN value.

**Accessing the RNDRRS**

Accesses to this register use the following encodings:

MRS <Xt>, RNDRRS

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>

RVBAR_EL1, Reset Vector Base Address Register (if EL2 and EL3 not implemented)

The RVBAR_EL1 characteristics are:

**Purpose**

If EL1 is the highest Exception level implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch64 state.

**Configuration**

Only implemented if the highest Exception level implemented is EL1.

**Attributes**

RVBAR_EL1 is a 64-bit register.

**Field descriptions**

The RVBAR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>62</th>
<th>61</th>
<th>60</th>
<th>59</th>
<th>58</th>

</tbody>
</table>

if PSTATE.EL == EL1 && IsHighestEL(EL1) then
  return RVBAR_EL1;
else
  UNDEFINED;
RVBAR_EL2, Reset Vector Base Address Register (if EL3 not implemented)

The RVBAR_EL2 characteristics are:

**Purpose**

If EL2 is the highest Exception level implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch64 state.

**Configuration**

Only implemented if the highest Exception level implemented is EL2.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

RVBAR_EL2 is a 64-bit register.

**Field descriptions**

The RVBAR_EL2 bit assignments are:

<table>
<thead>

else
  IMPLEMENTATION_DEFINED "";
The SCR_EL3 characteristics are:

**Purpose**

Defines the configuration of the current Security state. It specifies:

- The Security state of EL0, EL1, and EL2. The Security state is either Secure or Non-secure.
- The Execution state at lower Exception levels.
- Whether IRQ, FIQ, SError interrupts, and External abort exceptions are taken to EL3.
- Whether various operations are trapped to EL3.

**Configuration**

AArch64 System register SCR_EL3 bits [31:0] can be mapped to AArch32 System register SCR[31:0], but this is not architecturally mandated.

This register is present only when HaveEL(EL3). Otherwise, direct accesses to SCR_EL3 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

SCR_EL3 is a 64-bit register.

**Field descriptions**

The SCR_EL3 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 |

Bits [63:36]

Reserved, RES0.

**AMVOFFEN, bit [35]**

When ARMv8.6-AMU is implemented:

Activity Monitors Virtual Offsets Enable.

<table>
<thead>
<tr>
<th>AMVOFFEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>アクセスes to AMEVCNTVOFF0&lt;\textless n\textgreater &gt; EL2 and AMEVCNTVOFF1&lt;\textless n\textgreater &gt; EL2 at EL2 are trapped to EL3. Indirect reads of the virtual offset registers are zero.</td>
</tr>
<tr>
<td>0b1</td>
<td>アクセスes to AMEVCNTVOFF0&lt;\textless n\textgreater &gt; EL2 and AMEVCNTVOFF1&lt;\textless n\textgreater &gt; EL2 are not affected by this field.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.
TME, bit [34]

When TME is implemented:

Enables access to the TSTART, TCOMMIT, TTEST and TCANCEL instructions at EL0, EL1 and EL2.

<table>
<thead>
<tr>
<th>TME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0, EL1 and EL2 accesses to TSTART, TCOMMIT, TTEST and TCANCEL instructions are UNDEFINED.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instruction to be UNDEFINED.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEL, bits [33:30]

When ARMv8.6-TWED is implemented:

TWE Delay. A 4-bit unsigned number that, when SCR_EL3.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE caused by SCR_EL3.TWE as \(2^{(\text{TWEDEL} + 8)}\) cycles.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEn, bit [29]

When ARMv8.6-TWED is implemented:

TWE Delay Enable. Enables a configurable delayed trap of the WFE instruction caused by SCR_EL3.TWE.

<table>
<thead>
<tr>
<th>TWEDEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The delay for taking a WFE trap is IMPLEMENTATION DEFINED.</td>
</tr>
<tr>
<td>0b1</td>
<td>The delay for taking a WFE trap is at least the number of cycles defined in SCR_EL3.TWEDEL.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ECVEn, bit [28]

When ARMv8.6-ECV is implemented:

ECV Enable. Enables access to the CNTPOFF_EL2 register.

<table>
<thead>
<tr>
<th>ECVEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL2 accesses to CNTPOFF_EL2 are trapped to EL3, and the value of CNTPOFF_EL2 is treated as 0 for all purposes other than direct reads or writes to the register from EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL2 accesses to CNTPOFF_EL2 are not trapped to EL3 by this mechanism.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

FGTEn, bit [27]

When ARMv8.6-FGT is implemented:

Enables access to the Fine-Grained Traps registers: HAFGRTR_EL2, HDFGRTR_EL2, HDFGWTR_EL2, HFGTR_EL2 and HFGWTR_EL2.

<table>
<thead>
<tr>
<th>FGTEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL2 Accesses to HAFGRTR_EL2, HDFGRTR_EL2, HDFGWTR_EL2, HFGTR_EL2 and HFGWTR_EL2 registers are trapped to EL3, and those registers behave as if all bits are set to 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL2 Accesses to HAFGRTR_EL2, HDFGRTR_EL2, HDFGWTR_EL2, HFGTR_EL2 and HFGWTR_EL2 registers are not trapped to EL3 by this mechanism.</td>
</tr>
</tbody>
</table>

Traps caused by accesses to the fine-grained trap registers are reported using the EC code of 0x18 and its associated ISS.

Otherwise:

Reserved, RES0.

ATA, bit [26]

When ARMv8.5-MemTag is implemented:

Allocation Tag Access. Controls access at EL2, EL1 and EL0 to Allocation Tags.

When access is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.
- MRS and MSR instructions at EL1 and EL2 using GCR_EL1, RGSR_EL1, TFSR_EL1, TFSR_EL2 or TFSRE0_EL1 that are not UNDEFINED or trapped to a lower Exception level are trapped to EL3.
- MRS and MSR instructions at EL2 using TFSR_EL2 that are not UNDEFINED are trapped to EL3.

<table>
<thead>
<tr>
<th>ATA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access is prevented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access is not prevented.</td>
</tr>
</tbody>
</table>

This field is permitted to be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnSCXT, bit [25]
When ARMv8.0-CSV2 is implemented:

Enable access to the SCXTNUM_EL2, SCXTNUM_EL1, and SCXTNUM_EL0 registers. The defined values are:

<table>
<thead>
<tr>
<th>EnSCXT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL2, EL1 and EL0 access to SCXTNUM_EL0, EL2 and EL1 access to SCXTNUM_EL1, EL2 access to SCXTNUM_EL2 registers are disabled by this mechanism, causing an exception to EL3, and the values of these registers to be treated as 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause accesses to SCXTNUM_EL0, SCXTNUM_EL1, SCXTNUM_EL2 to be trapped.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [24:22]

Reserved, RES0.

FIEN, bit [21]

When ARMv8.4-RAS is implemented:

Fault Injection enable. Trap accesses to the RAS ERX* registers ERXPFGCDN_EL1, ERXPFGCTL_EL1, and ERXPFGF_EL1 from EL1 and EL2 to EL3, reported using EC syndrome value 0x18.

<table>
<thead>
<tr>
<th>FIEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to the specified registers from EL1 and EL2 generate a Trap exception to EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented, the Effective value of SCR_EL3.FIEN is 0b1.

If ERRIDR_EL1.NUM is zero, meaning no error records are implemented, or no error record accessible using System registers is owned by a node that implements the RAS Common Fault Injection Model Extension, then this bit might be RES0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMEA, bit [20]

When ARMv8.4-DFE is implemented:

Non-maskable External Aborts. When SCR_EL3.EA == 1, controls whether PSTATE.A masks SError interrupts at EL3.

<table>
<thead>
<tr>
<th>NMEA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If SCR_EL3.EA == 1, asserted SError interrupts are not taken at EL3 if PSTATE.A == 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>If SCR_EL3.EA == 1, asserted SError interrupts are taken at EL3 regardless of the value of PSTATE.A.</td>
</tr>
</tbody>
</table>

When SCR_EL3.EA == 0:

- Asserted SError interrupts are not taken at EL3 regardless of the value of PSTATE.A and this field.
- This field is ignored and its Effective value is 0.
This field resets to 0.

Otherwise:

Reserved, RES0.

**EASE, bit [19]**

When ARMv8.4-DFE is implemented:

External aborts to SError interrupt vector.

<table>
<thead>
<tr>
<th>EASE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Synchronous External abort exceptions taken to EL3 are taken to the appropriate synchronous exception vector offset from VBAR_EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>Synchronous External abort exceptions taken to EL3 are taken to the appropriate SError interrupt vector offset from VBAR_EL3.</td>
</tr>
</tbody>
</table>

This field resets to 0.

Otherwise:

Reserved, RES0.

**EEL2, bit [18]**

When ARMv8.4-SecEL2 is implemented:

Secure EL2 Enable.

<table>
<thead>
<tr>
<th>EEL2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All behaviors associated with Secure EL2 are disabled. All registers, including timer registers, defined by ARMv8.4-SecEL2 are UNDEFINED, and those timers are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>All behaviors associated with Secure EL2 are enabled.</td>
</tr>
</tbody>
</table>

When the value of this bit is 1, then:

- When SCR_EL3.NS == 0, the SCR_EL3.RW bit is treated as 1 for all purposes other than reading or writing the register.

- If Secure EL1 is using AArch32, then any of the following operations, executed in Secure EL1, is trapped to Secure EL2, using the EC value of ESR_EL2,EC== 0x3:
  - A read or write of the SCR.
  - A read or write of the NSACR.
  - A read or write of the MVBAR.
  - A read or write of the SDCR.
  - Execution of an ATS12NSO** instruction.

- If Secure EL1 is using AArch32, then any of the following operations, executed in Secure EL1, is trapped to Secure EL2 using the EC value of ESR_EL2,EC== 0x0:
  - Execution of an SRS instruction that uses R13_mon.
  - Execution of an MRS (Banked register) or MSR (Banked register) instruction that would access SPSR_mon, R13_mon, or R14_mon.

**Note**

If the Effective value of SCR_EL3.EEL2 is 0, then these operations executed in Secure EL1 using AArch32 are trapped to EL3.
In a Secure only implementation that does not implement EL3 but implements EL2, behaves as if SCR_EL3.EEL2 == 1.

This bit is permitted to be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

API, bit [17]

When ARMv8.4-SecEL2 is implemented and ARMv8.3-PAuth is implemented:

Controls the use of the following instructions related to Pointer Authentication. Traps are reported using EC syndrome value 0x09:

- PACGA, which is always enabled.
- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZB, RETAA, RETAB, BRAA, BRAB, BRBA, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ, ERETTA, ERETTB, LDRAA and LDRAB when:
  - In EL0, when HCR_EL2.TGE==0 or HCR_EL2.E2H==0, and the associated SCTLR_EL1.En<N><M> == 1.
  - In EL0, when HCR_EL2.TGE==1 and HCR_EL2.E2H==1, and the associated SCTLR_EL2.En<N><M> == 1.
  - In EL1, when the associated SCTLR_EL1.En<N><M> == 1.
  - In EL2, when the associated SCTLR_EL2.En<N><M> == 1.

<table>
<thead>
<tr>
<th>API</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The use of any instruction related to pointer authentication in any Exception level except EL3 when the instructions are enabled are trapped to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.API bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

An instruction is trapped only if Pointer Authentication is enabled for that instruction, for more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Note

If ARMv8.3-PAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

This field resets to an architecturally UNKNOWN value.

When ARMv8.4-SecEL2 is not implemented and ARMv8.3-PAuth is implemented:

Controls the use of instructions related to Pointer Authentication:

- PACGA.
- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZB, RETAA, RETAB, BRAA, BRAB, BRBA, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ, ERETTA, ERETTB, LDRAA and LDRAB when:
  - In Non-secure EL0, when HCR_EL2.TGE==0 or HCR_EL2.E2H==0, and the associated SCTLR_EL1.En<N><M> == 1.
  - In Non-secure EL0, when HCR_EL2.TGE==1 and HCR_EL2.E2H==1, and the associated SCTLR_EL2.En<N><M> == 1.
  - In Secure EL0, when the associated SCTLR_EL2.En<N><M> == 1.
  - In Secure or Non-secure EL1, when the associated SCTLR_EL1.En<N><M> == 1.
  - In EL2, when the associated SCTLR_EL2.En<N><M> == 1.
API

<table>
<thead>
<tr>
<th>API</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The use of any instruction related to pointer authentication in any Exception level except EL3 when the instructions are enabled are trapped to EL3 unless they are trapped to EL2 as a result of the \texttt{HCR_EL2.API} bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

**Note**

If ARMv8.3-PAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

This field resets to an architecturally \texttt{UNKNOWN} value.

date

Otherwise:

Reserved, \texttt{RES0}.

**APK, bit [16]**

\textbf{When ARMv8.3-PAuth is implemented:}

Trap registers holding "key" values for Pointer Authentication. Traps accesses to the following registers, using EC syndrome value 0x18, from EL1 or EL2 to EL3 unless they are trapped to EL2 as a result of the \texttt{HCR\_EL2.APK} bit or other traps:

- \texttt{APIAKeyLo\_EL1}, \texttt{APIAKeyHi\_EL1}, \texttt{APIBKeyLo\_EL1}, \texttt{APIBKeyHi\_EL1}.
- \texttt{APDAKeyLo\_EL1}, \texttt{APDAKeyHi\_EL1}, \texttt{APDBKeyLo\_EL1}, \texttt{APDBKeyHi\_EL1}.
- \texttt{APGAKeyLo\_EL1}, \texttt{APGAKeyHi\_EL1}.

<table>
<thead>
<tr>
<th>APK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to the registers holding “key” values for pointer authentication from EL1 or EL2 are trapped to EL3 unless they are trapped to EL2 as a result of the \texttt{HCR_EL2.APK} bit or other traps.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

For more information, see ‘System register control of pointer authentication’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Note**

If ARMv8.3-PAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

This field resets to an architecturally \texttt{UNKNOWN} value.

Otherwise:

Reserved, \texttt{RES0}.

**TERR, bit [15]**

\textbf{When RAS is implemented:}

Trap Error record accesses. Accesses to the RAS ERR and RAS ERX registers from EL1 and EL2 to EL3 are trapped as follows:

- If EL1 is using AArch64, \texttt{ERRIDR\_EL1}, \texttt{ERRSEL\_EL1}, \texttt{ERXADDR\_EL1}, \texttt{ERXCTLR\_EL1}, \texttt{ERXFR\_EL1}, \texttt{ERXMISC0\_EL1}, \texttt{ERXMISC1\_EL1}, and \texttt{ERXSTATUS\_EL1}, are trapped and reported using EC syndrome value 0x18.
If ARMv8.4-RAS is implemented, ERXMISC2_EL1 and ERXMISC3_EL1 are trapped and reported using EC syndrome value 0x18.

If EL1 is using AArch32, accesses by MCR or MRC to the following registers are reported using EC syndrome value 0x03, accesses by MCRR or MRRC are reported using EC syndrome value 0x04:

- ERRIDR, ERRSELR, ERXADDR, ERXADDR2, ERXCTRL, ERXCTRL2, ERXFR, ERXFR2, ERXMISC0, ERXMISC1, ERXMISC2, ERXMISC3, and ERXSTATUS.

If ARMv8.4-RAS is implemented, accesses by MCR or MRC to the following registers are reported using EC syndrome value 0x03, accesses by MCRR or MRRC are reported using EC syndrome value 0x04:

- ERXMISC4, ERXMISC5, ERXMISC6, and ERXMISC7.

<table>
<thead>
<tr>
<th>TER</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 and EL2 accesses to the LOR registers that are not UNDEFINED are trapped to EL3, unless it is trapped HCR_EL2.TLOR.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Reserved: RES0.

TLOR, bit [14]

When ARMv8.1-LOR is implemented:

Trap LOR registers. Traps accesses to the LORSA_EL1, LOREFA_EL1, LORN_EL1, LORC_EL1, and LORID_EL1 registers from EL1 and EL2 to EL3, unless the access has been trapped to EL2.

<table>
<thead>
<tr>
<th>TLOR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 and EL2 accesses to the LOR registers that are not UNDEFINED are trapped to EL3, unless it is trapped HCR_EL2.TLOR.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Reserved: RES0.

TWE, bit [13]

Traps EL2, EL1, and EL0 execution of WFE instructions to EL3, from both Security states and both Execution states, reported using EC syndrome value 0x01.

<table>
<thead>
<tr>
<th>TWE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any attempt to execute a WFE instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWE, HCR.TWE, SCTLR_EL1.nTWE, SCTLR_EL2.nTWE, or HCR_EL2.TWE.</td>
</tr>
</tbody>
</table>

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or
WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

For more information about when WFE instructions can cause the PE to enter a low-power state, see 'Wait for Event mechanism and Send event' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile. This field resets to an architecturally UNKNOWN value.

**TWI, bit [12]**

Traps EL2, EL1, and EL0 execution of WFI instructions to EL3, from both Security states and both Execution states, reported using EC syndrome value 0x01.

<table>
<thead>
<tr>
<th>TWI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any attempt to execute a WFI instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWI, HCR.TWI, SCTLR_EL1.nTWI, SCTLR_EL2.nTWI, or HCR_EL2.TWI.</td>
</tr>
</tbody>
</table>

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

For more information about when WFI instructions can cause the PE to enter a low-power state, see 'Wait for Interrupt' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile. This field resets to an architecturally UNKNOWN value.

**ST, bit [11]**

Traps Secure EL1 accesses to the Counter-timer Physical Secure timer registers to EL3, from AArch64 state only, reported using EC syndrome value 0x18.

<table>
<thead>
<tr>
<th>ST</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure EL1 using AArch64 accesses to the CNTPS.TVAL.EL1, CNTPS.CTL.EL1, and CNTPS.CVAL.EL1 are trapped to EL3 when Secure EL2 is disabled. If Secure EL2 is enabled, the behavior is as if the value of this field was 0b1.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

**Note**

Accesses to the Counter-timer Physical Secure timer registers are always enabled at EL3. These registers are not accessible at EL0.

This field resets to an architecturally UNKNOWN value.

**RW, bit [10]**

Execution state control for lower Exception levels.
Meaning

0b0  Lower levels are all AArch32.
0b1  The next lower level is AArch64.
    If EL2 is present:
      •  EL2 is AArch64.
      •  EL2 controls EL1 and EL0 behaviors.
    If EL2 is not present:
      •  EL1 is AArch64.
      •  EL0 is determined by the Execution state described in the current process state when executing at EL0.

If AArch32 state is not supported by the implementation at EL2 and AArch32 state is not supported by the implementation at EL1, then this bit is RAO/WI.

If AArch32 state is supported by the implementation at EL1, SCR_EL3.NS == 1 and AArch32 state is not supported by the implementation at EL2, the Effective value of this bit is 1.

If AArch32 state is supported by the implementation at EL1, ARMv8.4-SecEL2 is implemented and SCR_EL3.{EEL2, NS} == {1, 0}, the Effective value of this bit is 1.

This bit is permitted to be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

SIF, bit [9]

When ARMv8.4-SecEL2 is implemented:

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from memory marked in the first stage of translation as being Non-secure. The possible values for this bit are:

<table>
<thead>
<tr>
<th>SIF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure state instruction fetches from memory marked in the first stage of translation as being Non-secure are permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure state instruction fetches from memory marked in the first stage of translation as being Non-secure are not permitted.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from Non-secure memory.

<table>
<thead>
<tr>
<th>SIF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure state instruction fetches from Non-secure memory are permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure state instruction fetches from Non-secure memory are not permitted.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

HCE, bit [8]

Hypervisor Call instruction enable. Enables HVC instructions at EL3 and, if EL2 is enabled in the current Security state, at EL2 and EL1, in both Execution states, reported using EC syndrome value 0x00.

<table>
<thead>
<tr>
<th>HCE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>HVC instructions are UNDEFINED.</td>
</tr>
<tr>
<td>0b1</td>
<td>HVC instructions are enabled at EL3, EL2, and EL1.</td>
</tr>
</tbody>
</table>

Note
HVC instructions are always *UNDEFINED* at EL0 and, if Secure EL2 is disabled, at Secure EL1. Any resulting exception is taken from the current Exception level to the current Exception level.

If EL2 is not implemented, this bit is *RES0*. This field resets to an architecturally *UNKNOWN* value.

**SMD, bit [7]**

Secure Monitor Call disable. Disables SMC instructions at EL1 and above, from both Security states and both Execution states, reported using EC syndrome value 0x00.

<table>
<thead>
<tr>
<th>SMD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>SMC instructions are enabled at EL3, EL2 and EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>SMC instructions are <em>UNDEFINED</em>.</td>
</tr>
</tbody>
</table>

**Note**

SMC instructions are always *UNDEFINED* at EL0. Any resulting exception is taken from the current Exception level to the current Exception level.

If **HCR_EL2** TSC or **HCR**.TSC traps attempted EL1 execution of SMC instructions to EL2, that trap has priority over this disable.

This field resets to an architecturally *UNKNOWN* value.

**Bit [6]**

Reserved, *RES0*.

**Bits [5:4]**

Reserved, *RES1*.

**EA, bit [3]**

External Abort and SError interrupt routing.

<table>
<thead>
<tr>
<th>EA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When executing at Exception levels below EL3, External aborts and SError interrupts are not taken to EL3. In addition, when executing at EL3:</td>
</tr>
<tr>
<td></td>
<td>• SError interrupts are not taken.</td>
</tr>
<tr>
<td></td>
<td>• External aborts are taken to EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>When executing at any Exception level, External aborts and SError interrupts are taken to EL3.</td>
</tr>
</tbody>
</table>

For more information, see 'Asynchronous exception routing' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1 (The AArch64 System Level Programmers' Model).

This field resets to an architecturally *UNKNOWN* value.

**FIQ, bit [2]**

Physical FIQ Routing.
**SCR_EL3**, Secure Configuration Register

<table>
<thead>
<tr>
<th>FIQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When executing at Exception levels below EL3, physical FIQ interrupts are not taken to EL3. When executing at EL3, physical FIQ interrupts are not taken.</td>
</tr>
<tr>
<td>0b1</td>
<td>When executing at any Exception level, physical FIQ interrupts are taken to EL3.</td>
</tr>
</tbody>
</table>

For more information, see 'Asynchronous exception routing' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1.

This field resets to an architecturally UNKNOWN value.

**IRQ, bit [1]**

Physical IRQ Routing.

<table>
<thead>
<tr>
<th>IRQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When executing at Exception levels below EL3, physical IRQ interrupts are not taken to EL3. When executing at EL3, physical IRQ interrupts are not taken.</td>
</tr>
<tr>
<td>0b1</td>
<td>When executing at any Exception level, physical IRQ interrupts are taken to EL3.</td>
</tr>
</tbody>
</table>

For more information, see 'Asynchronous exception routing' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1.

This field resets to an architecturally UNKNOWN value.

**NS, bit [0]**

Non-secure bit.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Indicates that EL0 and EL1 are in Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Indicates that Exception levels lower than EL3 are in Non-secure state, and so memory accesses from those Exception levels cannot access Secure memory.</td>
</tr>
</tbody>
</table>

When SCR_EL3. {EEL2, NS} == {1, 0}, then EL2 is using AArch64 and in Secure state.

This field resets to an architecturally UNKNOWN value.

**Accessing the SCR_EL3**

Accesses to this register use the following encodings:

```
MRS <Xt>, SCR_EL3
```

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b110</td>
<td>0b0001</td>
<td>0b0001</td>
<td>0b000</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return SCR_EL3;```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    SCR_EL3 = X[t];
**SCTLR_EL1, System Control Register (EL1)**

The SCTLR_EL1 characteristics are:

### Purpose

Provides top level control of the system, including its memory system, at EL1 and EL0.

### Configuration

AArch64 System register SCTLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register SCTLR[31:0].

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL1 using AArch64. Otherwise, RW fields in this register reset to architecturally **UNKNOWN** values.

### Attributes

SCTLR_EL1 is a 64-bit register.

### Field descriptions

The SCTLR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-54</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>53</td>
<td>TME, bit [53]</td>
</tr>
<tr>
<td>52</td>
<td>TME0, bit [52]</td>
</tr>
</tbody>
</table>

**TME, bit [53]**

When TME is implemented:

Enables the Transactional Memory Extension at EL1.

<table>
<thead>
<tr>
<th>TME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a TSTART instruction at EL1 is trapped to EL1, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be UNDEFINED at EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any TSTART instruction to be trapped.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**TME0, bit [52]**

When TME is implemented:

Enables the Transactional Memory Extension at EL0.
Any attempt to execute a TSTART instruction at EL0 is trapped to EL1, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be UNDEFINED at EL0.

This control does not cause any TSTART instruction to be trapped.

If ARMv8.1-VHE is implemented, EL2 is implemented and enabled in the current Security state, and HCR_EL2.\{E2H, TGE\} == \{1,1\}, this field has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TMT, bit [51]

When TME is implemented:

Forces a trivial implementation of the Transactional Memory Extension at EL1.

<table>
<thead>
<tr>
<th>TMT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any TSTART instruction to fail.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the TSTART instruction is executed at EL1, the transaction fails with a TRIVIAL failure cause.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TMT0, bit [50]

When TME is implemented:

Forces a trivial implementation of the Transactional Memory Extension at EL0.

<table>
<thead>
<tr>
<th>TMT0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any TSTART instruction to fail.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the TSTART instruction is executed at EL0, the transaction fails with a TRIVIAL failure cause.</td>
</tr>
</tbody>
</table>

If ARMv8.1-VHE is implemented, EL2 is implemented and enabled in the current Security state, and HCR_EL2.\{E2H, TGE\} == \{1,1\}, this field has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEL, bits [49:46]

When ARMv8.6-TWED is implemented:

TWE Delay. A 4-bit unsigned number that, when SCTLR_EL1.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE caused by SCTLR_EL1.nTWE as \(2^{\text{TWEDEL} + 8}\) cycles.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

**TWEDEn, bit [45]**

**When ARMv8.6-TWED is implemented:**

TWE Delay Enable. Enables a configurable delayed trap of the WFE instruction caused by SCTLR_EL1.nTWE.

<table>
<thead>
<tr>
<th>TWEDEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The delay for taking a WFE trap is IMPLEMENTATION DEFINED.</td>
</tr>
<tr>
<td>0b1</td>
<td>The delay for taking a WFE trap is at least the number of cycles defined in SCTLR_EL1.TWEDEL.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

**DSSBS, bit [44]**

**When ARMv8.0-SSBS is implemented:**

Default PSTATE.SSBS value on Exception Entry. The defined values are:

<table>
<thead>
<tr>
<th>DSSBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PSTATE.SSBS is set to 0 on an exception to EL1</td>
</tr>
<tr>
<td>0b1</td>
<td>PSTATE.SSBS is set to 1 on an exception to EL1</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL1, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:
Reserved, RES0.

**ATA, bit [43]**

**When ARMv8.5-MemTag is implemented:**

Allocation Tag Access in EL1. When SCR_EL3.ATA=1 and HCR_EL2.ATA=1, controls EL1 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.

<table>
<thead>
<tr>
<th>ATA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to Allocation Tags is prevented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access to Allocation Tags is not prevented.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**ATA0, bit [42]**

When ARMv8.5-MemTag is implemented:

Allocation Tag Access in EL0. When SCR_EL3.ATA=1, HCR_EL2.ATA=1, and HCR_EL2.{E2H,TGE} != {1,1}, controls EL0 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.

<table>
<thead>
<tr>
<th>ATA0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to Allocation Tags is prevented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access to Allocation Tags is not prevented.</td>
</tr>
</tbody>
</table>

This field is permitted to be cached in a TLB.

**Note**

Software may change this control bit on a context switch.

In a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**TCF, bits [41:40]**

When ARMv8.5-MemTag is implemented:

Tag Check Fail in EL1. Controls the effect of tag check fails due to Loads and Stores in EL1.

<table>
<thead>
<tr>
<th>TCF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Tag check fails have no effect on the PE.</td>
</tr>
<tr>
<td>0b01</td>
<td>Tag check fails causes a synchronous exception.</td>
</tr>
<tr>
<td>0b10</td>
<td>Tag check fails are asynchronously accumulated.</td>
</tr>
</tbody>
</table>

The value 0b11 is reserved.

In a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.
TCF0, bits [39:38]
When ARMv8.5-MemTag is implemented:

Tag Check Fail in EL0. When HCR_EL2.E2H,TGE != {1,1}, controls the effect of tag check fails due to Loads and Stores in EL0.

<table>
<thead>
<tr>
<th>TCF0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Tag check fails have no effect on the PE.</td>
</tr>
<tr>
<td>0b01</td>
<td>Tag check fails causes a synchronous exception.</td>
</tr>
<tr>
<td>0b10</td>
<td>Tag check fails are asynchronously accumulated.</td>
</tr>
</tbody>
</table>

The value 0b11 is reserved.

Note
Software may change this control bit on a context switch.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

ITFSB, bit [37]
When ARMv8.5-MemTag is implemented:

When synchronous exceptions are not being generated by Tag Check fails which are generated for Loads and Stores in EL0 or EL1, controls the auto-synchronization of Tag Check fails into TFSRE0_EL1 and TFSR_EL1.

<table>
<thead>
<tr>
<th>ITFSB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Tag check fails are not synchronized on entry to EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Tag check fails are synchronized on entry to EL1.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

BT1, bit [36]
When ARMv8.5-BTI is implemented:

PAC Branch Type compatibility at EL1.

<table>
<thead>
<tr>
<th>BT1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When the PE is executing at EL1, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the PE is executing at EL1, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.
BT0, bit [35]

When ARMv8.5-BTI is implemented:

PAC Branch Type compatibility at EL0.

<table>
<thead>
<tr>
<th>BT0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When the PE is executing at EL0, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the PE is executing at EL0, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.</td>
</tr>
</tbody>
</table>

When HCR_EL2.E2H == 1 && HCR_EL2.TGE == 1, the value of the SCTLR_EL1.BT0 has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [34:32]

Reserved, RES0.

EnIA, bit [31]

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see ‘System register control of pointer authentication’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>EnIA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.</td>
</tr>
</tbody>
</table>

Note

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see ‘System register control of pointer authentication’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
EnIB

<table>
<thead>
<tr>
<th>Meaning</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Pointer authentication (using the APIBKey_EL1 key) of instruction</td>
<td></td>
</tr>
<tr>
<td>addresses is not enabled.</td>
<td></td>
</tr>
<tr>
<td>Pointer authentication (using the APIBKey_EL1 key) of instruction</td>
<td></td>
</tr>
<tr>
<td>addresses is enabled.</td>
<td></td>
</tr>
</tbody>
</table>

**Note**

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**LSMAOE, bit [29]**

**When ARMv8.2-LSMAOC is implemented:**

Load Multiple and Store Multiple Atomicity and Ordering Enable.

<table>
<thead>
<tr>
<th>LSMAOE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For all memory accesses at EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.</td>
</tr>
<tr>
<td>0b1</td>
<td>The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL0 is as defined for Armv8.0.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.E2H, TGE is {1,1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES1.

**nTLSMD, bit [28]**

**When ARMv8.2-LSMAOC is implemented:**

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

<table>
<thead>
<tr>
<th>nTLSMD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.</td>
</tr>
<tr>
<td>0b1</td>
<td>All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.E2H, TGE is {1,1}, this bit has no effect on execution at EL0.
In a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES1**.

**EnDA, bit [27]**

**When ARMv8.3-PAuth is implemented:**

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>EnDA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

**Note**

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**UCI, bit [26]**

Traps EL0 execution of cache maintenance instructions, to EL1, or to EL2 when it is implemented and enabled for the current Security state and **HCR_EL2.TGE** is 1, from AArch64 state only, reported using EC syndrome value 0x18.

This applies to **DC CVAU**, **DC CIVAC**, **DC CVAC**, **DC CVAP**, and **IC IVAU**.

If ARMv8.2-DCCVADP is implemented, this trap also applies to **DC CVADP**.

If ARMv8.5-MemTag is implemented, this trap also applies to **DC CIGVAC**, **DC CIGDVAC**, **DC CVAC**, **DC CGVAC**, **DC CGDVAC**, **DC CGVAP**, and **DC CGDVAP**.

If ARMv8.2-DCCVADP and ARMv8.5-MemTag are implemented, this trap also applies to **DC CGVADP** and **DC CGDVADP**.

<table>
<thead>
<tr>
<th>UCI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Execution of the specified instructions at EL0 using AArch64 is trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

When ARMv8.1-VHE is implemented, and the value of **HCR_EL2.{E2H, TGE}** is {1, 1}, this bit has no effect on execution at EL0.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.
If the Point of Unification is before any level of data cache, it is IMPLEMENTATIONDEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATIONDEFINED whether the execution of any instruction cache invalidate by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**EE, bit [25]**

Endianness of data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime.

The possible values of this bit are:

<table>
<thead>
<tr>
<th>EE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&amp;0 translation regime are little-endian.</td>
</tr>
<tr>
<td>0b1</td>
<td>Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&amp;0 translation regime are big-endian.</td>
</tr>
</tbody>
</table>

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

In a system where the PE resets into EL1, this field resets to an IMPLEMENTATIONDEFINED value.

**E0E, bit [24]**

Endianness of data accesses at EL0.

The possible values of this bit are:

<table>
<thead>
<tr>
<th>E0E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Explicit data accesses at EL0 are little-endian.</td>
</tr>
<tr>
<td>0b1</td>
<td>Explicit data accesses at EL0 are big-endian.</td>
</tr>
</tbody>
</table>

If an implementation only supports Little-endian accesses at EL0 then this bit is RES0. This option is not permitted when SCTLR_EL1.EE is RES1.

If an implementation only supports Big-endian accesses at EL0 then this bit is RES1. This option is not permitted when SCTLR_EL1.EE is RES0.

This bit has no effect on the endianness of LDTR, LDTRH, LDTRSH, LDTRSW, STTR, and STTRH instructions executed at EL1.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**SPAN, bit [23]**

When ARMv8.1-PAN is implemented:

Set Privileged Access Never, on taking an exception to EL1.

<table>
<thead>
<tr>
<th>SPAN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PSTATE.PAN is set to 1 on taking an exception to EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The value of PSTATE.PAN is left unchanged on taking an exception to EL1.</td>
</tr>
</tbody>
</table>

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.
In a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES1**.

**EIS, bit [22]**

When ARMv8.5-CSEH is implemented:

Exception Entry is Context Synchronizing. The defined values are:

<table>
<thead>
<tr>
<th>EIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The taking of an exception to EL1 is not a context synchronizing event.</td>
</tr>
<tr>
<td>0b1</td>
<td>The taking of an exception to EL1 is a context synchronizing event.</td>
</tr>
</tbody>
</table>

When ARMv8.1-VHE is implemented, and the value of **HCR_EL2** \(\{E2H, TGE\}\) is \{1,1\}, this bit has no effect on execution at EL0.

If **SCTLR_EL1.EIS** is set to 0b0:

- Indirect writes to **ESR_EL1**, **FAR_EL1**, **SPSR_EL1**, **ELR_EL1** are synchronized on exception entry to EL1, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of **SCTLR EL1.EIS**:

- Changes to the PSTATE information on entry to EL1.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

In a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES1**.

**IESB, bit [21]**

When ARMv8.2-IESB is implemented:

Implicit Error Synchronization event enable. Possible values are:

<table>
<thead>
<tr>
<th>IESB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>An implicit error synchronization event is added:</td>
</tr>
<tr>
<td></td>
<td>• At each exception taken to EL1.</td>
</tr>
<tr>
<td></td>
<td>• Before the operational pseudocode of each <strong>ERET</strong> instruction executed at EL1.</td>
</tr>
</tbody>
</table>

When the PE is in Debug state, the effect of this field is **CONSTRAINED UNPREDICTABLE**, and its **Effective** value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each **DCPSX** instruction taken to EL1 and before each **DRPS** instruction executed at EL1, in addition to the other cases where it is added.

In a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

TSCXT, bit [20]

When ARMv8.0-CSV2 is implemented:

Trap EL0 Access to the SCXTNUM_EL0 register, when EL0 is using AArch64. The defined values are:

<table>
<thead>
<tr>
<th>TSCXT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 access to SCXTNUM_EL0 is not disabled by this mechanism.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 access to SCXTNUM_EL0 is disabled, causing an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1. The value of SCXTNUM_EL0 is treated as 0.</td>
</tr>
</tbody>
</table>

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL1&0 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

<table>
<thead>
<tr>
<th>WXN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on memory access permissions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any region that is writable in the EL1&amp;0 translation regime is forced to XN for accesses from software executing at EL1 or EL0.</td>
</tr>
</tbody>
</table>

This bit applies only when SCTLR_EL1.M bit is set.

The WXN bit is permitted to be cached in a TLB.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

nTWE, bit [18]

Traps EL0 execution of WFE instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from both Execution states, reported using EC syndrome value 0x01.

<table>
<thead>
<tr>
<th>nTWE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a WFE instruction at EL0 is trapped, if the instruction would otherwise have caused the PE to enter a low-power state.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note
Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When ARMv8.1-VHE is implemented, and the value of `HCR_EL2` {E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Bit [17]**

Reserved, RES0.

**nTWI, bit [16]**

Traps EL0 execution of WFI instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and `HCR_EL2`.TGE is 1, from both Execution states, reported using EC syndrome value 0x01.

<table>
<thead>
<tr>
<th>nTWI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a WFI instruction at EL0 is trapped, if the instruction would otherwise have caused the PE to enter a low-power state.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When ARMv8.1-VHE is implemented, and the value of `HCR_EL2` {E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**UCT, bit [15]**

Traps EL0 accesses to the `CTR_EL0` to EL1, or to EL2 when it is implemented and enabled for the current Security state and `HCR_EL2`.TGE is 1, from AArch64 state only, reported using EC value 0x18.

<table>
<thead>
<tr>
<th>UCT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to the <code>CTR_EL0</code> from EL0 using AArch64 are trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

When ARMv8.1-VHE is implemented, and the value of `HCR_EL2` {E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**DZE, bit [14]**

Traps EL0 execution of `DC ZVA` instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and `HCR_EL2`.TGE is 1, from AArch64 state only, reported using EC syndrome value 0x18.

If ARMv8.5-MemTag is implemented, this trap also applies to `DC GVA` and `DC GZVA`. 

---

SCTLR_EL1, System Control Register (EL1)
**DZE**

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>0b0</strong> Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped.</td>
</tr>
<tr>
<td><strong>0b1</strong> This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

When ARMv8.1-VHE is implemented, and the value of HCR_EL2 {E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**EnDB, bit [13]**

*When ARMv8.3-PAuth is implemented:*

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>0b0</strong> Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.</td>
</tr>
<tr>
<td><strong>0b1</strong> Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

**Note**

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**I, bit [12]**

Instruction access Cacheability control, for accesses at EL0 and EL1:

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>0b0</strong> All instruction access to Normal memory from EL0 and EL1 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR_EL1.M is 0, instruction accesses from stage 1 of the EL1&amp;0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.</td>
</tr>
<tr>
<td><strong>0b1</strong> This control has no effect on the Cacheability of instruction access to Normal memory from EL0 and EL1. If the value of SCTLR_EL1.M is 0, instruction accesses from stage 1 of the EL1&amp;0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.</td>
</tr>
</tbody>
</table>

When the value of the HCR_EL2 DC bit is 1, then instruction access to Normal memory from EL0 and EL1 are Cacheable regardless of the value of the SCTLR_EL1.I bit.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2 {E2H, TGE} is {1, 1}, this bit has no effect on the PE.

In a system where the PE resets into EL1, this field resets to 0.
**EOS, bit [11]**

When ARMv8.5-CSEH is implemented:

Exception Exit is Context Synchronizing. The defined values are:

<table>
<thead>
<tr>
<th>EOS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An exception return from EL1 is not a context synchronizing event</td>
</tr>
<tr>
<td>0b1</td>
<td>An exception return from EL1 is a context synchronizing event</td>
</tr>
</tbody>
</table>

When ARMv8.1-VHE is implemented, and the value of \( \text{HCR} \_\text{EL2} \) \{E2H, TGE\} is \{1,1\}, this bit has no effect on execution at EL0.

If SCTLR\_EL1.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR\_EL1.EOS:

- The indirect write of the PSTATE and PC values from SPSR\_EL1 and ELR\_EL1 on exception return is synchronized.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.

**EnRCTX, bit [10]**

When ARMv8.0-PredInv is implemented:

Enable EL0 Access to the AArch32 CFPRCTX, DVPRCTX and CPPRCTX instructions, and the AArch64 CFP RCTX, DVP RCT and CPP RCTX instructions. The defined values are:

<table>
<thead>
<tr>
<th>EnRCTX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 access to these instructions is disabled, and these instructions are trapped to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 access to these instructions is enabled.</td>
</tr>
</tbody>
</table>

When ARMv8.1-VHE is implemented, and the value of \( \text{HCR} \_\text{EL2} \) \{E2H, TGE\} is \{1,1\}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**UMA, bit [9]**

User Mask Access. Traps EL0 execution of MSR and MRS instructions that access the PSTATE.{D, A, I, F} masks to EL1, or to EL2 when it is implemented and enabled for the current Security state and \( \text{HCR} \_\text{EL2} \).TGE is 1, from AArch64 state only, reported using EC syndrome value 0x18.
UMA, bit [7]

Any attempt at EL0 using AArch64 to execute an MRS, MSR(REGISTER), or MSR(IMMEDIATE) instruction that accesses the DAIF is trapped.

0b0 This control does not cause any instructions to be trapped.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

SED, bit [8]

SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

<table>
<thead>
<tr>
<th>SED</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>SETEND instruction execution is enabled at EL0 using AArch32.</td>
</tr>
<tr>
<td>0b1</td>
<td>SETEND instructions are UNDEFINED at EL0 using AArch32 and any attempt at EL0 to access a SETEND instruction generates an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, reported using EC syndrome value 0x00.</td>
</tr>
</tbody>
</table>

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

If EL0 cannot use AArch32, this bit is RES1.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

ITD, bit [7]

IT Disable. Disables some uses of IT instructions at EL0 using AArch32.
### ITD

**Meaning**

| 0b0 | All IT instruction functionality is enabled at EL0 using AArch32. |
| 0b1 | Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED and generates an exception, reported using EC syndrome value 0x0, to EL1 or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1: |
|     | - All encodings of the IT instruction with hw1[3:0]!=1000. |
|     | - All encodings of the subsequent instruction with the following values for hw1: |
|     |   - 0b11xxxxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM. |
|     |   - 0b1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section F3.2.5. |
|     |   - 0b10100xxxxxxxxxxx: ADD Rd, PC, #imm |
|     |   - 0b01001xxxxxxxxxxx: LDR Rd, [PC, #imm] |
|     |   - 0b0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC. |
|     |   - 0b010001xx1xxxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn. |
|     | These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block. |
|     | It is IMPLEMENTATION DEFINED whether the IT instruction is treated as: |
|     |   - A 16-bit instruction, that can only be followed by another 16-bit instruction. |
|     |   - The first half of a 32-bit instruction. |
|     | This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED. An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction. |

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see ‘Changes to an ITD control by an instruction in an IT block’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section E1.2.4

If EL0 cannot use AArch32, this bit is RES1.

**nAA, bit [6]**

*When ARMv8.4-LSE is implemented:*

Non-aligned access. This bit controls generation of Alignment faults at EL1 and EL0 under certain conditions.

| 0b0 | LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses. |
| 0b1 | This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes. |
When ARMv8.1-VHE is implemented, and the value of `HCR_EL2.{E2H, TGE}` is \{1, 1\}, this bit has no effect on execution at \( \text{EL0} \).

In a system where the PE resets into EL1, this field resets to an architecturally `UNKNOWN` value.

**Otherwise:**

Reserved, \( \text{RES0} \).

**CP15BEN, bit [5]**

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from \( \text{EL0} \):

<table>
<thead>
<tr>
<th>CP15BEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>( \text{EL0 using AArch32}: \text{EL0 execution of the CP15DMB, CP15DSB, and CP15ISB} ) instructions is \text{UNDEFINED} and generates an exception to ( \text{EL1} ), or to ( \text{EL2} ) when it is implemented and enabled for the current Security state and ( \text{HCR_EL2.TGE} ) is 1. The exception is reported using EC syndrome value 0x00.</td>
</tr>
<tr>
<td>0b1</td>
<td>( \text{EL0 using AArch32}: \text{EL0 execution of the CP15DMB, CP15DSB, and CP15ISB} ) instructions is enabled.</td>
</tr>
</tbody>
</table>

If \( \text{EL0} \) cannot use AArch32, this bit is \( \text{RES0} \).

CP15BEN is optional, but if it is implemented in the `SCTLR` then it must also be implemented in the `SCTLR_EL1`. If it is not implemented then this bit is RAO/WI.

When ARMv8.1-VHE is implemented, and the value of `HCR_EL2.{E2H, TGE}` is \{1, 1\}, this bit has no effect on execution at \( \text{EL0} \).

In a system where the PE resets into EL1, this field resets to an architecturally `UNKNOWN` value.

**SA0, bit [4]**

SP Alignment check enable for \( \text{EL0} \). When set to 1, if a load or store instruction executed at \( \text{EL0} \) uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see ‘SP alignment checking’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1 (The AArch64 System Level Programmers’ Model).

When ARMv8.1-VHE is implemented, and the value of `HCR_EL2.{E2H, TGE}` is \{1, 1\}, this bit has no effect on execution at \( \text{EL0} \).

In a system where the PE resets into EL1, this field resets to an architecturally `UNKNOWN` value.

**SA, bit [3]**

SP Alignment check enable. When set to 1, if a load or store instruction executed at \( \text{EL1} \) uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see ‘SP alignment checking’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1 (The AArch64 System Level Programmers’ Model).

When ARMv8.1-VHE is implemented, and the value of `HCR_EL2.{E2H, TGE}` is \{1, 1\}, this bit has no effect on the PE.

In a system where the PE resets into EL1, this field resets to an architecturally `UNKNOWN` value.

**C, bit [2]**

Cacheability control, for data accesses.
C, bit [0]

All data access to Normal memory from EL0 and EL1, and all Normal memory accesses to the EL1&0 stage 1 translation tables, are Non-cacheable for all levels of data and unified cache.

0b0
This control has no effect on the Cacheability of:
• Data access to Normal memory from EL0 and EL1.
• Normal memory accesses to the EL1&0 stage 1 translation tables.

0b1
When the value of the \texttt{HCR\_EL2}.DC bit is 1, the PE ignores \texttt{SCLTR.C}. This means that Non-secure EL0 and Non-secure EL1 data accesses to Normal memory are Cacheable.

When ARMv8.1-VHE is implemented, and the value of \texttt{HCR\_EL2}.{E2H, TGE} is \{1, 1\}, this bit has no effect on the PE.

In a system where the PE resets into EL1, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL1 and EL0.

0b0
Alignment fault checking disabled when executing at EL1 or EL0. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.

0b1
Alignment fault checking enabled when executing at EL1 or EL0. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

When ARMv8.1-VHE is implemented, and the value of \texttt{HCR\_EL2}.{E2H, TGE} is \{1, 1\}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally \texttt{UNKNOWN} value.

M, bit [0]

MMU enable for EL1 and EL0 stage 1 address translation. Possible values of this bit are:

0b0
EL1 and EL0 stage 1 address translation disabled. See the \texttt{SCTLR\_EL1.I} field for the behavior of instruction accesses to Normal memory.

0b1
EL1 and EL0 stage 1 address translation enabled.

If the value of \texttt{HCR\_EL2}.{DC, TGE} is not \{0, 0\} then in Non-secure state the PE behaves as if the value of the \texttt{SCTLR\_EL1.M} field is 0 for all purposes other than returning the value of a direct read of the field.

When ARMv8.1-VHE is implemented, and the value of \texttt{HCR\_EL2}.{E2H, TGE} is \{1, 1\}, this bit has no effect on the PE.

In a system where the PE resets into EL1, this field resets to 0.

Accessing the \texttt{SCTLR\_EL1}

When \texttt{HCR\_EL2}.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic \texttt{SCTLR\_EL1} or \texttt{SCTLR\_EL12} are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:
MRS <Xt>, SCTLR_EL1

  else
    UNDEFINED;
elsif PSTATE.EL == EL3 then
  if EL2Enabled() && HCR_EL2.E2H == '1' then
    SCTLR_EL1 = X[t];
  else
    UNDEFINED;
SCTLR_EL2, System Control Register (EL2)

The SCTLR_EL2 characteristics are:

**Purpose**

Provides top level control of the system, including its memory system, at EL2.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.E2H, TGE is {1, 1}, these controls apply also to execution at EL0.

**Configuration**

AArch64 System register SCTLR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HSCTLR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

SCTLR_EL2 is a 64-bit register.

**Field descriptions**

The SCTLR_EL2 bit assignments are:

**When HCR_EL2.E2H != 0b1 or HCR_EL2.TGE != 0b1:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | TME | RES0 | TMT | RES0 | DSSBS | ATA | RES0 | TCF | RES0 | ITF5 | EnIA | EnIB | RES1 | EnDA | RES0 | EE | RES0 | RES1 | EIS | IESB | RES0 | WXN | RES1 | RES0 | RES0 | EnDB | EOS | RES0 | nAA | RES1 | RES0 | RES0 | RES1 | RES0 | RES0 | RES0 | RES0 |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 |

This format applies in all Armv8.0 implementations, and from Armv8.1 when the Effective value of HCR_EL2.E2H, TGE} != {1, 1}.

**Bits [63:54]**

Reserved, RES0.

**TME, bit [53]**

When TME is implemented:

Enables the Transactional Memory Extension at EL2.

<table>
<thead>
<tr>
<th>TME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a TSTART instruction at EL2 is trapped, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be UNDEFINED at EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any TSTART instruction to be trapped.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**Bit [52]**

Reserved, RES0.

**TMT, bit [51]**

When TME is implemented:

Forces a trivial implementation of the Transactional Memory Extension at EL2.

<table>
<thead>
<tr>
<th>TMT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any TSTART instruction to fail.</td>

<tr>
<td>0b1</td>
<td>When the TSTART instruction is executed at EL2, the transaction fails with a TRIVIAL failure cause.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Bits [50:45]**

Reserved, RES0.

**DSSBS, bit [44]**

When ARMv8.0-SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry.

<table>
<thead>
<tr>
<th>DSSBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PSTATE.SSBS is set to 0 on an exception to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>PSTATE.SSBS is set to 1 on an exception to EL2.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

**ATA, bit [43]**

When ARMv8.5-MemTag is implemented:

Allocation Tag Access. When SCR_EL3.ATA=1, controls EL2 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.
<table>
<thead>
<tr>
<th>ATA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to Allocation Tags is prevented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access to Allocation Tags is not prevented.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [42]

Reserved, RES0.

TCF, bits [41:40]

When ARMv8.5-MemTag is implemented:

Tack Check Fail in EL2. Controls the effect of tag check fails due to Loads and Stores in EL2.

<table>
<thead>
<tr>
<th>TCF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Tag check fails have no effect on the PE.</td>
</tr>
<tr>
<td>0b01</td>
<td>Tag check fails causes a synchronous exception.</td>
</tr>
<tr>
<td>0b10</td>
<td>Tag check fails are asynchronously accumulated.</td>
</tr>
</tbody>
</table>

The value 0b11 is reserved.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [39:38]

Reserved, RES0.

ITFSB, bit [37]

When ARMv8.5-MemTag is implemented:

When synchronous exceptions are not being generated by Tag Check fails which are generated for Loads and Stores in EL0, EL1 or EL2, controls the auto-synchronisation of Tag Check fails into TFSRE0_EL1, TFSR_EL1 and TFSR_EL2.

<table>
<thead>
<tr>
<th>ITFSB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Tag check fails are not synchronized on entry to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Tag check fails are synchronized on entry to EL2.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

BT, bit [36]

When ARMv8.5-BTI is implemented:

PAC Branch Type compatibility at EL2.
BT

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

### Bits [35:32]

Reserved, RES0.

### EnIA, bit [31]

**When ARMv8.3-PAuth is implemented:**

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see ‘System register control of pointer authentication’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>EnIA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.</td>
</tr>
</tbody>
</table>

**Note**

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

### EnIB, bit [30]

**When ARMv8.3-PAuth is implemented:**

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see ‘System register control of pointer authentication’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>EnIB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.</td>
</tr>
</tbody>
</table>

**Note**
This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:28]

Reserved, RES1.

EnDA, bit [27]

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>EnDA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [26]

Reserved, RES0.

EE, bit [25]

Endianness of data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime.

The possible values of this bit are:
**EE**

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&amp;0 translation regime, and stage 2 translation table walks in the EL1&amp;0 translation regime are little-endian.</td>
</tr>
<tr>
<td>0b1</td>
<td>Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&amp;0 translation regime, and stage 2 translation table walks in the EL1&amp;0 translation regime are big-endian.</td>
</tr>
</tbody>
</table>

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is `RES0`.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is `RES1`.

The EE bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an **IMPLEMENTATION DEFINED** value.

**Bit [24]**

Reserved, `RES0`.

**Bit [23]**

Reserved, `RES1`.

**EIS, bit [22]**

### When ARMv8.5-CSEH is implemented:

Exception entry is a context synchronization event. The defined values are:

<table>
<thead>
<tr>
<th>EIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The taking of an exception to EL2 is not a context synchronization event.</td>
</tr>
<tr>
<td>0b1</td>
<td>The taking of an exception to EL2 is a context synchronization event.</td>
</tr>
</tbody>
</table>

If `SCTLR_EL2.EIS` is set to 0b0:

- Indirect writes to `ESR_EL2, FAR_EL2, SPSR_EL2, ELR_EL2, HPFAR_EL2` are synchronized on exception entry to EL2, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of `SCTLR_EL2.EIS`:

- Changes to the PSTATE information on entry to EL2.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, `RES1`.

**IESB, bit [21]**

### When ARMv8.2-IESB is implemented:

Implicit Error Synchronization event enable.
When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSX instruction taken to EL2 and before each DRPS instruction executed at EL2, in addition to the other cases where it is added.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Bit [20]**

Reserved, RES0.

**WXN, bit [19]**

Write permission implies XN (Execute-never). For the EL2 or EL2&0 translation regime, this bit can force all memory regions that are writable to be treated as XN:

<table>
<thead>
<tr>
<th>WXN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on memory access permissions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any region that is writable in the EL2 or EL2&amp;0 translation regime is forced to XN for accesses from software executing at EL2.</td>
</tr>
</tbody>
</table>

This bit applies only when SCTLR_EL2.M bit is set.

The WXN bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Bit [18]**

Reserved, RES1.

**Bit [17]**

Reserved, RES0.

**Bit [16]**

Reserved, RES1.

**Bits [15:14]**

Reserved, RES0.

**EnDB, bit [13]**

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL2&0 translation regime.
For more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>EnDB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

**Note**

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**I, bit [12]**

Instruction access Cacheability control, for accesses at EL2:

<table>
<thead>
<tr>
<th>I</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All instruction access to Normal memory from EL2 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&amp;0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control has no effect on the Cacheability of instruction access to Normal memory from EL2. If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&amp;0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.</td>
</tr>
</tbody>
</table>

This bit has no effect on the EL1&0 or EL3 translation regimes.

In a system where the PE resets into EL2, this field resets to 0.

**EOS, bit [11]**

*When ARMv8.5-CSEH is implemented:*

Exception exit is a context synchronization Event.

<table>
<thead>
<tr>
<th>EOS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An exception return from EL2 is not a context synchronization event.</td>
</tr>
<tr>
<td>0b1</td>
<td>An exception return from EL2 is a context synchronization event.</td>
</tr>
</tbody>
</table>

If SCTLR_EL2.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL2.EOS:

- The indirect write of the PSTATE and PC values from SPSR_EL2 and ELR_EL2 on exception return is synchronized.
Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.

Exit from Debug state.

In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES1.

**Bits [10:7]**

Reserved, RES0.

**nAA, bit [6]**

When ARMv8.4-LSE is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL2 under certain conditions.

<table>
<thead>
<tr>
<th>nAA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLURH, STLR, STLURH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLURH, STLR, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Bits [5:4]**

Reserved, RES1.

**SA, bit [3]**

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL2 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see 'SP alignment checking' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1 (The AArch64 System Level Programmers’ Model).

In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**C, bit [2]**

Cacheability control, for data accesses.

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All data access to Normal memory from EL2, and all Normal memory accesses to the EL2 translation tables, are Non-cacheable for all levels of data and unified cache.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control has no effect on the Cacheability of:</td>
</tr>
<tr>
<td></td>
<td>• Data access to Normal memory from EL2.</td>
</tr>
<tr>
<td></td>
<td>• Normal memory accesses to the EL2 translation tables.</td>
</tr>
</tbody>
</table>
This bit has no effect on the EL1&0 or EL3 translation regimes.

In a system where the PE resets into EL2, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL2:

<table>
<thead>
<tr>
<th>A</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Alignment fault checking disabled when executing at EL2. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.</td>
</tr>
<tr>
<td>0b1</td>
<td>Alignment fault checking enabled when executing at EL2. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.</td>
</tr>
</tbody>
</table>

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL2 stage 1 address translation. Possible values of this bit are:

<table>
<thead>
<tr>
<th>M</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL2 stage 1 address translation disabled. See the SCTLR_EL2.I field for the behavior of instruction accesses to Normal memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL2 stage 1 address translation enabled.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to 0.

When HCR_EL2.E2H == 0b1 and HCR_EL2.TGE == 0b1:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:54</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

TME, bit [53]

When TME is implemented:

Enables the Transactional Memory Extension at EL2.

<table>
<thead>
<tr>
<th>TME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a TSTART instruction at EL2 is trapped, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be UNDEFINED at EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any TSTART instruction to be trapped.</td>
</tr>
</tbody>
</table>
In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**TME0, bit [52]**

**When TME is implemented:**

Enables the Transactional Memory Extension at EL0.

<table>
<thead>
<tr>
<th>TME0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a TSTART instruction at EL0 is trapped to EL2, unless <strong>HCR_EL2.TME</strong> or <strong>SCR_EL3.TME</strong> causes TSTART instructions to be <strong>UNDEFINED</strong> at EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any TSTART instruction to be trapped.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**TMT, bit [51]**

**When TME is implemented:**

Forces a trivial implementation of the Transactional Memory Extension at EL2.

<table>
<thead>
<tr>
<th>TMT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any TSTART instruction to fail.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the TSTART instruction is executed at EL2, the transaction fails with a <strong>TRIVIAL</strong> failure cause.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**TMT0, bit [50]**

**When TME is implemented:**

Forces a trivial implementation of the Transactional Memory Extension at EL0.

<table>
<thead>
<tr>
<th>TMT0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any TSTART instruction to fail.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the TSTART instruction is executed at EL0, the transaction fails with a <strong>TRIVIAL</strong> failure cause.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**TWEDEL, bits [49:46]**
When ARMv8.6-TWED is implemented:

TWE Delay. A 4-bit unsigned number that, when SCTLR_EL2.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE caused by SCTLR_EL2.nTWE as $2^{(TWEDEL + 8)}$ cycles.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**TWEDEn, bit [45]**

When ARMv8.6-TWED is implemented:

TWE Delay Enable. Enables a configurable delayed trap of the WFE instruction caused by SCTLR_EL2.nTWE.

<table>
<thead>
<tr>
<th>TWDEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The delay for taking a WFE trap is IMPLEMENTATION DEFINED.</td>
</tr>
<tr>
<td>0b1</td>
<td>The delay for taking a WFE trap is at least the number of cycles defined in SCTLR_EL2.TWEDEL.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**DSSBS, bit [44]**

When ARMv8.0-SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry.

<table>
<thead>
<tr>
<th>DSSBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PSTATE.SSBS is set to 0 on an exception to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>PSTATE.SSBS is set to 1 on an exception to EL2.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

**ATA, bit [43]**

When ARMv8.5-MemTag is implemented:

Allocation Tag Access in EL2. When SCR_EL3.ATA=1, controls EL2 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.
ATA

<table>
<thead>
<tr>
<th>Meaning</th>
<th>ATA</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access to Allocation Tags is prevented.</td>
<td>0b0</td>
</tr>
<tr>
<td>Access to Allocation Tags is not prevented.</td>
<td>0b1</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**ATA0, bit [42]**

When ARMv8.5-MemTag is implemented:

Allocation Tag Access in EL0. When `SCR_EL3.ATA=1`, controls EL0 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>ATA0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access to Allocation Tags is prevented.</td>
<td>0b0</td>
</tr>
<tr>
<td>Access to Allocation Tags is not prevented.</td>
<td>0b1</td>
</tr>
</tbody>
</table>

This field is permitted to be cached in a TLB.

**Note**

Software may change this control bit on a context switch.

In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**TCF, bits [41:40]**

When ARMv8.5-MemTag is implemented:

Tag Check Fail in EL2. Controls the effect of tag check fails due to Loads and Stores in EL2.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>TCF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tag check fails have no effect on the PE.</td>
<td>0b00</td>
</tr>
<tr>
<td>Tag check fails causes a synchronous exception.</td>
<td>0b01</td>
</tr>
<tr>
<td>Tag check fails are asynchronously accumulated.</td>
<td>0b10</td>
</tr>
</tbody>
</table>

The value 0b11 is reserved.

In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**TCF0, bits [39:38]**

When ARMv8.5-MemTag is implemented:

Tag Check Fail in EL0. Controls the effect of tag check fails due to Loads and Stores in EL0.

<table>
<thead>
<tr>
<th>TCF0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>

<tr>
<td>0b1</td>
<td>Tag check fails are synchronized on entry to EL2.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**BT1, bit [36]**

When ARMv8.5-BTI is implemented:

PAC Branch Type compatibility at EL2.

<table>
<thead>
<tr>
<th>BT1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When the PE is executing at EL2, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the PE is executing at EL2, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
When ARMv8.5-BTI is implemented:

PAC Branch Type compatibility at EL0.

<table>
<thead>
<tr>
<th>BT0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When the PE is executing at EL0, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.</td>

<td>When the PE is executing at EL0, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

Bits [34:32]

Reserved, RES0.

EnIA, bit [31]

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see ‘System register control of pointer authentication’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>EnIA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.</td>
</tr>
</tbody>
</table>

Note

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see ‘System register control of pointer authentication’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
Meaning

0b0  Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.
0b1  Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.

Note

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LSMAOE, bit [29]

When ARMv8.2-LSMAOC is implemented:

Load Multiple and Store Multiple Atomicity and Ordering Enable.

Meaning

0b0  For all memory accesses at EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.
0b1  The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL0 is as defined for Armv8.0.

This bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

nTLSMD, bit [28]

When ARMv8.2-LSMAOC is implemented:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

Meaning

0b0  All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.
0b1  All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES1.

**EnDA, bit [27]**

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>EnDA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

**Note**

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**UCI, bit [26]**

Traps EL0 execution of cache maintenance instructions to EL2, from AArch64 state only. This applies to DC CVAU, DC CIVAC, DC CVAC, DC CVAP, and IC IVAU.

If ARMv8.2-DCCVADP is implemented, this trap also applies to DC CVADP.

If ARMv8.5-MemTag is implemented, this trap also applies to DC CIGVAC, DC CIGDVAC, DC CGVAC, DC CGDVAC, DC CGVAP, and DC CGDVAP.

If ARMv8.2-DCCVADP and ARMv8.5-MemTag are implemented, this trap also applies to DC CGVADP and DC CGDVADP.

<table>
<thead>
<tr>
<th>UCI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.
**EE, bit [25]**

Endianness of data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL2&0 translation regime.

The possible values of this bit are:

<table>
<thead>
<tr>
<th>EE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&amp;0 translation regime, and stage 2 translation table walks in the EL2&amp;0 translation regime are little-endian.</td>
</tr>
<tr>
<td>0b1</td>
<td>Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&amp;0 translation regime, and stage 2 translation table walks in the EL2&amp;0 translation regime are big-endian.</td>
</tr>
</tbody>
</table>

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an IMPLEMENTATION DEFINED value.

**E0E, bit [24]**

Endianness of data accesses at EL0.

<table>
<thead>
<tr>
<th>E0E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Explicit data accesses at EL0 are little-endian.</td>
</tr>
<tr>
<td>0b1</td>
<td>Explicit data accesses at EL0 are big-endian.</td>
</tr>
</tbody>
</table>

If an implementation only supports Little-endian accesses at EL0 then this bit is RES0. This option is not permitted when SCTLR_EL1.EE is RES1.

If an implementation only supports Big-endian accesses at EL0 then this bit is RES1. This option is not permitted when SCTLR_EL1.EE is RES0.

This bit has no effect on the endianness of LDTR, LDTRH, LDTRSH, LDTRSW, STTR, and STTRH instructions executed at EL1.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**SPAN, bit [23]**

Set Privileged Access Never, on taking an exception to EL2.

<table>
<thead>
<tr>
<th>SPAN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PSTATE.PAN is set to 1 on taking an exception to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>The value of PSTATE.PAN is left unchanged on taking an exception to EL2.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**EIS, bit [22]**

*When ARMv8.5-CSEH is implemented:*

Exception Entry is a context synchronization event.

<table>
<thead>
<tr>
<th>EIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The taking of an exception to EL2 is not a context synchronization event.</td>
</tr>
<tr>
<td>0b1</td>
<td>The taking of an exception to EL2 is a context synchronization event.</td>
</tr>
</tbody>
</table>

If SCTLR_EL2.EIS is set to 0b0:
Indirect writes to ESR_EL2, FAR_EL2, SPSR_EL2, ELR_EL2, HPFAR_EL2 are synchronized on exception entry to EL2, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.

Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.

Exception Catch debug events are synchronous debug events.

DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL2.EIS:

- Changes to the PSTATE information on entry to EL2.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.

**IESB, bit [21]**

*When ARMv8.2-IESB is implemented:*

Implicit Error Synchronization event Enable.

<table>
<thead>
<tr>
<th>IESB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>An implicit error synchronization event is added:</td>
</tr>
<tr>
<td></td>
<td>- After each exception taken to EL2.</td>
</tr>
<tr>
<td></td>
<td>- Before the operational pseudocode of each ERET instruction executed at EL2.</td>
</tr>
</tbody>
</table>

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSx instruction taken to EL2 and before each DRPS instruction executed at EL2, in addition to the other cases where it is added.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TSCXT, bit [20]**

*When ARMv8.0-CSV2 is implemented:*

Trap EL0 Access to the SCXTNUM_EL0 register, when EL0 is using AArch64.

<table>
<thead>
<tr>
<th>TSCXT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 access to SCXTNUM_EL0 is not disabled by this mechanism.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 access to SCXTNUM_EL0 is disabled, causing an exception to EL2, and the SCXTNUM_EL0 value is treated at 0.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.
WXN, bit [19]

Write permission implies XN (Execute-never). For the EL2 or EL2&0 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

<table>
<thead>
<tr>
<th>WXN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on memory access permissions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any region that is writable in the EL2 or EL2&amp;0 translation regime is forced to XN for accesses from software executing at EL2.</td>
</tr>
</tbody>
</table>

This bit applies only when SCTLR_EL2.M bit is set.

The WXN bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

nTWE, bit [18]

Traps EL0 execution of WFE instructions to EL2, from both Execution states.

<table>
<thead>
<tr>
<th>nTWE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a WFE instruction at EL0 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

Traps EL0 execution of WFI instructions to EL2, from both Execution states.

<table>
<thead>
<tr>
<th>nTWI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a WFI instruction at EL0 is trapped EL2, if the instruction would otherwise have caused the PE to enter a low-power state.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.
In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**UCT, bit [15]**

Traps EL0 accesses to the CTR_EL0 to EL2, from AArch64 state only.

<table>
<thead>
<tr>
<th>UCT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to the CTR_EL0 from EL0 using AArch64 are trapped to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**DZE, bit [14]**

Traps EL0 execution of DC ZVA instructions to EL2, from AArch64 state only.

If ARMv8.5-MemTag is implemented, this trap also applies to DC GVA and DC GZVA.

<table>
<thead>
<tr>
<th>DZE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped to EL2. Reading DCZID_EL0.DZP from EL0 returns 1, indicating that the instructions that this trap applies to are not supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**EnDB, bit [13]**

*When ARMv8.3-PAuth is implemented:*

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>EnDB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

**Note**

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**I, bit [12]**

Instruction access Cacheability control, for accesses at EL2 and EL0:

---

Page 1371
### SCTLR_EL2, System Control Register (EL2)

<table>
<thead>
<tr>
<th>I</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All instruction access to Normal memory from EL2 and EL0 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2&amp;0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control has no effect on the Cacheability of instruction access to Normal memory from EL2 and EL0. If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2&amp;0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory. This bit has no effect on the EL3 translation regimes.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to 0.

### EOS, bit [11]

**When ARMv8.5-CSEH is implemented:**

Exception exit is a context synchronization event.

<table>
<thead>
<tr>
<th>EOS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An exception return from EL2 is not a context synchronization event.</td>
</tr>
<tr>
<td>0b1</td>
<td>An exception return from EL2 is a context synchronization event.</td>
</tr>
</tbody>
</table>

If SCTLR_EL2.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL2.EOS:

- The indirect write of the PSTATE and PC values from SPSR_EL2 and ELR_EL2 on exception return is synchronized.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

### Otherwise:

Reserved, RES1.

### EnRCTX, bit [10]

**When ARMv8.0-PredInv is implemented:**

Enable EL0 Access to the AArch32 CFPRCTX, DVPRCTX and CPPRCTX instructions, and the AArch64 CFP RCTX, DVP RCT and CPP RCTX System instructions.

<table>
<thead>
<tr>
<th>EnRCTX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 access to these instructions is disabled, and these instructions are trapped to EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 access to these instructions is enabled.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

### Otherwise:

Reserved, RES0.
Bit [9]

Reserved, RES0.

SED, bit [8]

SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

<table>
<thead>
<tr>
<th>SED</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>SETEND instruction execution is enabled at EL0 using AArch32.</td>
</tr>
<tr>
<td>0b1</td>
<td>SETEND instructions are UNDEFINED at EL0 using AArch32.</td>
</tr>
</tbody>
</table>

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

If EL0 cannot use AArch32, this bit is RES1.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

ITD, bit [7]

IT Disable. Disables some uses of IT instructions at EL0 using AArch32.

<table>
<thead>
<tr>
<th>ITD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All IT instruction functionality is enabled at EL0 using AArch32.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED:</td>
</tr>
</tbody>
</table>

- All encodings of the IT instruction with hw1[3:0] != 1000.
- All encodings of the subsequent instruction with the following values for hw1:
  - 0b11xxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.
  - 0b1011xxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section F3.2.5.
  - 0b10100xxxxxxxx: ADD Rd, PC, #imm
  - 0b01001xxxxxxx: LDR Rd, [PC, #imm]
  - 0b01001xxxxxxx: ADD Rd, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.
  - 0b010001xxx1111xxx: ADD PC, Rn; CMP PC, Rm; MOV PC, Rm. This pattern also covers UNPREDICTABLE cases with BLX Rn.

These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.

It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:
- A 16-bit instruction, that can only be followed by another 16-bit instruction.
- The first half of a 32-bit instruction.

This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.

An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONstrained UNPREDICTABLE. For more information see 'Changes to an ITD control by an instruction in an IT block' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section E1.2.4

If EL0 cannot use AArch32, this bit is RES1.

ITD is optional, but if it is implemented in the SCTLR then it must also be implemented in the SCTLR_EL1. If it is not implemented then this bit is RAZ/WI.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.
When ARMv8.4-LSE is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL2 and EL0 under certain conditions.

<table>
<thead>
<tr>
<th>nAA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLUR, STLURH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLUR, STLURH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**CP15BEN, bit [5]**

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL0:

<table>
<thead>
<tr>
<th>CP15BEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is <strong>UNDEFINED</strong>.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.</td>
</tr>
</tbody>
</table>

If EL0 cannot use AArch32, this bit is RES0.

CP15BEN is optional, but if it is implemented in the SCTLR then it must also be implemented in the SCTLR_EL1. If it is not implemented then this bit is RAO/WI.

In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**SA0, bit [4]**

SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see 'SP alignment checking' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1 (The AArch64 System Level Programmers’ Model).

In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**SA, bit [3]**

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL2 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see 'SP alignment checking' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1 (The AArch64 System Level Programmers’ Model).

In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**C, bit [2]**

Cacheability control, for data accesses.
Meaning
0b0 All data access to Normal memory from EL2 and EL0, and all Normal memory accesses to the EL2&0 translation tables, are Non-cacheable for all levels of data and unified cache.
0b1 This control has no effect on the Cacheability of:
- Data access to Normal memory from EL2 and EL0.
- Normal memory accesses to the EL2&0 translation tables.

This bit has no effect on the EL3 translation regimes.

In a system where the PE resets into EL2, this field resets to 0.

Alignment check enable. This is the enable bit for Alignment fault checking at EL2 and EL0.

Meaning
0b0 Alignment fault checking disabled when executing at EL2 and EL0. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.
0b1 Alignment fault checking enabled when executing at EL2 and EL0. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

MMU enable for EL2&0 stage 1 address translation. Possible values of this bit are:

Meaning
0b0 EL2&0 stage 1 address translation disabled. See the SCTLR_EL2.I field for the behavior of instruction accesses to Normal memory.
0b1 EL2&0 stage 1 address translation enabled.

In a system where the PE resets into EL2, this field resets to 0.

Accessing the SCTLR_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic SCTLR_EL2 or SCTLR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

\[
\text{MRS} \ <Xt>, \ \text{SCTLR\_EL2}
\]

SCTLR_EL3, System Control Register (EL3)

The SCTLR_EL3 characteristics are:

Purpose

Provides top level control of the system, including its memory system, at EL3.

Configuration

This register is present only when HaveEL(EL3). Otherwise, direct accesses to SCTLR_EL3 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL3 using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

SCTLR_EL3 is a 64-bit register.

Field descriptions

The SCTLR_EL3 bit assignments are:

Bits [63:54]

Reserved, RES0.

TME, bit [53]

When TME is implemented:

Enables the Transactional Memory Extension at EL3.

<table>
<thead>
<tr>
<th>TME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a TSTART instruction at EL3 is trapped, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be UNDEFINED at EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any TSTART instruction to be trapped.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [52]

Reserved, RES0.

TMT, bit [51]
When TME is implemented:

Forces a trivial implementation of the Transactional Memory Extension at EL3.

<table>
<thead>
<tr>
<th>TMT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any TSTART instruction to fail.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the TSTART instruction is executed at EL3, the transaction</td>
</tr>
<tr>
<td></td>
<td>fails with a TRIVIAL failure cause.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [50:45]

Reserved, RES0.

DSSBS, bit [44]

When ARMv8.0-SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry.

<table>
<thead>
<tr>
<th>DSSBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PSTATE.SSBS is set to 0 on an exception to EL3</td>
</tr>
<tr>
<td>0b1</td>
<td>PSTATE.SSBS is set to 1 on an exception to EL3</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL3, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

ATA, bit [43]

When ARMv8.5-MemTag is implemented:

Allocation Tag Access in EL3. Controls EL3 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.

<table>
<thead>
<tr>
<th>ATA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to Allocation Tags is prevented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access to Allocation Tags is not prevented.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**Bit [42]**

Reserved, RES0.

**TCF, bits [41:40]**

*When ARMv8.5-MemTag is implemented:*

Tag Check Fail in EL3. Controls the effect of tag check fails due to Loads and Stores in EL3.

<table>
<thead>
<tr>
<th>TCF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Tag check fails have no effect on the PE.</td>
</tr>
<tr>
<td>0b1</td>
<td>Tag check fails causes a synchronous exception.</td>
</tr>
<tr>
<td>0b10</td>
<td>Tag check fails are asynchronously accumulated.</td>
</tr>
</tbody>
</table>

The value 0b11 is reserved.

In a system where the PE resets into EL3, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**Bits [39:38]**

Reserved, RES0.

**ITFSB, bit [37]**

*When ARMv8.5-MemTag is implemented:*

When asynchronous exceptions are being generated by Tag Check fails which are generated for Loads and Stores at any exception level, controls the auto-synchronisation of Tag Check fails into **TFSRE0_EL1** and **TFSR_ELx**.

<table>
<thead>
<tr>
<th>ITFSB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Tag check fails are not synchronized on entry to EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>Tag check fails are synchronized on entry to EL3.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL3, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**BT, bit [36]**

*When ARMv8.5-BTI is implemented:*

PAC Branch Type compatibility at EL3.

<table>
<thead>
<tr>
<th>BT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When the PE is executing at EL3, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the PE is executing at EL3, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL3, this field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**Bits [35:32]**

Reserved, RES0.

**EnIA, bit [31]**

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL3 translation regime.

Possible values of this bit are:

<table>
<thead>
<tr>
<th>EnIA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.</td>
</tr>
</tbody>
</table>

For more information, see ‘System register control of pointer authentication’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Note**

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL3, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**EnIB, bit [30]**

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL3 translation regime.

Possible values of this bit are:

<table>
<thead>
<tr>
<th>EnIB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.</td>
</tr>
</tbody>
</table>

For more information, see ‘System register control of pointer authentication’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Note**

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a
pointer to which a pointer authentication code has been added, and AuthIB
returns an authenticated copy of a pointer. When the field is 0, both of these
functions are NOP.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:28]

Reserved, RES1.

EnDA, bit [27]

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL3 translation regime.

<table>
<thead>
<tr>
<th>EnDA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

For more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [26]

Reserved, RES0.

EE, bit [25]

Endianness of data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime.

<table>
<thead>
<tr>
<th>EE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are little-endian.</td>
</tr>
<tr>
<td>0b1</td>
<td>Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are big-endian.</td>
</tr>
</tbody>
</table>

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.
If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

In a system where the PE resets into EL3, this field resets to an IMPLEMENTATION DEFINED value.

**Bit [24]**

Reserved, RES0.

**Bit [23]**

Reserved, RES1.

**EIS, bit [22]**

*When ARMv8.5-CSEH is implemented:*

Exception Entry is Context Synchronizing.

<table>
<thead>
<tr>
<th>EIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The taking of an exception to EL3 is not a context synchronizing event.</td>
</tr>
<tr>
<td>0b1</td>
<td>The taking of an exception to EL3 is a context synchronizing event.</td>
</tr>
</tbody>
</table>

If SCTLR_EL3.EIS is set to 0b0:

- Indirect writes to **ESR_EL3, FAR_EL3, SPSR_EL3, ELR_EL3** are synchronized on exception entry to EL3, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL3.EIS:

- Changes to the PSTATE information on entry to EL3.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Debug state exit.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES1.

**IESB, bit [21]**

*When ARMv8.2-IESB is implemented:*

Implicit Error Synchronization event enable.

<table>
<thead>
<tr>
<th>IESB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>An implicit error synchronization event is added:</td>
</tr>
<tr>
<td></td>
<td>• At each exception taken to EL3.</td>
</tr>
<tr>
<td></td>
<td>• Before the operational pseudocode of each ERET instruction executed at EL3.</td>
</tr>
</tbody>
</table>

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSX instruction taken to EL3 and before each DRPS instruction executed at EL3, in addition to the other cases where it is added.
When ARMv8.4-DFE is implemented, and the Effective value of SCR_EL3.NMEA is 1, this field is ignored and its Effective value is 1.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [20]

Reserved, RES0.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL3 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

<table>
<thead>
<tr>
<th>WXN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on memory access permissions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any region that is writable in the EL3 translation regime is forced to XN for accesses from software executing at EL3.</td>
</tr>
</tbody>
</table>

This bit applies only when SCTLRE_L3.M bit is set.

The WXN bit is permitted to be cached in a TLB.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Bit [18]

Reserved, RES1.

Bit [17]

Reserved, RES0.

Bit [16]

Reserved, RES1.

Bits [15:14]

Reserved, RES0.

EnDB, bit [13]

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL3 translation regime.

<table>
<thead>
<tr>
<th>EnDB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

For more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Note
This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL3:

<table>
<thead>
<tr>
<th>I</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All instruction access to Normal memory from EL3 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control has no effect on the Cacheability of instruction access to Normal memory from EL3. If the value of SCTLR_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.</td>
</tr>
</tbody>
</table>

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

In a system where the PE resets into EL3, this field resets to 0.

EOS, bit [11]

When ARMv8.5-CSEH is implemented:

Exception Exit is Context Synchronizing.

<table>
<thead>
<tr>
<th>EOS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An exception return from EL3 is not a context synchronizing event</td>
</tr>
<tr>
<td>0b1</td>
<td>An exception return from EL3 is a context synchronizing event</td>
</tr>
</tbody>
</table>

If SCTLR_EL3.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL3.EOS:

- The indirect write of the PSTATE and PC values from SPSR_EL3 and ELR_EL3 on exception return is synchronized.
- If the PE enters Debug state before the first instruction after an Exception return from EL3 to Non-secure state, any pending Halting debug event completes execution.
- The GIC behavior that allocates interrupts to FIQ or IRQ changes simultaneously with leaving the EL3 Exception level.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES1.

**Bits [10:7]**

Reserved, RES0.

**nAA, bit [6]**

When ARMv8.4-LSE is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL3 under certain conditions.

<table>
<thead>
<tr>
<th>nAA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Bits [5:4]**

Reserved, RES1.

**SA, bit [3]**

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL3 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see ‘SP alignment checking’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1 (The AArch64 System Level Programmers’ Model).

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

**C, bit [2]**

Cacheability control, for data accesses.

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All data access to Normal memory from EL3, and all Normal memory accesses to the EL3 translation tables, are Non-cacheable for all levels of data and unified cache.</td>
</tr>
</tbody>
</table>
| 0b1 | This control has no effect on the Cacheability of:  
• Data access to Normal memory from EL3.  
• Normal memory accesses to the EL3 translation tables. |

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

In a system where the PE resets into EL3, this field resets to 0.
A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL3.

<table>
<thead>
<tr>
<th>A</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Alignment fault checking disabled when executing at EL3. Instructions</td>
</tr>
<tr>
<td></td>
<td>that load or store one or more registers, other than load/store exclusive</td>
</tr>
<tr>
<td></td>
<td>and load-acquire/store-release, do not check that the address being</td>
</tr>
<tr>
<td></td>
<td>accessed is aligned to the size of the data element(s) being accessed.</td>
</tr>
<tr>
<td>0b1</td>
<td>Alignment fault checking enabled when executing at EL3. All instructions</td>
</tr>
<tr>
<td></td>
<td>that load or store one or more registers have an alignment check that</td>
</tr>
<tr>
<td></td>
<td>the address being accessed is aligned to the size of the data element(s)</td>
</tr>
<tr>
<td></td>
<td>being accessed. If this check fails it causes an Alignment fault, which</td>
</tr>
<tr>
<td></td>
<td>is taken as a Data Abort exception.</td>
</tr>
</tbody>
</table>

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL3 stage 1 address translation. Possible values of this bit are:

<table>
<thead>
<tr>
<th>M</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL3 stage 1 address translation disabled. See the SCTLR_EL3.I field</td>
</tr>
<tr>
<td></td>
<td>for the behavior of instruction accesses to Normal memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL3 stage 1 address translation enabled.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL3, this field resets to 0.

Accessing the SCTLR_EL3

Accesses to this register use the following encodings:

**MRS <Xt>, SCTLR_EL3**

```
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  UNDEFINED;
elsif PSTATE.EL == EL2 then
  UNDEFINED;
elsif PSTATE.EL == EL3 then
  return SCTLR_EL3;
```

**MSR SCTLR_EL3, <Xt>**

```
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  UNDEFINED;
elsif PSTATE.EL == EL2 then
  UNDEFINED;
elsif PSTATE.EL == EL3 then
  return SCTLR_EL3;
```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    SCTLR_EL3 = X[t];
The SCXTNUM_EL0 characteristics are:

**Purpose**

Provides a number that can be used to separate out different context numbers with the EL0 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

**Configuration**

This register is present only when ARMv8.0-CSV2 is implemented. Otherwise, direct accesses to SCXTNUM_EL0 are **UNDEFINED**.

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

SCXTNUM_EL0 is a 64-bit register.

**Field descriptions**

The SCXTNUM_EL0 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|

SCXTNUM_EL3, EL3 Read/Write Software Context Number

The SCXTNUM_EL3 characteristics are:

**Purpose**

Provides a number that can be used to separate out different context numbers with the EL3 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

**Configuration**

This register is present only when HaveEL(EL3) and ARMv8.0-CSV2 is implemented. Otherwise, direct accesses to SCXTNUM_EL3 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

SCXTNUM_EL3 is a 64-bit register.

**Field descriptions**

The SCXTNUM_EL3 bit assignments are:

|   | 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

SDER32_EL2, AArch32 Secure Debug Enable Register

The SDER32_EL2 characteristics are:

**Purpose**

Allows access to the AArch32 register SDER from Secure EL2 and EL3 only.

**Configuration**

This register is present only when ARMv8.4-SecEL2 is implemented and EL1 supports AArch32. Otherwise, direct accesses to SDER32_EL2 are **UNDEFINED**.

This register is ignored by the PE when one or more of the following are true:

- The PE is in Non-secure state.
- EL1 is using AArch64.

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

SDER32_EL2 is a 64-bit register.

**Field descriptions**

The SDER32_EL2 bit assignments are:

SDER32_EL3, AArch32 Secure Debug Enable Register

The SDER32_EL3 characteristics are:

**Purpose**

Allows access to the AArch32 register SDER from AArch64 state only. Its value has no effect on execution in AArch64 state.

**Configuration**

AArch64 System register SDER32_EL3 bits [31:0] are architecturally mapped to AArch32 System register SDER[31:0].

This register is present only when HaveEL(EL3) and EL1 supports AArch32. Otherwise, direct accesses to SDER32_EL3 are UNDEFINED.

This register is ignored by the PE when when one or more of the following are true:

- The PE is in Non-secure state.
- EL1 is using AArch64.

RW fields in this register reset to architecturally UNKNOWN values.

SP_EL3, Stack Pointer (EL3)

The SP_EL3 characteristics are:

**Purpose**

Holds the stack pointer associated with EL3. When executing at EL3, the value of SPSel.SP determines the current stack pointer:

<table>
<thead>
<tr>
<th>SPSel.SP</th>
<th>Current stack pointer</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>SP_EL0</td>
</tr>
<tr>
<td>0b1</td>
<td>SP_EL3</td>
</tr>
</tbody>
</table>

**Configuration**

This register is present only when HaveEL(EL3). Otherwise, direct accesses to SP_EL3 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

SP_EL3 is a 64-bit register.

**Field descriptions**

The SP_EL3 bit assignments are:

```
<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Stack pointer</td>
</tr>
<tr>
<td>32</td>
<td>Stack pointer</td>
</tr>
</tbody>
</table>
```

**Bits [63:0]**

Stack pointer.

This field resets to an architecturally UNKNOWN value.

**Accessing the SP_EL3**

This register is not accessible using MRS and MSR instructions.

When the value of SPSel.SP is 1, this register is accessible at EL3 as the current stack pointer.

**Note**

When the value of SPSel.SP is 0, SP_EL0 is used as the current stack pointer at all Exception levels.
SPSel, Stack Pointer Select

The SPSel characteristics are:

**Purpose**

Allows the Stack Pointer to be selected between SP_EL0 and SP_ELx.

**Configuration**

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

SPSel is a 64-bit register.

**Field descriptions**

The SPSel bit assignments are:

| Bit 63 | Bit 62 | Bit 61 | Bit 60 | Bit 59 | Bit 58 | Bit 57 | Bit 56 | Bit 55 | Bit 54 | Bit 53 | Bit 52 | Bit 51 | Bit 50 | Bit 49 | Bit 48 | Bit 47 | Bit 46 | Bit 45 | Bit 44 | Bit 43 | Bit 42 | Bit 41 | Bit 40 | Bit 39 | Bit 38 | Bit 37 | Bit 36 | Bit 35 | Bit 34 | Bit 33 | Bit 32 |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| RES0   | RES0   | SP     |

**Bits [63:1]**

Reserved, RES0.

**SP, bit [0]**

Stack pointer to use. Possible values of this bit are:

<table>
<thead>
<tr>
<th>SP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Use SP_EL0 at all Exception levels.</td>
</tr>
<tr>
<td>0b1</td>
<td>Use SP_ELx for Exception level ELx.</td>
</tr>
</tbody>
</table>

This field resets to 1.

**Accessing the SPSel**

For details on the operation of the MSR (immediate) accessor, see MSR (immediate) in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Accesses to this register use the following encodings:

MRS <Xt>, SPSel

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>
<td>0b0100</td>
<td>0b0010</td>
<td>0b000</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
UNDEFINED;
elsif PSTATE.EL == EL1 then
return Zeros(63):PSTATE.SP;
elsif PSTATE.EL == EL2 then
return Zeros(63):PSTATE.SP;
elsif PSTATE.EL == EL3 then
return Zeros(63):PSTATE.SP;

MSR SPSel, <Xt>

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>

</table>
SPSR_abt, Saved Program Status Register (Abort mode)

The SPSR_abt characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Abort mode.

**Configuration**

AArch64 System register SPSR_abt bits [31:0] are architecturally mapped to AArch32 System register SPSR_abt[31:0].

If EL1 does not support execution in AArch32 state, this register is RES0 from EL2 and EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

SPSR_abt is a 64-bit register.

**Field descriptions**

The SPSR_abt bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

**Bits [63:32]**

Reserved, RES0.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Abort mode, and copied to PSTATE.N on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Abort mode, and copied to PSTATE.Z on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Abort mode, and copied to PSTATE.C on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.
V, bit [28]
Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Abort mode, and copied to PSTATE.V on executing an exception return operation in Abort mode.
This field resets to an architecturally UNKNOWN value.

Q, bit [27]
Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Abort mode, and copied to PSTATE.Q on executing an exception return operation in Abort mode.
This field resets to an architecturally UNKNOWN value.

IT[1:0], bits [26:25]
If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Abort mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Abort mode.
On executing an exception return operation in Abort mode SPSR_abt.IT must contain a value that is valid for the instruction being returned to.
This field resets to an architecturally UNKNOWN value.

J, bit [24]
RES0.
In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state. Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]
When ARMv8.0-SSBS is implemented:
Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Abort mode, and copied to PSTATE.SSBS on executing an exception return operation in Abort mode.
This field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

PAN, bit [22]
When ARMv8.1-PAN is implemented:
Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Abort mode, and copied to PSTATE.PAN on executing an exception return operation in Abort mode.
This field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.
DIT, bit [21]

When ARMv8.4-DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Abort mode, and copied to PSTATE.DIT on executing an exception return operation in Abort mode.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, **RES0**.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Abort mode, and copied to PSTATE.IL on executing an exception return operation in Abort mode.

This field resets to an architecturally **UNKNOWN** value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Abort mode, and copied to PSTATE.GE on executing an exception return operation in Abort mode.

This field resets to an architecturally **UNKNOWN** value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Abort mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in Abort mode.

SPSR_abt.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Abort mode, and copied to PSTATE.E on executing an exception return operation in Abort mode.

If the implementation does not support big-endian operation, SPSR_abt.E is **RES0**. If the implementation does not support little-endian operation, SPSR_abt.E is **RES1**. On executing an exception return operation in Abort mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_abt.E is **RES0**, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_abt.E is **RES1**.

This field resets to an architecturally **UNKNOWN** value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Abort mode, and copied to PSTATE.A on executing an exception return operation in Abort mode.

This field resets to an architecturally **UNKNOWN** value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Abort mode, and copied to PSTATE.I on executing an exception return operation in Abort mode.

This field resets to an architecturally **UNKNOWN** value.
F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Abort mode, and copied to PSTATE.F on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Abort mode, and copied to PSTATE.T on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Abort mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Abort mode.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10000</td>
<td>User.</td>
</tr>
<tr>
<td>0b10001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b10010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b10011</td>
<td>Supervisor.</td>
</tr>
<tr>
<td>0b10111</td>
<td>Abort.</td>
</tr>
<tr>
<td>0b11011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b11111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_abt.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Abort mode is an illegal return event, as described in 'Illegal return events from AArch32 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

**Accessing the SPSR_abt**

Accesses to this register use the following encodings:

**MRS <Xt>, SPSR_abt**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

    SPSR_abt = X[t];
elsif PSTATE.EL == EL3
    SPSR_abt = X[t];
SPSR_EL1, Saved Program Status Register (EL1)

The SPSR_EL1 characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to EL1.

**Configuration**

AArch64 System register SPSR_EL1 bits [31:0] are architecturally mapped to AArch32 System register SPSR_svc[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

SPSR_EL1 is a 64-bit register.

**Field descriptions**

The SPSR_EL1 bit assignments are:

**When exception taken from AArch32 state:**

<table>

</tbody>
</table>

An exception return from EL1 using AArch64 makes SPSR_EL1 become UNKNOWN.

**Bits [63:32]**

Reserved, RES0.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL1, and copied to PSTATE.N on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL1, and copied to PSTATE.Z on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL1, and copied to PSTATE.C on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.
V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL1, and copied to PSTATE.V on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL1, and copied to PSTATE.Q on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to EL1, and copied to PSTATE.IT[1:0] on executing an exception return operation in EL1.

On executing an exception return operation in EL1 SPSR_EL1.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

**DIT, bit [24]**

*When* ARMv8.4-DIT *is implemented:*

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL1, and copied to PSTATE.DIT on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**SSBS, bit [23]**

*When* ARMv8.0-SSBS *is implemented:*

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL1, and copied to PSTATE.SSBS on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**PAN, bit [22]**

*When* ARMv8.1-PAN *is implemented:*

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL1, and copied to PSTATE.PAN on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE.SS on taking an exception to EL1, and conditionally copied to PSTATE.SS on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL1, and copied to PSTATE.IL on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL1, and copied to PSTATE.GE on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to EL1, and copied to PSTATE.IT[7:2] on executing an exception return operation in EL1.

SPSR_EL1.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to EL1, and copied to PSTATE.E on executing an exception return operation in EL1.

If the implementation does not support big-endian operation, SPSR_EL1.E is RES0. If the implementation does not support little-endian operation, SPSR_EL1.E is RES1. On executing an exception return operation in EL1, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_EL1.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_EL1.E is RES1.

This field resets to an architecturally **UNKNOWN** value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL1, and copied to PSTATE.A on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL1, and copied to PSTATE.I on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.
FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL1, and copied to PSTATE.F on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

**T, bit [5]**

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL1, and copied to PSTATE.T on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

**M[4], bit [4]**

Execution state. Set to 0b1, the value of PSTATE.nRW, on taking an exception to EL1 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL1.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>AArch32 execution state.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**M[3:0], bits [3:0]**

AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL1, and copied to PSTATE.M[3:0] on executing an exception return operation in EL1.

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>User.</td>
</tr>
<tr>
<td>0b0001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b0010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Supervisor.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Abort.</td>
</tr>
<tr>
<td>0b1011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b1111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL1 is an illegal return event, as described in ‘Illegal return events from AArch64 state’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally **UNKNOWN** value.

**When exception taken from AArch64 state:**

An exception return from EL1 using AArch64 makes SPSR_EL1 become **UNKNOWN**.

**Bits [63:32]**

Reserved, RES0.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL1, and copied to PSTATE.N on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.
Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL1, and copied to PSTATE.Z on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL1, and copied to PSTATE.C on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL1, and copied to PSTATE.V on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

Bits [27:26]

Reserved, RES0.

TCO, bit [25]

When ARMv8.5-MemTag is implemented:

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL1, and copied to PSTATE.TCO on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [24]

When ARMv8.4-DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL1, and copied to PSTATE.DIT on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UAO, bit [23]

When ARMv8.2-UAO is implemented:

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL1, and copied to PSTATE.UAO on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**PAN, bit [22]**

When ARMv8.1-PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL1, and copied to PSTATE.PAN on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE.SS on taking an exception to EL1, and conditionally copied to PSTATE.SS on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL1, and copied to PSTATE.IL on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

**Bits [19:13]**

Reserved, RES0.

**SSBS, bit [12]**

When ARMv8.0-SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL1, and copied to PSTATE.SSBS on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**BTYPE, bits [11:10]**

When ARMv8.5-BTI is implemented:

Branch Type Indicator. Set to the value of PSTATE.BTYPE on taking an exception to EL1, and copied to PSTATE.BTYPE on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.
D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL1, and copied to PSTATE.D on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL1, and copied to PSTATE.A on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL1, and copied to PSTATE.I on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL1, and copied to PSTATE.F on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

Execution state. Set to 0b0, the value of PSTATE.nRW, on taking an exception to EL1 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL1.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>AArch64 execution state.</td>
</tr>
</tbody>
</table>

If AArch32 is not supported at any Exception level, this bit is RES0.

This field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL0t.</td>
</tr>
<tr>
<td>0b0100</td>
<td>EL1t.</td>
</tr>
<tr>
<td>0b0101</td>
<td>EL1h.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL1 is an illegal return event, as described in 'Illegal return events from AArch64 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on taking an exception to EL1 and copied to PSTATE.EL on executing an exception return operation in EL1.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on taking an exception to EL1 and copied to PSTATE.SP on executing an exception return operation in EL1.
This field resets to an architecturally **UNKNOWN** value.

## Accessing the SPSR_EL1

When **HCR_EL2.E2H** is 1, without explicit synchronization, access from EL3 using the mnemonic SPSR_EL1 or SPSR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

### MRS <Xt>, SPSR_EL1

<table>
<thead>
<tr>

SPSR_EL2, Saved Program Status Register (EL2)

The SPSR_EL2 characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to EL2.

**Configuration**

AArch64 System register SPSR_EL2 bits [31:0] are architecturally mapped to AArch32 System register SPSR_hyp[31:0].

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

SPSR_EL2 is a 64-bit register.

**Field descriptions**

The SPSR_EL2 bit assignments are:

**When exception taken from AArch32 state:**

<table>

</table>

An exception return from EL2 using AArch64 makes SPSR_EL2 become **UNKNOWN**.

**Bits [63:32]**

Reserved, **RES0**.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL2, and copied to PSTATE.N on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL2, and copied to PSTATE.Z on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL2, and copied to PSTATE.C on executing an exception return operation in EL2.
This field resets to an architecturally **UNKNOWN** value.

**V, bit [28]**

Overflow Condition flag. Set to the value of \text{PSTATE.V} on taking an exception to EL2, and copied to \text{PSTATE.V} on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of \text{PSTATE.Q} on taking an exception to EL2, and copied to \text{PSTATE.Q} on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of \text{PSTATE.IT[1:0]} on taking an exception to EL2, and copied to \text{PSTATE.IT[1:0]} on executing an exception return operation in EL2.

On executing an exception return operation in EL2 \text{SPSR_EL2.IT} must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

**DIT, bit [24]**

*When ARMv8.4-DIT is implemented:*

Data Independent Timing. Set to the value of \text{PSTATE.DIT} on taking an exception to EL2, and copied to \text{PSTATE.DIT} on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, \text{RES0}.

**SSBS, bit [23]**

*When ARMv8.0-SSBS is implemented:*

Speculative Store Bypass. Set to the value of \text{PSTATE.SSBS} on taking an exception to EL2, and copied to \text{PSTATE.SSBS} on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, \text{RES0}.

**PAN, bit [22]**

*When ARMv8.1-PAN is implemented:*

Privileged Access Never. Set to the value of \text{PSTATE.PAN} on taking an exception to EL2, and copied to \text{PSTATE.PAN} on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE.SS on taking an exception to EL2, and conditionally copied to PSTATE.SS on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL2, and copied to PSTATE.IL on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL2, and copied to PSTATE.GE on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to EL2, and copied to PSTATE.IT[7:2] on executing an exception return operation in EL2.

SPSR_EL2.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to EL2, and copied to PSTATE.E on executing an exception return operation in EL2.

If the implementation does not support big-endian operation, SPSR_EL2.E is RES0. If the implementation does not support little-endian operation, SPSR_EL2.E is RES1. On executing an exception return operation in EL2, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_EL2.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_EL2.E is RES1.

This field resets to an architecturally **UNKNOWN** value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL2, and copied to PSTATE.A on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL2, and copied to PSTATE.I on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.
**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL2, and copied to PSTATE.F on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

**T, bit [5]**

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL2, and copied to PSTATE.T on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

**M[4], bit [4]**

Execution state. Set to 0b1, the value of PSTATE.nRW, on taking an exception to EL2 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL2.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>AArch32 execution state.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**M[3:0], bits [3:0]**

AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL2, and copied to PSTATE.M[3:0] on executing an exception return operation in EL2.

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>User.</td>
</tr>
<tr>
<td>0b0001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b0010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Supervisor.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Abort.</td>

<tr>
<td>0b1010</td>
<td>Hyp.</td>
</tr>
<tr>
<td>0b1011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b1111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_EL2.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL2 is an illegal return event, as described in ‘Illegal return events from AArch64 state’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally **UNKNOWN** value.

**When exception taken from AArch64 state:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

An exception return from EL2 using AArch64 makes SPSR_EL2 become **UNKNOWN**.

**Bits [63:32]**

Reserved, RES0.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL2, and copied to PSTATE.N on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.
**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL2, and copied to PSTATE.Z on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL2, and copied to PSTATE.C on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL2, and copied to PSTATE.V on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

**Bits [27:26]**

Reserved, RES0.

**TCO, bit [25]**

When ARMv8.5-MemTag is implemented:

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL2, and copied to PSTATE.TCO on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**DIT, bit [24]**

When ARMv8.4-DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL2, and copied to PSTATE.DIT on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**UAO, bit [23]**

When ARMv8.2-UAO is implemented:

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL2, and copied to PSTATE.UAO on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**PAN, bit [22]**  
When ARMv8.1-PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL2, and copied to PSTATE.PAN on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE.SS on taking an exception to EL2, and conditionally copied to PSTATE.SS on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL2, and copied to PSTATE.IL on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

**Bits [19:13]**

Reserved, RES0.

**SSBS, bit [12]**  
When ARMv8.0-SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL2, and copied to PSTATE.SSBS on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**BTYPE, bits [11:10]**  
When ARMv8.5-BTI is implemented:

Branch Type Indicator. Set to the value of PSTATE.BTYPE on taking an exception to EL2, and copied to PSTATE.BTYPE on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.
D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL2, and copied to PSTATE.D on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL2, and copied to PSTATE.A on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL2, and copied to PSTATE.I on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL2, and copied to PSTATE.F on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

Execution state. Set to 0b0, the value of PSTATE.nRW, on taking an exception to EL2 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL2.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>AArch64 execution state.</td>
</tr>
</tbody>
</table>

If AArch32 is not supported at any Exception level, this bit is RES0.

This field resets to an architecturally **UNKNOWN** value.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL0t.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EL0h.</td>
</tr>
<tr>
<td>0b0100</td>
<td>EL1t.</td>
</tr>
<tr>
<td>0b0101</td>
<td>EL1h.</td>
</tr>
<tr>
<td>0b1000</td>
<td>EL2t.</td>
</tr>
<tr>
<td>0b1001</td>
<td>EL2h.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_EL2.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL2 is an illegal return event, as described in 'Illegal return events from AArch64 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on taking an exception to EL2 and copied to PSTATE.EL on executing an exception return operation in EL2.
- M[1] is unused and is 0 for all non-reserved values.
• M[0] is set to the value of PSTATE.SP on taking an exception to EL2 and copied to PSTATE.SP on executing an exception return operation in EL2

This field resets to an architecturally **UNKNOWN** value.

## Accessing the SPSR_EL2

When `HCR_EL2.E2H` is 1, without explicit synchronization, access from EL2 using the mnemonic `SPSR_EL2` or `SPSR_EL1` are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

### MRS <Xt>, SPSR_EL2

```

SPSR_EL3, Saved Program Status Register (EL3)

The SPSR_EL3 characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to EL3.

**Configuration**

AArch64 System register SPSR_EL3 bits [31:0] can be mapped to AArch32 System register SPSR_mon[31:0], but this is not architecturally mandated.

This register is present only when HaveEL(EL3). Otherwise, direct accesses to SPSR_EL3 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

SPSR_EL3 is a 64-bit register.

**Field descriptions**

The SPSR_EL3 bit assignments are:

**When exception taken from AArch32 state:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

An exception return from EL3 using AArch64 makes SPSR_EL1 become UNKNOWN.

**Bits [63:32]**

Reserved, RES0.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL3, and copied to PSTATE.N on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL3, and copied to PSTATE.Z on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL3, and copied to PSTATE.C on executing an exception return operation in EL3.
This field resets to an architecturally **UNKNOWN** value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL3, and copied to PSTATE.V on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL3, and copied to PSTATE.Q on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to EL3, and copied to PSTATE.IT[1:0] on executing an exception return operation in EL3.

On executing an exception return operation in EL3 SPSR_EL1.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

**DIT, bit [24]**

*When ARMv8.4-DIT is implemented:*

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL3, and copied to PSTATE.DIT on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**SSBS, bit [23]**

*When ARMv8.0-SSBS is implemented:*

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL3, and copied to PSTATE.SSBS on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**PAN, bit [22]**

*When ARMv8.1-PAN is implemented:*

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL3, and copied to PSTATE.PAN on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE.SS on taking an exception to EL3, and conditionally copied to PSTATE.SS on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL3, and copied to PSTATE.IL on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL3, and copied to PSTATE.GE on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to EL3, and copied to PSTATE.IT[7:2] on executing an exception return operation in EL3.

SPSR_EL1.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to EL3, and copied to PSTATE.E on executing an exception return operation in EL3.

If the implementation does not support big-endian operation, SPSR_EL1.E is RES0. If the implementation does not support little-endian operation, SPSR_EL1.E is RES1. On executing an exception return operation in EL3, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_EL1.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_EL1.E is RES1.

This field resets to an architecturally **UNKNOWN** value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL3, and copied to PSTATE.A on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL3, and copied to PSTATE.I on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.
F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL3, and copied to PSTATE.F on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL3, and copied to PSTATE.T on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state. Set to 0b1, the value of PSTATE.nRW, on taking an exception to EL3 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL3.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>AArch32 execution state.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL3, and copied to PSTATE.M[3:0] on executing an exception return operation in EL3.

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>User.</td>
</tr>
<tr>
<td>0b0001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b0010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Supervisor.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Monitor.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Abort.</td>
</tr>
<tr>
<td>0b1010</td>
<td>Hyp.</td>
</tr>
<tr>
<td>0b1011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b1111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL3 is an illegal return event, as described in ‘Illegal return events from AArch64 state’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

When exception taken from AArch64 state:

An exception return from EL3 using AArch64 makes SPSR_EL1 become UNKNOWN.

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL3, and copied to PSTATE.N on executing an exception return operation in EL3.
This field resets to an architecturally **UNKNOWN** value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL3, and copied to PSTATE.Z on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL3, and copied to PSTATE.C on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL3, and copied to PSTATE.V on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

**Bits [27:26]**

Reserved, RES0.

**TCO, bit [25]**

*When ARMv8.5-MemTag is implemented:*

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL3, and copied to PSTATE.TCO on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**DIT, bit [24]**

*When ARMv8.4-DIT is implemented:*

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL3, and copied to PSTATE.DIT on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**UAO, bit [23]**

*When ARMv8.2-UAO is implemented:*

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL3, and copied to PSTATE.UAO on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL3, and copied to PSTATE.PAN on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL3, and conditionally copied to PSTATE.SS on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL3, and copied to PSTATE.IL on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

Bits [19:13]

Reserved, RES0.

SSBS, bit [12]

When ARMv8.0-SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL3, and copied to PSTATE.SSBS on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTYPE, bits [11:10]

When ARMv8.5-BTI is implemented:

Branch Type Indicator. Set to the value of PSTATE.BTYPE on taking an exception to EL3, and copied to PSTATE.BTYPE on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL3, and copied to PSTATE.D on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL3, and copied to PSTATE.A on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL3, and copied to PSTATE.I on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL3, and copied to PSTATE.F on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

Execution state. Set to 0b0, the value of PSTATE.nRW, on taking an exception to EL3 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL3.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>AArch64 execution state.</td>
</tr>
</tbody>
</table>

If AArch32 is not supported at any Exception level, this bit is **RES0**.

This field resets to an architecturally **UNKNOWN** value.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL0t</td>
</tr>
<tr>
<td>0b0100</td>
<td>EL1t</td>
</tr>
<tr>
<td>0b1001</td>
<td>EL1h</td>
</tr>
<tr>
<td>0b1000</td>
<td>EL2t</td>
</tr>
<tr>
<td>0b1001</td>
<td>EL2h</td>
</tr>
<tr>
<td>0b1100</td>
<td>EL3t</td>
</tr>
<tr>
<td>0b1101</td>
<td>EL3h</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_EL3.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL3 is an illegal return event, as described in 'Illegal return events from AArch64 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

The bits in this field are interpreted as follows:
• M[3:2] is set to the value of PSTATE.EL on taking an exception to EL3 and copied to PSTATE.EL on executing an exception return operation in EL3.
• M[1] is unused and is 0 for all non-reserved values.
• M[0] is set to the value of PSTATE.SP on taking an exception to EL3 and copied to PSTATE.SP on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

### Accessing the SPSR_EL3

Accesses to this register use the following encodings:

**MRS <Xt>, SPSR_EL3**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>

elsif PSTATE.EL == EL2 then
  UNDEFINED;
elsif PSTATE.EL == EL3 then
  SPSR_EL3 = X[t];
```
SPSR_fiq, Saved Program Status Register (FIQ mode)

The SPSR_fiq characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to FIQ mode.

**Configuration**

AArch64 System register SPSR_fiq bits [31:0] are architecturally mapped to AArch32 System register `SPSR_fiq[31:0]`. If EL1 does not support execution in AArch32 state, this register is Res0 from EL2 and EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

SPSR_fiq is a 64-bit register.

**Field descriptions**

The SPSR_fiq bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, Res0</td>
</tr>
<tr>
<td>31</td>
<td>N, Negative Condition flag</td>
</tr>
<tr>
<td>30</td>
<td>Z, Zero Condition flag</td>
</tr>
<tr>
<td>29</td>
<td>C, Carry Condition flag</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, Res0.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to FIQ mode, and copied to PSTATE.N on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to FIQ mode, and copied to PSTATE.Z on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to FIQ mode, and copied to PSTATE.C on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.
V, bit [28]
Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to FIQ mode, and copied to PSTATE.V on executing an exception return operation in FIQ mode.
This field resets to an architecturally "UNKNOWN" value.

Q, bit [27]
Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to FIQ mode, and copied to PSTATE.Q on executing an exception return operation in FIQ mode.
This field resets to an architecturally "UNKNOWN" value.

IT[1:0], bits [26:25]
If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to FIQ mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in FIQ mode.
On executing an exception return operation in FIQ mode SPSR_fiq.IT must contain a value that is valid for the instruction being returned to.
This field resets to an architecturally "UNKNOWN" value.

J, bit [24]
RES0.
In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state. Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]
When Armv8.0-SSBS is implemented:
Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to FIQ mode, and copied to PSTATE.SSBS on executing an exception return operation in FIQ mode.
This field resets to an architecturally "UNKNOWN" value.

Otherwise:
Reserved, RES0.

PAN, bit [22]
When Armv8.1-PAN is implemented:
Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to FIQ mode, and copied to PSTATE.PAN on executing an exception return operation in FIQ mode.
This field resets to an architecturally "UNKNOWN" value.

Otherwise:
Reserved, RES0.
DIT, bit [21]

When ARMv8.4-DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to FIQ mode, and copied to PSTATE.DIT on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to FIQ mode, and copied to PSTATE.IL on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to FIQ mode, and copied to PSTATE.GE on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to FIQ mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in FIQ mode.

SPSR_fiq.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to FIQ mode, and copied to PSTATE.E on executing an exception return operation in FIQ mode.

If the implementation does not support big-endian operation, SPSR_fiq.E is RES0. If the implementation does not support little-endian operation, SPSR_fiq.E is RES1. On executing an exception return operation in FIQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_fiq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_fiq.E is RES1.

This field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to FIQ mode, and copied to PSTATE.A on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to FIQ mode, and copied to PSTATE.I on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.
F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to FIQ mode, and copied to PSTATE.F on executing an exception return operation in FIQ mode.

This field resets to an architecturally **UNKNOWN** value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to FIQ mode, and copied to PSTATE.T on executing an exception return operation in FIQ mode.

This field resets to an architecturally **UNKNOWN** value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to FIQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in FIQ mode.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10000</td>
<td>User.</td>
</tr>
<tr>
<td>0b10001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b10010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b10011</td>
<td>Supervisor.</td>
</tr>
<tr>
<td>0b10111</td>
<td>Abort.</td>
</tr>
<tr>
<td>0b11011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b11111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_fiq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in FIQ mode is an illegal return event, as described in 'Illegal return events from AArch32 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the SPSR_fiq**

Accesses to this register use the following encodings:

SPSR_irq, Saved Program Status Register (IRQ mode)

The SPSR_irq characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to IRQ mode.

**Configuration**

AArch64 System register SPSR_irq bits [31:0] are architecturally mapped to AArch32 System register SPSR_irq[31:0]. If EL1 does not support execution in AArch32 state, this register is RES0 from EL2 and EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

SPSR_irq is a 64-bit register.

**Field descriptions**

The SPSR_irq bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

**Bits [63:32]**

Reserved, RES0.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to IRQ mode, and copied to PSTATE.N on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to IRQ mode, and copied to PSTATE.Z on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to IRQ mode, and copied to PSTATE.C on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.
V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to IRQ mode, and copied to PSTATE.V on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to IRQ mode, and copied to PSTATE.Q on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

IT[1:0], bits [26:25]

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to IRQ mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in IRQ mode.

On executing an exception return operation in IRQ mode SPSR_irq.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state. Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When ARMv8.0-SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to IRQ mode, and copied to PSTATE.SSBS on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to IRQ mode, and copied to PSTATE.PAN on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
**DIT, bit [21]**

*When ARMv8.4-DIT is implemented:*

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to IRQ mode, and copied to PSTATE.DIT on executing an exception return operation in IRQ mode.

This field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, **RES0**.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to IRQ mode, and copied to PSTATE.IL on executing an exception return operation in IRQ mode.

This field resets to an architecturally **UNKNOWN** value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to IRQ mode, and copied to PSTATE.GE on executing an exception return operation in IRQ mode.

This field resets to an architecturally **UNKNOWN** value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to IRQ mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in IRQ mode.

SPSR_irq.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to IRQ mode, and copied to PSTATE.E on executing an exception return operation in IRQ mode.

If the implementation does not support big-endian operation, SPSR_irq.E is **RES0**. If the implementation does not support little-endian operation, SPSR_irq.E is **RES1**. On executing an exception return operation in IRQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_irq.E is **RES0**, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_irq.E is **RES1**.

This field resets to an architecturally **UNKNOWN** value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to IRQ mode, and copied to PSTATE.A on executing an exception return operation in IRQ mode.

This field resets to an architecturally **UNKNOWN** value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to IRQ mode, and copied to PSTATE.I on executing an exception return operation in IRQ mode.

This field resets to an architecturally **UNKNOWN** value.
**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to IRQ mode, and copied to PSTATE.F on executing an exception return operation in IRQ mode.

This field resets to an architecturally **UNKNOWN** value.

**T, bit [5]**

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to IRQ mode, and copied to PSTATE.T on executing an exception return operation in IRQ mode.

This field resets to an architecturally **UNKNOWN** value.

**M[4:0], bits [4:0]**

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to IRQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in IRQ mode.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10000</td>
<td>User</td>
</tr>
<tr>
<td>0b10001</td>
<td>FIQ</td>
</tr>
<tr>
<td>0b10010</td>
<td>IRQ</td>
</tr>
<tr>
<td>0b10011</td>
<td>Supervisor</td>
</tr>
<tr>

<td>Abort</td>
</tr>
<tr>
<td>0b11011</td>
<td>Undefined</td>
</tr>
<tr>
<td>0b11111</td>
<td>System</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_irq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in IRQ mode is an illegal return event, as described in 'Illegal return events from AArch32 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the SPSR_irq**

Accesses to this register use the following encodings:

**MRS <Xt>, SPSR_irq**

```plaintext
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return SPSR_irq;
elsif PSTATE.EL == EL3 then
    return SPSR_irq;
```

**MSR SPSR_irq, <Xt>**

```plaintext
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return SPSR_irq;
elsif PSTATE.EL == EL3 then
    return SPSR_irq;
```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    SPSR_irq = X[t];
elsif PSTATE.EL == EL3 then
    SPSR_irq = X[t];
SPSR_und, Saved Program Status Register (Undefined mode)

The SPSR_und characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Undefined mode.

**Configuration**

AArch64 System register SPSR_und bits [31:0] are architecturally mapped to AArch32 System register SPSR_und[31:0].

If EL1 does not support execution in AArch32 state, this register is RES0 from EL2 and EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

SPSR_und is a 64-bit register.

**Field descriptions**

The SPSR_und bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| N  | Z  | C  | V  | Q  | IT(1:0) | TSBS | P | AN | DI | IT | IL | GE | IT(7:2) | E | A | I | F | T | M[4:0] |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

**Bits [63:32]**

Reserved, RES0.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Undefined mode, and copied to PSTATE.N on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Undefined mode, and copied to PSTATE.Z on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Undefined mode, and copied to PSTATE.C on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.
V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Undefined mode, and copied to PSTATE.V on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Undefined mode, and copied to PSTATE.Q on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

IT[1:0], bits [26:25]

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Undefined mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Undefined mode.

On executing an exception return operation in Undefined mode SPSR_und.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When ARMv8.0-SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Undefined mode, and copied to PSTATE.SSBS on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Undefined mode, and copied to PSTATE.PAN on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
**DIT, bit [21]**

*When ARMv8.4-DIT is implemented:*

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Undefined mode, and copied to PSTATE.DIT on executing an exception return operation in Undefined mode.

This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Undefined mode, and copied to PSTATE.IL on executing an exception return operation in Undefined mode.

This field resets to an architecturally **UNKNOWN** value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Undefined mode, and copied to PSTATE.GE on executing an exception return operation in Undefined mode.

This field resets to an architecturally **UNKNOWN** value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Undefined mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in Undefined mode.

SPSR_und.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to Undefined mode, and copied to PSTATE.E on executing an exception return operation in Undefined mode.

If the implementation does not support big-endian operation, SPSR_und.E is **RES0**. If the implementation does not support little-endian operation, SPSR_und.E is **RES1**. On executing an exception return operation in Undefined mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_und.E is **RES0**, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_und.E is **RES1**.

This field resets to an architecturally **UNKNOWN** value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Undefined mode, and copied to PSTATE.A on executing an exception return operation in Undefined mode.

This field resets to an architecturally **UNKNOWN** value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Undefined mode, and copied to PSTATE.I on executing an exception return operation in Undefined mode.

This field resets to an architecturally **UNKNOWN** value.
**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Undefined mode, and copied to PSTATE.F on executing an exception return operation in Undefined mode.

This field resets to an architecturally **UNKNOWN** value.

**T, bit [5]**

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Undefined mode, and copied to PSTATE.T on executing an exception return operation in Undefined mode.

This field resets to an architecturally **UNKNOWN** value.

**M[4:0], bits [4:0]**

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Undefined mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Undefined mode.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10000</td>
<td>User.</td>

<tr>
<td>0b10001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b10010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b10011</td>
<td>Supervisor.</td>
</tr>
<tr>
<td>0b10111</td>
<td>Abort.</td>
</tr>
<tr>
<td>0b11011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b11111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_und.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Undefined mode is an illegal return event, as described in 'Illegal return events from AArch32 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the SPSR_und**

Accesses to this register use the following encodings:

**MRS <Xt>, SPSR_und**

```plaintext
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return SPSR_und;
elsif PSTATE.EL == EL3 then
    return SPSR_und;
```

**MSR SPSR_und, <Xt>**

```plaintext
0b11 0b100 0b0100 0b0011 0b010
```
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && HCR_EL2.NV == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    UNDEFINED;
elsif PSTATE.EL == EL2 then
  SPSR_und = X[t];
elsif PSTATE.EL == EL3 then
  SPSR_und = X[t];
SSBS, Speculative Store Bypass Safe

The SSBS characteristics are:

**Purpose**

Allows access to the Speculative Store Bypass Safe bit.

**Configuration**

This register is present only when ARMv8.0-SSBS is implemented. Otherwise, direct accesses to SSBS are **UNDEFINED**.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

SSBS is a 64-bit register.

**Field descriptions**

The SSBS bit assignments are:

![SSBS Field Assignments]

**Bits [63:13]**

Reserved, RES0.

**SSBS, bit [12]**

Speculative Store Bypass Safe.

Prohibits speculative loads or stores which might practically allow a cache timing side channel.

A cache timing side channel might be exploited where a load or store uses an address that is derived from a register that is being loaded from memory using a load instruction speculatively read from a memory location. If PSTATE.SSBS is enabled, the address derived from the load instruction might be from earlier in the coherence order than the latest store to that memory location with the same virtual address.
<table>
<thead>
<tr>
<th>SSBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hardware is not permitted to load or store speculatively, in a manner that could practically give rise to a cache timing side channel, using an address derived from a register value that has been loaded from memory using a load instruction (L) that speculatively reads an entry from earlier in the coherence order from that location being loaded from than the entry generated by the latest store (S) to that location using the same virtual address as L.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hardware is permitted to load or store speculatively, in a manner that could practically give rise to a cache timing side channel, using an address derived from a register value that has been loaded from memory using a load instruction (L) that speculatively reads an entry from earlier in the coherence order from that location being loaded from than the entry generated by the latest store (S) to that location using the same virtual address as L.</td>
</tr>
</tbody>
</table>

The value of this bit is set to the value in the SCTLR_ELx.DSSBS field on taking an exception to ELx.

This field resets to an IMPLEMENTATION DEFINED value.

**Bits [11:0]**

Reserved, RES0.

### Accessing the SSBS

For details on the operation of the MSR (immediate) accessor, see MSR (immediate) in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Accesses to this register use the following encodings:

**MRS <Xt>, SSBS**

<table>
<thead>
<tr>

TCO, Tag Check Override

The TCO characteristics are:

### Purpose

When ARMv8.5-MemTag is implemented, this register allows tag checks to be disabled globally.

### Configuration

This register is present only when ARMv8.5-MemTag is implemented. Otherwise, direct accesses to TCO are UNDEFINED.

### Attributes

TCO is a 64-bit register.

### Field descriptions

### Accessing the TCO

For details on the operation of the MSR (immediate) accessor, see MSR (immediate).

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b011</td>
<td>0b0100</td>
<td>0b0010</td>
<td>0b111</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    return Zeros(38):PSTATE.TCO:Zeros(25);
elsif PSTATE.EL == EL1 then
    return Zeros(38):PSTATE.TCO:Zeros(25);
elsif PSTATE.EL == EL2 then
    return Zeros(38):PSTATE.TCO:Zeros(25);
elsif PSTATE.EL == EL3 then
    return Zeros(38):PSTATE.TCO:Zeros(25);

MSR TCO, <Xt>

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b011</td>
<td>0b0100</td>
<td>0b0010</td>
<td>0b111</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
    PSTATE.TCO = X[t]<25>;
elsif PSTATE.EL == EL1 then
    PSTATE.TCO = X[t]<25>;
elsif PSTATE.EL == EL2 then
    PSTATE.TCO = X[t]<25>;
elsif PSTATE.EL == EL3 then
    PSTATE.TCO = X[t]<25>;

The TCR_EL1 characteristics are:

**Purpose**

The control register for stage 1 of the EL1&0 translation regime.

**Configuration**

AArch64 System register TCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register TTBCR[31:0].

AArch64 System register TCR_EL1 bits [63:32] are architecturally mapped to AArch32 System register TTBCR2[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

TCR_EL1 is a 64-bit register.

**Field descriptions**

The TCR_EL1 bit assignments are:

<tr>
<td>0b1</td>
<td>All accesses at EL1 and EL0 are Unchecked.</td>
</tr>
</tbody>
</table>

**Note**

Software may change this control bit on a context switch.

This field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**TCMA0, bit [57]**

When ARMv8.5-MemTag is implemented:

Controls the generation of Unchecked accesses at EL1, and at EL0 if HCR_EL2.E2H,TGE!=\{1,1\}, when address[59:55]=0b00000.

<table>
<thead>
<tr>
<th>TCMA0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on the generation of Unchecked accesses at EL1 or EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>All accesses at EL1 and EL0 are Unchecked.</td>
</tr>
</tbody>
</table>

**Note**

Software may change this control bit on a context switch.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**E0PD1, bit [56]**

When ARMv8.5-E0PD is implemented:

Faulting control for EL0 access to any address translated by TTBR1_EL1.

<table>
<thead>
<tr>
<th>E0PD1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Unprivileged access to any address translated by TTBR1_EL1 will not generate a fault by this mechanism.</td>
</tr>
<tr>
<td>0b1</td>
<td>Unprivileged access to any address translated by TTBR1_EL1 will generate a level 0 translation fault</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**E0PD0, bit [55]**

When ARMv8.5-E0PD is implemented:

Faulting control for EL0 access to any address translated by TTBR0_EL1.

<table>
<thead>
<tr>
<th>E0PD0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Unprivileged access to any address translated by TTBR0_EL1 will not generate a fault by this mechanism.</td>
</tr>
<tr>
<td>0b1</td>
<td>Unprivileged access to any address translated by TTBR0_EL1 will generate a level 0 translation fault</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
NFD1, bit [54]

When SVE is implemented or TME is implemented:

Non-fault translation table walk disable for stage 1 translations using TTBR1_EL1.

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault access from EL0 for a virtual address that is translated using TTBR1_EL1.

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

See 'The Scalable Vector Extension (SVE)', in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile for more information.

If TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

Defined values are:

<table>
<thead>
<tr>
<th>NFD1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not disable stage 1 translation table walks using TTBR1_EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on a virtual address that is translated using TTBR1_EL1 due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD0, bit [53]

When SVE is implemented or TME is implemented:

Non-fault translation table walk disable for stage 1 translations using TTBR0_EL1.

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault access from EL0 for a virtual address that is translated using TTBR0_EL1.

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

See 'The Scalable Vector Extension (SVE)', in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile for more information.

If TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

Defined values are:
NFD0

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**TBID1, bit [52]**

*When ARMv8.3-PAuth is implemented:*

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging in AArch64 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>TBID1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TCR_EL1.TBI1 applies to Instruction and Data accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>TCR_EL1.TBI1 applies to Data accesses only.</td>
</tr>
</tbody>
</table>

This affects addresses where the address would be translated by tables pointed to by TTBR1_EL1.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**TBID0, bit [51]**

*When ARMv8.3-PAuth is implemented:*

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging in AArch64 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>TBID0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>

Reserved, **RES0**.

**TBI1, bit [38]**

Top Byte ignored - indicates whether the top byte of an address is used for address match for the **TTBR1_EL1** region, or ignored and used for tagged addresses. Defined values are:

<table>
<thead>
<tr>
<th>TBI1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Top Byte used in the address calculation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Top Byte ignored in the address calculation.</td>
</tr>
</tbody>
</table>

This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by **TTBR1_EL1**. It has an effect whether the EL1&0 translation regime is enabled or not.

If ARMv8.3-PAuth is implemented and TCR_EL1.TBID1 is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI1 is 1 and bit [55] of the target address to be stored to the PC is 1, then bits[63:56] of that target address are also set to 1 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

This field resets to an architecturally **UNKNOWN** value.

**TBI0, bit [37]**

Top Byte ignored - indicates whether the top byte of an address is used for address match for the **TTBR0_EL1** region, or ignored and used for tagged addresses. Defined values are:

<table>
<thead>
<tr>
<th>TBI0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Top Byte used in the address calculation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Top Byte ignored in the address calculation.</td>
</tr>
</tbody>
</table>

This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by **TTBR0_EL1**. It has an effect whether the EL1&0 translation regime is enabled or not.

If ARMv8.3-PAuth is implemented and TCR_EL1.TBID0 is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI0 is 1 and bit [55] of the target address to be stored to the PC is 0, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

This field resets to an architecturally **UNKNOWN** value.

**AS, bit [36]**

ASID Size. Defined values are:
### AS

<table>
<thead>
<tr>
<th>AS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>8 bit - the upper 8 bits of TTBR0_EL1 and TTBR1_EL1 are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB.</td>
</tr>
<tr>
<td>0b1</td>
<td>16 bit - the upper 16 bits of TTBR0_EL1 and TTBR1_EL1 are used for allocation and matching in the TLB.</td>
</tr>
</tbody>
</table>

If the implementation has only 8 bits of ASID, this field is RES0.

This field resets to an architecturally UNKNOWN value.

### Bit [35]

Reserved, RES0.

### IPS, bits [34:32]

Intermediate Physical Address Size.

<table>
<thead>
<tr>
<th>IPS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>32 bits, 4GB.</td>
</tr>
<tr>
<td>0b001</td>
<td>36 bits, 64GB.</td>
</tr>
<tr>
<td>0b010</td>
<td>40 bits, 1TB.</td>
</tr>
<tr>
<td>0b011</td>
<td>42 bits, 4TB.</td>
</tr>
<tr>
<td>0b100</td>
<td>44 bits, 16TB.</td>
</tr>
<tr>
<td>0b101</td>
<td>48 bits, 256TB.</td>
</tr>
<tr>
<td>0b110</td>
<td>52 bits, 4PB.</td>
</tr>
</tbody>
</table>

Other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

The value 0b110 is permitted only if ARMv8.2-LPA is implemented and the translation granule size is 64KB.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL1 are 0b0000.

This field resets to an architecturally UNKNOWN value.

### TG1, bits [31:30]

Granule size for the TTBR1 EL1.

<table>
<thead>
<tr>
<th>TG1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>16KB.</td>
</tr>
<tr>
<td>0b10</td>
<td>4KB.</td>
</tr>
<tr>
<td>0b11</td>
<td>64KB.</td>
</tr>
</tbody>
</table>

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

This field resets to an architecturally UNKNOWN value.

### SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using TTBR1_EL1.
Meaning

<table>
<thead>
<tr>
<th>SH1</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in AArch64 System registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

**ORGN1, bits [27:26]**

Outer cacheability attribute for memory associated with translation table walks using TTBR1_EL1.

<table>
<thead>
<tr>
<th>ORGN1</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**IRGN1, bits [25:24]**

Inner cacheability attribute for memory associated with translation table walks using TTBR1_EL1.

<table>
<thead>
<tr>
<th>IRGN1</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**EPD1, bit [23]**

Translation table walk disable for translations using TTBR1_EL1. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR1_EL1. The encoding of this bit is:

<table>
<thead>
<tr>
<th>EPD1</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Perform translation table walks using TTBR1_EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on an address that is translated using TTBR1_EL1 generates a Translation fault. No translation table walk is performed.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**A1, bit [22]**

Selects whether TTBR0_EL1 or TTBR1_EL1 defines the ASID. The encoding of this bit is:

<table>
<thead>
<tr>
<th>A1</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TTBR0_EL1 ASID defines the ASID.</td>
</tr>
<tr>
<td>0b1</td>
<td>TTBR1_EL1 ASID defines the ASID.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.
**T1SZ, bits [21:16]**

The size offset of the memory region addressed by TTBR1_EL1. The region size is $2^{64-T1SZ}$ bytes.

The maximum and minimum possible values for T1SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

This field resets to an architecturally UNKNOWN value.

**TG0, bits [15:14]**

Granule size for the TTBR0_EL1.

<table>
<thead>
<tr>
<th>TG0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>4KB</td>
</tr>
<tr>
<td>0b01</td>
<td>64KB</td>
</tr>
<tr>
<td>0b10</td>
<td>16KB</td>
</tr>
</tbody>
</table>

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

This field resets to an architecturally UNKNOWN value.

**SH0, bits [13:12]**

Shareability attribute for memory associated with translation table walks using TTBR0_EL1.

<table>
<thead>
<tr>
<th>SH0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in ‘Reserved values in AArch64 System registers and translation table entries’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

**ORGN0, bits [11:10]**

Outer cacheability attribute for memory associated with translation table walks using TTBR0_EL1.

<table>
<thead>
<tr>
<th>ORGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**IRGN0, bits [9:8]**

Inner cacheability attribute for memory associated with translation table walks using TTBR0_EL1.
IRGN0 | Meaning
---|---
0b00 | Normal memory, Inner Non-cacheable.
0b01 | Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10 | Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11 | Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to an architecturally **UNKNOWN** value.

**EPD0, bit [7]**

Translation table walk disable for translations using **TTBR0_EL1**. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using **TTBR0_EL1**. The encoding of this bit is:

<table>
<thead>
<tr>
<th>EPD0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Perform translation table walks using <strong>TTBR0_EL1</strong>.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on an address that is translated using <strong>TTBR0_EL1</strong> generates a Translation fault. No translation table walk is performed.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**Bit [6]**

Reserved, **RES0**.

**T0SZ, bits [5:0]**

The size offset of the memory region addressed by **TTBR0_EL1**. The region size is $2^{(64-\text{T0SZ})}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the TCR_EL1**

When **HCR_EL2.E2H** is 1, without explicit synchronization, access from EL3 using the mnemonic **TCR_EL1** or **TCR_EL12** are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

**MRS <Xt>, TCR_EL1**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>

The TCR_EL2 characteristics are:

**Purpose**

The control register for stage 1 of the EL2, or EL2&0, translation regime:

- When the Effective value of HCR_EL2.E2H is 0, this register controls stage 1 of the EL2 translation regime, that supports a single VA range, translated using TTBR0_EL2.
- When the value of HCR_EL2.E2H is 1, this register controls stage 1 of the EL2&0 translation regime, that supports both:
  - A lower VA range, translated using TTBR0_EL2.
  - A higher VA range, translated using TTBR1_EL2.

**Configuration**

AArch64 System register TCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HTC[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

TCR_EL2 is a 64-bit register.

**Field descriptions**

The TCR_EL2 bit assignments are:

**When HCR_EL2.E2H == 0:**

Any of the bits in TCR_EL2, other than the A1 bit and the EPDx bits when they have the value 1, are permitted to be cached in a TLB.

**Bits [63:32]**

Reserved, RES0.

**Bit [31]**

Reserved, RES1.

**TCMA, bit [30]**

*When ARMv8.5-MemTag is implemented:*

Controls the generation of Unchecked accesses at EL2 when address [59:56] = 0b0000.
### TCMA

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>This control has no effect on the generation of Unchecked accesses.</td>
</tr>
<tr>
<td>1</td>
<td>All accesses are Unchecked.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

### TBID, bit [29]

**When ARMv8.3-PAuth is implemented:**

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging in AArch64 state' in the Arm® Architecture Reference Manual, Armv8, for AArch64-A architecture profile.

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>TCR_EL2.TBI applies to Instruction and Data accesses.</td>
</tr>
<tr>
<td>1</td>
<td>TCR_EL2.TBI applies to Data accesses only.</td>
</tr>
</tbody>
</table>

This affects addresses where the address would be translated by tables pointed to by **TTBR0_EL2**.

This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

### HWU62, bit [28]

**When ARMv8.2-TTPHA is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>1</td>
<td>Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.
HWU61, bit [27]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU61</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU60, bit [26]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU60</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU59, bit [25]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU59</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

This field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

HPD, bit [24]

When ARMv8.1-HPD is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0_EL2.

<table>
<thead>
<tr>
<th>HPD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hierarchical permissions enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hierarchical permissions disabled.</td>
</tr>
</tbody>
</table>

Note

In this case bit[61] (APTable[0]) and bit[59] (PXNTable) of the next level descriptor attributes are required to be ignored by the PE, and are no longer reserved, allowing them to be used by software.

When disabled, the permissions are treated as if the bits are zero.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES1.

HD, bit [22]

When ARMv8.1-TTHM is implemented:

Hardware management of dirty state in stage 1 translations from EL2.

<table>
<thead>
<tr>
<th>HD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 1 hardware management of dirty state disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [21]

When ARMv8.1-TTHM is implemented:

Hardware Access flag update in stage 1 translations from EL2.

<table>
<thead>
<tr>
<th>HA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 1 Access flag update disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 1 Access flag update enabled.</td>
</tr>
</tbody>
</table>
This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**TBI, bit [20]**

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the **TTBR0_EL2** region, or ignored and used for tagged addresses.

For more information, see 'Address tagging in AArch64 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>TBI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Top Byte used in the address calculation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Top Byte ignored in the address calculation.</td>
</tr>
</tbody>
</table>

This affects addresses generated in EL2 using AArch64 where the address would be translated by tables pointed to by **TTBR0_EL2**. It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If ARMv8.3-PAuth is implemented and TCR_EL2.TBID is 1, then this field only applies to Data accesses.

If the value of TBI is 1, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL2.
- An exception taken to EL2.
- An exception return to EL2.

This field resets to an architecturally **UNKNOWN** value.

**Bit [19]**

Reserved, **RES0**.

**PS, bits [18:16]**

Physical Address Size.

<table>
<thead>
<tr>
<th>PS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>32 bits, 4GB.</td>
</tr>
<tr>
<td>0b001</td>
<td>36 bits, 64GB.</td>
</tr>
<tr>
<td>0b010</td>
<td>40 bits, 1TB.</td>
</tr>
<tr>
<td>0b011</td>
<td>42 bits, 4TB.</td>
</tr>
<tr>
<td>0b100</td>
<td>44 bits, 16TB.</td>
</tr>
<tr>
<td>0b101</td>
<td>48 bits, 256TB.</td>
</tr>
<tr>
<td>0b110</td>
<td>52 bits, 4PB.</td>
</tr>
</tbody>
</table>

Other values are reserved.

The reserved values behave in the same way as the **0b101** or **0b110** encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

The value **0b110** is permitted only if ARMv8.2-LPA is implemented and the translation granule size is 64KB.

In an implementation that supports 52-bit PAs, if the value of this field is not **0b110** or a value treated as **0b110**, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL2 are **0b0000**.

This field resets to an architecturally **UNKNOWN** value.

**TG0, bits [15:14]**

Granule size for the **TTBR0_EL2**.
### TCR_EL2, Translation Control Register (EL2)

<table>
<thead>
<tr>
<th>TG0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>4KB.</td>
</tr>
<tr>
<td>0b01</td>
<td>64KB.</td>
</tr>
<tr>
<td>0b10</td>
<td>16KB.</td>
</tr>
</tbody>
</table>

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

This field resets to an architecturally **UNKNOWN** value.

**SH0, bits [13:12]**

Shareability attribute for memory associated with translation table walks using **TTBR0_EL2**.

<table>
<thead>
<tr>
<th>SH0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONstrained UNPredictable, as described in 'Reserved values in AArch64 System registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally **UNKNOWN** value.

**ORGN0, bits [11:10]**

Outer cacheability attribute for memory associated with translation table walks using **TTBR0_EL2**.

<table>
<thead>
<tr>
<th>ORGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**IRGN0, bits [9:8]**

Inner cacheability attribute for memory associated with translation table walks using **TTBR0_EL2**.

<table>
<thead>
<tr>
<th>IRGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**Bits [7:6]**

Reserved, **RES0**.
**T0SZ, bits [5:0]**

The size offset of the memory region addressed by $TTBR0_{EL2}$. The region size is $2^{64-T0SZ}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

This field resets to an architecturally **UNKNOWN** value.

**When ARMv8.1-VHE is implemented and HCR_EL2.E2H == 1:**

Any of the bits in TCR_EL2 are permitted to be cached in a TLB.

**Bits [63:59]**

Reserved, RES0.

**TCMA1, bit [58]**

When ARMv8.5-MemTag is implemented:

Controls the generation of Unchecked accesses at EL2, and at EL0 if HCR_EL2.TGE=1, when address[59:55] = 0b111111.

<table>
<thead>
<tr>
<th>TCMA1</th>
<th>Meaning</th>

<tr>
<td>0b1</td>
<td>All accesses are Unchecked.</td>
</tr>
</tbody>
</table>

**Note**

Software may change this control bit on a context switch.

This field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**E0PD1, bit [56]**

When ARMv8.5-E0PD is implemented:

Faulting control for EL0 access to any address translated by TTBR1_EL2.

<table>
<thead>
<tr>
<th>E0PD1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Unprivileged access to any address translated by TTBR1_EL2 will not generate a fault by this mechanism.</td>
</tr>
<tr>
<td>0b1</td>
<td>Unprivileged access to any address translated by TTBR1_EL2 will generate a level 0 translation fault</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**E0PD0, bit [55]**

When ARMv8.5-E0PD is implemented:

Faulting control for EL0 access to any address translated by TTBR0_EL2.

<table>
<thead>
<tr>
<th>E0PD0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Unprivileged access to any address translated by TTBR0_EL2 will not generate a fault by this mechanism.</td>
</tr>
<tr>
<td>0b1</td>
<td>Unprivileged access to any address translated by TTBR0_EL2 will generate a level 0 translation fault</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**NFD1, bit [54]**

When SVE is implemented or TME is implemented:

Non-fault translation table walk disable for stage 1 translations using TTBR1_EL2.

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault access from EL0 for a virtual address that is translated using TTBR1_EL2.

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

See 'The Scalable Vector Extension (SVE)', in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile for more information.

If TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

Defined values are:
### NFD1

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

### NFD0, bit [53]

**When SVE is implemented or TME is implemented:**

Non-fault translation table walk disable for stage 1 translations using TTBR0_EL2.

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault access from EL0 for a virtual address that is translated using TTBR0_EL2.

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

If TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

Defined values are:

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

### TBID1, bit [52]

**When ARMv8.3-PAuth is implemented:**

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see ‘Address tagging in AArch64 state’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
<table>
<thead>
<tr>
<th>TBID1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TCR_EL2.TBI1 applies to Instruction and Data accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>TCR_EL2.TBI1 applies to Data accesses only.</td>
</tr>
</tbody>
</table>

This affects addresses where the address would be translated by tables pointed to by TTBR1_EL2.

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TBID0, bit [51]**

*When ARMv8.3-PAuth is implemented:*

Controls the use of the top byte of instruction addresses for address matching.

For more information, see 'Address tagging in AArch64 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>TBID0</th>
<th>Meaning</th>

</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TCR_EL2.TBI0 applies to Instruction and Data accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>TCR_EL2.TBI0 applies to Data accesses only.</td>
</tr>
</tbody>
</table>

This affects addresses where the address would be translated by tables pointed to by TTBR0_EL2.

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU162, bit [50]**

*When ARMv8.2-TTPBHA is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL2.

<table>
<thead>
<tr>
<th>HWU162</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For translations using TTBR1_EL2, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>For translations using TTBR1_EL2, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU161, bit [49]**

*When ARMv8.2-TTPBHA is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL2.
| HWU161 Meaning | 0b0 | For translations using TTBR1_EL2, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| | 0b1 | For translations using TTBR1_EL2, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1. |

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HWU160, bit [48]**

*When ARMv8.2-TTPBHA is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL2.

| HWU160 Meaning | 0b0 | For translations using TTBR1_EL2, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| | 0b1 | For translations using TTBR1_EL2, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1. |

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HWU159, bit [47]**

*When ARMv8.2-TTPBHA is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL2.

| HWU159 Meaning | 0b0 | For translations using TTBR1_EL2, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| | 0b1 | For translations using TTBR1_EL2, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1. |

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
HWU062, bit [46]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

<table>
<thead>
<tr>
<th>HWU062</th>
<th>Meaning</th>

<td>Hierarchical permissions are disabled.</td>
</tr>
</tbody>
</table>

When disabled, the permissions are treated as if the bits are zero.

This field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**HD, bit [40]**

*When ARMv8.1-TTHM is implemented:*

Hardware management of dirty state in stage 1 translations from EL2.

<table>
<thead>
<tr>
<th>HD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 1 hardware management of dirty state disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**HA, bit [39]**

*When ARMv8.1-TTHM is implemented:*

Hardware Access flag update in stage 1 translations from EL2.

<table>
<thead>
<tr>
<th>HA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 1 Access flag update disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 1 Access flag update enabled.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**TBI1, bit [38]**

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the TTBR1_EL2 region, or ignored and used for tagged addresses.

For more information, see 'Address tagging in AArch64 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>TBI1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Top Byte used in the address calculation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Top Byte ignored in the address calculation.</td>
</tr>
</tbody>
</table>

This affects addresses generated in EL0 and EL2 using AArch64 where the address would be translated by tables pointed to by TTBR1_EL2. It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If ARMv8.3-PAuth is implemented and TCR_EL2.TBID1 is 1, then this field only applies to Data accesses.

If the value of TBI1 is 1 and bit [55] of the target address to be stored to the PC is 1, then bits[63:56] of that target address are also set to 1 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

This field resets to an architecturally **UNKNOWN** value.
**TBI0, bit [37]**

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the TTBR0_EL2 region, or ignored and used for tagged addresses.

For more information, see 'Address tagging in AArch64 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>TBI0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Top Byte used in the address calculation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Top Byte ignored in the address calculation.</td>
</tr>
</tbody>
</table>

This affects addresses generated in EL0 and EL2 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL2. It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If ARMv8.3-PAuth is implemented and TCR_EL2.TBID0 is 1, then this field only applies to Data accesses.

If the value of TBI0 is 1 and bit [55] of the target address to be stored to the PC is 0, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

This field resets to an architecturally **UNKNOWN** value.

**AS, bit [36]**

ASID Size. Defined values are:

<table>
<thead>
<tr>
<th>AS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>8 bit - the upper 8 bits of TTBR0_EL2 and TTBR1_EL2 are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB.</td>
</tr>
<tr>
<td>0b1</td>
<td>16 bit - the upper 16 bits of TTBR0_EL2 and TTBR1_EL2 are used for allocation and matching in the TLB.</td>
</tr>
</tbody>
</table>

If the implementation has only 8 bits of ASID, this field is **RES0**.

This field resets to an architecturally **UNKNOWN** value.

**Bit [35]**

Reserved, **RES0**.

**IPS, bits [34:32]**

Intermediate Physical Address Size.

<table>
<thead>
<tr>
<th>IPS</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>32 bits, 4GB.</td>
<td></td>
</tr>
<tr>
<td>0b001</td>
<td>36 bits, 64GB.</td>
<td></td>
</tr>
<tr>
<td>0b010</td>
<td>40 bits, 1TB.</td>
<td></td>
</tr>
<tr>
<td>0b011</td>
<td>42 bits, 4TB.</td>
<td></td>
</tr>
<tr>
<td>0b100</td>
<td>44 bits, 16TB.</td>
<td></td>
</tr>
<tr>
<td>0b101</td>
<td>48 bits, 256TB.</td>
<td></td>
</tr>
<tr>
<td>0b110</td>
<td>52 bits, 4PB.</td>
<td>When ARMv8.2-LPA is implemented</td>
</tr>
</tbody>
</table>

Other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

The value 0b110 is permitted only if ARMv8.2-LPA is implemented and the translation granule size is 64KB.
In an implementation that supports 52-bit PAs, if the value of this field is not \(0b110\) or a value treated as \(0b110\), then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL2 are \(0b0000\).

This field resets to an architecturally **UNKNOWN** value.

**TG1, bits [31:30]**

Granule size for the TTBR1_EL2.

<table>
<thead>
<tr>
<th>TG1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>16KB.</td>
</tr>
<tr>
<td>0b10</td>
<td>4KB.</td>

<tr>
<td>0b11</td>
<td>64KB.</td>
</tr>
</tbody>
</table>

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

This field resets to an architecturally **UNKNOWN** value.

**SH1, bits [29:28]**

Shareability attribute for memory associated with translation table walks using TTBR1_EL2. Defined values are:

<table>
<thead>
<tr>
<th>SH1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in AArch64 System registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally **UNKNOWN** value.

**ORGN1, bits [27:26]**

Outer cacheability attribute for memory associated with translation table walks using TTBR1_EL2.

<table>
<thead>
<tr>
<th>ORGN1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**IRGN1, bits [25:24]**

Inner cacheability attribute for memory associated with translation table walks using TTBR1_EL2.
### IRGN1

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

### EPD1, bit [23]

Translation table walk disable for translations using `TTBR1_EL2`. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using `TTBR1_EL2`. The encoding of this bit is:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Perform translation table walks using <code>TTBR1_EL2</code>.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on an address that is translated using <code>TTBR1_EL2</code> generates a Translation fault. No translation table walk is performed.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

### A1, bit [22]

Selects whether `TTBR0_EL2` or `TTBR1_EL2` defines the ASID. The encoding of this bit is:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><code>TTBR0_EL2</code>.ASID defines the ASID.</td>
</tr>
<tr>
<td>0b1</td>
<td><code>TTBR1_EL2</code>.ASID defines the ASID.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

### T1SZ, bits [21:16]

The size offset of the memory region addressed by `TTBR1_EL2`. The region size is $2^{(64-T1SZ)}$ bytes.

The maximum and minimum possible values for T1SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

This field resets to an architecturally **UNKNOWN** value.

### TG0, bits [15:14]

Granule size for the `TTBR0_EL2`.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>4KB.</td>
</tr>
<tr>
<td>0b01</td>
<td>64KB.</td>
</tr>
<tr>
<td>0b10</td>
<td>16KB.</td>
</tr>
</tbody>
</table>

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an **IMPLEMENTATION DEFINED** choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is **IMPLEMENTATION DEFINED** whether the value read back is the value programmed or the value that corresponds to the size chosen.

This field resets to an architecturally **UNKNOWN** value.
SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using TTBR0_EL2.

<table>
<thead>
<tr>
<th>SH0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in AArch64 System registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using TTBR0_EL2.

<table>
<thead>
<tr>
<th>ORGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Read-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using TTBR0_EL2.

<table>
<thead>
<tr>
<th>IRGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Inner Write-Back Read-Allocate Read-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

EPD0, bit [7]

Translation table walk disable for translations using TTBR0_EL2. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR0_EL2. The encoding of this bit is:

<table>
<thead>
<tr>
<th>EPD0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Perform translation table walks using TTBR0_EL2</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on an address that is translated using TTBR0_EL2 generates a Translation fault. No translation table walk is performed.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.
T0SZ, bits [5:0]

The size offset of the memory region addressed by TTBR0_EL2. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

This field resets to an architecturally UNKNOWN value.

**Accessing the TCR_EL2**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic TCR_EL2 or TCR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, TCR_EL2

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>

TCR_EL3, Translated Control Register (EL3)

The TCR_EL3 characteristics are:

**Purpose**

The control register for stage 1 of the EL3 translation regime.

**Configuration**

This register is present only when HaveEL(EL3). Otherwise, direct accesses to TCR_EL3 are **UNDEFINED**.

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

TCR_EL3 is a 64-bit register.

**Field descriptions**

The TCR_EL3 bit assignments are:

<table>

Any of the bits in TCR_EL3 are permitted to be cached in a TLB.

**Bits [63:32]**

Reserved, RES0.

**Bit [31]**

Reserved, RES1.

**TCMA, bit [30]**

When ARMv8.5-MemTag is implemented:

Controls the generation of Unchecked accesses at EL3 when address [59:56] = 0b0000.

<table>
<thead>
<tr>
<th>TCMA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on the generation of Unchecked accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>All accesses are Unchecked.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.
TBID, bit [29]

When ARMv8.3-PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

<table>
<thead>
<tr>
<th>TBID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TCR_EL3.TBI applies to Instruction and Data accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>TCR_EL3.TBI applies to Data accesses only.</td>
</tr>
</tbody>
</table>

This affects addresses where the address would be translated by tables pointed to by TTBR0_EL3.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU62, bit [28]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU62</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU61, bit [27]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU61</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

This field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**HWU60, bit [26]**

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU60</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HWU59, bit [25]**

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU59</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HPD, bit [24]**

When ARMv8.1-HPD is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0_EL3.
<table>
<thead>
<tr>
<th>HPD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hierarchical permissions are enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hierarchical permissions are disabled.</td>
</tr>
</tbody>
</table>

**Note**

In this case bit[61] (APTable[0]) and bit[59] (PXNTable) of the next level descriptor attributes are required to be ignored by the PE, and are no longer reserved, allowing them to be used by software.

When disabled, the permissions are treated as if the bits are zero.

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bit [23]**

Reserved, RES1.

**HD, bit [22]**

When ARMv8.1-TTHM is implemented:

Hardware management of dirty state in stage 1 translations from EL3.

<table>
<thead>
<tr>
<th>HD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 1 hardware management of dirty state disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HA, bit [21]**

When ARMv8.1-TTHM is implemented:

Hardware Access flag update in stage 1 translations from EL3.

<table>
<thead>
<tr>
<th>HA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 1 Access flag update disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 1 Access flag update enabled.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TBI, bit [20]**

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the TTBR0_EL3 region, or ignored and used for tagged addresses.
TBI

<table>
<thead>
<tr>
<th>TBI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Top Byte used in the address calculation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Top Byte ignored in the address calculation.</td>
</tr>
</tbody>
</table>

This affects addresses generated in EL3 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL3. It has an effect whether the EL3 translation regime is enabled or not.

If ARMv8.3-PAuth is implemented and TCR_EL3.TBID is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI is 1, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL3.
- A exception taken to EL3.
- An exception return to EL3.

For more information, see 'Address tagging in AArch64 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Note**

This control determines the scope of address tagging. It never causes an exception to be generated.

This field resets to an architecturally **UNKNOWN** value.

**Bit [19]**

Reserved, RES0.

**PS, bits [18:16]**

Physical Address Size.

<table>
<thead>
<tr>
<th>PS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>32 bits, 4GB.</td>
</tr>
<tr>
<td>0b01</td>
<td>36 bits, 64GB.</td>
</tr>
<tr>
<td>0b10</td>
<td>40 bits, 1TB.</td>
</tr>
<tr>
<td>0b11</td>
<td>42 bits, 4TB.</td>
</tr>
<tr>
<td>0b10</td>
<td>44 bits, 16TB.</td>
</tr>
<tr>
<td>0b10</td>
<td>48 bits, 256TB.</td>
</tr>
<tr>
<td>0b11</td>
<td>52 bits, 4PB.</td>
</tr>
</tbody>
</table>

Other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

The value 0b110 is permitted only if ARMv8.2-LPA is implemented and the translation granule size is 64KB.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL3 are 0b0000.

This field resets to an architecturally **UNKNOWN** value.

**TG0, bits [15:14]**

Granule size for the TTBR0_EL3.

<table>
<thead>
<tr>
<th>TG0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>4KB.</td>
</tr>
<tr>
<td>0b01</td>
<td>64KB.</td>
</tr>
<tr>
<td>0b10</td>
<td>16KB.</td>
</tr>
</tbody>
</table>

Other values are reserved.
If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

This field resets to an architecturally UNKNOWN value.

**SH0, bits [13:12]**

Shareability attribute for memory associated with translation table walks using TTBR0_EL3.

<table>
<thead>
<tr>
<th>SH0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in AArch64 System registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section K1.2.2.

This field resets to an architecturally UNKNOWN value.

**ORGN0, bits [11:10]**

Outer cacheability attribute for memory associated with translation table walks using TTBR0_EL3.

<table>
<thead>
<tr>
<th>ORGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**IRGN0, bits [9:8]**

Inner cacheability attribute for memory associated with translation table walks using TTBR0_EL3.

<table>
<thead>
<tr>
<th>IRGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**Bits [7:6]**

Reserved, RES0.

**T0SZ, bits [5:0]**

The size offset of the memory region addressed by TTBR0_EL3. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.
This field resets to an architecturally **UNKNOWN** value.

TFSR_EL1, Tag Fail Status Register (EL1)

The TFSR_EL1 characteristics are:

**Purpose**

Holds accumulated Tag Check Fails occurring in EL1 which are not taken precisely.

**Configuration**

This register is present only when ARMv8.5-MemTag is implemented and ID_AA64PFR1_EL1.MTE != 0b0001. Otherwise, direct accesses to TFSR_EL1 are **UNDEFINED**. RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

TFSR_EL1 is a 64-bit register.

**Field descriptions**

The TFSR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-2</td>
<td>Reserved, RES0</td>
</tr>
<tr>

TFSRE0_EL1, Tag Fail Status Register (EL0).

The TFSRE0_EL1 characteristics are:

**Purpose**

Holds accumulated Tag Check Fails occurring in EL0 which are not taken precisely.

**Configuration**

This register is present only when ARMv8.5-MemTag is implemented and ID_AA64PFR1_EL1.MTE != 0b0001. Otherwise, direct accesses to TFSRE0_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

TFSRE0_EL1 is a 64-bit register.

**Field descriptions**

The TFSRE0_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:2]</th>
<th>RES0</th>
<th>RES0</th>
<th>TF1</th>
<th>TF0</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17</td>
<td>16 15 14 13 12 11 10 9 8 7 6 5 4 3 2</td>
<td>1 0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:2]**

Reserved, RES0.

**TF1, bit [1]**

Tag Check Fail. Asynchronously set to 1 when a Tag Check fail using a virtual address with bit<55>==0b1 occurs. This field resets to an architecturally UNKNOWN value.

**TF0, bit [0]**

Tag Check Fail. Asynchronously set to 1 when a Tag Check fail using a virtual address with bit<55>==0b0 occurs. This field resets to an architecturally UNKNOWN value.

TLBI ALLE1, TLB Invalidate All, EL1

The TLBI ALLE1 characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If SCR_EL3.NS is 0 and the entry would be required to translate an address using the Secure EL1&0 translation regime.
- If SCR_EL3.NS is 1 and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.

The invalidation applies to entries with any VMID.

The invalidation only applies to the PE that executes this System instruction.

**Note**

For the EL1&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

**Configuration**

**Attributes**

TLBI ALLE1 is a 64-bit System instruction.

**Field descriptions**

TLBI ALLE1 ignores the value in the register specified by the instruction encoding. Software does not have to write a value to the register before issuing this instruction.

**Executing the TLBI ALLE1 instruction**

Accesses to this instruction use the following encodings:

TLBI ALLE1{, <Xt>}

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>

TLBI ALLE1OS, TLB Invalidate All, EL1, Outer Shareable

The TLBI ALLE1OS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If `SCR_EL3.NS` is 0 and the entry would be required to translate an address using the Secure EL1&0 translation regime.
- If `SCR_EL3.NS` is 1 and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.

The invalidation applies to entries with any VMID.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Note**

For the EL1&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI ALLE1OS are UNDEFINED.

**Attributes**

TLBI ALLE1OS is a 64-bit System instruction.

**Field descriptions**

TLBI ALLE1OS ignores the value in the register specified by the instruction encoding. Software does not have to write a value to the register before issuing this instruction.

**Executing the TLBI ALLE1OS instruction**

Accesses to this instruction use the following encodings:

TLBI ALLE10S{, <Xt>}

TLBI ASIDE1, TLB Invalidate by ASID, EL1

The TLBI ASIDE1 characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate an address using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate an address using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate an address using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

**Configuration**

**Attributes**

TLBI ASIDE1 is a 64-bit System instruction.

**Field descriptions**

The TLBI ASIDE1 input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

elsif PSTATE.EL == EL3 then
  TLBI_ASIDE1IS(X[t]);

The TLBI ASIDE1OS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID, and would be required to translate an address using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate an address using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate an address using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI ASIDE1OS are **UNDEFINED**.

**Attributes**

TLBI ASIDE1OS is a 64-bit System instruction.

**Field descriptions**

  TLBI ASIDE1OS(X[t]);
endif
The TLBI IPAS2E1 characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - `SCR_EL3.NS==1` and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - `SCR_EL3.NS==0` and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction see 'Invalidation of TLB entries from stage 2 translations' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

**Attributes**

TLBI IPAS2E1 is a 64-bit System instruction.

**NS, bit [63]**

When ARMv8.4-SecEL2 is implemented:

Not Secure. Specifies the IPA space.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IPA is in the Secure IPA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>IPA is in the Non-secure IPA space.</td>
</tr>
</tbody>
</table>

When the instruction is executed in Non-secure state, this field is `RES0`, and the instruction applies only to the Non-secure IPA space.

When ARMv8.4-SecEL2 is not implemented or is disabled in the current Security state, this field is `RES0`. 
Otherwise:

Reserved, RES0.

**Bits [62:48]**

Reserved, RES0.

**TTL, bits [47:44]**

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

**Bits [43:40]**

Reserved, RES0.

**IPA[51:48], bits [39:36]**

When ARMv8.2-LPA is implemented:

Extension to IPA[47:12]. See IPA[47:12] for more details.

Otherwise:

Reserved, RES0.
IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits
of this field are RES0.

When ARMv8.2-LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form
the upper part of the address value. Otherwise, IPA[51:48] are RES0.

Executing the TLBI IPAS2E1 instruction

Accesses to this instruction use the following encodings:

TLBI IPAS2E1{, <Xt>}

<table>

**Executing the TLBI IPAS2E1OS instruction**

Accesses to this instruction use the following encodings:
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    TLBI_IPAS2E1OS(X[t]);
elsif PSTATE.EL == EL3 then
    if !EL2Enabled() then
        //no operation
    else
        TLBI_IPAS2E1OS(X[t]);

The TLBI IPAS2LE1 characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- One of the following applies:
  - $\text{SCR}_{EL3}.\text{NS}==1$ and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - $\text{SCR}_{EL3}.\text{NS}==0$ and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction see 'Invalidation of TLB entries from stage 2 translations' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

**Attributes**

TLBI IPAS2LE1 is a 64-bit System instruction.

**Field descriptions**

The TLBI IPAS2LE1 input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| NS | RES0 | TTL | RES0 | IPA[51:48] | IPA[47:12] |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**NS, bit [63]**

When ARMv8.4-SecEL2 is implemented:

Not Secure. Specifies the IPA space.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IPA is in the Secure IPA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>IPA is in the Non-secure IPA space.</td>
</tr>
</tbody>
</table>

When the instruction is executed in Non-secure state, this field is $\text{RES}0$, and the instruction applies only to the Non-secure IPA space.

When ARMv8.4-SecEL2 is not implemented or is disabled in the current Security state, this field is $\text{RES}0$. 
Otherwise:

Reserved, RES0.

**Bits [62:48]**

Reserved, RES0.

**TTL, bits [47:44]**

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

**Bits [43:40]**

Reserved, RES0.

**IPA[51:48], bits [39:36]**

When ARMv8.2-LPA is implemented:

Extension to IPA[47:12]. See IPA[47:12] for more details.

Otherwise:

Reserved, RES0.
IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When ARMv8.2-LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

Executing the TLBI IPAS2LE1 instruction

Accesses to this instruction use the following encodings:

\[
\text{TLBI IPAS2LE1\{, \langle \langle t \rangle \rangle \}}
\]

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>0b100</td>
<td>0b1000</td>
<td>0b0100</td>
<td>0b101</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && HCR_EL2.NV == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    UNDEFINED;
elsif PSTATE.EL == EL2 then
  TLBI_IPAS2LE1(X[t]);
elsif PSTATE.EL == EL3 then
  if !EL2Enabled() then
    //no operation
  else
    TLBI_IPAS2LE1(X[t]);
The TLBI IPAS2LE1IS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- One of the following applies:
  - SCR_EL3.NS==1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.NS==0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction see 'Invalidation of TLB entries from stage 2 translations' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

TLBI RIPAS2E1, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1

The TLBI RIPAS2E1 characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - \( \text{SCR}_{EL3}.\text{NS} == 1 \) and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - \( \text{SCR}_{EL3}.\text{NS} == 0 \) and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula \( \text{BaseADDR} < \text{VA} < \text{BaseADDR} + ((\text{NUM} +1) \times 2^{(5 \times \text{SCALE} +1) \times \text{Translation_Granule Size}}). \)

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If \( \text{TTL}==01 \) and \( \text{BaseADDR}[29:12] \) is not equal to 00000000000000000000000000.
  - If \( \text{TTL}==10 \) and \( \text{BaseADDR}[20:12] \) is not equal to 000000000.
- For the 16K translation granule:
  - If \( \text{TTL}==10 \) and \( \text{BaseADDR}[24:14] \) is not equal to 00000000000.
- For the 64K translation granule:
  - If \( \text{TTL}==01 \) and \( \text{BaseADDR}[41:16] \) is not equal to 000000000000000000000000000000.
  - If \( \text{TTL}==10 \) and \( \text{BaseADDR}[28:16] \) is not equal to 0000000000000.

For more information about the architectural requirements for this System instruction see 'Invalidation of TLB entries from stage 2 translations' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RIPAS2E1 are **UNDEFINED**.

**Attributes**

TLBI RIPAS2E1 is a 64-bit System instruction.
Field descriptions

The TLBI RIPAS2E1 input value bit assignments are:

<table>
<thead>
<tr>
<th>NS</th>
<th>RES0</th>
<th>TG</th>
<th>SCALE</th>
<th>NUM</th>
<th>TTL</th>
<th>BaseADDR</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>30</td>
<td>29</td>
<td>28</td>
<td>27</td>
<td>26</td>
<td>25</td>
</tr>
<tr>
<td>24</td>
<td>23</td>
<td>22</td>
<td>21</td>
<td>20</td>
<td>19</td>
<td>18</td>
</tr>
<tr>
<td>17</td>
<td>16</td>
<td>15</td>
<td>14</td>
<td>13</td>
<td>12</td>
<td>11</td>
</tr>
<tr>
<td>10</td>
<td>9</td>
<td>8</td>
<td>7</td>
<td>6</td>
<td>5</td>
<td>4</td>
</tr>
<tr>
<td>3</td>
<td>2</td>
<td>1</td>
<td>0</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

NS, bit [63]

When ARMv8.4-SecEL2 is implemented:

Not Secure. Specifies the IPA space.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0 IPA is in the Secure IPA space.</td>
<td></td>
</tr>
<tr>
<td>0b1 IPA is in the Non-secure IPA space.</td>
<td></td>
</tr>
</tbody>
</table>

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When ARMv8.4-SecEL2 is not implemented or is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00 Reserved.</td>
<td></td>
</tr>
<tr>
<td>0b01 4K translation granule.</td>
<td></td>
</tr>
<tr>
<td>0b10 16K translation granule.</td>
<td></td>
</tr>
<tr>
<td>0b11 64K translation granule.</td>
<td></td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.
<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation table entries.</td>
</tr>
<tr>
<td>0b01</td>
<td>When using a 4KB or 64KB translation granule, all entries to invalidate are Level 1 translation table entries. When using a 16KB translation granule, this value is reserved. Hardware should treat this field as 0b00.</td>
</tr>
<tr>
<td>0b10</td>
<td>All entries to invalidate are Level 2 translation table entries.</td>
</tr>
<tr>
<td>0b11</td>
<td>All entries to invalidate are Level 3 translation table entries.</td>
</tr>
</tbody>
</table>

**BaseADDR, bits [36:0]**

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

### Executing the TLBI RIPAS2E1 instruction

Accesses to this instruction use the following encodings:

TLBI RIPAS2E1{, <Xt>}

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>0b100</td>

The TLBI RIPAS2E1IS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - SCR_EL3.NS==1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.NS==0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula \[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} +1)^2(5\times\text{SCALE} +1) \times \text{Translation Granule Size})\].

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

For more information about the architectural requirements for this System instruction see 'Invalidation of TLB entries from stage 2 translations' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RIPAS2E1IS are UNDEFINED.

**Attributes**

TLBI RIPAS2E1IS is a 64-bit System instruction.
Field descriptions

The TLBI RIPAS2E1IS input value bit assignments are:

<table>
<thead>
<tr>
<th>NS</th>
<th>RES0</th>
<th>TG</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**NS, bit [63]**

When ARMv8.4-SecEL2 is implemented:

Not Secure. Specifies the IPA space.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IPA is in the Secure IPA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>IPA is in the Non-secure IPA space.</td>
</tr>
</tbody>
</table>

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When ARMv8.4-SecEL2 is not implemented or is disabled in the current Security state, this field is RES0.

**Otherwise:**

Reserved, RES0.

**Bits [62:48]**

Reserved, RES0.

**TG, bits [47:46]**

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

**SCALE, bits [45:44]**

The exponent element of the calculation that is used to produce the upper range.

**NUM, bits [43:39]**

The base element of the calculation that is used to produce the upper range.

**TTL, bits [38:37]**

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.
### TTL RIPAS2E1IS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1, Inner Shareable

TLBI RIPAS2E1OS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1, Outer Shareable

The TLBI RIPAS2E1OS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - \texttt{SCR\_EL3.NS==1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - \texttt{SCR\_EL3.NS==0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula \[ \text{BaseADDR} <= \text{VA} < \text{BaseADDR} + ((\text{NUM} +1) * 2^{(5\text{\_SCALE} + 1) \times \text{Translation\_Granule\_Size})].

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is \textit{UNPREDICTABLE} when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 0000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 000000000000.

For more information about the architectural requirements for this System instruction see 'Invalidation of TLB entries from stage 2 translations' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RIPAS2E1OS are \textit{UNDEFINED}.

**Attributes**

TLBI RIPAS2E1OS is a 64-bit System instruction.

elsif PSTATE.EL == EL3 then
  if !EL2Enabled() then
    //no operation
  else
    TLBI_RIPAS2E1OS(X[t]);
The TLBI RIPAS2LE1 characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- One of the following applies:
  - \( \text{SCR}_{\text{EL3}}.	ext{NS} = 1 \) and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - \( \text{SCR}_{\text{EL3}}.	ext{NS} = 0 \) and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula \([\text{BaseADDR} <= VA < \text{BaseADDR} + ((\text{NUM} +1)*2^{(5*\text{SCALE} +1) \ast \text{Translation_Granule_Size}})].\)

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation only applies to the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 000000000000000000.

For more information about the architectural requirements for this System instruction see 'Invalidation of TLB entries from stage 2 translations' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RIPAS2LE1 are UNDEFINED.

**Attributes**

TLBI RIPAS2LE1 is a 64-bit System instruction.
Field descriptions

The TLBI RIPAS2LE1IS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- One of the following applies:
  - \( \text{SCR} \_\text{EL}3\).\text{NS}==1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - \( \text{SCR} \_\text{EL}3\).\text{NS}==0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula \( \text{BaseADDR} <= \text{VA} < \text{BaseADDR} + ((\text{NUM} +1) \times 2^{(5 \times \text{SCALE} +1) \times \text{Translation Granule Size}}) \).

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 000000000000000000.

For more information about the architectural requirements for this System instruction see 'Invalidation of TLB entries from stage 2 translations' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RIPAS2LE1IS are **UNDEFINED**.

**Attributes**

TLBI RIPAS2LE1IS is a 64-bit System instruction.
Field descriptions

The TLBI RIPAS2LE1IS input value bit assignments are:

<td></td>
<td></td>
</tr>
</tbody>
</table>

**NS, bit [63]**

When ARMv8.4-SecEL2 is implemented:

Not Secure. Specifies the IPA space.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IPA is in the Secure IPA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>IPA is in the Non-secure IPA space.</td>
</tr>
</tbody>
</table>

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When ARMv8.4-SecEL2 is not implemented or is disabled in the current Security state, this field is RES0.

** Otherwise:**

Reserved, RES0.

**Bits [62:48]**

Reserved, RES0.

**TG, bits [47:46]**

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

**SCALE, bits [45:44]**

The exponent element of the calculation that is used to produce the upper range.

**NUM, bits [43:39]**

The base element of the calculation that is used to produce the upper range.

**TTL, bits [38:37]**

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.
**BaseADDR, bits [36:0]**

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

**Executing the TLBI RIPAS2LE1IS instruction**

Accesses to this instruction use the following encodings:

```

        TLBI_RIPAS2LE1IS(X[t]);
```
TLBI RIPAS2LE1OS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable

The TLBI RIPAS2LE1OS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - $\text{SCR_EL3} . \text{NS} == 1$ and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - $\text{SCR_EL3} . \text{NS} == 0$ and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula $\text{BaseADDR} <= \text{VA} < \text{BaseADDR} + ((\text{NUM} +1)^2(5^{\text{SCALE}+1})*\text{Translation_Granule_Size})$.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if $\text{SCR_EL3}.\text{EEL2} == 1$, then:

- A PE with $\text{SCR_EL3}.\text{EEL2} == 1$ is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with $\text{SCR_EL3}.\text{EEL2} == 0$.
- A PE with $\text{SCR_EL3}.\text{EEL2} == 0$ is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with $\text{SCR_EL3}.\text{EEL2} == 1$.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If $\text{TTL} == 01$ and $\text{BaseADDR}[29:12]$ is not equal to $00000000000000000000000000$.
  - If $\text{TTL} == 10$ and $\text{BaseADDR}[20:12]$ is not equal to $0000000000$.

- For the 16K translation granule:
  - If $\text{TTL} == 10$ and $\text{BaseADDR}[24:14]$ is not equal to $00000000000000000000000000$.

- For the 64K translation granule:
  - If $\text{TTL} == 01$ and $\text{BaseADDR}[41:16]$ is not equal to $0000000000000000000000000000000000$. 

If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

For more information about the architectural requirements for this System instruction see 'Invalidation of TLB entries from stage 2 translations' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

This instruction is present only when ARMv8.4-TLBi is implemented. Otherwise, direct accesses to TLBI RIPAS2LE1OS are UNDEFINED.

**Attributes**

TLBI RIPAS2LE1OS is a 64-bit System instruction.

**Field descriptions**

The TLBI RIPAS2LE1OS input value bit assignments are:

The TLBI RVAAE1 characteristics are:

### Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of `SCR_EL3_NS`:
  - If `HCR_EL2.{E2H, TGE}` is not `{1, 1}`, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If `HCR_EL2.{E2H, TGE}` is `{1, 1}`, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula `[BaseADDR <= VA < BaseADDR + ((NUM +1)*2^(5*SCALE +1) * Translation_Granule_Size)]`. The invalidation applies to the PE that executes this System instruction.

### Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both:

- Global entries.
- Non-global entries with any ASID.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

### Configuration

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RVAAE1 are **UNDEFINED**.

### Attributes

The TLBI RVAAE1IS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of \( \text{SCR\_EL3} \).NS:
  - If \( \text{HCR\_EL2} \).{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If \( \text{HCR\_EL2} \).{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \([\text{BaseADDR} <= \text{VA} < \text{BaseADDR} + ((\text{NUM} +1)\times2^{(5\times\text{SCALE} +1)} \times \text{Translation\_Granule\_Size})]\).

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if \( \text{SCR\_EL3.EEL2}==1 \), then:

- A PE with \( \text{SCR\_EL3.EEL2}==1 \) is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with \( \text{SCR\_EL3.EEL2}==0 \).
- A PE with \( \text{SCR\_EL3.EEL2}==0 \) is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with \( \text{SCR\_EL3.EEL2}==1 \).
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both:

- Global entries.
- Non-global entries with any ASID.

The range of addresses invalidated is \textit{UNPREDICTABLE} when:

- For the 4K translation granule:
  - If \( \text{TTL}==01 \) and \( \text{BaseADDR}[29:12] \) is not equal to 000000000000000000.
  - If \( \text{TTL}==10 \) and \( \text{BaseADDR}[20:12] \) is not equal to 000000000.
- For the 16K translation granule:
  - If \( \text{TTL}==10 \) and \( \text{BaseADDR}[24:14] \) is not equal to 0000000000.
- For the 64K translation granule:
  - If \( \text{TTL}==01 \) and \( \text{BaseADDR}[41:16] \) is not equal to 00000000000000000000000000.
If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

TLBI RVAE1OS, TLB Range Invalidate by VA, All ASID, EL1, Outer Shareable

The TLBI RVAE1OS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \([\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1)\times 2^{(5\times \text{SCALE} + 1)} \times \text{Translation_Granule_Size})]\).

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both:

- Global entries.
- Non-global entries with any ASID.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.

- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.

- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 0000000000000000000000000000000000.
If \( \text{TTL} = 10 \) and \( \text{BaseADDR}[28:16] \) is not equal to \( 00000000000000 \).

### Configuration

The TLBI RVAALE1IS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} +1)\times2^{(5\times\text{SCALE} +1) \times \text{Translation_Granule_Size}})\].

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both:

- Global entries.
- Non-global entries with any ASID.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 0000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 0000000000000000.
If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

elsif PSTATE.EL == EL3 then
  TLBI_RVAALE1IS(X[t]);
TLBI RVAALE1OS, TLB Range Invalidate by VA, All ASID, Last Level, EL1, Outer Shareable

The TLBI RVAALE1OS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \([\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} +1) \times 2^{(5 \times \text{SCALE} +1) \times \text{Translation_Granule_Size}}))\).

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both:

- Global entries.
- Non-global entries with any ASID.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.

- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.

- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RVAALE1OS are UNDEFINED.

**Attributes**

TLBI RVAALE1OS is a 64-bit System instruction.

**Field descriptions**

The TLBI RVAALE1OS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-48</td>
<td>Reserved</td>
</tr>
<tr>
<td>47-46</td>
<td>Translation granule size.</td>
</tr>
<tr>
<td>45-44</td>
<td>The exponent element of the calculation that is used to produce the upper range.</td>
</tr>
<tr>
<td>43-39</td>
<td>The base element of the calculation that is used to produce the upper range.</td>
</tr>
<tr>
<td>38-37</td>
<td>TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.</td>
</tr>
</tbody>
</table>

**Bits [63:48]**

Reserved, RES0.

**TG, bits [47:46]**

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>

TLBI RVAE1, TLB Range Invalidate by VA, EL1

The TLBI RVAE1 characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3:NS:
  - If \( \text{HCR\_EL2.\{E2H, TGE\}} \) is not \( \{1, 1\} \), the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If \( \text{HCR\_EL2.\{E2H, TGE\}} \) is \( \{1, 1\} \), the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \([\text{BaseADDR} <= \text{VA} < \text{BaseADDR} + ((\text{NUM} +1)\times 2^{(5\times \text{SCALE} +1)} \times \text{Translation\_Granule\_Size})]\).

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 0000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.

- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 000000000.

- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RVAE1 are **UNDEFINED**.

**Attributes**

TLBI RVAE1 is a 64-bit System instruction.

The TLBI RVAE1IS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If $HCR_{EL2}.\{E2H, TGE\}$ is not $\{1, 1\}$, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If $HCR_{EL2}.\{E2H, TGE\}$ is $\{1, 1\}$, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula $[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} +1)^2 \cdot (5\cdot\text{SCALE} + 1) \cdot \text{Translation Granule Size})]$.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with $\text{SCR}_E\text{L3}.\text{EEL2}=\text{1}$ is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with $\text{SCR}_E\text{L3}.\text{EEL2}=\text{0}$.
- A PE with $\text{SCR}_E\text{L3}.\text{EEL2}=\text{0}$ is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with $\text{SCR}_E\text{L3}.\text{EEL2}=\text{1}$.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.

If TTL==10 and BaseADDR[28:16] is not equal to 000000000000.

    elsif EL2Enabled() && !ELUsingAAArch32(EL2) && HCR_EL2.TTLBIS == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAAArch32(EL2) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGITR_EL2.TLBIRVAE1IS == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        TLBI_RVAE1IS(X[t]);
    elsif PSTATE_EL == EL2 then
        TLBI_RVAE1IS(X[t]);
    elsif PSTATE_EL == EL3 then
        TLBI_RVAE1IS(X[t]);
```
The TLBI RVAE1OS characteristics are:

**Purpose**

Invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} +1) \times 2^{(5 \times \text{SCALE} + 1)} \times \text{Translation Granule Size})\].

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.

If TTL==10 and BaseADDR[28:16] is not equal to 00000000000000.

Configuration

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RVAE1OS are UNDEFINED.

Attributes

TLBI RVAE1OS is a 64-bit System instruction.

Field descriptions

The TLBI RVAE1OS input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

TG, bits [47:46]

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

```
TLBI RVAE2, TLB Range Invalidate by VA, EL2

The TLBI RVAE2 characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula
  \[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{(5 \times \text{SCALE} + 1)} \times \text{Translation Granule Size})\], using the EL2 or EL2&0 translation regime.
- If \text{HCR\_EL2\_E2H} == 0, the entry is from any level of the translation table walk.
- If \text{HCR\_EL2\_E2H} == 1, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk and matches the specified ASID.

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.

- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.

- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

Configuration

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RVAE2 are UNDEFINED.

Attributes

TLBI RVAE2 is a 64-bit System instruction.

Field descriptions

The TLBI RVAE2 input value bit assignments are:

TLBI RVAE2IS, TLB Range Invalidate by VA, EL2, Inner Shareable

The TLBI RVAE2IS characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula 
  \[ \text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} +1)\times2^{(5\times\text{SCALE} +1) \times \text{Translation_Granule_Size}}) \], using the EL2 or EL2&0 translation regime.
- If \[ \text{HCR}_{\text{EL2}} \cdot E2H == 0 \], the entry is from any level of the translation table walk.
- If \[ \text{HCR}_{\text{EL2}} \cdot E2H == 1 \], one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk and matches the specified ASID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 0000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 00000000.

- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:12] is not equal to 0000000000.

- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RVAE2IS are UNDEFINED.

**Attributes**

TLBI RVAE2IS is a 64-bit System instruction.

**Field descriptions**

The TLBI RVAE2IS input value bit assignments are:
ASID, bits [63:48]

When HCR_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

    TLBI_VRAE2OS(X[t]);
TLBI RVAE3, TLB Range Invalidate by VA, EL3

The TLBI RVAE3 characteristics are:

**Purpose**

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.
- The entry is within the address range determined by the formula \[ \text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} +1)\times2^{(5\times\text{SCALE} +1)} \times \text{Translation_Granule_Size}) \].

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is *UNPREDICTABLE* when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 0000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.

- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.

- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RVAE3 are *UNDEFINED*.

**Attributes**

TLBI RVAE3 is a 64-bit System instruction.

**Field descriptions**

The TLBI RVAE3 input value bit assignments are:

|   | 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|---|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | TG | SCALE | NUM | TTL | BaseADDR |

**Bits [63:48]**

Reserved, RES0.
**TG, bits [47:46]**

Translation granule size.

<table>
<thead>

TLBI RVALE1, TLB Range Invalidate by VA, Last level, EL1

The TLBI RVALE1 characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of $SCR_EL3.NS$:
  - If $HCR_EL2\{E2H, TGE\}$ is not $\{1,1\}$, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If $HCR_EL2\{E2H, TGE\}$ is $\{1,1\}$, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula $[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + \left( (\text{NUM} + 1) \times 2^\left(5 \times \text{SCALE} + 1\right) \times \text{Translation Granule Size}\right)]$.

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 0000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 00000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 000000000000.

For more information about the architectural requirements for this System instruction see 'Invalidation of TLB entries from stage 2 translations' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RVALE1 are **UNDEFINED**.

**Attributes**

TLBI RVALE1 is a 64-bit System instruction.

TLBI RVALE1IS, TLB Range Invalidate by VA, Last level, EL1, Inner Shareable

The TLBI RVALE1IS characteristics are:

**Purpose**

Invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \( [\text{BaseADDR} \leq VA < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{(5 \times \text{SCALE} + 1)} \times \text{Translation\_Granule\_Size})] \).

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

### Configuration

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RVALE1IS are UNDEFINED.

### Attributes

TLBI RVALE1IS is a 64-bit System instruction.

### Field descriptions

The TLBI RVALE1IS input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ASID | TG | SCALE | NUM | TTL | BaseADDR |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

**TG, bits [47:46]**

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

**SCALE, bits [45:44]**

The exponent element of the calculation that is used to produce the upper range.

**NUM, bits [43:39]**

The base element of the calculation that is used to produce the upper range.

**TTL, bits [38:37]**

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.
**TLBI RVALE1IS, TLB Range Invalidate by VA, Last level, EL1, Inner Shareable**

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation table entries.</td>
</tr>
<tr>
<td>0b01</td>
<td>When using a 4KB or 64KB translation granule, all entries to invalidate are Level 1 translation table entries. When using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.</td>
</tr>
<tr>
<td>0b10</td>
<td>All entries to invalidate are Level 2 translation table entries.</td>
</tr>
<tr>
<td>0b11</td>
<td>All entries to invalidate are Level 3 translation table entries.</td>
</tr>
</tbody>
</table>

**BaseADDR, bits [36:0]**

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

**Executing the TLBI RVALE1IS instruction**

Accesses to this instruction use the following encodings:

`TLBI RVALE1IS{}, <Xt>`

TLBI RVALE1OS, TLB Range Invalidate by VA, Last level, EL1, Outer Shareable

The TLBI RVALE1OS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \([\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{5 \times \text{SCALE} + 1} \times \text{Translation Granule Size})]\).

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RVALE1OS are **UNDEFINED**.

**Attributes**

TLBI RVALE1OS is a 64-bit System instruction.

**Field descriptions**

The TLBI RVALE1OS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit Positions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-48</td>
<td>ASID</td>
</tr>
<tr>
<td>47-46</td>
<td>TG</td>
</tr>
<tr>
<td>45-44</td>
<td>SCALE</td>
</tr>
<tr>
<td>43-39</td>
<td>NUM</td>
</tr>
<tr>
<td>38-37</td>
<td>TTL</td>
</tr>
<tr>
<td>31-0</td>
<td>BaseADDR</td>
</tr>
</tbody>
</table>

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are **RES0**.

**TG, bits [47:46]**

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b1</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

**SCALE, bits [45:44]**

The exponent element of the calculation that is used to produce the upper range.

**NUM, bits [43:39]**

The base element of the calculation that is used to produce the upper range.

**TTL, bits [38:37]**

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.
### TTL, Meaning

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation table entries.</td>
</tr>
<tr>
<td>0b01</td>
<td>When using a 4KB or 64KB translation granule, all entries to invalidate are Level 1 translation table entries. When using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.</td>
</tr>
<tr>
<td>0b10</td>
<td>All entries to invalidate are Level 2 translation table entries.</td>
</tr>
<tr>
<td>0b11</td>
<td>All entries to invalidate are Level 3 translation table entries.</td>
</tr>
</tbody>
</table>

#### BaseADDR, bits [36:0]

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

### Executing the TLBI RVALE1OS instruction

Accesses to this instruction use the following encodings:

\[
\text{TLBI RVALE1OS\{, <Xt>\}}
\]

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>0b000</td>
<td>0b1000</td>
<td>0b0101</td>
<td>0b101</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TTLB == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TTLB0S == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGITR_EL2.TLBIRVALE1OS == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        TLBI_RVALE1OS(X[t]);
    end
elsif PSTATE.EL == EL2 then
    TLBI_RVALE1OS(X[t]);
elsif PSTATE.EL == EL3 then
    TLBI_RVALE1OS(X[t]);
The TLBI RVALE2 characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula
  \[
  \text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{5 \times \text{SCALE} + 1} \times \text{Translation_Granule_Size})
  \]
  using the EL2 or EL2&0 translation regime.
- If \( \text{HCR}_{EL2}.E2H = 0 \), the entry is from the final level of the translation table walk.
- If \( \text{HCR}_{EL2}.E2H = 1 \), one of the following applies:
  - The entry is a global entry from the final level of translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk and matches the specified ASID.

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.

- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.

- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 0000000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 00000000000000000000000000.

**Configuration**

TLBI RVALE2OS, TLB Range Invalidate by VA, Last level, EL2, Outer Shareable

The TLBI RVALE2OS characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula
  \[ \text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{(5 \times \text{SCALE} + 1)} \times \text{Translation_Granule_Size}) \] using the EL2 or EL2&0 translation regime.
- If \( \text{HCR_EL2.E2H} = 0 \), the entry is from the final level of the translation table walk.
- If \( \text{HCR_EL2.E2H} = 1 \), one of the following applies:
  - The entry is a global entry from the final level of translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk and matches the specified ASID.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RVALE2OS are **UNDEFINED**.

**Attributes**

TLBI RVALE2OS is a 64-bit System instruction.

**Field descriptions**

The TLBI RVALE2OS input value bit assignments are:
ASID, bits [63:48]

When HCR_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Reserved</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation table entries.</td>

</tr>
<tr>
<td>0b10</td>
<td>All entries to invalidate are Level 2 translation table entries.</td>
</tr>
<tr>
<td>0b11</td>
<td>All entries to invalidate are Level 3 translation table entries.</td>
</tr>
</tbody>
</table>

BaseADDR, bits [36:0]

The starting address for the range of the maintenance instruction.
When using a 4KB translation granule, this field is BaseADDR[48:12].
When using a 16KB translation granule, this field is BaseADDR[50:14].
When using a 64KB translation granule, this field is BaseADDR[52:16].

TLBI RVALE3, TLB Range Invalidate by VA, Last level, EL3

The TLBI RVALE3 characteristics are:

**Purpose**

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.
- The entry is within the address range determined by the formula \([\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} +1) \times 2^5 \times \text{SCALE} + 1) \times \text{Translation Granule Size})\].

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If \(\text{TTL}==01\) and \(\text{BaseADDR}[29:12]\) is not equal to \(00000000000000000000\).
  - If \(\text{TTL}==10\) and \(\text{BaseADDR}[20:12]\) is not equal to \(0000000000\).

- For the 16K translation granule:
  - If \(\text{TTL}==10\) and \(\text{BaseADDR}[24:14]\) is not equal to \(0000000000\).

- For the 64K translation granule:
  - If \(\text{TTL}==01\) and \(\text{BaseADDR}[41:16]\) is not equal to \(00000000000000000000000000\).
  - If \(\text{TTL}==10\) and \(\text{BaseADDR}[28:16]\) is not equal to \(000000000000\).

**Configuration**

The TLBI VAAE1 characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

**Note**

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

**Configuration**

**Attributes**

<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAAE1 instruction**

Accesses to this instruction use the following encodings:

```
TLBI VAAE1{, <Xt>}
```

TLBI VAAE1, TLB Invalidate by VA, All ASID, EL1
TLBI VAAE1IS, TLB Invalidate by VA, All ASID, EL1, Inner Shareable

The TLBI VAAE1IS characteristics are:

**Purpose**

Invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

The TLBI VAAE1OS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of $SCR_{EL3}.NS$:
  - If $HCR_{EL2}.\{E2H, TGE\}$ is not \{1, 1\}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If $HCR_{EL2}.\{E2H, TGE\}$ is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if $SCR_{EL3}.EEL2==1$, then:

- A PE with $SCR_{EL3}.EEL2==1$ is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with $SCR_{EL3}.EEL2==0$.
- A PE with $SCR_{EL3}.EEL2==0$ is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with $SCR_{EL3}.EEL2==1$.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

Configuration

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI VAAE1OS are UNDEFINED.

Attributes

TLBI VAAE1OS is a 64-bit System instruction.

Field descriptions

The TLBI VAAE1OS input value bit assignments are:
Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

The TLBI VAALE1 characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3:NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

**Note**

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

**Configuration**

**Attributes**

TLBI VAALE1 is a 64-bit System instruction.

**Field descriptions**

The TLBI VAALE1 input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:48]</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>TTL, bits [47:44]</strong></td>
<td></td>
</tr>
<tr>
<td>When ARMv8.4-TTL is implemented:</td>
<td></td>
</tr>
<tr>
<td>Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.</td>
<td></td>
</tr>
</tbody>
</table>
TTL | Meaning
---|---
0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is res0.
0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL<3:2> is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.
0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL<3:2> is 0b00. 0b01: Reserved. Treat as if TTL<3:2> is 0b00. 0b10: Level 2. 0b11: Level 3.
0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL<3:2> is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, res0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as res0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are res0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are res0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAALE1 instruction**

TLBI VAALE1IS, TLB Invalidate by VA, All ASID, Last Level, EL1, Inner Shareable

The TLBI VAALE1IS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

<td>VA[55:12]</td>
<td>61 to 55</td>
</tr>
</tbody>
</table>
**Bits [63:48]**

Reserved, RES0.

**TTL, bits [47:44]**

**When ARMv8.4-TTL is implemented:**

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAALE1IS instruction**

Accesses to this instruction use the following encodings:
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TTLB == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TTLBIS == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  elsif EL2Enabled() && !ELUsingAArch32(EL2) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
    HFGITR_EL2.TLBIVAALE1IS == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    TLBI_VAALE1IS(X[t]);
  end
elsif PSTATE.EL == EL2 then
  TLBI_VAALE1IS(X[t]);
elsif PSTATE.EL == EL3 then
  TLBI_VAALE1IS(X[t]);
TLBI VAALE1OS, TLB Invalidate by VA, All ASID, Last Level, EL1, Outer Shareable

The TLBI VAALE1OS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of `SCR_EL3.NS`:
  - If `HCR_EL2.{E2H, TGE}` is not `1, 1`, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If `HCR_EL2.{E2H, TGE}` is `1, 1`, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if `SCR_EL3.EEL2==1`, then:

- A PE with `SCR_EL3.EEL2==1` is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with `SCR_EL3.EEL2==0`.
- A PE with `SCR_EL3.EEL2==0` is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with `SCR_EL3.EEL2==1`.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of `0`.

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI VAALE1OS are **UNDEFINED**.

**Attributes**

TLBI VAALE1OS is a 64-bit System instruction.

**Field descriptions**

The TLBI VAALE1OS input value bit assignments are:
**Bits [63:48]**

Reserved, RES0.

**TTL, bits [47:44]**

*When ARMv8.4-TTL is implemented:*

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.
Executing the TLBI VAALE1OS instruction

Accesses to this instruction use the following encodings:

elsif PSTATE.EL == EL3 then
    TLBI_VAALE1OS(X[t]);
TLBI VAE1, TLB Invalidate by VA, EL1

The TLBI VAE1 characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of `SCR_EL3 NS`:
  - If `HCR_EL2 {E2H, TGE}` is not `{1, 1}`, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If `HCR_EL2 {E2H, TGE}` is `{1, 1}`, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

**Configuration**

**Attributes**

TLBI VAE1 is a 64-bit System instruction.

**Field descriptions**

The TLBI VAE1 input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>ASID</td>
</tr>
<tr>
<td>62</td>
<td>TTL</td>
</tr>
<tr>
<td>59</td>
<td>VA[55:12]</td>
</tr>
</tbody>
</table>

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are `RES0`.  

---

Page 1665
TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>

    end
elsif PSTATE.EL == EL2 then
    TLBI_VAE1(X[t]);
elsif PSTATE.EL == EL3 then
    TLBI_VAE1(X[t]);
The TLBI VAE1IS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of \( \text{SCR_EL3.NS} \):
  - If \( \text{HCR_EL2.\{E2H, TGE\}} \) is not \( \{1, 1\} \), the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If \( \text{HCR_EL2.\{E2H, TGE\}} \) is \( \{1, 1\} \), the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if \( \text{SCR_EL3.EEL2} == 1 \), then:

- A PE with \( \text{SCR_EL3.EEL2} == 1 \) is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with \( \text{SCR_EL3.EEL2} == 0 \).
- A PE with \( \text{SCR_EL3.EEL2} == 0 \) is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with \( \text{SCR_EL3.EEL2} == 1 \).
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

**Configuration**

**Attributes**

TLBI VAE1IS is a 64-bit System instruction.

**Field descriptions**

The TLBI VAE1IS input value bit assignments are:
ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are **RES0**.

TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is <strong>RES0</strong>.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, **RES0**.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as **RES0**.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
• Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.

• Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAE1IS instruction**

TLBI VAE1OS, TLB Invalidate by VA, EL1, Outer Shareable

The TLBI VAE1OS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI VAE1OS are UNDEFINED.

**Attributes**

TLBI VAE1OS is a 64-bit System instruction.

**Field descriptions**

The TLBI VAE1OS input value bit assignments are:
ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are \texttt{RES0}.

<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, \texttt{RES0}.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as \texttt{RES0}.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
• Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.

• Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAE10S instruction**

Accesses to this instruction use the following encodings:

TLBI VAE10S{, <Xt>}

<td>0b0001</td>
<td>0b001</td>
</tr>
</tbody>
</table>

```c
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TTLB == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TTLBOS == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
        HFGITR_EL2.TLBIVAE1OS == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        TLBI_VAE10S(X[t]);
    elsif PSTATE.EL == EL2 then
        TLBI_VAE10S(X[t]);
    elsif PSTATE.EL == EL3 then
        TLBI_VAE10S(X[t]);
```
The TLBI VAE2 characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be required to translate the specified VA using the EL2 or the EL2&0 translation regime.
- If \texttt{HCR\_E2H} == 0, the entry is from any level of the translation table walk.
- If \texttt{HCR\_E2H} == 1 one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk and matches the specified ASID.

The invalidation applies to the PE that executes this System instruction.

**Configuration**

**Attributes**

TLBI VAE2 is a 64-bit System instruction.

**Field descriptions**

The TLBI VAE2 input value bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |

|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are \texttt{RES0}.

**TTL, bits [47:44]**

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.
If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAE2 instruction**

**ASID, bits [63:48]**

When \( HCR\_EL2.E2H = 1 \):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.
Otherwise:

Reserved, RES0.

**TTL, bits [47:44]**

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as:</td>
</tr>
<tr>
<td></td>
<td>0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00.</td>
</tr>
<tr>
<td></td>
<td>0b01 : Level 1.</td>
</tr>
<tr>
<td></td>
<td>0b10 : Level 2.</td>
</tr>
<tr>
<td></td>
<td>0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as:</td>
</tr>
<tr>
<td></td>
<td>0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00.</td>
</tr>
<tr>
<td></td>
<td>0b01 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00.</td>
</tr>
<tr>
<td></td>
<td>0b10 : Level 2.</td>
</tr>
<tr>
<td></td>
<td>0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as:</td>
</tr>
<tr>
<td></td>
<td>0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00.</td>
</tr>
<tr>
<td></td>
<td>0b01 : Level 1.</td>
</tr>
<tr>
<td></td>
<td>0b10 : Level 2.</td>
</tr>
<tr>
<td></td>
<td>0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAE2OS instruction**

Accesses to this instruction use the following encodings:
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then

Reserved, RES0.

**TTL, bits [47:44]**

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.
TTL | Meaning
---|---
0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is res0.
0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as:
| 0b00 : Reserved. Treat as if TTL<3:2> is 0b00.
| 0b01 : Level 1.
| 0b10 : Level 2.
| 0b11 : Level 3.
0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as:
| 0b00 : Reserved. Treat as if TTL<3:2> is 0b00.
| 0b01 : Reserved. Treat as if TTL<3:2> is 0b00.
| 0b10 : Level 2.
| 0b11 : Level 3.
0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as:
| 0b00 : Reserved. Treat as if TTL<3:2> is 0b00.
| 0b01 : Level 1.
| 0b10 : Level 2.
| 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, res0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as res0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are res0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are res0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAE3 instruction**

Accesses to this instruction use the following encodings:

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>0b110</td>
<td>0b1000</td>
<td>0b0111</td>
<td>0b001</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    TLBI_VAE3(X[t]);
The TLBI VAE3IS characteristics are:

**Purpose**

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Configuration**

**Attributes**

TLBI VAE3IS is a 64-bit System instruction.

**Field descriptions**

The TLBI VAE3IS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit Positions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</td>
<td>RES0</td>
</tr>
<tr>

    UNDEFINED;
elsif PSTATE.EL == EL3 then
    TLBI_VAE3OS(X[t]);
TLBI VALE1, TLB Invalidate by VA, Last level, EL1

The TLBI VALE1 characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

**Configuration**

**Attributes**

TLBI VALE1 is a 64-bit System instruction.

**Field descriptions**

The TLBI VALE1 input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ASID | TTL | VA[55:12] |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

**TTL, bits [47:44]**

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.
TTL

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
</tr>
<tr>
<td>0b01xx</td>
</tr>
<tr>
<td>0b10xx</td>
</tr>
<tr>
<td>0b11xx</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VALE1 instruction**

Accesses to this instruction use the following encodings:

\[
\text{TLBI VALE1}, \langle \text{Xt} \rangle
\]

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>

elsif PSTATE.EL == EL3 then
  TLBI_VAAE1(X[t]);
TLBI VALE1IS, TLB Invalidate by VA, Last level, EL1, Inner Shareable

The TLBI VALE1IS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

---

**Note**

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

---

**Configuration**

**Attributes**

TLBI VALE1IS is a 64-bit System instruction.

**Field descriptions**

The TLBI VALE1IS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>ASID</th>
<th>TTL</th>
<th>VA[55:12]</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>62</td>
<td>61</td>
<td>60</td>
</tr>
<tr>
<td>31</td>
<td>30</td>
<td>29</td>
<td>28</td>
</tr>
</tbody>
</table>
ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.
Executing the TLBI VALE1IS instruction

Accesses to this instruction use the following encodings:

TLBI VALE1IS{, <Xt>}

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

</tbody>
</table>

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TTLB == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TTLBIS == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && (!HaveEL(EL3) || SCR_EL3.FGETen == '1') &&
        HFGITR_EL2.TLBIVALE1IS == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        TLBI VALE1IS(X[t]);
    elseif PSTATE.EL == EL2 then
        TLBI VALE1IS(X[t]);
    elseif PSTATE.EL == EL3 then
        TLBI VALE1IS(X[t]);

TLBI VALE1OS, TLB Invalidate by VA, Last level, EL1, Outer Shareable

The TLBI VALE1OS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of \( \text{SCR_EL3.NS} \):
  - If \( \text{HCR_EL2.E2H, TGE} \) is not \( \{1, 1\} \), the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If \( \text{HCR_EL2.E2H, TGE} \) is \( \{1, 1\} \), the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if \( \text{SCR_EL3.EEL2}==1 \), then:

- A PE with \( \text{SCR_EL3.EEL2}==1 \) is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with \( \text{SCR_EL3.EEL2}==0 \).
- A PE with \( \text{SCR_EL3.EEL2}==0 \) is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with \( \text{SCR_EL3.EEL2}==1 \).
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI VALE1OS are **UNDEFINED**.

**Attributes**

TLBI VALE1OS is a 64-bit System instruction.

**Field descriptions**

The TLBI VALE1OS input value bit assignments are:
**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

**TTL, bits [47:44]**

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
</tbody>
</table>
| 0b01xx| The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as:  
|       | 0b00 : Reserved. Treat as if TTL<3:2> is 0b00.  
|       | 0b01 : Level 1.  
|       | 0b10 : Level 2.  
|       | 0b11 : Level 3. |
| 0b10xx| The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as:  
|       | 0b00 : Reserved. Treat as if TTL<3:2> is 0b00.  
|       | 0b01 : Reserved. Treat as if TTL<3:2> is 0b00.  
|       | 0b10 : Level 2.  
|       | 0b11 : Level 3. |
| 0b11xx| The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as:  
|       | 0b00 : Reserved. Treat as if TTL<3:2> is 0b00.  
|       | 0b01 : Level 1.  
|       | 0b10 : Level 2.  
|       | 0b11 : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.

Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VALE1OS instruction**

Accesses to this instruction use the following encodings:

TLBI VALE1OS{, <Xt>}

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>0b000</td>
<td>0b1000</td>
<td>0b0001</td>
<td>0b101</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TTLB == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TTLBOS == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  elsif EL2Enabled() && !ELUsingAArch32(EL2) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
    HFGITR_EL2.TLBIVALE1OS == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    TLBI_VALE1OS(X[t]);
  endif;
elsif PSTATE.EL == EL2 then
  TLBI_VALE1OS(X[t]);
elsif PSTATE.EL == EL3 then
  TLBI_VALE1OS(X[t]);
The TLBI VALE2 characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime.
- If $\text{HCR}_\text{EL2}.\text{E2H} = 0$, the entry is from the final level of the translation table walk.
- If $\text{HCR}_\text{EL2}.\text{E2H} = 1$, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of translation table walk that matches the specified ASID.

The invalidation applies to the PE that executes this System instruction.

**Configuration**

**Attributes**

TLBI VALE2 is a 64-bit System instruction.

**Field descriptions**

The TLBI VALE2 input value bit assignments are:

<p>| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|</p>
<table>
<thead>
<tr>
<th>ASID</th>
<th>TTL</th>
<th>VA[55:12]</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>30</td>
<td>29</td>
</tr>
</tbody>
</table>

**ASID, bits [63:48]**

When $\text{HCR}_\text{EL2}.\text{E2H} = 1$:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

Otherwise:

Reserved, RES0.
TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>

TLBI VALE2IS, TLB Invalidate by VA, Last level, EL2, Inner Shareable

The TLBI VALE2IS characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime.
- If \( HCR_{EL2}.E2H == 0 \), the entry is from the final level of the translation table walk.
- If \( HCR_{EL2}.E2H == 1 \), one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of translation table walk that matches the specified ASID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Configuration**

**Attributes**

TLBI VALE2IS is a 64-bit System instruction.

**Field descriptions**

The TLBI VALE2IS input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| ASID | TTL | VA[55:12] |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

**TTL, bits [47:44]**

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.
### TTL to Meaning

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

### VA[55:12], bits [43:0]

Bits [55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits [55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

### Executing the TLBI VALE2IS instruction

        UNDEFINED;
elsif PSTATE.EL == EL2 then
    TLBI_VALE2IS(X[t]);
elsif PSTATE.EL == EL3 then
    if !EL2Enabled() then
        UNDEFINED;
    else
        TLBI_VALE2IS(X[t]);
**TLBI VALE2OS, TLB Invalidate by VA, Last level, EL2, Outer Shareable**

The TLBI VALE2OS characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime.
- If HCR_EL2.E2H == 0, the entry is from the final level of the translation table walk.
- If HCR_EL2.E2H == 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of translation table walk that matches the specified ASID.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI VALE2OS are UNDEFINED.

**Attributes**

TLBI VALE2OS is a 64-bit System instruction.

**Field descriptions**

The TLBI VALE2OS input value bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| ASID | TTL | VA[55:12] |
| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |

**ASID, bits [63:48]**

When HCR_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.
Otherwise:

Reserved, RES0.

**TTL, bits [47:44]**

*When ARMv8.4-TTL is implemented:*

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VALE2OS instruction**

Accesses to this instruction use the following encodings:
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && HCR_EL2.NV == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    UNDEFINED;
elsif PSTATE.EL == EL2 then
  TLBI_VALE2OS(X[t]);
elsif PSTATE.EL == EL3 then
  if !EL2Enabled() then
    UNDEFINED;
  else
    TLBI_VALE2OS(X[t]);
The TLBI VALE3 characteristics are:

**Purpose**

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to the PE that executes this System instruction.

**Configuration**

**Attributes**

TLBI VALE3 is a 64-bit System instruction.

**Field descriptions**

The TLBI VALE3 input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-48</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>47-44</td>
<td>TTL, bits</td>
</tr>
<tr>
<td>55-12</td>
<td>VA[55:12]</td>
</tr>
</tbody>
</table>

**Bits [63:48]**

Reserved, RES0.

**TTL, bits [47:44]**

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.
<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VALE3 instruction**

Accesses to this instruction use the following encodings:

```
TLBI VALE3{, <Xt>}
```

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>0b110</td>
<td>0b1000</td>
<td>0b0111</td>
<td>0b101</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  UNDEFINED;
elsif PSTATE.EL == EL2 then
  UNDEFINED;
elsif PSTATE.EL == EL3 then
  TLBI_VALE3(X[t]);
The TLBI VALE3IS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

• The entry is a stage 1 translation table entry, from the final level of the translation table walk.
• The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

Attributes

TLBI VALE3IS is a 64-bit System instruction.

Field descriptions

The TLBI VALE3IS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
</tr>
<tr>
<td>62</td>
<td>TTL</td>
</tr>
<tr>
<td>61</td>
<td>VA[55:12]</td>
</tr>
<tr>
<td>31</td>
<td>VA[55:12]</td>
</tr>
</tbody>
</table>

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.
<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is res0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, res0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as res0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are res0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are res0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VALE3IS instruction**

Accesses to this instruction use the following encodings:

```
TLBI VALE3IS{, <Xt>}
```

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>

</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>0b110</td>
<td>0b1000</td>
<td>0b0011</td>
<td>0b101</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    TLBI_VALE3IS(X[t]);

The TLBI VALE3OS characteristics are:

**Purpose**

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI VALE3OS are UNDEFINED.

**Attributes**

TLBI VALE3OS is a 64-bit System instruction.

**Field descriptions**

The TLBI VALE3OS input value bit assignments are:

<p>| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|</p>
<table>
<thead>
<tr>
<th>RES0</th>
<th>TTL</th>
<th>VA[55:12]</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>30</td>
<td>29</td>
</tr>
</tbody>
</table>

**Bits [63:48]**

Reserved, RES0.

**TTL, bits [47:44]**

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.
If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VALE3OS instruction**

Accesses to this instruction use the following encodings:

TLBI VALE3OS{, <Xt>}

elsif PSTATE.EL == EL3 then
  TLBI_VALE3OS(X[t]);
The TLBI VMALLE1 characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of `SCR_EL3.NS`:
  - If `HCR_EL2.{E2H, TGE}` is not `{1, 1}`, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If `HCR_EL2.{E2H, TGE}` is `{1, 1}`, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

**Note**

For the EL1&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

**Configuration**

**Attributes**

TLBI VMALLE1 is a 64-bit System instruction.

**Field descriptions**

TLBI VMALLE1 ignores the value in the register specified by the instruction encoding. Software does not have to write a value to the register before issuing this instruction.

**Executing the TLBI VMALLE1 instruction**

Accesses to this instruction use the following encodings:

```
TLBI VMALLE1{, <Xt>}

The TLBI VMALLE1IS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For the EL1&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

**Configuration**

**Attributes**

TLBI VMALLE1IS is a 64-bit System instruction.

**Field descriptions**

TLBI VMALLE1IS ignores the value in the register specified by the instruction encoding. Software does not have to write a value to the register before issuing this instruction.

TPIDR_EL0, EL0 Read/Write Software Thread ID Register

The TPIDR_EL0 characteristics are:

**Purpose**

Provides a location where software executing at EL0 can store thread identifying information, for OS management purposes.

The PE makes no use of this register.

**Configuration**

AArch64 System register TPIDR_EL0 bits [31:0] are architecturally mapped to AArch32 System register TPIDRURW[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

TPIDR_EL0 is a 64-bit register.

**Field descriptions**

The TPIDR_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [63:0]**

Thread ID. Thread identifying information stored by software running at this Exception level.

This field resets to an architecturally UNKNOWN value.

**Accessing the TPIDR_EL0**

Accesses to this register use the following encodings:

TPIDR_EL2, EL2 Software Thread ID Register

The TPIDR_EL2 characteristics are:

**Purpose**

Provides a location where software executing at EL2 can store thread identifying information, for OS management purposes.

The PE makes no use of this register.

**Configuration**

AArch64 System register TPIDR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HTPIDR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

TPIDR_EL2 is a 64-bit register.

**Field descriptions**

The TPIDR_EL2 bit assignments are:

**BASE**, bits [63:12]

Trace Buffer Base pointer address. (TRBBASER_EL1.BASE << 12) is the address of the first byte in the trace buffer. Bits [11:0] of the Base pointer address are always zero. If the smallest implemented translation granule is not 4KB, then TRBBASER_EL1[N-1:12] are RES0, where N is the IMPLEMENTATION DEFINED value \( \log_2 \) (smallest implemented translation granule).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [11:0]**

Reserved, RES0.

**Accessing the TRBBASER_EL1**

The PE might ignore a direct write to TRBBASER_EL1 if TRBLIMITR_EL1.E == 1.

Accesses to this register use the following encodings:

```
MRS <Xt>, TRBBASER_EL1
```

<table>

TRBIDR_EL1, Trace Buffer ID Register

The TRBIDR_EL1 characteristics are:

**Purpose**

Describes constraints on using the Trace Buffer Extension to software, including whether the Trace Buffer Extension can be programmed at the current Exception level.

**Configuration**

This register is present only when TRBE is implemented. Otherwise, direct accesses to TRBIDR_EL1 are **UNDEFINED**.

**Attributes**

TRBIDR_EL1 is a 64-bit register.

**Field descriptions**

The TRBIDR_EL1 bit assignments are:

</tr>
<tr>
<td>0</td>
<td>Reserved, res0.</td>
</tr>
</tbody>
</table>

**Bits [63:6]**

Reserved, res0.

**F, bit [5]**

Flag Updates. Defines whether the address translation performed by the Trace Buffer Extension manages the Access Flag and dirty state.

<table>
<thead>
<tr>
<th>F</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Trace buffer address translation does not manage the Access flag and dirty state in translation tables.</td>
</tr>
<tr>
<td>1</td>
<td>Trace buffer address translation manages the Access Flag and dirty state in the same way as the MMU on this PE.</td>
</tr>
</tbody>
</table>

**P, bit [4]**

Programming not allowed. The trace buffer is owned by a higher Exception level or by the other Security state.

<table>
<thead>
<tr>
<th>P</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>The owning Exception level is the current Exception level or a lower Exception level, and the owning Security state is the current Security state.</td>
</tr>
<tr>
<td>1</td>
<td>The owning Exception level is a higher Exception level, or the owning Security state is not the current Security state.</td>
</tr>
</tbody>
</table>

The value read from this field depends on the current Exception level and the values of MDCR_EL3.NSTB and MDCR_EL2.E2TB:

- If EL3 is implemented and either MDCR_EL3.NSTB == 0b00 or MDCR_EL3.NSTB == 0b01, meaning the owning Security state is Secure state, this bit reads as one from:
Non-secure EL2.

Non-secure EL1.

If Secure EL2 is implemented and enabled, and MDCR_EL2.E2TB == 0b00, Secure EL1.

- If EL3 is implemented and either MDCR_EL3.NSTB == 0b10 or MDCR_EL3.NSTB == 0b11, meaning the owning Security state is Non-secure state, this bit reads as one from:
  - Secure EL1.
  - If Secure EL2 is implemented, Secure EL2.
  - If EL2 is implemented and MDCR_EL2.E2TB == 0b00, Non-secure EL1.

- If EL3 is not implemented, EL2 is implemented, and MDCR_EL2.E2TB == 0b00, this bit reads as one from EL1.

Otherwise, this bit reads as zero.

**Align, bits [3:0]**

Defines the minimum alignment constraint for writes to TRBPTR_EL1 and TRBTRG_EL1.

<table>
<thead>
<tr>
<th>Align</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Byte.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Halfword.</td>
</tr>
<tr>

TRBLIMITR_EL1, Trace Buffer Limit Address Register

The TRBLIMITR_EL1 characteristics are:

**Purpose**

Defines the top address for the trace buffer, and controls the trace buffer modes and enable.

**Configuration**

This register is present only when TRBE is implemented. Otherwise, direct accesses to TRBLIMITR_EL1 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

TRBLIMITR_EL1 is a 64-bit register.

**Field descriptions**

The TRBLIMITR_EL1 bit assignments are:

**LIMIT, bits [63:12]**

Trace Buffer Limit pointer address. (TRBLIMITR_EL1.LIMIT << 12) is the address of the last byte in the trace buffer plus one. Bits [11:0] of the Limit pointer address are always zero. If the smallest implemented translation granule is not 4KB, then TRBLIMITR_EL1[N-1:12] are RES0, where N is the IMPLEMENTATION DEFINED value Log2(smallest implemented translation granule).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [11:6]**

Reserved, RES0.

**nVM, bit [5]**

Address mode.

<table>
<thead>
<tr>
<th>nVM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace buffer pointers are virtual addresses.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace buffer pointers are:</td>
</tr>
<tr>
<td></td>
<td>• Physical address in the owning security state if the owning translation regime has no stage 2 translation.</td>
</tr>
<tr>
<td></td>
<td>• Intermediate physical addresses in the owning security state if the owning translation regime has stage 2 translations.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally UNKNOWN value.
**TM, bits [4:3]**

Trigger mode.

<table>
<thead>
<tr>
<th>TM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Stop on trigger. Flush then stop collection and raise maintenance interrupt on Trigger Event.</td>
</tr>
<tr>
<td>0b01</td>
<td>IRQ on trigger. Continue collection and raise maintenance interrupt on Trigger Event.</td>
</tr>
<tr>
<td>0b11</td>
<td>Ignore trigger. Continue collection and do not raise maintenance interrupt on Trigger Event.</td>
</tr>
</tbody>
</table>

All other values are reserved.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**FM, bits [2:1]**

Trace buffer mode.

<table>
<thead>
<tr>
<th>FM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Fill mode. Stop collection and raise maintenance interrupt on current write pointer wrap.</td>
</tr>
<tr>
<td>0b01</td>
<td>Wrap mode. Continue collection and raise maintenance interrupt on current write pointer wrap.</td>
</tr>
<tr>
<td>0b11</td>
<td>Circular Buffer mode. Continue collection and do not raise maintenance interrupt on current write pointer wrap.</td>
</tr>
</tbody>
</table>

All other values are reserved.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**E, bit [0]**

Trace Buffer Extension enable.

<table>
<thead>
<tr>
<th>E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Trace Buffer Extension disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trace Buffer Extension enabled by this control.</td>
</tr>
</tbody>
</table>

Regardless of the value of this bit, the Trace Buffer Extension is disabled when `SelfHostedTraceEnabled() == FALSE`. All output is discarded by the Trace Buffer Extension when it is disabled.

This field resets to 0.

**Accessing the TRBLIMITR_EL1**

The PE might ignore a direct write to TRBLIMITR_EL1, other than a direct write that modifies TRBLIMITR_EL1.E, if TRBLIMITR_EL1.E == 1.

Accesses to this register use the following encodings:

```
MRS <Xt>, TRBLIMITR_EL1
```

<table>
<thead>
<tr>

TRBMAR_EL1, Trace Buffer Memory Attribute Register

The TRBMAR_EL1 characteristics are:

**Purpose**

Controls Trace Buffer Extension accesses to memory.

If the trace buffer pointers specify virtual addresses, the address properties are defined by the translation tables and this register is ignored.

**Configuration**

This register is present only when TRBE is implemented. Otherwise, direct accesses to TRBMAR_EL1 are undefined.

RW fields in this register reset to architecturally unknown values.

**Attributes**

TRBMAR_EL1 is a 64-bit register.

**Field descriptions**

The TRBMAR_EL1 bit assignments are:

TRBTRG_EL1, Trace Buffer Trigger Counter Register

The TRBTRG_EL1 characteristics are:

**Purpose**

Specifies the number of bytes of trace to capture following a Detected Trigger before a Trigger Event.

**Configuration**

This register is present only when TRBE is implemented. Otherwise, direct accesses to TRBTRG_EL1 are UNDEFINED. RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

TRBTRG_EL1 is a 64-bit register.

**Field descriptions**

The TRBTRG_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit(s)</th>
<th>Assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>31-0</td>
<td>Trigger count (TRG).</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**TRG, bits [31:0]**

Trigger count.

Specifies the number of bytes of trace to capture following a Detected Trigger before a Trigger Event.

TRBTRG_EL1 decrements by 1 for every byte of trace written to the trace buffer when all of the following are true:

- TRBTRG_EL1 is nonzero.
- TRBSR_EL1.TRG is set to 1.

The architecture places restrictions on the values that software can write to the counter.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRBTRG_EL1**

The PE might ignore a direct write to TRBTRG_EL1 if TRBLIMITR_EL1.E == 1.

Accesses to this register use the following encodings:

<table>
<thead>

TRCACATR<n>, Address Comparator Access Type Register <n>, n = 0 - 15

The TRCACATR<n> characteristics are:

**Purpose**

Defines the type of access for the corresponding TRCACVR<n> Register. This register configures the context type, Exception levels, alignment, masking that is applied by the Address Comparator, and how the Address Comparator behaves when it is one half of an Address Range Comparator.

**Configuration**

AArch64 System register TRCACATR<n> bits [63:0] are architecturally mapped to External register TRCACATR<n>[63:0].

This register is present only when ETE is implemented and TRCIDR4.NUMACPAIRS * 2 > n. Otherwise, direct accesses to TRCACATR<n> are UNDEFINED.

**Attributes**

TRCACATR<n> is a 64-bit register.

**Field descriptions**

The TRCACATR<n> bit assignments are:

<table>
<thead>
<tr>
<th>Bit Location</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:15</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>14</td>
<td>EXLEVEL_NS_EL2, bit [14]</td>
</tr>
<tr>
<td></td>
<td>When Non-secure EL2 is implemented:</td>
</tr>
<tr>
<td></td>
<td>Non-secure EL2 address comparison control. Controls whether a comparison can occur at EL2 in Non-secure state.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>0b0</td>
</tr>
<tr>
<td></td>
<td>0b1</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
EXLEVEL_NS_EL1, bit [13]

When Non-secure EL1 is implemented:
Non-secure EL1 address comparison control. Controls whether a comparison can occur at EL1 in Non-secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_NS_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Address Comparator performs comparisons in Non-secure EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Address Comparator does not perform comparisons in Non-secure EL1.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

EXLEVEL_NS_EL0, bit [12]

When Non-secure EL0 is implemented:
Non-secure EL0 address comparison control. Controls whether a comparison can occur at EL0 in Non-secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_NS_EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Address Comparator performs comparisons in Non-secure EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Address Comparator does not perform comparisons in Non-secure EL0.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

EXLEVEL_S_EL3, bit [11]

When HaveEL(EL3):
Secure EL3 address comparison control. Controls whether a comparison can occur at EL3 in Secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Address Comparator performs comparisons in Secure EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Address Comparator does not perform comparisons in Secure EL3.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

EXLEVEL_S_EL2, bit [10]

When HaveEL(EL2) and ARMv8.4-SecEL2 is implemented:
Secure EL2 address comparison control. Controls whether a comparison can occur at EL2 in Secure state.
EXLEVEL_S_EL2

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Address Comparator performs comparisons in Secure EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Address Comparator does not perform comparisons in Secure EL2.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL1, bit [9]

When Secure EL1 is implemented:

Secure EL1 address comparison control. Controls whether a comparison can occur at EL1 in Secure state.

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Address Comparator performs comparisons in Secure EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Address Comparator does not perform comparisons in Secure EL1.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL0, bit [8]

When Secure EL0 is implemented:

Secure EL0 address comparison control. Controls whether a comparison can occur at EL0 in Secure state.

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Address Comparator performs comparisons in Secure EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Address Comparator does not perform comparisons in Secure EL0.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [7]

Reserved, RES0.

CONTEXT, bits [6:4]

Selects a Context Identifier Comparator or Virtual Context Identifier Comparator:
The width of this field is dependent on the maximum number of Context Identifier Comparators or Virtual Context Identifier Comparators implemented. Unimplemented bits are RES0.

If TRCIDR4.UMCIDC == 0b0000 and TRCIDR4.VMVMIDC == 0b0000, then this field is RES0.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**CONTEXTTYPE, bits [3:2]**

Controls whether the Address Comparator is dependent on a Context Identifier Comparator, a Virtual Context Identifier Comparator, or both comparisons:

<table>
<thead>
<tr>
<th>CONTEXTTYPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The Address Comparator is not dependent on the Context Identifier Comparators or Virtual Context Identifier Comparators.</td>
</tr>
<tr>
<td>0b01</td>
<td>The Address Comparator is dependent on the Context Identifier Comparator that the CONTEXT field specifies. If both the Context Identifier Comparator and the address comparison match, the Address Comparator signals a match.</td>
</tr>
<tr>
<td>0b10</td>
<td>The Address Comparator is dependent on the Virtual Context Identifier Comparator that the CONTEXT field specifies. If both the Virtual Context Identifier Comparator and the address comparison match, the Address Comparator signals a match.</td>
</tr>
<tr>
<td>0b11</td>
<td>The Address Comparator is dependent on the Context Identifier Comparator and Virtual Context Identifier Comparator that the CONTEXT field specifies. If the Context Identifier Comparator, the Virtual Context Identifier Comparator and address comparison all match, the Address Comparator signals a match.</td>
</tr>
</tbody>
</table>

If TRCIDR4.UMCIDC == 0b0000, then bit [2] is RES0.

If TRCIDR4.VMVMIDC == 0b0000, then bit [3] is RES0.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Bits [1:0]**

Reserved, RES0.

**Accessing the TRCACATR<n>**

Must be programmed if any of the following are true:

- TRCBBCtlr.RANGE[n/2] == 0b1.
- TRCRSCTLR<a>.GROUP == 0b0100 and TRCRSCTLR<a>.SAC[n] == 0b1.
- TRCRSCTLR<a>.GROUP == 0b0101 and TRCRSCTLR<a>.ARC[n/2] == 0b1.
- TRCVIIECTLR.EXCLUDE[n/2] == 0b1.
- TRCVIIECTLR.INCLUDE[n/2] == 0b1.
• TRCVISSCTLR.START[n] == 0b1.
• TRCVISSCTLR.STOP[n] == 0b1.
• TRCSSCCR<>.ARC[n/2] == 0b1.
• TRCSSCCR<>.SAC[n] == 0b1.
• TRCQCTLR.RANGE[n/2] == 0b1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

**ADDRESS, bits [63:0]**

Address Value.

The Address Comparators can support implementations that use multiple address widths. When the trace unit compares the ADDRESS field with an address that has a width less than this field, then the address must be zero-extended to the ADDRESS field width. The trace unit then compares all implemented bits. For example, in a system that supports both 32-bit and 64-bit addresses, when the PE is in AArch32 state the comparator must zero-extend the 32-bit address and compare against the full 64 bits that are stored in the TRCACVR<n>. This requires that the trace analyzer always programs all implemented bits of the TRCACVR<n>.

The result of writing a value other than all zeros or all ones to ADDRESS at bits[63:P] is an UNKNOWN value, where P is defined as the virtual address size supported by the PE.

The result of writing a value of all zeros or all ones to ADDRESS at bits[63:P] is the written value, and a read of the register returns the written value.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCACVR<n>**

Must be programmed if any of the following are true:

- TRCBBCTLR.RANGE[n/2] == 0b1.
- TRCRSCTLR<a>.GROUP == 0b0100 and TRCRSCTLR<a>.SAC[n] == 0b1.
- TRCRSCTLR<a>.GROUP == 0b0101 and TRCRSCTLR<a>.ARC[n/2] == 0b1.
TRCVIIECTLR.EXCLUDE[n/2] == 0b1.
TRCVIIECTLR.INCLUDE[n/2] == 0b1.
TRCVISSCTLR.START[n] == 0b1.
TRCVISSCTLR.STOP[n] == 0b1.
TRCSSCCR<=.ARC[n/2] == 0b1.
TRCSSCCR<=.SAC[n] == 0b1.
TRCOCTL.RANGE[n/2] == 0b1.

Writes are CONSTRANED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

The TRCAUTHSTATUS characteristics are:

**Purpose**

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

For additional information see the CoreSight Architecture Specification.

**Configuration**

AArch64 System register TRCAUTHSTATUS bits [31:0] are architecturally mapped to External register TRCAUTHSTATUS[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCAUTHSTATUS are UNDEFINED.

**Attributes**

TRCAUTHSTATUS is a 64-bit register.

**Field descriptions**

The TRCAUTHSTATUS bit assignments are:

<table>

<td>Implemented and enabled.</td>
</tr>
</tbody>
</table>

All other values are reserved.

When EL3 is implemented, this field reads as 0b11.

When EL3 is not implemented and the PE is Non-secure, this field reads as 0b11.

When EL3 is not implemented and the PE is Secure, this field reads as 0b00.

**NSID, bits [1:0]**

Non-secure Invasive Debug. Indicates whether Non-secure invasive debug features are implemented and enabled.

<table>
<thead>
<tr>
<th>NSID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-secure invasive debug features not implemented.</td>
</tr>
<tr>
<td>0b10</td>
<td>Implemented and disabled.</td>
</tr>
<tr>
<td>0b11</td>
<td>Implemented and enabled.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b00.

**Accessing the TRCAUTHSTATUS**

For implementations that support multiple access mechanisms, different access mechanisms can return different values for reads of TRCAUTHSTATUS if the authentication signals have changed and that change has not yet been synchronized by a Context synchronization event. This scenario can happen if, for example, the external debugger view is implemented separately from the system instruction view to allow for separate power domains, and so observes changes on the signals differently.

Accesses to this register use the following encodings:

```
MRS <Xt>, TRCAUTHSTATUS
```

<table>

TRCCCCTLR, Cycle Count Control Register

The TRCCCCTLR characteristics are:

**Purpose**

Set the threshold value for cycle counting.

**Configuration**

AArch64 System register TRCCCCTLR bits [31:0] are architecturally mapped to External register TRCCCCTLR[31:0].

This register is present only when ETE is implemented and TRCIDR0.TRCCCI == 0b1. Otherwise, direct accesses to TRCCCCTLR are UNDEFINED.

**Attributes**

TRCCCCTLR is a 64-bit register.

**Field descriptions**

The TRCCCCTLR bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RES0 | THRESHOLD |

**Bits [63:12]**

Reserved, RES0.

**THRESHOLD, bits [11:0]**

Sets the threshold value for instruction trace cycle counting.

The minimum threshold value that can be programmed into THRESHOLD is given in TRCIDR3.CCITMIN. If the THRESHOLD value is smaller than the value in TRCIDR3.CCITMIN then the behavior is CONSTRAINED UNPREDICTABLE. That is, cycle counts might or might not be included in the trace and the cycle count threshold is not known.

Writing a value of zero when TRCCONFIGR.CCI is set to enable instruction trace cycle counting, results in CONSTRAINED UNPREDICTABLE behavior. That is, cycle counts might or might not be included in the trace and the cycle count threshold is not known.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCCCCTLR**

Must be programmed if TRCCONFIGR.CCI == 0b1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

MRS <Xt>, TRCCCCTLR

MSR TRCCCCTLR, <Xt>
TRCCIDCCTRLR0, Context Identifier Comparator Control Register 0

The TRCCIDCCTRLR0 characteristics are:

**Purpose**

Contains Context identifier mask values for the TRCCIDCVR<n> registers, for n = 0 to 3.

**Configuration**

AArch64 System register TRCCIDCCTRLR0 bits [31:0] are architecturally mapped to External register TRCCIDCCTRLR0[31:0].

This register is present only when ETE is implemented, TRCIDR4.NUMCIDC > 0x0 and TRCIDR2.CIDSIZE > 0b00000. Otherwise, direct accesses to TRCCIDCCTRLR0 are UNDEFINED.

**Attributes**

TRCCIDCCTRLR0 is a 64-bit register.

**Field descriptions**

The TRCCIDCCTRLR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
</tr>
<tr>
<td>62</td>
<td>COMP3&lt;m&gt;, bit [m+24]</td>
</tr>
<tr>
<td>61</td>
<td>COMP2&lt;m&gt;, bit [m+16]</td>
</tr>
<tr>
<td>60</td>
<td>COMP1&lt;m&gt;, bit [m+8]</td>
</tr>
<tr>
<td>59</td>
<td>COMP0&lt;m&gt;, bit [m]</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**COMP3<m>, bit [m+24], for m = 0 to 7**

When TRCIDR4.NUMCIDC > 3:

TRCCIDCVR3 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR3. Each bit in this field corresponds to a byte in TRCCIDCVR3.

<table>
<thead>
<tr>
<th>COMP3&lt;m&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCCIDCVR3[(m×8+7):(m×8)] when it performs the Context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCCIDCVR3[(m×8+7):(m×8)] when it performs the Context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= TRCIDR2.CIDSIZE.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**COMP2<m>, bit [m+16], for m = 0 to 7**
When TRCIDR4.NUMCIDC > 2:

TRCCIDCVR2 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR2. Each bit in this field corresponds to a byte in TRCCIDCVR2.

<table>
<thead>
<tr>
<th>COMP2&lt;\texttt{m}&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0}</td>
<td>The trace unit includes TRCCIDCVR2((m\times8+7):(m\times8)) when it performs the Context identifier comparison.</td>
</tr>
<tr>
<td>\texttt{0b1}</td>
<td>The trace unit ignores TRCCIDCVR2((m\times8+7):(m\times8)) when it performs the Context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is RES0 if \(m \geq \text{TRCIDR2.CIDSIZE}\).

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

\textbf{COMP1<\texttt{m}>}, bit \([m+8]\), for \(m = 0\) to 7

When TRCIDR4.NUMCIDC > 1:

TRCCIDCVR1 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR1. Each bit in this field corresponds to a byte in TRCCIDCVR1.

<table>
<thead>
<tr>
<th>COMP1&lt;\texttt{m}&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0}</td>
<td>The trace unit includes TRCCIDCVR1((m\times8+7):(m\times8)) when it performs the Context identifier comparison.</td>
</tr>
<tr>
<td>\texttt{0b1}</td>
<td>The trace unit ignores TRCCIDCVR1((m\times8+7):(m\times8)) when it performs the Context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is RES0 if \(m \geq \text{TRCIDR2.CIDSIZE}\).

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

\textbf{COMP0<\texttt{m}>}, bit \([m]\), for \(m = 0\) to 7

When TRCIDR4.NUMCIDC > 0:

TRCCIDCVR0 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR0. Each bit in this field corresponds to a byte in TRCCIDCVR0.

<table>
<thead>
<tr>
<th>COMP0&lt;\texttt{m}&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0}</td>
<td>The trace unit includes TRCCIDCVR0((m\times8+7):(m\times8)) when it performs the Context identifier comparison.</td>
</tr>
<tr>
<td>\texttt{0b1}</td>
<td>The trace unit ignores TRCCIDCVR0((m\times8+7):(m\times8)) when it performs the Context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is RES0 if \(m \geq \text{TRCIDR2.CIDSIZE}\).

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
Accessing the TRCCIDCCTLR0

If software uses the TRCCIDCVR<n> registers, for n = 0 to 3, then it must program this register.

If software sets a mask bit to 0b1 then it must program the relevant byte in TRCCIDCVR<n> to 0x00.

If any bit is 0b1 and the relevant byte in TRCCIDCVR<n> is not 0x00, the behavior of the Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

MRS <Xt>, TRCCIDCCTLR0

TRCCIDCVR<n> is a 64-bit register.

**Field descriptions**

The TRCCIDCVR<n> bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| VALUE | VALUE |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |

**VALUE, bits [63:0]**

Context identifier value. The width of this field is indicated by TRCIDR2.CIDSIZE. Unimplemented bits are RES0. After a PE Reset, the trace unit assumes that the Context identifier is zero until the PE updates the Context identifier.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCCIDCVR<n>**

Must be programmed if any of the following are true:

- TRCRSCLTR<a>.GROUP == 0b0110 and TRCRSCLTR<a>.CID[n] == 0b1.
- TRCACATR<a>.CONTEXTTYPE == 0b01 or 0b11 and TRCACATR<a>.CONTEXT == n.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10</td>
<td>0b001</td>
<td>0b0011</td>
<td>n[2:0]:0b0</td>
<td>0b000</td>
</tr>
</tbody>
</table>

TRCCLAIMCLR, Claim Tag Clear Register

The TRCCLAIMCLR characteristics are:

**Purpose**

In conjunction with TRCCLAIMSET, provides Claim Tag bits that can be separately set and cleared to indicate whether functionality is in use by a debug agent.

For additional information see the CoreSight Architecture Specification.

**Configuration**

AArch64 System register TRCCLAIMCLR bits [31:0] are architecturally mapped to External register TRCCLAIMCLR[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCCLAIMCLR are UNDEFINED.

**Attributes**

TRCCLAIMCLR is a 64-bit register.

**Field descriptions**

The TRCCLAIMCLR bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLR&lt;m&gt;</td>
<td>Claim Tag Clear. Indicates the current status of the Claim Tag bit m, and is used to clear Claim Tag bit m to 0b0.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>CLR&lt;m&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>On a read: Claim Tag bit m is not set. On a write: Ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>On a read: Claim Tag bit m is set. On a write: Clear Claim tag bit m to 0b0.</td>
</tr>
</tbody>
</table>

The number of Claim Tag bits implemented is indicated in TRCCLAIMSET.

On a Trace unit reset, this field resets to 0.

**Accessing the TRCCLAIMCLR**

Accesses to this register use the following encodings:

TRCCLAIMSET, Claim Tag Set Register

The TRCCLAIMSET characteristics are:

Purpose

In conjunction with TRCCLAIMCLR, provides Claim Tag bits that can be separately set and cleared to indicate whether functionality is in use by a debug agent.

For additional information see the CoreSight Architecture Specification.

Configuration

AArch64 System register TRCCLAIMSET bits [31:0] are architecturally mapped to External register TRCCLAIMSET[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCCLAIMSET are UNDEFINED.

The number of claim tag bits implemented is IMPLEMENTATION DEFINED. Arm recommends that implementations support a minimum of four claim tag bits, that is, SET[3:0] reads as 0b1111.

Attributes

TRCCLAIMSET is a 64-bit register.

TRCCNTCTRLR\(<n>\), Counter Control Register \(<n>\), n = 0 - 3

The TRCCNTCTRLR\(<n>\) characteristics are:

**Purpose**

Controls the operation of Counter \(<n>\).

**Configuration**

AArch64 System register TRCCNTCTRLR\(<n>\) bits [31:0] are architecturally mapped to External register TRCCNTCTRLR\(<n>\[31:0].

This register is present only when ETE is implemented and TRCIDR5.NUMCNTR > n. Otherwise, direct accesses to TRCCNTCTRLR\(<n>\) are **UNDEFINED**.

**Attributes**

TRCCNTCTRLR\(<n>\) is a 64-bit register.

**Field descriptions**

The TRCCNTCTRLR\(<n>\) bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Bit Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 - 18</td>
<td>Reserved, RES0</td>
<td></td>
</tr>
<tr>
<td>17</td>
<td>CNTCHAIN</td>
<td>For TRCCNTCTRLR3 and TRCCNTCTRLR1, this bit controls whether the Counter decrements when a reload event occurs for Counter (&lt;n-1&gt;).</td>
</tr>
<tr>
<td>16</td>
<td>RLDSELF</td>
<td>Controls whether a reload event occurs for the Counter, when the Counter reaches zero.</td>
</tr>
</tbody>
</table>

CNTCHAIN is not implemented for TRCCNTCTRLR0 and TRCCNTCTRLR2.

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

RLDSELF, bit [16]

Controls whether a reload event occurs for the Counter, when the Counter reaches zero.
On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**RLDEVENT_TYPE, bit [15]**

Chooses the type of Resource Selector.

Selects an event, that when it occurs causes a reload event for Counter <n>.

<table>
<thead>
<tr>
<th>RLDEVENT_TYPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A single Resource Selector: TRCCNTCTRL&lt;n&gt;.RLDEVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Boolean-combined pair of Resource Selectors. TRCCNTCTRL&lt;n&gt;.RLDEVENT.SEL[3:0] selects the Resource Selector pair; from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCCNTCTRL&lt;n&gt;.RLDEVENT.SEL[4] is RES.0.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Bits [14:13]**

Reserved, RES.0.

**RLDEVENT_SEL, bits [12:8]**

Defines the selected Resource Selector or pair of Resource Selectors. TRCCNTCTRL<n>.RLDEVENT.TYPE controls whether TRCCNTCTRL<n>.RLDEVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Selects an event, that when it occurs causes a reload event for Counter <n>.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**CNTEVENT_TYPE, bit [7]**

Chooses the type of Resource Selector.

Selects an event, that when it occurs causes Counter <n> to decrement.

<table>
<thead>
<tr>
<th>CNTEVENT_TYPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A single Resource Selector: TRCCNTCTRL&lt;n&gt;.CNTEVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Boolean-combined pair of Resource Selectors. TRCCNTCTRL&lt;n&gt;.CNTEVENT.SEL[3:0] selects the Resource Selector pair; from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCCNTCTRL&lt;n&gt;.CNTEVENT.SEL[4] is RES.0.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
Reserved, RES0.

CNTEVENT_SEL, bits [4:0]

Defines the selected Resource Selector or pair of Resource Selectors. TRCCNTCTR<n>.CNTEVENT.TYPE controls whether TRCCNTCTR<n>.CNTEVENT_SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Selects an event, that when it occurs causes Counter <n> to decrement.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing the TRCCNTCTR<n>

Must be programmed if TRCRSCTR<a>.GROUP == 0b0010 and TRCRSCTR<a>.COUNTERS[n] == 0b1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

        TRCCNTCTLR[UInt(CRm<1:0>)] = X[t];
    end if
TRCCNTRLDVR\(n\), Counter Reload Value Register \(n\), \(n = 0 - 3\)

The TRCCNTRLDVR\(n\) characteristics are:

**Purpose**

This sets or returns the reload count value for Counter \(n\).

**Configuration**

AArch64 System register TRCCNTRLDVR\(n\) bits \([31:0]\) are architecturally mapped to External register TRCCNTRLDVR\(n\)[31:0].

This register is present only when ETE is implemented and TRCIDR5.NUMCNTR > \(n\). Otherwise, direct accesses to TRCCNTRLDVR\(n\) are **UNDEFINED**.

**Attributes**

TRCCNTRLDVR\(n\) is a 64-bit register.

**Field descriptions**

The TRCCNTRLDVR\(n\) bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-16</td>
<td>Reserved, RESO</td>
<td>0</td>
</tr>
<tr>
<td>15-0</td>
<td>VALUE</td>
<td>0</td>
</tr>
</tbody>
</table>

**Bits [63:16]**

Reserved, RESO.

**VALUE, bits [15:0]**

Contains the reload value for Counter \(n\). When a reload event occurs for Counter \(n\) then the trace unit copies the VALUE\(n\) field into Counter \(n\).

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the TRCCNTRLDVR\(n\)**

Must be programmed if TRCRSCTL\(a\).GROUP == 0b0010 and TRCRSCTL\(a\).COUNTERS[\(n\)] == 0b1.

Writes are **CONSTRAINED UNPREDICTABLE** if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>

The TRCDEVARCH characteristics are:

**Purpose**

Provides discovery information for the component.

For additional information see the CoreSight Architecture Specification.

**Configuration**

AArch64 System register TRCDEVARCH bits [31:0] are architecturally mapped to External register TRCDEVARCH[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCDEVARCH are UNDEFINED.

**Attributes**

TRCDEVARCH is a 64-bit register.

**Field descriptions**

The TRCDEVARCH bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | ARCHITECT | PRESENT | REVISION | ARCHVER | ARCHPART |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:32]**

Reserved, RES0.

**ARCHITECT, bits [31:21]**

Architect. Defines the architect of the component. Bits [31:28] are the JEP106 continuation code (JEP106 bank ID, minus 1) and bits [27:21] are the JEP106 ID code.

<table>
<thead>
<tr>
<th>ARCHITECT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01000111011</td>
<td>JEP106 continuation code 0x4, ID code 0x3B. Arm Limited.</td>
</tr>
</tbody>
</table>

Other values are defined by the JEDEC JEP106 standard.

This field reads as 0x23B.

**PRESENT, bit [20]**

DEVARCH Present. Defines that the DEVARCH register is present.

<table>
<thead>
<tr>
<th>PRESENT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Device Architecture information not present.</td>
</tr>
<tr>
<td>0b1</td>
<td>Device Architecture information present.</td>
</tr>
</tbody>
</table>

This bit reads as 0b1.
REVISION, bits [19:16]

Revision. Defines the architecture revision of the component.

<table>
<thead>
<tr>
<th>REVISION</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>ETE Version 1.0.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component.

<table>
<thead>
<tr>
<th>ARCHVER</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0101</td>
<td>ETE Version 1.</td>
</tr>
</tbody>
</table>

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHVER is ARCHID[15:12]. This field reads as 0x5.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

<table>
<thead>
<tr>
<th>ARCHPART</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0xA13    | Arm PE trace architecture.

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHPART is ARCHID[11:0]. This field reads as 0xA13.

Accessing the TRCDEVARCH

Accesses to this register use the following encodings:

**TRCEVENTCTL0R, Event Control 0 Register**

The TRCEVENTCTL0R characteristics are:

### Purpose

Controls the generation of ETEEvents.

### Configuration

AArch64 System register TRCEVENTCTL0R bits [31:0] are architecturally mapped to External register TRCEVENTCTL0R[31:0].

This register is present only when ETE is implemented and TRCIDR4.NUMRSPAIR != 0b0000. Otherwise, direct accesses to TRCEVENTCTL0R are **UNDEFINED**.

### Attributes

TRCEVENTCTL0R is a 64-bit register.

### Field descriptions

The TRCEVENTCTL0R bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 |

TRCEVENTCTL1R, Event Control 1 Register

The TRCEVENTCTL1R characteristics are:

Purpose

Controls the behavior of the ETEEvents that TRCEVENTCTRL0R selects.

Configuration

AArch64 System register TRCEVENTCTL1R bits [31:0] are architecturally mapped to External register TRCEVENTCTL1R[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCEVENTCTL1R are UNDEFINED.

Attributes

TRCEVENTCTL1R is a 64-bit register.

Field descriptions

The TRCEVENTCTL1R bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-13</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>12</td>
<td>LPOVERRIDE, bit [12]</td>
</tr>
<tr>
<td>11</td>
<td>ATB, bit [11]</td>
</tr>
</tbody>
</table>

LPOVERRIDE, bit [12]

When TRCIDR5.LPOVERRIDE == 0b1:

Low-power Override Mode select.

<table>
<thead>
<tr>
<th>LPOVERRIDE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Trace unit Low-power Override Mode is not enabled. That is, the trace unit is permitted to enter low-power state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trace unit Low-power Override Mode is enabled. That is, entry to a low-power state does not affect the trace unit resources or trace generation.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

ATB, bit [11]

When TRCIDR5.ATBTRIG == 0b1:

AMBA Trace Bus (ATB) trigger enable.
If a CoreSight ATB interface is implemented then when ETEEvent 0 occurs the trace unit sets:

- \( \text{ATID} = \text{0x7D} \).
- \( \text{ATDATA} \) to the value of \text{TRCTRACEIDR}.

If the width of ATDATA is greater than the width of \text{TRCTRACEIDR}.TRACEID then the trace unit zeros the upper ATDATA bits.

If ETEEvent 0 is programmed to occur based on program execution, such as an Address Comparator, the ATB trigger might not be inserted into the ATB stream at the same time as any trace generated by that program execution is output by the trace unit. Typically, the generated trace might be buffered in a trace unit which means that the ATB trigger would be output before the associated trace is output.

If ETEEvent 0 is asserted multiple times in close succession, the trace unit is required to generate an ATB trigger for the first assertion, but might ignore one or more of the subsequent assertions. Arm recommends that the window in which ETEEvent 0 is ignored is limited only by the time taken to output an ATB trigger.

<table>
<thead>
<tr>
<th>ATB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ATB trigger is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>ATB trigger is enabled.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

**Bits [10:4]**

Reserved, RES0.

**INSTEN\(<m>\), bit \([m]\), for \(m = 0\) to \(3\)**

Event element control.

<table>
<thead>
<tr>
<th>INSTEN(&lt;m&gt;)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit does not generate an Event element (m).</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit generates an Event element (m).</td>
</tr>
</tbody>
</table>

This bit is RES0 if \(m \geq \) the number indicated by \text{TRCIDR0}.NUMEVENT.

**Accessing the TRCEVENTCTL1R**

Must be programmed.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

The TRCEXTINSELR<n> characteristics are:

**Purpose**

Use this to set, or read, which External Inputs are resources to the trace unit.

**Configuration**

AArch64 System register TRCEXTINSELR<n> bits [31:0] are architecturally mapped to External register TRCEXTINSELR<n>[31:0].

This register is present only when ETE is implemented and TRCIDR5.NUMEXTINSEL > n. Otherwise, direct accesses to TRCEXTINSELR<n> are UNDEFINED.

**Attributes**

TRCEXTINSELR<n> is a 64-bit register.

**Field descriptions**

The TRCEXTINSELR<n> bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RES0 | evtCount |

**Bits [63:16]**

Reserved, RES0.

**evtCount, bits [15:0]**

PMU event to select.

The event number as defined by the Arm ARM.

Software must program this field with a PMU event that is supported by the PE being programmed.

There are three ranges of PMU event numbers:

- PMU event numbers in the range 0x0000 to 0x003F are common architectural and microarchitectural events.
- PMU event numbers in the range 0x0040 to 0x00FF are Arm recommended common architectural and microarchitectural PMU events.
- PMU event numbers in the range 0x00C0 to 0x03FF are IMPLEMENTATION DEFINED PMU events.

If evtCount is programmed to a PMU event that is reserved or not supported by the PE, the behavior depends on the PMU event type:

- For the range 0x0000 to 0x003F, then the PMU event is not active, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED PMU events, it is UNPREDICTABLE what PMU event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

UNPREDICTABLE means the PMU event must not expose privileged information.
Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include a PMU event from a set of common IMPLEMENTATION DEFINED PMU events, then no PMU event is counted and the value read back on evtCount is the value written.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCEXTINSELR<n>**

Must be programmed if any of the following is true: TRCRSCTRLR<a>.GROUP == 0b0000 and TRCRSCTRLR<a>.EXTIN[n] == 0b1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

**MRS <Xt>, TRCEXTINSELR<n>**

**COMMOPT, bit [29]**

Indicates how the commit field in Cycle count packets is interpreted.

<table>
<thead>
<tr>
<th>COMMOPT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Commit mode 0. Cycle count packets includes the Commit element to which the Cycle Count element is attached.</td>
</tr>
<tr>
<td>0b1</td>
<td>Commit mode 1. Cycle count packets do not include Commit elements. The Cycle Count element is attached to the most recent Commit element.</td>
</tr>
</tbody>
</table>

This bit reads-as-one if TRCIDR0.TRCCCI == 0b1 and TRCIDR0.MAXSPEC == 0x0. This bit reads-as-zero if TRCIDR0.TRCCCI == 0b0.
**TSSIZE, bits [28:24]**

Indicates that the trace unit implements Global timestamping and the size of the timestamp value.

<table>
<thead>
<tr>
<th>TSSIZE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>Global timestamping not implemented.</td>
</tr>
<tr>
<td>0b010000</td>
<td>Global timestamping implemented with a 64-bit timestamp value.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b01000.

**Bits [23:18]**

Reserved, RES0.

**TRCEXDATA, bit [17]**

*When TRCIDR0.TRCDATA != 0b00:*

Indicates if the trace unit implements tracing of data transfers for exceptions and exception returns. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

<table>
<thead>
<tr>
<th>TRCEXDATA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Tracing of data transfers for exceptions and exception returns not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Tracing of data transfers for exceptions and exception returns implemented.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

**QSUPP, bits [16:15]**

Indicates that the trace unit implements Q element support.

<table>
<thead>
<tr>
<th>QSUPP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Q element support is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Q element support is implemented, and only supports Q elements with instruction counts.</td>
</tr>
<tr>
<td>0b10</td>
<td>Q element support is implemented, and only supports Q elements without instruction counts.</td>
</tr>
<tr>
<td>0b11</td>
<td>Q element support is implemented, and supports:</td>
</tr>
<tr>
<td></td>
<td>• Q elements with instruction counts.</td>
</tr>
<tr>
<td></td>
<td>• Q elements without instruction counts.</td>
</tr>
</tbody>
</table>

**QFILT, bit [14]**

*When TRCIDR0.QSUPP != 0b00:*

Indicates if the trace unit implements Q element filtering.

<table>
<thead>
<tr>
<th>QFILT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Q element filtering is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Q element filtering is implemented.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.
CONDTYPE, bits [13:12]

When TRCIDR0.TRCCOND == 0b1:

Indicates how conditional instructions are traced. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

<table>
<thead>
<tr>
<th>CONDTYPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Conditional instructions are traced with an indication of whether they pass or fail their condition code check.</td>
</tr>
<tr>
<td>0b01</td>
<td>Conditional instructions are traced with an indication of the APSR condition flags.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Otherwise:

Reserved, RES0.

NUMEVENT, bits [11:10]

When TRCIDR4.NUMRSPAIR == 0b0000:

Indicates the number of ETEEvents implemented.

<table>
<thead>
<tr>
<th>NUMEVENT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The trace unit supports 0 ETEEvents.</td>
</tr>
</tbody>
</table>

All other values are reserved.

When TRCIDR4.NUMRSPAIR != 0b0000:

Indicates the number of ETEEvents implemented.

<table>
<thead>
<tr>
<th>NUMEVENT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The trace unit supports 1 ETEEvent.</td>
</tr>
<tr>
<td>0b01</td>
<td>The trace unit supports 2 ETEEvents.</td>
</tr>
<tr>
<td>0b10</td>
<td>The trace unit supports 3 ETEEvents.</td>
</tr>
<tr>
<td>0b11</td>
<td>The trace unit supports 4 ETEEvents.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

RETSTACK, bit [9]

Indicates if the trace unit supports the return stack.

<table>
<thead>
<tr>
<th>RETSTACK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Return stack not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Return stack implemented.</td>
</tr>
</tbody>
</table>

Bit [8]

Reserved, RES0.

TRCCCI, bit [7]

Indicates if the trace unit implements cycle counting.
TRCCCI

<table>
<thead>
<tr>
<th>TRCCCI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counting not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Cycle counting implemented.</td>
</tr>
</tbody>
</table>

This bit reads as 0b1.

TRCOND, bit [6]

Indicates if the trace unit implements conditional instruction tracing. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures.

<table>
<thead>
<tr>
<th>TRCOND</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Conditional instruction tracing not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Conditional instruction tracing implemented.</td>
</tr>
</tbody>
</table>

This bit reads as 0b0.

TRCBB, bit [5]

Indicates if the trace unit implements branch broadcasting.

<table>
<thead>
<tr>
<th>TRCBB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Branch broadcasting not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Branch broadcasting implemented.</td>
</tr>
</tbody>
</table>

This bit reads as 0b1.

TRCDATA, bits [4:3]

Indicates if the trace unit implements data tracing. Data tracing is not implemented in ETE and this field is reserved for other trace architectures.

<table>
<thead>
<tr>
<th>TRCDATA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Data tracing not implemented.</td>
</tr>
<tr>
<td>0b11</td>
<td>Data tracing implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b00.

INSTP0, bits [2:1]

Indicates if load and store instructions are P0 instructions. Load and store instructions as P0 instructions is not implemented in ETE and this field is reserved for other trace architectures.

<table>
<thead>
<tr>
<th>INSTP0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Load and store instructions are not P0 instructions.</td>
</tr>
<tr>
<td>0b11</td>
<td>Load and store instructions are P0 instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b00.

Bit [0]

Reserved, RES1.

<tbody>
<tr>
<td>0b1111</td>
<td>If both TRCARCHMAJ and TRCARCHMIN == 0xF then refer to TRCDEVARCH.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b1111.
**TRCARCHMIN, bits [7:4]**

Minor architecture version.

<table>
<thead>
<tr>
<th>TRCARCHMIN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>If both TRCARCHMAJ and TRCARCHMIN == 0xF then refer to TRCDEVARCH.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b1111.

**REVISION, bits [3:0]**

Implementation revision.

Returns an IMPLEMENTATION DEFINED value that identifies the revision of:

- The trace registers.
- The OS Lock registers.

Arm recommends that the initial implementation sets REVISION == 0x0 and the field then increments for any subsequent implementations. However, it is acceptable to omit some values or use another scheme to identify the revision number.

Arm recommends that TRCPIDR2.REVISION == TRCIDR1.REVISION. However, in situations where it is difficult to align these fields, such as with a metal layer fix then it is acceptable to change the REVISION fields independently.

**Accessing the TRCIDR1**

Accesses to this register use the following encodings:

```markdown
MRS <Xt>, TRCIDR1
```

<table>
<thead>
<tr>

TRCIDR10, ID Register 10

The TRCIDR10 characteristics are:

**Purpose**

Returns the tracing capabilities of the trace unit.

**Configuration**

AArch64 System register TRCIDR10 bits [31:0] are architecturally mapped to External register TRCIDR10[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCIDR10 are **UNDEFINED**.

**Attributes**

TRCIDR10 is a 64-bit register.

**Field descriptions**

The TRCIDR10 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

The TRCIDR2 characteristics are:

## Purpose

Returns the tracing capabilities of the trace unit.

## Configuration

AArch64 System register TRCIDR2 bits [31:0] are architecturally mapped to External register TRCIDR2[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCIDR2 are undefined.

## Attributes

TRCIDR2 is a 64-bit register.

## Field descriptions

The TRCIDR2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | WFXMODE | VMIDOPT | CCSIZE | DVSIZE | DASIZE | VMIDSIZE | CIDSIZE | IASIZE |

### Bits [63:32]

Reserved, RES0.

### WFXMODE, bit [31]

Indicates whether WFI and WFE instructions are classified as P0 instructions:

<table>
<thead>
<tr>
<th>WFXMODE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>WFI and WFE instructions are not classified as P0 instructions.</td>
</tr>
<tr>
<td>0b1</td>
<td>WFI and WFE instructions are classified as P0 instructions.</td>
</tr>
</tbody>
</table>

### VMIDOPT, bits [30:29]

When TRCIDR2.VMIDSIZE != 0b0000:

Indicates the options for Virtual context identifier selection.

<table>
<thead>
<tr>
<th>VMIDOPT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Virtual context identifier selection not supported. TRCCONFIGR.VMIDOPT is RES0.</td>
</tr>
<tr>

<tr>
<td>0b001000</td>
<td>Data value tracing has a maximum of 32-bit data values.</td>
</tr>
<tr>
<td>0b010000</td>
<td>Data value tracing has a maximum of 64-bit data values.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Reserved, RES0.

**DASIZE, bits [19:15]**

When TRCIDR0.TRCDATA != 0b00:

Indicates the data address size in bytes. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

<table>
<thead>
<tr>
<th>DASIZE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>Data address tracing not implemented.</td>
</tr>
<tr>
<td>0b001000</td>
<td>Data address tracing has a maximum of 32-bit data addresses.</td>
</tr>
<tr>
<td>0b010000</td>
<td>Data address tracing has a maximum of 64-bit data addresses.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Reserved, RES0.
VMIDSIZE, bits [14:10]

When HaveEL(EL2):

Indicates the trace unit Virtual context identifier size.

<table>
<thead>
<tr>
<th>VMIDSIZE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00000</td>
<td>Virtual context identifier tracing is not supported.</td>
</tr>
<tr>
<td>0b00001</td>
<td>8-bit Virtual context identifier size.</td>
</tr>
<tr>
<td>0b00010</td>
<td>16-bit Virtual context identifier size.</td>
</tr>
<tr>
<td>0b00100</td>
<td>32-bit Virtual context identifier size.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b00100.

Otherwise:

Reserved, RES0.

CIDSIZE, bits [9:5]

Indicates the Context identifier size.

<table>
<thead>
<tr>
<th>CIDSIZE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00000</td>
<td>Context identifier tracing is not supported.</td>
</tr>
<tr>
<td>0b00100</td>
<td>32-bit Context identifier size.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b00100.

IASIZE, bits [4:0]

Virtual instruction address size.

<table>
<thead>
<tr>
<th>IASIZE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01000</td>
<td>Maximum of 32-bit instruction address size.</td>
</tr>
<tr>
<td>0b01000</td>
<td>Maximum of 64-bit instruction address size.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b01000.

Accessing the TRCIDR2

Accesses to this register use the following encodings:

TRCIDR3, ID Register 3

The TRCIDR3 characteristics are:

**Purpose**

Returns the base architecture of the trace unit.

**Configuration**

AArch64 System register TRCIDR3 bits [31:0] are architecturally mapped to External register TRCIDR3[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCIDR3 are UNDEFINED.

**Attributes**

TRCIDR3 is a 64-bit register.

**Field descriptions**

The TRCIDR3 bit assignments are:

<table>
<thead>
<tr>

</table>

Bits [63:32]

Reserved, RES0.

**NOOVERFLOW, bit [31]**

Indicates if overflow prevention is implemented.

<table>
<thead>
<tr>
<th>NOOVERFLOW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Overflow prevention is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Overflow prevention is implemented.</td>
</tr>
</tbody>
</table>

**NUMPROC[2:0], bits [30:28]**

This field is bits[2:0] of NUMPROC[4:0].

Indicates the number of PEs available for tracing.

<table>
<thead>
<tr>
<th>NUMPROC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>The trace unit can trace one PE.</td>
</tr>
</tbody>
</table>

This field reads as 0b00000.

The NUMPROC field is split as follows:

- NUMPROC[2:0] is TRCIDR3[30:28].
- NUMPROC[4:3] is TRCIDR3[13:12].
SYSSTALL, bit [27]

When TRCIDR3.STALLCTL == 0b1:

Indicates if stalling of the PE is permitted.

<table>
<thead>
<tr>
<th>SYSSTALL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stalling of the PE is not permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stalling of the PE is permitted.</td>
</tr>
</tbody>
</table>

The value of this field might be dynamic and change based on system conditions.

Otherwise:

Reserved, RES0.

STALLCTL, bit [26]

Indicates if trace unit implements stalling of the PE.

<table>
<thead>
<tr>
<th>STALLCTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stalling of the PE is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stalling of the PE is implemented.</td>
</tr>
</tbody>
</table>

SYNCPR, bit [25]

Indicates if an implementation has a fixed synchronization period.

<table>
<thead>
<tr>
<th>SYNCPR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TRCSYNCPR is read-write so software can change the synchronization period.</td>
</tr>
<tr>
<td>0b1</td>
<td>TRCSYNCPR is read-only so the synchronization period is fixed.</td>
</tr>
</tbody>
</table>

This bit reads as 0b0.

TRCERR, bit [24]

Indicates forced tracing of System Error exceptions is implemented.

<table>
<thead>
<tr>
<th>TRCERR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Forced tracing of System Error exceptions is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Forced tracing of System Error exceptions is implemented.</td>
</tr>
</tbody>
</table>

This bit reads as 0b1.

Bit [23]

Reserved, RES0.

EXLEVEL_NS_EL2, bit [22]

Indicates if Non-secure EL2 implemented.

<table>
<thead>
<tr>
<th>EXLEVEL_NS_EL2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL2 is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL2 is implemented.</td>
</tr>
</tbody>
</table>

EXLEVEL_NS_EL1, bit [21]

Indicates if Non-secure EL1 implemented.
**EXLEVEL_NS_EL1**, bit [20]

Indicates if Non-secure EL1 implemented.

<table>
<thead>
<tr>
<th>EXLEVEL_NS_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL1 is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 is implemented.</td>
</tr>
</tbody>
</table>

**EXLEVEL_NS_EL0, bit [19]**

Indicates if Non-secure EL0 implemented.

<table>
<thead>
<tr>
<th>EXLEVEL_NS_EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL0 is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL0 is implemented.</td>
</tr>
</tbody>
</table>

**EXLEVEL_S_EL3, bit [19]**

Indicates if Secure EL3 implemented.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure EL3 is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure EL3 is implemented.</td>
</tr>
</tbody>
</table>

**EXLEVEL_S_EL2, bit [18]**

Indicates if Secure EL2 implemented.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure EL2 is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure EL2 is implemented.</td>
</tr>
</tbody>
</table>

**EXLEVEL_S_EL1, bit [17]**

Indicates if Secure EL1 implemented.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure EL1 is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure EL1 is implemented.</td>
</tr>
</tbody>
</table>

**EXLEVEL_S_EL0, bit [16]**

Indicates if Secure EL0 implemented.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure EL0 is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure EL0 is implemented.</td>
</tr>
</tbody>
</table>

**Bits [15:14]**

Reserved, RES0.

**NUMPROC[4:3], bits [13:12]**

This field is bits[4:3] of NUMPROC[4:0].

See NUMPROC[2:0] for the field description.

**CCITMIN, bits [11:0]**

When TRCIDR0.TRCCI == 0b1:

Indicates the minimum value that can be programmed in TRCCTLR.THRESHOLD.

When cycle counting in the instruction trace is supported, that is TRCIDR0.TRCCI == 0b1, then the minimum value of this field is 0x001.
Otherwise:

Reserved, RES0.

**Accessing the TRCIDR3**

Accesses to this register use the following encodings:

</tr>
</tbody>
</table>

All other values are reserved.

### Bits [11:9]

Reserved, RES0.

### SUPPDAC, bit [8]

When TRCIDR4.NUMACPAIRS ! = 0b0000:

Indicates whether data address comparisons are implemented. Data address comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>Binary Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data address comparisons not implemented.</td>
<td>0b0</td>
</tr>
<tr>
<td>Data address comparisons implemented.</td>
<td>0b1</td>
</tr>
</tbody>
</table>

This bit reads as 0b0.

Otherwise:

Reserved, RES0.

### NUMDVC, bits [7:4]

Indicates the number of data value comparators. Data value comparators are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.
<table>
<thead>
<tr>
<th>NUMDVC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>

<tr>
<td>0b100</td>
<td>Four Counters implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field is RES0 if TRCIDR4.NUMRSPAIR == 0b0000.

**NUMSEQSTATE, bits [27:25]**

Indicates if the Sequencer is implemented and the number of Sequencer states that are implemented.

<table>
<thead>
<tr>
<th>NUMSEQSTATE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>The Sequencer is not implemented.</td>
</tr>
<tr>
<td>0b100</td>
<td>Four Sequencer states are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field is RES0 if TRCIDR4.NUMRSPAIR == 0b0000.
Bit [24]
Reserved, RES0.

LPOVERRIDE, bit [23]
Indicates support for Low-power Override Mode.

<table>
<thead>
<tr>
<th>LPOVERRIDE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit does not support Low-power Override Mode.</td>

</tbody>
</table>

ATBTRIG, bit [22]
Indicates if the implementation can support ATB triggers.

<table>
<thead>
<tr>
<th>ATBTRIG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The implementation does not support ATB triggers.</td>
</tr>
<tr>
<td>0b1</td>
<td>The implementation supports ATB triggers.</td>
</tr>
</tbody>
</table>

This bit is RES0 if TRCIDR4.NUMRSPAIR == 0b0000.

TRACEIDSIZE, bits [21:16]
Indicates the trace ID width.

<table>
<thead>
<tr>
<th>TRACEIDSIZE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>The external trace interface is not implemented.</td>
</tr>
<tr>
<td>0b000111</td>
<td>The implementation supports a 7-bit trace ID.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Note that AMBA ATB requires a 7-bit trace ID width.

Bits [15:12]
Reserved, RES0.

NUMEXTINSEL, bits [11:9]
Indicates how many External Input Selector resources are implemented.

<table>
<thead>
<tr>
<th>NUMEXTINSEL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>No External Input Selector resources are available.</td>
</tr>
<tr>
<td>0b001</td>

TRCIMSPEC<n>, IMP DEF Register <n>, n = 1 - 7

The TRCIMSPEC<n> characteristics are:

**Purpose**

These registers might return information that is specific to an implementation, or enable features specific to an implementation to be programmed. The product Technical Reference Manual describes these registers.

**Configuration**

AArch64 System register TRCIMSPEC<n> bits [31:0] are architecturally mapped to External register TRCIMSPEC<n>[31:0].

This register is present only when the trace unit implements this OPTIONAL register and ETE is implemented. Otherwise, direct accesses to TRCIMSPEC<n> are **UNDEFINED**.

**Attributes**

TRCIMSPEC<n> is a 64-bit register.

**Field descriptions**

The TRCIMSPEC<n> bit assignments are:

TRCQCTRL, Q Element Control Register

The TRCQCTRL characteristics are:

**Purpose**

Controls when Q elements are enabled.

**Configuration**

AArch64 System register TRCQCTRL bits [31:0] are architecturally mapped to External register TRCQCTRL[31:0].

This register is present only when ETE is implemented and TRCIDR0.QFILT == 0b1. Otherwise, direct accesses to TRCQCTRL are **UNDEFINED**.

**Attributes**

TRCQCTRL is a 64-bit register.

**Field descriptions**

The TRCQCTRL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>31</td>
<td>MODE</td>
<td>Selects whether the Address Range Comparators selected by the RANGE field indicate address ranges where the trace unit is permitted to generate Q elements or address ranges where the trace unit is not permitted to generate Q elements:</td>
</tr>
<tr>
<td>30</td>
<td>RANGE</td>
<td>Specifies the Address Range Comparators to be used for controlling Q elements.</td>
</tr>
</tbody>
</table>

**Bits [63:9]**

Reserved, RES0.

**MODE, bit [8]**

Selects whether the Address Range Comparators selected by the RANGE field indicate address ranges where the trace unit is permitted to generate Q elements or address ranges where the trace unit is not permitted to generate Q elements:

<table>
<thead>
<tr>
<th>MODE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Exclude mode. The Address Range Comparators selected by the RANGE field indicate address ranges where the trace unit must not generate Q elements. If no ranges are selected, Q elements are permitted across the entire memory map.</td>
</tr>
<tr>
<td>0b1</td>
<td>Include Mode. The Address Range Comparators selected by the RANGE field indicate address ranges where the trace unit can generate Q elements. If all the implemented bits in RANGE are set to 0b0 then Q elements are disabled.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**RANGE<m>, bit [m], for m = 0 to 7**

Specifies the Address Range Comparators to be used for controlling Q elements.
### RANGE<\(m\)>

<table>
<thead>
<tr>
<th>(\text{Meaning} )</th>
<th>(\text{RANGE&lt;}m\text{&gt;} )</th>
</tr>
</thead>
<tbody>
<tr>
<td>The address range that Address Range Comparator (m) defines, is not selected.</td>
<td>0b0</td>
</tr>
<tr>
<td>The address range that Address Range Comparator (m) defines, is selected.</td>
<td>0b1</td>
</tr>
</tbody>
</table>

This bit is \(\text{RES}0\) if \(m \geq \text{TRCIDR4.NUMACPAIRS}\).

On a Trace unit reset, this field resets to an architecturally \textit{UNKNOWN} value.

### Accessing the TRCQCTRLR

Must be programmed if \text{TRCCONFIGR.}QE \(!= 0b00\).

Writes are \textit{CONSTRAINED UNPREDICTABLE} if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

**MRS \(<Xt>, \text{TRCQCTRLR}\)**

<table>
<thead>
<tr>
<th>(\text{op0} )</th>
<th>(\text{op1} )</th>
<th>(\text{CRn} )</th>
<th>(\text{CRm} )</th>
<th>(\text{op2} )</th>
</tr>
</thead>
<tbody>
<tr>

    end
TRCRSCTLR<n>, Resource Selection Control Register <n>, n = 2 - 31

The TRCRSCTLR<n> characteristics are:

**Purpose**

Controls the selection of the resources in the trace unit.

**Configuration**

AArch64 System register TRCRSCTLR<n> bits [31:0] are architecturally mapped to External register TRCRSCTLR<n>[31:0].

This register is present only when ETE is implemented and ((AArch64-TRCIDR4.NUMRSPAIR + 1) * 2) > n. Otherwise, direct accesses to TRCRSCTLR<n> are UNDEFINED.

Resource selector 0 always returns FALSE.

Resource selector 1 always returns TRUE.

Resource selectors are implemented in pairs. Each odd numbered resource selector is part of a pair with the even numbered resource selector that is numbered as one less than it. For example, resource selectors 2 and 3 form a pair.

**Attributes**

TRCRSCTLR<n> is a 64-bit register.

**Field descriptions**

The TRCRSCTLR<n> bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

**Bits [63:22]**

Reserved, RES0.

**PAIRINV, bit [21]**

For TRCRSCTLR<n>, where n is even, controls whether the combined result from a resource selector pair is inverted.

<table>
<thead>
<tr>
<th>PAIRINV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not invert the combined output of the 2 resource selectors.</td>
</tr>
<tr>
<td>0b1</td>
<td>Invert the combined output of the 2 resource selectors.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**INV, bit [20]**

Controls whether the resource, that GROUP and SELECT selects, is inverted.
<table>
<thead>
<tr>
<th>INV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not invert the output of this selector.</td>
</tr>
<tr>
<td>0b1</td>
<td>Invert the output of this selector.</td>
</tr>
</tbody>
</table>

If:

- A is the register TRCRSCTLR< m > where m is even.
- B is the register TRCRSCTLR< m+1 >.

Then the combined output of the 2 resource selectors A and B depends on the value of (A.PAIRINV, A.INV, B.INV) as follows:

- 0b000 -> A and B.
- 0b001 -> RESERVED.
- 0b010 -> not(A) and B.
- 0b011 -> not(A) and not(B).
- 0b100 -> not(A) or not(B).
- 0b101 -> not(A) or B.
- 0b110 -> RESERVED.
- 0b111 -> A or B.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**GROUP, bits [19:16]**

Selects a group of resources.

<table>
<thead>
<tr>
<th>GROUP</th>
<th>Meaning</th>
<th>SELECT encoding for External Input Selectors</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>External Input Selectors.</td>

<td></td>
</tr>
<tr>
<td>0b0111</td>
<td>Virtual Context Identifier Comparators.</td>
<td></td>
</tr>
</tbody>
</table>

All other values are reserved.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**SELECT, bits [15:0]**

Resource Specific Controls. Contains the controls specific to the resource group selected by GROUP, described in the following sections.
EXTIN\(<m>\), bit \([m]\), for \(m = 0\) to \(3\)

Selects one or more External Inputs.

<table>
<thead>
<tr>
<th>EXTIN(&lt;m&gt;)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>

**Bits [15:8]**

Reserved, RES0.

**VMID<sub>m>, bit [m], for m = 0 to 7**

Selects one or more Virtual Context Identifier Comparators.

<table>
<thead>
<tr>
<th>VMID&lt;sub&gt;m&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Ignore Virtual Context Identifier Comparator m.</td>
</tr>
<tr>
<td>0b1</td>
<td>Select Virtual Context Identifier Comparator m.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally unknown value.

**Accessing the TRCRSCTLR<n>**

Must be programmed if any of the following are true:

- TRCCNTCTRL<sub>a>.RLDEVENT.TYPE == 0b0 and TRCCNTCTRL<sub>a>.RLDEVENT.SEL == n.
- TRCCNTCTRL<sub>a>.RLDEVENT.TYPE == 0b1 and TRCCNTCTRL<sub>a>.RLDEVENT.SEL == n/2.
- TRCCNTCTRL<sub>a>.CNTEVENT.TYPE == 0b0 and TRCCNTCTRL<sub>a>.CNTEVENT.SEL == n.
- TRCCNTCTRL<sub>a>.CNTEVENT.TYPE == 0b1 and TRCCNTCTRL<sub>a>.CNTEVENT.SEL == n/2.
- TRCEVENTCTLR0.EVENT0.TYPE == 0b0 and TRCEVENTCTLR0.EVENT0.SEL == n.
- TRCEVENTCTLR0.EVENT0.TYPE == 0b1 and TRCEVENTCTLR0.EVENT0.SEL == n/2.
- TRCEVENTCTLR0.EVENT1.TYPE == 0b0 and TRCEVENTCTLR0.EVENT1.SEL == n.
- TRCEVENTCTLR0.EVENT1.TYPE == 0b1 and TRCEVENTCTLR0.EVENT1.SEL == n/2.
- TRCEVENTCTLR0.EVENT2.TYPE == 0b0 and TRCEVENTCTLR0.EVENT2.SEL == n.
- TRCEVENTCTLR0.EVENT2.TYPE == 0b1 and TRCEVENTCTLR0.EVENT2.SEL == n/2.
- TRCEVENTCTLR0.EVENT3.TYPE == 0b0 and TRCEVENTCTLR0.EVENT3.SEL == n.
- TRCEVENTCTLR0.EVENT3.TYPE == 0b1 and TRCEVENTCTLR0.EVENT3.SEL == n/2.
- TRCSEQEVR<sub>a>.B.TYPE == 0b0 and TRCSEQEVR<sub>a>.B.SEL == n.
- TRCSEQEVR<sub>a>.B.TYPE == 0b1 and TRCSEQEVR<sub>a>.B.SEL == n/2.
- TRCSEQEVR<sub>a>.F.TYPE == 0b0 and TRCSEQEVR<sub>a>.F.SEL == n.
- TRCSEQEVR<sub>a>.F.TYPE == 0b1 and TRCSEQEVR<sub>a>.F.SEL == n/2.
- TRCSEQRST.<sub>TEVR.RST.TYPE == 0b0 and TRCSEQRST.<sub>TEVR.RST.SEL == n.
• TRCSEQRSTEVR.RST.TYPE == 0b1 and TRCSEQRSTEVR.RST.SEL == n/2.
• TRCTSCTRL.EVENT.TYPE == 0b0 and TRCTSCTRL.EVENT.SEL == n.
• TRCTSCTRL.EVENT.TYPE == 0b1 and TRCTSCTRL.EVENT.SEL == n/2.
• TRCVICTLR.EVENT.TYPE == 0b0 and TRCVICTLR.EVENT.SEL == n.
• TRCVICTLR.EVENT.TYPE == 0b1 and TRCVICTLR.EVENT.SEL == n/2.

Writes are constrained unpredictable if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

TRCRSR, Resources Status Register

The TRCRSR characteristics are:

**Purpose**

Use this to set, or read, the status of the resources.

**Configuration**

AArch64 System register TRCRSR bits [31:0] are architecturally mapped to External register TRCRSR[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCRSR are UNDEFINED.

**Attributes**

TRCRSR is a 64-bit register.

**Field descriptions**

The TRCRSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-13</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>12</td>
<td>TA, bit [12]</td>
</tr>
<tr>
<td>11-0</td>
<td>EVENT(&lt;m&gt;), bit [m+8], for m = 0 to 3</td>
</tr>
</tbody>
</table>

**Bits [63:13]**

Reserved, RES0.

**TA, bit [12]**

Tracing active.

<table>
<thead>
<tr>
<th>TA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Tracing is not active.</td>
</tr>
<tr>
<td>0b1</td>
<td>Tracing is active.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**EVENT\(<m>\), bit [m+8], for m = 0 to 3**

Untraced status of ETEEEvents.

<table>
<thead>
<tr>
<th>EVENT(&lt;m&gt;)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An ETEEEvent[n] has not occurred.</td>
</tr>

</tbody>
</table>

This bit is RES0 if TRCIDR4.NUMRSPAIR == 0 \(\|\) m > TRCIDR0.NUMEVENT.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
**Bits [7:4]**

Reserved, RES0.

**EXTIN<m>, bit [m], for m = 0 to 3**

The sticky status of the External Input Selectors.

<table>
<thead>
<tr>
<th>EXTIN&lt;m&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>An event selected by External Input Selector[n] has not occurred.</td>
</tr>
<tr>
<td>01</td>
<td>At least one event selected by External Input Selector[n] has occurred while the resources were in the Paused state.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= TRCIDR5.NUMEXTINSEL.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCRSR**

Must always be programmed.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings:

**MRS <Xt>, TRCRSR**

The TRCSEQEVR\textsubscript{n} characteristics are:

**Purpose**

Moves the Sequencer state:

- Backwards, from state \(n+1\) to state \(n\) when a programmed resource event occurs.
- Forwards, from state \(n\) to state \(n+1\) when a programmed resource event occurs.

**Configuration**

AArch64 System register TRCSEQEVR\textsubscript{n} bits [31:0] are architecturally mapped to External register TRCSEQEVR\textsubscript{n}[31:0].

This register is present only when ETE is implemented and TRCIDR5.NUMSEQSTATE != 0b000. Otherwise, direct accesses to TRCSEQEVR\textsubscript{n} are **UNDEFINED**.

**Attributes**

TRCSEQEVR\textsubscript{n} is a 64-bit register.

**Field descriptions**

The TRCSEQEVR\textsubscript{n} bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:16]</td>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

Backward field. Defines whether the backward resource event is a single Resource Selector or a Resource Selector pair. When the resource event occurs then the Sequencer state moves from state \(n+1\) to state \(n\). For example, if TRCSEQEVR2.B.SEL == 0x14 then when event 0x14 occurs, the Sequencer moves from state 3 to state 2.

<table>
<thead>
<tr>
<th>B_TYPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A single Resource Selector. TRCSEQEVR\textsubscript{n}.B.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Boolean-combined pair of Resource Selectors. TRCSEQEVR\textsubscript{n}.B.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQEVR\textsubscript{n}.B.SEL[4] is RES0.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.
Bits [14:13]

Reserved, RES0.

B_SEL, bits [12:8]

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQEVR<n>.B.TYPE controls whether TRCSEQEVR<n>.B.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Backward field. Selects the single Resource Selector or Resource Selector pair.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

F_TYPE, bit [7]

Chooses the type of Resource Selector.

Backward field. Defines whether the forward resource event is a single Resource Selector or a Resource Selector pair. When the resource event occurs then the Sequencer state moves from state n to state n+1. For example, if TRCSEQEVR1.F.SEL == 0x12 then when event 0x12 occurs, the Sequencer moves from state 1 to state 2.

<table>
<thead>
<tr>
<th>F_TYPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A single Resource Selector. TRCSEQEVR&lt;n&gt;.F.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Boolean-combined pair of Resource Selectors. TRCSEQEVR&lt;n&gt;.F.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQEVR&lt;n&gt;.F.SEL[4] is RES0.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

F_SEL, bits [4:0]

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQEVR<n>.F.TYPE controls whether TRCSEQEVR<n>.F.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Forward field. Selects the single Resource Selector or Resource Selector pair.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing the TRCSEQEVR<n>

Must be programmed if TRCRSCTLR<a>.GROUP == 0b0010 and TRCRSCTLR<a>.SEQUENCER != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

TRCSSCCR\(<n>\), Single-shot Comparator Control Register \(<n>\), n = 0 - 7

The TRCSSCCR\(<n>\) characteristics are:

**Purpose**

Controls the corresponding Single-shot Comparator Control resource.

**Configuration**

AArch64 System register TRCSSCCR\(<n>\) bits [31:0] are architecturally mapped to External register TRCSSCCR\(<n>[31:0]\).

This register is present only when ETE is implemented and TRCIDR4.NUMSSCC > n. Otherwise, direct accesses to TRCSSCCR\(<n>\) are undefined.

**Attributes**

TRCSSCCR\(<n>\) is a 64-bit register.

**Field descriptions**

The TRCSSCCR\(<n>\) bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
<td>Reserved, Reserved.</td>
</tr>
<tr>
<td>62</td>
<td>RST</td>
<td>Selects the Single-shot Comparator Control mode.</td>
</tr>
<tr>
<td>61</td>
<td>ARC&lt;0&gt;, bit [16]</td>
<td>Selects one or more Address Range Comparators.</td>
</tr>
<tr>
<td>59</td>
<td>ARC&lt;1&gt;, bit [16]</td>
<td></td>
</tr>
<tr>
<td>57</td>
<td>ARC&lt;2&gt;, bit [16]</td>
<td></td>
</tr>
<tr>
<td>55</td>
<td>ARC&lt;3&gt;, bit [16]</td>
<td></td>
</tr>
<tr>
<td>53</td>
<td>ARC&lt;4&gt;, bit [16]</td>
<td></td>
</tr>
<tr>
<td>51</td>
<td>ARC&lt;5&gt;, bit [16]</td>
<td></td>
</tr>
<tr>
<td>49</td>
<td>ARC&lt;6&gt;, bit [16]</td>
<td></td>
</tr>
<tr>
<td>47</td>
<td>ARC&lt;7&gt;, bit [16]</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:25]**

Reserved, RES0.

**RST, bit [24]**

Selects the Single-shot Comparator Control mode.

<table>
<thead>
<tr>
<th>RST</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Single-shot Comparator Control is in single-shot mode.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Single-shot Comparator Control is in multi-shot mode.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**ARC<\(m\)>, bit [\(m+16\)]**, for \(m = 0\) to 7

Selects one or more Address Range Comparators for Single-shot control.

<table>
<thead>
<tr>
<th>ARC&lt;(m)&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Address Range Comparator (m), is not selected for Single-shot control.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Address Range Comparator (m), is selected for Single-shot control.</td>
</tr>
</tbody>
</table>

This bit is RES0 if \(m \geq\) TRCIDR4.NUMACPAIRS.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
**SAC\(<m>\), bit [m], for m = 0 to 15**

Selects one or more Single Address Comparators for Single-shot control.

<table>
<thead>
<tr>
<th>SAC(&lt;m&gt;)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Single Address Comparator (m), is not selected for Single-shot control.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Single Address Comparator (m), is selected for Single-shot control.</td>
</tr>
</tbody>
</table>

This bit is \texttt{RES0} if \(m \geq 2 \times \text{TRCIDI4[NUMACPAIRS]}\).

On a Trace unit reset, this field resets to an architecturally \texttt{UNKNOWN} value.

**Accessing the TRCSSCCR\(<n>\)**

Must be programmed if any TRCRSCTLR\(<a>\).GROUP == 0b0011 and TRCRSCTLR\(<a>\).SINGLE_SHOT[\(n\)] == 0b1.

Writes are \texttt{CONSTRAINED UNPREDICTABLE} if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

**MRS \(<Xt>, TRCSSCCR\(<n>\)**

<table>
<thead>
<tr>

</tr>
<tr>
<td>30</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>29 - 0</td>
<td>Reserved, PCDVDAIENST.</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**STATUS, bit [31]**

Single-shot Comparator Control status. Indicates if any of the comparators selected by this Single-shot Comparator control have matched. The selected comparators are defined by TRCSSCCR\(<n>\).ARC, TRCSSCCR\(<n>\).SAC, and TRCSSPCICR\(<n>\).PC.

<table>
<thead>
<tr>
<th>STATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No match has occurred. When the first match occurs, this field takes a value of 0b1. It remains at 0b1 until explicitly modified by a write to this register.</td>
</tr>
</tbody>
</table>
| 0b1    | One or more matches has occurred. If TRCSSCCR\(<n>\).RST == 0b0 then:  
• There is only one match and no more matches are possible.  
• Software must reset this bit to 0b0 to re-enable the Single-shot Comparator Control. |

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**PENDING, bit [30]**

Single-shot pending status. The Single-shot Comparator Control fired while the resources were in the Paused state.
### PENDING

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

### Bits [29:4]

Reserved, RES0.

### PC, bit [3]

PE Comparator Input support. Indicates if the Single-shot Comparator Control supports PE Comparator Inputs.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

Access to this field is **RO**.

### DV, bit [2]

Data value comparator support. Data value comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

This bit reads as 0b0.

Access to this field is **RO**.

### DA, bit [1]

Data Address Comparator support. Data address comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

This bit reads as 0b0.

Access to this field is **RO**.

### INST, bit [0]

Instruction Address Comparator support. Indicates if the Single-shot Comparator Control supports instruction address comparisons.
This Single-shot Comparator Control does not support instruction address comparisons.

This Single-shot Comparator Control supports instruction address comparisons. This bit reads as 0b1.

Access to this field is RO.

### Accessing the TRCSSCSR<n>

Must be programmed if TRCRSCTL<e>.GROUP == 0b0011 and TRCRSCTL<e>.SINGLE_SHOT[n] == 0b1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings:

The TRCSTALLCTRL characteristics are:

**Purpose**

Enables trace unit functionality that prevents trace unit buffer overflows.

**Configuration**

AArch64 System register TRCSTALLCTRL bits [31:0] are architecturally mapped to External register TRCSTALLCTRL[31:0].

This register is present only when ETE is implemented and TRCIDR3.STALLCTL == 0b1. Otherwise, direct accesses to TRCSTALLCTRL are UNDEFINED.

**Attributes**

TRCSTALLCTRL is a 64-bit register.

**Field descriptions**

The TRCSTALLCTRL bit assignments are:

</tbody>
</table>

**Bits [63:14]**

Reserved, RES0.

**NOOVERFLOW, bit [13]**

When TRCIDR3.NOOVERFLOW == 0b1:

Trace overflow prevention.

<table>
<thead>
<tr>
<th>NOOVERFLOW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Trace unit buffer overflow prevention is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trace unit buffer overflow prevention is enabled.</td>
</tr>
</tbody>
</table>

Note that enabling this feature might cause a significant performance impact.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Bits [12:9]**

Reserved, RES0.
ISTALL, bit [8]

Instruction stall control. Controls if a trace unit can stall the PE when the trace buffer space is less than LEVEL.

<table>
<thead>
<tr>
<th>ISTALL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit must not stall the PE.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit can stall the PE.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [7:4]

Reserved, RES0.

LEVEL, bits [3:0]

Threshold level field. The field can support 16 monotonic levels from 0b0000 to 0b1111.

<table>
<thead>
<tr>
<th>LEVEL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Minimal invasion.</td>
</tr>
<tr>
<td></td>
<td>This setting has a greater risk of a trace unit buffer overflow.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Maximum invasion.</td>
</tr>
<tr>
<td></td>
<td>Reduced risk of a trace unit buffer overflow.</td>
</tr>
</tbody>
</table>

Note that for some implementations, invasion might occur at the minimal invasion level.

It is IMPLEMENTATION DEFINED whether some of the least significant bits are supported. Arm recommends that bits[3:2] are supported.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing the TRCSTALLCTRL

Must be programmed if implemented.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

MRS <Xt>, TRCSTALLCTRL

<table>

TRCSYNCPR, Synchronization Period Register

The TRCSYNCPR characteristics are:

**Purpose**

Controls how often trace protocol synchronization requests occur.

**Configuration**

AArch64 System register TRCSYNCPR bits [31:0] are architecturally mapped to External register TRCSYNCPR[31:0]. This register is present only when ETE is implemented. Otherwise, direct accesses to TRCSYNCPR are **UNDEFINED**.

**Attributes**

TRCSYNCPR is a 64-bit register.

**Field descriptions**

The TRCSYNCPR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
</tr>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>6</td>
<td>PERIOD</td>
</tr>
<tr>
<td>0</td>
<td>PERIOD</td>
</tr>
</tbody>
</table>

**Bits [63:5]**

Reserved, RES0.

**PERIOD, bits [4:0]**

Defines the number of bytes of trace between each periodic trace protocol synchronization request.
<table>
<thead>
<tr>
<th>PERIOD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00000</td>
<td>Trace protocol synchronization is disabled.</td>
</tr>
<tr>
<td>0b01000</td>
<td>Trace protocol synchronization request occurs after $2^8$ bytes of trace.</td>
</tr>
<tr>
<td>0b01001</td>
<td>Trace protocol synchronization request occurs after $2^9$ bytes of trace.</td>
</tr>
<tr>
<td>0b01010</td>
<td>Trace protocol synchronization request occurs after $2^{10}$ bytes of trace.</td>
</tr>
<tr>
<td>0b01011</td>
<td>Trace protocol synchronization request occurs after $2^{11}$ bytes of trace.</td>
</tr>
<tr>
<td>0b01100</td>
<td>Trace protocol synchronization request occurs after $2^{12}$ bytes of trace.</td>
</tr>
<tr>
<td>0b01101</td>
<td>Trace protocol synchronization request occurs after $2^{13}$ bytes of trace.</td>
</tr>
<tr>
<td>0b01110</td>
<td>Trace protocol synchronization request occurs after $2^{14}$ bytes of trace.</td>
</tr>
<tr>
<td>0b01111</td>
<td>Trace protocol synchronization request occurs after $2^{15}$ bytes of trace.</td>
</tr>
<tr>
<td>0b10000</td>
<td>Trace protocol synchronization request occurs after $2^{16}$ bytes of trace.</td>
</tr>
<tr>
<td>0b10001</td>
<td>Trace protocol synchronization request occurs after $2^{17}$ bytes of trace.</td>
</tr>
<tr>
<td>0b10010</td>
<td>Trace protocol synchronization request occurs after $2^{18}$ bytes of trace.</td>
</tr>
<tr>
<td>0b10011</td>
<td>Trace protocol synchronization request occurs after $2^{19}$ bytes of trace.</td>
</tr>
<tr>
<td>0b10100</td>
<td>Trace protocol synchronization request occurs after $2^{20}$ bytes of trace.</td>
</tr>
</tbody>
</table>

Other values are reserved. If a reserved value is programmed into PERIOD, then the behavior of the synchronization period counter is CONSTRAINED UNPREDICTABLE and one of the following behaviors occurs:

- No trace protocol synchronization requests are generated by this counter.
- Trace protocol synchronization requests occur at the specified period.
- Trace protocol synchronization requests occur at some other UNKNOWN period which can vary.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCSYNCR**

Must be programmed if TRCIDR3.SYNCR == 0b0.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

```
MRS <Xt>, TRCSYNPR
```

</tbody>
</table>

**Bits [63:7]**

Reserved, RES0.

**TRACEID, bits [6:0]**

Trace ID field. Sets the trace ID value for instruction trace. The width of the field is indicated by the value of TRCIDR5.TRACEIDSIZE. Unimplemented bits are RES0.

If an implementation supports AMBA ATB, then:

- The width of the field is 7 bits.
- Writing a reserved trace ID value does not affect behavior of the trace unit but it might cause UNPREDICTABLE behavior of the trace capture infrastructure.

See the AMBA ATB Protocol Specification for information about which ATID values are reserved.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCTRACEIDR**

Must be programmed if implemented.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:
MRS <Xt>, TRCTRACEIDR

TRCTSCTRL, Timestamp Control Register

The TRCTSCTRL characteristics are:

Purpose

Controls the insertion of global timestamps in the trace stream.

Configuration

AArch64 System register TRCTSCTRL bits [31:0] are architecturally mapped to External register TRCTSCTRL[31:0].

This register is present only when ETE is implemented and TRCId[0].TSSIZE != 0b0000. Otherwise, direct accesses to TRCTSCTRL are UNDEFINED.

Attributes

TRCTSCTRL is a 64-bit register.

Field descriptions

The TRCTSCTRL bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

Bits [63:8]

Reserved, RES0.

EVENT_TYPE, bit [7]

Chooses the type of Resource Selector.

<table>
<thead>
<tr>
<th>EVENT_TYPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A single Resource Selector. TRCTSCTRL EVENT_SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Boolean-combined pair of Resource Selectors. TRCTSCTRL EVENT_SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCTSCTRL EVENT_SEL[4] is RES0.</td>
</tr>
</tbody>
</table>

This bit is RES0 if TRCId[4].NUMRSPAIR == 0b0000.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.
EVENT_SEL, bits [4:0]

Defines the selected Resource Selector or pair of Resource Selectors. TRCTSCTRL.EVENT.TYPE controls whether TRCTSCTRL.EVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire.

This field is RES0 if TRCIDR4.NUMRSPAIR == 0b0000.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing the TRCTSCTRL

Must be programmed if TRCCONFIGR.TS == 0b1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

MRS <Xt>, TRCTSCTRL

TRCVICTLR, ViewInst Main Control Register

The TRCVICTLR characteristics are:

**Purpose**

Controls instruction trace filtering.

**Configuration**

AArch64 System register TRCVICTLR bits [31:0] are architecturally mapped to External register TRCVICTLR[31:0]. This register is present only when ETE is implemented. Otherwise, direct accesses to TRCVICTLR are UNDEFINED.

**Attributes**

TRCVICTLR is a 64-bit register.

**Field descriptions**

The TRCVICTLR bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:23]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>EXLEVEL_NS_EL2, bit [22]</td>
<td>Filter instruction trace for EL2 in Non-secure state.</td>
</tr>
<tr>
<td>0b0</td>
<td>The trace unit generates instruction trace for EL2 in Non-secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit does not generate instruction trace for EL2 in Non-secure state.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

EXLEVEL_NS_EL1, bit [21]  
When Non-secure EL1 is implemented:

Filter instruction trace for EL1 in Non-secure state.
EXLEVEL_NS_EL1, bit [20]

When Non-secure EL1 is implemented:

Filter instruction trace for EL1 in Non-secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_NS_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit generates instruction trace for EL1 in Non-secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit does not generate instruction trace for EL1 in Non-secure state.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL0, bit [20]

When Non-secure EL0 is implemented:

Filter instruction trace for EL0 in Non-secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_NS_EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit generates instruction trace for EL0 in Non-secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit does not generate instruction trace for EL0 in Non-secure state.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL3, bit [19]

When HaveEL(EL3):

Filter instruction trace for EL3 in Secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit generates instruction trace for EL3 in Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit does not generate instruction trace for EL3 in Secure state.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL2, bit [18]

When HaveEL(EL2) and ARMv8.4-SecEL2 is implemented:

Filter instruction trace for EL2 in Secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit generates instruction trace for EL2 in Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit does not generate instruction trace for EL2 in Secure state.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
Reserved, RES0.

**EXLEVEL_S_EL1, bit [17]**

*When Secure EL1 is implemented:*

Filter instruction trace for EL1 in Secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit generates instruction trace for EL1 in Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit does not generate instruction trace for EL1 in Secure state.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Reserved, RES0.

**EXLEVEL_S_EL0, bit [16]**

*When Secure EL0 is implemented:*

Filter instruction trace for EL0 in Secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit generates instruction trace for EL0 in Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit does not generate instruction trace for EL0 in Secure state.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Reserved, RES0.

**Bits [15:12]**

Reserved, RES0.

**TRCERR, bit [11]**

*When TRCIDR3.TRCCERR == 0b1:*

Controls the forced tracing of System Error exceptions.

<table>
<thead>
<tr>
<th>TRCERR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Forced tracing of System Error exceptions is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Forced tracing of System Error exceptions is enabled.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Reserved, RES0.
TRCRESET, bit [10]

Controls the forced tracing of PE Resets.

<table>
<thead>
<tr>
<th>TRCRESET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Forced tracing of PE Resets is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Forced tracing of PE Resets is enabled.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SSSTATUS, bit [9]

ViewInst start/stop function status.

<table>
<thead>
<tr>
<th>SSSTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stopped State. The ViewInst start/stop function is in the stopped state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Started State. The ViewInst start/stop function is in the started state.</td>
</tr>
</tbody>
</table>

Before software enables the trace unit, it must write to this bit to set the initial state of the ViewInst start/stop function. If the ViewInst start/stop function is not used then set this bit to 0b1. Arm recommends that the value of this bit is set before each trace session begins.

If the trace unit becomes disabled while a start point or stop point is still speculative, then the value of TRCVICTLR.SSSTATUS is UNKNOWN and might represent the result of a speculative start point or stop point.

If software which is running on the PE being traced disables the trace unit, either by clearing TRCPBGCTRL.EN or locking the OS Lock, Arm recommends that a DSB and an ISB instruction are executed before disabling the trace unit to prevent any start points or stop points being speculative at the point of disabling the trace unit. This procedure assumes that all start points or stop points occur before the barrier instructions are executed. The procedure does not guarantee that there are no speculative start points or stop points when disabling, although it helps minimize the probability.

This bit is res1 if TRCIDR4.NUMACPAIRS == 0b0000 and TRCIDR4.NUMPC == 0b0000.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

EVENT_TYPE, bit [7]

When TRCIDR4.NUMRSPAIR != 0b0000:

Chooses the type of Resource Selector.

<table>
<thead>
<tr>
<th>EVENT_TYPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A single Resource Selector. TRCVICTLR.EVENT_SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Boolean-combined pair of Resource Selectors. TRCVICTLR.EVENT_SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCVICTLR.EVENT_SEL[4] is RES0.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
Bits [6:5]
Reserved, RES0.

EVENT_SEL, bits [4:0]

When TRCIDR4.NUMRSPAIR != 0b0000:

Defines the selected Resource Selector or pair of Resource Selectors. TRCVICTLR.EVENT.TYPE controls whether TRCVICTLR.EVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

When TRCIDR4.NUMRSPAIR == 0b0000:

This field is reserved:
• Bits [4:1] are RES0.
• Bit [0] is RES1.

Otherwise:
Reserved, RES0.

Accessing the TRCVICTLR

Must be programmed.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings:

The TRCVIIECTLR characteristics are:

**Purpose**

Use this to select, or read, the Address Range Comparators for the ViewInst include/exclude function.

**Configuration**

AArch64 System register TRCVIIECTLR bits [31:0] are architecturally mapped to External register TRCVIIECTLR[31:0].

This register is present only when ETE is implemented and TRCIDR4.NUMACPAIRS > 0b0000. Otherwise, direct accesses to TRCVIIECTLR are UNDEFINED.

**Attributes**

TRCVIIECTLR is a 64-bit register.

**Field descriptions**

The TRCVIIECTLR bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | EXCLUDE<m>, bit [m+16] | RES0 | INCLUDE<m>, bit [m] |

**Bits [63:24]**

Reserved, RES0.

**EXCLUDE<m>, bit [m+16], for m = 0 to 7**

Selects which Address Range Comparators are in use with the ViewInst exclude function.

Each bit represents an Address Range Comparator, so bit[m] controls the selection of Address Range Comparator m.

<table>
<thead>
<tr>
<th>EXCLUDE&lt;m&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The address range that Address Range Comparator m defines, is not selected for the ViewInst exclude function.</td>
</tr>
<tr>
<td>0b1</td>
<td>The address range that Address Range Comparator m defines, is selected for the ViewInst exclude function.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= TRCIDR4.NUMACPAIRS.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Bits [15:8]**

Reserved, RES0.
**INCLUDE<\textit{m}>, bit \[m\], for \textit{m} = 0 to 7**

Selects which Address Range Comparators are in use with the ViewInst include function.

Each bit represents an Address Range Comparator, so bit\([m]\) controls the selection of Address Range Comparator \(m\).

Selecting no comparators for the ViewInst include function indicates that all instructions are included by default.

The ViewInst exclude function then indicates which ranges are excluded.

<table>
<thead>
<tr>
<th>INCLUDE&lt;\textit{m}&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The address range that Address Range Comparator (m) defines, is not selected for the ViewInst include function.</td>
</tr>
<tr>
<td>0b1</td>
<td>The address range that Address Range Comparator (m) defines, is selected for the ViewInst include function.</td>
</tr>
</tbody>
</table>

This bit is \texttt{res0} if \(m \geq \text{TRCIDR4.NUMACPAIRS}\).

On a Trace unit reset, this field resets to an architecturally \texttt{UNKNOWN} value.

**Accessing the TRCVIIECTLR**

Must be programmed if \texttt{TRCIDR4.NUMACPAIRS} > \texttt{0b0000}.

Writes are \texttt{CONSTRAINED UNPREDICTABLE} if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

MRS \(<\textit{Xt}>, \text{TRCVIIECTLR}\)

```

TRCVIPCSSCTRL, ViewInst Start/Stop PE Comparator Control Register

The TRCVIPCSSCTRL characteristics are:

**Purpose**

Use this to select, or read, which PE Comparator Inputs can control the ViewInst start/stop function.

**Configuration**

AArch64 System register TRCVIPCSSCTRL bits [31:0] are architecturally mapped to External register TRCVIPCSSCTRL[31:0].

This register is present only when ETE is implemented and TRCIDR4.NUMPC > 0b0000. Otherwise, direct accesses to TRCVIPCSSCTRL are UNDEFINED.

**Attributes**

TRCVIPCSSCTRL is a 64-bit register.

**Field descriptions**

The TRCVIPCSSCTRL bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | STOP<m>, bit [m+16] | RES0 | START<m>, bit [m] |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:24]**

Reserved, RES0.

**STOP<m>, bit [m+16], for m = 0 to 7**

Selects which PE Comparator Inputs are in use with ViewInst start/stop function, for the purpose of stopping trace.

<table>
<thead>
<tr>
<th>STOP&lt;m&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>

TRCVISSCTLR, ViewInst Start/Stop Control Register

The TRCVISSCTL characteristics are:

**Purpose**

Use this to select, or read, the Single Address Comparators for the ViewInst start/stop function.

**Configuration**

AArch64 System register TRCVISSCTL[31:0] are architecturally mapped to External register TRCVISSCTL[31:0].

This register is present only when ETE is implemented and TRCIDR4.NUMACPAIRS > 0b0000. Otherwise, direct accesses to TRCVISSCTL are **UNDEFINED**.

**Attributes**

TRCVISSCTL is a 64-bit register.

**Field descriptions**

The TRCVISSCTL bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| STOP<m>, bit [m+16] | RES0 | START<m>, bit [m] |

**Bits [63:32]**

Reserved, RES0.

**STOP<m>, bit [m+16], for m = 0 to 15**

Selects which Single Address Comparators are in use with ViewInst start/stop function, for the purpose of stopping trace.

<table>
<thead>
<tr>
<th>STOP&lt;m&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Single Address Comparator m, is not selected as a stop resource.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Single Address Comparator m, is selected as a stop resource.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= 2 \times TRCIDR4.NUMACPAIRS.

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**START<m>, bit [m], for m = 0 to 15**

Selects which Single Address Comparators are in use with ViewInst start/stop function, for the purpose of starting trace.

<table>
<thead>
<tr>
<th>START&lt;m&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>0b1</td>
<td>The trace unit ignores TRCVMIDCVR2[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is res0 if m >= TRCIDR2.VMIDSIZE.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP1< m >, bit [ m+8], for m = 0 to 7

When TRCIDR4.NUMVMIDC > 1:

TRCVMIDCVR1 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR1. Each bit in this field corresponds to a byte in TRCVMIDCVR1.

<table>
<thead>
<tr>
<th>COMP1&lt; m &gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCVMIDCVR1[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCVMIDCVR1[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is res0 if m >= TRCIDR2.VMIDSIZE.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP0< m >, bit [ m], for m = 0 to 7

When TRCIDR4.NUMVMIDC > 0:

TRCVMIDCVR0 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR0. Each bit in this field corresponds to a byte in TRCVMIDCVR0.

<table>
<thead>
<tr>
<th>COMP0&lt; m &gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCVMIDCVR0[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCVMIDCVR0[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is res0 if m >= TRCIDR2.VMIDSIZE.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

**Accessing the TRCVMIDCCTLR0**

If software uses the TRCVMIDCVR\textsubscript{n} registers, where n=0-3, then it must program this register.

If software sets a mask bit to 0b1 then it must program the relevant byte in TRCVMIDCVR\textsubscript{n} to 0x00.

If any bit is 0b1 and the relevant byte in TRCVMIDCVR\textsubscript{n} is not 0x00, the behavior of the Virtual Context Identifier Comparator is **CONSTRAINED UNPREDICTABLE**. In this scenario the comparator might match unexpectedly or might not match.

Writes are **CONSTRAINED UNPREDICTABLE** if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

\[
\text{MRS <Xt>, TRCVMIDCCTLR0}
\]

The TRCVMIDCCTRL1 characteristics are:

**Purpose**

Virtual Context Identifier Comparator mask values for the TRCVMIDCVR<\text{n}> registers, where \text{n}=4-7.

**Configuration**

AArch64 System register TRCVMIDCCTRL1 bits [31:0] are architecturally mapped to External register TRCVMIDCCTRL1[31:0].

This register is present only when ETE is implemented, TRCIDR4.NUMVMIDC > 0x4 and TRCIDR2.VMIDSIZE > 0b00000. Otherwise, direct accesses to TRCVMIDCCTRL1 are **UNDEFINED**.

**Attributes**

TRCVMIDCCTRL1 is a 64-bit register.

**Field descriptions**

The TRCVMIDCCTRL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Field Assignment</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:32]</td>
<td><strong>RES0</strong></td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>[31:24]</td>
<td>COMP7\text{&lt;m&gt;}, bit \text{[m+24]}</td>
<td>When TRCIDR4.NUMVMIDC &gt; 7:</td>
</tr>
<tr>
<td>[23:16]</td>
<td>COMP6\text{&lt;m&gt;}, bit \text{[m+16]}</td>

</tr>
<tr>
<td>[15:8]</td>
<td>COMP5\text{&lt;m&gt;}, bit \text{[m+8]}</td>
<td></td>
</tr>
<tr>
<td>[7:0]</td>
<td>COMP4\text{&lt;m&gt;}, bit \text{[m]}</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**COMP7\text{<m>}, bit \text{[m+24]}, for \text{m} = 0 to 7**

When TRCIDR4.NUMVMIDC > 7:

TRCVMIDCVR7 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR7. Each bit in this field corresponds to a byte in TRCVMIDCVR7.

<table>
<thead>
<tr>
<th>COMP7\text{&lt;m&gt;}</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCVMIDCVR7[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCVMIDCVR7[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is **RES0** if \text{m} >= TRCIDR2.VMIDSIZE.

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.
COMP6<\(m\)>, bit \([m+16]\), for \(m = 0\) to \(7\)

When TRCIDR4.NUMVMIDC > 6:

TRCVMIDCVR6 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR6. Each bit in this field corresponds to a byte in TRCVMIDCVR6.

<table>
<thead>
<tr>
<th>COMP6&lt;(m)&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCVMIDCVR6([(m\times8+7):(m\times8)]) when it performs the Virtual context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCVMIDCVR6([(m\times8+7):(m\times8)]) when it performs the Virtual context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is res0 if \(m \geq\) TRCIDR2.VMIDSIZE.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, res0.

COMP5<\(m\)>, bit \([m+8]\), for \(m = 0\) to \(7\)

When TRCIDR4.NUMVMIDC > 5:

TRCVMIDCVR5 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR5. Each bit in this field corresponds to a byte in TRCVMIDCVR5.

<table>
<thead>
<tr>
<th>COMP5&lt;(m)&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCVMIDCVR5([(m\times8+7):(m\times8)]) when it performs the Virtual context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCVMIDCVR5([(m\times8+7):(m\times8)]) when it performs the Virtual context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is res0 if \(m \geq\) TRCIDR2.VMIDSIZE.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, res0.

COMP4<\(m\)>, bit \([m]\), for \(m = 0\) to \(7\)

When TRCIDR4.NUMVMIDC > 4:

TRCVMIDCVR4 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR4. Each bit in this field corresponds to a byte in TRCVMIDCVR4.

<table>
<thead>
<tr>
<th>COMP4&lt;(m)&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCVMIDCVR4([(m\times8+7):(m\times8)]) when it performs the Virtual context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCVMIDCVR4([(m\times8+7):(m\times8)]) when it performs the Virtual context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is res0 if \(m \geq\) TRCIDR2.VMIDSIZE.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

Accessing the TRCVMIDCCTL_R1

If software uses the TRCVMIDCVR<\text{n}> registers, where \(n=4-7\), then it must program this register.

If software sets a mask bit to 0b1 then it must program the relevant byte in TRCVMIDCVR<\text{n}> to 0x00.

If any bit is 0b1 and the relevant byte in TRCVMIDCVR<\text{n}> is not 0x00, the behavior of the Virtual Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

\[
\begin{array}{|c|c|c|c|c|}
\hline
\text{op0} & \text{op1} & \text{CRn} & \text{CRm} & \text{op2} \\
\hline
0b10 & 0b001 & 0b0011 & 0b0011 & 0b010 \\
\hline
\end{array}
\]

TRCVMIDCVR<n>, Virtual Context Identifier Comparator Value Register <n>, n = 0 - 7

The TRCVMIDCVR<n> characteristics are:

** Purpose**

Contains the Virtual Context Identifier Comparator value.

** Configuration**

AArch64 System register TRCVMIDCVR<n> bits [63:0] are architecturally mapped to External register TRCVMIDCVR<n>[63:0].

This register is present only when ETE is implemented and TRCIDR4.NUMVMIDC > n. Otherwise, direct accesses to TRCVMIDCVR<n> are UNDEFINED.

** Attributes**

TRCVMIDCVR<n> is a 64-bit register.

** Field descriptions**

The TRCVMIDCVR<n> bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| VALUE | VALUE |

** VALUE, bits [63:0]**

Virtual context identifier value. The width of this field is indicated by TRCIDR2.VMIDSIZE. Unimplemented bits are RES0. After a PE Reset, the trace unit assumes that the Virtual context identifier is zero until the PE updates the Virtual context identifier.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

** Accessing the TRCVMIDCVR<n>**

Must be programmed if any of the following are true:

- TRCRSCTLR<a>.GROUP == 0b0111 and TRCRSCTLR<a>.VMID[n] == 0b1.
- TRCACATR<a>.CONTEXTTYPE == 0b10 or 0b11 and TRCACATR<a>.CONTEXT == n.

Accesses to this register use the following encodings:

TRFCR_EL1, Trace Filter Control Register (EL1)

The TRFCR_EL1 characteristics are:

**Purpose**

Provides EL1 controls for Trace.

**Configuration**

AArch64 System register TRFCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register TRFCR[31:0].

This register is present only when ARMv8.4-Trace is implemented. Otherwise, direct accesses to TRFCR_EL1 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

TRFCR_EL1 is a 64-bit register.

**Field descriptions**

The TRFCR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

All other values are reserved

This field is ignored if any of the following are true:

- SelfHostedTraceEnabled() == FALSE.
- EL2 is implemented and TRFCR_EL2.TS != 0b00.
When EL2 is implemented and enabled in the current Security state, the physical counter uses a fixed physical offset of zero if either of the following are true:

- `CNTHCTL_EL2.ECV` is 0.
- `SCR_EL3.ECVEn` is 0.
- `HCR_EL2.{E2H, TGE}` is \{1, 1\}.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [4:2]**

Reserved, RES0.

**E1TRE, bit [1]**

EL1 Trace Enable.

<table>
<thead>
<tr>
<th>E1TRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Trace is prohibited at EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trace is allowed at EL1.</td>
</tr>
</tbody>
</table>

This field is ignored if `SelfHostedTraceEnabled() == FALSE`.

On a Warm reset, this field resets to 0.

**E0TRE, bit [0]**

EL0 Trace Enable.

<table>
<thead>
<tr>
<th>E0TRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Trace is prohibited at EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trace is allowed at EL0.</td>
</tr>
</tbody>
</table>

This field is ignored if any of the following are true:

- `SelfHostedTraceEnabled() == FALSE`.
- EL2 is implemented and enabled in the current Security state and `HCR_EL2.TGE == 1`.

On a Warm reset, this field resets to 0.

**Accessing the TRFCR_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, TRFCR_EL1

<table>
<thead>
<tr>
<th>op0</th>

TRFCR_EL2, Trace Filter Control Register (EL2)

The TRFCR_EL2 characteristics are:

**Purpose**

Provides EL2 controls for Trace.

**Configuration**

AArch64 System register TRFCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HTRFCR[31:0].

This register is present only when ARMv8.4-Trace is implemented. Otherwise, direct accesses to TRFCR_EL2 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

TRFCR_EL2 is a 64-bit register.

**Field descriptions**

The TRFCR_EL2 bit assignments are:

<td>0b01</td>
<td>Virtual timestamp. The traced timestamp is the physical counter value, minus the value of CNTVOFF_EL2.</td>
<td>When ARMv8.6-ECV is implemented</td>
</tr>
<tr>
<td>0b10</td>
<td>Guest Physical timestamp. The traced timestamp is the physical counter value, minus the value of CNTPOFF_EL2.</td>
<td></td>
</tr>
<tr>
<td>0b11</td>
<td>Physical timestamp. The traced timestamp is the physical counter value.</td>
<td></td>
</tr>
</tbody>
</table>

All other values are reserved.

This field is ignored if SelfHostedTraceEnabled() == FALSE.
When EL2 is implemented and enabled in the current Security state, the physical counter uses a fixed physical offset of zero if either of the following are true:

- \texttt{CNTHCTL\_EL2.ECV} is 0.
- \texttt{SCR\_EL3.ECVEn} is 0.
- \texttt{HCR\_EL2.(E2H, TGE)} is \{1, 1\}.

On a Warm reset, this field resets to 0.

**Bit [4]**

Reserved, \texttt{RES0}.

**CX, bit [3]**

\texttt{CONTEXTIDR\_EL2} and VMID trace enable.

<table>
<thead>
<tr>
<th>CX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>\texttt{CONTEXTIDR_EL2} and VMID trace prohibited.</td>
</tr>
<tr>
<td>0b1</td>
<td>\texttt{CONTEXTIDR_EL2} and VMID trace allowed.</td>
</tr>
</tbody>
</table>

This field is ignored if \texttt{SelfHostedTraceEnabled()} == FALSE.

On a Warm reset, this field resets to 0.

**Bit [2]**

Reserved, \texttt{RES0}.

**E2TRE, bit [1]**

EL2 Trace Enable.

<table>
<thead>
<tr>
<th>E2TRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Trace is prohibited at EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trace is allowed at EL2.</td>
</tr>
</tbody>
</table>

This field is ignored if \texttt{SelfHostedTraceEnabled()} == FALSE.

On a Warm reset, this field resets to 0.

**E0HTRE, bit [0]**

EL0 Trace Enable.

<table>
<thead>
<tr>
<th>E0HTRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Trace is prohibited at EL0 when \texttt{HCR_EL2.TGE} == 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trace is allowed at EL0 when \texttt{HCR_EL2.TGE} == 1.</td>
</tr>
</tbody>
</table>

This field is ignored if any of the following are true:

- \texttt{SelfHostedTraceEnabled()} == FALSE.
- EL2 is disabled in the current security state.
- \texttt{HCR\_EL2.TGE} == 0.

On a Warm reset, this field resets to 0.

TTBR0_EL1, Translation Table Base Register 0 (EL1)

The TTBR0_EL1 characteristics are:

**Purpose**

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the EL1&0 translation regime, and other information for this translation regime.

**Configuration**

AArch64 System register TTBR0_EL1 bits [63:0] are architecturally mapped to AArch32 System register TTBR0[63:0]. RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

TTBR0_EL1 is a 64-bit register.

**Field descriptions**

The TTBR0_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ASID | BADDR | BADDR | CnP |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**ASID, bits [63:48]**

An ASID for the translation table base address. The TCR_EL1.A1 field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

This field resets to an architecturally UNKNOWN value.

**BADDR, bits [47:1]**

Translation table base address, A[47:x] or A[51:x], bits[47:1].

**Note**

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes ARMv8.2-LPA and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes ARMv8.2-LPA, if the value of TCR_EL1.IPS is 0b110, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
  - If \( x >= 6 \) then \( z=x \).
  - Otherwise, \( z=6 \).
- When \( z>x \) register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When \( x>6 \) register bits[(x-1):6] are RES0.
Register bit[1] is RES0.

Bits[5:2] of the stage 1 translation table base address are zero.

In an implementation that includes ARMv8.2-TTCNP bit[0] of the stage 1 translation table base address is zero.

### Note

- In an implementation that includes ARMv8.2-LPA a TCR_EL1 IPS value of 0b110, that selects an IPA size of 52 bits, is permitted only when using the 64KB translation granule.
- When the value of ID_AAA64MMFR0_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of TCR_EL1 IPS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of TCR_EL1 IPS is not 0b110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits[51:48] of the translation table base addresses used in this stage of translation are 0b0000.

### Note

This definition applies:

- To an implementation that includes ARMv8.2-LPA and is using a translation granule smaller than 64KB.
- To any implementation that does not include ARMv8.2-LPA.

If any TTBR0_EL1[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using TTBR0_EL1, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL1.T0SZ, the stage of translation, and the translation granule size.

This field resets to an architecturally UNKNOWN value.

### CnP, bit [0]

**When ARMv8.2-TTCNP is implemented:**

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL1.CnP is 1.

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0  | The translation table entries pointed to by TTBR0_EL1, for the current translation regime and ASID, are permitted to differ from corresponding entries for TTBR0_EL1 for other PEs in the Inner Shareable domain. This is not affected by:  
  - The value of TTBR0_EL1.CnP on those other PEs.  
  - The value of the current ASID.  
  - If EL2 is implemented and enabled in the current Security state, the value of the current VMID.  |
| 0b1  | The translation table entries pointed to by TTBR0_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL1.CnP is 1 and all of the following apply:  
  - The translation table entries are pointed to by TTBR0_EL1.  
  - The translation tables relate to the same translation regime.  
  - The ASID is the same as the current ASID.  
  - If EL2 is implemented and enabled in the current Security state, the value of the current VMID. |
This field is permitted to be cached in a TLB.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

**Note**

If the value of the TTBR0_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are **CONSTRAINED UNPREDICTABLE**, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Accessing the TTBR0_EL1**

When **HCR_EL2.E2H** is 1, without explicit synchronization, access from EL3 using the mnemonic TTBR0_EL1 or TTBR0_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

TTBR0_EL2, Translation Table Base Register 0 (EL2)

The TTBR0_EL2 characteristics are:

**Purpose**

When **HCR_EL2.E2H** is 0, holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL2 translation regime, and other information for this translation regime.

When **HCR_EL2.E2H** is 1, holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the EL2&0 translation regime, and other information for this translation regime.

**Configuration**

AArch64 System register TTBR0_EL2 bits [47:1] are architecturally mapped to AArch32 System register **HTTBR[47:1]**.

If EL2 is not implemented, this register is **RES0** from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

TTBR0_EL2 is a 64-bit register.

**Field descriptions**

The TTBR0_EL2 bit assignments are:

</table>

**ASID, bits [63:48]**

When ARMv8.1-VHE is implemented:

When **HCR_EL2.E2H** is 0, this field is **RES0**.

When **HCR_EL2.E2H** is 1, it holds an ASID for the translation table base address. The **TCR_EL2.A1** field selects either TTBR0_EL2.ASID or TTBR1_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are **RES0**.

This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**BADDR, bits [47:1]**

Translation table base address, A[47:x] or A[51:x], bits[47:1].
Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes ARMv8.2-LPA and is using the 64KB translation granule.

A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes ARMv8.2-LPA, if the value of \( \text{TCR} \_\text{EL2} \).\{1\}PS is \( 0b110 \), then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
  - If \( x \geq 6 \) then \( z=x \).
  - Otherwise, \( z=6 \).
- When \( z>x \) register bits\((z-1):x\) are RES0, and bits\((z-1):x\) of the translation table base address are zero.
- When \( x>6 \) register bits\((x-1):6\) are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes ARMv8.2-TTCNP bit[0] of the stage 1 translation table base address is zero.

Note

In an implementation that includes ARMv8.2-LPA:

- A \( \text{TCR} \_\text{EL2} \).\{1\}PS value of \( 0b110 \), that selects an OA size of 52 bits, is permitted only when using the 64KB translation granule.
- The OA size is specified by:
  - The value of \( \text{TCR} \_\text{EL2} \).PS when the value of \( \text{HCR} \_\text{EL2} \).E2H is 0.
  - The value of \( \text{TCR} \_\text{EL2} \).IPS when the value of \( \text{HCR} \_\text{EL2} \).E2H is 1.

When the value of \( \text{ID} \_\text{AA64MMFR0} \_\text{EL1} \).\text{PARange} indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of \( \text{TCR} \_\text{EL2} \).\{1\}PS is \( 0b110 \) and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of \( \text{TCR} \_\text{EL2} \).\{1\}PS is not \( 0b110 \) then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits\((x-1):1\) are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits[51:48] of the translation table base addresses used in this stage of translation are \( 0b0000 \).

Note

This definition applies:

- To an implementation that includes ARMv8.2-LPA and is using a translation granule smaller than 64KB.
- To any implementation that does not include ARMv8.2-LPA.

If any TTBR0 \_EL2[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using TTBR0 \_EL2, then the translation table base address might be misaligned, with effects that are \textsc{constrained unpredictable}, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how \( x \) is calculated based on the value of \( \text{TCR} \_\text{EL2} \).T0SZ, the stage of translation, and the translation granule size.

This field resets to an architecturally \textsc{unknown} value.

CnP, bit [0]
When ARMv8.2-TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL2.CnP is 1.

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The translation table entries pointed to by TTBR0_EL2 for the current translation regime, and ASID if applicable, are permitted to differ from corresponding entries for TTBR0_EL2 for other PEs in the Inner Shareable domain. This is not affected by:</td>
</tr>
<tr>
<td></td>
<td>• The value of TTBR0_EL2.CnP on those other PEs.</td>
</tr>
<tr>
<td></td>
<td>• When the current translation regime is the EL2&amp;0 regime, the value of the current ASID.</td>
</tr>
<tr>
<td>0b1</td>
<td>The translation table entries pointed to by TTBR0_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL2.CnP is 1 and all of the following apply:</td>
</tr>
<tr>
<td></td>
<td>• The translation table entries are pointed to by TTBR0_EL2.</td>
</tr>
<tr>
<td></td>
<td>• The translation tables relate to the same translation regime.</td>
</tr>
<tr>
<td></td>
<td>• If that translation regime is the EL2&amp;0 regime, the ASID is the same as the current ASID.</td>
</tr>
</tbody>
</table>

This field is permitted to be cached in a TLB.

Note

If the value of the TTBR0_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the TTBR0_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic TTBR0_EL2 or TTBR0_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

**Bits [63:48]**

Reserved, RES0.

**BADDR, bits [47:1]**

Translation table base address, A[47:x] or A[51:x].

**Note**

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes ARMv8.2-LPA and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes ARMv8.2-LPA, if the value of TCR_EL3.PS is 0b110 then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
  - If x >= 6 then z=x.
  - Otherwise, z=6.
- When z>=x register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When x>6 register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes ARMv8.2-TTCNP bit[0] of the stage 1 translation table base address is zero.
Note

- In an implementation that includes ARMv8.2-LPA a TCR_EL3 PS value of 0b110, that selects a PA size of 52 bits, is permitted only when using the 64KB translation granularity.
- When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation does not support a 52-bit PA size, if a translation table lookup uses this register with the 64KB translation granularity when the value of TCR_EL3 PS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of TCR_EL3 PS is not 0b110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits[51:48] of the translation table base addresses used in this stage of translation are 0b0000.

Note

This definition applies:

- To an implementation that includes ARMv8.2-LPA and is using a translation granularity smaller than 64KB.
- To any implementation that does not include ARMv8.2-LPA.

If any TTBR0_EL3[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using TTBR0_EL3, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL3.T0SZ, the stage of translation, and the translation granularity size.

This field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When ARMv8.2-TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL3 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL3.CnP is 1.

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The translation table entries pointed to by TTBR0_EL3, for the current translation regime, are permitted to differ from corresponding entries for TTBR0_EL3 for other PEs in the Inner Shareable domain. This is not affected by the value of TTBR0_EL3.CnP on those other PEs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The translation table entries pointed to by TTBR0_EL3 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL3.CnP is 1 and the translation table entries are pointed to by TTBR0_EL3.</td>
</tr>
</tbody>
</table>

This field is permitted to be cached in a TLB.

Note

If the value of the TTBR0_EL3.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL3s do not point to the same translation table entries the results of translations using TTBR0_EL3 are CONSTRAINED UNPREDICTABLE, see ‘CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, `RES0`.

**Accessing the TTBR0_EL3**

Accesses to this register use the following encodings:

**MRS <Xt>, TTBR0_EL3**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b110</td>
<td>0b0010</td>
<td>0b0000</td>
<td>0b000</td>
</tr>
</tbody>
</table>

if `PSTATE.EL == EL0` then
    UNDEFINED;
elsif `PSTATE.EL == EL1` then
    UNDEFINED;
elsif `PSTATE.EL == EL2` then
    UNDEFINED;
elsif `PSTATE.EL == EL3` then
    return TTBR0_EL3;

**MSR TTBR0_EL3, <Xt>**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b110</td>
<td>0b0010</td>
<td>0b0000</td>
<td>0b000</td>
</tr>
</tbody>
</table>

if `PSTATE.EL == EL0` then
    UNDEFINED;
elsif `PSTATE.EL == EL1` then
    UNDEFINED;
elsif `PSTATE.EL == EL2` then
    UNDEFINED;
elsif `PSTATE.EL == EL3` then
    TTBR0_EL3 = X[t];
**TTBR1_EL1, Translation Table Base Register 1 (EL1)**

The TTBR1_EL1 characteristics are:

**Purpose**

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the EL1&0 stage 1 translation regime, and other information for this translation regime.

**Configuration**

AArch64 System register TTBR1_EL1 bits [63:0] are architecturally mapped to AArch32 System register TTBR1[63:0].

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

TTBR1_EL1 is a 64-bit register.

**Field descriptions**

The TTBR1_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ASID | BADDR | BADDR | CnP |

**ASID, bits [63:48]**

An ASID for the translation table base address. The TCR_EL1.A1 field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0. This field resets to an architecturally UNKNOWN value.

**BADDR, bits [47:1]**

Translation table base address, A[47:x] or A[51:x], bits[47:1].

**Note**

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes ARMv8.2-LPA and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes ARMv8.2-LPA, if the value of TCR_EL1.IPS is 0b110, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
  - If x >= 6 then z=x.
  - Otherwise, z=6.
- When z>x register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When x>6 register bits[(x-1):6] are RES0.
Register bit[1] is RES0.
Bits[5:2] of the stage 1 translation table base address are zero.
In an implementation that includes ARMv8.2-TTCNP bit[0] of the stage 1 translation table base address is zero.

Note

- In an implementation that includes ARMv8.2-LPA a TCR_EL1 IPS value of 0b110, that selects an IPA size of 52 bits, is permitted only when using the 64KB translation granule.
- When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of TCR_EL1 IPS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of TCR_EL1 IPS is not 0b110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits[51:48] of the translation table base addresses used in this stage of translation are 0b0000.

Note

This definition applies:

- To an implementation that includes ARMv8.2-LPA and is using a translation granule smaller than 64KB.
- To any implementation that does not include ARMv8.2-LPA.

If any TTBR1_EL1[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using TTBR1_EL1, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL1.T1SZ, the stage of translation, and the translation granule size.

This field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When ARMv8.2-TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TBR1_EL1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1_EL1.CnP is 1.

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0 | The translation table entries pointed to by TTBR1_EL1, for the current translation regime and ASID, are permitted to differ from corresponding entries for TTBR1_EL1 for other PEs in the Inner Shareable domain. This is not affected by:
  - The value of TTBR1_EL1.CnP on those other PEs.
  - The value of the current ASID.
  - If EL2 is implemented and enabled in the current Security state, the value of the current VMID. |
| 0b1 | The translation table entries pointed to by TTBR1_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1_EL1.CnP is 1 and all of the following apply:
  - The translation table entries are pointed to by TTBR1_EL1.
  - The translation tables relate to the same translation regime.
  - The ASID is the same as the current ASID.
  - If EL2 is implemented and enabled in the current Security state, the value of the current VMID. |
This field is permitted to be cached in a TLB.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

---

**Note**

If the value of the TTBR1_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are **CONSTRAINED UNPREDICTABLE**, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally **UNKNOWN** value.

---

**Otherwise:**

Reserved, RES0.

**Accessing the TTBR1_EL1**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic TTBR1_EL1 or TTBR1_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

**MRS <Xt>, TTBR1_EL1**

TTBR1_EL2, Translation Table Base Register 1 (EL2)

The TTBR1_EL2 characteristics are:

**Purpose**

When HCR_EL2.E2H is 1, holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the EL2&0 translation regime, and other information for this translation regime.

**Note**

When HCR_EL2.E2H is 0, the contents of this register are ignored by the PE, except for a direct read or write of the register.

**Configuration**

This register is present only when ARMv8.1-VHE is implemented. Otherwise, direct accesses to TTBR1_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

TTBR1_EL2 is a 64-bit register.

**Field descriptions**

The TTBR1_EL2 bit assignments are:

**ASID, bits [63:48]**

An ASID for the translation table base address. The TCR_EL2.A1 field selects either TTBR0_EL2.ASID or TTBR1_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

This field resets to an architecturally UNKNOWN value.

**BADDR, bits [47:1]**

Translation table base address, A[47:x] or A[51:x], bits[47:1].

**Note**

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes ARMv8.2-LPA and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the
In an implementation that includes ARMv8.2-LPA, if the value of TCR_EL2.IPS is 0b110, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
  - If x >= 6 then z=x.
  - Otherwise, z=6.
- When z>x register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When x>6 register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes ARMv8.2-TTCNP bit[0] of the stage 1 translation table base address is zero.

**Note**

- In an implementation that includes ARMv8.2-LPA a TCR_EL2.IPS value of 0b110, that selects an OA size of 52 bits, is permitted only when using the 64KB translation granule.
- When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of TCR_EL2.IPS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of TCR_EL2.IPS is not 0b110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits[51:48] of the translation table base addresses used in this stage of translation are 0b0000.

**Note**

- To an implementation that includes ARMv8.2-LPA and is using a translation granule smaller than 64KB.
- To any implementation that does not include ARMv8.2-LPA.

If any TTBR1_EL2[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using TTBR1_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL2.T1SZ, the stage of translation, and the translation granule size.

This field resets to an architecturally UNKNOWN value.

**CnP, bit [0]**

When ARMv8.2-TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TBR1_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1_EL2.CnP is 1.
<table>

</tr>
</tbody>
</table>

This field is permitted to be cached in a TLB.

**Note**

- TTBR1_EL2 is accessible only when the value of HCR_EL2.E2H is 1, meaning the current translation regime is the EL2&0 regime.
- If the value of the TTBR1_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are **CONSTRAINED UNPREDICTABLE**, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Accessing the TTBR1_EL2**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic TTBR1_EL2 or TTBR1_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

**Bits [63:11]**

Vector Base Address. Base address of the exception vectors for exceptions taken to EL3.

If the implementation does not support ARMv8.2-LVA, then:

- If tagged addresses are being used, bits [55:48] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:48] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.

If the implementation supports ARMv8.2-LVA, then:

- If tagged addresses are being used, bits [55:52] of VBAR_EL3 must be the same or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:52] of VBAR_EL3 must be the same or else the use of the vector address will result in a recursive exception.

This field resets to an architecturally **UNKNOWN** value.

**Bits [10:0]**

Reserved, **RES0**.

**Accessing the VBAR_EL3**

Accesses to this register use the following encodings:

VDISR_EL2, Virtual Deferred Interrupt Status Register

The VDISR_EL2 characteristics are:

**Purpose**

Records that a virtual SError interrupt has been consumed by an ESB instruction executed at EL1.

An indirect write to VDISR_EL2 made by an ESB instruction does not require an explicit synchronization operation for the value written to be observed by a direct read of DISR_EL1 or DISR occurring in program order after the ESB instruction.

**Configuration**

AArch64 System register VDISR_EL2 bits [31:0] are architecturally mapped to AArch32 System register VDISR[31:0]. This register is present only when RAS is implemented. Otherwise, direct accesses to VDISR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is res0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

VDISR_EL2 is a 64-bit register.

**Field descriptions**

The VDISR_EL2 bit assignments are:

**When !ELUsingAArch32(EL1):**

<table>

VMPIDR_EL2, Virtualization Multiprocessor ID Register

The VMPIDR_EL2 characteristics are:

**Purpose**

Holds the value of the Virtualization Multiprocessor ID. This is the value returned by EL1 reads of MPIDR_EL1.

**Configuration**

AArch64 System register VMPIDR_EL2 bits [31:0] are architecturally mapped to AArch32 System register VMPIDR[31:0].

If EL2 is not implemented, reads of this register return the value of the MPIDR_EL1, and writes to the register are ignored.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

VMPIDR_EL2 is a 64-bit register.

**Field descriptions**

The VMPIDR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:40]</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aff3 is not supported in AArch32 state.</td>
<td></td>
</tr>
<tr>
<td>This field resets to an architecturally UNKNOWN value.</td>
<td></td>
</tr>
<tr>
<td><strong>Bit [31]</strong></td>
<td>Reserved, RES1.</td>
</tr>
<tr>
<td><strong>U, bit [30]</strong></td>
<td>Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. The possible values of this bit are:</td>
</tr>
<tr>
<td><strong>U</strong></td>
<td><strong>Meaning</strong></td>
</tr>
<tr>
<td>0b0</td>
<td>Processor is part of a multiprocessor system.</td>
</tr>
<tr>
<td>0b1</td>
<td>Processor is part of a uniprocessor system.</td>
</tr>
</tbody>
</table>
This field resets to an architecturally `UNKNOWN` value.

**Bits [29:25]**

Reserved, RES0.

**MT, bit [24]**

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of Aff0 for more information about affinity levels. The possible values of this bit are:

<table>
<thead>
<tr>
<th>MT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Performance of PEs at the lowest affinity level is largely independent.</td>
</tr>
<tr>
<td>0b1</td>
<td>Performance of PEs at the lowest affinity level is very interdependent.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally `UNKNOWN` value.

**Aff2, bits [23:16]**

Affinity level 2. See the description of Aff0 for more information.

This field resets to an architecturally `UNKNOWN` value.

**Aff1, bits [15:8]**

Affinity level 1. See the description of Aff0 for more information.

This field resets to an architecturally `UNKNOWN` value.

**Aff0, bits [7:0]**

Affinity level 0. This is the affinity level that is most significant for determining PE behavior. Higher affinity levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

This field resets to an architecturally `UNKNOWN` value.

VNCR_EL2, Virtual Nested Control Register

The VNCR_EL2 characteristics are:

**Purpose**

When ARMv8.4-NV is implemented, holds the base address that is used to define the memory location that is accessed by transformed reads and writes of System registers.

**Configuration**

This register is present only when ARMv8.4-NV is implemented. Otherwise, direct accesses to VNCR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

VNCR_EL2 is a 64-bit register.

**Field descriptions**

The VNCR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit (63:53)</th>
<th>Bit (52:12)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RESS</td>
<td>BADDR</td>
</tr>
<tr>
<td></td>
<td>RES0</td>
</tr>
</tbody>
</table>

**RESS, bits [63:53]**

Reserved, Sign extended. If the bits marked as RESS do not all have the same value, then there is a CONSTRAINED UNPREDICTABLE choice between:

- Generating an EL2 translation regime Translation abort on use of the VNCR_EL2 register.
- Bits[63:49] of VNCR_EL2 are treated as the same value as bit[48] for all purposes other than reading back the register.
- Bits[63:49] of VNCR_EL2 are treated as the same value as bit[48] for all purposes.
- If the virtual address space for EL2 supports more than 48 bits, bits[63:53] of VNCR_EL2 are treated as the same value as bit[52] for all purposes other than reading back the register.
- If the virtual address space for EL2 supports more than 48 bits, bits[63:53] of VNCR_EL2 are treated as the same value as bit[52].

Where the EL2 translation regime has upper and lower address ranges, bit[52] is used to select between those address ranges to determine if the address space supports more than 48 bits.

**BADDR, bits [52:12]**

Base Address. If the virtual address space for EL2 does not support more than 48 bits, then bits [52:49] are RESS.

When a register read/write is transformed to be a Load or Store, the address of the load/store is to SignOffset(VNCR.BADDR.Offset<11:0>, 64).

This field resets to an architecturally UNKNOWN value.
Bits [11:0]

Reserved, RES0.

Accessing the VNCR_EL2

    VNCR_EL2 = X[t];
VPIDR_EL2, Virtualization Processor ID Register

The VPIDR_EL2 characteristics are:

**Purpose**

Holds the value of the Virtualization Processor ID. This is the value returned by EL1 reads of MIDR_EL1.

**Configuration**

AArch64 System register VPIDR_EL2 bits [31:0] are architecturally mapped to AArch32 System register VPIDR[31:0].

If EL2 is not implemented, reads of this register return the value of the MIDR_EL1, and writes to the register are ignored.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VPIDR_EL2 is a 64-bit register.

**Field descriptions**

The VPIDR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:32]</td>
<td>RESERVED, RES0</td>
</tr>
<tr>
<td>[31:24]</td>
<td>Implementer</td>
</tr>
<tr>
<td>[23:16]</td>
<td>Variant</td>
</tr>
<tr>
<td>[15:8]</td>
<td>Architecture</td>
</tr>
<tr>
<td>[7:0]</td>
<td>PartNum</td>
</tr>
</tbody>
</table>

**Implementer, bits [31:24]**

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

<table>
<thead>
<tr>
<th>Hex representation</th>
<th>ASCII representation</th>
<th>Implementer</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x41</td>
<td>A</td>
<td>Arm Limited</td>
</tr>
<tr>
<td>0x42</td>
<td>B</td>
<td>Broadcom Corporation</td>
</tr>
<tr>
<td>0x43</td>
<td>C</td>
<td>Cavium Inc.</td>
</tr>
<tr>
<td>0x44</td>
<td>D</td>
<td>Digital Equipment Corporation</td>
</tr>
<tr>
<td>0x49</td>
<td>I</td>
<td>Infineon Technologies AG</td>
</tr>
<tr>
<td>0x4D</td>
<td>M</td>
<td>Motorola or Freescale</td>
</tr>
<tr>
<td>0x50</td>
<td>P</td>
<td>Applied Micro Circuits Corporation</td>
</tr>
<tr>
<td>0x51</td>
<td>Q</td>
<td>Qualcomm Inc.</td>
</tr>
<tr>
<td>0x56</td>
<td>V</td>
<td>Marvell International Ltd.</td>
</tr>
<tr>
<td>0x69</td>
<td>i</td>
<td>Intel Corporation</td>
</tr>
</tbody>
</table>

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.
This field resets to an architecturally **UNKNOWN** value.

**Variant, bits [23:20]**

An **IMPLEMENTATION DEFINED** variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

This field resets to an architecturally **UNKNOWN** value.

**Architecture, bits [19:16]**

The permitted values of this field are:

<table>
<thead>
<tr>
<th>Architecture</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>Armv4.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Armv4T.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Armv5 (obsolete).</td>
</tr>
<tr>
<td>0b0100</td>
<td>Armv5T.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Armv5TE.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Armv5TEJ.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Armv6.</td>
</tr>
</tbody>
</table>
| 0b1111       | Architectural features are individually identified in the | | ID * registers, see 'ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section K12.3.3. All other values are reserved. This field resets to an architecturally **UNKNOWN** value.

**PartNum, bits [15:4]**

An **IMPLEMENTATION DEFINED** primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

This field resets to an architecturally **UNKNOWN** value.

**Revision, bits [3:0]**

An **IMPLEMENTATION DEFINED** revision number for the device.

This field resets to an architecturally **UNKNOWN** value.

VPIDR_EL2, Virtualization Processor ID Register
The VSESR_EL2 characteristics are:

**Purpose**

Provides the syndrome value reported to software on taking a virtual SError interrupt exception to EL1, or on executing an ESB instruction at EL1.

When the virtual SError interrupt is taken to EL1 using AArch64, then the syndrome value is reported in ESR_EL1.

When the virtual SError interrupt is taken to EL1 using AArch32, then the syndrome value is reported in DFSR. {AET, ExT} and the remainder of DFSR is set as defined by VMSAv8-32. For more information, see The AArch32 Virtual Memory System Architecture.

When the virtual SError interrupt is deferred by an ESB instruction, then the syndrome value is written to VDISR_EL2.

**Configuration**

AArch64 System register VSESR_EL2 bits [31:0] are architecturally mapped to AArch32 System register VDFSR[31:0].

This register is present only when RAS is implemented. Otherwise, direct accesses to VSESR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

VSESR_EL2 is a 64-bit register.

**Field descriptions**

The VSESR_EL2 bit assignments are:

VSTCR_EL2, Virtualization Secure Translation Control Register

The VSTCR_EL2 characteristics are:

**Purpose**

The control register for stage 2 of the Secure EL1&0 translation regime.

**Configuration**

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to VSTCR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

VSTCR_EL2 is a 64-bit register.

**Field descriptions**

The VSTCR_EL2 bit assignments are:

| Bit 63 | Bit 62 | Bit 61 | Bit 60 | Bit 59 | Bit 58 | Bit 57 | Bit 56 | Bit 55 | Bit 54 | Bit 53 | Bit 52 | Bit 51 | Bit 50 | Bit 49 | Bit 48 | Bit 47 | Bit 46 | Bit 45 | Bit 44 | Bit 43 | Bit 42 | Bit 41 | Bit 40 | Bit 39 | Bit 38 | Bit 37 | Bit 36 | Bit 35 | Bit 34 | Bit 33 | Bit 32 |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|

Any of the bits in VSTCR_EL2 are permitted to be cached in a TLB.

**Bits [63:32]**

Reserved, RES0.

**Bit [31]**

Reserved, RES1.

**SA, bit [30]**

Secure stage 2 translation output address space.

<table>
<thead>
<tr>
<th>SA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All stage 2 translations for the Secure IPA space access the Secure PA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>All stage 2 translations for the Secure IPA space access the Non-secure PA space.</td>
</tr>
</tbody>
</table>

When the value of VSTCR_EL2.SW is 1, this bit behaves as 1 for all purposes other than reading back the value of the bit.

This field resets to an architecturally UNKNOWN value.
SW, bit [29]

Secure stage 2 translation address space.

<table>
<thead>
<tr>
<th>SW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All stage 2 translation table walks for the Secure IPA space are to the Secure PA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>All stage 2 translation table walks for the Secure IPA space are to the Non-secure PA space.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**Bits [28:16]**

Reserved, RES0.

**TG0, bits [15:14]**

Secure stage 2 granule size for **VSTTBR_EL2**.

<table>
<thead>
<tr>
<th>TG0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>4KB.</td>
</tr>
<tr>
<td>0b01</td>
<td>64KB.</td>
</tr>
<tr>
<td>0b10</td>
<td>16KB.</td>
</tr>
</tbody>
</table>

Other values are reserved.

If ARMv8.5-GTG is implemented, **ID_AA64MMFR0_EL1**.{TGran4_2, TGran16_2, TGran64_2} indicate which granule sizes are supported for Level 2 translation.

If ARMv8.5-GTG is not implemented, **ID_AA64MMFR0_EL1**.{TGran4, TGran16, TGran64} indicate which granule sizes are supported.

If the value is programmed to either a reserved value, or a size that has not been implemented, then for all purposes other than read back from this register, the hardware will treat the field as if it has been programmed to an **IMPLEMENTATION DEFINED** choice of the sizes that has been implemented.

It is **IMPLEMENTATION DEFINED** whether the value read back is the value programmed or the value that corresponds to the size chosen.

This field resets to an architecturally **UNKNOWN** value.

**Bits [13:8]**

Reserved, RES0.

**SL0, bits [7:6]**

Starting level of the Secure stage 2 translation lookup, controlled by VSTCR_EL2. The meaning of this field depends on the value of VSTCR_EL2.TG0.

<table>
<thead>
<tr>
<th>SL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 2. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.</td>
</tr>
<tr>
<td>0b01</td>
<td>If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 1. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.</td>
</tr>
<tr>
<td>0b10</td>
<td>If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 0. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.</td>
</tr>
<tr>
<td>0b11</td>
<td>If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 3.</td>
</tr>
</tbody>
</table>
All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of VSTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Starting level of the Secure stage 2 translation lookup, controlled by VSTCR_EL2. The meaning of this field depends on the value of VSTCR_EL2.TG0.

<table>
<thead>
<tr>
<th>SL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 2. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.</td>
</tr>
<tr>
<td>0b01</td>
<td>If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 1. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.</td>
</tr>
<tr>
<td>0b10</td>
<td>If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 0. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.</td>
</tr>
</tbody>
</table>

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of VSTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

This field resets to an architecturally UNKNOWN value.

T0SZ, bits [5:0]

The size offset of the memory region addressed by VSTTBR_EL2. The region size is $2^{(64-VSTCR_EL2.T0SZ)}$ bytes.

The maximum and minimum possible values for this field depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

If this field is programmed to a value that is not consistent with the programming of SL0, then a stage 2 level 0 Translation fault is generated.

This field resets to an architecturally UNKNOWN value.

**Accessing the VSTCR_EL2**

Accesses to this register use the following encodings:

MRS <Xt>, VSTCR_EL2

VSTTBR_EL2, Virtualization Secure Translation Table Base Register

The VSTTBR_EL2 characteristics are:

**Purpose**

The base register for stage 2 of the Secure EL1&0 translation regime. Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the Secure EL1&0 translation regime, and other information for this translation stage.

**Configuration**

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to VSTTBR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

VSTTBR_EL2 is a 64-bit register.

**Field descriptions**

The VSTTBR_EL2 bit assignments are:

</tbody>
</table>

Any of the bits in VSTTBR_EL2 are permitted to be cached in a TLB.

**Bits [63:48]**

Reserved, RES0.

**BADDR, bits [47:1]**

Translation table base address, A[47:x] or A[51:x].

**Note**

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes ARMv8.2-LPA and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

If the value of VTCR_EL2.PS is 0b110, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
  - If x >= 6 then z=x.
  - Otherwise, z=6.
When z>x register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
When x>6 register bits[(x-1):6] are RES0.
Register bit[1] is RES0.
Bits[5:2] of the stage 1 translation table base address are zero.

Note
When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of VTCR_EL2.PS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of VTCR_EL2.PS is not 0b110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:48] of the translation table base addresses used in this stage of translation are 0b0000.

If any VSTTBR_EL2[47:1] bit that is defined as RES0 has the value 1 when a translation table walk is performed using VSTTBR_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of VSTCR_EL2.T0SZ, the stage of translation, and the translation granule size.

This field resets to an architecturally UNKNOWN value.

CnP, bit [0]

Common not Private, for stage 2 of the Secure EL1&0 translation regime. In an implementation that includes ARMv8.2-TTNP, indicates whether each entry that is pointed to by VSTTBR_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VSTTBR_EL2.CnP is 1.

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The translation table entries pointed to by VSTTBR_EL2 are permitted to differ from the entries for VSTTBR_EL2 for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.</td>
</tr>
<tr>
<td>0b1</td>
<td>The translation table entries pointed to by VSTTBR_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VSTTBR_EL2.CnP is 1 and the VMID is the same as the current VMID.</td>
</tr>
</tbody>
</table>

Note
If the value of VSTTBR_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VSTTBR_EL2s do not point to the same translation table entries when using the current VMID, then the results of translations using VSTTBR_EL2 are CONSTRAINED UNPREDICTABLE, see CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-6254.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to an architecturally UNKNOWN value.

```
VTCR_EL2, Virtualization Translation Control Register

The VTCR_EL2 characteristics are:

**Purpose**

The control register for stage 2 of the EL1&0 translation regime.

**Configuration**

AArch64 System register VTCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register VTCR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

VTCR_EL2 is a 64-bit register.

**Field descriptions**

The VTCR_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Any of the bits in VTCR_EL2 are permitted to be cached in a TLB.

**Bits [63:32]**

Reserved, RES0.

**Bit [31]**

Reserved, RES1.

**NSA, bit [30]**

When ARMv8.4-SecEL2 is implemented:

Non-secure stage 2 translation output address space.

<table>
<thead>
<tr>
<th>NSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All stage 2 translations for the Non-secure IPA space of the Secure EL1&amp;0 translation regime access the Secure PA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>All stage 2 translations for the Non-secure IPA space of the Secure EL1&amp;0 translation regime access the Non-secure PA space.</td>
</tr>
</tbody>
</table>

This bit behaves as 1 for all purposes other than reading back the value of the bit when one of the following is true:

- The PE is executing in Non-secure state.
- The value of VTCR_EL2.NSW is 1.
- The value of VSTCR_EL2.SA is 1.
This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**NSW, bit [29]**

*When ARMv8.4-SecEL2 is implemented:*

Non-secure stage 2 translation table address space.

<table>
<thead>
<tr>
<th>NSW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>

<td>Stage 2 hardware management of dirty state enabled, only if the VTCR_EL2.HA bit is also set to 1.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**HA, bit [21]**

When ARMv8.1-TTHM is implemented:

Hardware Access flag update in Non-secure and Secure stage 2 translations when EL2 is enabled in the current Security state.

<table>
<thead>
<tr>
<th>HA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 2 Access flag update disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 2 Access flag update enabled.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

**Bit [20]**

Reserved, RES0.

**VS, bit [19]**

When ARMv8.1-VMID16 is implemented:

VMID Size.

<table>
<thead>
<tr>
<th>VS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>8 bit - the upper 8 bits of VTTBR_EL2 and VSTTBR_EL2 are ignored by the hardware, and treated as if they are all zeros, for every purpose except when reading back the register.</td>
</tr>
<tr>
<td>0b1</td>
<td>16 bit - the upper 8 bits of VTTBR_EL2 and VSTTBR_EL2 are used for allocation and matching in the TLB.</td>
</tr>
</tbody>
</table>

If the implementation only supports an 8-bit VMID, this field is RES0.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**PS, bits [18:16]**

Physical address Size for the Second Stage of translation.
### PS, Meaning

<table>
<thead>
<tr>
<th>PS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>32 bits, 4GB.</td>
</tr>
<tr>
<td>0b01</td>
<td>36 bits, 64GB.</td>
</tr>
<tr>
<td>0b10</td>
<td>40 bits, 1TB.</td>
</tr>
<tr>
<td>0b11</td>
<td>42 bits, 4TB.</td>
</tr>
<tr>
<td>0b100</td>
<td>44 bits, 16TB.</td>
</tr>
<tr>
<td>0b101</td>
<td>48 bits, 256TB.</td>
</tr>
<tr>
<td>0b110</td>
<td>52 bits, 4PB.</td>
</tr>
</tbody>
</table>

Other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

The value 0b110 is permitted only if ARMv8.2-LPA is implemented and the translation granule size is 64KB.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by VTCR_EL2 are 0b0000.

This field resets to an architecturally UNKNOWN value.

### TG0, bits [15:14]

Granule size for the VTTBR_EL2.

<table>
<thead>
<tr>
<th>TG0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>4KB.</td>
</tr>
<tr>
<td>0b01</td>
<td>64KB.</td>
</tr>
<tr>
<td>0b10</td>
<td>16KB.</td>
</tr>
</tbody>
</table>

Other values are reserved.

If ARMv8.5-GTG is implemented, ID_AA64MMFR0_EL1.{TGran4_2, TGran16_2, TGran64_2} indicate which granule sizes are supported for Level 2 translation.

If ARMv8.5-GTG is not implemented, ID_AA64MMFR0_EL1.{TGran4, TGran16, TGran64} indicate which granule sizes are supported.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

This field resets to an architecturally UNKNOWN value.

### SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using VTTBR_EL2 or VSTTBR_EL2.

<table>
<thead>
<tr>
<th>SH0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in AArch64 System registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section K1.2.2.

This field resets to an architecturally UNKNOWN value.

### ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using VTTBR_EL2 or VSTTBR_EL2.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in AArch64 System registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section K1.2.2.

This field resets to an architecturally UNKNOWN value.
ORGN0 | Meaning
--- | ---
0b00 | Normal memory, Outer Non-cacheable.
0b01 | Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10 | Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11 | Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to an architecturally UNKNOWN value.

**IRGN0, bits [9:8]**

Inner cacheability attribute for memory associated with translation table walks using VTTBR_EL2 or VSTTBR_EL2.

| IRGN0 | Meaning |
--- | ---
0b00 | Normal memory, Inner Non-cacheable. |
0b01 | Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable. |
0b10 | Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable. |
0b11 | Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable. |

This field resets to an architecturally UNKNOWN value.

**SL0, bits [7:6]**

When ARMv8.4-TTST is implemented:

Starting level of the Secure stage 2 translation lookup, controlled by VTCR_EL2. The meaning of this field depends on the value of VTCR_EL2.TG0.

| SL0 | Meaning |
--- | ---
0b00 | If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 2. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3. |
0b01 | If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 1. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2. |
0b10 | If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 0. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1. |
0b11 | If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 3. |

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of VTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Starting level of the Secure stage 2 translation lookup, controlled by VTCR_EL2. The meaning of this field depends on the value of VTCR_EL2.TG0.

| SL0 | Meaning |
--- | ---
0b00 | If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 2. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3. |
0b01 | If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 1. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2. |
0b10 | If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 0. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1. |
All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of VTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

This field resets to an architecturally **UNKNOWN** value.

**T0SZ, bits [5:0]**

The size offset of the memory region addressed by VTTBR_EL2. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

If this field is programmed to a value that is not consistent with the programming of SL0 then a stage 2 level 0 Translation fault is generated.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the VTCR_EL2**

Any of the bits in VTCR_EL2 are permitted to be cached in a TLB.

Accesses to this register use the following encodings:

**MRS <Xt>, VTCR_EL2**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>

VTTBR_EL2, Virtualization Translation Table Base Register

The VTTBR_EL2 characteristics are:

**Purpose**

Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the EL1&0 translation regime, and other information for this translation regime.

**Configuration**

AArch64 System register VTTBR_EL2 bits [63:0] are architecturally mapped to AArch32 System register VTTBR[63:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

VTTBR_EL2 is a 64-bit register.

**Field descriptions**

The VTTBR_EL2 bit assignments are:

</table>

**VMID[15:8], bits [63:56]**

When ARMv8.1-VMID16 is implemented:

Extension to VMID[7:0]. See VMID[7:0] for more details.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**VMID[7:0], bits [55:48]**

The VMID for the translation table.

It is IMPLEMENTATION DEFINED whether the VMID is 8 bits or 16 bits.

If the implementation has an 8-bit VMID, then VMID[15:8] are RES0.

If the implementation has a 16-bit VMID, then:
The VTCR_EL2 VS bit selects whether VMID[15:8] are ignored by the hardware for every purpose except reading back the register, or whether these bits are used for allocation and matching in the TLB.

The 16-bit VMID is only supported when EL2 is using AArch64. This means the hardware must ignore VMID[15:8] when EL2 is using AArch32.

This field resets to an architecturally UNKNOWN value.

**BADDR, bits [47:1]**

Translation table base address, A[47:x] or A[51:x], bits[47:1].

**Note**
- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes ARMv8.2-LPA and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes ARMv8.2-LPA, if the value of VTCR_EL2.PS is 0b110, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
  - If x >= 6 then z=x.
  - Otherwise, z=6.
- When z=x register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When x>6 register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes ARMv8.2-TTCNP, bit[0] of the stage 1 translation table base address is zero.

**Note**
- In an implementation that includes ARMv8.2-LPA a VTCR_EL2 PS value of 0b110, that selects a PA size of 52 bits, is permitted only when using the 64KB translation granule.
- When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of VTCR_EL2.PS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of VTCR_EL2.PS is not 0b110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:48] of the translation table base addresses used in this stage of translation are 0b0000.

**Note**
This definition applies:

- To an implementation that includes ARMv8.2-LPA and is using a translation granule smaller than 64KB.
- To any implementation that does not include ARMv8.2-LPA.

If any VTTBR_EL2[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using VTTBR_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.
The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of VTCR_EL2.T0SZ, the stage of translation, and the translation granule size.

This field resets to an architecturally **UNKNOWN** value.

### CnP, bit [0]

When ARMv8.2-TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by VTTBR_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VTTBR_EL2.CnP is 1.

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The translation table entries pointed to by VTTBR_EL2 are permitted to differ from the entries for VTTBR_EL2 for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.</td>
</tr>
<tr>
<td>0b1</td>
<td>The translation table entries pointed to by VTTBR_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VTTBR_EL2.CnP is 1 and the VMID is the same as the current VMID.</td>
</tr>
</tbody>
</table>

This field is permitted to be cached in a TLB.

**Note**

If the value of VTTBR_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VTTBR_EL2s do not point to the same translation table entries when using the current VMID then the results of translations using VTTBR_EL2 are **CONSTRAINED UNPREDICTABLE**, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

### Accessing the VTTBR_EL2

Accesses to this register use the following encodings:

MRS <Xt>, VTTBR_EL2

<table>

elsif PSTATE.EL == EL3 then
  VTTBR_EL2 = X[t];
ZCR_EL1, SVE Control Register for EL1

The ZCR_EL1 characteristics are:

Purpose

The SVE Control Register for EL1 is used to control aspects of SVE visible at Exception levels EL1 and EL0.

Configuration

This register is present only when SVE is implemented. Otherwise, direct accesses to ZCR_EL1 are UNDEFINED.

When HCR_EL2.{E2H, TGE} == {1, 1} and EL2 is enabled in the current Security state, the fields in this register have no effect on execution at EL0

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ZCR_EL1 is a 64-bit register.

Field descriptions

The ZCR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RES0 | RAZ/WI | LEN |

Bits [63:9]

Reserved, RES0.

Bits [8:4]

Reserved, RAZ/WI.

LEN, bits [3:0]

Constrains the scalable vector register length for EL1 and EL0 to (LEN+1)x128 bits. For all purposes other than returning the result of a direct read of ZCR_EL1 then this field behaves as if it is set to the minimum of the stored value and the constrained length inherited from more privileged Exception levels in the current Security state, rounded down to the nearest implemented vector length.

An indirect read of ZCR_EL1.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

This field resets to an architecturally UNKNOWN value.

Accessing the ZCR_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic ZCR_EL1 or ZCR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

ZCR_EL2, SVE Control Register for EL2

The ZCR_EL2 characteristics are:

**Purpose**

The SVE Control Register for EL2 is used to control aspects of SVE visible at Exception levels EL2, EL1, and EL0, when EL2 is enabled in the current Security state.

**Configuration**

This register is present only when SVE is implemented. Otherwise, direct accesses to ZCR_EL2 are **UNDEFINED**.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

ZCR_EL2 is a 64-bit register.

**Field descriptions**

The ZCR_EL2 bit assignments are:

<table>
<thead>
<tr>

**Bits [63:9]**

Reserved, RES0.

**Bits [8:4]**

Reserved, RAZ/WI.

**LEN, bits [3:0]**

Constrains the scalable vector register length for EL2, EL1, and EL0 to (LEN+1)x128 bits, when EL2 is enabled in the current Security state. For all purposes other than returning the result of a direct read of ZCR_EL2 then this field behaves as if it is set to the minimum of the stored value and the constrained length inherited from more privileged Exception levels in the current Security state, rounded down to the nearest implemented vector length.

An indirect read of ZCR_EL2.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the ZCR_EL2**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic ZCR_EL2 or ZCR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

ACTLR, Auxiliary Control Register

The ACTLR characteristics are:

**Purpose**

Provides IMPLEMENTATION DEFINED configuration and control options for execution at EL1 and EL0.

**Configuration**

AArch32 System register ACTLR bits [31:0] are architecturally mapped to AArch64 System register ACTLR_EL1[31:0].

Some bits might define global configuration settings, and be common to the Secure and Non-secure instances of the register.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ACTLR is a 32-bit register.

**Field descriptions**

The ACTLR bit assignments are:

|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| 31| 30| 29| 28| 27| 26| 25| 24| 23| 22| 21| 20| 19| 18| 17| 16| 15| 14| 13| 12| 11| 10|  9|  8|  7|  6|  5|  4|  3|  2|  1|  0|
|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |

    end if
The ACTLR2 characteristics are:

**Purpose**

Provides additional space to the ACTLR register to hold IMPLEMENTATION DEFINED trap functionality for execution at EL1 and EL0.

**Configuration**

AArch32 System register ACTLR2 bits [31:0] are architecturally mapped to AArch64 System register ACTLR_EL1[63:32].

In Armv8.0 and Armv8.1, it is IMPLEMENTATION DEFINED whether this register is implemented, or whether it causes UNDEFINED exceptions when accessed. The implementation of this register can be detected by examining ID_MMFR4.AC2.

From Armv8.2 this register must be implemented.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ACTLR2 is a 32-bit register.

**Field descriptions**

The ACTLR2 bit assignments are:

AMAIR0, Auxiliary Memory Attribute Indirection Register 0

The AMAIR0 characteristics are:

**Purpose**

When using the Long-descriptor format translation tables for stage 1 translations, provides IMPLEMENTATION DEFINED memory attributes for the memory regions specified by MAIR0.

**Configuration**

AArch32 System register AMAIR0 bits [31:0] are architecturally mapped to AArch64 System register AMAIR_EL1[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

AMAIR0 is a 32-bit register.

**Field descriptions**

The AMAIR0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>

<td>0</td>
<td></td>
</tr>
</tbody>
</table>

This register is RES0 in the following cases:

- When an implementation does not provide any IMPLEMENTATION DEFINED memory attributes.
- When the Long-descriptor translation table format is not used.

If EL3 is implemented and is using AArch32:

- AMAIR0(S) gives the value for memory accesses from Secure state.
- AMAIR0(NS) gives the value for memory accesses from Non-secure states other than Hyp mode.

Any IMPLEMENTATION DEFINED memory attributes are additional qualifiers for the memory locations and must not change the architectured behavior specified by MAIR0 and MAIR1.

In a typical implementation, AMAIR0 and AMAIR1 split into eight one-byte fields, corresponding to the MAIRn.Attr<n> fields, but the architecture does not require them to do so.

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

**Accessing the AMAIR0**

Accesses to this register use the following encodings:

\[ \text{MRC\{<c>\{<q>\} <coproc>, \{#\}<opc1>, <Rt>, <CRn>, <CRm>{, \{#\}<opc2>}} \]

**AMAIR1, Auxiliary Memory Attribute Indirection Register 1**

The AMAIR1 characteristics are:

**Purpose**

When using the Long-descriptor format translation tables for stage 1 translations, provides IMPLEMENTATION DEFINED memory attributes for the memory regions specified by MAIR1.

**Configuration**

AArch32 System register AMAIR1 bits [31:0] are architecturally mapped to AArch64 System register AMAIR_EL1[63:32].

When EL3 is using AArch32, write access to AMAIR1(S) is disabled when the CP15SDISABLE signal is asserted HIGH. RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

AMAIR1 is a 32-bit register.

**Field descriptions**

The AMAIR1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

This register is RES0 in the following cases:

- When an implementation does not provide any IMPLEMENTATION DEFINED memory attributes.
- When the Long-descriptor translation table format is not used.

If EL3 is implemented and is using AArch32:

- AMAIR1(S) gives the value for memory accesses from Secure state.
- AMAIR1(NS) gives the value for memory accesses from Non-secure states other than Hyp mode.

Any IMPLEMENTATION DEFINED memory attributes are additional qualifiers for the memory locations and must not change the architected behavior specified by MAIR0 and MAIR1.

In a typical implementation, AMAIR0 and AMAIR1 split into eight one-byte fields, corresponding to the MAIRn.Attr<n> fields, but the architecture does not require them to do so.

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

AMCFGR, Activity Monitors Configuration Register

The AMCFGR characteristics are:

**Purpose**

Global configuration register for the activity monitors.

Provides information on supported features, the number of counter groups implemented, the total number of activity
monitor event counters implemented, and the size of the counters. AMCFGR is applicable to both the architected and
the auxiliary counter groups.

**Configuration**

AArch32 System register AMCFGR bits [31:0] are architecturally mapped to AArch64 System register
AMCFGR_EL0[31:0].

AArch32 System register AMCFGR bits [31:0] are architecturally mapped to External register AMCFGR[31:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCFGR are UNDEFINED.

**Attributes**

AMCFGR is a 32-bit register.

**Field descriptions**

The AMCFGR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**NCG, bits [31:28]**

Defines the number of counter groups.

The number of implemented counter groups is defined as [AMCFGR.NCG + 1].

If the number of implemented auxiliary activity monitor event counters is zero, this field has a value of 0b0000. Otherwise, this field has a value of 0b0001.

**Bits [27:25]**

Reserved, RES0.

**HDBG, bit [24]**

Halt-on-debug supported.

From Armv8, this feature must be supported, and so this bit is 0b1.

<table>
<thead>
<tr>
<th>HDBG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>AMCR.HDBG is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>AMCR.HDBG is read/write.</td>
</tr>
</tbody>
</table>

**Bits [23:14]**

Reserved, RAZ.
**SIZE, bits [13:8]**

Defines the size of activity monitor event counters.

The size of the activity monitor event counters implemented by the Activity Monitors Extension is defined as [AMCFGR.SIZE + 1].

From Armv8, the counters are 64-bit, and so this field is 0b111111.

---

**Note**

Software also uses this field to determine the spacing of counters in the memory-map. From Armv8, the counters are at doubleword-aligned addresses.

---

**N, bits [7:0]**

Defines the number of activity monitor event counters.

The total number of counters implemented in all groups by the Activity Monitors Extension is defined as [AMCFGR.N + 1].

---

**Accessing the AMCFGR**

The AMCGCR characteristics are:

**Purpose**

Provides information on the number of activity monitor event counters implemented within each counter group.

**Configuration**

AArch32 System register AMCGCR bits [31:0] are architecturally mapped to AArch64 System register AMCGCR_EL0[31:0].

AArch32 System register AMCGCR bits [31:0] are architecturally mapped to External register AMCGCR[31:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCGCR are undefined.

**Attributes**

AMCGCR is a 32-bit register.

**Field descriptions**

The AMCGCR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-16</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>15-8</td>
<td>Counter Group 1 Number of Counters</td>
</tr>
<tr>
<td>7-0</td>
<td>Counter Group 0 Number of Counters</td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**CG1NC, bits [15:8]**

Counter Group 1 Number of Counters. The number of counters in the auxiliary counter group.

In AMUv1, the permitted range of values is 0 to 16.

**CG0NC, bits [7:0]**

Counter Group 0 Number of Counters. The number of counters in the architected counter group.

In AMUv1, the value of this field is 4.

**Accessing the AMCGCR**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>}{coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>

AMCNTENCLR0, Activity Monitors Count Enable Clear Register 0

The AMCNTENCLR0 characteristics are:

**Purpose**

Disable control bits for the architected activity monitors event counters, AMEVCNTR0.<n>.

**Configuration**

AArch32 System register AMCNTENCLR0 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENCLR0_EL0[31:0].

AArch32 System register AMCNTENCLR0 bits [31:0] are architecturally mapped to External register AMCNTENCLR0[31:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR0 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

AMCNTENCLR0 is a 32-bit register.

**Field descriptions**

The AMCNTENCLR0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | P<n>, bit [n] |

**Bits [31:16]**

Reserved, RES0.

**P<n>, bit [n], for n = 0 to 15**

Activity monitor event counter disable bit for AMEVCNTR0.<n>.

Bits [31:16] are RES0. Bits [15:N] are RAZ/WI. N is the value in AMCGCR.CG0NC.

Possible values of each bit are:

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that AMEVCNTR0.&lt;n&gt; is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that AMEVCNTR0.&lt;n&gt; is enabled. When written, disables AMEVCNTR0.&lt;n&gt;.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.

**Accessing the AMCNTENCLR0**

  UNDEFINED;
AMCNTENCLR1, Activity Monitors Count Enable Clear Register 1

The AMCNTENCLR1 characteristics are:

**Purpose**

Disable control bits for the auxiliary activity monitors event counters, AMEVCNTR1<n>.

**Configuration**

AArch32 System register AMCNTENCLR1 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENCLR1_EL0[31:0].

AArch32 System register AMCNTENCLR1 bits [31:0] are architecturally mapped to External register AMCNTENCLR1[31:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR1 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

AMCNTENCLR1 is a 32-bit register.

**Field descriptions**

The AMCNTENCLR1 bit assignments are:

|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
| RES0 | P<n>, bit [n] |

**Bits [31:16]**

Reserved, RES0.

**P<n>, bit [n], for n = 0 to 15**

Activity monitor event counter disable bit for AMEVCNTR1<n>.

Bits [31:16] are RES0. Bits [15:N] are RAZ/WI. N is the value in AMCGCR_EL0.CG1NC.

Possible values of each bit are:

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that AMEVCNTR1&lt;n&gt; is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that AMEVCNTR1&lt;n&gt; is enabled. When written, disables AMEVCNTR1&lt;n&gt;.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.
Accessing the AMCNTENCLR1

If the number of auxiliary activity monitor event counters implemented is zero, reads and writes of AMCNTENCLR1 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.

**Note**

The number of auxiliary activity monitor event counters implemented is zero exactly when AMCFGR.NCG == 0b0000.

Accesses to this register use the following encodings:

\[ \text{MRC\{<c>\}{<q>} <coproc>, \{#\}<opc1>, <Rt>, <CRn>, <CRm>{, \{#\}<opc2>} \]

<table>
<thead>
<tr>
