Arm® Architecture Registers
Future Architecture Technologies in the A architecture profile

Beta
AArch64 System Registers

**ACTLR_EL1**: Auxiliary Control Register (EL1)

**ACTLR_EL2**: Auxiliary Control Register (EL2)

**ACTLR_EL3**: Auxiliary Control Register (EL3)

**AFSR0_EL1**: Auxiliary Fault Status Register 0 (EL1)

**AFSR0_EL2**: Auxiliary Fault Status Register 0 (EL2)

**AFSR0_EL3**: Auxiliary Fault Status Register 0 (EL3)

**AFSR1_EL1**: Auxiliary Fault Status Register 1 (EL1)

**AFSR1_EL2**: Auxiliary Fault Status Register 1 (EL2)

**AFSR1_EL3**: Auxiliary Fault Status Register 1 (EL3)

**AIDR_EL1**: Auxiliary ID Register

**AMAIR_EL1**: Auxiliary Memory Attribute Indirection Register (EL1)

**AMAIR_EL2**: Auxiliary Memory Attribute Indirection Register (EL2)

**AMAIR_EL3**: Auxiliary Memory Attribute Indirection Register (EL3)

**AMCFGR_EL0**: Activity Monitors Configuration Register

**AMCG1IDR_EL0**: Activity Monitors Counter Group 1 Identification Register

**AMCGCR_EL0**: Activity Monitors Counter Group Configuration Register

**AMCNTENCLR0_EL0**: Activity Monitors Count Enable Clear Register 0

**AMCNTENCLR1_EL0**: Activity Monitors Count Enable Clear Register 1

**AMCNTENSET0_EL0**: Activity Monitors Count Enable Set Register 0

**AMCNTENSET1_EL0**: Activity Monitors Count Enable Set Register 1

**AMCR_EL0**: Activity Monitors Control Register

**AMEVCNTR0<n>_EL0**: Activity Monitors Event Counter Registers 0

**AMEVCNTR1<n>_EL0**: Activity Monitors Event Counter Registers 1

**AMEVCNTVOFF0<n>_EL2**: Activity Monitors Event Counter Virtual Offset Registers 0

**AMEVCNTVOFF1<n>_EL2**: Activity Monitors Event Counter Virtual Offset Registers 1

**AMEVTYPER0<n>_EL0**: Activity Monitors Event Type Registers 0

**AMEVTYPER1<n>_EL0**: Activity Monitors Event Type Registers 1

**AMUSERENR_EL0**: Activity Monitors User Enable Register

**APDAKeyHi_EL1**: Pointer Authentication Key A for Data (bits[127:64])

**APDAKeyLo_EL1**: Pointer Authentication Key A for Data (bits[63:0])

**APDBKeyHi_EL1**: Pointer Authentication Key B for Data (bits[127:64])

**APDBKeyLo_EL1**: Pointer Authentication Key B for Data (bits[63:0])

**APGAKeyHi_EL1**: Pointer Authentication Key A for Code (bits[127:64])

**APGAKeyLo_EL1**: Pointer Authentication Key A for Code (bits[63:0])
AArch64 System Registers

APIAKeyHi_EL1: Pointer Authentication Key A for Instruction (bits[127:64])
APIAKeyLo_EL1: Pointer Authentication Key A for Instruction (bits[63:0])
APIBKeyHi_EL1: Pointer Authentication Key B for Instruction (bits[127:64])
APIBKeyLo_EL1: Pointer Authentication Key B for Instruction (bits[63:0])
CCSIDR2_EL1: Current Cache Size ID Register 2
CCSIDR_EL1: Current Cache Size ID Register
CLIDR_EL1: Cache Level ID Register
CNTFRO_EL0: Counter-timer Frequency register
CNTHCTL_EL2: Counter-timer Hypervisor Control register
CNTHPS_CTL_EL2: Counter-timer Secure Physical Timer Control register (EL2)
CNTHPS_CVAL_EL2: Counter-timer Secure Physical Timer CompareValue register (EL2)
CNTHPS_TVAL_EL2: Counter-timer Secure Physical Timer TimerValue register (EL2)
CNTHP_CTL_EL2: Counter-timer Hypervisor Physical Timer Control register
CNTHP_CVAL_EL2: Counter-timer Physical Timer CompareValue register (EL2)
CNTHP_TVAL_EL2: Counter-timer Physical Timer TimerValue register (EL2)
CNTHSV_CTL_EL2: Counter-timer Secure Virtual Timer Control register (EL2)
CNTHSV_CVAL_EL2: Counter-timer Secure Virtual Timer CompareValue register (EL2)
CNTHSV_TVAL_EL2: Counter-timer Secure Virtual Timer TimerValue register (EL2)
CNTHV_CTL_EL2: Counter-timer Virtual Timer Control register (EL2)
CNTHV_CVAL_EL2: Counter-timer Virtual Timer CompareValue register (EL2)
CNTHV_TVAL_EL2: Counter-timer Virtual Timer TimerValue Register (EL2)
CNTKCTL_EL1: Counter-timer Kernel Control register
CNTPCSS_EL0: Counter-timer Self-Synchronized Physical Count register
CNTPCTL_EL0: Counter-timer Physical Count register
CNTPOFF_EL2: Counter-timer Physical Offset register
CNTPS_CTL_EL1: Counter-timer Physical Secure Timer Control register
CNTPS_CVAL_EL1: Counter-timer Physical Secure Timer CompareValue register
CNTPS_TVAL_EL1: Counter-timer Physical Secure Timer TimerValue register
CNTP_CTL_EL0: Counter-timer Physical Timer Control register
CNTP_CVAL_EL0: Counter-timer Physical Timer CompareValue register
CNTP_TVAL_EL0: Counter-timer Physical Timer TimerValue register
CNTVCSS_EL0: Counter-timer Self-Synchronized Virtual Count register
CNTVCT_EL0: Counter-timer Virtual Count register
CNTVOFF_EL2: Counter-timer Virtual Offset register
CNTV_CTL_EL0: Counter-timer Virtual Timer Control register
CNTV_CVAL_EL0: Counter-timer Virtual Timer CompareValue register
COUNTV_TVAL_EL0: Counter-timer Virtual Timer TimerValue register

CONTEXTIDR_EL1: Context ID Register (EL1)

CONTEXTIDR_EL2: Context ID Register (EL2)

CPACR_EL1: Architectural Feature Access Control Register

CPTR_EL2: Architectural Feature Trap Register (EL2)

CPTR_EL3: Architectural Feature Trap Register (EL3)

CSSELR_EL1: Cache Size Selection Register

CTR_EL0: Cache Type Register

CurrentEL: Current Exception Level

DACR32_EL2: Domain Access Control Register

DAIF: Interrupt Mask Bits

DBGAUTHSTATUS_EL1: Debug Authentication Status register

DBGBCR<n>_EL1: Debug Breakpoint Control Registers

DBGBVR<n>_EL1: Debug Breakpoint Value Registers

DBGCLAIMCLR_EL1: Debug CLAIM Tag Clear register

DBGCLAIMSET_EL1: Debug CLAIM Tag Set register

DBGDTRR<EL0: Debug Data Transfer Register, Receive

DBGDTTX<EL0: Debug Data Transfer Register, Transmit

DBGDTR_EL0: Debug Data Transfer Register, half-duplex

DBGPRCR_EL1: Debug Power Control Register

DBGVCR32_EL2: Debug Vector Catch Register

DBGWCR<n> EL1: Debug Watchpoint Control Registers

DBGWVR<n> EL1: Debug Watchpoint Value Registers

DCZID_EL0: Data Cache Zero ID register

DISR_EL1: Deferred Interrupt Status Register

DIT: Data Independent Timing

DLR_EL0: Debug Link Register

DSPSR_EL0: Debug Saved Program Status Register

ELR_EL1: Exception Link Register (EL1)

ELR_EL2: Exception Link Register (EL2)

ELR_EL3: Exception Link Register (EL3)

ERRIDR_EL1: Error Record ID Register

ERRSELR_EL1: Error Record Select Register

ERXADDR_EL1: Selected Error Record Address Register

ERXCTLR_EL1: Selected Error Record Control Register

ERXFR_EL1: Selected Error Record Feature Register
ERXMISC0_EL1: Selected Error Record Miscellaneous Register 0
ERXMISC1_EL1: Selected Error Record Miscellaneous Register 1
ERXMISC2_EL1: Selected Error Record Miscellaneous Register 2
ERXMISC3_EL1: Selected Error Record Miscellaneous Register 3
ERXPFGCDN_EL1: Selected Pseudo-fault Generation Countdown Register
ERXPFGCTL_EL1: Selected Pseudo-fault Generation Control Register
ERXPFGF_EL1: Selected Pseudo-fault Generation Feature Register
ERXSTATUS_EL1: Selected Error Record Primary Status Register
ESR_EL1: Exception Syndrome Register (EL1)
ESR_EL2: Exception Syndrome Register (EL2)
ESR_EL3: Exception Syndrome Register (EL3)
FAR_EL1: Fault Address Register (EL1)
FAR_EL2: Fault Address Register (EL2)
FAR_EL3: Fault Address Register (EL3)
FPCR: Floating-point Control Register
FPEXC32_EL2: Floating-Point Exception Control register
FPSR: Floating-point Status Register
GCR_EL1: Tag Control Register.
GMID_EL1: Multiple tag transfer ID register
HACR_EL2: Hypervisor Auxiliary Control Register
HAFGRTR_EL2: Hypervisor Activity Monitors Fine-Grained Read Trap Register
HCR_EL2: Hypervisor Configuration Register
HDFGRTR_EL2: Hypervisor Debug Fine-Grained Read Trap Register
HDFGWTR_EL2: Hypervisor Debug Fine-Grained Write Trap Register
HFGITR_EL2: Hypervisor Fine-Grained Instruction Trap Register
HFGRTR_EL2: Hypervisor Fine-Grained Read Trap Register
HFGWTR_EL2: Hypervisor Fine-Grained Write Trap Register
HPFAR_EL2: Hypervisor IPA Fault Address Register
HSTR_EL2: Hypervisor System Trap Register
ICC_AP0R<n>_EL1: Interrupt Controller Active Priorities Group 0 Registers
ICC_AP1R<n>_EL1: Interrupt Controller Active Priorities Group 1 Registers
ICC_ASGI1R_EL1: Interrupt Controller Alias Software Generated Interrupt Group 1 Register
ICC_BPR0_EL1: Interrupt Controller Binary Point Register 0
ICC_BPR1_EL1: Interrupt Controller Binary Point Register 1
ICC_CTLR_EL1: Interrupt Controller Control Register (EL1)
ICC_CTLR_EL3: Interrupt Controller Control Register (EL3)
ICC_DIR_EL1: Interrupt Controller Deactivate Interrupt Register
ICC_EOIR0_EL1: Interrupt Controller End Of Interrupt Register 0
ICC_EOIR1_EL1: Interrupt Controller End Of Interrupt Register 1
ICC_HPPIR0_EL1: Interrupt Controller Highest Priority Pending Interrupt Register 0
ICC_HPPIR1_EL1: Interrupt Controller Highest Priority Pending Interrupt Register 1
ICC_IAR0_EL1: Interrupt Controller Interrupt Acknowledge Register 0
ICC_IAR1_EL1: Interrupt Controller Interrupt Acknowledge Register 1
ICC_IGRPEN0_EL1: Interrupt Controller Interrupt Group 0 Enable register
ICC_IGRPEN1_EL1: Interrupt Controller Interrupt Group 1 Enable register
ICC_IGRPEN1_EL3: Interrupt Controller Interrupt Group 1 Enable register (EL3)
ICC_PMR_EL1: Interrupt Controller Interrupt Priority Mask Register
ICC_RPR_EL1: Interrupt Controller Running Priority Register
ICC_SGI0R_EL1: Interrupt Controller Software Generated Interrupt Group 0 Register
ICC_SGI1R_EL1: Interrupt Controller Software Generated Interrupt Group 1 Register
ICC_SRE_EL1: Interrupt Controller System Register Enable register (EL1)
ICC_SRE_EL2: Interrupt Controller System Register Enable register (EL2)
ICC_SRE_EL3: Interrupt Controller System Register Enable register (EL3)
ICH_AP0R<n>_EL2: Interrupt Controller Hyp Active Priorities Group 0 Registers
ICH_AP1R<n>_EL2: Interrupt Controller Hyp Active Priorities Group 1 Registers
ICH_EISR_EL2: Interrupt Controller End of Interrupt Status Register
ICH_ELRSR_EL2: Interrupt Controller Empty List Register Status Register
ICH_HCR_EL2: Interrupt Controller Hyp Control Register
ICH_LR<n>_EL2: Interrupt Controller List Registers
ICH_MISR_EL2: Interrupt Controller Maintenance Interrupt State Register
ICH_VMCR_EL2: Interrupt Controller Virtual Machine Control Register
ICH_VTR_EL2: Interrupt Controller VGIC Type Register
ICV_AP0R<n>_EL1: Interrupt Controller Virtual Active Priorities Group 0 Registers
ICV_AP1R<n>_EL1: Interrupt Controller Virtual Active Priorities Group 1 Registers
ICV_BPR0_EL1: Interrupt Controller Virtual Binary Point Register 0
ICV_BPR1_EL1: Interrupt Controller Virtual Binary Point Register 1
ICV_CTRL_EL1: Interrupt Controller Virtual Control Register
ICV_DIR_EL1: Interrupt Controller Deactivate Virtual Interrupt Register
ICV_EOIR0_EL1: Interrupt Controller Virtual End Of Interrupt Register 0
ICV_EOIR1_EL1: Interrupt Controller Virtual End Of Interrupt Register 1
ICV_HPPIR0_EL1: Interrupt Controller Virtual Highest Priority Pending Interrupt Register 0
ICV_HPPIR1_EL1: Interrupt Controller Virtual Highest Priority Pending Interrupt Register 1
ICV_IAR0_EL1: Interrupt Controller Virtual Interrupt Acknowledge Register 0
ICV_IAR1_EL1: Interrupt Controller Virtual Interrupt Acknowledge Register 1
ICV_IGRPEN0_EL1: Interrupt Controller Virtual Interrupt Group 0 Enable register
ICV_IGRPEN1_EL1: Interrupt Controller Virtual Interrupt Group 1 Enable register
ICV_PMR_EL1: Interrupt Controller Virtual Interrupt Priority Mask Register
ICV_RPR_EL1: Interrupt Controller Virtual Running Priority Register

The ACTLR_EL1 characteristics are:

**Purpose**

Provides IMPLEMENTATION DEFINED configuration and control options for execution at EL1 and EL0.

**Note**

Arm recommends the contents of this register have no effect on the PE when HCR_EL2.{E2H, TGE} is {1, 1}, and instead the configuration and control fields are provided by the ACTLR_EL2 register. This avoids the need for software to manage the contents of these register when switching between a Guest OS and a Host OS.

**Configuration**

AArch64 System register ACTLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ACTLR[31:0].

AArch64 System register ACTLR_EL1 bits [63:32] are architecturally mapped to AArch32 System register ACTLR2[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ACTLR_EL1 is a 64-bit register.

**Field descriptions**

The ACTLR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

ACTLR_EL2, Auxiliary Control Register (EL2)

The ACTLR_EL2 characteristics are:

**Purpose**

Provides **IMPLEMENTATION DEFINED** configuration and control options for EL2.

---

**Note**

Arm recommends the contents of this register are updated to apply to EL0 when `HCR_EL2.{E2H, TGE}` is `{1, 1}`, gaining configuration and control fields from the `ACTLR_EL1`. This avoids the need for software to manage the contents of these registers when switching between a Guest OS and a Host OS.

---

**Configuration**

AArch64 System register ACTLR_EL2 bits [31:0] are architecturally mapped to AArch32 System register `HACTLR31:01`.

AArch64 System register ACTLR_EL2 bits [63:32] are architecturally mapped to AArch32 System register `HACTLR2[31:01]`.

If EL2 is not implemented, this register is `RES0` from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

ACTLR_EL2 is a 64-bit register.

**Field descriptions**

The ACTLR_EL2 bit assignments are:

<table>

AFSR0_EL1, Auxiliary Fault Status Register 0 (EL1)

The AFSR0_EL1 characteristics are:

**Purpose**

Provides additional IMPLEMENTATION DEFINED fault status information for exceptions taken to EL1.

**Configuration**

AArch64 System register AFSR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ADFSR[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

AFSR0_EL1 is a 64-bit register.

**Field descriptions**

The AFSR0_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

AFSR0_EL2, Auxiliary Fault Status Register 0 (EL2)

The AFSR0_EL2 characteristics are:

**Purpose**

Provides additional IMPLEMENTATION DEFINED fault status information for exceptions taken to EL2.

**Configuration**

AArch64 System register AFSR0_EL2 bits [31:0] are architecturally mapped to AArch32 System register HADFSR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

AFSR0_EL2 is a 64-bit register.

**Field descriptions**

The AFSR0_EL2 bit assignments are:

<table>
<thead>
<tr>

AFSR1_EL2, Auxiliary Fault Status Register 1 (EL2)

The AFSR1_EL2 characteristics are:

**Purpose**

Provides additional IMPLEMENTATION DEFINED fault status information for exceptions taken to EL2.

**Configuration**

AArch64 System register AFSR1_EL2 bits [31:0] are architecturally mapped to AArch32 System register HAIFSR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

AFSR1_EL2 is a 64-bit register.

**Field descriptions**

The AFSR1_EL2 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |

AMAIR_EL3, Auxiliary Memory Attribute Indirection Register (EL3)

The AMAIR_EL3 characteristics are:

**Purpose**

Provides IMPLEMENTATION DEFINED memory attributes for the memory regions specified by MAIR_EL3.

**Configuration**

This register is present only when HaveEL(EL3). Otherwise, direct accesses to AMAIR_EL3 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

AMAIR_EL3 is a 64-bit register.

**Field descriptions**

The AMAIR_EL3 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

The AMCFGR_EL0 characteristics are:

**Purpose**

Global configuration register for the activity monitors.

Provides information on supported features, the number of counter groups implemented, the total number of activity monitor event counters implemented, and the size of the counters. AMCFGR_EL0 is applicable to both the architected and the auxiliary counter groups.

**Configuration**

AArch64 System register AMCFGR_EL0 bits [31:0] are architecturally mapped to AArch32 System register AMCFGR[31:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCFGR_EL0 are UNDEFINED.

**Attributes**

AMCFGR_EL0 is a 64-bit register.

**Field descriptions**

The AMCFGR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Range</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:32]</td>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>[31:28]</td>
<td>NCG</td>
<td>Defines the number of counter groups.</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**NCG, bits [31:28]**

Defines the number of counter groups.

The number of implemented counter groups is defined as \([\text{AMCFGR_EL0.NCG} + 1]\).

If the number of implemented auxiliary activity monitor event counters is zero, this field has a value of 0b0000. Otherwise, this field has a value of 0b0001.

**Bits [27:25]**

Reserved, RES0.

**HDBG, bit [24]**

Halt-on-debug supported.

From Armv8, this feature must be supported, and so this bit is 0b1.
<table>
<thead>
<tr>
<th>HDBG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>AMCR_EL0.HDBG is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>AMCR_EL0.HDBG is read/write.</td>
</tr>
</tbody>
</table>

**Bits [23:14]**

Reserved, `RAZ`.

**SIZE, bits [13:8]**

Defines the size of activity monitor event counters.

The size of the activity monitor event counters implemented by the activity monitors Extension is defined as \([\text{AMCFGR_EL0.SIZE} + 1]\).

From Armv8, the counters are 64-bit, and so this field is `0b111111`.

---

**Note**

Software also uses this field to determine the spacing of counters in the memory-map. From Armv8, the counters are at doubleword-aligned addresses.

---

**N, bits [7:0]**

Defines the number of activity monitor event counters.

The total number of counters implemented in all groups by the Activity Monitors Extension is defined as \([\text{AMCFGR_EL0.N} + 1]\).

**Accessing the AMCFGR_EL0**

AMCG1IDR_EL0, Activity Monitors Counter Group 1 Identification Register

The AMCG1IDR_EL0 characteristics are:

**Purpose**

Defines which auxiliary counters are implemented, and which of them have a corresponding virtual offset register, AMEVCNTVOFF1<\n>EL2 implemented.

**Configuration**

This register is present only when ARMv8.6-AMU is implemented. Otherwise, direct accesses to AMCG1IDR_EL0 are UNDEFINED.

**Attributes**

AMCG1IDR_EL0 is a 64-bit register.

**Field descriptions**

The AMCG1IDR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
</tr>

The AMCGCR_EL0 characteristics are:

**Purpose**

Provides information on the number of activity monitor event counters implemented within each counter group.

**Configuration**

AArch64 System register AMCGCR_EL0 bits [31:0] are architecturally mapped to AArch32 System register AMCGCR[31:0].

AArch64 System register AMCGCR_EL0 bits [31:0] are architecturally mapped to External register AMCGCR[31:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCGCR_EL0 are UNDEFINED.

**Attributes**

AMCGCR_EL0 is a 64-bit register.

**Field descriptions**

The AMCGCR_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

<td>When read, means that AMEVCNTR1&lt;n&gt;_EL0 is enabled. When written, disables AMEVCNTR1&lt;n&gt;_EL0.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.
Accessing the AMCNTENCLR1_EL0

If the number of auxiliary activity monitor event counters implemented is zero, reads and writes of AMCNTENCLR1_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.

**Note**

The number of auxiliary activity monitor event counters implemented is zero exactly when AMCFGR_EL0.NCG == 0b0000.

Accesses to this register use the following encodings:

MRS <Xt>, AMCNTENCLR1_EL0

**Bits [63:16]**

Reserved, RES0.

**P<n>, bit [n], for n = 0 to 15**

Activity monitor event counter enable bit for AMEVCNTR1<n>_EL0.

Bits [31:16] are RES0. Bits [15:N] are RAZ/WI. N is the value in AMCGCR_EL0.CG1NC.

Possible values of each bit are:

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that AMEVCNTR1&lt;n&gt;_EL0 is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that AMEVCNTR1&lt;n&gt;_EL0 is enabled. When written, enables AMEVCNTR1&lt;n&gt;_EL0.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.
Accessing the AMCNTENSET1_EL0

If the number of auxiliary activity monitor event counters implemented is zero, reads and writes of AMCNTENSET1_EL0 are constrained unpredictable, and the following behaviors are permitted:

- Accesses to the register are undefined.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.

**Note**

The number of auxiliary activity monitor counters implemented is zero when AMCFGR_EL0.NCG == 0b0000.

Accesses to this register use the following encodings:

**MRS <Xt>, AMCNTENSET1_EL0**

<table>

Bits [63:16]

Reserved, RES0.

**evtCount, bits [15:0]**

Event to count. The event number of the event that is counted by the auxiliary activity monitor event counter AMEVCNTR1<n>_EL0.

It is IMPLEMENTATION DEFINED what values are supported by each counter.

If software writes a value to this field which is not supported by the corresponding counter AMEVCNTR1<n>_EL0, then:

- It is UNPREDICTABLE which event will be counted.
- The value read back is UNKNOWN.

The event counted by AMEVCNTR1<n>_EL0 might be fixed at implementation. In this case, the field is read-only and writes are UNDEFINED.

If the corresponding counter AMEVCNTR1<n>_EL0 is enabled, writes to this register have UNPREDICTABLE results.
Accessing the AMEVTYPER1\(<n>_EL0\) Activity Monitors Event Type Registers 1, \(n = 0 \cdot 15\)

If \(<n>_\) is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVTYPER1\(<n>_EL0\) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.

**Note**

AMEGCR_EL0.CG1NC identifies the number of auxiliary activity monitor event counters.

Accesses to this register use the following encodings:

Global user enable register for the activity monitors. Enables or disables EL0 access to the activity monitors. AMUSERENR_EL0 is applicable to both the architected and the auxiliary counter groups.

**Configuration**

AArch64 System register AMUSERENR_EL0 bits [31:0] are architecturally mapped to AArch32 System register AMUSERENR[31:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMUSERENR_EL0 are UNDEFINED.

**Attributes**

AMUSERENR_EL0 is a 64-bit register.

**Field descriptions**

The AMUSERENR_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | RES0 | EN |

**Bits [63:1]**

Reserved, RES0.

**EN, bit [0]**

Traps EL0 accesses to the activity monitors registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, as follows:

- In AArch64 state, accesses to the following registers are trapped, reported using EC syndrome value 0x18:
  - AMCFGR_ELO, AMCGCR_ELO, AMCNTENCLR0_ELO, AMCNTENCLR1_ELO, AMCNTENSET0_ELO, AMCNTENSET1_ELO, AMCR_ELO, AMVCNTR0<n>_ELO, AMVCNTR1<n>_ELO, AMEVTYPE0<n>_ELO, and AMEVTYPE1<n>_ELO.

- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value 0x03, MRRC and MCRR accesses are trapped and reported using EC syndrome value 0x04:
  - AMCFGR, AMCGCR, AMCNTENCLR0, AMCNTENCLR1, AMCNTENSET0, AMCNTENSET1, AMCR, AMEVCNTR0<n>, AMEVCNTR1<n>, AMEVTYPE0<n>, and AMEVTYPE1<n>.

<table>
<thead>
<tr>
<th>EN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 accesses to the activity monitors registers are trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped. Software can access all activity monitor registers at EL0.</td>
</tr>
</tbody>
</table>

**Note**
- AMUSERENR_EL0 can always be read at EL0 and is not governed by this bit.

### Accessing the AMUSERENR_EL0

Accesses to this register use the following encodings:

APGAKeyLo_EL1, Pointer Authentication Key A for Code (bits[63:0])

The APGAKeyLo_EL1 characteristics are:

**Purpose**

Holds bits[63:0] of key used for generic pointer authentication code.

**Note**

The term APGAKey_EL1 is used to describe the concatenation of APGAKeyHi_EL1: APGAKeyLo_EL1.

**Configuration**

This register is present only when ARMv8.3-PAuth is implemented. Otherwise, direct accesses to APGAKeyLo_EL1 are **UNDEFINED**.

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

APGAKeyLo_EL1 is a 64-bit register.

**Field descriptions**

The APGAKeyLo_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>64 bit value, bits[63:0] of the 128 bit pointer authentication key value</td>

AT S12E0R, Address Translate Stages 1 and 2 EL0 Read

The AT S12E0R characteristics are:

**Purpose**

Performs stage 1 and 2 address translations from EL0, with permissions as if reading from the given virtual address from EL0, using the following translation regime:

- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the EL2&0 translation regime.
- Otherwise, the EL1&0 translation regime.

**Configuration**

**Attributes**

AT S12E0R is a 64-bit System instruction.

**Field descriptions**

The AT S12E0R input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Input address for translation</td>

**Purpose**

Performs stage 1 address translation, with permissions as if writing to the given virtual address from EL1, or from EL2 if the Effective value of \( HCR_{EL2}.\{E2H, TGE\} \) is \( \{1, 1\} \), using the following translation regime:

- When EL2 is implemented and enabled in the Security state described by the current value of \( SCR_{EL3}.NS \):
  - If \( HCR_{EL2}.\{E2H, TGE\} \) is not \( \{1, 1\} \), the EL1&0 translation regime, accessed from EL1.
  - If \( HCR_{EL2}.\{E2H, TGE\} \) is \( \{1, 1\} \), the EL2&0 translation regime, accessed from EL2.
- Otherwise, the EL1&0 translation regime, accessed from EL1.

**Configuration**

**Attributes**

AT S1E1W is a 64-bit System instruction.

**Field descriptions**

The AT S1E1W input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [63:0]**

Input address for translation. The resulting address can be read from the \( PAR_{EL1} \).

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is \( \text{RES}0 \).

**Executing the AT S1E1W instruction**

Accesses to this instruction use the following encodings:

\[
\text{AT S1E1W, } <\text{Xt}>
\]

<table>
<thead>
<tr>

elsif PSTATE.EL == EL3 then
  AT_S1E1W(X[t]);
AT S1E1WP, Address Translate Stage 1 EL1 Write PAN

The AT S1E1WP characteristics are:

Purpose

Performs a stage 1 address translation, where the value of PSTATE.PAN determines if a write to a location will generate a permission fault for a privileged access, using the following translation regime:

- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the EL1&0 translation regime, accessed from EL1.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the EL2&0 translation regime, accessed from EL2.
- Otherwise, the EL1&0 translation regime, accessed from EL1.

Configuration

This instruction is present only when ARMv8.2-ATS1E1 is implemented. Otherwise, direct accesses to AT S1E1WP are UNDEFINED.

Attributes

AT S1E1WP is a 64-bit System instruction.

Field descriptions

The AT S1E1WP input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-0</td>
<td>Input address for translation</td>
</tr>
</tbody>
</table>

Input address for translation. The resulting address can be read from the PAR_EL1.

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

Executing the AT S1E1WP instruction

Accesses to this instruction use the following encodings:

CCSIDR2_EL1, Current Cache Size ID Register 2

The CCSIDR2_EL1 characteristics are:

**Purpose**

When ARMv8.3-CCIDX is implemented, provides the information about the architecture of the currently selected cache from bits[63:32] of CCSIDR_EL1.

When ARMv8.3-CCIDX is not implemented, this register is not implemented.

**Configuration**

AArch64 System register CCSIDR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register CCSIDR2[31:0].

This register is present only when ARMv8.3-CCIDX is implemented. Otherwise, direct accesses to CCSIDR2_EL1 are UNDEFINED.

If AArch32 is not implemented, it is IMPLEMENTATION DEFINED whether reading this register gives an UNKNOWN value or is UNDEFINED.

The implementation includes one CCSIDR2_EL1 for each cache that it can access. CSSELR_EL1 selects which Cache Size ID Register is accessible.

**Attributes**

CCSIDR2_EL1 is a 64-bit register.

**Field descriptions**

The CCSIDR2_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>62</th>
<th>61</th>
<th>60</th>
<th>59</th>
<th>58</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:24]**

Reserved, RES0.

**NumSets, bits [23:0]**

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

**Accessing the CCSIDR2_EL1**

If CSSELR_EL1 Level is programmed to a cache level that is not implemented, then on a read of the CCSIDR2_EL1 the behavior is CONSTRAINED UNPREDICTABLE, and can be one of the following:

- The CCSIDR2_EL1 read is treated as NOP.
- The CCSIDR2_EL1 read is UNDEFINED.
- The CCSIDR2_EL1 read returns an UNKNOWN value.

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
  if IsFeatureImplemented("ARMv8.4-IDST") then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
      AArch64.SystemAccessTrap(EL2, 0x18);
    else
      AArch64.SystemAccessTrap(EL1, 0x18);
    else
      UNDEFINED;
  elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID2 == '1' then
      AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID4 == '1' then
      AArch64.SystemAccessTrap(EL2, 0x18);
    else
      return CCSIDR2_EL1;
  elsif PSTATE.EL == EL2 then
    return CCSIDR2_EL1;
  elsif PSTATE.EL == EL3 then
    return CCSIDR2_EL1;
CCSIDR_EL1, Current Cache Size ID Register

The CCSIDR_EL1 characteristics are:

**Purpose**

Provides information about the architecture of the currently selected cache.

**Configuration**

AArch64 System register CCSIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register CCSIDR[31:0].

AArch64 System register CCSIDR_EL1 bits [63:32] are architecturally mapped to AArch32 System register CCSIDR2.

The implementation includes one CCSIDR_EL1 for each cache that it can access. CSSELR_EL1 selects which Cache Size ID Register is accessible.

**Attributes**

CCSIDR_EL1 is a 64-bit register.

**Field descriptions**

The CCSIDR_EL1 bit assignments are:

</tbody>
</table>

**Note**

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

**Bits [63:56]**

Reserved, RES0.

**NumSets, bits [55:32]**

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

**Bits [31:24]**

Reserved, RES0.
Associativity, bits [23:3]

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

LineSize, bits [2:0]

(Log₂(Number of bytes in cache line)) - 4. For example:

- For a line length of 16 bytes: Log₂(16) = 4, LineSize entry = 0. This is the minimum line length.
- For a line length of 32 bytes: Log₂(32) = 5, LineSize entry = 1.

When ARMv8.5-MemTag is implemented and enabled, where a cache only holds Allocation tags, this field is RES0.

Otherwise:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RE0 | UNKOWN | NumSets | Associativity | LineSize |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Note

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

Bits [63:32]

Reserved, RE0.

Bits [31:28]

Reserved, UNKOWN.

NumSets, bits [27:13]

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

Associativity, bits [12:3]

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

LineSize, bits [2:0]

(Log₂(Number of bytes in cache line)) - 4. For example:

- For a line length of 16 bytes: Log₂(16) = 4, LineSize entry = 0. This is the minimum line length.
- For a line length of 32 bytes: Log₂(32) = 5, LineSize entry = 1.

Accessing the CCSIDR_EL1

If CSSEL_EL1.Level is programmed to a cache level that is not implemented, then on a read of the CCSIDR_EL1 the behavior is CONSTRAINED UNPREDICTABLE, and can be one of the following:

- The CCSIDR_EL1 read is treated as NOP.
• The CCSIDR_EL1 read is **UNDEFINED**.
• The CCSIDR_EL1 read returns an **UNKNOWN** value.

Accesses to this register use the following encodings:

**MRS <Xt>, CCSIDR_EL1**

```
The CFP RCTX characteristics are:

### Purpose

Control Flow Prediction Restriction by Context applies to all Control Flow Prediction Resources that predict execution based on information gathered within the target execution context or contexts.

When this instruction is complete and synchronized, control flow prediction does not permit later speculative execution within the target execution context to be observable through side channels.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

**Note**

This instruction does not require the invalidation of prediction structures so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

### Configuration

This instruction is present only when ARMv8.0-PredInv is implemented. Otherwise, direct accesses to CFP RCTX are UNDEFINED.

### Attributes

CFP RCTX is a 64-bit System instruction.

### Field descriptions

The CFP RCTX input value bit assignments are:

</tbody>
</table>

**Bits [63:49]**

Reserved, RES0.

**GVMID, bit [48]**

Execution of this instruction applies to all VMIDs or a specified VMID.
If the instruction is executed at EL0 or EL1, then this field has an Effective value of 0.

**VMID, bits [47:32]**

Only applies when bit[48] is 0 and either:
- an EL1 context.
- an EL0 context when \( \text{HCR}\_\text{EL2}.E2H==0 \) or \( \text{HCR}\_\text{EL2}.TGE==0 \).

Otherwise this field is RES0.

When the instruction is executed at EL1 then this field is treated as the current VMID.

When the instruction is executed at EL0 and \( \text{HCR}\_\text{EL2}.E2H==0 \) or \( \text{HCR}\_\text{EL2}.TGE==0 \) then this field is treated as the current VMID.

When the instruction is executed at EL0 and \( \text{HCR}\_\text{EL2}.E2H==1 \) and \( \text{HCR}\_\text{EL2}.TGE==1 \) then this field is ignored.

**Bits [31:27]**

Reserved, RES0.

**NS, bit [26]**

Security State

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure state</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure state</td>
</tr>
</tbody>
</table>

If the instruction is executed in Non-secure state, this field has an Effective value of 1.

**EL, bits [25:24]**

Exception Level

<table>
<thead>
<tr>
<th>EL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>EL0</td>
</tr>
<tr>
<td>0b01</td>
<td>EL1</td>
</tr>
<tr>
<td>0b10</td>
<td>EL2</td>
</tr>
<tr>
<td>0b11</td>
<td>EL3</td>
</tr>
</tbody>
</table>

If the instruction is executed at an exception level lower than the specified level, this instruction is treated as a NOP.

**Bits [23:17]**

Reserved, RES0.

**GASID, bit [16]**

Execution of this instruction applies to all ASIDs or a specified ASID.

<table>
<thead>
<tr>
<th>GASID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Applies to specified ASID for an EL0 context. For all other contexts this field is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Applies to all ASID for an EL0 context. For all other contexts this field is RES0.</td>
</tr>
</tbody>
</table>
If the instruction is executed at EL0, then this field has an Effective value of 0.

**ASID, bits [15:0]**

Only applies for an EL0 context and when bit[16] is 0.

Otherwise this field is RES0.

When the instruction is executed at EL0 then this field is treated as the current ASID.

**Executing the CFP RCTX instruction**

Accesses to this instruction use the following encodings:

```
<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>

      CFP_RCTX(X[t]);
    else
      if PSTATE.EL == EL3 then
        CFP_RCTX(X[t]);
      else
        CFP_RCTX(X[t]);
      endif
    endif
  endif
```
The CLIDR_EL1 characteristics are:

### Purpose

Identifies the type of cache, or caches, that are implemented at each level and can be managed using the architected cache maintenance instructions that operate by set/way, up to a maximum of seven levels. Also identifies the Level of Coherence (LoC) and Level of Unification (LoU) for the cache hierarchy.

### Configuration

AArch64 System register CLIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register CLIDR[31:0].

### Attributes

CLIDR_EL1 is a 64-bit register.

### Field descriptions

The CLIDR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Ttype&lt;n&gt;, bits [2(n-1)+34:2(n-1)+33], for n = 1 to 7</td>
</tr>
<tr>
<td>62</td>
<td>Bits [63:47]</td>
</tr>
<tr>
<td>61</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>60</td>
<td>ICB, bits [32:30]</td>
</tr>
<tr>
<td>59</td>
<td>Inner cache boundary. This field indicates the boundary for caching Inner Cacheable memory regions.</td>
</tr>
<tr>
<td>58</td>
<td>The possible values are:</td>
</tr>
<tr>
<td>57</td>
<td>0b00: No Tag Cache.</td>
</tr>
<tr>
<td>56</td>
<td>0b01: Separate Allocation Tag Cache.</td>
</tr>
<tr>
<td>55</td>
<td>0b10: Unified Allocation Tag and Data cache, Allocation Tags and Data in unified lines.</td>
</tr>
<tr>
<td>54</td>
<td>0b11: Unified Allocation Tag and Data cache, Allocation Tags and Data in separate lines.</td>
</tr>
<tr>
<td>53</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>52</td>
<td>Otherwise:</td>
</tr>
<tr>
<td>51</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>50</td>
<td>ICB, bits [32:30]</td>
</tr>
<tr>
<td>49</td>
<td>Inner cache boundary. This field indicates the boundary for caching Inner Cacheable memory regions.</td>
</tr>
<tr>
<td>48</td>
<td>The possible values are:</td>
</tr>
</tbody>
</table>
ICB | Meaning
--- | ---
0b000 | Not disclosed by this mechanism.
0b001 | L1 cache is the highest Inner Cacheable level.
0b010 | L2 cache is the highest Inner Cacheable level.
0b011 | L3 cache is the highest Inner Cacheable level.
0b100 | L4 cache is the highest Inner Cacheable level.
0b101 | L5 cache is the highest Inner Cacheable level.
0b110 | L6 cache is the highest Inner Cacheable level.
0b111 | L7 cache is the highest Inner Cacheable level.

LoUU, bits [29:27]
Level of Unification Uniprocessor for the cache hierarchy.

LoC, bits [26:24]
Level of Coherence for the cache hierarchy.

LoUIS, bits [23:21]
Level of Unification Inner Shareable for the cache hierarchy.

Ctype<n>, bits [3(n-1)+2:3(n-1)], for n = 1 to 7
Cache Type fields. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy. Possible values of each field are:

<table>
<thead>
<tr>
<th>Ctype&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>No cache.</td>
</tr>
<tr>
<td>0b001</td>
<td>Instruction cache only.</td>
</tr>
<tr>
<td>0b010</td>
<td>Data cache only.</td>
</tr>
<tr>
<td>0b011</td>
<td>Separate instruction and data caches.</td>
</tr>
<tr>
<td>0b100</td>
<td>Unified cache.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If software reads the Cache Type fields from Ctype1 upwards, once it has seen a value of 000, no caches that can be managed using the architected cache maintenance instructions that operate by set/way exist at further-out levels of the hierarchy. So, for example, if Ctype3 is the first Cache Type field with a value of 000, the values of Ctype4 to Ctype7 must be ignored.

Accessing the CLIDR_EL1

Accesses to this register use the following encodings:

MRS <Xt>, CLIDR_EL1

CNTFRQ_EL0, Counter-timer Frequency register

The CNTFRQ_EL0 characteristics are:

**Purpose**

This register is provided so that software can discover the frequency of the system counter. It must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

**Configuration**

AArch64 System register CNTFRQ_EL0 bits [31:0] are architecturally mapped to AArch32 System register CNTFRQ[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTFRQ_EL0 is a 64-bit register.

**Field descriptions**

The CNTFRQ_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>31</td>
<td>Clock frequency</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**Bits [31:0]**

Clock frequency. Indicates the system counter clock frequency, in Hz.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTFRQ_EL0**

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>MRS &lt;Xt&gt;, CNTFRQ_EL0</th>
</tr>
</thead>
<tbody>
<tr>
<td>op0</td>
</tr>
<tr>
<td>0b11</td>

  elseif PSTATE.EL == EL3 then
    return CNTFRQ_EL0;
endif

if IsHighestEL(PSTATE.EL) then
  CNTFRQ_EL0 = X[t];
else
  UNDEFINED;
end
CNTHCTL_EL2, Counter-timer Hypervisor Control register

The CNTHCTL_EL2 characteristics are:

**Purpose**

Controls the generation of an event stream from the physical counter, and access from EL1 to the physical counter and the EL1 physical timer.

**Configuration**

AArch64 System register CNTHCTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHCTL[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTHCTL_EL2 is a 64-bit register.

**Field descriptions**

The CNTHCTL_EL2 bit assignments are:

**When ARMv8.1-VHE is implemented and HCR_EL2.E2H == 1:**

| Bit Position | 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 |
|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

**Bits [63:18]**

Reserved, RES0.

**EVNTIS, bit [17]**

When ARMv8.6-ECV is implemented:

Controls the scale of the generation of the event stream.

<table>
<thead>
<tr>
<th>EVNTIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CNTHCTL_EL2.EVNTI field applies to CNTPCT_EL0[15:0].</td>
</tr>
<tr>
<td>0b1</td>
<td>The CNTHCTL_EL2.EVNTI field applies to CNTPCT_EL0[23:8].</td>
</tr>
</tbody>
</table>

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

This field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**EL1NVVCT, bit [16]**

When ARMv8.6-ECV is implemented:

Traps EL1 accesses to the specified EL1 virtual timer registers using the EL02 descriptors to EL2, when EL2 is enabled for the current Security state.

<table>
<thead>
<tr>
<th>EL1NVVCT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>

</tr>
<tr>
<td>0b1</td>
<td>If ( (HCR_EL2).E2H==1 &amp;&amp; (HCR_EL2).TGE==1)</td>
</tr>
</tbody>
</table>

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL\_EL2.ECV bit.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**EL1NVPCT, bit [15]**

When ARMv8.6-ECV is implemented:

Traps EL1 accesses to the specified EL1 physical timer registers using the EL02 descriptors to EL2, when EL2 is enabled for the current Security state.

<table>
<thead>
<tr>
<th>EL1NVPCT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>If ( (HCR_EL2).E2H==1 &amp;&amp; (HCR_EL2).TGE==1)</td>
</tr>
</tbody>
</table>

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL\_EL2.ECV bit.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**EL1TVCT, bit [14]**
When ARMv8.6-ECV is implemented:

Traps EL0 and EL1 accesses to the EL1 virtual counter registers to EL2, when EL2 is enabled for the current Security state.

<table>
<thead>
<tr>
<th>EL1TVCT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>
| 0b1     | If HCR_EL2.\{E2H, TGE\} is \{1, 1\}, this control does not cause any instructions to be trapped.  
          If HCR_EL2.E2H is 0 or HCR_EL2.TGE is 0, then:  
          • In AArch64 state, traps EL0 and EL1 accesses to CNTVCT_EL0 to EL2, unless they are trapped by CNTKCTL_EL1.EL0VTEN.  
          • In AArch32 state, traps EL0 and EL1 accesses to CNTV_CTL_EL0, CNTV_CVAL_EL0, and CNTV_TVAL_EL0 to EL2, unless they are trapped by CNTKCTL_EL1.EL0VTEN |

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1TVT, bit [13]

When ARMv8.6-ECV is implemented:

Traps EL0 and EL1 accesses to the EL1 virtual timer registers to EL2, when EL2 is enabled for the current Security state.

<table>
<thead>
<tr>
<th>EL1TVT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>
| 0b1     | If HCR_EL2.\{E2H, TGE\} is \{1, 1\}, this control does not cause any instructions to be trapped.  
          If HCR_EL2.E2H is 0 or HCR_EL2.TGE is 0, then:  
          • In AArch64 state, traps EL0 and EL1 accesses to CNTV_CTL_EL0, CNTV_CVAL_EL0, and CNTV_TVAL_EL0 to EL2, unless they are trapped by CNTKCTL_EL1.EL0VTEN.  
          • In AArch32 state, traps EL0 and EL1 accesses to CNTV_CTL, CNTV_CVAL, and CNTV_TVAL to EL2, unless they are trapped by CNTKCTL_EL1.EL0VTEN or CNTKCTL.PL0VTEN |

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
When ARMv8.6-ECV is implemented:

Enables the Enhanced Counter Virtualization functionality registers.

<table>
<thead>
<tr>
<th>ECV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Enhanced Counter Virtualization functionality is disabled.</td>
</tr>
<tr>
<td>01</td>
<td>When HCR_EL2.TGE == 1 or SCR_EL3.EEL2 == 1, then Enhanced Counter Virtualization functionality is disabled.</td>
</tr>
<tr>
<td></td>
<td>When SCR_EL3.NS or SCR_EL3.EEL2 are 1, and HCR_EL2.E2H or HCR_EL2.TGE are 0, then Enhanced Counter Virtualization functionality is enabled.</td>
</tr>
</tbody>
</table>
|      | This means that:
|      | • An MRS to CNTPCT_EL0 from either EL0 or EL1 that is not trapped will return the value (PCount<63:0> - CNTPOFF_EL2<63:0>).               |
|      | • The EL1 physical timer interrupt is triggered when ((PCount<63:0> - CNTPOFF_EL2<63:0>) - PCVal<63:0>) is greater than or equal to 0. PCVal<63:0> is the EL1 physical timer compare value for this timer. |

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1PTEN, bit [11]

When HCR_EL2.TGE is 0, traps EL0 and EL1 accesses to the EL1 physical timer registers to EL2 when EL2 is enabled in the current Security state.

<table>
<thead>
<tr>
<th>EL1PTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>

CNGTHP_CTL_EL2, Counter-timer Hypervisor Physical Timer Control register

The CNGTHP_CTL_EL2 characteristics are:

**Purpose**

Control register for the EL2 physical timer.

**Configuration**

AArch64 System register CNGTHP_CTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNGTHP_CTL[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNGTHP_CTL_EL2 is a 64-bit register.

**Field descriptions**

The CNGTHP_CTL_EL2 bit assignments are:

<table>
<thead>
<tr>

</tbody>
</table>

**Bits [63:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see ‘Operation of the CompareValue views of the timers' and ‘Operation of the TimerValue views of the timers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, chapter D6.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:
IMASK

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>

For more information, see the description of the ISTATUS bit.

This field resets to an architecturally UNKNOWN value.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from `CNTHP_TVAL_EL2` continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTHP_CTL_EL2**

When `HCR_EL2.E2H` is 1, without explicit synchronization, access from EL2 using the mnemonic `CNTHP_CTL_EL2` or `CNTP_CTL_EL0` are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

CNTHP_CVAL_EL2, Counter-timer Physical Timer CompareValue register (EL2)

The CNTHP_CVAL_EL2 characteristics are:

**Purpose**

Holds the compare value for the EL2 physical timer.

**Configuration**

AArch64 System register CNTHP_CVAL_EL2 bits [63:0] are architecturally mapped to AArch32 System register CNTHP_CVAL[63:0].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTHP_CVAL_EL2 is a 64-bit register.

**Field descriptions**

The CNTHP_CVAL_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| CompareValue | CompareValue |

**CompareValue, bits [63:0]**

Holds the EL2 physical timer CompareValue.

When CNTHP_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHP_CTL_EL2.ISTATUS is set to 1.
- If CNTHP_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHP_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTHP_CVAL_EL2**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHP_CVAL_EL2 or CNTP_CVAL_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

**Bits [63:32]**

Reserved, RES0.

**TimerValue, bits [31:0]**

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If CNTHP_CTL_EL2.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHP_CTL_EL2.ENABLE is 1, the value returned is (CNTHP_CVAL_EL2 - CNTPCT_EL0).

On a write of this register, CNTHP_CVAL_EL2 is set to (CNTPCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHP_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CNTHP_CVAL_EL2) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHP_CTL_EL2.ISTATUS is set to 1.
- If CNTHP_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHP_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.
Accessing the CNTHP_TVAL_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHP_TVAL_EL2 or CNTP_TVAL_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

      end
    end
  end
The CNTHPS_CTL_EL2 characteristics are:

**Purpose**

Control register for the Secure EL2 physical timer.

**Configuration**

AArch64 System register CNTHPS_CTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHPS_CTL[31:0].

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to CNTHPS_CTL_EL2 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTHPS_CTL_EL2 is a 64-bit register.

**Field descriptions**

The CNTHPS_CTL_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|  RES0 |  ISTATUS | IMASK | ENABLE |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |

**Bits [63:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the CNTHPS_CTL_EL2.ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the CNTHPS_CTL_EL2.ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see 'Operation of the CompareValue views of the timers' and 'Operation of the TimerValue views of the timers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, chapter D6.

This bit is read-only.
**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>

For more information, see the description of the ISTATUS bit.

This field resets to an architecturally **UNKNOWN** value.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from **CNTHPS_TVAL_EL2** continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

This field resets to an architecturally **UNKNOWN** value.

**CompareValue, bits [63:0]**

Holds the EL2 physical timer CompareValue.

When CNTHPS_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHPS_CTL_EL2.ISTATUS is set to 1.
- If CNTHPS_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHPS_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

This field resets to an architecturally UNKNOWN value.

endif
The CNTHPS_TVAL_EL2 characteristics are:

**Purpose**

Holds the timer value for the Secure EL2 physical timer.

**Configuration**

AArch64 System register CNTHPS_TVAL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHPS_TVAL[31:0].

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to CNTHPS_TVAL_EL2 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTHPS_TVAL_EL2 is a 64-bit register.

**Field descriptions**

The CNTHPS_TVAL_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|    |
| RES0 | TimerValue |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:32]**

Reserved, RES0.

**TimerValue, bits [31:0]**

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If CNTHPS_CTL_EL2.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHPS_CTL_EL2.ENABLE is 1, the value returned is (CNTHPS_CVAL_EL2 - CNTPCT_EL0).

On a write of this register, CNTHPS_CVAL_EL2 is set to (CNTPCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHPS_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CNTHPS_CVAL_EL2) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHPS_CTL_EL2.ISTATUS is set to 1.
- If CNTHPS_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHPS_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

The CNTHV_CTL_EL2 characteristics are:

**Purpose**

Control register for the EL2 virtual timer.

**Configuration**

AArch64 System register CNTHV_CTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHV_CTL[31:0].

This register is present only when ARMv8.1-VHE is implemented. Otherwise, direct accesses to CNTHV_CTL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTHV_CTL_EL2 is a 64-bit register.

**Field descriptions**

The CNTHV_CTL_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>62</th>
<th>61</th>
<th>60</th>
<th>59</th>
<th>58</th>
<th>57</th>
<th>56</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>RES0</td>
<td></td>
</tr>
<tr>
<td>31</td>
<td>30</td>
<td>29</td>
<td>28</td>
<td>27</td>
<td>26</td>
<td>25</td>
<td>24</td>
<td>23</td>
<td>22</td>
<td>21</td>
<td>20</td>
<td>19</td>
<td>18</td>
<td>17</td>
<td>16</td>
<td>15</td>
<td>14</td>
<td>13</td>
<td>12</td>
<td>11</td>
<td>10</td>
<td>9</td>
<td>8</td>
<td>7</td>
<td>6</td>
<td>5</td>
<td>4</td>
<td>3</td>
<td>2</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

**Bits [63:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see 'Operation of the CompareValue views of the timers' and 'Operation of the TimerValue views of the timers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, chapter D6.

This bit is read-only.
**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>

For more information, see the description of the ISTATUS bit.

This field resets to an architecturally **UNKNOWN** value.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from **CNTHV_TVAL_EL2** continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the CNTHV_CTL_EL2**

When **HCR_EL2.E2H** is 1, without explicit synchronization, access from EL2 using the mnemonic **CNTHV_CTL_EL2** or **CNTV_CTL_EL0** are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

**CompareValue, bits [63:0]**

Holds the EL2 virtual timer CompareValue.

When CNTHV_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTVCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHV_CTL_EL2.ISTATUS is set to 1.
- If CNTHV_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHV_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTHV_CVAL_EL2**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHV_CVAL_EL2 or CNTV_CVAL_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.
Accesses to this register use the following encodings:

CNTHV_TVAL_EL2, Counter-timer Virtual Timer TimerValue Register (EL2)

The CNTHV_TVAL_EL2 characteristics are:

**Purpose**

Holds the timer value for the EL2 virtual timer.

**Configuration**

AArch64 System register CNTHV_TVAL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHV_TVAL[31:0].

This register is present only when ARMv8.1-VHE is implemented. Otherwise, direct accesses to CNTHV_TVAL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTHV_TVAL_EL2 is a 64-bit register.

**Field descriptions**

The CNTHV_TVAL_EL2 bit assignments are:

<table>
<thead>
<tr>

**Bits [63:32]**

Reserved, RES0.

**TimerValue, bits [31:0]**

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If CNTHV_CTL_EL2.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHV_CTL_EL2.ENABLE is 1, the value returned is (CNTHV_CVAL_EL2 - CNTVCT_EL0).

On a write of this register, CNTHV_CVAL_EL2 is set to (CNTVCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHV_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTVCT_EL0 - CNTHV_CVAL_EL2) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHV_CTL_EL2.ISTATUS is set to 1.
- If CNTHV_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHV_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count, so the TimerValue view appears to continue to count down.
This field resets to an architecturally **UNKNOWN** value.

## Accessing the CNTHV_TVAL_EL2

When **HCR_EL2.E2H** is 1, without explicit synchronization, access from EL2 using the mnemonic `CNTHV_TVAL_EL2` or `CNTV_TVAL_EL0` are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

### MRS <Xt>, CNTHV_TVAL_EL2

<table>

CNTHVS_CTL_EL2, Counter-timer Secure Virtual Timer Control register (EL2)

The CNTHVS_CTL_EL2 characteristics are:

**Purpose**

Control register for the Secure EL2 virtual timer.

**Configuration**

AArch64 System register CNTHVS_CTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHVS_CTL[31:0].

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to CNTHVS_CTL_EL2 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTHVS_CTL_EL2 is a 64-bit register.

**Field descriptions**

The CNTHVS_CTL_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
</tr>
<tr>
<td>62</td>
<td></td>
</tr>
<tr>
<td>61</td>
<td></td>
</tr>
<tr>
<td>60</td>
<td></td>
</tr>
<tr>
<td>59</td>
<td></td>
</tr>
<tr>
<td>58</td>
<td></td>
</tr>
<tr>
<td>57</td>
<td></td>
</tr>
<tr>
<td>56</td>
<td></td>
</tr>
<tr>
<td>55</td>
<td></td>
</tr>
<tr>
<td>54</td>
<td></td>
</tr>
<tr>
<td>53</td>
<td></td>
</tr>
<tr>
<td>52</td>
<td></td>
</tr>
<tr>
<td>51</td>
<td></td>
</tr>
<tr>
<td>50</td>
<td></td>
</tr>
<tr>
<td>49</td>
<td></td>
</tr>
<tr>
<td>48</td>
<td></td>
</tr>
<tr>
<td>47</td>
<td></td>
</tr>
<tr>
<td>46</td>
<td></td>
</tr>
<tr>
<td>45</td>
<td></td>
</tr>
<tr>
<td>44</td>
<td></td>
</tr>
<tr>
<td>43</td>
<td></td>
</tr>
<tr>
<td>42</td>
<td></td>
</tr>
<tr>
<td>41</td>
<td></td>
</tr>
<tr>
<td>40</td>
<td></td>
</tr>
<tr>
<td>39</td>
<td></td>
</tr>
<tr>
<td>38</td>
<td></td>
</tr>
<tr>
<td>37</td>
<td></td>
</tr>
<tr>
<td>36</td>
<td></td>
</tr>
<tr>
<td>35</td>
<td></td>
</tr>
<tr>
<td>34</td>
<td></td>
</tr>
<tr>
<td>33</td>
<td></td>
</tr>
<tr>
<td>32</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the CNTHVS_CTL_EL2.ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see 'Operation of the CompareValue views of the timers' and 'Operation of the TimerValue views of the timers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, chapter D6.

This bit is read-only.
IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>

For more information, see the description of the CNTHVS_CTL_EL2.ISTATUS bit.

This field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHVS_TVAL_EL2 continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTHVS_CTL_EL2**

Accesses to this register use the following encodings:

The CNTHS_CVALID_EL2 characteristics are:

### Purpose

Holds the compare value for the Secure EL2 virtual timer.

### Configuration

AArch64 System register CNTHS_CVALID_EL2 bits [63:0] are architecturally mapped to AArch32 System register `CNTHS_CVALID[63:0]`.

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to `CNTHS_CVALID_EL2` are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

CNTHS_CVALID_EL2 is a 64-bit register.

### Field descriptions

The CNTHS_CVALID_EL2 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

**CompareValue**, bits [63:0]

Holds the Secure EL2 virtual timer CompareValue.

When `CNTHS_CTL_EL2`.ENABLE is 1, the timer condition is met when `(CNTVCT_EL0 - CompareValue)` is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- `CNTHS_CTL_EL2`.ISTATUS is set to 1.
- If `CNTHS_CTL_EL2`.IMASK is 0, an interrupt is generated.

When `CNTHS_CTL_EL2`.ENABLE is 0, the timer condition is not met, but `CNTVCT_EL0` continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

This field resets to an architecturally UNKNOWN value.

### Accessing the CNTHS_CVALID_EL2

Accesses to this register use the following encodings:

The CNTHVS_TVAL_EL2 characteristics are:

**Purpose**

Holds the timer value for the Secure EL2 virtual timer.

**Configuration**

AArch64 System register CNTHVS_TVAL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHVS_TVAL[31:0].

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to CNTHVS_TVAL_EL2 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTHVS_TVAL_EL2 is a 64-bit register.

**Field descriptions**

The CNTHVS_TVAL_EL2 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0 | TimerValue |
| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |

**Bits [63:32]**

Reserved, RES0.

**TimerValue, bits [31:0]**

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If CNTHVS_CTL_EL2.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHVS_CTL_EL2.ENABLE is 1, the value returned is (CNTHVS_CVAL_EL2 - CNTVCT_EL0).

On a write of this register, CNTHVS_CVAL_EL2 is set to (CNTVCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHVS_CTL_EL2.ENABLE is 1, the timer condition is met when ((CNTVCT_EL0 - CNTHVS_CVAL_EL2) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHVS_CTL_EL2.ISTATUS is set to 1.
- If CNTHVS_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHVS_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

MSR CNTV_TVAL_EL0, <Xt>
CNTKCTL_EL1, Counter-timer Kernel Control register

The CNTKCTL_EL1 characteristics are:

**Purpose**

When ARMv8.1-VHE is not implemented, or when HCR_EL2.{E2H, TGE} is not {1, 1}, this register controls the generation of an event stream from the virtual counter, and access from EL0 to the physical counter, virtual counter, EL1 physical timers, and the virtual timer.

When ARMv8.1-VHE is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, this register does not cause any event stream from the virtual counter to be generated, and does not control access to the counters and timers. The access to counters and timers at EL0 is controlled by CNTHCTL_EL2.

**Configuration**

AArch64 System register CNTKCTL_EL1 bits [31:0] are architecturally mapped to AArch32 System register CNTKCTL[31:0].

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTKCTL_EL1 is a 64-bit register.

**Field descriptions**

The CNTKCTL_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>RES0</th>
<th>EVNTIS</th>
<th>RES0</th>
<th>ELOPTEN</th>
<th>ELOVTEN</th>
<th>EVNTI</th>

<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

**Bits [63:18]**

Reserved, RES0.

**EVNTIS, bit [17]**

When ARMv8.6-ECV is implemented:

Controls the scale of the generation of the event stream.

<table>
<thead>
<tr>
<th>EVNTIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CNTKCTL_EL1.EVNTI field applies to CNTVCT_EL0[15:0].</td>
</tr>
<tr>
<td>0b1</td>
<td>The CNTKCTL_EL1.EVNTI field applies to CNTVCT_EL0[23:8].</td>
</tr>
</tbody>
</table>

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.
Bits [16:10]

Reserved, RES0.

**ELOPTEN, bit [9]**

Traps EL0 accesses to the physical timer registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, as follows:

- In AArch64 state, the following registers are trapped, reported using EC syndrome value 0x18:
  - CNTP_CTL_EL0, CNTP_CVAL_EL0, and CNTP_TVAL_EL0.

- In AArch32 state, MRC and MCR accesses to the following registers are trapped, reported using EC syndrome value 0x03, MRRC and MCRR accesses are trapped, reported using EC syndrome value 0x04:
  - CNTP_CTL, CNTP_CVAL, CNTP_TVAL.

<table>
<thead>
<tr>
<th>ELOPTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 accesses to the physical timer registers are trapped to EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

When ARMv8.1-VHE is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

This field resets to an architecturally **UNKNOWN** value.

**EL0VTEN, bit [8]**

Traps EL0 accesses to the virtual timer registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, as follows:

- In AArch64 state, accesses to the following registers are trapped, reported using EC syndrome value 0x18:
  - CNTV_CTL_EL0, CNTV_CVAL_EL0, and CNTV_TVAL_EL0.

- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value 0x03, MRRC and MCRR accesses are trapped using EC syndrome value 0x04:
  - CNTV_CTL, CNTV_CVAL, and CNTV_TVAL.

<table>
<thead>
<tr>
<th>EL0VTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 accesses to the virtual timer registers are trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

When ARMv8.1-VHE is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

This field resets to an architecturally **UNKNOWN** value.

**EVNTI, bits [7:4]**

Selects which bit (0 to 15) of the counter register CNTVCT_EL0 is the trigger for the event stream generated from that counter, when that stream is enabled.

This field resets to an architecturally **UNKNOWN** value.

**EVNTDIR, bit [3]**

Controls which transition of the counter register CNTVCT_EL0 trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

<table>
<thead>
<tr>
<th>EVNTDIR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A 0 to 1 transition of the trigger bit triggers an event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A 1 to 0 transition of the trigger bit triggers an event.</td>
</tr>
</tbody>
</table>
This field resets to an architecturally **UNKNOWN** value.

### EVNTEN, bit [2]

When ARMv8.1-VHE is not implemented, or when \texttt{HCR\_EL2}.\{E2H, TGE\} is not \{1, 1\}, enables the generation of an event stream from the counter register \texttt{CNTVCT\_EL0}:

<table>
<thead>
<tr>
<th>EVNTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disables the event stream.</td>
</tr>
<tr>
<td>0b1</td>
<td>Enables the event stream.</td>
</tr>
</tbody>
</table>

When ARMv8.1-VHE is implemented and \texttt{HCR\_EL2}.\{E2H, TGE\} is \{1, 1\}, this control does not enable the event stream.

This field resets to 0.

### ELOVCTEN, bit [1]

Traps EL0 accesses to the frequency register and virtual counter register to EL1, or to EL2 when it is implemented and enabled for the current Security state and \texttt{HCR\_EL2}.TGE is 1, as follows:

- In AArch64 state, accesses to the following registers are trapped and reported using EC syndrome value 0x18:
  - \texttt{CNTVCT\_EL0} and if \texttt{CNTKCTL\_EL1}.EL0VCTEN is 0, \texttt{CNTFRQ\_EL0}.
- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value 0x03, MRRC and MCRR accesses are trapped and reported using EC syndrome value 0x04:
  - \texttt{CNTVCT} and if \texttt{CNTKCTL\_EL1}.EL0VCTEN is 0, \texttt{CNTFRQ}.

<table>
<thead>
<tr>
<th>ELOVCTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 accesses to the frequency register and virtual counter registers are trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

When ARMv8.1-VHE is implemented and \texttt{HCR\_EL2}.\{E2H, TGE\} is \{1, 1\}, this control does not cause any instructions to be trapped.

This field resets to an architecturally **UNKNOWN** value.

### ELOPCTEN, bit [0]

Traps EL0 accesses to the frequency register and physical counter register to EL1, or to EL2 when it is implemented and enabled for the current Security state and \texttt{HCR\_EL2}.TGE is 1, as follows:

- In AArch64 state, the following registers are trapped, reported using EC syndrome value 0x18:
  - \texttt{CNTPCT\_EL0} and if \texttt{CNTKCTL\_EL1}.EL0PCTEN is 0, \texttt{CNTFRQ\_EL0}.
- In AArch32 state, MCR or MRC accesses the following registers are trapped, reported using EC syndrome value 0x03, MCRR or MRRC accesses are trapped and reported using EC syndrome value 0x04:
  - \texttt{CNTCT} and if \texttt{CNTKCTL\_EL1}.EL0PCTEN is 0, \texttt{CNTFRQ}.

<table>
<thead>
<tr>
<th>ELOPCTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 accesses to the frequency register and physical counter register are trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

When ARMv8.1-VHE is implemented and \texttt{HCR\_EL2}.\{E2H, TGE\} is \{1, 1\}, this control does not cause any instructions to be trapped.

This field resets to an architecturally **UNKNOWN** value.

### Accessing the CNTKCTL\_EL1

When \texttt{HCR\_EL2}.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTKCTL\_EL1 or CNTKCTL\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

    else
        UNDEFINED;
The CNTP_CTL_EL0 characteristics are:

**Purpose**

Control register for the EL1 physical timer.

**Configuration**

AArch64 System register CNTP_CTL_EL0 bits [31:0] are architecturally mapped to AArch32 System register CNTP_CTL[31:0].

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

CNTP_CTL_EL0 is a 64-bit register.

**Field descriptions**

The CNTP_CTL_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-32</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>31</td>
<td>ISTATUS</td>
</tr>
<tr>
<td>30</td>
<td>IMASK</td>
</tr>
<tr>
<td>29</td>
<td>ENABLE</td>
</tr>
</tbody>
</table>

**Bits [63:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is **UNKNOWN**.

For more information see 'Operation of the CompareValue views of the timers' and 'Operation of the TimerValue views of the timers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, chapter D6.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:
### IMASK

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>

For more information, see the description of the ISTATUS bit.

This field resets to an architecturally **UNKNOWN** value.

### ENABLE, bit [0]

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from `CNTP_TVAL_EL0` continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

This field resets to an architecturally **UNKNOWN** value.

### Accessing the CNTP_CTL_EL0

When `HCR_EL2.E2H` is 1, without explicit synchronization, access from EL3 using the mnemonic `CNTP_CTL_EL0` or `CNTP_CTL_EL02` are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

endif
The CNTP_CVAL_EL0 characteristics are:

**Purpose**

Holds the compare value for the EL1 physical timer.

**Configuration**

AArch64 System register CNTP_CVAL_EL0 bits [63:0] are architecturally mapped to AArch32 System register CNTP_CVAL[63:0].

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTP_CVAL_EL0 is a 64-bit register.

**Field descriptions**

The CNTP_CVAL_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**CompareValue, bits [63:0]**

Holds the EL1 physical timer CompareValue.

When CNTP_CTL_EL0.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTP_CTL_EL0.ISTATUS is set to 1.
- If CNTP_CTL_EL0.IMASK is 0, an interrupt is generated.

When CNTP_CTL_EL0.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTP_CVAL_EL0**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTP_CVAL_EL0 or CNTP_CVAL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

**Bits [63:32]**

Reserved, RES0.

**TimerValue, bits [31:0]**

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If CNTP_CTL_EL0.ENABLE is 0, the value returned is **UNKNOWN**.
- If CNTP_CTL_EL0.ENABLE is 1, the value returned is (CNTP_CVAL_EL0 - CNTPCT_EL0).

On a write of this register, CNTP_CVAL_EL0 is set to (CNTPCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTP_CTL_EL0.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CNTP_CVAL_EL0) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTP_CTL_EL0.ISTATUS is set to 1.
- If CNTP_CTL_EL0.IMASK is 0, an interrupt is generated.

When CNTP_CTL_EL0.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally **UNKNOWN** value.
## Accessing the CNTP_TVAL_EL0

When \texttt{HCR_EL2.E2H} is 1, without explicit synchronization, access from EL3 using the mnemonic \texttt{CNTP_TVAL_EL0} or \texttt{CNTP_TVAL_EL02} are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

CNTPCT_EL0, Counter-timer Physical Count register

The CNTPCT_EL0 characteristics are:

**Purpose**

Holds the 64-bit physical count value.

**Configuration**

AArch64 System register CNTPCT_EL0 bits [63:0] are architecturally mapped to AArch32 System register CNTPCT[63:0].

All reads to the CNTPCT_EL0 occur in program order relative to reads to CNTPCTSS_EL0 or CNTPCT_EL0.

**Attributes**

CNTPCT_EL0 is a 64-bit register.

**Field descriptions**

The CNTPCT_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Physical count value</td>
</tr>
<tr>
<td>62</td>
<td>Physical count value</td>
</tr>
<tr>
<td>...</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td>Physical count value</td>
</tr>
</tbody>
</table>

**Bits [63:0]**

Physical count value.

Reads of CNTPCT_EL0 from EL0 or EL1 return (PCount<63:0> - CNTPOFF_EL2<63:0>) if the access is not trapped, and all of the following are true:

- CNTHCTL_EL2.ECV is 1.
- HCR_EL2.{E2H, TGE} is not {1, 1}.

Where PCount<63:0> is the physical count returned when CNTPCT_EL0 is read from EL2 or EL3.

**Accessing the CNTPCT_EL0**

Accesses to this register use the following encodings:

MRS <Xt>, CNTPCT_EL0

CNTPCTSS_EL0, Counter-timer Self-Synchronized Physical Count register

The CNTPCTSS_EL0 characteristics are:

**Purpose**

Holds the self-synchronized view of the 64-bit physical count value.

**Configuration**

AArch64 System register CNTPCTSS_EL0 bits [63:0] are architecturally mapped to AArch32 System register CNTPCTSS[63:0].

This register is present only when ARMv8.6-ECV is implemented. Otherwise, direct accesses to CNTPCTSS_EL0 are UNDEFINED.

All reads to the CNTPCTSS_EL0 occur in program order relative to reads to CNTPCT_EL0 or CNTPCTSS_EL0.

This register is a self-synchronised view of the CNTPCT_EL0 counter, and cannot be read speculatively.

**Attributes**

CNTPCTSS_EL0 is a 64-bit register.

**Field descriptions**

The CNTPCTSS_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-0</td>
<td>Self-synchronized physical count value</td>
</tr>
</tbody>
</table>

CNTPOFF_EL2, Counter-timer Physical Offset register

The CNTPOFF_EL2 characteristics are:

Purpose

Holds the 64-bit physical offset. This is the offset for the AArch64 physical timers and counters when Enhanced Counter Virtualization is enabled.

Configuration

This register is present only when ARMv8.6-ECV is implemented. Otherwise, direct accesses to CNTPOFF_EL2 are UNDEFINED.

The offsetting of the timers and counters based on EL2 using AArch64 apply at:

- EL1 when EL1 is using AArch64 or AArch32.
- EL0 when EL0 is using AArch64 or AArch32.

When EL2 is implemented and enabled in the current Security state, the physical counter uses a fixed physical offset of zero if either of the following are true:

- CNTHCTL_EL2. ECV is 0.
- SCR_EL3. ECVEN is 0.
- HCR_EL2. {E2H, TGE} is {1, 1}.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTPOFF_EL2 is a 64-bit register.

Field descriptions

The CNTPOFF_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

CNTPS_CTL_EL1, Counter-timer Physical Secure Timer Control register

The CNTPS_CTL_EL1 characteristics are:

**Purpose**

Control register for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

**Configuration**

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTPS_CTL_EL1 is a 64-bit register.

**Field descriptions**

The CNTPS_CTL_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>ISTATUS</td>
<td>The status of the timer. This bit indicates whether the timer condition is met:</td>
</tr>
<tr>
<td>IMASK</td>
<td>Timer interrupt mask bit. Permitted values are:</td>
</tr>
<tr>
<td>ENABLE</td>
<td></td>
</tr>
</tbody>
</table>

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see 'Operation of the CompareValue views of the timers' and 'Operation of the TimerValue views of the timers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, chapter D6.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>
For more information, see the description of the ISTATUS bit.

This field resets to an architecturally **UNKNOWN** value.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from **CNTPS_TVAL_EL1** continues to count down.

---

**Note**

Disabling the output signal might be a power-saving option.

---

This field resets to an architecturally **UNKNOWN** value.

**Accessing the CNTPS_CTL_EL1**

Accesses to this register use the following encodings:

```plaintext
MRS <Xt>, CNTPS_CTL_EL1
```

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b11</td>
<td>0b111</td>
<td>0b0010</td>
<td>0b001</td>
</tr>
</tbody>
</table>

```plaintext
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if HaveEL(EL3) && SCR_EL3.NS == '0' then

    elsif PSTATE.EI == EL3 then
        CNTPS_CTL_EL1 = XI[t];

The CNTPS_CVAL_EL1 characteristics are:

**Purpose**

Holds the compare value for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

**Configuration**

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTPS_CVAL_EL1 is a 64-bit register.

**Field descriptions**

The CNTPS_CVAL_EL1 bit assignments are:

CNTPS_TVAL_EL1, Counter-timer Physical Secure Timer TimerValue register

The CNTPS_TVAL_EL1 characteristics are:

**Purpose**

Holds the timer value for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

**Configuration**

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

CNTPS_TVAL_EL1 is a 64-bit register.

**Field descriptions**

The CNTPS_TVAL_EL1 bit assignments are:

```
 63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32
77 76 75 74 73 72 71 70 69 68 67 66 65 64 63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47
66 65 64 63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36
55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32 31 30 29 28 27 26 25
44 43 42 41 40 39 38 37 36 35 34 33 32 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14
33 32 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
```

**Bits [63:32]**

Reserved, RES0.

**TimerValue, bits [31:0]**

The TimerValue view of the secure physical timer.

On a read of this register:

- If **CNTPS_CTL_EL1**.ENABLE is 0, the value returned is **UNKNOWN**.
- If **CNTPS_CTL_EL1**.ENABLE is 1, the value returned is (**CNTPS_CVAL_EL1** - **CNTPCT_EL0**).

On a write of this register, **CNTPS_CVAL_EL1** is set to (**CNTPCT_EL0** + TimerValue), where TimerValue is treated as a signed 32-bit integer:

When **CNTPS_CTL_EL1**.ENABLE is 1, the timer condition is met when (**CNTPCT_EL0** - **CNTPS_CVAL_EL1**) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- **CNTPS_CTL_EL1**.ISTATUS is set to 1.
- If **CNTPS_CTL_EL1**.IMASK is 0, an interrupt is generated.

When **CNTPS_CTL_EL1**.ENABLE is 0, the timer condition is not met, but **CNTPCT_EL0** continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally **UNKNOWN** value.
Accessing the CNTPS_TVAL_EL1

Accesses to this register use the following encodings:

MRS <Xt>, CNTPS_TVAL_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>

The CNTV_CTL_EL0 characteristics are:

**Purpose**
Control register for the virtual timer.

**Configuration**
AArch64 System register CNTV_CTL_EL0 bits [31:0] are architecturally mapped to AArch32 System register CNTV_CTL[31:0].

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**
CNTV_CTL_EL0 is a 64-bit register.

**Field descriptions**
The CNTV_CTL_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>62</td>
<td>ISTATUS</td>
<td>The status of the timer. This bit indicates whether the timer condition is met:</td>
</tr>
<tr>
<td>61</td>
<td>IMASK</td>
<td>Timer interrupt mask bit. Permitted values are:</td>
</tr>
<tr>
<td>60</td>
<td>ENABLE</td>
<td>When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted. When the value of the ENABLE bit is 0, the ISTATUS field is <strong>UNKNOWN</strong>. For more information see 'Operation of the CompareValue views of the timers' and 'Operation of the TimerValue views of the timers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, chapter D6. This bit is read-only.</td>
</tr>
</tbody>
</table>
Meaning

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>

For more information, see the description of the ISTATUS bit.

This field resets to an architecturally UNKNOWN value.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTV_TVAL_EL0 continues to count down.

---

**Note**

Disabling the output signal might be a power-saving option.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTV_CTL_EL0**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTV_CTL_EL0 or CNTV_CTL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

**MRS <Xt>, CNTV_CTL_EL0**

The CNTV_CVAL_EL0 characteristics are:

**Purpose**

Holds the compare value for the virtual timer.

**Configuration**

AArch64 System register CNTV_CVAL_EL0 bits [63:0] are architecturally mapped to AArch32 System register CNTV_CVAL[63:0].

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTV_CVAL_EL0 is a 64-bit register.

**Field descriptions**

The CNTV_CVAL_EL0 bit assignments are:

| Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit |

**CompareValue, bits [63:0]**

Holds the EL1 virtual timer CompareValue.

When CNTV_CTL_EL0.ENABLE is 1, the timer condition is met when (CNTVCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTV_CTL_EL0.ISTATUS is set to 1.
- If CNTV_CTL_EL0.IMASK is 0, an interrupt is generated.

When CNTV_CTL_EL0.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTV_CVAL_EL0**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTV_CVAL_EL0 or CNTV_CVAL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
    if !ELUsingAArch32(EL1) && !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && CNTKCTL_EL1.EL0VTEN

The CNTV_TVAL_EL0 characteristics are:

**Purpose**

Holds the timer value for the EL1 virtual timer.

**Configuration**

AArch64 System register CNTV_TVAL_EL0 bits [31:0] are architecturally mapped to AArch32 System register CNTV_TVAL[31:0].

RW fields in this register reset to architecturally unknown values.

**Attributes**

CNTV_TVAL_EL0 is a 64-bit register.

**Field descriptions**

The CNTV_TVAL_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 |
| TimerValue |

**Bits [63:32]**

Reserved, RES0.

**TimerValue, bits [31:0]**

The TimerValue view of the EL1 virtual timer.

On a read of this register:

- If `CNTV_CTL_EL0.ENABLE` is 0, the value returned is unknown.
- If `CNTV_CTL_EL0.ENABLE` is 1, the value returned is `(CNTV_CVAL_EL0 - CNTVCT_EL0)`.

On a write of this register, `CNTV_CVAL_EL0` is set to `(CNTVCT_EL0 + TimerValue)`, where TimerValue is treated as a signed 32-bit integer.

When `CNTV_CTL_EL0.ENABLE` is 1, the timer condition is met when `(CNTVCT_EL0 - CNTV_CVAL_EL0)` is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- `CNTV_CTL_EL0.ISTATUS` is set to 1.
- If `CNTV_CTL_EL0.IMASK` is 0, an interrupt is generated.

When `CNTV_CTL_EL0.ENABLE` is 0, the timer condition is not met, but `CNTVCT_EL0` continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally unknown value.
Accessing the CNTV_TVAL_EL0

When \(HCR\text{.}E2H\) is 1, without explicit synchronization, access from EL3 using the mnemonic CNTV_TVAL_EL0 or CNTV_TVAL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

\[

CNTVCT_EL0, Counter-timer Virtual Count register

The CNTVCT_EL0 characteristics are:

Purpose

Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value minus the virtual offset visible in CNTVOFF_EL2.

Configuration

AArch64 System register CNTVCT_EL0 bits [63:0] are architecturally mapped to AArch32 System register CNTVCT[63:0].

The value of this register is the same as the value of CNTPCT_EL0 in the following conditions:

- When EL2 is not implemented.
- When EL2 is implemented, HCR_EL2.E2H is 1, and this register is read from EL2.
- When EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} is {1, 1}, and this register is read from EL0 or EL2.

All reads to the CNTVCT_EL0 occur in program order relative to reads to CNTVCTSS_EL0 or CNTVCT_EL0.

Attributes

CNTVCT_EL0 is a 64-bit register.

Field descriptions

The CNTVCT_EL0 bit assignments are:

CNTVCTSS_EL0, Counter-timer Self-Synchronized Virtual Count register

The CNTVCTSS_EL0 characteristics are:

**Purpose**

Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value visible in CNTPCT_EL0 minus the virtual offset visible in CNTVOFF_EL2.

**Configuration**

AArch64 System register CNTVCTSS_EL0 bits [63:0] are architecturally mapped to AArch32 System register CNTVCTSS[63:0].

This register is present only when ARMv8.6-ECV is implemented. Otherwise, direct accesses to CNTVCTSS_EL0 are UNDEFINED.

All reads to the CNTVCTSS_EL0 occur in program order relative to reads to CNTPCT_EL0 or CNTVCTSS_EL0.

This register is a self-synchronised view of the CNTPCT_EL0 counter, and cannot be read speculatively.

**Attributes**

CNTVCTSS_EL0 is a 64-bit register.

**Field descriptions**

The CNTVCTSS_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

            return CNTVCTSS_EL0;
        elsif PSTATE.EL == EL3 then
            return CNTVCTSS_EL0;
        end
    end
CNTVOFF_EL2, Counter-timer Virtual Offset register

The CNTVOFF_EL2 characteristics are:

**Purpose**

Holds the 64-bit virtual offset. This is the offset between the physical count value visible in CNTPCT_EL0 and the virtual count value visible in CNTVCT_EL0.

**Configuration**

AArch64 System register CNTVOFF_EL2 bits [63:0] are architecturally mapped to AArch32 System register CNTVOFF[63:0].

If EL2 is not implemented, this register is RES0 from EL3 and the virtual counter uses a fixed virtual offset of zero.

**Note**

When EL2 is implemented and enabled in the current Security state, and is using AArch64, the virtual counter uses a fixed virtual offset of zero in the following situations:

- HCR_EL2.E2H is 1, and CNTVCT_EL0 is read from EL2.
- HCR_EL2.{E2H, TGE} is {1, 1}, and either:
  - CNTVCT_EL0 is read from EL0 or EL2.
  - CNTVCT is read from EL0.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTVOFF_EL2 is a 64-bit register.

**Field descriptions**

The CNTVOFF_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Virtual offset</td>
<td></td>
</tr>
<tr>
<td>62</td>
<td>Virtual offset</td>
<td></td>
</tr>
<tr>
<td>...</td>
<td>...</td>
<td>...</td>
</tr>
<tr>
<td>0</td>
<td>Virtual offset</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:0]**

Virtual offset.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTVOFF_EL2**

Accesses to this register use the following encodings:
MRS <Xt>, CNTVOFF_EL2

<table>

elsif PSTATE.EL == EL3 then
    CNTVOFF_EL2 = X[t];
endif
The CONTEXTIDR_EL1 characteristics are:

**Purpose**

Identifies the current Process Identifier.

The value of the whole of this register is called the Context ID and is used by:

- The debug logic, for Linked and Unlinked Context ID matching.
- The trace logic, to identify the current process.

The significance of this register is for debug and trace use only.

This register is used when ARMv8.1-VHE is not implemented, or when ARMv8.1-VHE is implemented and HCR_EL2.E2H is set to 0.

**Note**

When ARMv8.1-VHE is implemented and HCR_EL2.E2H is set to 1, CONTEXTIDR_EL2 is used.

**Configuration**

AArch64 System register CONTEXTIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register CONTEXTIDR[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CONTEXTIDR_EL1 is a 64-bit register.

**Field descriptions**

The CONTEXTIDR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

| RES0 | PROCID |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:32]**

Reserved, RES0.

**PROCID, bits [31:0]**

Process Identifier. This field must be programmed with a unique value that identifies the current process.

**Note**

In AArch32 state, when TTBCR.EAE is set to 0, CONTEXTIDR.ASID holds the ASID.
In AArch64 state, CONTEXTIDR_EL1 is independent of the ASID, and for the
EL1&0 translation regime either TTBR0_EL1 or TTBR1_EL1 holds the ASID.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the CONTEXTIDR_EL1**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CONTEXTIDR_EL1 or CONTEXTIDR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

CONTEXTIDR_EL2, Context ID Register (EL2)

The CONTEXTIDR_EL2 characteristics are:

**Purpose**

When HCR_EL2.E2H is set to 1, identifies the current Process Identifier.

The value of the whole of this register is called the Context ID and is used by:

- The debug logic, for Linked and Unlinked Context ID matching.
- The trace logic, to identify the current process.

The significance of this register is for debug and trace use only.

**Note**

When HCR_EL2.E2H is 0, CONTEXTIDR_EL2 replaces CONTEXTIDR_EL1 where CONTEXTIDR_EL1 would usually be used.

**Configuration**

This register is present only when ARMv8.1-VHE is implemented. Otherwise, direct accesses to CONTEXTIDR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CONTEXTIDR_EL2 is a 64-bit register.

**Field descriptions**

The CONTEXTIDR_EL2 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0| PROCID |

**Bits [63:32]**

Reserved, RES0.

**PROCID, bits [31:0]**

Process Identifier. This field must be programmed with a unique value that identifies the current process.

**Note**

In AArch32 state, when TTBCR.EAE is set to 0, CONTEXTIDR ASID holds the ASID.
In AArch64 state, CONTEXTIDR_EL2 is independent of the ASID, and for the EL2&0 translation regime either TTBR0_EL2 or TTBR1_EL2 holds the ASID.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the CONTEXTIDR_EL2**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CONTEXTIDR_EL2 or CONTEXTIDR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

**MRS <Xt>, CONTEXTIDR_EL2**

The CPACR_EL1 characteristics are:

**Purpose**

Controls access to trace, SVE, Advanced SIMD and floating-point functionality.

**Configuration**

AArch64 System register CPACR_EL1 bits [31:0] are architecturally mapped to AArch32 System register CPACR[31:0].

When HCR_EL2.{E2H, TGE} == {1, 1}, the fields in this register have no effect on execution at EL0 and EL1. In this case, the controls provided by CPTR_EL2 are used.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CPACR_EL1 is a 64-bit register.

**Field descriptions**

The CPACR_EL1 bit assignments are:

**Bits [63:29]**

Reserved, RES0.

**TTA, bit [28]**

Traps EL0 and EL1 System register accesses to all implemented trace registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from both Execution states as follows:

- In AArch64 state, accesses to trace registers are trapped, reported using EC syndrome value 0x18.
- In AArch32 state, MRC and MCR accesses to trace registers are trapped, reported using EC syndrome value 0x05.
- In AArch32 state, MRRC and MCRR accesses to trace registers are trapped, reported using EC syndrome value 0x0C.

<table>
<thead>
<tr>
<th>TTA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control causes EL0 and EL1 System register accesses to all implemented trace registers to be trapped.</td>
</tr>
</tbody>
</table>

**Note**

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the Armv8-A architecture is implemented with an ETMv4 implementation, EL0 accesses to the trace registers are UNDEFINED, and
any resulting exception is higher priority than an exception that would be generated because the value of CPACR_EL1.TTA is 1.

- The Armv8-A architecture does not provide traps on trace register accesses through the optional memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

If System register access to the trace functionality is not implemented, this bit is RE0.

This field resets to an architecturally UNKNOWN value.

**Bits [27:22]**

Reserved, RE0.

**FPEN, bits [21:20]**

Traps EL0 and EL1 accesses to the SVE, Advanced SIMD, and floating-point registers to EL1, reported using EC syndrome value 0x07, or to EL2 reported using EC syndrome value 0x00, when EL2 is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from both Execution states as follows:

- In AArch64 state, accesses to FPCR, FPSR, any of the SIMD and floating-point registers V0-V31, including their views as D0-D31 registers or S0-31 registers. See ‘The SIMD and floating-point registers, V0-V31’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
- FPCSR, and any of the SIMD and floating-point registers Q0-15, including their views as D0-D31 registers or S0-31 registers. See ‘Advanced SIMD and floating-point System registers’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>FPEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>This control causes any instructions at EL0 or EL1 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, unless they are trapped by CPACR_EL1.ZEN.</td>

The CPP RCTX characteristics are:

**Purpose**

Cache Prefetch Prediction Restriction by Context applies to all Cache Allocation Resources that predict cache allocations based on information gathered within the target execution context or contexts.

When this instruction is complete and synchronized, cache prefetch prediction does not permit later speculative execution within the target execution context to be observable through side channels.

This instruction applies to all:

- Instruction caches.
- Data caches.
- TLB prefetching hardware used by the executing PE that applies to the supplied context or contexts.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

**Note**

This instruction does not require the invalidation of Cache Allocation Resources so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

**Configuration**

This instruction is present only when ARMv8.0-PredInv is implemented. Otherwise, direct accesses to CPP RCTX are UNDEFINED.

**Attributes**

CPP RCTX is a 64-bit System instruction.

**Field descriptions**

The CPP RCTX input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-49</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

Reserved, RES0.
GVMID, bit [48]

Execution of this instruction applies to all VMIDs or a specified VMID.

<table>
<thead>
<tr>
<th>GVMID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Applies to specified VMID for an EL0 or EL1 context. For all other contexts this field is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Applies to all VMIDs for an EL0 or EL1 context. For all other contexts this field is RES0.</td>
</tr>
</tbody>
</table>

If the instruction is executed at EL0 or EL1, then this field has an Effective value of 0.

VMID, bits [47:32]

Only applies when bit[48] is 0 and one of:

- an EL1 context.
- an EL0 context when (HCR_EL2.E2H==0 or HCR_EL2.TGE==0).

Otherwise this field is RES0.

When the instruction is executed at EL1 then this field is treated as the current VMID.

When the instruction is executed at EL0 and (HCR_EL2.E2H==0 or HCR_EL2.TGE==0) then this field is treated as the current VMID.

When the instruction is executed at EL0 and (HCR_EL2.E2H==1 and HCR_EL2.TGE==1) then this field is ignored.

Bits [31:27]

Reserved, RES0.

NS, bit [26]

Security State.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure state.</td>
</tr>
</tbody>
</table>

If the instruction is executed in Non-secure state, this field has an Effective value of 1.

EL, bits [25:24]

Exception Level.

<table>
<thead>
<tr>
<th>EL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>EL0</td>
</tr>
<tr>
<td>0b01</td>
<td>EL1</td>
</tr>
<tr>
<td>0b10</td>
<td>EL2</td>
</tr>
<tr>
<td>0b11</td>
<td>EL3</td>
</tr>
</tbody>
</table>

If the instruction is executed at an exception level lower than the specified level, this instruction is treated as a NOP.

Bits [23:17]

Reserved, RES0.

GASID, bit [16]

Execution of this instruction applies to all ASIDs or a specified ASID.
### GASID

<table>
<thead>
<tr>
<th>GASID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Applies to specified ASID for an EL0 context. For all other contexts this field is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Applies to all ASID for an EL0 context. For all other contexts this field is RES0.</td>
</tr>
</tbody>
</table>

If the instruction is executed at EL0, then this field has an Effective value of 0.

### ASID, bits [15:0]

Only applies for an EL0 context and when bit[16] is 0.

Otherwise this field is RES0.

When the instruction is executed at EL0 then this field is treated as the current ASID.

### Executing the CPP RCTX instruction

Accesses to this instruction use the following encodings:

**CPP RCTX, <Xt>**

```
<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>0b011</td>
<td>0b0111</td>
<td>0b0011</td>
<td>0b111</td>
</tr>
</tbody>
</table>
```

```c
if PSTATE.EL == EL0 then
  if !ELUsingAArch32(EL1) && !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '1') && SCTLR_EL1.EnRCTX == '0' then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
      AArch64.SystemAccessTrap(EL2, 0x18);
    else
      AArch64.SystemAccessTrap(EL1, 0x18);
    endif;
    elsif EL2Enabled() && !ELUsingAArch32(EL1) && HCR_EL2.<E2H,TGE> != '11' && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGITR_EL2.CPPRCTX == '1' then
      AArch64.SystemAccessTrap(EL2, 0x18);
    else
      if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
      else
        CPP_RCTX(X[t]);
      endif;
    else
      CPP_RCTX(X[t]);
    endif;
  else
    CPP_RCTX(X[t]);
  endif;
else
  CPP_RCTX(X[t]);
endif;
```
**CPTR_EL2, Architectural Feature Trap Register (EL2)**

The CPTR_EL2 characteristics are:

### Purpose

**Controls:**

- Trapping to EL2 of access to CPACR, CPACR_EL1, trace functionality, and to SVE, Advanced SIMD and floating-point functionality.
- EL2 access to trace functionality, and to SVE, Advanced SIMD and floating-point functionality.

### Configuration

AArch64 System register CPTR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HCPTR[31:0]. If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

CPTR_EL2 is a 64-bit register.

### Field descriptions

The CPTR_EL2 bit assignments are:

**When ARMv8.1-VHE is implemented and HCR_EL2.E2H == 1:**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>62</td>
<td>EL1 accesses to CPACR_EL1 and CPACR are trapped to EL2 when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**TCPAC, bit [31]**

When HCR_EL2.TGE is 0, traps EL1 accesses to CPACR_EL1 reported using EC syndrome value 0x18, and accesses to CPACR reported using EC syndrome value 0x03, to EL2 when EL2 is enabled in the current Security state.

<table>
<thead>
<tr>
<th>TCPAC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 accesses to CPACR_EL1 and CPACR are trapped to EL2 when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

When HCR_EL2.TGE is 1, this control does not cause any instructions to be trapped.

### Note

CPACR_EL1 and CPACR are not accessible at EL0.
When AMUv1 is implemented:

Trap Activity Monitor access. Traps EL1 and EL0 accesses to all Activity Monitor registers to EL2, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - `AMUSERENR_EL0`, `AMCFGR_EL0`, `AMCGCR_EL0`, `AMCNTENCLR0_EL0`, `AMCNTENCLR1_EL0`, `AMCNTENSET0_EL0`, `AMCNTENSET1_EL0`, `AMCR_EL0`, `AMEVCNTR0<n>_EL0`, `AMEVTYPER0<n>_EL0`, and `AMEVTYPER1<n>_EL0`.

- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2 and reported using EC syndrome value 0x03:
  - `AMUSERENR`, `AMCFGR`, `AMCGCR`, `AMCNTENCLR0`, `AMCNTENCLR1`, `AMCNTENSET0`, `AMCNTENSET1`, `AMCR`, `AMEVTYPER0<n>`, and `AMEVTYPER1<n>`.

- In AArch32 state, MRRC or MCRR accesses to `AMEVCNTR0<n>` and `AMEVCNTR1<n>`, are trapped to EL2, reported using EC syndrome value 0x04.

<table>
<thead>
<tr>
<th>TAM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses from EL1 and EL0 to Activity Monitor registers are not trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses from EL1 and EL0 to Activity Monitor registers are trapped to EL2, when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

- Reserved, RES0.

Bit [29]

- Reserved, RES0.

TTA, bit [28]

Traps System register accesses to all implemented trace registers to EL2 when EL2 is enabled in the current Security state, from both Execution states, as follows:

- In AArch64 state, accesses to trace registers with op0=2, op1=1 are trapped to EL2, reported using EC syndrome value 0x18.

- In AArch32 state, MRC or MCR accesses to trace registers with cpnum=14, opc1=1, are trapped to EL2, reported using EC syndrome value 0x05.

- In AArch32 state, MRRC or MCRR accesses to trace registers with cpnum=14, opc1=1, are trapped to EL2, reported using EC syndrome value 0x0C.

<table>
<thead>
<tr>
<th>TTA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any attempt at EL0, EL1 or EL2, to execute a System register access to an implemented trace register is trapped to EL2 when EL2 is enabled in the current Security state, unless <code>HCR_EL2.TGE</code> is 0 and it is trapped by <code>CPACR.NSTRCDIS</code> or <code>CPACR_EL1.TTA</code>. When <code>HCR_EL2.TGE</code> is 1, any attempt at EL0 or EL2 to execute a System register access to an implemented trace register is trapped to EL2 when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

Note
The ETMv4 architecture does not permit EL0 to access the trace registers. If the Armv8-A architecture is implemented with an ETMv4 implementation, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPTR_EL2.TTA is 1.

EL2 does not provide traps on trace register accesses through the optional memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

If System register access to the trace functionality is not supported, this bit is RES0.

This field resets to an architecturally UNKNOWN value.

### Bits [27:22]

Reserved, RES0.

### FPEN, bits [21:20]

Traps EL0, EL2 and, when HCR_EL2.TGE is 0, EL1 accesses to the SVE, Advanced SIMD and floating-point registers to EL2 when EL2 is enabled in the current Security state, from both Execution states.

<table>
<thead>
<tr>
<th>FPEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>This control causes any instructions at EL0, EL1, or EL2 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, subject to the exception prioritization rules, unless they are trapped by CPTR_EL2.ZEN.</td>
</tr>
<tr>
<td>0b01</td>
<td>When HCR_EL2.TGE is 0, this control does not cause any instructions to be trapped. When HCR_EL2.TGE is 1, this control causes instructions at EL0 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, unless they are trapped by CPTR_EL2.ZEN, but does not cause any instruction at EL2 to be trapped.</td>
</tr>
<tr>
<td>0b10</td>
<td>This control causes any instructions at EL0, EL1, or EL2 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, subject to the exception prioritization rules, unless they are trapped by CPTR_EL2.ZEN.</td>
</tr>
<tr>
<td>0b11</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

Writes to MVFR0, MVFR1, and MVFR2 from EL1 or higher are CONSTRAINED UNPREDICTABLE and whether these accesses can be trapped by this control depends on implemented CONSTRAINED UNPREDICTABLE behavior.

---

**Note**

- Attempts to write to the FPSID count as use of the registers for accesses from EL1 or higher.
- Accesses from EL0 to FPSID, MVFR0, MVFR1, MVFR2, and FPFXC are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPTR_EL2.FPEN is not 0b11.

This field resets to an architecturally UNKNOWN value.

### Bits [19:18]

Reserved, RES0.

### ZEN, bits [17:16]

When SVE is implemented:

Traps execution at EL2, EL1, and EL0 of SVE instructions or instructions that access SVE System registers to EL2 when EL2 is enabled in the current Security state.
This control causes execution at EL2, EL1, and EL0 of these instructions to be trapped, subject to the exception prioritization rules.

When `HCR_EL2.TGE` is 0, this control does not cause any instruction to be trapped.

When `HCR_EL2.TGE` is 1, this control causes these instructions executed at EL0 to be trapped, but does not cause any instruction at EL2 to be trapped.

This control causes execution at EL2, EL1, and EL0 of these instructions to be trapped, subject to the exception prioritization rules.

This control does not cause any instruction to be trapped.

This field resets to an architecturally `UNKNOWN` value.

**Otherwise:**

Reserved, RES0.

**Bits [15:0]**

Reserved, RES0.

**Otherwise:**

<table>
<thead>
<tr>

</tr>
<tr>
<td>0b01</td>
<td>EL1 accesses to <code>CPACR_EL1</code> and <code>CPACR</code> are trapped to EL2 when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

Traps EL1 accesses to `CPACR_EL1`, reported using EC syndrome value 0x18 and accesses to `CPACR`, reported using EC syndrome value 0x03, to EL2 when EL2 is enabled in the current Security state.

When `HCR_EL2.TGE` is 1, this control does not cause any instructions to be trapped.

**TCPAC, bit [31]**

When AMUv1 is implemented:

Trap Activity Monitor access. Traps EL1 and EL0 accesses to all Activity Monitor registers to EL2, as follows:

- `TCPAC` and `TAM` are not accessible at EL0.

This field resets to an architecturally `UNKNOWN` value.

**Note**

`CPACR_EL1` and `CPACR` are not accessible at EL0.
• In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - AMUSERENR_EL0, AMCFGR_EL0, AMCGCR_EL0, AMCNTENCLR0_EL0, AMCNTENCLR1_EL0, AMCNTESET0_EL0, AMCNTESET1_EL0, AMCR_EL0, AMEVCNTR0<n>_EL0, AMEVCNTR1<n>_EL0, AMEVTYPER0<n>_EL0, and AMEVTYPER1<n>_EL0.

• In AArch32 state, MCR or MRC accesses to the following registers are trapped to EL2 and reported using EC syndrome value 0x03:
  - AMUSERENR, AMCFGR, AMCGCR, AMCNTENCLR0, AMCNTENCLR1, AMCNTESET0, AMCNTESET1, AMCR, AMEVTYPER0<n>, and AMEVTYPER1<n>.

• In AArch32 state, MCRR or MRRC accesses to AMEVCNTR0<n> and AMEVCNTR1<n>, are trapped to EL2, reported using EC syndrome value 0x04.

<table>

<td>Any attempt at EL0, EL1, or EL2, to execute a System register access to an implemented trace register is trapped to EL2 when EL2 is enabled in the current Security state, unless it is trapped by CPACR.TRCDIS or CPACR.EL1.TTA.</td>
</tr>
</tbody>
</table>

**Note**

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the Armv8-A architecture is implemented with an ETMv4 implementation, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPTR_EL2.TTA is 1.
- EL2 does not provide traps on trace register accesses through the optional memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

If System register access to the trace functionality is not supported, this bit is RES0.
This field resets to an architecturally **UNKNOWN** value.

**Bits [19:14]**

Reserved, **RES0**.

**Bits [13:12]**

Reserved, **RES1**.

**Bit [11]**

Reserved, **RES0**.

**TFP, bit [10]**

Traps accesses to SVE, Advanced SIMD and floating-point functionality to EL2 when EL2 is enabled in the current Security state, from both Execution states, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x07:
  - **FPCR, FPSR, FPEXC32_EL2**, any of the SIMD and floating-point registers V0-V31, including their views as D0-D31 registers or S0-31 registers. See 'The SIMD and floating-point registers, V0-V31' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x07:
  - **MVFR0, MVFR1, MVFR2, FPCSR, FPEXC**, and any of the SIMD and floating-point registers Q0-15, including their views as D0-D31 registers or S0-31 registers. See ‘Advanced SIMD and floating-point System registers’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile. For the purposes of this trap, the architecture defines a VMSR access to **FPSID** from EL1 or higher as an access to a SIMD and floating point register. Otherwise, permitted VMSR accesses to **FPSID** are ignored.

**Bits [63:32]**

Reserved, RES0.

**TCPAC, bit [31]**

Traps all of the following to EL3, from both Security states and both Execution states.

- EL2 accesses to CPTR_EL2, reported using EC syndrome value 0x18, or HCPTR, reported using EC syndrome value 0x03.
- EL2 and EL1 accesses to CPACR_EL1 reported using EC syndrome value 0x18, or CPACR reported using EC syndrome value 0x03.

When CPTR_EL3.TCPAC is:

<table>
<thead>
<tr>
<th>TCPAC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL2 accesses to the CPTR_EL2 or HCPTR, and EL2 and EL1 accesses to the CPACR_EL1 or CPACR, are trapped to EL3, unless they are trapped by CPTR_EL2.TCPAC.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**TAM, bit [30]**

When AMUv1 is implemented:

Trap Activity Monitor access. Traps EL2, EL1 and EL0 accesses to all Activity Monitor registers to EL3.

Accesses to the Activity Monitors registers are trapped as follows:
In AArch64 state, the following registers are trapped to EL3 and reported with EC syndrome value \(0x18\):

- AMUSERENR_EL0, AMCFGR_EL0, AMCGCR_EL0, AMCNTENCLR0_EL0, AMCNTENCLR1_EL0, AMCNTENSET0_EL0, AMCNTENSET1_EL0, AMCR_EL0, AMEVCTR0<n>_EL0, AMEVCTR1<n>_EL0, and AMEVTYPER0<n>_EL0.

In AArch32 state, accesses with MRC or MCR to the following registers reported with EC syndrome value \(0x03\):

- AMUSERENR, AMCFGR, AMCGCR, AMCNTENCLR0, AMCNTENCLR1, AMCNTENSET0, AMCNTENSET1, AMCR, AMEVTYPER0<n>, and AMEVTYPER1<n>.

In AArch32 state, accesses with MRRC or MCRR to the following registers, reported with EC syndrome value \(0x04\):

- AMEVCTR0<n>, AMEVCTR1<n>.

### TAM

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>0b0</strong></td>
</tr>
<tr>
<td><strong>0b1</strong></td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

### Otherwise:

Reserved, RES0.

### Bits [29:21]

Reserved, RES0.

### TTA, bit [20]

Traps System register accesses. Accesses to the trace registers, from all Exception levels, both Security states, and both Execution states are trapped to EL3 as follows:

- In AArch64 state, Trace registers with \(op0=2\), \(op1=1\), are trapped to EL3 and reported using EC syndrome value \(0x18\).
- In AArch32 state, accesses using MCR or MRC to the Trace registers with \(cpnum=14\) and \(opc1=1\) are reported using EC syndrome value \(0x05\).
- In AArch32 state, accesses using MCRR or MRRC to the Trace registers with \(cpnum=14\) and \(opc1=1\) are reported using EC syndrome value \(0x0C\).

### TTA

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>0b0</strong></td>
</tr>
<tr>
<td><strong>0b1</strong></td>
</tr>
</tbody>
</table>

If System register access to trace functionality is not supported, this bit is RES0.

### Note

The ETMv4 architecture does not permit EL0 to access the trace registers. If the Armv8-A architecture is implemented with an ETMv4 implementation, EL0 accesses to the trace registers are **UNDEFINED**, and any resulting exception is higher priority than this trap exception.

EL3 does not provide traps on trace register accesses through the Memory-mapped interface.
System register accesses to the trace registers can have side-effects. When a System register access is trapped, no side-effects occur before the exception is taken, see 'Register access instructions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

**Bits [19:11]**

Reserved, RES0.

**TFP, bit [10]**

Traps all accesses to SVE, Advanced SIMD and floating-point functionality, from all Exception levels, both Security states, and both Execution states, to EL3. Defined values are:

This includes the following registers, all reported using EC syndrome value 0x07:

- FPCR, FPSR, FPEXC32_EL2, any of the SIMD and floating-point registers V0-V31, including their views as D0-D31 registers or S0-31 registers. See 'The SIMD and floating-point registers, V0-V31' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
- MVFR0, MVFR1, MVFR2, FPCSR, FPEXC, and any of the SIMD and floating-point registers Q0-15, including their views as D0-D31 registers or S0-31 registers. See 'Advanced SIMD and floating-point System registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Permitted VMSR accesses to FPSID are ignored, but for the purposes of this trap the architecture define a VMSR access to the FPSID from EL1 or higher as an access to a SIMD and floating-point register.

<table>
<thead>
<tr>
<th>TFP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any attempt at any Exception level to execute an instruction that uses the registers associated with SVE, Advanced SIMD and floating-point is trapped to EL3, subject to the exception prioritization rules, unless it is trapped by CPTR_EL3.EZ.</td>
</tr>
</tbody>
</table>

**Note**

FPEXC32_EL2 is not accessible from EL0 using AArch64.

FPSID, MRFR0, MVFR1, and FPEXC are not accessible from EL0 using AArch32.

This field resets to an architecturally UNKNOWN value.

**Bit [9]**

Reserved, RES0.

**EZ, bit [8]**

**When SVE is implemented:**

Traps all accesses to SVE functionality and registers from all Exception levels, and both Security states, to EL3.

<table>
<thead>
<tr>
<th>EZ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control causes these instructions executed at any Exception level to be trapped, subject to the exception prioritization rules.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instruction to be trapped.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.
Bits [7:0]

CSSELR_EL1, Cache Size Selection Register

The CSSELR_EL1 characteristics are:

**Purpose**

Selects the current Cache Size ID Register, CSIDR_EL1, by specifying the required cache level and the cache type (either instruction or data cache).

**Configuration**

AArch64 System register CSSELR_EL1 bits [31:0] are architecturally mapped to AArch32 System register CSSEL[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CSSELR_EL1 is a 64-bit register.

**Field descriptions**

The CSSELR_EL1 bit assignments are:

<table>

</tbody>
</table>

**Bits [63:5]**

Reserved, RES0.

**TnD, bit [4]**

*When ARMv8.5-MemTag is implemented:*

Allocation Tag not Data bit.

<table>
<thead>
<tr>
<th>TnD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Data, Instruction or Unified cache.</td>
</tr>
<tr>
<td>0b1</td>
<td>Separate Allocation Tag cache.</td>
</tr>
</tbody>
</table>

When CSSELR_EL1.InD == 1, this bit is RES0.

If CSSELR_EL1.Level is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR_EL1 is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Level, bits [3:1]**

Cache level of required cache.
## Level, Meaning

<table>
<thead>
<tr>
<th>Level</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Level 1 cache.</td>
</tr>
<tr>
<td>0b001</td>
<td>Level 2 cache.</td>
</tr>
<tr>
<td>0b010</td>
<td>Level 3 cache.</td>
</tr>
<tr>
<td>0b011</td>
<td>Level 4 cache.</td>
</tr>
<tr>
<td>0b100</td>
<td>Level 5 cache.</td>
</tr>
<tr>
<td>0b101</td>
<td>Level 6 cache.</td>
</tr>
<tr>
<td>0b110</td>
<td>Level 7 cache.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If CSSEL_EL1.Level is programmed to a cache level that is not implemented, then the value for this field on a read of CSSEL_EL1 is **UNKNOWN**.

This field resets to an architecturally **UNKNOWN** value.

### InD, bit [0]

Instruction not Data bit.

<table>
<thead>
<tr>
<th>InD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Data or unified cache.</td>
</tr>
<tr>
<td>0b1</td>
<td>Instruction cache.</td>
</tr>
</tbody>
</table>

If CSSEL_EL1.Level is programmed to a cache level that is not implemented, then a read of CSSEL_EL1 is **CONSTRAINED UNPREDICTABLE**, and returns **UNKNOWN** values for CSSEL_EL1.{Level, InD}.

This field resets to an architecturally **UNKNOWN** value.

## Accessing the CSSEL_EL1

Accesses to this register use the following encodings:

### MRS <Xt>, CSSEL_EL1

<td>Data cache clean to the Point of Unification is required for instruction to data coherence, unless CLIDR_EL1.LoC == 0b000 or (CLIDR_EL1.LoUIS == 0b000 &amp;&amp; CLIDR_EL1.LoUU == 0b000).</td>
</tr>
<tr>
<td>0b1</td>
<td>Data cache clean to the Point of Unification is not required for instruction to data coherence.</td>
</tr>
</tbody>
</table>

**CWG, bits [27:24]**

Cache writeback granule. \( \log_2 \) of the number of words of the maximum size of memory that can be overwritten as a result of the eviction of a cache entry that has had a memory location in it modified.

A value of 0b0000 indicates that this register does not provide Cache writeback granule information and either:

- The architectural maximum of 512 words (2KB) must be assumed.
- The Cache writeback granule can be determined from maximum cache line size encoded in the Cache Size ID Registers.

Values greater than 0b1001 are reserved.

Arm recommends that an implementation that does not support cache write-back implements this field as 0b0001. This applies, for example, to an implementation that supports only write-through caches.

**ERG, bits [23:20]**

Exclusives reservation granule, and, if TME is implemented, transactional reservation granule. \( \log_2 \) of the number of words of the maximum size of the reservation granule for the Load-Exclusive and Store-Exclusive instructions, and, if TME is implemented, for detecting transactional conflicts.

A value of 0b0000 indicates that this register does not provide granule information and the architectural maximum of 512 words (2KB) must be assumed.

Value 0b0001 and values greater than 0b1001 are reserved.

**DminLine, bits [19:16]**

\( \log_2 \) of the number of words in the smallest cache line of all the data caches and unified caches that are controlled by the PE.

**L1Ip, bits [15:14]**

Level 1 instruction cache policy. Indicates the indexing and tagging policy for the L1 instruction cache. Possible values of this field are:
### L1Ip Meaning

<table>
<thead>
<tr>
<th>L1Ip</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>VMID aware Physical Index, Physical tag (VPIPT)</td>
</tr>
<tr>
<td>0b01</td>
<td>ASID-tagged Virtual Index, Virtual Tag (AIVVT)</td>
</tr>
<tr>
<td>0b10</td>
<td>Virtual Index, Physical Tag (VIPT)</td>
</tr>
<tr>
<td>0b11</td>
<td>Physical Index, Physical Tag (PIPT)</td>
</tr>
</tbody>
</table>

The value 0b01 is reserved in Armv8.

The value 0b00 is permitted only in an implementation that includes ARMv8.2-PIPTV, otherwise the value is reserved.

**Bits [13:4]**

- Reserved, RES0.

**IminLine, bits [3:0]**

$\log_2$ of the number of words in the smallest cache line of all the instruction caches that are controlled by the PE.

### Accessing the CTR_EL0

Accesses to this register use the following encodings:

```plaintext
MRS <Xt>, CTR_EL0
```

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b011</td>
<td>0b0000</td>
<td>0b0000</td>
<td>0b001</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
  if !ELUsingAArch32(EL1) && !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && SCTL_EL1.UCT == '0' then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
      AArch64.SystemAccessTrap(EL2, 0x18);
    else
      AArch64.SystemAccessTrap(EL1, 0x18);
    endif
  else
    AArch64.SystemAccessTrap(EL2, 0x18);
  endif
elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.<E2H,TGE> != '11' && HCR_EL2.TID2 == '1' then
  elsif EL2Enabled() && !ELUsingAArch32(EL2) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGRTR_EL2.CTR_EL0 == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    AArch64.SystemAccessTrap(EL2, 0x18);
  endif
else
  return CTR_EL0;
endif
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID2 == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    return CTR_EL0;
  endif
elsif PSTATE.EL == EL2 then
  return CTR_EL0;
elsif PSTATE.EL == EL3 then
  return CTR_EL0;
```

CurrentEL, Current Exception Level

The CurrentEL characteristics are:

**Purpose**

Holds the current Exception level.

**Configuration**

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

CurrentEL is a 64-bit register.

**Field descriptions**

The CurrentEL bit assignments are:

| Bits [63:4] | Reserved, RES0. |
| EL, bits [3:2] | Current Exception level. Possible values of this field are: |
| EL | Meaning |
| 0b00 | EL0 |
| 0b01 | EL1 |
| 0b10 | EL2 |
| 0b11 | EL3 |

When the **HCR_EL2**.NV bit is 1, EL1 read accesses to the CurrentEL register return the value of 0b10 in this field. This field resets to the highest implemented Exception Level.

**Bits [1:0]**

Reserved, RES0.

**Accessing the CurrentEL**

Accesses to this register use the following encodings:

**MRS <Xt>, CurrentEL**
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() \&\& HCR_EL2.NV == '1' then
        return Zeros(60):'10':Zeros(2);
    else
        return Zeros(60):PSTATE.EL:Zeros(2);
    end if;
elsif PSTATE.EL == EL2 then
    return Zeros(60):PSTATE.EL:Zeros(2);
elsif PSTATE.EL == EL3 then
    return Zeros(60):PSTATE.EL:Zeros(2);
DACR32_EL2, Domain Access Control Register

The DACR32_EL2 characteristics are:

**Purpose**

Allows access to the AArch32 DACR register from AArch64 state only. Its value has no effect on execution in AArch64 state.

**Configuration**

AArch64 System register DACR32_EL2 bits [31:0] are architecturally mapped to AArch32 System register DACR[31:0].

If EL1 does not support AArch32, this register is **UNDEFINED**.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is **RES0**.

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

DACR32_EL2 is a 64-bit register.

**Field descriptions**

The DACR32_EL2 bit assignments are:

```
<table>
<thead>
<tr>
<th>63</th>
<th>62</th>
<th>61</th>
<th>60</th>
<th>59</th>
<th>58</th>
<th>57</th>

<td></td>
<td></td>
</tr>
</tbody>
</table>
```

**Bits [63:32]**

Reserved, RES0.

**D<n>**, bits [2n+1:2n], for n = 0 to 15

Domain n access permission, where n = 0 to 15. Permitted values are:

<table>
<thead>
<tr>
<th>D&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>No access. Any access to the domain generates a Domain fault.</td>

**Bits [63:10]**

Reserved, RES0.

**D, bit [9]**

Process state D mask. The possible values of this bit are:

<table>
<thead>
<tr>
<th>D</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Watchpoint, Breakpoint, and Software Step exceptions targeted at the current Exception level are not masked.</td>
</tr>
<tr>
<td>0b1</td>
<td>Watchpoint, Breakpoint, and Software Step exceptions targeted at the current Exception level are masked.</td>
</tr>
</tbody>
</table>

When the target Exception level of the debug exception is higher than the current Exception level, the exception is not masked by this bit.

This field resets to 1.

**A, bit [8]**

SError interrupt mask bit. The possible values of this bit are:

<table>
<thead>
<tr>
<th>A</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Exception not masked.</td>

DBGAUTHSTATUS_EL1, Debug Authentication Status register

The DBGAUTHSTATUS_EL1 characteristics are:

**Purpose**

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

**Configuration**

AArch64 System register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGAUTHSTATUS[31:0].

AArch64 System register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to External register DBGAUTHSTATUS_EL1[31:0].

**Attributes**

DBGAUTHSTATUS_EL1 is a 64-bit register.

**Field descriptions**

The DBGAUTHSTATUS_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>62</td>
<td>SNID, bits [7:6]</td>

    else
        return DBGAUTHSTATUS_EL1;
    end
elsif PSTATE.EL == EL3 then
    return DBGAUTHSTATUS_EL1;
The DBGBCR\textsubscript{n} EL1 characteristics are:

**Purpose**

Holds control information for a breakpoint. Forms breakpoint \(n\) together with value register DBGVR\textsubscript{n} EL1.

**Configuration**

AArch64 System register DBGBCR\textsubscript{n} EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGBCR\textsubscript{n}[31:0].

AArch64 System register DBGBCR\textsubscript{n} EL1 bits [31:0] are architecturally mapped to External register DBGBCR\textsubscript{n} EL1[31:0].

If breakpoint \(n\) is not implemented then accesses to this register are **UNDEFINED**.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

DBGBCR\textsubscript{n} EL1 is a 64-bit register.

**Field descriptions**

The DBGBCR\textsubscript{n} EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

**Bits [63:24]**

Reserved, RES0.

**BT, bits [23:20]**

Breakpoint Type. Possible values are:
<table>
<thead>
<tr>
<th>BT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Unlinked instruction address match. DBGBVR&lt;-&gt;_EL1 is the address of an instruction.</td>
</tr>
<tr>
<td>0b0001</td>
<td>As 0b0000, but linked to a Context matching breakpoint.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Unlinked Context ID match. When ARMv8.1-VHE is implemented, EL2 is using AArch64, and the Effective value of HCR_EL2.E2H is 1, if either the PE is executing at EL0 with HCR_EL2.TGE set to 1 or the PE is executing at EL2, then DBGBVR&lt;-&gt;_EL1.ContextID must match the CONTEXTIDR_EL2 value. Otherwise, DBGBVR&lt;-&gt;_EL1.ContextID must match the CONTEXTIDR_EL1 value</td>
</tr>
<tr>
<td>0b0011</td>
<td>As 0b0010, with linking enabled.</td>
</tr>
<tr>
<td>0b0100</td>
<td>Unlinked VMID match. DBGBVR&lt;-&gt;_EL1.VMID is a VMID compared against VTTBR_EL2.VMID.</td>

</tbody>
</table>

All other values are reserved. Constraints on breakpoint programming mean other values are reserved under some conditions.

For more information on the operation of the SSC, HMC, and PMC fields, and on the effect of programming this field to a reserved value, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug) and 'Reserved DBGBCR<->_EL1.BT values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug).

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

**LBN, bits [19:16]**

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of DBGBCR<->_EL1.BE is 0.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.
**SSC, bits [15:14]**

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the \{HMC, SSC, PMC\} fields.

For more information on the operation of the SSC, HMC, and PMC fields, and the effect of programming the fields to a reserved set of values, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug) and 'Reserved DBGCR<n>_EL1.(SSC, HMC, PMC) values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug).

The following resets apply:

- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
- On a Warm reset, the value of this field is unchanged.

**HMC, bit [13]**

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the \{HMC, SSC, PMC\} fields. For more information see the SSC, bits [15:14] description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug).

The following resets apply:

- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
- On a Warm reset, the value of this field is unchanged.

**Bits [12:9]**

Reserved, RES0.

**BAS, bits [8:5]**

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state. In an AArch64 only implementation, this field is reserved, RES1.

The permitted values depend on the breakpoint type.

For Address match breakpoints, the permitted values are:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Match instruction at</th>
<th>Constraint for debuggers</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0011</td>
<td>DBGBVR&lt;n&gt;_EL1</td>
<td>Use for T32 instructions</td>
</tr>
<tr>
<td>0b1100</td>
<td>DBGBVR&lt;n&gt;_EL1 + 2</td>
<td>Use for T32 instructions</td>
</tr>
<tr>
<td>0b1111</td>
<td>DBGBVR&lt;n&gt;_EL1</td>
<td>Use for A64 and A32 instructions</td>
</tr>
</tbody>
</table>

All other values are reserved. For more information, see 'Reserved DBGCR<n>_EL1.BAS values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug).

For more information on using the BAS field in address match breakpoints, see 'Using the BAS field in Address Match breakpoints' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G2 (AArch32 Self-hosted Debug).

For Context matching breakpoints, this field is RES1 and ignored.

The following resets apply:

- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
- On a Warm reset, the value of this field is unchanged.
Bits [4:3]
Reserved, RES0.

PMC, bits [2:1]
Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the DBGBCR<n>_EL1.SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug).

The following resets apply:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

E, bit [0]
Enable breakpoint DBGBVR<n>_EL1. Possible values are:

<table>
<thead>
<tr>
<th>E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Breakpoint disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Breakpoint enabled.</td>
</tr>
</tbody>
</table>

The following resets apply:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

DBGBVR\textsubscript{n}\_EL1, Debug Breakpoint Value Registers, \textit{n} = 0 - 15

The DBGBVR\textsubscript{n}\_EL1 characteristics are:

**Purpose**

Holds a virtual address, or a VMID and/or a context ID, for use in breakpoint matching. Forms breakpoint \textit{n} together with control register DBGBCR\textsubscript{n}\_EL1.

**Configuration**

AArch64 System register DBGBVR\textsubscript{n}\_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGBVR\textsubscript{n}[31:0].

AArch64 System register DBGBVR\textsubscript{n}\_EL1 bits [63:32] are architecturally mapped to AArch32 System register DBGBXVR\textsubscript{n}[31:0].

AArch64 System register DBGBVR\textsubscript{n}\_EL1 bits [63:0] are architecturally mapped to External register DBGBVR\textsubscript{n}\_EL1[63:0].

If breakpoint \textit{n} is not implemented then accesses to this register are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

How this register is interpreted depends on the value of DBGBCR\textsubscript{n}\_EL1.BT.

- When DBGBCR\textsubscript{n}\_EL1.BT is 0b000x, this register holds a virtual address.
- When DBGBCR\textsubscript{n}\_EL1.BT is 0b001x, 0b011x, or 0b110x, this register holds a Context ID.
- When DBGBCR\textsubscript{n}\_EL1.BT is 0b100x, this register holds a VMID.
- When DBGBCR\textsubscript{n}\_EL1.BT is 0b101x, this register holds a VMID and a Context ID.
- When DBGBCR\textsubscript{n}\_EL1.BT is 0b111x, this register holds two Context ID values.

For other values of DBGBCR\textsubscript{n}\_EL1.BT, this register is RES0.

**Field descriptions**

The DBGBVR\textsubscript{n}\_EL1 bit assignments are:

**When DBGBCR\textsubscript{n}\_EL1.BT == 0b000x:**

VA[48:2]

31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0

**RESS[14:4], bits [63:53]**

Reserved, Sign extended. Software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

It is IMPLEMENTATION DEFINED whether:

- Reads return the value of the most significant bit of the VA for every bit in this field.
- Reads return the last value written.
The PE ignores this field.

**VA[52:49], bits [52:49]**

When ARMv8.2-LVA is implemented:

The following resets apply:

- On a Cold reset, this field resets to an architecturally `UNKNOWN` value.
- On a Warm reset, the value of this field is unchanged.

Otherwise:

**VA[48:2], bits [48:2]**

Bits[48:2] of the address value for comparison.

When ARMv8.2-LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, VA[52:49] are RESS.

The following resets apply:

- On a Cold reset, this field resets to an architecturally `UNKNOWN` value.
- On a Warm reset, the value of this field is unchanged.

**Bits [1:0]**

Reserved, RES0.

**When DBGBCR<n>_EL1.BT == 0b001x:**

- `RES0` ContextID

**Bits [63:32]**

Reserved, RES0.

**ContextID, bits [31:0]**

Context ID value for comparison.

The value is compared against `CONTEXTIDR_EL2` when ARMv8.1-VHE is implemented, `HCR_EL2.E2H` is 1, and either:

- The PE is executing at EL2.
- `HCR_EL2.TGE` is 1, the PE is executing at EL0, and EL2 is enabled in the current Security state.

Otherwise, the value is compared against `CONTEXTIDR_EL1`.

The following resets apply:

- On a Cold reset, this field resets to an architecturally `UNKNOWN` value.
- On a Warm reset, the value of this field is unchanged.
When DBGBCR<n>_EL1.BT == 0b011x:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | ContextID |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:32]**

Reserved, RES0.

**ContextID, bits [31:0]**

Context ID value for comparison against CONTEXTIDR_EL1.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

When DBGBCR<n>_EL1.BT == 0b100x and HaveEL(EL2):

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | VMID[15:8] | VMID[7:0] |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:48]**

Reserved, RES0.

**VMID[15:8], bits [47:40]**

When ARMv8.1-VMID16 is implemented:

Extension to VMID[7:0]. See VMID[7:0] for more details.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

**Otherwise:**

Reserved, RES0.

**VMID[7:0], bits [39:32]**

VMID value for comparison.

The VMID is 8 bits in the following cases.

- EL2 is using AArch32.
- ARMv8.1-VMID16 is not implemented.

When ARMv8.1-VMID16 is implemented and EL2 is using AArch64, it is IMPLEMENTATION DEFINED whether the VMID is 8 bits or 16 bits.

VMID[15:8] is RES0 if any of the following applies:

- The implementation has an 8-bit VMID.
• \texttt{VTCR\_EL2\_VS} has a value of 0.
• EL2 is using AArch32.

The following resets apply:

• On a Cold reset, this field resets to an architecturally \texttt{UNKNOWN} value.
• On a Warm reset, the value of this field is unchanged.

\textbf{Bits [31:0]}

Reserved, \texttt{RES0}.

\textbf{When DBGBCR\textless n\textgreater\_EL1\_BT == 0b101x and HaveEL(EL2):}

\begin{verbatim}
<table>
<thead>
<tr>
<th>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
</tr>
<tr>
<td>ContextID</td>
</tr>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
</tr>
</tbody>
</table>
\end{verbatim}

\textbf{Bits [63:48]}

Reserved, \texttt{RES0}.

\textbf{VMID[15:8], bits [47:40]}

\textbf{When ARMv8.1-VMID16 is implemented:}

Extension to VMID[7:0]. See VMID[7:0] for more details.

The following resets apply:

• On a Cold reset, this field resets to an architecturally \texttt{UNKNOWN} value.
• On a Warm reset, the value of this field is unchanged.

\textbf{Otherwise:}

Reserved, \texttt{RES0}.

\textbf{VMID[7:0], bits [39:32]}

VMID value for comparison.

The VMID is 8 bits in the following cases.

• EL2 is using AArch32.
• ARMv8.1-VMID16 is not implemented.

When ARMv8.1-VMID16 is implemented and EL2 is using AArch64, it is \texttt{IMPLEMENTATION DEFINED} whether the VMID is 8 bits or 16 bits.

VMID[15:8] is \texttt{RES0} if any of the following applies:

• The implementation has an 8-bit VMID.
• \texttt{VTCR\_EL2\_VS} has a value of 0.
• EL2 is using AArch32.

The following resets apply:

• On a Cold reset, this field resets to an architecturally \texttt{UNKNOWN} value.
• On a Warm reset, the value of this field is unchanged.
ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

When DBGBCR<n>_EL1.BT == 0b110x and HaveEL(EL2):

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ContextID2 | RES0 |

ContextID2, bits [63:32]

When ARMv8.1-VHE is implemented:

Context ID value for comparison against CONTEXTIDR_EL2.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

Otherwise:

Reserved, RES0.

Bits [31:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT == 0b111x, HaveEL(EL2) and ARMv8.1-VHE is implemented:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ContextID2 | ContextID |

ContextID2, bits [63:32]

When ARMv8.1-VHE is implemented:

Context ID value for comparison against CONTEXTIDR_EL2.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

Otherwise:

Reserved, RES0.
Context ID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

Accessing the DBGVR<n>_EL1

Accesses to this register use the following encodings:

DBGCLAIMCLR_EL1, Debug CLAIM Tag Clear register

The DBGCLAIMCLR_EL1 characteristics are:

**Purpose**

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0.

The architecture does not define any functionality for the CLAIM tag bits.

---

**Note**

CLAIM tags are typically used for communication between the debugger and target software.

---

Used in conjunction with the DBGCLAIMSET_EL1 register.

**Configuration**

AArch64 System register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGCLAIMCLR[31:0].

AArch64 System register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to External register DBGCLAIMCLR_EL1[31:0].

An implementation must include eight CLAIM tag bits.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

DBGCLAIMCLR_EL1 is a 64-bit register.

**Field descriptions**

The DBGCLAIMCLR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
</tr>
<tr>
<td>62</td>
<td>RAZ/SBZ</td>
</tr>
<tr>
<td>31</td>
<td>CLAIM</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**Bits [31:8]**

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

**CLAIM, bits [7:0]**

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.
Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

On a Cold reset, this field resets to 0.

### Accessing the DBGCLAIMCLR_EL1

Accesses to this register use the following encodings:

**MRS <Xt>, DBGCLAIMCLR_EL1**

DBGCLAIMSET_EL1, Debug CLAIM Tag Set register

The DBGCLAIMSET_EL1 characteristics are:

**Purpose**

Used by software to set the CLAIM tag bits to 1.

The architecture does not define any functionality for the CLAIM tag bits.

---

**Note**

CLAIM tags are typically used for communication between the debugger and target software.

---

Used in conjunction with the [DBGCLAIMCLR_EL1](#) register.

**Configuration**

AArch64 System register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGCLAIMSET][31:0].

AArch64 System register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to External register [DBGCLAIMSET_EL1][31:0].

An implementation must include eight CLAIM tag bits.

**Attributes**

DBGCLAIMSET_EL1 is a 64-bit register.

**Field descriptions**

The DBGCLAIMSET_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

DBGDTR_EL0, Debug Data Transfer Register, half-duplex

The DBGDTR_EL0 characteristics are:

**Purpose**

Transfers 64 bits of data between the PE and an external debugger. Can transfer both ways using only a single register.

**Configuration**

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to AArch32 System register DBGDTRRXint[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to External register DBGDTRRX_EL0[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to AArch64 System register DBGDTRRX_EL0[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRTXint[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to External register DBGDTRTX_EL0[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to AArch64 System register DBGDTRTX_EL0[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to External register DBGDTRTX_EL0[31:0] when read.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRTX_EL0[31:0] when read.

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to AArch64 System register DBGDTRTXint[31:0] when read.

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to External register DBGDTRTX_EL0[31:0] when read.

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to AArch64 System register DBGDTRTX_EL0[31:0] when read.

**Attributes**

DBGDTR_EL0 is a 64-bit register.

**Field descriptions**

The DBGDTR_EL0 bit assignments are:

</tbody>
</table>
HighWord, bits [63:32]

Writes to this register set DTRRX to the value in this field and do not change RXfull.

Reads of this register:
  • If RXfull is set to 1, return the last value written to DTRTX.
  • If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull is cleared to 0.

LowWord, bits [31:0]

Writes to this register set DTRTX to the value in this field and set TXfull to 1.

Reads of this register:
  • If RXfull is set to 1, return the last value written to DTRRX.
  • If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull is cleared to 0.

DBGDTRRX_EL0, Debug Data Transfer Register, Receive

The DBGDTRRX_EL0 characteristics are:

**Purpose**

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communications Channel.

**Configuration**

AArch64 System register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRRXint[31:0].

AArch64 System register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to External register DBGDTRRX_EL0[31:0].

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

DBGDTRRX_EL0 is a 64-bit register.

**Field descriptions**

The DBGDTRRX_EL0 bit assignments are:

**Bits [63:32]**

Reserved, RES0.

**Bits [31:0]**

Update DTRRX.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRRX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull is cleared to 0.

For the full behavior of the Debug Communications Channel, see The Debug Communication Channel and Instruction Transfer Register.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

DBGPRCR_EL1, Debug Power Control Register

The DBGPRCR_EL1 characteristics are:

**Purpose**

Controls behavior of the PE on powerdown request.

**Configuration**

AArch64 System register DBGPRCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGPRCR[31:0].

Bit [0] of this register is mapped to EDPRCR.CORENPDRQ, bit [0] of the external view of this register.

The other bits in these registers are not mapped to each other.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

DBGPRCR_EL1 is a 64-bit register.

**Field descriptions**

The DBGPRCR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RES0 | CORENPDRQ |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:1]**

Reserved, RES0.

**CORENPDRQ, bit [0]**

*When ARMv8.3-DoPD is implemented:*

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the **IMPLEMENTATION DEFINED** nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

<table>
<thead>
<tr>
<th>CORENPDRQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If the system responds to a powerdown request, it powers down Core power domain.</td>
</tr>
<tr>
<td>0b1</td>
<td>If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.</td>
</tr>
</tbody>
</table>

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is **IMPLEMENTATION DEFINED** whether this bit is reset to its Cold reset value on exit from an **IMPLEMENTATION DEFINED** software-visible retention state. For more information about retention states see Core power domain power states.
Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The following resets apply:

- On a Cold reset, this field is set to 1 if the powerup request is implemented and the powerup request has been asserted, and is set to 0 otherwise.
- On a Warm reset, the value of this field is unchanged.

Otherwise:

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

<table>
<thead>
<tr>
<th>CORENPDRQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If the system responds to a powerdown request, it powers down Core power domain.</td>
</tr>
<tr>
<td>0b1</td>
<td>If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.</td>
</tr>
</tbody>
</table>

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of EDPRCR.COREPURQ on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see Core power domain power states.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The following resets apply:

- On a Cold reset, this field resets to the value in EDPRCR.COREPURQ.
- On a Warm reset, the value of this field is unchanged.

DBGVCR32_EL2, Debug Vector Catch Register

The DBGVCR32_EL2 characteristics are:

**Purpose**

Allows access to the AArch32 register DBGVCR from AArch64 state only. Its value has no effect on execution in AArch64 state.

**Configuration**

AArch64 System register DBGVCR32_EL2 bits [31:0] are architecturally mapped to AArch32 System register DBGVCR[31:0].

If EL1 does not support AArch32, this register is **UNDEFINED**.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not **RES0**.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

DBGVCR32_EL2 is a 64-bit register.

**Field descriptions**

The DBGVCR32_EL2 bit assignments are:

**When HaveEL(EL3) and !ELUsingAArch32(EL3):**

  DBGVCR32_EL2 = X[t];
DBGWCR<n>_EL1, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n>_EL1 characteristics are:

**Purpose**

Holds control information for a watchpoint. Forms watchpoint n together with value register DBGVR<n>_EL1.

**Configuration**

AArch64 System register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGWVR<n>[31:0].

AArch64 System register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to External register DBGWCR<n>_EL1[31:0].

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

DBGWCR<n>_EL1 is a 64-bit register.

**Field descriptions**

The DBGWCR<n>_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>62</th>
<th>61</th>
<th>60</th>
<th>59</th>
<th>58</th>
<th>57</th>
<th>56</th>
<th>55</th>
<th>54</th>
<th>53</th>
<th>52</th>
<th>51</th>
<th>50</th>
<th>49</th>
<th>48</th>
<th>47</th>
<th>46</th>
<th>45</th>
<th>44</th>
<th>43</th>
<th>42</th>
<th>41</th>
<th>40</th>
<th>39</th>
<th>38</th>
<th>37</th>
<th>36</th>
<th>35</th>
<th>34</th>
<th>33</th>
<th>32</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:29]**

Reserved, RES0.

**MASK, bits [28:24]**

Address mask. Only objects up to 2GB can be watched using a single mask.

<table>
<thead>
<tr>
<th>MASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00000</td>
<td>No mask.</td>
</tr>
<tr>
<td>0b00001</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b00010</td>
<td>Reserved.</td>
</tr>
</tbody>
</table>

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.
Other values mask the corresponding number of address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

The following resets apply:

- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
- On a Warm reset, the value of this field is unchanged.

**Bits [23:21]**

Reserved, **RES0**.

**WT, bit [20]**

Watchpoint type. Possible values are:

<table>
<thead>
<tr>
<th>WT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Unlinked data address match.</td>
</tr>
<tr>
<td>0b1</td>
<td>Linked data address match.</td>
</tr>
</tbody>
</table>

The following resets apply:

- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
- On a Warm reset, the value of this field is unchanged.

**LBN, bits [19:16]**

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

The following resets apply:

- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
- On a Warm reset, the value of this field is unchanged.

**SSC, bits [15:14]**

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

For more information, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug), and 'Reserved DBGBCR<n>_EL1. {SSC, HMC, PMC} values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug).

The following resets apply:

- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
- On a Warm reset, the value of this field is unchanged.

**HMC, bit [13]**

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug).

The following resets apply:

- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
• On a Warm reset, the value of this field is unchanged.

**BAS, bits [12:5]**

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by \texttt{DBGWVR<n>_EL1} is being watched.

<table>
<thead>
<tr>
<th>BAS</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xxxxxxx1</td>
<td>Match byte at \texttt{DBGWVR&lt;n&gt;_EL1}</td>
</tr>
<tr>
<td>xxxxxx1x</td>
<td>Match byte at \texttt{DBGWVR&lt;n&gt;_EL1} + 1</td>
</tr>
<tr>
<td>xxxxx1xx</td>
<td>Match byte at \texttt{DBGWVR&lt;n&gt;_EL1} + 2</td>
</tr>
<tr>
<td>xxx1xxx</td>
<td>Match byte at \texttt{DBGWVR&lt;n&gt;_EL1} + 3</td>
</tr>
</tbody>
</table>

In cases where \texttt{DBGWVR<n>_EL1} addresses a double-word:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Description, if \texttt{DBGWVR&lt;n&gt;_EL1}[2] == 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>xxx1xxxx</td>
<td>Match byte at \texttt{DBGWVR&lt;n&gt;_EL1} + 4</td>
</tr>
<tr>
<td>xx1xxxxx</td>
<td>Match byte at \texttt{DBGWVR&lt;n&gt;_EL1} + 5</td>
</tr>
<tr>
<td>x1xxxxxx</td>
<td>Match byte at \texttt{DBGWVR&lt;n&gt;_EL1} + 6</td>
</tr>
<tr>
<td>1xxxxxxx</td>
<td>Match byte at \texttt{DBGWVR&lt;n&gt;_EL1} + 7</td>
</tr>
</tbody>
</table>

If \texttt{DBGWVR<n>_EL1}[2] == 1, only BAS[3:0] are used and BAS[7:4] are ignored. Arm deprecates setting \texttt{DBGWVR<n>_EL1}[2] == 1.

The valid values for BAS are non-zero binary numbers all of whose set bits are contiguous. All other values are reserved and must not be used by software. See 'Reserved DBGWCR<n>_EL1.BAS values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug).

The following resets apply:

- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
- On a Warm reset, the value of this field is unchanged.

**LSC, bits [4:3]**

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

<table>
<thead>
<tr>
<th>LSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>Match instructions that load from a watchpointed address.</td>
</tr>
<tr>
<td>0b10</td>
<td>Match instructions that store to a watchpointed address.</td>
</tr>
<tr>
<td>0b11</td>
<td>Match instructions that load from or store to a watchpointed address.</td>
</tr>
</tbody>
</table>

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

The following resets apply:

- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
- On a Warm reset, the value of this field is unchanged.

**PAC, bits [2:1]**

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and HMC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug).

The following resets apply:

- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
- On a Warm reset, the value of this field is unchanged.
E, bit [0]

Enable watchpoint n. Possible values are:

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Watchpoint disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Watchpoint enabled.</td>
</tr>
</tbody>
</table>

The following resets apply:

- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
- On a Warm reset, the value of this field is unchanged.

DBGWVR<n>_EL1, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n>_EL1 characteristics are:

**Purpose**

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register DBGWCR<n>_EL1.

**Configuration**

AArch64 System register DBGWVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGWVR<n>[31:0].

AArch64 System register DBGWVR<n>_EL1 bits [63:0] are architecturally mapped to External register DBGWVR<n>_EL1[63:0].

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

DBGWVR<n>_EL1 is a 64-bit register.

**Field descriptions**

</tr>
</tbody>
</table>

**RESS[14:4], bits [63:53]**

Reserved, Sign extended. Hardware and software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

**VA[52:49], bits [52:49]**

When ARMv8.2-LVA is implemented:

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.
Otherwise:

VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When ARMv8.2-LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, VA[52:49] are RESS.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

Bits [1:0]

Reserved, RES0.

Accessing the DBGWVR<n>_EL1

Accesses to this register use the following encodings:

DC CGDSW, Data, Allocation Tag or unified Cache line Clean of Data and Allocation Tags by Set/Way

The DC CGDSW characteristics are:

**Purpose**

Clean data and Allocation Tags in data cache by set/way.

**Configuration**

This instruction is present only when ARMv8.5-MemTag is implemented and ID_AA64PFR1_EL1.MTE != 0b0001. Otherwise, direct accesses to DC CGDSW are **UNDEFINED**.

**Attributes**

DC CGDSW is a 64-bit System instruction.

**Field descriptions**

The DC CGDSW input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    | RES0 |    |    |    |    |    |    |    | SetWay |    |    |    |    |    |    |    |    |    |    |    | Level |    |    |    |    | RES0 |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:32]**

Reserved, RES0.

**SetWay, bits [31:4]**

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[1:4] are RES0.

\[ A = \log_2(\text{ASSOCIATIVITY}), \quad L = \log_2(\text{LINELEN}), \quad B = (L + S), \quad S = \log_2(\text{NSETS}). \]

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

**Level, bits [3:1]**

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

**Bit [0]**

Reserved, RES0.
Executing the DC CGDSW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings:

DC CGDSW, <Xt>

The DC CGSW characteristics are:

**Purpose**

Clean Allocation Tags in data cache by set/way.

**Configuration**

This instruction is present only when ARMv8.5-MemTag is implemented and ID_AA64PFR1_EL1.MTE != 0b0001. Otherwise, direct accesses to DC CGSW are **UNDEFINED**.

**Attributes**

DC CGSW is a 64-bit System instruction.

**Field descriptions**

The DC CGSW input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Bit Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-32</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>31-4</td>
<td>SetWay, bits [31:4]</td>
</tr>
<tr>
<td>3-0</td>
<td>Level, bits [3:1]</td>
</tr>
<tr>
<td>0</td>
<td>Bit [0] Reserved, RES0</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**SetWay, bits [31:4]**

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

A = \( \log_2(\text{ASSOCIATIVITY})\), L = \( \log_2(\text{LINELEN})\), B = (L + S), S = \( \log_2(\text{NSETS})\).

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

**Level, bits [3:1]**

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

**Bit [0]**

Reserved, RES0.
Executing the DC CGSW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings:

DC CGSW, <Xt>

**DC CGVAP, Data, Allocation Tag or unified Cache line Clean of Allocation Tags by VA to PoP**

The DC CGVAP characteristics are:

**Purpose**

Clean Allocation Tags in data cache by address to Point of Persistence.

If the memory system does not identify a Point of Persistence, then this instruction behaves as a [DC CGVAC](#).

**Configuration**

This instruction is present only when ARMv8.5-MemTag is implemented. Otherwise, direct accesses to DC CGVAP are **UNDEFINED**.

**Attributes**

DC CGVAP is a 64-bit System instruction.

**Field descriptions**

The DC CGVAP input value bit assignments are:

<table>

**Virtual address to use**

Virtual address to use. No alignment restrictions apply to this VA.

**Executing the DC CGVAP instruction**

If EL0 access is enabled, when executed at EL0, this instruction requires read access permission to the VA, otherwise it generates a Permission Fault, see 'Permission fault' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Accesses to this instruction use the following encodings:

**DC CGVAP, <Xt>**

**Bits [63:32]**

Reserved, RES0.

**SetWay, bits [31:4]**

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

\[
A = \log_2(ASSOCIATIVITY), \quad L = \log_2(LINELEN), \quad B = (L + S), \quad S = \log_2(NSETS).
\]

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

**Level, bits [3:1]**

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

**Bit [0]**

Reserved, RES0.
Executing the DC CIGDSW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings:

DC CIGDSW, <Xt>

<table>
<thead>
<tr>
<th>op0</th>

</thead>
<tbody>
<tr>
<td>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</td>
<td>Virtual address to use</td>
</tr>
</tbody>
</table>

**Executing the DC CIGDVAC instruction**

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

If EL0 access is enabled, when executed at EL0, this instruction requires read access permission to the VA, otherwise it generates a Permission Fault, subject to the constraints described in 'Permission fault' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Accesses to this instruction use the following encodings:

**DC CIGDVAC, <Xt>**

#### Bits [63:32]

Reserved, RES0.

#### SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

\[ A = \log_2(\text{ASSOCIATIVITY}), \quad L = \log_2(\text{LINELEN}), \quad B = (L + S), \quad S = \log_2(\text{NSETS}). \]

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

#### Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

#### Bit [0]

Reserved, RES0.
Executing the DC CIGSW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings:

DC CIGVAC, Data, Allocation Tag or unified Cache line Clean and Invalidate of Allocation Tags by VA to PoC

The DC CIGVAC characteristics are:

**Purpose**

Clean and Invalidate Allocation Tags in data cache by address to Point of Coherency.

**Configuration**

This instruction is present only when ARMv8.5-MemTag is implemented. Otherwise, direct accesses to DC CIGVAC are UNDEFINED.

**Attributes**

DC CIGVAC is a 64-bit System instruction.

**Field descriptions**

The DC CIGVAC input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Virtual address to use</td>
</tr>
<tr>
<td>31</td>
<td>Virtual address to use</td>
</tr>
</tbody>
</table>

**Bits [63:0]**

Virtual address to use. No alignment restrictions apply to this VA.

**Executing the DC CIGVAC instruction**

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

If EL0 access is enabled, when executed at EL0, this instruction requires read access permission to the VA, otherwise it generates a Permission Fault, subject to the constraints described in 'Permission fault' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Accesses to this instruction use the following encodings:

<table>
<thead>
<tr>
<th>DC CIGVAC, &lt;Xt&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>op0</td>
</tr>
<tr>
<td>0b01</td>
</tr>
</tbody>
</table>

Virtual address to use. No alignment restrictions apply to this VA.
if PSTATE.EL == EL0 then
    if !ELUsingAArch32(EL1) && !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '1') && SCTLR_EL1.UCI == '0' then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.<E2H,TGE> != '11' && HCR_EL2.TPCP == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGITR_EL2.DCCIVAC == '1' then

    DC_CIGVAC(X[t]);
end if
DC CISW, Data or unified Cache line Clean and Invalidate by Set/Way

The DC CISW characteristics are:

**Purpose**

Clean and Invalidate data cache by set/way.

When ARMv8.5-MemTag is implemented, this instruction might clean and invalidate Allocation Tags from caches.

**Configuration**

AArch64 System instruction DC CISW performs the same function as AArch32 System instruction DCCISW.

**Attributes**

DC CISW is a 64-bit System instruction.

**Field descriptions**

The DC CISW input value bit assignments are:

| Bits [63:32] | Reserved, RES0. |
| SetWay, bits [31:4] | Contains two fields: |
| | • Way, bits[31:32-A], the number of the way to operate on. |
| | • Set, bits[B-1:L], the number of the set to operate on. |
| | Bits[L-1:4] are RES0. |
| | A = Log2(ASSOCIATIVITY), L = Log2(LINELEN), B = (L + S), S = Log2(NSETS). |
| | ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer. |
| Level, bits [3:1] | Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache. |
| Bit [0] | Reserved, RES0. |
### Executing the DC CISW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is **CONSTRAINED UNPREDICTABLE** and one of the following occurs:

- The instruction is **UNDEFINED**.
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings:

**DC CISW, <Xt>**

<table>

        DC_CVADP(X[t]);
    elsif PSTATE.EL == EL3 then
        DC_CVADP(X[t]);

The DC CVAP characteristics are:

**Purpose**

Clean data cache by address to Point of Persistence.

If the memory system does not identify a Point of Persistence, then this instruction behaves as a DC CVAC.

When ARMv8.5-MemTag is implemented, this instruction might clean Allocation Tags from caches.

**Configuration**

This instruction is present only when ARMv8.2-DCPoP is implemented. Otherwise, direct accesses to DC CVAP are UNDEFINED.

**Attributes**

DC CVAP is a 64-bit System instruction.

**Field descriptions**

The DC CVAP input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

| Virtual address to use |
| Virtual address to use |

**Bits [63:0]**

Virtual address to use. No alignment restrictions apply to this VA.

**Executing the DC CVAP instruction**

If EL0 access is enabled, when executed at EL0, this instruction requires read access permission to the VA, otherwise it generates a Permission Fault, see 'Permission fault' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Accesses to this instruction use the following encodings:

**Bits [63:0]**

Virtual address to use. There is no alignment restriction on the address within the block of N bytes that is used.

**Executing the DC GVA instruction**

When this instruction is executed, it can generate memory faults or watchpoints which are prioritized in the same way as other memory-related faults or watchpoints. If a synchronous data abort fault or a watchpoint is generated, the CM bit in the ESR_ELx.ISS field is not set.

If the memory region being zeroed is any type of Device memory, this instruction can give an alignment fault which is prioritized in the same way as other alignment faults that are determined by the memory type.

This instruction applies to Normal memory regardless of cacheability attributes.

This instruction behaves as a set of Stores to each byte within the block being accessed, and so it:

- Generates a Permission Fault if the translation system does not permit writes to the locations.
- Requires the same considerations for ordering and the management of coherency as any other store instructions.

Accesses to this instruction use the following encodings:

**DC GVA, <Xt>**

**Bits [63:32]**

Reserved, RES0.

**SetWay, bits [31:4]**

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

\[
A = \log_2(\text{ASSOCIATIVITY}), \quad L = \log_2(\text{LINELEN}), \quad B = (L + S), \quad S = \log_2(\text{NSETS}).
\]

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

**Level, bits [3:1]**

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

**Bit [0]**

Reserved, RES0.
Executing the DC IGDSW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings:

DC IGDSW, <Xt>

Virtual address to use

Virtual address to use

**Bits [63:0]**

Virtual address to use. No alignment restrictions apply to this VA.

**Executing the DC IGDVAC instruction**

When the instruction is executed, it can generate a watchpoint, which is prioritized in the same way as other watchpoints. If a watchpoint is generated, the CM bit in the ESR_ELx.ISS field is set to 1.

This instruction requires write access permission to the VA, otherwise it generates a Permission Fault, subject to the constraints described in 'Permission fault' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Accesses to this instruction use the following encodings:

<th><strong>Level</strong></th>
<th><strong>RES0</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>30</td>
<td>29</td>
<td>28</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, **RES0**.

**SetWay, bits [31:4]**

Contains two fields:
- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are **RES0**.

A = Log₂(ASSOCIATIVITY), L = Log₂(LINELEN), B = (L + S), S = Log₂(NSETS).

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

**Level, bits [3:1]**

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

**Bit [0]**

Reserved, **RES0**.

---

**Bits [63:0]**

Virtual address to use. No alignment restrictions apply to this VA.

**Executing the DC IVAC instruction**

When the instruction is executed, it can generate a watchpoint, which is prioritized in the same way as other watchpoints. If a watchpoint is generated, the CM bit in the ESR_ELx.ISS field is set to 1.

This instruction requires write access permission to the VA, otherwise it generates a Permission Fault, subject to the constraints described in 'Permission fault' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Accesses to this instruction use the following encodings:

<table>

  DC_IVAC(X[t]);
The DC ZVA characteristics are:

**Purpose**

Zero data cache by address. Zeroes a naturally aligned block of N bytes, where the size of N is identified in DCZID_EL0.

**Configuration**

**Attributes**

DC ZVA is a 64-bit System instruction.

**Field descriptions**

The DC ZVA input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Virtual address to use**

Virtual address to use. There is no alignment restriction on the address within the block of N bytes that is used.

**Executing the DC ZVA instruction**

When this instruction is executed, it can generate memory faults or watchpoints which are prioritized in the same way as other memory-related faults or watchpoints. If a synchronous data abort fault or a watchpoint is generated, the CM bit in the ESR_ELx.ISS field is set to 0.

If the memory region being zeroed is any type of Device memory, this instruction can give an Alignment fault which is prioritized in the same way as other Alignment faults that are determined by the memory type.

This instruction applies to Normal memory regardless of cacheability attributes.

This instruction behaves as a set of Stores to each byte within the block being accessed, and so it:

- Generates a Permission Fault if the translation system does not permit writes to the locations.
- Requires the same considerations for ordering and the management of coherency as any other store instructions.

Accesses to this instruction use the following encodings:

DCZID_EL0, Data Cache Zero ID register

The DCZID_EL0 characteristics are:

**Purpose**

Indicates the block size that is written with byte values of 0 by the DC ZVA (Data Cache Zero by Address) System instruction.

If ARMv8.5-MemTag is implemented, this register also indicates the granularity at which the DC GVA and DC GZVA instructions write.

**Configuration**

**Attributes**

DCZID_EL0 is a 64-bit register.

**Field descriptions**

The DCZID_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:5</td>
<td>Reserved, RES0.</td>
<td></td>
</tr>
<tr>
<td>31:0</td>
<td>DZP</td>
<td>Data Zero Prohibited. This field indicates whether use of DC ZVA instructions is permitted or prohibited.</td>
</tr>
<tr>
<td></td>
<td>BS</td>
<td>Log2 of the block size in words. The maximum size supported is 2KB (value == 9).</td>
</tr>
</tbody>
</table>

**Bits [63:5]**

Reserved, RES0.

**DZP, bit [4]**

Data Zero Prohibited. This field indicates whether use of DC ZVA instructions is permitted or prohibited.

If ARMv8.5-MemTag is implemented, this field also indicates whether use of the DC GVA and DC GZVA instructions are permitted or prohibited.

<table>
<thead>
<tr>
<th>DZP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Instructions are permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Instructions are prohibited.</td>
</tr>
</tbody>
</table>

The value read from this field is governed by the access state and the values of the HCR_EL2.TDZ and SCTLR_EL1.DZE bits.

**BS, bits [3:0]**

Log2 of the block size in words. The maximum size supported is 2KB (value == 9).

**Accessing the DCZID_EL0**

Accesses to this register use the following encodings:

MRS <Xt>, DCZID_EL0

<table>
<thead>
<tr>

**DISR_EL1, Deferred Interrupt Status Register**

The DISR_EL1 characteristics are:

### Purpose

Records that an SError interrupt has been consumed by an ESB instruction.

### Configuration

AArch64 System register DISR_EL1 bits [31:0] are architecturally mapped to AArch32 System register `DISR[31:0]`. This register is present only when RAS is implemented. Otherwise, direct accesses to DISR_EL1 are **UNDEFINED**. RW fields in this register reset to architecturally **UNKNOWN** values.

### Attributes

DISR_EL1 is a 64-bit register.

### Field descriptions

The DISR_EL1 bit assignments are:

#### When DISR_EL1.IDS == 0:

Reserved, RES0.

A, bit [31]

Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

This field resets to an architecturally UNKNOWN value.

Bits [30:25]

Reserved, RES0.

IDS, bit [24]

Indicates the deferred SError interrupt type.

<table>
<thead>
<tr>
<th>IDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>Deferred error uses IMPLEMENTATION DEFINED format.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

ISS, bits [23:0]

IMPLEMENTATION DEFINED.
IMPLEMENTATION DEFINED syndrome. See the description of ESR_ELx[23:0] for an SError interrupt.

This field resets to an architecturally UNKNOWN value.

**Accessing the DISR_EL1**

An indirect write to DISR_EL1 made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of DISR_EL1 occurring in program order after the ESB instruction.

DISR_EL1 is RAZ/WI if EL3 is implemented, the PE is in Non-debug state, SCR_EL3.EA == 1, and any of the following apply:

- At EL2.
- At EL1 and ((SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0) || HCR_EL2.AMO == 0).

Accesses to this register use the following encodings:

**MRS <Xt>, DISR_EL1**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>

elsif PSTATE.EL == EL3 then
    DISR_EL1 = X[t];
DIT, Data Independent Timing

The DIT characteristics are:

**Purpose**

Allows access to the Data Independent Timing bit.

**Configuration**

This register is present only when ARMv8.4-DIT is implemented. Otherwise, direct accesses to DIT are **UNDEFINED**.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

DIT is a 64-bit register.

**Field descriptions**

The DIT bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |

<td>• For certain data processing instructions, the response of the instruction to asynchronous exceptions does not vary based on:</td>
</tr>
<tr>
<td></td>
<td>◦ The values of the data supplied in any of its registers.</td>
</tr>
<tr>
<td></td>
<td>◦ The values of the NZCV flags.</td>
</tr>
</tbody>
</table>

The data processing instructions affected by this bit are:

• All cryptographic instructions. These instructions are:
A subset of those instructions which use the general-purpose register file. These instructions are:

- ADC, ADCS, ADD, ADDS, AND, ANDS, ASR, ASRV, BFC, BFI, BFMI, BIC, BICS, CCMN, CCMPS, CFIN, CINC, CINV, CLS, CLZ, CMP, CNEG, CSEL, CSAT, CSETM, CSI, CSINC, CSINV, CSNEG, EON, EOR, EXTR, LSL, LSLV, LSR, LSRV, MADD, MNEG, MOV, MOVK, MOVV, MOVZ, MSUB, MUL, MVN, NEG, NEGS, NGC, NGCS, NOP, ORN, ORR, RBIT, RET, REV, REV16, REV32, REV64, RMIF, ROR, RORV, SBC, SBCS, SBFIZ, SBFM, SBFX, SETF8, SETF16, SMADDL, SMNEGL, SMSUBL, SMULH, SMULL, SUB, SUBS, SXTB, SXTH, SXTW, TST, UBIFIZ, UBFM, UBFX, UMADDL, UMNEGL, UMSUBL, UMULH, UMULL, UXTH, and UXTH.

- A subset of those instructions which use the SIMD&FP register file. These instructions are:

- ABS, ADD, ADDHN, ADDHN2, ADDP, ADDY, AND, BIC, BIF, BIT, BSL, CLS, CLZ, CMEQ, CMGE, CMGT, CMHI, CMHS, CMLE, CMLT, CMST, CNT, CRC32B, CRC32C, CRC32CH, CRC32CX, CRC32CH, CRC32CW, CRC32CX, DUP, EOR, EXT, FCSEL, INS, MLA, MLS, MOV, MOVI, MUL, MVN, MVNI, NEG, NOT, ORN, ORR, PMUL, PMULL, PMULL2, RADDHN, RADDHN2, RBIT, REV16, REV32, RSHRN, RSHRN2, RSUBHN, RSUBHN2, SABA, SABD, SABAL, SABAL2, SABDL, SABDL2, SADALP, SADDL, SADDL2, SADDP, SADDLV, SADDW, SADDW2, SHADD, SRL, SRLH, SRLH2, SHR, SHR2, SHSUB, SLI, SMAX, SMAXP, SMAXV, SMIN, SMINP, SMINV, SMLAL, SMLAL2, SMLSL, SMLSL2, SMOV, SMULL, SMULL2, SRI, SSHL, SSHLL, SSHLL2, SSRH, SSRH2, SSRA, SSUBL, SSUBL, SSUBW, SSUBW2, SUB, SUBH, SUBHN, SXTL, SXTH, TBL, TBX, TRN1, TRN2, UABA, UABAL, UABAL2, UABD, UABDL, UADLP, UADDL, UADDL2, UADDP, UADDLV, UADDW, UADDW2, UHADD, UHSUB, UMAX, UMAP, UMAXV, UMIN, UMINV, UMLAL, UMLAL2, UMLSL, UMOM, UMLSL2, UMULL, UMULL2, USHL, USHL2, USHR, USRA, USUBL, USUBL2, USUBW, USUBW2, UXTH, UXTL, UXTL2, UZP1, UZP2, XTN, XTN2, ZIP1, and ZIP2.

Note

The architecture makes no statement about the timing properties when the PSTATE.DIT bit is not set. However, it is likely that many of these instructions have timing that is invariant of the data in many situations.

In particular, Arm strongly recommends that the Armv8.3 pointer authentication instructions do not have their timing dependent on the key value used in the pointer authentication in all cases, regardless of the PSTATE.DIT bit.

This field resets to 0.

Bits [23:0]

Reserved, RES0.

Accessing the DIT

For details on the operation of the MSR (immediate) accessor, see MSR (immediate) in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

DSPSR_EL0, Debug Saved Program Status Register

The DSPSR_EL0 characteristics are:

**Purpose**

Holds the saved process state for Debug state. On entering Debug state, PSTATE information is written to this register. On exiting Debug state, values are copied from this register to PSTATE.

**Configuration**

AArch64 System register DSPSR_EL0 bits [31:0] are architecturally mapped to AArch32 System register DSPSR[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

DSPSR_EL0 is a 64-bit register.

**Field descriptions**

The DSPSR_EL0 bit assignments are:

When exiting Debug state to AArch32 state:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

**N, bit [31]**

Negative Condition flag. Copied to PSTATE.N on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Copied to PSTATE.Z on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Copied to PSTATE.C on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Copied to PSTATE.V on exiting Debug state.
This field resets to an architecturally **UNKNOWN** value.

**Q, bit [27]**

Overflow or saturation flag. Copied to PSTATE.Q on exiting Debug state.

This field resets to an architecturally **UNKNOWN** value.

**IT[1:0], bits [26:25]**

If-Then. Copied to PSTATE.IT[1:0] on exiting Debug state.

On exiting Debug state DSPSR_EL0.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

**DIT, bit [24]**

*When ARMv8.4-DIT is implemented:*

Data Independent Timing. Copied to PSTATE.DIT on exiting Debug state.

This field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**SSBS, bit [23]**

*When ARMv8.0-SSBS is implemented:*

Speculative Store Bypass. Copied to PSTATE.SSBS on exiting Debug state.

This field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**PAN, bit [22]**

*When ARMv8.1-PAN is implemented:*

Privileged Access Never. Copied to PSTATE.PAN on exiting Debug state.

This field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**SS, bit [21]**

Software Step. Copied to PSTATE.SS on exiting Debug state.

This field resets to an architecturally **UNKNOWN** value.
IL, bit [20]

Illegal Execution state. Copied to PSTATE.I on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Copied to PSTATE.GE on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

If-Then. Copied to PSTATE.IT[7:2] on exiting Debug state.

DSPSR_EL0.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Copied to PSTATE.E on exiting Debug state.

If the implementation does not support big-endian operation, DSPSR_EL0.E is RES0. If the implementation does not support little-endian operation, DSPSR_EL0.E is RES1. On exiting Debug state, if the implementation does not support big-endian operation at the Exception level being returned to, DSPSR_EL0.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, DSPSR_EL0.E is RES1.

This field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Copied to PSTATE.A on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Copied to PSTATE.I on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Copied to PSTATE.F on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Copied to PSTATE.T on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state. Copied to PSTATE.nRW on exiting Debug state.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>AArch32 execution state.</td>
</tr>
</tbody>
</table>
This field resets to an architecturally unknown value.

M[3:0], bits [3:0]

AArch32 Mode. Copied to PSTATE.M[3:0] on exiting Debug state.

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>User.</td>

</tbody>
</table>

Other values are reserved. If DSPSR_EL0.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, exiting Debug state is an illegal return event, as described in ‘Illegal return events from AArch64 state’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally unknown value.

When entering Debug state from AArch64 state and exiting Debug state to AArch64 state:

<table>
<thead>
<tr>
<th>Bits [63:32]</th>

</tr>
</tbody>
</table>

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on entering Debug state, and copied to PSTATE.N on exiting Debug state.

This field resets to an architecturally unknown value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on entering Debug state, and copied to PSTATE.Z on exiting Debug state.

This field resets to an architecturally unknown value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on entering Debug state, and copied to PSTATE.C on exiting Debug state.

This field resets to an architecturally unknown value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on entering Debug state, and copied to PSTATE.V on exiting Debug state.

This field resets to an architecturally unknown value.
Bits [27:26]

Reserved, RES0.

TCO, bit [25]

When ARMv8.5-MemTag is implemented:

Tag Check Override. Set to the value of PSTATE.TCO on entering Debug state, and copied to PSTATE.TCO on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [24]

When ARMv8.4-DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on entering Debug state, and copied to PSTATE.DIT on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UAO, bit [23]

When ARMv8.2-UAO is implemented:

User Access Override. Set to the value of PSTATE.UAO on entering Debug state, and copied to PSTATE.UAO on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on entering Debug state, and copied to PSTATE.PAN on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on entering Debug state, and conditionally copied to PSTATE.SS on exiting Debug state.
This field resets to an architecturally unknown value.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on entering Debug state, and copied to PSTATE.IL on exiting Debug state.

This field resets to an architecturally unknown value.

**Bits [19:13]**

Reserved, RES0.

**SSBS, bit [12]**

*When ARMv8.0-SSBS is implemented:*

Speculative Store Bypass. Set to the value of PSTATE.SSBS on entering Debug state, and copied to PSTATE.SSBS on exiting Debug state.

This field resets to an architecturally unknown value.

*Otherwise:*

Reserved, RES0.

**BTYPE, bits [11:10]**

*When ARMv8.5-BTI is implemented:*

Branch Type Indicator. Set to the value of PSTATE.BTYPE on entering Debug state, and copied to PSTATE.BTYPE on exiting Debug state.

This field resets to an architecturally unknown value.

*Otherwise:*

Reserved, RES0.

**D, bit [9]**

Debug exception mask. Set to the value of PSTATE.D on entering Debug state, and copied to PSTATE.D on exiting Debug state.

This field resets to an architecturally unknown value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on entering Debug state, and copied to PSTATE.A on exiting Debug state.

This field resets to an architecturally unknown value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on entering Debug state, and copied to PSTATE.I on exiting Debug state.

This field resets to an architecturally unknown value.
**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on entering Debug state, and copied to PSTATE.F on exiting Debug state.

This field resets to an architecturally **UNKNOWN** value.

**Bit [5]**

Reserved, RES0.

**M[4], bit [4]**

Execution state. Set to 0b0, the value of PSTATE.nRW, on entering Debug state from AArch64 state, and copied to PSTATE.nRW on exiting Debug state.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>AArch64 execution state.</td>
</tr>
</tbody>
</table>

If AArch32 is not supported at any Exception level, this bit is RES0.

This field resets to an architecturally **UNKNOWN** value.

**M[3:0], bits [3:0]**

AArch64 Exception level and selected Stack Pointer.

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL0t</td>
</tr>
<tr>
<td>0b0100</td>

<tr>
<td>0b0101</td>
<td>EL1h</td>
</tr>
<tr>
<td>0b1000</td>
<td>EL2t</td>
</tr>
<tr>
<td>0b1001</td>
<td>EL2h</td>
</tr>
<tr>
<td>0b1100</td>
<td>EL3t</td>
</tr>
<tr>
<td>0b1101</td>
<td>EL3h</td>
</tr>
</tbody>
</table>

Other values are reserved. If DSPSR_EL0.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, exiting Debug state is an illegal return event, as described in 'Illegal return events from AArch64 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on entering Debug state and copied to PSTATE.EL on exiting Debug state.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on entering Debug state and copied to PSTATE.SP on exiting Debug state.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the DSPSR_EL0**

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>MRS &lt;Xt&gt;, DSPSR_EL0</th>
</tr>
</thead>
<tbody>
<tr>
<td>op0</td>
</tr>
<tr>
<td>0b11</td>
</tr>
</tbody>

<td>0b000</td>
</tr>
</tbody>
</table>

if !Halted() then
  UNDEFINED;
else
  DSPSR_EL0 = X[t];
DVP RCTX, Data Value Prediction Restriction by Context

The DVP RCTX characteristics are:

**Purpose**

Data Value Prediction Restriction by Context applies to all Data Value Prediction Resources that predict execution based on information gathered within the target execution context or contexts.

When this instruction is complete and synchronized, data value prediction does not permit later speculative execution within the target execution context to be observable through side channels.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

**Note**

This instruction does not require the invalidation of prediction structures so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

**Configuration**

This instruction is present only when ARMv8.0-PredInv is implemented. Otherwise, direct accesses to DVP RCTX are UNDEFINED.

**Attributes**

DVP RCTX is a 64-bit System instruction.

**Field descriptions**

The DVP RCTX input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:49]</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>[48]</td>
<td>GVMID</td>
</tr>
<tr>
<td>[47:32]</td>
<td>VMID</td>
</tr>
<tr>
<td>[31:16]</td>
<td>ASID</td>
</tr>
<tr>
<td>[15:0]</td>
<td>GASID</td>
</tr>
</tbody>
</table>

**Bits [63:49]**

Reserved, RES0.

**GVMID, bit [48]**

Execution of this instruction applies to all VMIDs or a specified VMID.
### GVMID

<table>
<thead>
<tr>
<th>GVMID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Applies to specified VMID for an EL0 or EL1 context. For all other contexts this field is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Applies to all VMIDs for an EL0 or EL1 context. For all other contexts this field is RES0.</td>
</tr>
</tbody>
</table>

If the instruction is executed at EL0 or EL1, then this field has an Effective value of 0.

### VMID, bits [47:32]

Only applies when bit[48] is 0 and one of:

- an EL1 context.
- an EL0 context when \(\text{HCR\_EL2}.E2H==0\) or \(\text{HCR\_EL2}.TGE==0\).

Otherwise this field is RES0.

When the instruction is executed at EL1 then this field is treated as the current VMID.

When the instruction is executed at EL0 and \(\text{HCR\_EL2}.E2H==0\) or \(\text{HCR\_EL2}.TGE==0\) then this field is treated as the current VMID.

When the instruction is executed at EL0 and \(\text{HCR\_EL2}.E2H==1\) and \(\text{HCR\_EL2}.TGE==1\) then this field is ignored.

### Bits [31:27]

Reserved, RES0.

### NS, bit [26]

Security State.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure state.</td>
</tr>
</tbody>
</table>

If the instruction is executed in Non-secure state, this field has an Effective value of 1.

### EL, bits [25:24]

Exception Level

<table>
<thead>
<tr>
<th>EL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>EL0.</td>
</tr>
<tr>
<td>0b01</td>
<td>EL1.</td>
</tr>
<tr>
<td>0b10</td>
<td>EL2.</td>
</tr>
<tr>
<td>0b11</td>
<td>EL3.</td>
</tr>
</tbody>
</table>

If the instruction is executed at an exception level lower than the specified level, this instruction is treated as a NOP.

### Bits [23:17]

Reserved, RES0.

### GASID, bit [16]

Execution of this instruction applies to all ASIDs or a specified ASID.

<table>
<thead>
<tr>
<th>GASID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Applies to specified ASID for an EL0 context. For all other contexts this field is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Applies to all ASID for an EL0 context. For all other contexts this field is RES0.</td>
</tr>
</tbody>
</table>
If the instruction is executed at EL0, then this field has an Effective value of 0.

**ASID, bits [15:0]**

Only applies for an EL0 context and when bit[16] is 0.
Otherwise this field is RES0.
When the instruction is executed at EL0 then this field is treated as the current ASID.

**Executing the DVP RCTX instruction**

Accesses to this instruction use the following encodings:

DVP RCTX, <Xt>

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>0b011</td>
<td>0b0111</td>
<td>0b0011</td>
<td>0b101</td>
</tr>
</tbody>
</table>

</tbody>
</table>

**Bits [63:0]**

Return address.

An exception return from EL1 using AArch64 makes ELR_EL1 become UNKNOWN.

This field resets to an architecturally UNKNOWN value.

**Accessing the ELR_EL1**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic ELR_EL1 or ELR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>

ELR_EL2, Exception Link Register (EL2)

The ELR_EL2 characteristics are:

**Purpose**

When taking an exception to EL2, holds the address to return to.

**Configuration**

AArch64 System register ELR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ELR_hyp[31:0].

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally unknown values.

**Attributes**

ELR_EL2 is a 64-bit register.

**Field descriptions**

The ELR_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Return address | Return address |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:0]**

Return address.

An exception return from EL2 using AArch64 makes ELR_EL2 become unknown.

When EL2 is in AArch32 Execution state and an exception is taken from EL0, EL1, or EL2 to EL3 and AArch64 execution, the upper 32-bits of ELR_EL2 are either set to 0 or hold the same value that they did before AArch32 execution. Which option is adopted is determined by an implementation, and might vary dynamically within an implementation. Correspondingly software must regard the value as being an unknown choice between the two values.

This field resets to an architecturally unknown value.

**Accessing the ELR_EL2**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic ELR_EL2 or ELR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>

**ERRIDR_EL1, Error Record ID Register**

The ERRIDR_EL1 characteristics are:

**Purpose**

Defines the highest numbered index of the error records that can be accessed through the Error Record System registers.

**Configuration**

AArch64 System register ERRIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ERRIDR[31:0].

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRIDR_EL1 are **UNDEFINED**.

**Attributes**

ERRIDR_EL1 is a 64-bit register.

**Field descriptions**

The ERRIDR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-16</td>
<td>Reserved (RES0)</td>
</tr>
<tr>
<td>15-0</td>
<td>Highest numbered index of the records that can be accessed through the Error Record System registers plus one. Zero indicates that no records can be accessed through the Error Record System registers. Each implemented record is owned by a node. A node might own multiple records.</td>
</tr>
</tbody>
</table>

**Accessing the ERRIDR_EL1**

Accesses to this register use the following encodings:

```
MRS <Xt>, ERRIDR_EL1
```

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>

    end
elsif PSTATE.EL == EL3 then
    return ERRIDR_EL1;
end
ERRSELR_EL1, Error Record Select Register

The ERRSELR_EL1 characteristics are:

**Purpose**

Selects an error record to be accessed through the Error Record System registers.

**Configuration**

AArch64 System register ERRSELR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ERRSELR[31:0].

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRSELR_EL1 are UNDEFINED.

If ERRIDR_EL1 indicates that zero records are implemented, then it is IMPLEMENTATION DEFINED whether ERRSELR_EL1 is UNDEFINED or RES0.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ERRSELR_EL1 is a 64-bit register.

**Field descriptions**

The ERRSELR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RES0 | SEL |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

**Bits [63:16]**

Reserved, RES0.

**SEL, bits [15:0]**

Selects the record accessed through the ERX registers.

For example, if ERRSELR_EL1.SEL is set to 0x4, then direct reads and writes of ERXSTATUS_EL1 access ERR4STATUS.

If ERRSELR_EL1.SEL is set to a value greater than or equal to ERRIDR_EL1.NUM, then all of the following apply:

- The value read back from ERRSELR_EL1.SEL is UNKNOWN.
- One of the following occurs:
  - An UNKNOWN error record is selected.
  - The ERX* registers are RAZ/WI.
  - ERX* register reads and writes are NOPs.
  - ERX* register reads and writes are UNDEFINED.

This field resets to an architecturally UNKNOWN value.

ERXSTATUS_EL1, Selected Error Record Primary Status Register

The ERXSTATUS_EL1 characteristics are:

**Purpose**

Accesses `ERR<n>STATUS` for the error record selected by `ERRSELR_EL1.SEL`.

**Configuration**

AArch64 System register ERXSTATUS_EL1 bits [31:0] are architecturally mapped to AArch32 System register `ERXSTATUS[31:0]`.

This register is present only when RAS is implemented. Otherwise, direct accesses to ERXSTATUS_EL1 are **UNDEFINED**.

For **IMPLEMENTATION DEFINED** fields in this register, writing zero must always be supported to return the error record to an initial state.

In particular, if any **IMPLEMENTATION DEFINED** syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero and ignore writes are compliant with this requirement.

**Note**

Arm recommends that any **IMPLEMENTATION DEFINED** syndrome fields that can generate a Fault Handling, Error Recovery, Critical, or **IMPLEMENTATION DEFINED** interrupt request are disabled at Cold reset and are enabled by software writing a **IMPLEMENTATION DEFINED** non-zero value to an **IMPLEMENTATION DEFINED** field in `ERR<q>CTRL`, where q is the index of the first error record owned by the same node as error record n. If the node owns a single record then q = n.

**Attributes**

ERXSTATUS_EL1 is a 64-bit register.

**Field descriptions**

The ERXSTATUS_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [63:0]</td>
</tr>
</tbody>
</table>

ERXSTATUS_EL1 accesses `ERR<n>STATUS`, where n is the value in `ERRSELR_EL1.SEL`.

**Accessing the ERXSTATUS_EL1**

If `ERRIDR_EL1.NUM == 0` or `ERRSELR_EL1.SEL` is set to a value greater than or equal to `ERRIDR_EL1.NUM`, then one of the following occurs:

</tbody>
</table>

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL1, the value of ESR_EL1 is UNKNOWN. The value written to ESR_EL1 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

**Bits [63:32]**

Reserved, RES0.

**EC, bits [31:26]**

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.

Possible values of the EC field are:
<table>
<thead>

</tbody>
</table>
architecture profile, section D1.10.4.

0b001100 Trapped MRRC access with (coproc==0b1110).

ISS encoding for an exception from an MCRR or MRRC access.

When ARMv8.5-BTI is implemented

0b001101 Branch Target Exception.

ISS encoding for an exception from Branch Target Identification instruction.

0b001110 Illegal Execution state.

ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault.

0b010001 SVC instruction execution in AArch32 state.

ISS encoding for an exception from HVC or SVC instruction execution.

This is reported in ESR_EL1 only when the exception is generated because the value of HCR_EL2.TGE is 1.

0b010101 SVC instruction execution in AArch64 state.

ISS encoding for an exception from HVC or SVC instruction execution.

0b011000 Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC 0b0000000, 0b0000001 or 0b0001111.

If ARMv8.4-IDST is implemented, also exceptions generated by a read access to the feature ID space.

If ARMv8.0-CSV2 is implemented, also Cache Speculation Variant exceptions.

If ARMv8.2-EVT is implemented, also traps for EL1 and EL0 Cache controls.

This includes all instructions that cause exceptions that are part of the encoding space defined in 'System instruction class encoding overview' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section C5.2.2, except for those exceptions reported in ESR_EL1.
using EC values 0b000000, 0b000001, or 0b000111.

**0b011001**
Access to SVE functionality trapped as a result of CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ, that is not reported using EC 0b000000. This EC is defined only if SVE is implemented.

**0b011011**
Exception from an access to a TSTART instruction at EL0 when SCLTR_EL1.TME0 == 0, EL0 when SCLTR_EL2.TME0 == 0, at EL1 when SCLTR_EL1.TME == 0, at EL2 when SCLTR_EL2.TME == 0 or at EL3 when SCLTR_EL3.TME == 0.

**0b011100**
Exception from a Pointer Authentication instruction authentication failure

**0b100000**
Instruction Abort from a lower Exception level, that might be using AArch32 or AArch64. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.

**0b100001**
Instruction Abort taken without a change in Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.

**0b100010**
PC alignment fault exception.
**ESR_EL1, Exception Syndrome Register (EL1)**

</table>

All other EC values are reserved by Arm, and:

- Unused values in the range 0b0000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.
The effect of programming this field to a reserved value is that behavior is **CONSTRAINED UNPREDICTABLE**, as described in 'Reserved values in System and memory-mapped registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section K1.1.11.

This field resets to an architecturally **UNKNOWN** value.

**IL, bit [25]**

Instruction Length for synchronous exceptions. Possible values of this bit are:

<table>
<thead>
<tr>
<th>IL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>16-bit instruction trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>32-bit instruction trapped. This value is also used when the exception is one of the following:</td>
</tr>
<tr>
<td></td>
<td>• An SError interrupt.</td>
</tr>
<tr>
<td></td>
<td>• An Instruction Abort exception.</td>
</tr>
<tr>
<td></td>
<td>• A PC alignment fault exception.</td>
</tr>
<tr>
<td></td>
<td>• An SP alignment fault exception.</td>
</tr>
<tr>
<td></td>
<td>• A Data Abort exception for which the value of the ISV bit is 0.</td>
</tr>
<tr>
<td></td>
<td>• An Illegal Execution state exception.</td>
</tr>
<tr>
<td></td>
<td>• Any debug exception except for Breakpoint instruction exceptions. For Breakpoint instruction exceptions, this bit has its standard meaning:</td>
</tr>
<tr>
<td></td>
<td>◦ 0b0: 16-bit T32 BKPT instruction.</td>
</tr>
<tr>
<td></td>
<td>◦ 0b1: 32-bit A32 BKPT instruction or A64 BRK instruction.</td>
</tr>
<tr>
<td></td>
<td>• An exception reported using EC value 0b000000.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**ISS, bits [24:0]**

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number. For an exception taken from AArch32 state, 'Mapping of the general-purpose registers between the Execution states' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

If the AArch32 register descriptor is 0b1111, then:

- If the instruction that generated the exception was not **UNPREDICTABLE**, the field takes the value 0b11111.
- If the instruction that generated the exception was **UNPREDICTABLE**, the field takes an **UNKNOWN** value that must be either:
  - The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
  - The value 0b11111.

When the EC field is 0b000000, indicating an exception with an unknown reason, the ISS field is not valid, **RES0**.

**ISS encoding for exceptions with an unknown reason**

| 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 | RES0 |

**Bits [24:0]**

Reserved, **RES0**.

When an exception is reported using this EC code the IL field is set to 1.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:
• The attempted execution of an instruction bit pattern that has no allocated instruction or that is not accessible at the current Exception level and Security state, including:
  ◦ A read access using a System register pattern that is not allocated for reads or that does not permit reads at the current Exception level and Security state.
  ◦ A write access using a System register pattern that is not allocated for writes or that does not permit writes at the current Exception level and Security state.
  ◦ Instruction encodings that are unallocated.
  ◦ Instruction encodings for instructions that are not implemented in the implementation.
• In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
• In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
• In AArch32 state, attempted execution of a short vector floating-point instruction.
• In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
• An exception generated because of the value of one of the SCTLR_EL1, {ITD, SED, CP15BEN} control bits.
• Attempted execution of:
  ◦ An HVC instruction when disabled by HCR_EL2.HCD or SCR_EL3.HCE.
  ◦ An SMC instruction when disabled by SCR_EL3.SMD.
  ◦ An HLT instruction when disabled by EDSCR.HDE.
• Attempted execution of an MSR or MRS instruction to access SP_EL0 when the value of SPSEL.SP is 0.
• Attempted execution, in Debug state, of:
  ◦ A DCPS1 instruction when the value of HCR_EL2.TGE is 1 and EL2 is disabled or not implemented in the current Security state.
  ◦ A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.
  ◦ A DCPS3 instruction when the value of EDSCR.SDD is 1, or when EL3 is not implemented.
• When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using R13 mon. See ‘Traps to EL3 of monitor functionality from Secure EL1 using AArch32’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
• In Debug state when the value of EDSCR.SDD is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.
• In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to SPSR_mon, SP_mon, or LR_mon.
• An exception that is taken to EL2 because the value of HCR_EL2.TGE is 1 that, if the value of HCR_EL2.TGE was 0 would have been reported with an ESR_ELx.EC value of 0b000111.
  ◦ When SVE is not implemented, attempted execution of:
    ◦ An SVE instruction.
    ◦ An MSR or MRS instruction to access ZCR_EL1, ZCR_EL2, or ZCR_EL3.
• In Non-transactional state, attempted execution of a TCOMMIT instruction.

ISS encoding for an exception from a WFI or WFE instruction

<table>
<thead>

CV, bit [24]

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

• When an A32 instruction is trapped, CV is set to 1.
• When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.
This field resets to an architecturally unknown value.

**COND, bits [23:20]**

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is implementation defined whether:
  - CV is set to 0 and COND is set to an unknown value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is implementation defined whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally unknown value.

**Bits [19:1]**

Reserved, RES0.

**TI, bit [0]**

Trapped instruction. Possible values of this bit are:

<table>
<thead>
<tr>
<th>TI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>WFI trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>WFE trapped.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally unknown value.

The following fields describe configuration settings for generating this exception:

- SCTLR_EL1.{nTWE, nTWI}.
- HCR_EL2.{TWE, TWI}.
- SCR_EL3.{TWE, TWI}.

**ISS encoding for an exception from an MCR or MRC access**

<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.
For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

**Opc2, bits [19:17]**

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value 0b000.

This field resets to an architecturally UNKNOWN value.

**Opc1, bits [16:14]**

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value 0b111.

This field resets to an architecturally UNKNOWN value.

**CRn, bits [13:10]**

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

This field resets to an architecturally UNKNOWN value.

**Rt, bits [9:5]**

The Rt value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
This field resets to an architecturally **UNKNOWN** value.

**CRm, bits [4:1]**

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value **0b0000**.

This field resets to an architecturally **UNKNOWN** value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Write to System register space. MCR instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read from System register space. MRC or VMRS instruction.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

The following fields describe configuration settings for generating exceptions that are reported using EC value **0b000011**:

- **CNTKCTL_EL1. {EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN},** for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **PMUSERENR_EL0. {ER, CR, SW, EN},** for accesses to Performance Monitor registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **AMUSERENR_EL0. EN,** for accesses to Activity Monitors registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **HCR_EL2. {TRVM, TVM},** for accesses to virtual memory control registers from EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **HCR_EL2. TCL, TCTL, TSW, TPC, TPU, TACR, TIDCP, CPTR_EL2.TAM, HSTR_EL2. T<n>,** for accesses to System registers using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **HCR_EL2. TIDCP, for accesses to System registers using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **CPTR_EL2.TCPAC, for accesses to CPACR_EL1 or CPACR using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **HSTR_EL2. T<n>,** for accesses to System registers using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.

The following fields describe configuration settings for generating exceptions that are reported using EC value **0b000101**:

- **ESR_EL1, Exception Syndrome Register (EL1)**
• **CPACR_EL1.TTA** for accesses to trace registers, MCR or MRC access (coproc == 0b11110) trapped to EL1 or EL2.

• **MDSCR_EL1.TDC,** for accesses to the Debug Communications Channel (DCC) registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.

• If ARMv8.6-FGT is implemented, **MDCR_EL2.TDCC** and **MDCR_EL3.TDCC,** for accesses to the DCC registers at EL0 and EL1, trapped to EL2.

• **HCR_EL2.TID0,** for accesses to the **IIDR** register in the ID group 0 at EL0 and EL1 using AArch32, MRC access (coproc == 0b11110) trapped to EL2.

• **CPTR_EL2.TTA,** for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b11110) trapped to EL2.

• **MDCR_EL2.TDRA,** for accesses to Debug ROM registers **DBGDRAR** and AArch-DBGDSAR using AArch32, MCR or MRC access (coproc == 0b11110) trapped to EL2.

• **MDCR_EL2.TDOSA,** for accesses to powerdown debug registers, using AArch32 state, MCR or MRC access (coproc == 0b11110) trapped to EL2.

• **CPTR_EL2.TDA,** for accesses to other debug registers, using AArch32 state, MCR or MRC access (coproc == 0b11110) trapped to EL2.

• **MDCR_EL3.TDOSA,** for accesses to powerdown debug registers using AArch32, MCR or MRC access (coproc == 0b11110) trapped to EL3.

• **MDCR_EL3.TDA,** for accesses to other debug registers, using AArch32, MCR or MRC access (coproc == 0b11110) trapped to EL3.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b001000:

• **HCR_EL2.TID0,** for accesses to the **FPSID** register in ID group 0 at EL1 using AArch32 state, VMRS access trapped to EL2.

• **HCR_EL2.TID3,** for accesses to registers in ID group 3 including **MVFR0, MVFR1** and **MVFR2,** VMRS access trapped to EL2.

### ISS encoding for an exception from an MCRR or MRRC access

<table>
<thead>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

• When an A32 instruction is trapped, CV is set to 1.

• When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

• When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to \(0b1110\), the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is implementation defined whether:

- CV is set to 0 and COND is set to an unknown value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is implementation defined whether the COND field is set to \(0b1110\), or to the value of any condition that applied to the instruction.

This field resets to an architecturally unknown value.

**Opc1, bits [19:16]**

The Opc1 value from the issued instruction.

This field resets to an architecturally unknown value.

**Bit [15]**

Reserved, RES0.

**Rt2, bits [14:10]**

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally unknown value.

**Rt, bits [9:5]**

The Rt value from the issued instruction, the first general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally unknown value.

**CRm, bits [4:1]**

The CRm value from the issued instruction.

This field resets to an architecturally unknown value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Write to System register space. MCRR instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read from System register space. MRRC instruction.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally unknown value.

The following fields describe configuration settings for generating exceptions that are reported using EC value \(0b000100\):

- **CNTKCTL_EL1** (EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN), for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **PMUSERENR_EL0** (CR, EN), for accesses to Performance Monitor registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
The following sections describe configuration settings for generating exceptions that are reported using EC value 0b001100:

- **CPACR_EL1.TTA** for accesses to trace registers using MCR or MRC instructions, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- **MDSCR_EL1.TDCC**, for accesses to the Debug Communications Channel (DCC) registers DBGDSAR and DBGDRAR at EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **CPTR_EL2.TTA**, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **MDCR_EL2.TDRA**, for accesses to Debug ROM registers DBGDRAR and AArch-DBGDSAR using AArch32, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **CPTR_EL3.TTA**, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- **MDCR_EL3.TDOA**, for traps to powerdown debug registers using AArch32, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- **MDCR_EL3.TDA**, for accesses to other debug registers, using AArch32, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.
For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

**imm8, bits [19:12]**

The immediate value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

**Bits [11:10]**

Reserved, RES0.

**Rn, bits [9:5]**

The Rn value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

**Offset, bit [4]**

Indicates whether the offset is added or subtracted:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Subtract offset.</td>
</tr>
<tr>
<td>0b1</td>
<td>Add offset.</td>
</tr>
</tbody>
</table>

This bit corresponds to the U bit in the instruction encoding.

This field resets to an architecturally UNKNOWN value.

**AM, bits [3:1]**

Addressing mode. The permitted values of this field are:
<table>
<thead>
<tr>
<th>AM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Immediate unindexed.</td>
</tr>
<tr>
<td>0b001</td>
<td>Immediate post-indexed.</td>
</tr>
<tr>
<td>0b010</td>
<td>Immediate offset.</td>
</tr>
<tr>
<td>0b011</td>
<td>Immediate pre-indexed.</td>
</tr>
<tr>
<td>0b100</td>
<td>For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.</td>
</tr>
<tr>
<td>0b110</td>
<td>For a trapped STC instruction, this encoding is reserved.</td>
</tr>
</tbody>
</table>

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is **CONSTRAINED UNPREDICTABLE**, as described in 'Reserved values in System and memory-mapped registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits \{P, W\} in the instruction encoding.

This field resets to an architecturally **UNKNOWN** value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Write to memory. STC instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read from memory. LDC instruction.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000110:

- **MDSCR_EL1.TDCC**, for accesses using AArch32 state, LDC access to **DBGDTRXInt** or STC access to **DBGDTRXInt** trapped to EL1 or EL2.
- **MDCR_EL2.TDA**, for accesses using AArch32 state, LDC access to **DBGDTRXInt** or STC access to **DBGDTRXInt** MCR or MRC access trapped to EL2.
- **MDCR_EL3.TDA**, for accesses using AArch32 state, LDC access to **DBGDTRXInt** or STC access to **DBGDTRXInt** MCR or MRC access trapped to EL3.
- If ARMv8.6-FGT is implemented, **MDCR_EL2.TDCC** and **MDCR_EL3.TDCC**, for accesses to the DCC registers at EL0 and EL1, trapped to EL2.

**ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from CPACR_EL1.FPEN, CPTR_EL2.FPEN or CPTR_ELx.TFP**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| CV | COND | RE50 |

The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SIMD and floating-point System registers.

For an implementation that does not include either SVE or support for floating-point and Advanced SIMD, the exception is reported using the EC value 0b000000.

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.
For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

**Bits [19:0]**

Reserved, RES0.

The following sections describe the configuration settings for the traps that are reported using EC value 0b000111:

- CPACR_EL1.FPEN, for accesses to SIMD and floating-point registers trapped to EL1.
- CPTR_EL2.TFP, for accesses to SIMD and floating-point registers trapped to EL2.
- CPTR_EL2.TFP, for accesses to SIMD and floating-point registers trapped to EL3.

**ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 |

**Bits [24:0]**

When SVE is implemented:

Reserved, RES0.

Otherwise:

Reserved, RES0.
The accesses covered by this trap include:

- Execution of SVE instructions.
- Accesses to the SVE system registers, ZCR_ELx and ID_AA64ZFR0_EL1.

For an implementation that does not include SVE, the exception is reported using the EC value 0b000000.

**ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault**

<table>
<thead>
<tr>
<th>24</th>

</tr>
</tbody>
</table>

**Bits [24:0]**

Reserved, RES0.

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about these exceptions see 'The Illegal Execution state exception' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile and 'PC alignment checking' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

‘Stack pointer alignment checking’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile describes the configuration settings for generating SP alignment fault exceptions.

**ISS encoding for an exception from HVC or SVC instruction execution**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | imm16 |

**Bits [24:16]**

Reserved, RES0.

**imm16, bits [15:0]**

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For A64 instructions, see ‘SVC’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile and ‘HVC’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

If ARMv8.6-FGT is implemented, HFGITR_EL2, {SVC_EL1, SVC_EL0} control fine-grained traps on SVC execution.
ISS encoding for an exception from SMC instruction execution in AArch32 state

24  23  22  21  20  19  18  17  16  15  14  13  12  11  10  9  8  7  6  5  4  3  2  1  0
CV  COND  CCKNOWNPASS  RES0

For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is RES0.

For an SMC instruction that is trapped to EL2 from EL1 because HCR_EL2.TSC is 1, the ISS encoding is as shown in the diagram.

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is only valid if CCKNOWNPASS is 1, otherwise it is RES0.

This field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is only valid if CCKNOWNPASS is 1, otherwise it is RES0.

This field resets to an architecturally UNKNOWN value.

**CCKNOWNPASS, bit [19]**

Indicates whether the instruction might have failed its condition code check.
### CKNOWNPASS

<table>
<thead>
<tr>
<th>CKNOWNPASS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The instruction was unconditional, or was conditional and passed its condition code check.</td>
</tr>
<tr>
<td>0b1</td>
<td>The instruction was conditional, and might have failed its condition code check.</td>
</tr>
</tbody>
</table>

#### Note

In an implementation in which an SMC instruction that fails its code check is not trapped, this field can always return the value 0.

This field resets to an architecturally **UNKNOWN** value.

### Bits [18:0]

Reserved, **RES0**.

HCR_EL2.TSC describes the configuration settings for trapping SMC instructions to EL2.

See ‘System calls’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile describes the case where these exceptions are trapped to EL3.

### ISS encoding for an exception from SMC instruction execution in AArch64 state

<table>
<thead>
<tr>
<th>Bit positions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>24–22</td>
<td><strong>RES0</strong></td>
</tr>
<tr>
<td>15–0</td>
<td><em>imm16</em></td>
</tr>
</tbody>
</table>

#### Bits [24:16]

Reserved, **RES0**.

**imm16**, bits [15:0]

The value of the immediate field from the issued SMC instruction.

This field resets to an architecturally **UNKNOWN** value.

The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

HCR_EL2.TSC describes the configuration settings for trapping SMC from EL1 modes.

‘System calls’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile describes the case where these exceptions are trapped to EL3.

### ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state

<table>
<thead>
<tr>
<th>Bit positions</th>
<th>Description</th>
</tr>

</tr>
<tr>
<td>23</td>
<td><strong>CRm</strong></td>
</tr>
<tr>
<td>22</td>
<td><strong>Direction</strong></td>
</tr>
</tbody>
</table>

#### Bits [24:22]

Reserved, **RES0**.
Op0, bits [21:20]

The Op0 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Op2, bits [19:17]

The Op2 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Op1, bits [16:14]

The Op1 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

This field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Write access, including MSR instructions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read access, including MRS instructions.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

For exceptions caused by System instructions, see 'System' subsection of 'Branches, exception generating and System instructions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile for the encoding values returned by an instruction.

The following fields describe configuration settings for generating the exception that is reported using EC value 0b011000:

- **SCTLR_EL1.UCI**, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **SCTLR_EL1.UCT**, for accesses to **CTR_EL0** using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **SCTLR_EL1.DZE**, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **SCTLR_EL1.UMA**, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **CPACR_EL1.TTA**, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
• **MDSCR_EL1.TDCC**, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
• If ARMv8.6-FGT is implemented, **MDSCR_EL2.TDCC** and **MDSCR_EL3.TDCC**, for accesses to the DCC registers at EL0 and EL1, trapped to EL2.
• **CNTKCTL_EL1.EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN** accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
• **PMUSERENR_EL0** (ER, CR, SW, EN), for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
• **AMUSERENR_EL0.** EN, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
• **HCR_EL2.TRDV**, for accesses to the Auxiliary Control Register, **ACTLR_EL1**, using AArch64 state, MSR or MRS access trapped to EL2.
• **HCR_EL2.TDCP**, for accesses to lock-down, DMA, and TCM operations using AArch64 state, MSR or MRS access trapped to EL2.
• **HCR_EL2.TID1, TID2, TID3**, for accesses to ID group 1, ID group 2 or ID group 3 registers, using AArch64 state, MSR or MRS access trapped to EL2.
• **CPTR_EL2.TCPAC**, for accesses to **CPACR_EL1**, using AArch64 state, MSR or MRS access trapped to EL2.
• **CPTR_EL2.TTA**, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL2.
• **MDCR_EL2.TTRF**, for accesses to the trace filter register, **TRFCR_EL1**, using AArch64 state, MSR or MRS access trapped to EL2.
• **MDCR_EL2.TDRA**, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.
• **MDCR_EL2.TDOSA**, for accesses to powerdown debug registers using AArch64 state, MSR or MRS access trapped to EL2.
• **CNTKCTL_EL2.EL1PCEN, EL1PCTEN**, for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.
• **MDCR_EL2.TDA**, for accesses to debug registers using AArch64 state, MSR or MRS access trapped to EL2.
• **MDCR_EL2.** {TPM, TPMCR}, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL2.
• **MDCR_EL2.TAM**, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.
• **HCR_EL2.APK**, for accesses to Pointer authentication key registers. using AArch64 state, MSR or MRS access trapped to EL2.
• **HCR_EL2.NV, NV1**, for Nested virtualization register access, using AArch64 state, MSR or MRS access trapped to EL2.
• **HCR_EL2.AT**, for execution of AT S1E* instructions, using AArch64 state, MSR or MRS access, trapped to EL2.
• **HCR_EL2.TERR, FIEN**, for accesses to RAS registers, using AArch64 state, MSR or MRS access, trapped to EL2.
• **SCP_EL3.** APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL3.
• **SCP_EL3.ST**, for accesses to the Counter-timer Physical Secure timer registers, using AArch64 state, MSR or MRS access trapped to EL3.
• **SCP_EL3.TERR, FIEN**, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL3.
• **CPTR_EL3.TCPAC**, for accesses to **CPTR_EL2** and **CPACR_EL1** using AArch64 state, MSR or MRS access trapped to EL3.
• **CPTR_EL3.TTA**, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL3.
• **MDCR_EL3.TTRF**, for accesses to the filter trace control registers, **TRFCR_EL1** and **TRFCR_EL2**, using AArch64 state, MSR or MRS access trapped to EL3.
• **MDCR_EL3.TDA**, for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
• **MDCR_EL3.TDOSA**, for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
• **MDCR_EL3.TPM**, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.
• **CPTR_EL3.TAM**, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access, trapped to EL3.
• If ARMv8.2-EVT is implemented, \texttt{HCR\_EL2\{TTLBOS, TTLBIS, TICAB, TOCU, TID4\}} and \texttt{HCR\_EL2\{TTLBIS, TICAB, TOCU, TID4\}} control traps for EL1 and EL0 Cache controls that use this EC value.

• If ARMv8.6-FGT is implemented:
  - \texttt{SCR\_EL3\_FGTEn}, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
  - \texttt{HFGRTR\_EL2} for reads and \texttt{HFGWTR\_EL2} for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
  - \texttt{HFGITR\_EL2} for execution of system instructions, MSR or MRS access trapped to EL2.
  - \texttt{HDFGRTR\_EL2} for reads and \texttt{HDFGWTR\_EL2} for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
  - \texttt{HAFGRTR\_EL2} for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.

**ISS encoding for an IMPLEMENTATION DEFINED exception to EL3**

\begin{verbatim}
  24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
  IMPLEMENTATION DEFINED
\end{verbatim}

**IMPLEMENTATION DEFINED, bits [24:0]**

- This field resets to an architecturally UNKNOWN value.

**ISS encoding for an exception from an Instruction Abort**

\begin{verbatim}
  24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
  RES0 SET FnV EA RES0 S1PTW RES0 IFSC
\end{verbatim}

**Bits [24:13]**

- Reserved, RES0.

**SET, bits [12:11]**

Synchronous Error Type. When the RAS Extension is implemented and IFSC is 0b010000, describes the state of the PE after taking the Instruction Abort exception. The possible values of this field are:

<table>
<thead>
<tr>
<th>SET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Recoverable error (UER).</td>
</tr>
<tr>
<td>0b10</td>
<td>Uncontainable error (UC).</td>
</tr>
<tr>
<td>0b11</td>
<td>Restartable error (UEO) or Corrected error (CE).</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Note**

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in an unrecoverable PE state.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the IFSC field is not 0b010000.

This field resets to an architecturally UNKNOWN value.
**FnV, bit [10]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<table>
<thead>
<tr>
<th>FnV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FAR is valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>FAR is not valid, and holds an UNKNOWN value.</td>
</tr>
</tbody>
</table>

This field is only valid if the IFSC code is 0b010000. It is RES0 for all other aborts.

This field resets to an architecturally UNKNOWN value.

**EA, bit [9]**

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field resets to an architecturally UNKNOWN value.

**Bit [8]**

Reserved, RES0.

**S1PTW, bit [7]**

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

<table>
<thead>
<tr>
<th>S1PTW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault not on a stage 2 translation for a stage 1 translation table walk.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault on the stage 2 translation of an access for a stage 1 translation table walk.</td>
</tr>
</tbody>
</table>

For any abort other than a stage 2 fault this bit is RES0.

This field resets to an architecturally UNKNOWN value.

**Bit [6]**

Reserved, RES0.

**IFSC, bits [5:0]**

Instruction Fault Status Code. Possible values of this field are:
### IFSC Encoding

<table>
<thead>
<tr>
<th>IFSC</th>

</tr>
<tr>
<td>0b011111</td>
<td>Synchronous parity or ECC error on memory access on translation table walk, level 3</td>
</tr>
<tr>
<td>0b110000</td>
<td>TLB conflict abort</td>
</tr>
<tr>
<td>0b110001</td>
<td>Unsupported atomic hardware update fault, if the implementation includes ARMv8.1-TTHM. Otherwise reserved.</td>
</tr>
</tbody>
</table>

All other values are reserved.

When the RAS Extension is implemented, 0b011000, 0b011100, 0b011101, 0b011110, and 0b011111, are reserved.

---

**Note**

Armv8.2 requires the implementation of the RAS Extension.

---

For more information about the lookup level associated with a fault, see ‘The level associated with MMU faults’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

---

**Note**

Because Access flag faults and Permission faults can only result from a Block or Page translation table descriptor, they cannot occur at level 0.

---

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

This field resets to an architecturally **UNKNOWN** value.

---

**ISS encoding for an exception from a Data Abort**
ISV, bit [24]

Instruction syndrome valid. Indicates whether the syndrome information in ISS[23:14] is valid.

<table>
<thead>
<tr>
<th>ISV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No valid instruction syndrome. ISS[23:14] are RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>ISS[23:14] hold a valid instruction syndrome.</td>
</tr>
</tbody>
</table>

This bit is 0 for all faults reported in ESR_EL2 except the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b11111, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback.
- AArch32 instructions where the instruction:
  ○ Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
  ○ Is not performing register writeback.
  ○ Is not using R15 as a source or destination register.

For these cases, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

ISV is 0 for all faults reported in ESR_EL1 or ESR_EL3.

When the RAS Extension is implemented, ISV is 0 for any synchronous External abort.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When the RAS Extension is not implemented, the value of ISV on a synchronous External abort on a stage 2 translation table walk is IMPLEMENTATIONDEFINED.

This field resets to an architecturally UNKNOWN value.

SAS, bits [23:22]

Syndrome Access Size. When ISV is 1, indicates the size of the access attempted by the faulting operation.

<table>
<thead>
<tr>
<th>SAS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Byte</td>
</tr>
<tr>
<td>0b01</td>
<td>Halfword</td>
</tr>
<tr>
<td>0b10</td>
<td>Word</td>
</tr>
<tr>
<td>0b11</td>
<td>Doubleword</td>
</tr>
</tbody>
</table>

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

SSE, bit [21]

Syndrome Sign Extend. When ISV is 1, for a byte, halfword, or word load operation, indicates whether the data item must be sign extended. For these cases, the possible values of this bit are:

<table>
<thead>
<tr>
<th>SSE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sign-extension not required.</td>
</tr>
<tr>
<td>0b1</td>
<td>Data item must be sign-extended.</td>
</tr>
</tbody>
</table>

For all other operations this bit is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.
This field resets to an architecturally **UNKNOWN** value.

**SRT, bits [20:16]**

Syndrome Register transfer. When ISV is 1, the register number of the Rt operand of the faulting instruction. If the exception was taken from an Exception level that is using AArch32 then this is the AArch64 view of the register. See ‘Mapping of the general-purpose registers between the Execution states’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field is **UNKNOWN** when the value of ISV is **UNKNOWN**.

This field is **RES0** when the value of ISV is 0.

This field resets to an architecturally **UNKNOWN** value.

**SF, bit [15]**

Width of the register accessed by the instruction is Sixty-Four. When ISV is 1, the possible values of this bit are:

<table>
<thead>
<tr>
<th>SF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Instruction loads/stores a 32-bit wide register.</td>
</tr>
<tr>
<td>0b1</td>
<td>Instruction loads/stores a 64-bit wide register.</td>
</tr>
</tbody>
</table>

**Note**

This field specifies the register width identified by the instruction, not the Execution state.

This field is **UNKNOWN** when the value of ISV is **UNKNOWN**.

This field is **RES0** when the value of ISV is 0.

This field resets to an architecturally **UNKNOWN** value.

**AR, bit [14]**

Acquire/Release. When ISV is 1, the possible values of this bit are:

<table>
<thead>
<tr>
<th>AR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Instruction did not have acquire/release semantics.</td>
</tr>
<tr>
<td>0b1</td>
<td>Instruction did have acquire/release semantics.</td>
</tr>
</tbody>
</table>

This field is **UNKNOWN** when the value of ISV is **UNKNOWN**.

This field is **RES0** when the value of ISV is 0.

This field resets to an architecturally **UNKNOWN** value.

**VNCR, bit [13]**

When ARMv8.4-NV is implemented:

Indicates that the fault came from use of **VNCR_EL2** register by EL1 code.

<table>
<thead>
<tr>
<th>VNCR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The fault was not generated by the use of <strong>VNCR_EL2</strong>, by an MRS or MSR instruction executed at EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The fault was generated by the use of <strong>VNCR_EL2</strong>, by an MRS or MSR instruction executed at EL1.</td>
</tr>
</tbody>
</table>

This field is 0 in ESR_EL1.

This field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**SET, bits [12:11]**

Synchronous Error Type. When the RAS Extension is implemented and DFSC is 0b010000, describes the state of the PE after taking the Data Abort exception. The possible values of this field are:

<table>
<thead>
<tr>
<th>SET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Recoverable error (UER).</td>
</tr>
<tr>
<td>0b10</td>
<td>Uncontainable error (UC).</td>
</tr>
<tr>
<td>0b11</td>
<td>Restartable error (UEO) or Corrected error (CE).</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Note**

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in an unrecoverable PE state.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the DFSC field is not 0b010000.

This field resets to an architecturally UNKNOWN value.

**FnV, bit [10]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<table>
<thead>
<tr>
<th>FnV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FAR is valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>FAR is not valid, and holds an UNKNOWN value.</td>
</tr>
</tbody>
</table>

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

This field resets to an architecturally UNKNOWN value.

**EA, bit [9]**

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field resets to an architecturally UNKNOWN value.

**CM, bit [8]**

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:
CM

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0 The Data Abort was not generated by the execution of one of the</td>
</tr>
<tr>
<td>System instructions identified in the description of value 1.</td>
</tr>
<tr>
<td>0b1 The Data Abort was generated by either the execution of a</td>
</tr>
<tr>
<td>cache maintenance instruction or by a synchronous fault on the</td>
</tr>
<tr>
<td>execution of an address translation instruction. The DC ZVA instruction</td>
</tr>
<tr>
<td>is not classified as a cache maintenance instruction, and therefore</td>
</tr>
<tr>
<td>its execution cannot cause this field to be set to 1.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

<table>
<thead>
<tr>
<th>S1PTW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault not on a stage 2 translation for a stage 1 translation table walk.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault on the stage 2 translation of an access for a stage 1 translation table walk.</td>
</tr>
</tbody>
</table>

For any abort other than a stage 2 fault this bit is RES0.

This field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location. The possible values of this bit are:

<table>
<thead>
<tr>
<th>WnR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Abort caused by an instruction reading from a memory location.</td>
</tr>
<tr>
<td>0b1</td>
<td>Abort caused by an instruction writing to a memory location.</td>
</tr>
</tbody>
</table>

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

This field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code. Possible values of this field are:
### DFSC

<table>
<thead>
<tr>
<th>DFSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>Address size fault, level 0 of translation or translation table base register.</td>
</tr>
<tr>
<td>0b000001</td>
<td>Address size fault, level 1.</td>
</tr>
<tr>
<td>0b000010</td>
<td>Address size fault, level 2.</td>
</tr>
<tr>
<td>0b000011</td>
<td>Address size fault, level 3.</td>
</tr>
<tr>
<td>0b000100</td>
<td>Translation fault, level 0.</td>
</tr>
<tr>
<td>0b000101</td>

</tr>
<tr>
<td>0b111111</td>
<td>Page Domain Fault, used only for faults reported in the PAR_EL1.</td>
</tr>
</tbody>
</table>

All other values are reserved.

When the RAS Extension is implemented, 0b011000, 0b011100, 0b011101, 0b011110, and 0b011111, are reserved.

For more information about the lookup level associated with a fault, see ‘The level associated with MMU faults’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Note**

Because Access flag faults and Permission faults can only result from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

This field resets to an architecturally **UNKNOWN** value.
ISS encoding for an exception from a trapped floating-point exception

| 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0 | TFV | RES0 | VECITR | IDF | RES0 | IXF | UFF | OFF | DZF | IOF |

Bit [24]

Reserved, RES0.

TFV, bit [23]

Trapped Fault Valid bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions. The possible values of this bit are:

<table>
<thead>
<tr>
<th>TFV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are UNKNOWN.</td>
</tr>
<tr>
<td>0b1</td>
<td>One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information see 'Floating-point exception traps' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.</td>
</tr>
</tbody>
</table>

It is IMPLEMENTATION DEFINED whether this field is set to 0 on an exception generated by a trapped floating-point exception from a vector instruction.

Note

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from a vector instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

This field resets to an architecturally UNKNOWN value.

Bits [22:11]

Reserved, RES0.

VECITR, bits [10:8]

For a trapped floating-point exception from an instruction executed in AArch32 state this field is RES1.

For a trapped floating-point exception from an instruction executed in AArch64 state this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

IDF, bit [7]

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>IDF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Input denormal floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Input denormal floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.
**Bits [6:5]**

Reserved, RES0.

**IXF, bit [4]**

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is **UNKNOWN**. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>IXF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Inexact floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Inexact floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**UFF, bit [3]**

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is **UNKNOWN**. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>UFF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Underflow floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Underflow floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**OFF, bit [2]**

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is **UNKNOWN**. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>OFF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Overflow floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Overflow floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**DZF, bit [1]**

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is **UNKNOWN**. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>DZF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Divide by Zero floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Divide by Zero floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**IOF, bit [0]**

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is **UNKNOWN**. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>IOF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Invalid Operation floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Invalid Operation floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.
In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the \texttt{FPSCR.\{IDE, IXE, UFE, OFE, DZE, IOE\}} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the \texttt{FPSCR.\{IDE, IXE, UFE, OFE, DZE, IOE\}} bits enable each of the floating-point exception traps.

**ISS encoding for an SError interrupt**

<td>EA</td>
<td>RES0</td>
<td>DFSC</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**IDS, bit [24]**

**IMPLEMENTATION DEFINED** syndrome. Possible values of this bit are:

<table>
<thead>
<tr>
<th>IDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bits[23:0] of the ISS field holds the fields described in this encoding.</td>
</tr>
</tbody>
</table>

**Note**

If the RAS Extension is not implemented, this means that bits[23:0] of the ISS field are \texttt{RES0}.

<table>
<thead>
<tr>
<th>IDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>Bits[23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError interrupt.</td>
</tr>
</tbody>
</table>

**Note**

This field was previously called ISV.

This field resets to an architecturally \texttt{UNKNOWN} value.

**Bits [23:14]**

Reserved, \texttt{RES0}.

**IESB, bit [13]**

**When ARMv8.2-IESB is implemented:**

Implicit error synchronization event.

<table>
<thead>
<tr>
<th>IESB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The SError interrupt was either not synchronized by the implicit error synchronization event or not taken immediately.</td>
</tr>
<tr>
<td>0b1</td>
<td>The SError interrupt was synchronized by the implicit error synchronization event and taken immediately.</td>
</tr>
</tbody>
</table>

This field is \texttt{RES0} if the value returned in the DFSC field is not \texttt{0b010001}.

**Note**

Armv8.2 requires the implementation of the RAS Extension and ARMv8.2-IESB.

This field resets to an architecturally \texttt{UNKNOWN} value.
Otherwise:

Reserved, RES0.

**AET, bits [12:10]**

Asynchronous Error Type.

When the RAS Extension is implemented and DFSC is 0b010001, describes the state of the PE after taking the SError interrupt exception. The possible values of this field are:

<table>
<thead>
<tr>
<th>AET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Uncontainable error (UC)</td>
</tr>
<tr>
<td>0b001</td>
<td>Unrecoverable error (UEU)</td>
</tr>
<tr>
<td>0b010</td>
<td>Restartable error (UEO)</td>
</tr>
<tr>
<td>0b011</td>
<td>Recoverable error (UER)</td>
</tr>
<tr>
<td>0b110</td>
<td>Corrected error (CE)</td>
</tr>
</tbody>
</table>

All other values are reserved.

If multiple errors are taken as a single SError interrupt exception, the overall state of the PE is reported. For example, if both a Recoverable and Unrecoverable error occurred, the state is Unrecoverable.

**Note**

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the DFSC field is not 0b010001.

**Note**

Armv8.2 requires the implementation of the RAS Extension.

This field resets to an architecturally **UNKNOWN** value.

**EA, bit [9]**

External abort type. When the RAS Extension is implemented, this bit can provide an **IMPLEMENTATION DEFINED** classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the DFSC field is not 0b010001.

**Note**

Armv8.2 requires the implementation of the RAS Extension.

This field resets to an architecturally **UNKNOWN** value.

**Bits [8:6]**

Reserved, RES0.
**DFSC, bits [5:0]**

Data Fault Status Code. When the RAS Extension is implemented, possible values of this field are:

<table>
<thead>
<tr>
<th>DFSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>Uncategorized.</td>
</tr>
<tr>
<td>0b010001</td>
<td>Asynchronous SError interrupt.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If the RAS Extension is not implemented, this field is RES0.

---

**Note**

Armv8.2 requires the implementation of the RAS Extension.

This field resets to an architecturally UNKNOWN value.

---

**ISS encoding for an exception from a Breakpoint or Vector Catch debug exception**

**ISV, bit [24]**

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:

<table>
<thead>
<tr>
<th>ISV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EX bit is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>EX bit is valid.</td>
</tr>
</tbody>
</table>

See the EX bit description for more information.

This field resets to an architecturally UNKNOWN value.
**Bits [23:7]**

Reserved, RES0.

**EX, bit [6]**

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

<table>
<thead>
<tr>
<th>EX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An instruction other than a Load-Exclusive instruction was stepped.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Load-Exclusive instruction was stepped.</td>
</tr>
</tbody>
</table>

If the ISV bit is set to 0, this bit is RES0, indicating no syndrome data is available.

This field resets to an architecturally **UNKNOWN** value.

**IFSC, bits [5:0]**

Instruction Fault Status Code. This field is set to 0b100010, to indicate a Debug exception.

This field resets to an architecturally **UNKNOWN** value.

For more information about generating these exceptions, see 'Software Step exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**ISS encoding for an exception from a Watchpoint exception**

<table>
<thead>
<tr>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [24:14]**

Reserved, RES0.

**VNCR, bit [13]**

When ARMv8.4-NV is implemented:

Indicates that the watchpoint came from use of **VNCR_EL2** register by EL1 code.

<table>
<thead>
<tr>
<th>VNCR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The watchpoint was not generated by the use of <strong>VNCR_EL2</strong> by EL1 code.</td>
</tr>
<tr>
<td>0b1</td>
<td>The watchpoint was generated by the use of <strong>VNCR_EL2</strong> by EL1 code.</td>
</tr>
</tbody>
</table>

This field is 0 in ESR_EL1.

This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Bits [12:9]**

Reserved, RES0.
Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance or address translation instruction:

<table>
<thead>
<tr>
<th>CM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Watchpoint exception was not generated by the execution of one of the System instructions identified in the description of value 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Watchpoint exception was generated by either the execution of a cache maintenance instruction or by a synchronous Watchpoint exception on the execution of an address translation instruction. The DC_ZVA instruction is not classified as a cache maintenance instruction, and therefore its execution cannot cause this field to be set to 1.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**Bit [7]**

Reserved, RES0.

**WnR, bit [6]**

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location. The possible values of this bit are:

<table>
<thead>
<tr>
<th>WnR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Watchpoint exception caused by an instruction reading from a memory location.</td>
</tr>
<tr>
<td>0b1</td>
<td>Watchpoint exception caused by an instruction writing to a memory location.</td>
</tr>
</tbody>
</table>

For Watchpoint exceptions on cache maintenance and address translation instructions, this bit always returns a value of 1.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is **UNPREDICTABLE** which watchpoint generates the Watchpoint exception.

This field resets to an architecturally **UNKNOWN** value.

**DFSC, bits [5:0]**

Data Fault Status Code. This field is set to 0b100010, to indicate a Debug exception.

This field resets to an architecturally **UNKNOWN** value.

For more information about generating these exceptions, see ‘Watchpoint exceptions’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**ISS encoding for an exception from execution of a Breakpoint instruction**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|--|--|--|--|--|--|--|
| RES0 | Comment |

**Bits [24:16]**

Reserved, RES0.
**Comment, bits [15:0]**

Set to the instruction comment field value, zero extended as necessary. For the AArch32 BKPT instructions, the comment field is described as the immediate field.

This field resets to an architecturally **UNKNOWN** value.

For more information about generating these exceptions, see 'Breakpoint instruction exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**ISS encoding for an exception from ERET, ERETTA or ERETAB instruction**

```
24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

This EC value applies when ARMv8.6-FGT is implemented, or when **HCR_EL2**.NV is 1.

**Bits [24:2]**

Reserved, **RES0**.

**ERET, bit [1]**

Indicates whether an ERET or ERETTA* instruction was trapped to EL2. Possible values are:

<table>
<thead>
<tr>
<th>ERET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERET instruction trapped to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>ERETTA or ERETAB instruction trapped to EL2.</td>
</tr>
</tbody>
</table>

If this bit is 0, the ERETTA field is **RES0**.

This field resets to an architecturally **UNKNOWN** value.

**ERE T A, bit [0]**

Indicates whether an ERETTA or ERETAB instruction was trapped to EL2. Possible values are:

<table>
<thead>
<tr>
<th>ERETTA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERETTA instruction trapped to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>ERETAB instruction trapped to EL2.</td>
</tr>
</tbody>
</table>

When the ERET field is 0, this bit is **RES0**.

This field resets to an architecturally **UNKNOWN** value.

For more information about generating these exceptions, see **HCR_EL2**.NV.

If ARMv8.6-FGT is implemented, **HFGITR_EL2**.ERET controls fine-grained trap exceptions from ERET, ERETTA and ERETAB execution.

**ISS encoding for an exception from a TSTART instruction**

```
24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

| RES0 |

Bits [24:0]

Reserved, RES0.

For more information about generating these exceptions, see:

- **HCR_EL2.API**, for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL2.
- **SCR_EL3.API**, for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL3.

ISS encoding for an exception from a Pointer Authentication instruction authentication failure

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | Bit [1] Bit [0] |

Bits [24:2]

Reserved, RES0.

Bit [1], bit [1]

This field indicates whether the exception is as a result of an Instruction key or a Data key.

<table>
<thead>
<tr>
<th>Bit [1]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Instruction Key.</td>
</tr>
<tr>
<td>0b1</td>
<td>Data Key.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.
**Bit [0], bit [0]**

This field indicates whether the exception is as a result of an A key or a B key.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A key.</td>
</tr>
<tr>
<td>0b1</td>
<td>B key.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

The following instructions generate an exception when the Pointer Authentication Code (PAC) is incorrect:

- AUTIASP, AUTIAZ, AUTIA1716.
- AUTIBSP, AUTIBZ, AUTIB1716.
- AUTIA, AUTDA, AUTIB, AUTDB.
- AUTIZA, AUTIZB, AUTDZA, AUTDZB.

It is **IMPLEMENTATION DEFINED** whether the following instructions generate an exception directly from the authorization failure, rather than changing the address in a way that will generate a translation fault when the address is accessed:

- RETAA, RETAB.
- BRAA, BRAB, BLRAA, BLRAB.
- BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERATA, ERATB.
- LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

### Accessing the ESR_EL1

**ESR_EL1, Exception Syndrome Register (EL1)**

When **HCR_EL2.E2H** is 1, without explicit synchronization, access from EL3 using the mnemonic ESR_EL1 or ESR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

**MRS <Xt>, ESR_EL1**

<table>
<thead>
<tr>
<th>op0</th>

ESR_EL2, Exception Syndrome Register (EL2)

The ESR_EL2 characteristics are:

**Purpose**

Holds syndrome information for an exception taken to EL2.

**Configuration**

AArch64 System register ESR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HSR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ESR_EL2 is a 64-bit register.

**Field descriptions**

The ESR_EL2 bit assignments are:

<table>

ESR_EL2 is made UNKNOWN as a result of an exception return from EL2.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL2, the value of ESR_EL2 is UNKNOWN. The value written to ESR_EL2 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

**Bits [63:32]**

Reserved, RES0.

**EC, bits [31:26]**

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.

Possible values of the EC field are:
<table>
<thead>
<tr>
<th>EC</th>
<th>Meaning</th>
<th>ISS Encoding for exceptions with an unknown reason</th>
<th>Applies when</th>

</tbody>
</table>
architecture profile, section D1.10.4.

Trapped VMRS access, from ID group trap, that is not reported using EC 0b000111.

ISS encoding for an exception from an MCR or MRC access

Trapped use of a Pointer authentication instruction because HCR_EL2.API == 0 || SCR_EL3.API == 0.

ISS encoding for an exception from a Pointer Authentication instruction when HCR_EL2.API == 0 || SCR_EL3.API == 0.

Trapped MRRC access with (coproc==0b1110).

ISS encoding for an exception from an MCRR or MRRC access

when ARMv8.3-PAuth is implemented

Branch Target Exception.

ISS encoding for an exception from Branch Target Identification instruction

when ARMv8.5-BTI is implemented

Illegal Execution state.

ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault

when ARMv8.3-PAuth is implemented

SVC instruction execution in AArch32 state.

ISS encoding for an exception from HVC or SVC instruction execution

This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TGE is 1.

HVC instruction execution in AArch32 state, when HVC is not disabled.

ISS encoding for an exception from HVC or SVC instruction execution

SMC instruction execution in AArch32 state, when SMC is not disabled.

ISS encoding for an exception from SMC instruction execution in AArch32 state

This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TSC is 1.

SVC instruction execution in AArch64 state.

ISS encoding for an exception from HVC or SVC instruction execution

HVC instruction execution in AArch64 state, when HVC is not disabled.

ISS encoding for an exception from HVC or SVC instruction execution

SMC instruction execution in AArch64 state, when SMC is not disabled.

ISS encoding for an exception from SMC instruction execution in AArch64 state

This is reported in ESR_EL2 only when
the exception is generated because the value of HCR_EL2.TSC is 1.

0b011000
Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC 0b000000, 0b000001 or 0b000111.
If ARMv8.4-IDST is implemented, also exceptions generated by a read access to the feature ID space.
If ARMv8.0-CSV2 is implemented, also Cache Speculation Variant exceptions.
If ARMv8.2-EVT is implemented, also traps for EL1 and EL0 Cache controls.
This includes all instructions that cause exceptions that are part of the encoding space defined in ‘System instruction class encoding overview’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section C5.2.2, except for those exceptions reported using EC values 0b000000, 0b000001, or 0b000111.

0b011001
Access to SVE functionality trapped as a result of CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ, that is not reported using EC 0b000000.
This EC is defined only if SVE is implemented.

0b011010
Trapped ERET, ERETAA, or ERETAB instruction execution.

0b011011
Exception from an access to a TSTART instruction at EL0 when SCTLR_EL1.TME0 == 0, EL0 when
SCTLR_EL2.TME0 == 0, at EL1 when
SCTLR_EL1.TME == 0, at EL2 when
SCTLR_EL2.TME == 0 or at EL3 when
SCTLR_EL3.TME == 0.

0b011100 Exception from a Pointer Authentication instruction authentication failure
ISS encoding for an exception from a Pointer Authentication instruction authentication failure
When ARMv8.3-FPAC is implemented

0b100000 Instruction Abort from a lower Exception level, that might be using AArch32 or AArch64. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.
ISS encoding for an exception from an Instruction Abort

0b100001 Instruction Abort taken without a change in Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.
ISS encoding for an exception from an Instruction Abort

0b100010 PC alignment fault exception.
ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault

0b100100 Data Abort from a lower Exception level, excluding Data Aborts taken to EL2 as a result of accesses generated associated with VNCR_EL2 as part of nested virtualization support. These Data Aborts might be generated from Exception levels using AArch32 or AArch64.
ISS encoding for an exception from a Data Abort
<table>
<thead>
<tr>
<th>EC Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b100101</td>
<td>Data Abort without a change in Exception level, or Data Aborts taken to EL2 as a result of accesses generated associated with VNCR_EL2 as part of nested virtualization support. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.</td>
</tr>
<tr>
<td>0b100110</td>
<td>SP alignment fault exception.</td>
</tr>
<tr>
<td>0b101000</td>
<td>Trapped floating-point exception taken from AArch32 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.</td>
</tr>
<tr>
<td>0b101100</td>
<td>Trapped floating-point exception taken from AArch64 state.</td>
</tr>
</tbody>
</table>
This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.

0b101111 SError interrupt. ISS encoding for an SError interrupt

0b110000 Breakpoint exception from a lower Exception level, that might be using AArch32 or AArch64. ISS encoding for an exception from a Breakpoint or Vector Catch debug exception

0b110001 Breakpoint exception taken without a change in Exception level. ISS encoding for an exception from a Breakpoint or Vector Catch debug exception

0b110010 Software Step exception from a lower Exception level, that might be using AArch32 or AArch64. ISS encoding for an exception from a Software Step exception

0b110011 Software Step exception taken without a change in Exception level. ISS encoding for an exception from a Software Step exception

0b110100 Watchpoint from a lower Exception level, excluding Watchpoint Exceptions taken to EL2 as a result of accesses generated associated with VNCR_EL2 as part of nested virtualization support. ISS encoding for an exception from a Watchpoint exception

0b110101 Watchpoint exceptions without a change in Exception level, or Watchpoint exceptions taken to EL2 as a result of accesses generated associated with VNCR_EL2 as part of nested virtualization support. ISS encoding for an exception from a Watchpoint exception
0b111000 BKPT instruction execution in AArch32 state. ISS encoding for an exception from execution of a Breakpoint instruction

0b111010 Vector Catch exception from AArch32 state. The only case where a Vector Catch exception is taken to an Exception level that is using AArch64 is when the exception is routed to EL2 and EL2 is using AArch64. ISS encoding for an exception from a Breakpoint or Vector Catch debug exception

0b111100 BRK instruction execution in AArch64 state. ISS encoding for an exception from execution of a Breakpoint instruction

All other EC values are reserved by Arm, and:

• Unused values in the range 0b00000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
• Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in System and memory-mapped registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section K1.1.11.

This field resets to an architecturally UNKNOWN value.

IL, bit [25]

Instruction Length for synchronous exceptions. Possible values of this bit are:

<table>
<thead>
<tr>
<th>IL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>16-bit instruction trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>32-bit instruction trapped. This value is also used when the exception is one of the following:</td>
</tr>
<tr>
<td></td>
<td>• An SError interrupt.</td>
</tr>
<tr>
<td></td>
<td>• An Instruction Abort exception.</td>
</tr>
<tr>
<td></td>
<td>• A PC alignment fault exception.</td>
</tr>
<tr>
<td></td>
<td>• An SP alignment fault exception.</td>
</tr>
<tr>
<td></td>
<td>• A Data Abort exception for which the value of the ISV bit is 0.</td>
</tr>
<tr>
<td></td>
<td>• An Illegal Execution state exception.</td>
</tr>
<tr>
<td></td>
<td>• Any debug exception except for Breakpoint instruction exceptions. For Breakpoint instruction exceptions, this bit has its standard meaning:</td>
</tr>
<tr>
<td></td>
<td>• 0b0: 16-bit T32 BKPT instruction.</td>
</tr>
<tr>
<td></td>
<td>• 0b1: 32-bit A32 BKPT instruction or A64 BRK instruction.</td>
</tr>
<tr>
<td></td>
<td>• An exception reported using EC value 0b000000.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.
Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number. For an exception taken from AArch32 state, ‘Mapping of the general-purpose registers between the Execution states’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

If the AArch32 register descriptor is \(0b1111\), then:

- If the instruction that generated the exception was not \textit{UNPREDICTABLE}, the field takes the value \(0b11111\).
- If the instruction that generated the exception was \textit{UNPREDICTABLE}, the field takes an \textit{UNKNOWN} value that must be either:
  - The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
  - The value \(0b11111\).

When the EC field is \(0b000000\), indicating an exception with an unknown reason, the ISS field is not valid, \texttt{RES0}.

**ISS encoding for exceptions with an unknown reason**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 |

\textbf{Bits [24:0]}

Reserved, \texttt{RES0}.

When an exception is reported using this EC code the IL field is set to 1.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or that is not accessible at the current Exception level and Security state, including:
  - A read access using a System register pattern that is not allocated for reads or that does not permit reads at the current Exception level and Security state.
  - A write access using a System register pattern that is not allocated for writes or that does not permit writes at the current Exception level and Security state.
  - Instruction encodings that are unallocated.
  - Instruction encodings for instructions that are not implemented in the implementation.
- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- In AArch32 state, attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the \texttt{SCTLR_EL1 \{ITD, SED, CP15BEN\}} control bits.
- Attempted execution of:
  - An HVC instruction when disabled by \texttt{HCR_EL2.HCD} or \texttt{SCR_EL3.HCE}.
  - An SMC instruction when disabled by \texttt{SCR_EL3.SMD}.
  - An HLT instruction when disabled by \texttt{EDSCR.HDE}.
- Attempted execution of an MSR or MRS instruction to access \texttt{SP_EL0} when the value of \texttt{SPSel.SP} is 0.
- Attempted execution, in Debug state, of:
  - A DCPS1 instruction when the value of \texttt{HCR_EL2.TGE} is 1 and EL2 is disabled or not implemented in the current Security state.
  - A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.
  - A DCPS3 instruction when the value of \texttt{EDSCR.SDD} is 1, or when EL3 is not implemented.
- When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using R13 mon. See ‘Traps to EL3 of monitor functionality from Secure EL1 using AArch32’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
- In Debug state when the value of \texttt{EDSCR.SDD} is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.
- In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to SPSR_mon, SP_mon, or LR_mon.
• An exception that is taken to EL2 because the value of \texttt{HCR\_EL2.TGE} is 1 that, if the value of \texttt{HCR\_EL2.TGE} was 0 would have been reported with an \texttt{ESR\_ELx.EC} value of \texttt{0b000111}.

• When SVE is not implemented, attempted execution of:
  ◦ An SVE instruction.
  ◦ An MSR or MRS instruction to access \texttt{ZCR\_EL1}, \texttt{ZCR\_EL2}, or \texttt{ZCR\_EL3}.

• In Non-transactional state, attempted execution of a TCOMMIT instruction.

### ISS encoding for an exception from a WFI or WFE instruction

<table>
<thead>
<tr>
<th>CV</th>
<th>COND</th>
<th>RES0</th>
<th>Ti</th>
</tr>
</thead>
<tbody>
<tr>
<td>24</td>
<td>23</td>
<td>22</td>
<td>21</td>
</tr>
</tbody>
</table>

#### CV, bit [24]
Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

• When an A32 instruction is trapped, CV is set to 1.
• When a T32 instruction is trapped, it is \texttt{IMPLEMENTATION DEFINED} whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally \texttt{UNKNOWN} value.

#### COND, bits [23:20]
The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to \texttt{0b1110}.

For exceptions taken from AArch32:

• When an A32 instruction is trapped, CV is set to 1 and:
  ◦ If the instruction is conditional, COND is set to the condition code field value from the instruction.
  ◦ If the instruction is unconditional, COND is set to \texttt{0b1110}.
• A conditional A32 instruction that is known to pass its condition code check can be presented either:
  ◦ With COND set to \texttt{0b1110}, the value for unconditional.
  ◦ With the COND value held in the instruction.
• When a T32 instruction is trapped, it is \texttt{IMPLEMENTATION DEFINED} whether:
  ◦ CV is set to 0 and COND is set to an \texttt{UNKNOWN} value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  ◦ CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
• For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is \texttt{IMPLEMENTATION DEFINED} whether the COND field is set to \texttt{0b1110}, or to the value of any condition that applied to the instruction.

This field resets to an architecturally \texttt{UNKNOWN} value.

#### Bits [19:1]
Reserved, \texttt{RES0}. 
TI, bit [0]

Trapped instruction. Possible values of this bit are:

<table>
<thead>
<tr>
<th>TI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>WFI trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>WFE trapped.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating this exception:

- `SCTLR_EL1`.{nTWE, nTWI}.
- `HCR_EL2`.{TWE, TWI}.
- `SCR_EL3`.{TWE, TWI}.

### ISS encoding for an exception from an MCR or MRC access

</tbody>
</table>

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.
Opc2, bits [19:17]

The Opc2 value from the issued instruction.
For a trapped VMRS access, holds the value 0b000.
This field resets to an architecturally UNKNOWN value.

Opc1, bits [16:14]

The Opc1 value from the issued instruction.
For a trapped VMRS access, holds the value 0b111.
This field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.
For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.
This field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
This field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.
For a trapped VMRS access, holds the value 0b0000.
This field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Write to System register space. MCR instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read from System register space. MRC or VMRS instruction.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000011:

- **CNTKCTL_EL1**, {EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **PMUSERENR_EL0**, {ER, CR, SW, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **AMUSERENR_EL0**, EN, for accesses to Activity Monitors registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **HCR_EL2**, {TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **HCR_EL2**, TTLB, for execution of TLB maintenance instructions at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
• **HCR_EL2.** (TSW, TPC, TPU) for execution of cache maintenance instructions at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.

• **HCR_EL2.TACR** for accesses to the Auxiliary Control Register at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.

• **HCR_EL2.TIDCP** for accesses to lockdown, DMA, and TCM operations at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.

• **HCR_EL2.** (TID1, TID2, TID3), for accesses to ID registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.

• **CPTR_EL2.TCPAC** for accesses to **CPACR_EL1** or **CPACR** using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.

• **HSTR_EL2.T<n>** for accesses to System registers using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.

• **CNTHCTL_EL2.EL1PCEN** for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.

• **MDCR_EL2.** (TPM, TPMCR), for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.

• **CPTR_EL2.TAM** for accesses to Activity Monitors registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.

• **CPTR_EL2.** TCPAC for accesses to **CPACR_EL1** or **CPACR** using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.

• **CPTR_EL3.TCPAC** for accesses to **CPACR** from EL1 and EL2, and accesses to **HCPTR** from EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.

• **HCR_EL2.TID0**, for accesses to the **JIDR** register in the ID group 0 at EL0 and EL1 using AArch32, MRC access (coproc == 0b1111) trapped to EL2.

• **CPTR_EL2.TTA**, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1111) trapped to EL2.

• **MDCR_EL2.TDRA**, for accesses to Debug ROM registers **DBGDRAR** and AArch-DBGDSAR using AArch32, MCR or MRC access (coproc == 0b1111) trapped to EL2.

• **MDCR_EL2.TDOSA**, for accesses to powerdown debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.

• **MDCR_EL3.TDA**, for accesses to other debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.

• **MDCR_EL3.TDOSA**, for accesses to powerdown debug registers using AArch32, MCR or MRC access (coproc == 0b1111) trapped to EL3.

• **MDCR_EL3.TDA**, for accesses to other debug registers, using AArch32, MCR or MRC access (coproc == 0b1111) trapped to EL3.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000101:

• **CPACR_EL1.TTA** for accesses to trace registers, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.

• **MDSCR_EL1.TDCC**, for accesses to the Debug Communications Channel (DCC) registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.

• If ARMv8.6-FGT is implemented, **MDCR_EL2.TDCC** and **MDCR_EL3.TDCC**, for accesses to the DCC registers at EL0 and EL1, trapped to EL2.

• **HCR_EL2.TID0**, for accesses to the **FPSID** register in ID group 0 at EL1 using AArch32 state, VMRS access trapped to EL2.

• **HCR_EL2.TID3**, for accesses to registers in ID group 3 including **MVFR0**, **MVFR1** and **MVFR2**, VMRS access trapped to EL2.

**ISS encoding for an exception from an MCRR or MRRC access**

</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

**Opc1, bits [19:16]**

The Opc1 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

**Bit [15]**

Reserved, RES0.

**Rt2, bits [14:10]**

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.
Rt, bits [9:5]

The Rt value from the issued instruction, the first general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally **UNKNOWN** value.

CRm, bits [4:1]

The CRm value from the issued instruction.

This field resets to an architecturally **UNKNOWN** value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is **IMPLEMENTATION DEFINED** whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally **UNKNOWN** value.

**COND, bits [23:20]**

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is **IMPLEMENTATION DEFINED** whether:
  - CV is set to 0 and COND is set to an **UNKNOWN** value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is **IMPLEMENTATION DEFINED** whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally **UNKNOWN** value.

**imm8, bits [19:12]**

The immediate value from the issued instruction.

This field resets to an architecturally **UNKNOWN** value.

**Bits [11:10]**

Reserved, RES0.
Rn, bits [9:5]

The Rn value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See ‘Mapping of the general-purpose registers between the Execution states’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

Offset, bit [4]

Indicates whether the offset is added or subtracted:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Subtract offset.</td>
</tr>
<tr>
<td>0b1</td>
<td>Add offset.</td>
</tr>
</tbody>
</table>

This bit corresponds to the U bit in the instruction encoding.

This field resets to an architecturally UNKNOWN value.

AM, bits [3:1]

Addressing mode. The permitted values of this field are:

<table>
<thead>
<tr>
<th>AM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Immediate unindexed.</td>
</tr>
<tr>
<td>0b001</td>
<td>Immediate post-indexed.</td>
</tr>
<tr>
<td>0b010</td>
<td>Immediate offset.</td>
</tr>
<tr>
<td>0b011</td>
<td>Immediate pre-indexed.</td>
</tr>
<tr>
<td>0b100</td>
<td>For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.</td>
</tr>
<tr>
<td>0b110</td>
<td>For a trapped STC instruction, this encoding is reserved.</td>
</tr>
</tbody>
</table>

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in ‘Reserved values in System and memory-mapped registers and translation table entries’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

This field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Write to memory. STC instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read from memory. LDC instruction.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000110:

- MDSCR_EL1.TDCC, for accesses using AArch32 state, LDC access to DBGDTRTXint or STC access to DBGDTRRXint trapped to EL1 or EL2.
- MDSCR_EL2.TDA, for accesses using AArch32 state, LDC access to DBGDTRTXint or STC access to DBGDTRRXint MCR or MRC access trapped to EL2.
- MDSCR_EL3.TDA, for accesses using AArch32 state, LDC access to DBGDTRTXint or STC access to DBGDTRRXint MCR or MRC access trapped to EL3.
If ARMv8.6-FGT is implemented, MDCR_EL2.TDCC and MDCR_EL3.TDCC, for accesses to the DCC registers at EL0 and EL1, trapped to EL2.

### ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from CPACR_EL1.FPEN, CPTR_EL2.FPEN or CPTR_ELx.TFP

<table>
<thead>
<tr>
<th>CV</th>
<th>COND</th>
<th>RES0</th>
</tr>
</thead>
<tbody>
<tr>
<td>24</td>
<td>23</td>
<td>22</td>
</tr>
</tbody>
</table>

The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SIMD and floating-point System registers.

For an implementation that does not include either SVE or support for floating-point and Advanced SIMD, the exception is reported using the EC value 0b000000.

#### CV, bit [24]

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

#### COND, bits [23:20]

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.
Bits [19:0]

Reserved, RES0.

The following sections describe the configuration settings for the traps that are reported using EC value 0b000111:

- **CPACR_EL1.FPEN**, for accesses to SIMD and floating-point registers trapped to EL1.
- **CPTR_EL2.TFP**, for accesses to SIMD and floating-point registers trapped to EL2.
- **CPTR_EL3.TFP**, for accesses to SIMD and floating-point registers trapped to EL3.

**ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ**

<table>

Bits [24:0]

When SVE is implemented:

Reserved, RES0.

Otherwise:

Reserved, RES0.

The accesses covered by this trap include:

- Execution of SVE instructions.
- Accesses to the SVE system registers, ZCR_ELx and ID_AA64ZFR0_EL1.

For an implementation that does not include SVE, the exception is reported using the EC value 0b000000.

**ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault**

<td></td>
<td></td>
<td></td>
<td>imm16</td>
</tr>
</tbody>
</table>

Page 518
Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For A64 instructions, see ‘SVC’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile and ‘HVC’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

If ARMv8.6-FGT is implemented, HFGITR_EL2.{SVC_EL1, SVC_EL0} control fine-grained traps on SVC execution.

ISS encoding for an exception from SMC instruction execution in AArch32 state

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| CV | COND | CCKNOWNPASS | RES0 |

For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is RES0.

For an SMC instruction that is trapped to EL2 from EL1 because HCR_EL2.TSC is 1, the ISS encoding is as shown in the diagram.

CV, bit [24]

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is only valid if CCKNOWNPASS is 1, otherwise it is RES0.

This field resets to an architecturally UNKNOWN value.
**COND, bits [23:20]**

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is only valid if CCKNOWPASS is 1, otherwise it is RES0.

This field resets to an architecturally UNKNOWN value.

**CCKNOWPASS, bit [19]**

Indicates whether the instruction might have failed its condition code check.

<table>
<thead>
<tr>
<th>CCKNOWPASS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The instruction was unconditional, or was conditional and passed its condition code check.</td>
</tr>
<tr>
<td>0b1</td>
<td>The instruction was conditional, and might have failed its condition code check.</td>
</tr>
</tbody>
</table>

**Note**

In an implementation in which an SMC instruction that fails it code check is not trapped, this field can always return the value 0.

This field resets to an architecturally UNKNOWN value.

**Bits [18:0]**

Reserved, RES0.

HCR_EL2.TSC describes the configuration settings for trapping SMC instructions to EL2.

See ‘System calls’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile describes the case where these exceptions are trapped to EL3.

**ISS encoding for an exception from SMC instruction execution in AArch64 state**

```
  24 23 22 21 20 19 18 17 16 15 14 13 12 11 10  9  8  7  6  5  4  3  2  1  0
  |RES0|imm16|
```

Page 520
Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the issued SMC instruction.

This field resets to an architecturally **UNKNOWN** value.

The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

HCR_EL2.TSC describes the configuration settings for trapping SMC from EL1 modes.

‘System calls' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile describes the case where these exceptions are trapped to EL3.

ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state

</table>

Bits [24:22]

Reserved, RES0.

Op0, bits [21:20]

The Op0 value from the issued instruction.

This field resets to an architecturally **UNKNOWN** value.

Op2, bits [19:17]

The Op2 value from the issued instruction.

This field resets to an architecturally **UNKNOWN** value.

Op1, bits [16:14]

The Op1 value from the issued instruction.

This field resets to an architecturally **UNKNOWN** value.

CRn, bits [13:10]

The CRn value from the issued instruction.

This field resets to an architecturally **UNKNOWN** value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

This field resets to an architecturally **UNKNOWN** value.
**CRm, bits [4:1]**

The CRm value from the issued instruction.

This field resets to an architecturally **UNKNOWN** value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Write access, including MSR instructions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read access, including MRS instructions.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

For exceptions caused by System instructions, see 'System' subsection of 'Branches, exception generating and System instructions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile for the encoding values returned by an instruction.

The following fields describe configuration settings for generating the exception that is reported using EC value 0b011000:

- **SCTLR_EL1.UCI**, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **SCTLR_EL1.UCT**, for accesses to **CTR_EL0** using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **SCTLR_EL1.DZE**, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **SCTLR_EL1.UMA**, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **CPACR_EL1.TTA**, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **MDSCR_EL1.TDCC**, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- If ARMv8.6-FGT is implemented, **MDCR_EL2.TDCC** and **MDCR_EL3.TDCC**, for accesses to the DCC registers at EL0 and EL1, trapped to EL2.
- **CNTKCTL_EL1.{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}** accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **PMUSERENR_EL0.{ER, CR, SW, EN}**, for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **AMUSERENR_EL0.EN**, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **HCR_EL2.{TRVM, TVM}**, for accesses to virtual memory control registers using AArch64 state, MSR or MRS access trapped to EL2.
- **HCR_EL2.TDZ**, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL2.
- **HCR_EL2.TTLB**, for execution of TLB maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- **HCR_EL2.TACP**, for accesses to **CPACR_EL1**, using AArch64 state, MSR or MRS access trapped to EL2.
- **CPTR_EL2.TTCP**, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL2.
- **MDCR_EL2.TTRF**, for accesses to the trace filter register, **TRFCR_EL1**, using AArch64 state, MSR or MRS access trapped to EL2.
- **MDCR_EL2.TDRA**, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.
- **MDCR_EL2.TDOSA**, for accesses to powerdown debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- **CNTKCTL_EL2.{EL1PCEN, EL1PCTEN}**, for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.
• **MDCR_EL2.TDA**, for accesses to debug registers using AArch64 state, MSR or MRS access trapped to EL2.

• **MDCR_EL2. (TPM, TPMCR)**, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL2.

• **CPRTR_EL2.TAM**, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.

• **HCR_EL2.APK**, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL2.

• **HCR_EL2. (NV, NV1)**, for Nested virtualization register access, using AArch64 state, MSR or MRS access trapped to EL2.

• **HCR_EL2.AT**, for execution of AT S1E* instructions, using AArch64 state, MSR or MRS access trapped to EL2.

• **HCR_EL2. (TERR, FIEN)**, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL2.

• **SCR_EL3.APK**, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL3.

• **SCR_EL3.ST**, for accesses to the Counter-timer Physical Secure timer registers, using AArch64 state, MSR or MRS access trapped to EL3.

• **SCR_EL3. (TERR, FIEN)**, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL3.

• **CRTR_EL3.TCPAC**, for accesses to **CPRTR_EL2** and **CPACR_EL1** using AArch64 state, MSR or MRS access trapped to EL3.

• **CRTR_EL3.TTA**, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL3.

• **MDCR_EL3.TTRF**, for accesses to the filter trace control registers, **TRFCR_EL1** and **TRFCR_EL2**, using AArch64 state, MSR or MRS access trapped to EL3.

• **MDCR_EL3.TDA**, for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.

• **MDCR_EL3.TDOSA**, for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.

• **MDCR_EL3.TPM**, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.

• **CPRTR_EL3.TAM**, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL3.

• If ARMv8.2-EVT is implemented, **HCR_EL2. (TTLBOS, TTLBIS, TICAB, TOCU, TID4)** and **HCR2. (TTLBIS, TICAB, TOCU, TID4)** control traps for EL1 and EL0 Cache controls that use this EC value.

• If ARMv8.6-FGT is implemented:
  - **SCR_EL3.FGTEn**, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
  - **HFGTR_EL2** for reads and **HFGWTR_EL2** for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
  - **HFGITR_EL2** for execution of system instructions, MSR or MRS access trapped to EL2.
  - **HDFGTR_EL2** for reads and **HDFGWTR_EL2** for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
  - **HAFGRTR_EL2** for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.

### ISS encoding for an IMPLEMENTATION DEFINED exception to EL3

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---
Bits [24:13]
Reserved, RES0.

SET, bits [12:11]
Synchronous Error Type. When the RAS Extension is implemented and IFSC is \texttt{0b010000}, describes the state of the PE after taking the Instruction Abort exception. The possible values of this field are:

<table>
<thead>
<tr>
<th>SET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b00}</td>
<td>Recoverable error (UER).</td>
</tr>
<tr>
<td>\texttt{0b10}</td>
<td>Uncontainable error (UC).</td>
</tr>
<tr>
<td>\texttt{0b11}</td>
<td>Restartable error (UEO) or Corrected error (CE).</td>
</tr>
</tbody>
</table>

All other values are reserved.

Note
Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in an unrecoverable PE state.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the IFSC field is not \texttt{0b010000}.

This field resets to an architecturally UNKNOWN value.

FnV, bit [10]
FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<table>
<thead>
<tr>
<th>FnV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0}</td>
<td>FAR is valid.</td>
</tr>
<tr>
<td>\texttt{0b1}</td>
<td>FAR is not valid, and holds an UNKNOWN value.</td>
</tr>
</tbody>
</table>

This field is only valid if the IFSC code is \texttt{0b010000}. It is RES0 for all other aborts.

This field resets to an architecturally UNKNOWN value.

EA, bit [9]
External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field resets to an architecturally UNKNOWN value.

Bit [8]
Reserved, RES0.

S1PTW, bit [7]
For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

<table>
<thead>
<tr>
<th>S1PTW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0}</td>
<td>Fault not on a stage 2 translation for a stage 1 translation table walk.</td>
</tr>
<tr>
<td>\texttt{0b1}</td>
<td>Fault on the stage 2 translation of an access for a stage 1 translation table walk.</td>
</tr>
</tbody>
</table>
For any abort other than a stage 2 fault this bit is RES0. This field resets to an architecturally UNKNOWN value.

**Bit [6]**

Reserved, RES0.

**IFSC, bits [5:0]**

Instruction Fault Status Code. Possible values of this field are:

<table>
<thead>
<tr>
<th>IFSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>Address size fault, level 0 of translation or translation table base register</td>
</tr>
<tr>
<td>0b000001</td>
<td>Address size fault, level 1</td>
</tr>
<tr>
<td>0b000010</td>
<td>Address size fault, level 2</td>
</tr>
<tr>
<td>0b000011</td>
<td>Address size fault, level 3</td>
</tr>
<tr>
<td>0b000100</td>
<td>Translation fault, level 0</td>
</tr>
<tr>
<td>0b000101</td>
<td>Translation fault, level 1</td>
</tr>
<tr>
<td>0b000110</td>
<td>Translation fault, level 2</td>
</tr>
<tr>
<td>0b000111</td>
<td>Translation fault, level 3</td>
</tr>
<tr>
<td>0b001001</td>
<td>Access flag fault, level 1</td>
</tr>
<tr>
<td>0b001010</td>
<td>Access flag fault, level 2</td>
</tr>
<tr>
<td>0b001110</td>
<td>Access flag fault, level 3</td>
</tr>
<tr>
<td>0b001111</td>
<td>Access flag fault, level 3</td>
</tr>
<tr>
<td>0b010000</td>
<td>Synchronous External abort, not on translation table walk</td>
</tr>
<tr>
<td>0b010100</td>
<td>Synchronous External abort, on translation table walk, level 0</td>
</tr>
<tr>
<td>0b010101</td>
<td>Synchronous External abort, on translation table walk, level 1</td>
</tr>
<tr>
<td>0b010110</td>
<td>Synchronous External abort, on translation table walk, level 2</td>
</tr>
<tr>
<td>0b010111</td>
<td>Synchronous External abort, on translation table walk, level 3</td>
</tr>
<tr>
<td>0b011000</td>
<td>Synchronous parity or ECC error on memory access, not on translation table walk</td>
</tr>
<tr>
<td>0b011100</td>
<td>Synchronous parity or ECC error on memory access on translation table walk, level 0</td>
</tr>
<tr>
<td>0b011101</td>
<td>Synchronous parity or ECC error on memory access on translation table walk, level 1</td>
</tr>
<tr>
<td>0b011110</td>
<td>Synchronous parity or ECC error on memory access on translation table walk, level 2</td>
</tr>
<tr>
<td>0b011111</td>
<td>Synchronous parity or ECC error on memory access on translation table walk, level 3</td>
</tr>
<tr>
<td>0b110000</td>
<td>TLB conflict abort</td>
</tr>
<tr>
<td>0b110001</td>
<td>Unsupported atomic hardware update fault, if the implementation includes ARMv8.1-TTHM]. Otherwise reserved.</td>
</tr>
</tbody>
</table>

All other values are reserved.

When the RAS Extension is implemented, 0b011000, 0b011100, 0b011101, 0b011110, and 0b011111, are reserved.

**Note**

Armv8.2 requires the implementation of the RAS Extension.

For more information about the lookup level associated with a fault, see ‘The level associated with MMU faults’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Note**
Because Access flag faults and Permission faults can only result from a Block or Page translation table descriptor; they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

This field resets to an architecturally UNKNOWN value.

**ISS encoding for an exception from a Data Abort**

<table>
<thead>
<tr>
<th>ISV</th>
<th>SAS</th>
<th>SSE</th>
<th>SRT</th>
<th>SF</th>
<th>AR</th>
<th>VNCR</th>
<th>SET</th>
<th>FnV</th>
<th>EA</th>
<th>CM</th>
<th>S1PTW</th>
<th>WnR</th>
<th>DFSC</th>
</tr>
</thead>
</table>

**ISV, bit [24]**

Instruction syndrome valid. Indicates whether the syndrome information in ISS[23:14] is valid.

<table>
<thead>
<tr>
<th>ISV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No valid instruction syndrome. ISS[23:14] are RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>ISS[23:14] hold a valid instruction syndrome.</td>
</tr>
</tbody>
</table>

This bit is 0 for all faults reported in ESR_EL2 except the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b11111, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback.
- AArch32 instructions where the instruction:
  - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
  - Is not performing register writeback.
  - Is not using R15 as a source or destination register.

For these cases, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

ISV is 0 for all faults reported in ESR_EL1 or ESR_EL3.

When the RAS Extension is implemented, ISV is 0 for any synchronous External abort.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When the RAS Extension is not implemented, the value of ISV on a synchronous External abort on a stage 2 translation table walk is IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

**SAS, bits [23:22]**

Syndrome Access Size. When ISV is 1, indicates the size of the access attempted by the faulting operation.

<table>
<thead>
<tr>
<th>SAS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Byte</td>
</tr>
<tr>
<td>0b01</td>
<td>Halfword</td>
</tr>
<tr>
<td>0b10</td>
<td>Word</td>
</tr>
<tr>
<td>0b11</td>
<td>Doubleword</td>
</tr>
</tbody>
</table>

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.
SSE, bit [21]

Syndrome Sign Extend. When ISV is 1, for a byte, halfword, or word load operation, indicates whether the data item must be sign extended. For these cases, the possible values of this bit are:

<table>
<thead>
<tr>
<th>SSE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sign-extension not required.</td>
</tr>
<tr>
<td>0b1</td>
<td>Data item must be sign-extended.</td>
</tr>
</tbody>
</table>

For all other operations this bit is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

SRT, bits [20:16]

Syndrome Register transfer. When ISV is 1, the register number of the Rt operand of the faulting instruction. If the exception was taken from an Exception level that is using AArch32 then this is the AArch64 view of the register. See ‘Mapping of the general-purpose registers between the Execution states’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

SF, bit [15]

Width of the register accessed by the instruction is Sixty-Four. When ISV is 1, the possible values of this bit are:

<table>
<thead>
<tr>
<th>SF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Instruction loads/stores a 32-bit wide register.</td>
</tr>
<tr>
<td>0b1</td>
<td>Instruction loads/stores a 64-bit wide register.</td>
</tr>
</tbody>
</table>

Note

This field specifies the register width identified by the instruction, not the Execution state.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

AR, bit [14]

Acquire/Release. When ISV is 1, the possible values of this bit are:

<table>
<thead>
<tr>
<th>AR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Instruction did not have acquire/release semantics.</td>
</tr>
<tr>
<td>0b1</td>
<td>Instruction did have acquire/release semantics.</td>
</tr>
</tbody>
</table>

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

VNCR, bit [13]
**When ARMv8.4-NV is implemented:**

Indicates that the fault came from use of VNCR_EL2 register by EL1 code.

<table>
<thead>
<tr>
<th>VNCR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The fault was not generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The fault was generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.</td>
</tr>
</tbody>
</table>

This field is 0 in ESR_EL1.

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SET, bits [12:11]**

Synchronous Error Type. When the RAS Extension is implemented and DFSC is 0b010000, describes the state of the PE after taking the Data Abort exception. The possible values of this field are:

<table>
<thead>
<tr>
<th>SET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Recoverable error (UER).</td>
</tr>
<tr>
<td>0b10</td>
<td>Uncontainable error (UC).</td>
</tr>
<tr>
<td>0b11</td>
<td>Restartable error (UEO) or Corrected error (CE).</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Note**

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in an unrecoverable PE state.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the DFSC field is not 0b010000.

This field resets to an architecturally UNKNOWN value.

**FnV, bit [10]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<table>
<thead>
<tr>
<th>FnV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FAR is valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>FAR is not valid, and holds an UNKNOWN value.</td>
</tr>
</tbody>
</table>

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

This field resets to an architecturally UNKNOWN value.

**EA, bit [9]**

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field resets to an architecturally UNKNOWN value.
**CM, bit [8]**

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

<table>
<thead>
<tr>
<th>CM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DCZVA instruction is not classified as a cache maintenance instruction, and therefore its execution cannot cause this field to be set to 1.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**S1PTW, bit [7]**

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

<table>
<thead>
<tr>
<th>S1PTW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault not on a stage 2 translation for a stage 1 translation table walk.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault on the stage 2 translation of an access for a stage 1 translation table walk.</td>
</tr>
</tbody>
</table>

For any abort other than a stage 2 fault this bit is **RES0**.

This field resets to an architecturally **UNKNOWN** value.

**WnR, bit [6]**

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location. The possible values of this bit are:

<table>
<thead>
<tr>
<th>WnR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Abort caused by an instruction reading from a memory location.</td>
</tr>
<tr>
<td>0b1</td>
<td>Abort caused by an instruction writing to a memory location.</td>
</tr>
</tbody>
</table>

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is **UNKNOWN** for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

This field resets to an architecturally **UNKNOWN** value.

**DFSC, bits [5:0]**

Data Fault Status Code. Possible values of this field are:
<table>
<thead>
<tr>
<th>DFSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>Address size fault, level 0 of translation or translation table base register.</td>
</tr>
<tr>
<td>0b000001</td>
<td>Address size fault, level 1.</td>
</tr>
<tr>
<td>0b000010</td>
<td>Address size fault, level 2.</td>
</tr>
<tr>
<td>0b000011</td>
<td>Address size fault, level 3.</td>
</tr>
<tr>
<td>0b000100</td>
<td>Translation fault, level 0.</td>
</tr>
<tr>
<td>0b000101</td>
<td>Translation fault, level 1.</td>
</tr>
<tr>
<td>0b000110</td>
<td>Translation fault, level 2.</td>
</tr>
<tr>
<td>0b000111</td>
<td>Translation fault, level 3.</td>
</tr>
<tr>
<td>0b001000</td>
<td>Access flag fault, level 1.</td>
</tr>
<tr>
<td>0b001001</td>
<td>Access flag fault, level 2.</td>
</tr>
<tr>
<td>0b001010</td>
<td>Access flag fault, level 3.</td>
</tr>
<tr>
<td>0b001011</td>
<td>Permission fault, level 1.</td>
</tr>
<tr>
<td>0b001100</td>
<td>Permission fault, level 2.</td>
</tr>
<tr>
<td>0b001101</td>
<td>Permission fault, level 3.</td>
</tr>
<tr>
<td>0b001110</td>
<td>Synchronous External abort, not on translation table walk.</td>
</tr>
<tr>
<td>0b001111</td>
<td>Synchronous Tag Check fail</td>
</tr>
<tr>
<td>0b001110</td>
<td>Synchronous External abort, on translation table walk, level 0.</td>
</tr>
<tr>
<td>0b001111</td>
<td>Synchronous External abort, on translation table walk, level 1.</td>
</tr>
<tr>
<td>0b010100</td>
<td>Synchronous External abort, on translation table walk, level 2.</td>
</tr>
<tr>
<td>0b010110</td>
<td>Synchronous External abort, on translation table walk, level 3.</td>
</tr>
<tr>
<td>0b011000</td>
<td>Synchronous parity or ECC error on memory access, not on translation table walk.</td>
</tr>
<tr>
<td>0b011001</td>
<td>Synchronous parity or ECC error on memory access on translation table walk, level 0.</td>
</tr>
<tr>
<td>0b011011</td>
<td>Synchronous parity or ECC error on memory access on translation table walk, level 1.</td>
</tr>
<tr>
<td>0b011110</td>
<td>Synchronous parity or ECC error on memory access on translation table walk, level 2.</td>
</tr>
<tr>
<td>0b011111</td>
<td>Synchronous parity or ECC error on memory access on translation table walk, level 3.</td>
</tr>
<tr>
<td>0b100001</td>
<td>Alignment fault.</td>
</tr>
<tr>
<td>0b110000</td>
<td>TLB conflict abort.</td>
</tr>
<tr>
<td>0b110001</td>
<td>Unsupported atomic hardware update fault, if the implementation includes ARMv8.1-TTHM]. Otherwise reserved.</td>
</tr>
<tr>
<td>0b110100</td>
<td>IMPLEMENTATION DEFINED fault (Lockdown).</td>
</tr>
<tr>
<td>0b110101</td>
<td>IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).</td>
</tr>
<tr>
<td>0b111010</td>
<td>Section Domain Fault, used only for faults reported in the PAR_EL1.</td>
</tr>
<tr>
<td>0b111110</td>
<td>Page Domain Fault, used only for faults reported in the PAR_EL1.</td>
</tr>
</tbody>
</table>

All other values are reserved.

When the RAS Extension is implemented, 0b011000, 0b011100, 0b011101, 0b011110, and 0b011111, are reserved.

For more information about the lookup level associated with a fault, see ‘The level associated with MMU faults‘ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Note**

Because Access flag faults and Permission faults can only result from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

This field resets to an architecturally UNKNOWN value.
ISS encoding for an exception from a trapped floating-point exception

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>[24]</td>
<td>Reserved, RES0.</td>

<tr>
<td>0b0</td>
<td>Input denormal floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Input denormal floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.
Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>IXF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Inexact floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Inexact floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

UFF, bit [3]

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>UFF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Underflow floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Underflow floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

OFF, bit [2]

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>OFF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Overflow floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Overflow floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

DZF, bit [1]

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>DZF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Divide by Zero floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Divide by Zero floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

IOF, bit [0]

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>IOF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Invalid Operation floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Invalid Operation floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.
In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the FPCR, `{IDE, IXE, UFE, OFE, DZE, IOE}` bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the FPSCR, `{IDE, IXE, UFE, OFE, DZE, IOE}` bits enable each of the floating-point exception traps.

**ISS encoding for an SError interrupt**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| IDS | RES0 | IESB | AET | EA | RES0 | DFSC |

**IDS, bit [24]**

IMPLEMENTATION DEFINED syndrome. Possible values of this bit are:

<table>
<thead>
<tr>
<th>IDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bits[23:0] of the ISS field holds the fields described in this encoding.</td>
</tr>
</tbody>
</table>

**Note**

If the RAS Extension is not implemented, this means that bits[23:0] of the ISS field are RES0.

<table>
<thead>
<tr>
<th>IDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>Bits[23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError interrupt.</td>
</tr>
</tbody>
</table>

**Note**

This field was previously called ISV.

This field resets to an architecturally UNKNOWN value.

**Bits [23:14]**

Reserved, RES0.

**IESB, bit [13]**

When ARMv8.2-IESB is implemented:

Implicit error synchronization event.

<table>
<thead>
<tr>
<th>IESB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The SError interrupt was either not synchronized by the implicit error synchronization event or not taken immediately.</td>
</tr>
<tr>
<td>0b1</td>
<td>The SError interrupt was synchronized by the implicit error synchronization event and taken immediately.</td>
</tr>
</tbody>
</table>

This field is RES0 if the value returned in the DFSC field is not 0b010001.

**Note**

Armv8.2 requires the implementation of the RAS Extension and ARMv8.2-IESB.

This field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**AET, bits [12:10]**

Asynchronous Error Type.

When the RAS Extension is implemented and DFSC is 0b010001, describes the state of the PE after taking the SError interrupt exception. The possible values of this field are:

<table>
<thead>
<tr>
<th>AET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Uncontainable error (UC).</td>
</tr>
<tr>
<td>0b001</td>
<td>Unrecoverable error (UEU).</td>
</tr>
<tr>
<td>0b010</td>
<td>Restartable error (UEO).</td>
</tr>
<tr>
<td>0b011</td>
<td>Recoverable error (UER).</td>
</tr>
<tr>
<td>0b110</td>
<td>Corrected error (CE).</td>
</tr>
</tbody>
</table>

All other values are reserved.

If multiple errors are taken as a single SError interrupt exception, the overall state of the PE is reported. For example, if both a Recoverable and Unrecoverable error occurred, the state is Unrecoverable.

**Note**

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the DFSC field is not 0b010001.

**Note**

Armv8.2 requires the implementation of the RAS Extension.

This field resets to an architecturally UNKNOWN value.

**EA, bit [9]**

External abort type. When the RAS Extension is implemented, this bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the DFSC field is not 0b010001.

**Note**

Armv8.2 requires the implementation of the RAS Extension.

This field resets to an architecturally UNKNOWN value.

**Bits [8:6]**

Reserved, RES0.
**DFSC, bits [5:0]**

Data Fault Status Code. When the RAS Extension is implemented, possible values of this field are:

<table>
<thead>
<tr>
<th>DFSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>Uncategorized.</td>
</tr>
<tr>
<td>0b010001</td>
<td>Asynchronous SError interrupt.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If the RAS Extension is not implemented, this field is RES0.

---

**Note**

Armv8.2 requires the implementation of the RAS Extension.

This field resets to an architecturally UNKNOWN value.

---

**ISS encoding for an exception from a Breakpoint or Vector Catch debug exception**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | IFSC |

**Bits [24:6]**

Reserved, RES0.

**IFSC, bits [5:0]**

Instruction Fault Status Code. This field is set to 0b100010, to indicate a Debug exception.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions:

- For exceptions from AArch64, see 'Breakpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

---

**ISS encoding for an exception from a Software Step exception**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ISV | RES0 | EX  | IFSC |

**ISV, bit [24]**

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:

<table>
<thead>
<tr>
<th>ISV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EX bit is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>EX bit is valid.</td>
</tr>
</tbody>
</table>

See the EX bit description for more information.

This field resets to an architecturally UNKNOWN value.
Bits [23:7]
Reserved, RES0.

EX, bit [6]
Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

<table>
<thead>
<tr>
<th>EX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An instruction other than a Load-Exclusive instruction was stepped.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Load-Exclusive instruction was stepped.</td>
</tr>
</tbody>
</table>

If the ISV bit is set to 0, this bit is RES0, indicating no syndrome data is available.

This field resets to an architecturally UNKNOWN value.

IFSC, bits [5:0]
Instruction Fault Status Code. This field is set to 0b100010, to indicate a Debug exception.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see ‘Software Step exceptions’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile..

ISS encoding for an exception from a Watchpoint exception

<table>
<thead>
<tr>
<th>24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0     VNCR</td>
</tr>
</tbody>
</table>

Bits [24:14]
Reserved, RES0.

VNCR, bit [13]
When ARMv8.4-NV is implemented:

Indicates that the watchpoint came from use of VNCR_EL2 register by EL1 code.

<table>
<thead>
<tr>
<th>VNCR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The watchpoint was not generated by the use of VNCR_EL2 by EL1 code.</td>
</tr>
<tr>
<td>0b1</td>
<td>The watchpoint was generated by the use of VNCR_EL2 by EL1 code.</td>
</tr>
</tbody>
</table>

This field is 0 in ESR_EL1.

This field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

Bits [12:9]
Reserved, RES0.
CM, bit [8]

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance or address translation instruction:

<table>
<thead>
<tr>
<th>CM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Watchpoint exception was not generated by the execution of one of the System instructions identified in the description of value 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Watchpoint exception was generated by either the execution of a cache maintenance instruction or by a synchronous Watchpoint exception on the execution of an address translation instruction. The DC ZVA instruction is not classified as a cache maintenance instruction, and therefore its execution cannot cause this field to be set to 1.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

WnR, bit [6]

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location. The possible values of this bit are:

<table>
<thead>
<tr>
<th>WnR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Watchpoint exception caused by an instruction reading from a memory location.</td>
</tr>
<tr>
<td>0b1</td>
<td>Watchpoint exception caused by an instruction writing to a memory location.</td>
</tr>
</tbody>
</table>

For Watchpoint exceptions on cache maintenance and address translation instructions, this bit always returns a value of 1.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is UNPREDICTABLE which watchpoint generates the Watchpoint exception.

This field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code. This field is set to 0b100010, to indicate a Debug exception.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Watchpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

ISS encoding for an exception from execution of a Breakpoint instruction

<table>
<thead>

<td></td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

Reserved, RES0.
Comment, bits [15:0]

Set to the instruction comment field value, zero extended as necessary. For the AArch32 BKPT instructions, the comment field is described as the immediate field.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see ‘Breakpoint instruction exceptions’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

ISS encoding for an exception from ERET, ERETTAA or ERETAB instruction

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | ERETERETA |

This EC value applies when ARMv8.6-FGT is implemented, or when HCR_EL2.NV is 1.

Bits [24:2]

Reserved, RES0.

ERET, bit [1]

Indicates whether an ERET or ERETA* instruction was trapped to EL2. Possible values are:

<table>
<thead>
<tr>
<th>ERET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERET instruction trapped to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>ERETTAA or ERETAB instruction trapped to EL2.</td>
</tr>
</tbody>
</table>

If this bit is 0, the ERETA field is RES0.

This field resets to an architecturally UNKNOWN value.

EREETA, bit [0]

Indicates whether an ERETTAA or ERETAB instruction was trapped to EL2. Possible values are:

<table>
<thead>
<tr>
<th>ERETTAA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERETTAA instruction trapped to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>ERETAB instruction trapped to EL2.</td>
</tr>
</tbody>
</table>

When the ERET field is 0, this bit is RES0.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see HCR_EL2.NV.

If ARMv8.6-FGT is implemented, HFGITR_EL2.ERET controls fine-grained trap exceptions from ERET, ERETTAA and ERETAB execution.

ISS encoding for an exception from a TSTART instruction

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | Rd | RES0 |

Bits [24:10]

Reserved, RES0.

Rd, bits [9:5]

The Rd value from the issued instruction, the general purpose register used for the destination.
Bits [4:0]

Reserved, RES0.

ISS encoding for an exception from Branch Target Identification instruction

Bits [24:2]

Reserved, RES0.

Bit [1], bit [1]

This field indicates whether the exception is as a result of an Instruction key or a Data key.

<table>
<thead>
<tr>
<th>Bit [1]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Instruction Key.</td>
</tr>
<tr>
<td>0b1</td>
<td>Data Key.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.
Bit [0], bit [0]

This field indicates whether the exception is as a result of an A key or a B key.

<table>
<thead>
<tr>
<th>Bit [0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A key</td>
</tr>
<tr>
<td>0b1</td>
<td>B key</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

The following instructions generate an exception when the Pointer Authentication Code (PAC) is incorrect:

- AUTIASP, AUTIAZ, AUTIA1716.
- AUTIBSP, AUTIBZ, AUTIB1716.
- AUTIA, AUTDA, AUTIB, AUTDB.
- AUTIZA, AUTIZB, AUTDZA, AUTDZB.

It is **IMPLEMENTATION DEFINED** whether the following instructions generate an exception directly from the authorization failure, rather than changing the address in a way that will generate a translation fault when the address is accessed:

- RETAA, RETAB.
- BRAA, BRAB, BLRAA, BLRAB.
- BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETA, ERETAB.
- LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

**Accessing the ESR_EL2**

When **HCR_EL2.E2H** is 1, without explicit synchronization, access from EL2 using the mnemonic ESR_EL2 or ESR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

**MRS <Xt>, ESR_EL2**

```
<table>
<thead>
<tr>
<th>op0</th>

    ESR_EL2 = X[t];
  else
    ESR_EL1 = X[t];
elsif PSTATE.EL == EL3 then
  ESR_EL1 = X[t];
ESR_EL3, Exception Syndrome Register (EL3)

The ESR_EL3 characteristics are:

**Purpose**

Holds syndrome information for an exception taken to EL3.

**Configuration**

This register is present only when HaveEL(EL3). Otherwise, direct accesses to ESR_EL3 are **UNDEFINED**.

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

ESR_EL3 is a 64-bit register.

**Field descriptions**

The ESR_EL3 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 |

When an **UNPREDICTABLE** instruction is treated as **UNDEFINED**, and the exception is taken to EL3, the value of ESR_EL3 is **UNKNOWN**. The value written to ESR_EL3 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not **UNPREDICTABLE** at that Exception level, in order to avoid the possibility of a privilege violation.

**Bits [63:32]**

Reserved, RES0.

**EC, bits [31:26]**

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.

Possible values of the EC field are:
<table>

</tbody>
</table>
architecture profile, section D1.10.4.

0b001001 Trapped use of a Pointer authentication instruction because HCR_EL2.API == 0 || SCR_EL3.API == 0.

ISS encoding for an exception from a Pointer Authentication instruction when HCR_EL2.API == 0 || SCR_EL3.API == 0.

When ARMv8.3-PAuth is implemented

0b001100 Trapped MRRC access with (coproc==0b1110).

ISS encoding for an exception from an MCRR or MRRC access.

When ARMv8.5-BTI is implemented

0b001101 Branch Target Exception.

ISS encoding for an exception from Branch Target Identification instruction.

0b001110 Illegal Execution state.

ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault.

0b010011 SMC instruction execution in AArch32 state, when SMC is not disabled. This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TSC is 1.

ISS encoding for an exception from SMC instruction execution in AArch32 state.

0b010101 SVC instruction execution in AArch64 state.

ISS encoding for an exception from HVC or SVC instruction execution.

0b010110 HVC instruction execution in AArch64 state, when HVC is not disabled.

ISS encoding for an exception from HVC or SVC instruction execution.

0b010111 SMC instruction execution in AArch64 state, when SMC is not disabled. This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TSC is 1.

ISS encoding for an exception from SMC instruction execution in AArch64 state.

0b011000 Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC 0b000000, 0b000001 or 0b000111.

If ARMv8.4-IDST is implemented, also exceptions generated by a read access to the feature ID space.

ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state.
If ARMv8.0-CSV2 is implemented, also Cache Speculation Variant exceptions. This includes all instructions that cause exceptions that are part of the encoding space defined in 'System instruction class encoding overview' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section C5.2.2, except for those exceptions reported using EC values 0b000000, 0b000001, or 0b000111.

**0b0110001**
Access to SVE functionality trapped as a result of CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ, that is not reported using EC 0b000000. This EC is defined only if SVE is implemented.

**0b011011**
Exception from an access to a TSTART instruction at EL0 when SCTLR_EL1.TME0 == 0, EL0 when SCTLR_EL2.TME0 == 0, at EL1 when SCTLR_EL1.TME == 0, at EL2 when SCTLR_EL2.TME == 0 or at EL3 when SCTLR_EL3.TME == 0.

**0b011100**
Exception from a Pointer Authentication instruction authentication failure

**0b011111**
IMPLEMENTATION DEFINED exception to EL3.

**0b100000**
Instruction Abort from a lower Exception level, that might be using AArch32 or AArch64.

Used for MMU faults generated by instruction accesses

**ISS encoding for an exception from a SVE access**

**ISS encoding for an exception from a TSTART instruction**

**ISS encoding for an exception from a Pointer Authentication instruction authentication failure**

**ISS encoding for an IMPLEMENTATION DEFINED exception to EL3**

**ISS encoding for an Instruction Abort**

When TME is implemented

When ARMv8.3-FPAC is implemented
and synchronous
External aborts, including
synchronous parity
or ECC errors. Not
used for debug
related exceptions.

0b100001  Instruction Abort
taken without a change in Exception
level. Used for MMU faults generated by
instruction accesses and synchronous
External aborts, including
synchronous parity
or ECC errors. Not
used for debug
related exceptions.

0b100010  PC alignment fault exception.

0b100100  Data Abort from a lower Exception
level, that might be using AArch32 or
AArch64. Used for MMU faults generated by
data accesses, alignment faults
other than those caused by Stack
Pointer misalignment, and synchronous
External aborts, including
synchronous parity
or ECC errors. Not
used for debug
related exceptions.

0b100101  Data Abort taken without a change in
Exception level. Used for MMU faults generated by
data accesses, alignment faults
other than those caused by Stack
Pointer misalignment, and synchronous
External aborts, including
synchronous parity
or ECC errors. Not
used for debug
related exceptions.

0b100110  SP alignment fault exception.
Trapped floating-point exception taken from AArch64 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is implementation defined.

0b101111 SError interrupt.

0b111100 BRK instruction execution in AArch64 state. This is reported in ESR_EL3 only if a BRK instruction is executed.

All other EC values are reserved by Arm, and:

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is constrained unpredictable, as described in 'Reserved values in System and memory-mapped registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section K1.1.11.

This field resets to an architecturally unknown value.

**IL, bit [25]**

Instruction Length for synchronous exceptions. Possible values of this bit are:

<table>
<thead>
<tr>
<th>IL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>16-bit instruction trapped.</td>
</tr>
</tbody>
</table>
| 0b1 | 32-bit instruction trapped. This value is also used when the exception is one of the following:  
  - An SError interrupt.  
  - An Instruction Abort exception.  
  - A PC alignment fault exception.  
  - An SP alignment fault exception.  
  - A Data Abort exception for which the value of the ISV bit is 0.  
  - An Illegal Execution state exception.  
  - Any debug exception except for Breakpoint instruction exceptions. For Breakpoint instruction exceptions, this bit has its standard meaning:  
    - 0b0: 16-bit T32 BKPT instruction.  
    - 0b1: 32-bit A32 BKPT instruction or A64 BRK instruction.  
  - An exception reported using EC value 0b000000. |

This field resets to an architecturally unknown value.
ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number. For an exception taken from AArch32 state, 'Mapping of the general-purpose registers between the Execution states' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

If the AArch32 register descriptor is 0b1111, then:

- If the instruction that generated the exception was not UNPREDICTABLE, the field takes the value 0b1111.
- If the instruction that generated the exception was UNPREDICTABLE, the field takes an UNKNOWN value that must be either:
  - The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
  - The value 0b1111.

When the EC field is 0b000000, indicating an exception with an unknown reason, the ISS field is not valid, RES0.

ISS encoding for exceptions with an unknown reason

<table>
<thead>
<tr>
<th>24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>reserv0</td>
</tr>
</tbody>
</table>

Bits [24:0]

Reserved, RES0.

When an exception is reported using this EC code the IL field is set to 1.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or that is not accessible at the current Exception level and Security state, including:
  - A read access using a System register pattern that is not allocated for reads or that does not permit reads at the current Exception level and Security state.
  - A write access using a System register pattern that is not allocated for writes or that does not permit writes at the current Exception level and Security state.
  - Instruction encodings that are unallocated.
  - Instruction encodings for instructions that are not implemented in the implementation.
- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- In AArch32 state, attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the SCTLR_EL1, {ITD, SED, CP15BEN} control bits.
- Attempted execution of:
  - An HVC instruction when disabled by HCR_EL2.HCD or SCR_EL3.HCE.
  - An SMC instruction when disabled by SCR_EL3.SMD.
  - An HLT instruction when disabled by EDSCR.HDE.
- Attempted execution of an MSR or MRS instruction to access SP_EL0 when the value of SPSEL.SP is 0.
- Attempted execution, in Debug state, of:
  - A DCPS1 instruction when the value of HCR_EL2.TGE is 1 and EL2 is disabled or not implemented in the current Security state.
  - A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.
  - A DCPS3 instruction when the value of EDSCR.SDD is 1, or when EL3 is not implemented.
• When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using R13_mon. See 'Traps to EL3 of monitor functionality from Secure EL1 using AArch32' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
• In Debug state when the value of EDSCR.SDD is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.
• In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to SPSR_mon, SP_mon, or LR_mon.
• An exception that is taken to EL2 because the value of HCR_EL2.TGE is 1 that, if the value of HCR_EL2.TGE was 0 would have been reported with an ESR_ELx.EC value of 0b000111.
• When SVE is not implemented, attempted execution of:
  ◦ An SVE instruction.
  ◦ An MSR or MRS instruction to access ZCR_EL1, ZCR_EL2, or ZCR_EL3.
• In Non-transactional state, attempted execution of a TCOMMIT instruction.

**ISS encoding for an exception from a WFI or WFE instruction**

<table>

</tbody>
</table>

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

• When an A32 instruction is trapped, CV is set to 1.
• When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

• When an A32 instruction is trapped, CV is set to 1 and:
  ◦ If the instruction is conditional, COND is set to the condition code field value from the instruction.
  ◦ If the instruction is unconditional, COND is set to 0b1110.
• A conditional A32 instruction that is known to pass its condition code check can be presented either:
  ◦ With COND set to 0b1110, the value for unconditional.
  ◦ With the COND value held in the instruction.
• When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  ◦ CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  ◦ CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
• For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.
**Bits [19:1]**

Reserved, RES0.

**TI, bit [0]**

Trapped instruction. Possible values of this bit are:

<table>
<thead>
<tr>
<th>TI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>WFI trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>WFE trapped.</td>

</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

The following fields describe configuration settings for generating this exception:

- **SCTLR_EL1**: \{nTWE, nTWI\}.
- **HCR_EL2**: \{TWE, TWI\}.
- **SCR_EL3**: \{TWE, TWI\}.

**ISS encoding for an exception from an MCR or MRC access**

```
   24 23 22 21 20 19 18 17 16 15 14 13 12 11 10  9  8  7  6  5  4  3  2  1  0
  CV COND  Opc2  Opc1  CRn  Rt  CRm  Direction
```

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is **IMPLEMENTATION DEFINED** whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally **UNKNOWN** value.

**COND, bits [23:20]**

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is **IMPLEMENTATION DEFINED** whether:
  - CV is set to 0 and COND is set to an **UNKNOWN** value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean
that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

**Opc2, bits [19:17]**

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value 0b0000.

This field resets to an architecturally UNKNOWN value.

**Opc1, bits [16:14]**

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value 0b111.

This field resets to an architecturally UNKNOWN value.

**CRn, bits [13:10]**

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

This field resets to an architecturally UNKNOWN value.

**Rt, bits [9:5]**

The Rt value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

**CRm, bits [4:1]**

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value 0b0000.

This field resets to an architecturally UNKNOWN value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Write to System register space. MCR instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read from System register space. MRC or VMRS instruction.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000011:

- **CNTKCTL_EL1** (EL0PTEN, EL0VTEN, EL0PCTEN, ELOVCTEN), for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **PMUSERENR_EL0** (ER, CR, SW, EN), for accesses to Performance Monitor registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000101:

- **CPACR_EL1.TTA**, for accesses to trace registers, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- **MDCR_EL1.TDCC**, for accesses to the Debug Communications Channel (DCC) registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- If ARMv8.6-FGT is implemented, **MDCR_EL2.TDCC** and **MDCR_EL3.TDCC**, for accesses to the DCC registers at EL0 and EL1, trapped to EL2.
- **HCR_EL2.TID0**, for accesses to the **IIDR** register in the ID group 0 at EL0 and EL1 using AArch32, MRC access (coproc == 0b1111) trapped to EL2.
- **CPTR_EL2.TTA**, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- **MDCR_EL2.TDRA**, for accesses to Debug ROM registers **DBGDRAR** and AArch-DBGDSAR using AArch32, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **MDCR_EL2.TDOSA**, for accesses to powerdown debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- **MDCR_EL2.TDA**, for accesses to other debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- **CPTR_EL3.TTA**, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- **MDCR_EL3.TDOSA**, for accesses to powerdown debug registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.
- **MDCR_EL3.TDA**, for accesses to other debug registers, using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b001000:

- **HCR_EL2.TID0**, for accesses to the **FPSID** register in ID group 0 at EL1 using AArch32 state, VMRS access trapped to EL2.
- **HCR_EL2.TID3**, for accesses to registers in ID group 3 including **MVFR0**, **MVFR1** and **MVFR2**, VMRS access trapped to EL2.

| CV | COND | Opc1 | RES0 | Rt2 | Rt | CRm | Direction |

CV, bit [24]

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

Opc1, bits [19:16]

The Opc1 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.
Rt2, bits [14:10]

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See ‘Mapping of the general-purpose registers between the Execution states’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally **UNKNOWN** value.

Rt, bits [9:5]

The Rt value from the issued instruction, the first general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See ‘Mapping of the general-purpose registers between the Execution states’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally **UNKNOWN** value.

CRm, bits [4:1]

The CRm value from the issued instruction.

This field resets to an architecturally **UNKNOWN** value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Write to System register space. MCRR instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read from System register space. MRRC instruction.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

The following fields describe configuration settings for generating exceptions that are reported using EC value **0b000100**:

- **CNTKCTL_EL1**, {EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **PMUSERENR_EL0**, {CR, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **AMUSERENR_EL0**, {EN}, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **HCR_EL2**, (TRVM, TVM), for accesses to virtual memory control registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **HSTR_EL2**, T<n>, for accesses to System registers using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **CNTHCTL_EL2**, {EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **MDCR_EL2**, (TPM, TPMCR), for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **CPTER_EL2**, TAM, for accesses to Activity Monitors registers registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **HDFGRTR_EL2**, for MRRC access and HDFGWTR_EL2, PMCCNTR_EL0 for MCRR access to PMCCNTR at EL0, trapped to EL2.

The following sections describe configuration settings for generating exceptions that are reported using EC value **0b0001010**:

- **CPACR_EL1**, TTA for accesses to trace registers using MCR or MRC instructions, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
• MDSCR_EL1.TDCC, for accesses to the Debug Communications Channel (DCC) registers DBGDSAR and DBGDRAR at EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
• CPTR_EL2.TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
• MDSCR_EL2.TDRA, for accesses to Debug ROM registers DBGDRAR and AArch-DBGDSAR using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
• CPTR_EL3.TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.
• MDSCR_EL3.TDOSA, for traps to powerdown debug registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.
• MDSCR_EL3.TDA, for accesses to other debug registers, using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.

**ISS encoding for an exception from an LDC or STC instruction**

<table>
<thead>
<tr>
<th>CV</th>
<th>COND</th>
<th>imm8</th>
<th>RES0</th>
<th>Rn</th>
<th>Offset</th>
<th>AM</th>
<th>Direction</th>
</tr>
</thead>
</table>

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

• When an A32 instruction is trapped, CV is set to 1.
• When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

• When an A32 instruction is trapped, CV is set to 1 and:
  ◦ If the instruction is conditional, COND is set to the condition code field value from the instruction.
  ◦ If the instruction is unconditional, COND is set to 0b1110.
• A conditional A32 instruction that is known to pass its condition code check can be presented either:
  ◦ With COND set to 0b1110, the value for unconditional.
  ◦ With the COND value held in the instruction.
• When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  ◦ CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  ◦ CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
• For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.
imm8, bits [19:12]

The immediate value from the issued instruction.

This field resets to an architecturally **UNKNOWN** value.

**Bits [11:10]**

Reserved, **RES0**.

**Rn, bits [9:5]**

The Rn value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is **UNKNOWN**.

This field resets to an architecturally **UNKNOWN** value.

**Offset, bit [4]**

Indicates whether the offset is added or subtracted:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Subtract offset.</td>
</tr>
<tr>
<td>0b1</td>
<td>Add offset.</td>
</tr>
</tbody>
</table>

This bit corresponds to the U bit in the instruction encoding.

This field resets to an architecturally **UNKNOWN** value.

**AM, bits [3:1]**

Addressing mode. The permitted values of this field are:

<table>
<thead>
<tr>
<th>AM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Immediate unindexed.</td>
</tr>
<tr>
<td>0b001</td>
<td>Immediate post-indexed.</td>
</tr>
<tr>
<td>0b010</td>
<td>Immediate offset.</td>
</tr>
<tr>
<td>0b011</td>
<td>Immediate pre-indexed.</td>
</tr>
<tr>
<td>0b100</td>
<td>For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.</td>
</tr>
<tr>
<td>0b110</td>
<td>For a trapped STC instruction, this encoding is reserved.</td>
</tr>
</tbody>
</table>

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is **CONSTRAINED UNPREDICTABLE**, as described in 'Reserved values in System and memory-mapped registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

This field resets to an architecturally **UNKNOWN** value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Write to memory. STC instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read from memory. LDC instruction.</td>
</tr>
</tbody>
</table>
This field resets to an architecturally unknown value.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000110:

- **MDSCR_EL1.TDCC**, for accesses using AArch32 state, LDC access to **DBGDTRTXint** or STC access to **DBGDTRRXint** trapped to EL1 or EL2.
- **MDCR_EL2.TDA**, for accesses using AArch32 state, LDC access to **DBGDTRTXint** or STC access to **DBGDTRRXint** MCR or MRC access trapped to EL2.
- **MDCR_EL3.TDA**, for accesses using AArch32 state, LDC access to **DBGDTRTXint** or STC access to **DBGDTRRXint** MCR or MRC access trapped to EL3.
- If ARMv8.6-FGT is implemented, **MDCR_EL2.TDCC** and **MDCR_EL3.TDCC**, for accesses to the DCC registers at EL0 and EL1, trapped to EL2.

### ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from CPACR_EL1.FPEN, CPTR_EL2.FPEN or CPTR_ELx.TFP

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| CV | COND | RES0 |

The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SIMD and floating-point System registers.

For an implementation that does not include either SVE or support for floating-point and Advanced SIMD, the exception is reported using the EC value 0b000000.

### CV, bit [24]

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is implementation defined whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally unknown value.

### COND, bits [23:20]

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is implementation defined whether:
  - CV is set to 0 and COND is set to an unknown value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

**Bits [19:0]**

Reserved, RES0.

The following sections describe the configuration settings for the traps that are reported using EC value 0b000111:

- **CPACR_EL1.FPEN**, for accesses to SIMD and floating-point registers trapped to EL1.
- **CPTR_EL2.TFP**, for accesses to SIMD and floating-point registers trapped to EL2.
- **CPTR_EL2.TFP**, for accesses to SIMD and floating-point registers trapped to EL3.

**ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ**

```
24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
```

**Bits [24:0]**

When SVE is implemented:

Reserved, RES0.

Otherwise:

Reserved, RES0.

The accesses covered by this trap include:

- Execution of SVE instructions.
- Accesses to the SVE system registers, ZCR_ELx and ID_AA64ZFR0_EL1.

For an implementation that does not include SVE, the exception is reported using the EC value 0b000000.

**ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault**

```
24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
```

**Bits [24:0]**

Reserved, RES0.

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about these exceptions see 'The Illegal Execution state exception' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile and 'PC alignment checking' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

'Stack pointer alignment checking' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile describes the configuration settings for generating SP alignment fault exceptions.
ISS encoding for an exception from HVC or SVC instruction execution

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | imm16 |

Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

If ARMv8.6-FGT is implemented, HFGITR_EL2, {SVC_EL1, SVC_EL0} control fine-grained traps on SVC execution.

ISS encoding for an exception from SMC instruction execution in AArch32 state

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| CV | COND | CKNOWNPASS | RES0 |

For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is RES0.

For an SMC instruction that is trapped to EL2 from EL1 because HCR_EL2.TSC is 1, the ISS encoding is as shown in the diagram.

CV, bit [24]

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
When a T32 instruction is trapped, it is **IMPLEMENTATION DEFINED** whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is only valid if CCKNOWNPASS is 1, otherwise it is RES0.

This field resets to an architecturally **UNKNOWN** value.

**COND, bits [23:20]**

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is **IMPLEMENTATION DEFINED** whether:
  - CV is set to 0 and COND is set to an **UNKNOWN** value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is **IMPLEMENTATION DEFINED** whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is only valid if CCKNOWNPASS is 1, otherwise it is RES0.

This field resets to an architecturally **UNKNOWN** value.

**CCKNOWNPASS, bit [19]**

Indicates whether the instruction might have failed its condition code check.

<table>
<thead>
<tr>
<th>CCKNOWNPASS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The instruction was unconditional, or was conditional and passed its condition code check.</td>
</tr>
<tr>
<td>0b1</td>
<td>The instruction was conditional, and might have failed its condition code check.</td>
</tr>
</tbody>
</table>

**Note**

In an implementation in which an SMC instruction that fails its code check is not trapped, this field can always return the value 0.

This field resets to an architecturally **UNKNOWN** value.

**Bits [18:0]**

Reserved, RES0.

HCR_EL2.TSC describes the configuration settings for trapping SMC instructions to EL2.

See ‘System calls’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile describes the case where these exceptions are trapped to EL3.

**ISS encoding for an exception from SMC instruction execution in AArch64 state**
Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the issued SMC instruction.

This field resets to an architecturally **UNKNOWN** value.

The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

HCR_EL2.TSC describes the configuration settings for trapping SMC from EL1 modes.

'System calls' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile describes the case where these exceptions are trapped to EL3.

**ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | Op0 | Op2 | Op1 | CRn | Rt | CRm | Direction |

Bits [24:22]

Reserved, RES0.

Op0, bits [21:20]

The Op0 value from the issued instruction.

This field resets to an architecturally **UNKNOWN** value.

Op2, bits [19:17]

The Op2 value from the issued instruction.

This field resets to an architecturally **UNKNOWN** value.

Op1, bits [16:14]

The Op1 value from the issued instruction.

This field resets to an architecturally **UNKNOWN** value.

CRn, bits [13:10]

The CRn value from the issued instruction.

This field resets to an architecturally **UNKNOWN** value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.
This field resets to an architecturally **UNKNOWN** value.

**CRm, bits [4:1]**

The CRm value from the issued instruction.

This field resets to an architecturally **UNKNOWN** value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Write access, including MSR instructions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read access, including MRS instructions.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

For exceptions caused by System instructions, see 'System' subsection of 'Branches, exception generating and System instructions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile for the encoding values returned by an instruction.

The following fields describe configuration settings for generating the exception that is reported using EC value 0b011000:

- **SCTLR_EL1.uci**, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **SCTLR_EL1.uct**, for accesses to **CTR_EL0** using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **SCTLR_EL1.dze**, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **SCTLR_EL1.uma**, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **CPACR_EL1.tta**, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **MDSCR_EL1.tdcc**, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **MDSCR_EL1.TDCC**, for accesses to the Trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **CPACR_EL1.tta**, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **MDSCR_EL1.TDCC**, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- If ARMv8.6-FGT is implemented, **MDCR_EL2.tdcc** and **MDCR_EL3.tdcc**, for accesses to the DCC registers at EL0 and EL1, trapped to EL2.
- **CNTKCTL_EL1.EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN**, accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **PMUSERENR_EL0.ER, CR, SW, EN**, for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **AMUSERENR_EL0.EN**, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **HCR_EL2.TRVM, TVM**, for accesses to virtual memory control registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **HCR_EL2.TSTF, TPC, TPU**, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- **HCR_EL2.TACR**, for accesses to the Auxiliary Control Register, **ACTLR_EL1**, using AArch64 state, MSR or MRS access trapped to EL2.
- **HCR_EL2.TDACP, for accesses to the auxiliary control registers, using AArch64 state, MSR or MRS access trapped to EL2.**
- **HCR_EL2.TSTF, TPC, TPU**, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- **HCR_EL2.TID1, TID2, TID3**, for accesses to ID group 1, ID group 2 or ID group 3 registers, using AArch64 state, MSR or MRS access trapped to EL2.
- **CPTR_EL2.TCPAC**, for accesses to **CPACR_EL1**, using AArch64 state, MSR or MRS access trapped to EL2.
- **CPTR_EL2.TTA**, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL2.
- **MDCR_EL2.TTRF**, for accesses to the trace filter register, **TRFCR_EL1**, using AArch64 state, MSR or MRS access trapped to EL2.
- **MDCR_EL2.TDRA**, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.
ESR_EL3, Exception Syndrome Register (EL3)

- **MDCR_EL2**.TDOSA, for accesses to powerdown debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- **CNTHCTL_EL2**. {EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.
- **MDCR_EL2**.TDA, for accesses to debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- **MDCR_EL2**. {TPM, TPMCR}, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL2.
- **CPTR_EL2**.TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.
- **HCR_EL2**.APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL2.
- **HCR_EL2**. {NV, NV1}, for Nested virtualization register access, using AArch64 state, MSR or MRS access trapped to EL2.
- **HCR_EL2**.AT, for execution of AT S1E* instructions, using AArch64 state, MSR or MRS access trapped to EL2.
- **HCR_EL2**. {TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL2.
- **SCR_EL3**.APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL3.
- **SCR_EL3**.ST, for accesses to the Counter-timer Physical Secure timer registers, using AArch64 state, MSR or MRS access trapped to EL3.
- **SCR_EL3**. {TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL3.
- **CPTR_EL3**.TCPAC, for accesses to **CPTR_EL2** and **CPACR_EL1** using AArch64 state, MSR or MRS access trapped to EL3.
- **CPTR_EL3**.TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL3.
- **MDCR_EL3**.TTRF, for accesses to the filter trace control registers, **TRFCR_EL1** and **TRFCR_EL2**, using AArch64 state, MSR or MRS access trapped to EL3.
- **MDCR_EL3**.TDA, for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- **MDCR_EL3**.TDOSA, for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- **MDCR_EL3**.TPM, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.
- **CPTR_EL3**.TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL3.
- If ARMv8.2-EVT is implemented, **HCR_EL2**. {TTLBOS, TTLBIS, TICAB, TOCU, TID4} and **HCR2**. {TTLBIS, TICAB, TOCU, TID4} control traps for EL1 and EL0 Cache controls that use this EC value.
- If ARMv8.6-FGT is implemented:
  - **SCR_EL3**.FGTen, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
  - **HFGTR_EL2** for reads and **HFGWTR_EL2** for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
  - **HFGITR_EL2** for execution of system instructions, MSR or MRS access trapped to EL2.
  - **HDFGTR_EL2** for reads and **HDFGWTR_EL2** for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
  - **HAFGTR_EL2** for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.

### ISS encoding for an IMPLEMENTATION DEFINED exception to EL3

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| | | | | | | | | | | | | | | | | | | | | | | | | | | | | IMPLEMENTATION DEFINED |

### IMPLEMENTATION DEFINED, bits [24:0]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

### ISS encoding for an exception from an Instruction Abort
Bits [24:13]

Reserved, RES0.

SET, bits [12:11]

Synchronous Error Type. When the RAS Extension is implemented and IFSC is 0b010000, describes the state of the PE after taking the Instruction Abort exception. The possible values of this field are:

<table>
<thead>
<tr>
<th>SET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Recoverable error (UER).</td>
</tr>
<tr>
<td>0b10</td>
<td>Uncontainable error (UC).</td>
</tr>
<tr>
<td>0b11</td>
<td>Restartable error (UEO) or Corrected error (CE).</td>
</tr>
</tbody>
</table>

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in an unrecoverable PE state.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the IFSC field is not 0b010000.

This field resets to an architecturally UNKNOWN value.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<table>
<thead>
<tr>
<th>FnV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FAR is valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>FAR is not valid, and holds an UNKNOWN value.</td>
</tr>
</tbody>
</table>

This field is only valid if the IFSC code is 0b010000. It is RES0 for all other aborts.

This field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:
For any abort other than a stage 2 fault this bit is RES0.

This field resets to an architecturally UNKNOWN value.

**Bit [6]**

Reserved, RES0.

**IFSC, bits [5:0]**

Instruction Fault Status Code. Possible values of this field are:

<table>
<thead>
<tr>
<th>IFSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>Address size fault, level 0 of translation or translation table base register</td>
</tr>
<tr>
<td>0b000001</td>
<td>Address size fault, level 1</td>
</tr>
<tr>
<td>0b000010</td>
<td>Address size fault, level 2</td>
</tr>
<tr>
<td>0b000011</td>
<td>Address size fault, level 3</td>
</tr>
<tr>
<td>0b000100</td>
<td>Translation fault, level 0</td>
</tr>
<tr>
<td>0b000101</td>
<td>Translation fault, level 1</td>
</tr>
<tr>
<td>0b000110</td>
<td>Translation fault, level 2</td>
</tr>
<tr>
<td>0b000111</td>
<td>Translation fault, level 3</td>
</tr>
<tr>
<td>0b001001</td>
<td>Access flag fault, level 1</td>
</tr>
<tr>
<td>0b001010</td>
<td>Access flag fault, level 2</td>
</tr>
<tr>
<td>0b001011</td>
<td>Access flag fault, level 3</td>
</tr>
<tr>
<td>0b001101</td>
<td>Permission fault, level 1</td>
</tr>
<tr>
<td>0b001110</td>
<td>Permission fault, level 2</td>
</tr>
<tr>
<td>0b001111</td>
<td>Permission fault, level 3</td>
</tr>
<tr>
<td>0b010000</td>
<td>Synchronous External abort, not on translation table walk</td>
</tr>
<tr>
<td>0b010100</td>
<td>Synchronous External abort, on translation table walk, level 0</td>
</tr>
<tr>
<td>0b010101</td>
<td>Synchronous External abort, on translation table walk, level 1</td>
</tr>
<tr>
<td>0b010110</td>
<td>Synchronous External abort, on translation table walk, level 2</td>
</tr>
<tr>
<td>0b010111</td>
<td>Synchronous External abort, on translation table walk, level 3</td>
</tr>
<tr>
<td>0b011000</td>
<td>Synchronous parity or ECC error on memory access, not on translation table walk</td>
</tr>
<tr>
<td>0b011100</td>
<td>Synchronous parity or ECC error on memory access on translation table walk, level 0</td>
</tr>
<tr>
<td>0b011101</td>
<td>Synchronous parity or ECC error on memory access on translation table walk, level 1</td>
</tr>
<tr>
<td>0b011110</td>
<td>Synchronous parity or ECC error on memory access on translation table walk, level 2</td>
</tr>
<tr>
<td>0b011111</td>
<td>Synchronous parity or ECC error on memory access on translation table walk, level 3</td>
</tr>
<tr>
<td>0b110000</td>
<td>TLB conflict abort</td>
</tr>
<tr>
<td>0b110001</td>
<td>Unsupported atomic hardware update fault, if the implementation includes ARMv8.1-TTHM. Otherwise reserved.</td>
</tr>
</tbody>
</table>

All other values are reserved.

When the RAS Extension is implemented, 0b011000, 0b011100, 0b011101, 0b011110, and 0b011111, are reserved.

**Note**

Armv8.2 requires the implementation of the RAS Extension.
For more information about the lookup level associated with a fault, see 'The level associated with MMU faults’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

---

**Note**

Because Access flag faults and Permission faults can only result from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

This field resets to an architecturally **UNKNOWN** value.

---

**ISS encoding for an exception from a Data Abort**

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When the RAS Extension is not implemented, the value of ISV on a synchronous External abort on a stage 2 translation table walk is **IMPLEMENTATION DEFINED**.

This field resets to an architecturally **UNKNOWN** value.

---

**ISS, bit [24]**

Instruction syndrome valid. Indicates whether the syndrome information in ISS[23:14] is valid.

<table>
<thead>
<tr>
<th>ISV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No valid instruction syndrome. ISS[23:14] are RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>ISS[23:14] hold a valid instruction syndrome.</td>
</tr>
</tbody>
</table>

This bit is 0 for all faults reported in ESR_EL2 except the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b11111, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback.
- AArch32 instructions where the instruction:
  - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
  - Is not performing register writeback.
  - Is not using R15 as a source or destination register.

For these cases, ISV is **UNKNOWN** if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

ISV is 0 for all faults reported in ESR_EL1 or ESR_EL3.

When the RAS Extension is implemented, ISV is 0 for any synchronous External abort.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When the RAS Extension is not implemented, the value of ISV on a synchronous External abort on a stage 2 translation table walk is **IMPLEMENTATION DEFINED**.

This field resets to an architecturally **UNKNOWN** value.

---

**SAS, bits [23:22]**

Syndrome Access Size. When ISV is 1, indicates the size of the access attempted by the faulting operation.

<table>
<thead>
<tr>
<th>SAS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Byte</td>
</tr>
<tr>
<td>0b01</td>
<td>Halfword</td>
</tr>
<tr>
<td>0b10</td>
<td>Word</td>
</tr>
<tr>
<td>0b11</td>
<td>Doubleword</td>
</tr>
</tbody>
</table>

This field is **UNKNOWN** when the value of ISV is **UNKNOWN**.

This field is RES0 when the value of ISV is 0.

---
This field resets to an architecturally **UNKNOWN** value.

**SSE, bit [21]**

Syndrome Sign Extend. When ISV is 1, for a byte, halfword, or word load operation, indicates whether the data item must be sign extended. For these cases, the possible values of this bit are:

<table>
<thead>
<tr>
<th>SSE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sign-extension not required.</td>
</tr>
<tr>
<td>0b1</td>
<td>Data item must be sign-extended.</td>
</tr>
</tbody>
</table>

For all other operations this bit is 0.

This field is **UNKNOWN** when the value of ISV is **UNKNOWN**.

This field is **RES0** when the value of ISV is 0.

This field resets to an architecturally **UNKNOWN** value.

**SRT, bits [20:16]**

Syndrome Register transfer. When ISV is 1, the register number of the Rt operand of the faulting instruction. If the exception was taken from an Exception level that is using AArch32 then this is the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field is **UNKNOWN** when the value of ISV is **UNKNOWN**.

This field is **RES0** when the value of ISV is 0.

This field resets to an architecturally **UNKNOWN** value.

**SF, bit [15]**

Width of the register accessed by the instruction is Sixty-Four. When ISV is 1, the possible values of this bit are:

<table>
<thead>
<tr>
<th>SF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Instruction loads/stores a 32-bit wide register.</td>
</tr>
<tr>
<td>0b1</td>
<td>Instruction loads/stores a 64-bit wide register.</td>
</tr>
</tbody>
</table>

**Note**

This field specifies the register width identified by the instruction, not the Execution state.

This field is **UNKNOWN** when the value of ISV is **UNKNOWN**.

This field is **RES0** when the value of ISV is 0.

This field resets to an architecturally **UNKNOWN** value.

**AR, bit [14]**

Acquire/Release. When ISV is 1, the possible values of this bit are:

<table>
<thead>
<tr>
<th>AR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Instruction did not have acquire/release semantics.</td>
</tr>
<tr>
<td>0b1</td>
<td>Instruction did have acquire/release semantics.</td>
</tr>
</tbody>
</table>

This field is **UNKNOWN** when the value of ISV is **UNKNOWN**.

This field is **RES0** when the value of ISV is 0.

This field resets to an architecturally **UNKNOWN** value.
**VNCR, bit [13]**

When ARMv8.4-NV is implemented:

Indicates that the fault came from use of `VNCR_EL2` register by EL1 code.

<table>
<thead>
<tr>
<th>VNCR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The fault was not generated by the use of <code>VNCR_EL2</code>, by an MRS or MSR instruction executed at EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The fault was generated by the use of <code>VNCR_EL2</code>, by an MRS or MSR instruction executed at EL1.</td>
</tr>
</tbody>
</table>

This field is 0 in ESR_EL1.

This field resets to an architecturally `UNKNOWN` value.

**Otherwise:**

Reserved, `RES0`.

**SET, bits [12:11]**

Synchronous Error Type. When the RAS Extension is implemented and DFSC is 0b010000, describes the state of the PE after taking the Data Abort exception. The possible values of this field are:

<table>
<thead>
<tr>
<th>SET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Recoverable error (UER).</td>
</tr>
<tr>
<td>0b10</td>
<td>Uncontainable error (UC).</td>
</tr>
<tr>
<td>0b11</td>
<td>Restartable error (UEO) or Corrected error (CE).</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Note**

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in an unrecoverable PE state.

This field is `RES0` if either:

- The RAS Extension is not implemented.
- The value returned in the DFSC field is not 0b010000.

This field resets to an architecturally `UNKNOWN` value.

**FnV, bit [10]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<table>
<thead>
<tr>
<th>FnV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FAR is valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>FAR is not valid, and holds an <code>UNKNOWN</code> value.</td>
</tr>
</tbody>
</table>

This field is valid only if the DFSC code is 0b010000. It is `RES0` for all other aborts.

This field resets to an architecturally `UNKNOWN` value.

**EA, bit [9]**

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.
This field resets to an architecturally **UNKNOWN** value.

### CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

<table>
<thead>
<tr>
<th>CM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA instruction is not classified as a cache maintenance instruction, and therefore its execution cannot cause this field to be set to 1.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

### S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

<table>
<thead>
<tr>
<th>S1PTW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault not on a stage 2 translation for a stage 1 translation table walk.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault on the stage 2 translation of an access for a stage 1 translation table walk.</td>
</tr>
</tbody>
</table>

For any abort other than a stage 2 fault this bit is **RES0**.

This field resets to an architecturally **UNKNOWN** value.

### WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location. The possible values of this bit are:

<table>
<thead>
<tr>
<th>WnR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Abort caused by an instruction reading from a memory location.</td>
</tr>
<tr>
<td>0b1</td>
<td>Abort caused by an instruction writing to a memory location.</td>
</tr>
</tbody>
</table>

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is **UNKNOWN** for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

This field resets to an architecturally **UNKNOWN** value.

### DFSC, bits [5:0]

Data Fault Status Code. Possible values of this field are:
<table>
<thead>
<tr>
<th>DFSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>Address size fault, level 0 of translation or translation table base register.</td>
</tr>
<tr>
<td>0b000001</td>
<td>Address size fault, level 1.</td>
</tr>
<tr>
<td>0b000010</td>
<td>Address size fault, level 2.</td>
</tr>
<tr>
<td>0b000011</td>
<td>Address size fault, level 3.</td>
</tr>
<tr>
<td>0b000100</td>
<td>Translation fault, level 0.</td>
</tr>
<tr>
<td>0b000101</td>
<td>Translation fault, level 1.</td>
</tr>
<tr>
<td>0b000110</td>
<td>Translation fault, level 2.</td>
</tr>
<tr>
<td>0b000111</td>
<td>Translation fault, level 3.</td>
</tr>
<tr>
<td>0b001000</td>
<td>Access flag fault, level 1.</td>
</tr>
<tr>
<td>0b001010</td>
<td>Access flag fault, level 2.</td>
</tr>
<tr>
<td>0b001100</td>
<td>Access flag fault, level 3.</td>
</tr>
<tr>
<td>0b001101</td>
<td>Permission fault, level 1.</td>
</tr>
<tr>
<td>0b001110</td>
<td>Permission fault, level 2.</td>
</tr>
<tr>
<td>0b001111</td>
<td>Permission fault, level 3.</td>
</tr>
<tr>
<td>0b010000</td>
<td>Synchronous External abort, not on translation table walk.</td>
</tr>
<tr>
<td>0b010001</td>
<td>Synchronous Tag Check fail.</td>
</tr>
<tr>
<td>0b010100</td>
<td>Synchronous External abort, on translation table walk, level 0.</td>
</tr>
<tr>
<td>0b010101</td>
<td>Synchronous External abort, on translation table walk, level 1.</td>
</tr>
<tr>
<td>0b010110</td>
<td>Synchronous External abort, on translation table walk, level 2.</td>
</tr>
<tr>
<td>0b010111</td>
<td>Synchronous External abort, on translation table walk, level 3.</td>
</tr>
<tr>
<td>0b011000</td>
<td>Synchronous parity or ECC error on memory access, not on translation table walk.</td>
</tr>
<tr>
<td>0b011100</td>
<td>Synchronous parity or ECC error on memory access on translation table walk, level 0.</td>
</tr>
<tr>
<td>0b011101</td>
<td>Synchronous parity or ECC error on memory access on translation table walk, level 1.</td>
</tr>
<tr>
<td>0b011110</td>
<td>Synchronous parity or ECC error on memory access on translation table walk, level 2.</td>
</tr>
<tr>
<td>0b011111</td>
<td>Synchronous parity or ECC error on memory access on translation table walk, level 3.</td>
</tr>
<tr>
<td>0b100001</td>
<td>Alignment fault.</td>
</tr>
<tr>
<td>0b110000</td>
<td>TLB conflict abort.</td>
</tr>
<tr>
<td>0b110001</td>
<td>Unsupported atomic hardware update fault, if the implementation includes ARMv8.1-TTHM]. Otherwise reserved.</td>
</tr>
<tr>
<td>0b110100</td>
<td>IMPLEMENTATION DEFINED fault (Lockdown).</td>
</tr>
<tr>
<td>0b110101</td>
<td>IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).</td>
</tr>
<tr>
<td>0b111101</td>
<td>Section Domain Fault, used only for faults reported in the PAR_EL1.</td>
</tr>
<tr>
<td>0b111110</td>
<td>Page Domain Fault, used only for faults reported in the PAR_EL1.</td>
</tr>
</tbody>
</table>

All other values are reserved.

When the RAS Extension is implemented, 0b011000, 0b011100, 0b011101, 0b011110, and 0b011111, are reserved.

For more information about the lookup level associated with a fault, see ‘The level associated with MMU faults’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Note**

Because Access flag faults and Permission faults can only result from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

This field resets to an architecturally **UNKNOWN** value.
ISS encoding for an exception from a trapped floating-point exception

Bit [24]

Reserved, RES0.

TFV, bit [23]

Trapped Fault Valid bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions. The possible values of this bit are:

<table>
<thead>
<tr>
<th>TFV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are UNKNOWN.</td>
</tr>
<tr>
<td>0b1</td>
<td>One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information see 'Floating-point exception traps' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.</td>
</tr>
</tbody>
</table>

It is IMPLEMENTATION DEFINED whether this field is set to 0 on an exception generated by a trapped floating point exception from a vector instruction.

**Note**

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from a vector instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

This field resets to an architecturally UNKNOWN value.

Bits [22:11]

Reserved, RES0.

VECITR, bits [10:8]

For a trapped floating-point exception from an instruction executed in AArch32 state this field is RES1.

For a trapped floating-point exception from an instruction executed in AArch64 state this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

IDF, bit [7]

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>IDF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Input denormal floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Input denormal floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.
Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>IXF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Inexact floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Inexact floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

UFF, bit [3]

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>UFF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Underflow floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Underflow floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

OFF, bit [2]

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>OFF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Overflow floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Overflow floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

DZF, bit [1]

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>DZF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Divide by Zero floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Divide by Zero floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

IOF, bit [0]

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

<table>
<thead>
<tr>
<th>IOF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Invalid Operation floating-point exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Invalid Operation floating-point exception occurred during execution of the reported instruction.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.
In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the `FPSCR.{IDE, IXE, UFE, OFE, DZE, IOE}` bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the `FPSCR.{IDE, IXE, UFE, OFE, DZE, IOE}` bits enable each of the floating-point exception traps.

### ISS encoding for an SError interrupt

![Table of ISS encoding](image)

**IDS, bit [24]**

**IMPLEMENTATION DEFINED** syndrome. Possible values of this bit are:

<table>
<thead>
<tr>
<th>IDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bits[23:0] of the ISS field holds the fields described in this encoding.</td>
</tr>
</tbody>
</table>

**Note**

If the RAS Extension is not implemented, this means that bits[23:0] of the ISS field are RES0.

<table>
<thead>
<tr>
<th>IDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>Bits[23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError interrupt.</td>
</tr>
</tbody>
</table>

**Note**

This field was previously called ISV.

This field resets to an architecturally UNKNOWN value.

**Bits [23:14]**

Reserved, RES0.

**IESB, bit [13]**

**When ARMv8.2-IESB is implemented:**

Implicit error synchronization event.

<table>
<thead>
<tr>
<th>IESB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The SError interrupt was either not synchronized by the implicit error synchronization event or not taken immediately.</td>
</tr>
<tr>
<td>0b1</td>
<td>The SError interrupt was synchronized by the implicit error synchronization event and taken immediately.</td>
</tr>
</tbody>
</table>

This field is RES0 if the value returned in the DFSC field is not 0b010001.

**Note**

Armv8.2 requires the implementation of the RAS Extension and ARMv8.2-IESB.

This field resets to an architecturally UNKNOWN value.
Reserved, RES0.

**AET, bits [12:10]**

Asynchronous Error Type.

When the RAS Extension is implemented and DFSC is 0b010001, describes the state of the PE after taking the SError interrupt exception. The possible values of this field are:

<table>
<thead>
<tr>
<th>AET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Uncontainable error (UC).</td>
</tr>
<tr>
<td>0b001</td>
<td>Unrecoverable error (UEU).</td>
</tr>
<tr>
<td>0b010</td>
<td>Restartable error (UEO).</td>
</tr>
<tr>
<td>0b011</td>
<td>Recoverable error (UER).</td>
</tr>
<tr>
<td>0b110</td>
<td>Corrected error (CE).</td>
</tr>
</tbody>
</table>

All other values are reserved.

If multiple errors are taken as a single SError interrupt exception, the overall state of the PE is reported. For example, if both a Recoverable and Unrecoverable error occurred, the state is Unrecoverable.

**Note**

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the DFSC field is not 0b010001.

**Note**

Armv8.2 requires the implementation of the RAS Extension.

This field resets to an architecturally UNKNOWN value.

**EA, bit [9]**

External abort type. When the RAS Extension is implemented, this bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the DFSC field is not 0b010001.

**Note**

Armv8.2 requires the implementation of the RAS Extension.

This field resets to an architecturally UNKNOWN value.

**Bits [8:6]**

Reserved, RES0.
DFSC, bits [5:0]

Data Fault Status Code. When the RAS Extension is implemented, possible values of this field are:

<table>
<thead>
<tr>
<th>DFSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>000000</td>
<td>Uncategorized.</td>
</tr>
<tr>
<td>001001</td>
<td>Asynchronous SError interrupt.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If the RAS Extension is not implemented, this field is RES0.

**Note**

Armv8.2 requires the implementation of the RAS Extension.

This field resets to an architecturally **UNKNOWN** value.

ISS encoding for an exception from a Breakpoint or Vector Catch debug exception

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | IFSC |

**Bits [24:6]**

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code. This field is set to 0b100010, to indicate a Debug exception.

This field resets to an architecturally **UNKNOWN** value.

For more information about generating these exceptions:

- For exceptions from AArch64, see 'Breakpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

ISS encoding for an exception from a Software Step exception

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ISV | RES0 | EX | IFSC |

**ISV, bit [24]**

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:

<table>
<thead>
<tr>
<th>ISV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EX bit is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>EX bit is valid.</td>
</tr>
</tbody>
</table>

See the EX bit description for more information.

This field resets to an architecturally **UNKNOWN** value.
Bits [23:7]

Reserved, RES0.

EX, bit [6]

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

<table>
<thead>
<tr>
<th>EX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An instruction other than a Load-Exclusive instruction was stepped.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Load-Exclusive instruction was stepped.</td>
</tr>
</tbody>
</table>

If the ISV bit is set to 0, this bit is RES0, indicating no syndrome data is available.

This field resets to an architecturally UNKNOWN value.

IFSC, bits [5:0]

Instruction Fault Status Code. This field is set to 0b100010, to indicate a Debug exception.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Software Step exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

ISS encoding for an exception from a Watchpoint exception

| 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0| VNCR| RES0| CM  | RES0| WnR | DFSC|

Bits [24:14]

Reserved, RES0.

VNCR, bit [13]

When ARMv8.4-NV is implemented:

Indicates that the watchpoint came from use of VNCR_EL2 register by EL1 code.

<table>
<thead>
<tr>
<th>VNCR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The watchpoint was not generated by the use of VNCR_EL2 by EL1 code.</td>
</tr>
<tr>
<td>0b1</td>
<td>The watchpoint was generated by the use of VNCR_EL2 by EL1 code.</td>
</tr>
</tbody>
</table>

This field is 0 in ESR_EL1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:9]

Reserved, RES0.
CM, bit [8]

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance or address translation instruction:

<table>
<thead>
<tr>
<th>CM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Watchpoint exception was not generated by the execution of one of</td>
</tr>
<tr>
<td></td>
<td>the System instructions identified in the description of value 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Watchpoint exception was generated by either the execution of a</td>
</tr>
<tr>
<td></td>
<td>cache maintenance instruction or by a synchronous Watchpoint exception</td>
</tr>
<tr>
<td></td>
<td>on the execution of an address translation instruction. The <strong>DC,ZVA</strong></td>
</tr>
<tr>
<td></td>
<td>instruction is not classified as a cache maintenance instruction, and</td>
</tr>
<tr>
<td></td>
<td>therefore its execution cannot cause this field to be set to 1.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

Bit [7]

Reserved, **RES0**.

WnR, bit [6]

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location. The possible values of this bit are:

<table>
<thead>
<tr>
<th>WnR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Watchpoint exception caused by an instruction reading from a memory</td>
</tr>
<tr>
<td></td>
<td>location.</td>
</tr>
<tr>
<td>0b1</td>
<td>Watchpoint exception caused by an instruction writing to a memory</td>
</tr>
<tr>
<td></td>
<td>location.</td>
</tr>
</tbody>
</table>

For Watchpoint exceptions on cache maintenance and address translation instructions, this bit always returns a value of 1.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is **UNPREDICTABLE** which watchpoint generates the Watchpoint exception.

This field resets to an architecturally **UNKNOWN** value.

DFSC, bits [5:0]

Data Fault Status Code. This field is set to 0b100010, to indicate a Debug exception.

This field resets to an architecturally **UNKNOWN** value.

For more information about generating these exceptions, see ‘Watchpoint exceptions’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

ISS encoding for an exception from execution of a Breakpoint instruction

| 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

Comment

<table>
<thead>
<tr>
<th>Bits [24:16]</th>
</tr>
</thead>
</table>

Reserved, **RES0**.
Comment, bits [15:0]

Set to the instruction comment field value, zero extended as necessary. For the AArch32 BKPT instructions, the comment field is described as the immediate field.

This field resets to an architecturally unknown value.

For more information about generating these exceptions, see ‘Breakpoint instruction exceptions’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

ISS encoding for an exception from ERET, ERETTA or ERETAB instruction

This EC value applies when ARMv8.6-FGT is implemented, or when HCR_EL2.NV is 1.

Bits [24:2]

Reserved, RES0.

ERET, bit [1]

Indicates whether an ERET or ERETA* instruction was trapped to EL2. Possible values are:

<table>
<thead>
<tr>
<th>ERET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERET instruction trapped to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>ERETTA or ERETAB instruction trapped to EL2.</td>
</tr>
</tbody>
</table>

If this bit is 0, the ERETA field is RES0.

This field resets to an architecturally unknown value.

ERETA, bit [0]

Indicates whether an ERETTA or ERETAB instruction was trapped to EL2. Possible values are:

<table>
<thead>
<tr>
<th>ERETA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ERETTA instruction trapped to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>ERETAB instruction trapped to EL2.</td>
</tr>
</tbody>
</table>

When the ERET field is 0, this bit is RES0.

This field resets to an architecturally unknown value.

For more information about generating these exceptions, see HCR_EL2.NV.

If ARMv8.6-FGT is implemented, HFGITR_EL2.ERET controls fine-grained trap exceptions from ERET, ERETTA and ERETAB execution.

ISS encoding for an exception from a TSTART instruction

Bits [24:10]

Reserved, RES0.

Rd, bits [9:5]

The Rd value from the issued instruction, the general purpose register used for the destination.
Bits [4:0]

Reserved, RES0.

ISS encoding for an exception from Branch Target Identification instruction

|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | Bit [1] Bit [0] |

Bits [24:2]

Reserved, RES0.

Bit [1], bit [1]

This field indicates whether the exception is as a result of an Instruction key or a Data key.

<table>
<thead>
<tr>
<th>Bit [1]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Instruction Key.</td>
</tr>
<tr>
<td>0b1</td>
<td>Data Key.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.
**Bit [0], bit [0]**

This field indicates whether the exception is as a result of an A key or a B key.

<table>
<thead>
<tr>
<th>Bit [0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A key.</td>
</tr>
<tr>
<td>0b1</td>
<td>B key.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

The following instructions generate an exception when the Pointer Authentication Code (PAC) is incorrect:

- AUTIASP, AUTIAZ, AUTIA1716.
- AUTIBSP, AUTIBZ, AUTIB1716.
- AUTIA, AUTDA, AUTIB, AUTDB.
- AUTIZA, AUTIZB, AUTDZA, AUTDZB.

It is **IMPLEMENTATION DEFINED** whether the following instructions generate an exception directly from the authorization failure, rather than changing the address in a way that will generate a translation fault when the address is accessed:

- RETAA, RETAB.
- BRAA, BRAB, BLRAA, BLRAB.
- BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETTA, ERETAB.
- LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

**Accessing the ESR_EL3**

Accesses to this register use the following encodings:

**MRS <Xt>, ESR_EL3**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b110</td>
<td>0b0101</td>
<td>0b0010</td>
<td>0b000</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
else PSTATE.EL == EL3 then
    return ESR_EL3;

**MSR ESR_EL3, <Xt>**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b110</td>
<td>0b0101</td>
<td>0b0010</td>
<td>0b000</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
else PSTATE.EL == EL3 then
    ESR_EL3 = X[t];
The FAR_EL1 characteristics are:

**Purpose**

Holds the faulting Virtual Address for all synchronous Instruction or Data Abort, PC alignment fault and Watchpoint exceptions that are taken to EL1.

**Configuration**

AArch64 System register FAR_EL1 bits [31:0] are architecturally mapped to AArch32 System register `DFAR[31:0] (NS)`.

AArch64 System register FAR_EL1 bits [63:32] are architecturally mapped to AArch32 System register `IFAR[31:0] (NS)`.

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

FAR_EL1 is a 64-bit register.

**Field descriptions**

The FAR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit(s)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-3</td>
<td>Faulting Virtual Address for synchronous exceptions taken to EL1</td>
</tr>
<tr>
<td>31-0</td>
<td>Faulting Virtual Address for synchronous exceptions taken to EL1</td>
</tr>
</tbody>
</table>

**Bits [63:0]**

Faulting Virtual Address for synchronous exceptions taken to EL1. Exceptions that set the FAR_EL1 are Instruction Aborts (EC 0x20 or 0x21), Data Aborts (EC 0x24 or 0x25), PC alignment faults (EC 0x22), and Watchpoints (EC 0x34 or 0x35). `ESR_EL1`.EC holds the EC value for the exception.

For a synchronous External abort, if the VA that generated the abort was from an address range for which TCR_ELx.TBI{<0|1>} == 1 for the translation regime in use when the abort was generated, then the top eight bits of FAR_EL1 are **UNKNOWN**.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if `ESR_EL1`.FnV is 0, and the FAR_EL1 is **UNKNOWN** if `ESR_EL1`.FnV is 1.

For all other exceptions taken to EL1, the FAR_EL1 is **UNKNOWN**.

If a memory fault that sets FAR_EL1 is generated from a data cache maintenance or other DC instruction, this field holds the address specified in the register argument of the instruction.

If the exception that updates FAR_EL1 is taken from an Exception level that is using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR_EL1 are 0x00000001:

- The faulting address was generated by a load or store instruction that sequentially incremented from address 0xFFFFFFFF. Such a load or store is **CONSTRAINED UNPREDICTABLE**. See ‘Out of range VA’ in Appendix K1 Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.

For a Data Abort or Watchpoint exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see ‘Address tagging in AArch64 state’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
Execution at EL0 makes FAR_EL1 become **UNKNOWN**.

---

**Note**

The address held in this field is an address accessed by the instruction fetch or data access that caused the exception that gave rise to the instruction or data abort. It is the lower address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores a mis-aligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

---

FAR_EL1 is made **UNKNOWN** on an exception return from EL1.

This field resets to an architecturally **UNKNOWN** value.

### Accessing the FAR_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic FAR_EL1 or FAR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

**MRS <Xt>, FAR_EL1**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>

FAR_EL2, Fault Address Register (EL2)

The FAR_EL2 characteristics are:

**Purpose**

Holds the faulting Virtual Address for all synchronous Instruction or Data Abort, PC alignment fault and Watchpoint exceptions that are taken to EL2.

**Configuration**

AArch64 System register FAR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HDFAR[31:0].

AArch64 System register FAR_EL2 bits [63:32] are architecturally mapped to AArch32 System register HIFAR[31:0].

AArch64 System register FAR_EL2 bits [31:0] are architecturally mapped to AArch32 System register DFAR[31:0] when HaveEL(EL2).

AArch64 System register FAR_EL2 bits [63:32] are architecturally mapped to AArch32 System register IFAR[31:0] when HaveEL(EL2).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

FAR_EL2 is a 64-bit register.

**Field descriptions**

The FAR_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | Faulting Virtual Address for synchronous exceptions taken to EL2 |
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [63:0]**

Faulting Virtual Address for synchronous exceptions taken to EL2. Exceptions that set the FAR_EL2 are Instruction Aborts (EC 0x20 or 0x21), Data Aborts (EC 0x24 or 0x25), PC alignment faults (EC 0x22), and Watchpoints (EC 0x34 or 0x35). ESR_EL2.EC holds the EC value for the exception.

For a synchronous External abort, if the VA that generated the abort was from an address range for which TCR_ELx.TBI{<0|1>} == 1 for the translation regime in use when the abort was generated, then the top eight bits of FAR_EL2 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if ESR_EL2.FnV is 0, and the FAR_EL2 is UNKNOWN if ESR_EL2.FnV is 1.

For all other exceptions taken to EL2, the FAR_EL2 is UNKNOWN.

If a memory fault that sets FAR_EL2 is generated from a data cache maintenance or other DC instruction, this field holds the address specified in the register argument of the instruction.

If the exception that updates FAR_EL2 is taken from an Exception level that is using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR_ELx are 0x00000001:
• The faulting address was generated by a load or store instruction that sequentially incremented from address 0xFFFFFFFF. Such a load or store instruction is CONSTRAINED UNPREDICTABLE. See 'Out of range VA' in Appendix K1 Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

• The implementation treats such incrementing as setting bit[32] of the virtual address to 1.

For a Data Abort or Watchpoint exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see 'Address tagging in AArch64 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Execution at EL1 or EL0 makes FAR_EL2 become UNKNOWN.

---

**Note**

The address held in this field is an address accessed by the instruction fetch or data access that caused the exception that gave rise to the instruction or data abort. It is the lower address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores a mis-aligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

---

FAR_EL2 is made UNKNOWN on an exception return from EL2.

This field resets to an architecturally UNKNOWN value.

### Accessing the FAR_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic FAR_EL2 or FAR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

FAR_EL3, Fault Address Register (EL3)

The FAR_EL3 characteristics are:

**Purpose**

Holds the faulting Virtual Address for all synchronous Instruction or Data Abort and PC alignment fault exceptions that are taken to EL3.

**Configuration**

This register is present only when HaveEL(EL3). Otherwise, direct accesses to FAR_EL3 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

FAR_EL3 is a 64-bit register.

**Field descriptions**

The FAR_EL3 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

Faulting Virtual Address for synchronous exceptions taken to EL3

Bits [63:0]

Faulting Virtual Address for synchronous exceptions taken to EL3. Exceptions that set the FAR_EL3 are Instruction Aborts (EC 0x20 or 0x21), Data Aborts (EC 0x24 or 0x25), and PC alignment faults (EC 0x22). ESR_EL3.EC holds the EC value for the exception.

For a synchronous External abort, if the VA that generated the abort was from an address range for which TCR_ELx.TBI{<0|1>} == 1 for the translation regime in use when the abort was generated, then the top eight bits of FAR_EL3 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if ESR_EL3.FnV is 0, and the FAR_EL3 is UNKNOWN if ESR_EL3.FnV is 1.

For all other exceptions taken to EL3, the FAR_EL3 is UNKNOWN.

If a memory fault that sets FAR_EL3 is generated from a data cache maintenance or other DC instruction, this field holds the address specified in the register argument of the instruction.

If the exception that updates FAR_EL3 is taken from an Exception Level using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR_ELx are 0x00000001:

- The faulting address was generated by a load or store instruction that sequentially incremented from address 0xFFFFFFFF. Such a load or store instruction is CONSTRAINED UNPREDICTABLE. See 'Out of range VA' in Appendix K1 Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.

For a Data Abort or Watchpoint exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see 'Address tagging in AArch64 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Execution at EL2, EL1 or EL0 makes FAR_EL3 become UNKNOWN.
Note

The address held in this register is an address accessed by the instruction fetch or data access that caused the exception that actually gave rise to the instruction or data abort. It is the lowest address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores a mis-aligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

FAR_EL3 is made **UNKNOWN** on an exception return from EL3.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the FAR_EL3**

Accesses to this register use the following encodings:

**MRS <Xt>, FAR_EL3**

<table>

    FAR_EL3 = X[t];
```
FPCR, Floating-point Control Register

The FPCR characteristics are:

**Purpose**

Controls floating-point behavior.

**Configuration**

The named fields in this register map to the equivalent fields in the AArch32 FPSCR.

It is **IMPLEMENTATION DEFINED** whether the Len and Stride fields can be programmed to non-zero values, which will cause some AArch32 floating-point instruction encodings to be **UNDEFINED**, or whether these fields are **RAZ**.

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

FPCR is a 64-bit register.

**Field descriptions**

The FPCR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>62</td>
<td>AHP</td>
<td>Alternative half-precision control bit:</td>
</tr>
<tr>
<td>61</td>
<td>DN</td>
<td>Default NaN mode control bit:</td>
</tr>
<tr>
<td>60</td>
<td>FZ</td>
<td>IEEE half-precision format selected.</td>
</tr>
<tr>
<td>59</td>
<td>RMode</td>
<td>Alternative half-precision format selected.</td>
</tr>
<tr>
<td>58</td>
<td>FZ16</td>
<td>NaN operands propagate through to the output of a floating-point operation.</td>
</tr>
<tr>
<td>57</td>
<td>Len</td>
<td>Any operation involving one or more NaNs returns the Default NaN.</td>
</tr>
<tr>
<td>56</td>
<td>IDE</td>

<td>NaN operands propagate through to the output of a floating-point operation.</td>
</tr>
<tr>
<td>52</td>
<td>IOE</td>
<td>NaN operands propagate through to the output of a floating-point operation.</td>
</tr>
</tbody>
</table>

This bit is only used for conversions between half-precision floating-point and other floating-point formats.

The data-processing instructions added as part of the ARMv8.2-FP16 extension always use the IEEE half-precision format, and ignore the value of this bit.

This field resets to an architecturally **UNKNOWN** value.
The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

This field resets to an architecturally *UNKNOWN* value.

**FZ, bit [24]**

Flush-to-zero mode control bit:

<table>
<thead>
<tr>
<th>FZ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Flush-to-zero mode disabled. Behavior of the floating-point system</td>
</tr>
<tr>
<td></td>
<td>is fully compliant with the IEEE 754 standard.</td>
</tr>
<tr>
<td>0b1</td>
<td>Flush-to-zero mode enabled.</td>
</tr>
</tbody>
</table>

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

This bit has no effect on half-precision calculations.

This field resets to an architecturally *UNKNOWN* value.

**RMode, bits [23:22]**

Rounding Mode control field. The encoding of this field is:

<table>
<thead>
<tr>
<th>RMode</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Round to Nearest (RN) mode.</td>
</tr>
<tr>
<td>0b01</td>
<td>Round towards Plus Infinity (RP) mode.</td>
</tr>
<tr>
<td>0b10</td>
<td>Round towards Minus Infinity (RM) mode.</td>
</tr>
<tr>
<td>0b11</td>
<td>Round towards Zero (RZ) mode.</td>
</tr>
</tbody>
</table>

The specified rounding mode is used by both scalar and Advanced SIMD floating-point instructions.

This field resets to an architecturally *UNKNOWN* value.

**Stride, bits [21:20]**

This field has no function in AArch64 state, and non-zero values are ignored during execution in AArch64 state. It is included only for context saving and restoration of the AArch32 FPSCR.Stride field.

This field resets to an architecturally *UNKNOWN* value.

**FZ16, bit [19]**

*When ARMv8.2-FP16 is implemented:*

Flush-to-zero mode control bit on half-precision data-processing instructions:

<table>
<thead>
<tr>
<th>FZ16</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Flush-to-zero mode disabled. Behavior of the floating-point system</td>
</tr>
<tr>
<td></td>
<td>system is fully compliant with the IEEE 754 standard.</td>
</tr>
<tr>
<td>0b1</td>
<td>Flush-to-zero mode enabled.</td>
</tr>
</tbody>
</table>

The value of this bit applies to both scalar and Advanced SIMD floating-point half-precision calculations. A half-precision floating-point number that is flushed to zero as a result of the value of the FZ16 bit does not generate an Input Denormal exception.

This field resets to an architecturally *UNKNOWN* value.

*Otherwise:*

Reserved, RES0.
Len, bits [18:16]

This field has no function in AArch64 state, and non-zero values are ignored during execution in AArch64 state. It is included only for context saving and restoration of the AArch32 FPSCR.Len field.

This field resets to an architecturally \textit{UNKNOWN} value.

IDE, bit [15]

Input Denormal floating-point exception trap enable. Possible values are:

<table>
<thead>
<tr>
<th>IDE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Untracked exception handling selected. If the floating-point exception occurs then the FPSR.IDC bit is set to 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.IDC bit. The trap handling software can decide whether to set the FPSR.IDC bit to 1.</td>
</tr>
</tbody>
</table>

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

This field resets to an architecturally \textit{UNKNOWN} value.

Bits [14:13]

Reserved, RES0.

IXE, bit [12]

Inexact floating-point exception trap enable. Possible values are:

<table>
<thead>
<tr>
<th>IXE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Untracked exception handling selected. If the floating-point exception occurs then the FPSR.IXC bit is set to 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Tracked exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.IXC bit. The trap handling software can decide whether to set the FPSR.IXC bit to 1.</td>
</tr>
</tbody>
</table>

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

This field resets to an architecturally \textit{UNKNOWN} value.

UFE, bit [11]

Underflow floating-point exception trap enable. Possible values are:

<table>
<thead>
<tr>
<th>UFE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Untracked exception handling selected. If the floating-point exception occurs then the FPSR.UFC bit is set to 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Tracked exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.UFC bit. The trap handling software can decide whether to set the FPSR.UFC bit to 1.</td>
</tr>
</tbody>
</table>

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

This field resets to an architecturally \textit{UNKNOWN} value.
**OFE, bit [10]**

Overflow floating-point exception trap enable. Possible values are:

<table>
<thead>
<tr>
<th>OFE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Untrapped exception handling selected. If the floating-point exception occurs then the FPSR.OFC bit is set to 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.OFC bit. The trap handling software can decide whether to set the FPSR.OFC bit to 1.</td>
</tr>
</tbody>
</table>

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

This field resets to an architecturally **UNKNOWN** value.

**DZE, bit [9]**

Divide by Zero floating-point exception trap enable. Possible values are:

<table>
<thead>
<tr>
<th>DZE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Untrapped exception handling selected. If the floating-point exception occurs then the FPSR.DZC bit is set to 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.DZC bit. The trap handling software can decide whether to set the FPSR.DZC bit to 1.</td>
</tr>
</tbody>
</table>

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

This field resets to an architecturally **UNKNOWN** value.

**IOE, bit [8]**

Invalid Operation floating-point exception trap enable. Possible values are:

<table>
<thead>
<tr>
<th>IOE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Untrapped exception handling selected. If the floating-point exception occurs then the FPSR.IOC bit is set to 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.IOC bit. The trap handling software can decide whether to set the FPSR.IOC bit to 1.</td>
</tr>
</tbody>
</table>

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

This field resets to an architecturally **UNKNOWN** value.

**Bits [7:0]**

Reserved, RES0.

**Accessing the FPCR**

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
  if !ELUsingAArch32(EL1) && !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && CPACR_EL1.FPEN != '11' then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
      AArch64.SystemAccessTrap(EL2, 0x00);
    else
      AArch64.SystemAccessTrap(EL1, 0x07);
    endif
  elseif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.<E2H,TGE> == '11' && CPTR_EL2.FPEN != '11' then
    AArch64.SystemAccessTrap(EL2, 0x07);

**FPEXC32_EL2, Floating-Point Exception Control register**

The FPEXC32_EL2 characteristics are:

**Purpose**

Allows access to the AArch32 register FPEXC from AArch64 state only. Its value has no effect on execution in AArch64 state.

**Configuration**

AArch64 System register FPEXC32_EL2 bits [31:0] are architecturally mapped to AArch32 System register FPEXC[31:0].

If EL1 cannot use AArch32, this register is UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

FPEXC32_EL2 is a 64-bit register.

**Field descriptions**

The FPEXC32_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>31</td>
<td>EX, bit [31]</td>
</tr>
<tr>
<td>30</td>
<td>EN, bit [30]</td>
</tr>
</tbody>
</table>

**EX, bit [31]**

Exception bit. From Armv8, this bit is RAZ/WI.

This field resets to an architecturally UNKNOWN value.

**EN, bit [30]**

Enables access to the Advanced SIMD and floating-point functionality from all Exception levels, except that setting this field to 0 does not disable the following:

- VMSR accesses to the FPEXC or FPSID.
- VMRS accesses from the FPEXC, FPSID, MVFR0, MVFR1, or MVFR2.
Meaning

<table>
<thead>
<tr>
<th>EN</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to the FPSCR, and any of the SIMD and floating-point registers Q0-Q15, including their views as D0-D31 registers or S0-S31 registers, are UNDEFINED at all Exception levels.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control permits access to the Advanced SIMD and floating-point functionality at all Exception levels.</td>
</tr>
</tbody>
</table>

Execution of floating-point and Advanced SIMD instructions in AArch32 state can be disabled or trapped by the following controls:

- **CPACR**.cp10, or, if executing at EL0, **CPACR_EL1**. FPEN.
- **FPEXC.EN**.
- If executing in Non-secure state:
  - **HCPtr.TCP10**, or if EL2 is using AArch64, **CPTR_EL2.TFP**.
  - **NSACR**.cp10, or if EL3 is using AArch64, **CPTR_EL3.TFP**.
- For Advanced SIMD instructions only:
  - **CPACR.ASEDIS**.
  - If executing in Non-secure state, **HCPtr.TASE** and **NSACR.NSTRCDIS**.

See the descriptions of the controls for more information.

**Note**

When executing at EL0 using AArch32:

- If EL1 is using AArch64 then behavior is as if the value of FPEXC.EN is 1.
- If EL2 is using AArch64 and enabled in the current Security state, and the value of **HCR_EL2**. {RW, TGE} is {1, 1} then behavior is as if the value of FPEXC.EN is 1.
- If EL2 is using AArch64 and enabled in the current Security state, and the value of **HCR_EL2**. {RW, TGE} is {0, 1} then it is IMPLEMENTATION DEFINED whether the behavior is:
  - As if the value of FPEXC.EN is 1.
  - Determined by the value of FPEXC32_EL2.EN, as described in this field description. However, Arm deprecates using the value of FPEXC32_EL2.EN to determine behavior.

This field resets to an architecturally **UNKNOWN** value.

**DEX, bit [29]**

Defined synchronous exception on floating-point execution.

This field identifies whether a synchronous exception generated by the attempted execution of an instruction was generated by an unallocated encoding. The instruction must be in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr() returning TRUE. This field also indicates whether the FPEXC32_EL2.TFV field is valid.

The meaning of this bit is:

<table>
<thead>
<tr>
<th>DEX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The exception was generated by the attempted execution of an unallocated instruction in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr(). If FPEXC32_EL2.TFV is RW then it is invalid and <strong>UNKNOWN</strong>. If FPEXC32_EL2.{IDF, IXF, UFF, OFF, DZF, IOF} are RW then they are invalid and <strong>UNKNOWN</strong>.</td>
</tr>
<tr>
<td>0b1</td>
<td>The exception was generated during the execution of an unallocated encoding. FPEXC32_EL2.TFV is valid and indicates the cause of the exception.</td>
</tr>
</tbody>
</table>

On an exception that sets this bit to 1 the exception-handling routine must clear this bit to 0.

On an implementation that both does not support trapping of floating-point exceptions and implements the AArch32 FPSCR. {Stride, Len} fields as RAZ, this bit is **RES0**.

This field resets to an architecturally **UNKNOWN** value.
FP2V, bit [28]

FPINST2 instruction valid bit. From Armv8, this bit is RES0.

This field resets to an architecturally UNKNOWN value.

VV, bit [27]

VECITR valid bit. From Armv8, this bit is RES0.

This field resets to an architecturally UNKNOWN value.

TFV, bit [26]

Trapped Fault Valid bit. Valid only when the value of FPEXC.DEX is 1. When valid, it indicates the cause of the exception and therefore whether the FPEXC.{IDF, IXF, OFF, DZF, IOF} bits are valid.

<table>
<thead>
<tr>
<th>TFV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The exception was caused by the execution of a floating-point VABS, VADD, VDIV, VFMA, VFMS, VFNMA, VFNMS, VMLA, VMLS, VMOV, VMUL, VNEG, VNMLA, VNMLS, VNMUL, VSQRT, or VSUB instruction when one or both of FPSCR. {Stride, Len} was non-zero. If the FPEXC.{IDF, IXF, OFF, DZF, IOF} bits are RW then they are invalid and UNKNOWN.</td>
</tr>
<tr>
<td>0b1</td>
<td>FPEXC.{IDF, IXF, OFF, DZF, IOF} indicate the presence of trapped floating-point exceptions that had occurred at the time of the exception. Bits are set for all trapped exceptions that had occurred at the time of the exception.</td>
</tr>
</tbody>
</table>

This bit returns a status value and ignores writes.

When the value of FPEXC.DEX is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On an implementation that supports the trapping of floating-point exceptions and implements FPSCR. {Stride, Len} as RAZ, this bit is RAO/WI.

This field resets to an architecturally UNKNOWN value.

Bits [25:11]

Reserved, RES0.

VECITR, bits [10:8]

Vector iteration count. From Armv8, this field is RES1.

This field resets to an architecturally UNKNOWN value.

IDF, bit [7]

Input Denormal trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Input Denormal exception occurred while FPSCR. FZ was 1:

<table>
<thead>
<tr>
<th>IDF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Input Denormal exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Input Denormal exception has occurred.</td>
</tr>
</tbody>
</table>

Input Denormal exceptions can occur only when FPSCR. FZ is 1.

Note
A half-precision floating-point value that is flushed to zero because the value of \texttt{FPSCR.FZ16} is 1 does not generate an Input Denormal exception.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC32_EL2.TFV is 0 and this bit is RW, this bit is invalid and \texttt{UNKNOWN}.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

This field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{Bits [6:5]}

Reserved, \texttt{RES0}.

\textbf{IXF, bit [4]}

Inexact trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Inexact exception occurred while \texttt{FPSCR.IXE} was 1:

<table>
<thead>
<tr>
<th>IXF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Inexact exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Inexact exception has occurred.</td>
</tr>
</tbody>
</table>

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and \texttt{UNKNOWN}.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

This field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{UFF, bit [3]}

Underflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Underflow exception occurred while \texttt{FPSCR.UFE} was 1:

<table>
<thead>
<tr>
<th>UFF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Underflow exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Underflow exception has occurred.</td>
</tr>
</tbody>
</table>

Underflow trapped exceptions can occur:

- On half-precision data-processing instructions only when \texttt{FPSCR.FZ16} is 0.
- Otherwise only when \texttt{FPSCR.FZ} is 0.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC32_EL2.TFV is 0 and this bit is RW, this bit is invalid and \texttt{UNKNOWN}.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

This field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{OFF, bit [2]}

Overflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Overflow exception occurred while \texttt{FPSCR.OFE} was 1:

<table>
<thead>
<tr>
<th>OFF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Overflow exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Overflow exception has occurred.</td>
</tr>
</tbody>
</table>

This bit must be cleared to 0 by the exception-handling routine.
When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and **UNKNOWN**.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

This field resets to an architecturally **UNKNOWN** value.

### DZF, bit [1]

Divide by Zero trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether a Divide by Zero exception occurred while **FPSCR.DZE** was 1:

<table>
<thead>
<tr>
<th>DZF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Divide by Zero exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Divide by Zero exception has occurred.</td>
</tr>
</tbody>
</table>

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and **UNKNOWN**.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

This field resets to an architecturally **UNKNOWN** value.

### IOF, bit [0]

Invalid Operation trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Invalid Operation exception occurred while **FPSCR.IOE** was 1:

<table>
<thead>
<tr>
<th>IOF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Invalid Operation exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Invalid Operation exception has occurred.</td>
</tr>
</tbody>
</table>

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and **UNKNOWN**.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

This field resets to an architecturally **UNKNOWN** value.

### Accessing the FPEXC32_EL2

Accesses to this register use the following encodings:

**MRS <Xt>, FPEXC32_EL2**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b100</td>
<td>0b0101</td>
<td>0b0011</td>
<td>0b000</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
   UNDEFINED;
elsif PSTATE.EL == EL1 then
   if EL2Enabled() && HCR_EL2.NV == '1' then
      AArch64.SystemAccessTrap(EL2, 0x18);
   else
      UNDEFINED;
elsif PSTATE.EL == EL2 then
   if HCR_EL2.E2H == '0' && CPTR_EL2.TFP == '1' then
      AArch64.SystemAccessTrap(EL2, 0x07);
   elsif HCR_EL2.E2H == '1' && CPTR_EL2.FPEN == 'x0' then
      AArch64.SystemAccessTrap(EL2, 0x07);
   elsif HaveEL(EL3) && !ELUsingAArch32(EL3) && CPTR_EL3.TFP == '1' then
      AArch64.SystemAccessTrap(EL3, 0x07);
   else
      FPEXC32_EL2 = X[t];

FPSR, Floating-point Status Register

The FPSR characteristics are:

**Purpose**

Provides floating-point system status information.

**Configuration**

The named fields in this register map to the equivalent fields in the AArch32 FPSR.

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

FPSR is a 64-bit register.

**Field descriptions**

The FPSR bit assignments are:

|   | 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|---|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| N | Z  | C  | V  | QC | RES0| DC | RES0| IXC | UFC | OFC | DZC | IOC | RES0| RES0| RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 |
|---|----|----|----|----|-----|----|-----|-----|-----|-----|-----|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|

**Bits [63:32]**

Reserved, **RES0**.

**N, bit [31]**

Negative condition flag for AArch32 floating-point comparison operations. AArch64 floating-point comparisons set the PSTATE.N flag instead.

This field resets to an architecturally **UNKNOWN** value.

**Z, bit [30]**

Zero condition flag for AArch32 floating-point comparison operations. AArch64 floating-point comparisons set the PSTATE.Z flag instead.

This field resets to an architecturally **UNKNOWN** value.

**C, bit [29]**

Carry condition flag for AArch32 floating-point comparison operations. AArch64 floating-point comparisons set the PSTATE.C flag instead.

This field resets to an architecturally **UNKNOWN** value.

**V, bit [28]**

Overflow condition flag for AArch32 floating-point comparison operations. AArch64 floating-point comparisons set the PSTATE.V flag instead.
This field resets to an architecturally **UNKNOWN** value.

**QC, bit [27]**

Cumulative saturation bit, Advanced SIMD only. This bit is set to 1 to indicate that an Advanced SIMD integer operation has saturated since 0 was last written to this bit.

This field resets to an architecturally **UNKNOWN** value.

**Bits [26:8]**

Reserved, RES0.

**IDC, bit [7]**

Input Denormal cumulative floating-point exception bit. This bit is set to 1 to indicate that the Input Denormal floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.IDE bit. This bit is only set to 1 to indicate a floating-point exception if FPCR.IDE is 0, or if trapping software sets it.

This field resets to an architecturally **UNKNOWN** value.

**Bits [6:5]**

Reserved, RES0.

**IXC, bit [4]**

Inexact cumulative floating-point exception bit. This bit is set to 1 to indicate that the Inexact exception floating-point has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.IXE bit. This bit is only set to 1 to indicate a floating-point exception if FPCR.IXE is 0, or if trapping software sets it.

This field resets to an architecturally **UNKNOWN** value.

**UFC, bit [3]**

Underflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Underflow floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.UFE bit. This bit is only set to 1 to indicate a floating-point exception if FPCR.UFE is 0, or if trapping software sets it.

This field resets to an architecturally **UNKNOWN** value.

**OFC, bit [2]**

Overflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Overflow floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.OFE bit. This bit is only set to 1 to indicate a floating-point exception if FPCR.OFE is 0, or if trapping software sets it.

This field resets to an architecturally **UNKNOWN** value.

**DZC, bit [1]**

Divide by Zero cumulative floating-point exception bit. This bit is set to 1 to indicate that the Divide by Zero floating-point exception has occurred since 0 was last written to this bit.
How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.DZE bit. This bit is only set to 1 to indicate a floating-point exception if FPCR.DZE is 0, or if trapping software sets it.

This field resets to an architecturally UNKNOWN value.

**IOC, bit [0]**

Invalid Operation cumulative floating-point exception bit. This bit is set to 1 to indicate that the Invalid Operation floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.IOE bit. This bit is only set to 1 to indicate a floating-point exception if FPCR.IOE is 0, or if trapping software sets it.

This field resets to an architecturally UNKNOWN value.

GCR_EL1, Tag Control Register.

The GCR_EL1 characteristics are:

**Purpose**

Tag Control Register.

**Configuration**

This register is present only when ARMv8.5-MemTag is implemented and ID_AA64PFR1_EL1.MTE != 0b0001. Otherwise, direct accesses to GCR_EL1 are **UNDEFINED**.

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

GCR_EL1 is a 64-bit register.

**Field descriptions**

The GCR_EL1 bit assignments are:

```

</table>
```

**Bits [63:17]**

Reserved, RES0.

**RRND, bit [16]**

Controls whether RandomTag() generates a deterministic value solely based on the contents of RGSR_EL1, or a non-deterministic value.

<table>
<thead>
<tr>
<th>RRND</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Generate a deterministic value based on RGSR_EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Generate an IMPLEMENTATION DEFINED non-deterministic value.</td>
</tr>
</tbody>
</table>

**Note**

When the value of GCR_EL1.RRND is 1, the value generated does not need to be cryptographically random.

A similar algorithm to that used when RRND=0 but with free running clock is sufficient.

This field resets to an architecturally **UNKNOWN** value.

**Exclude, bits [15:0]**

Allocation Tag values excluded from selection by ChooseNonExcludedTag().

This field resets to an architecturally **UNKNOWN** value.

HACR_EL2, Hypervisor Auxiliary Control Register

The HACR_EL2 characteristics are:

**Purpose**

Controls trapping to EL2 of IMPLEMENTATION DEFINED aspects of EL1 or EL0 operation.

**Note**

Arm recommends that the values in this register do not cause unnecessary traps to EL2 when HCR_EL2.E2H, TGE == {1, 1}.

**Configuration**

AArch64 System register HACR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HACR[31:0].

If EL2 is not implemented, this register is RES from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HACR_EL2 is a 64-bit register.

**Field descriptions**

The HACR_EL2 bit assignments are:

MSR HACR_EL2, <Xt>
The HAFGRTR_EL2 characteristics are:

**Purpose**

Provides controls for traps of MRS reads of Activity Monitors System registers.

**Configuration**

This register is present only when AMUv1 is implemented and ARMv8.6-FGT is implemented. Otherwise, direct accesses to HAFGRTR_EL2 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HAFGRTR_EL2 is a 64-bit register.

**Field descriptions**

The HAFGRTR_EL2 bit assignments are:

HCR_EL2, Hypervisor Configuration Register

The HCR_EL2 characteristics are:

**Purpose**

Provides configuration controls for virtualization, including defining whether various operations are trapped to EL2.

**Configuration**

AArch64 System register HCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HCR[31:0].

AArch64 System register HCR_EL2 bits [63:32] are architecturally mapped to AArch32 System register HCR2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

The bits in this register behave as if they are 0 for all purposes other than direct reads of the register if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HCR_EL2 is a 64-bit register.

**Field descriptions**

The HCR_EL2 bit assignments are:

**TWEDEL, bits [63:60]**

When ARMv8.6-TWED is implemented:

TWE Delay. A 4-bit unsigned number that, when HCR_EL2.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE caused by HCR_EL2.TWE as $2^{(TWEDEL + 8)}$ cycles.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**TWDEn, bit [59]**

When ARMv8.6-TWED is implemented:

TWE Delay Enable. Enables a configurable delayed trap of the WFE instruction caused by HCR_EL2.TWE.

<table>
<thead>
<tr>
<th>TWDEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>000</td>
<td>The delay for taking a WFE trap is IMPLEMENTATION DEFINED.</td>
</tr>
<tr>
<td>001</td>
<td>The delay for taking a WFE trap is at least the number of cycles defined in HCR_EL2.TWEDEL.</td>
</tr>
</tbody>
</table>
This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**TID5, bit [58]**

**When ARMv8.5-MemTag is implemented:**

Trap ID group 5. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

AArch64:

- **GMID_EL1.**

<table>
<thead>
<tr>
<th>TID5</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>The specified EL1 and EL0 accesses to ID group 5 registers are</td>
</tr>
<tr>
<td></td>
<td>trapped to EL2.</td>
</tr>
</tbody>
</table>

When the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field has an Effective value of 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**DCT, bit [57]**

**When ARMv8.5-MemTag is implemented:**

Default Cacheability Tagging. When **HCR_EL2.DC** is in effect, controls whether stage 1 translations are treated as Tagged or Untagged.

<table>
<thead>
<tr>
<th>DCT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 1 translations are treated as Untagged.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 1 translations are treated as Tagged.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

** Otherwise:**

Reserved, RES0.

**ATA, bit [56]**

**When ARMv8.5-MemTag is implemented:**

Allocation Tag Access. When **SCR_EL3.ATA=1** and **HCR_EL2.(E2H,TGE) != {1,1}**, controls EL1 and EL0 access to Allocation Tags.

When access is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.

MRS and MSR instructions at EL1 using GCR_EL1, RGSR_EL1, TFSR_EL1, TFSR_EL2, or TFSRE0_EL1 that are not UNDEFINED are trapped to EL2.

<table>
<thead>
<tr>
<th>ATA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access is prevented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access is not prevented.</td>
</tr>
</tbody>
</table>

This field is permitted to be cached in a TLB.
This field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

**TTLBOS, bit [55]**

When ARMv8.2-EVT is implemented:

Trap TLB maintenance instructions that operate on the Outer Shareable domain. Traps execution of those TLB maintenance instructions at EL1 using AArch64 to EL2 when EL2 is enabled in the current Security state. This applies to the following instructions:

- TLBI VMALLE1OS
- TLBI VAE1OS
- TLBI ASIDE1OS
- TLBI VAAE1OS
- TLBI VALE1OS
- TLBI VALE1OS
- TLBI RVAE1OS
- TLBI RVAAE1OS
- TLBI RVFAE1OS
- TLBI VAALE1OS
- TLBI RVALE1OS

<table>
<thead>
<tr>
<th>TTLBOS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Execution of the specified instructions are trapped to EL2.</td>
</tr>
</tbody>
</table>

If ARMv8.2-EVT is not implemented, this field is RES0.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2 {E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

**TTLBIS, bit [54]**

When ARMv8.2-EVT is implemented:

Trap TLB maintenance instructions that operate on the Inner Shareable domain. Traps execution of those TLB maintenance instructions at EL1 using AArch64, and at EL1 using AArch32, to EL2 when EL2 is enabled in the current Security state. This applies to the following instructions:

- When EL1 is using AArch64, TLBI VMALLE1IS, TLBI VAE1IS, TLBI ASIDE1IS, TLBI VAAE1IS, TLBI VALE1IS, TLBI RVAE1IS, TLBI RVAAE1IS, TLBI RVFAE1IS, and TLBI VAALE1IS.
- When EL1 is using AArch32, TLBIALIS, TLBIMVAIS, TLBIASIDIS, TLBIMVAIS, TLBIMVALIS, and TLBIMVAALIS.

<table>
<thead>
<tr>
<th>TTLBIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Execution of the specified instructions are trapped to EL2.</td>
</tr>
</tbody>
</table>

If ARMv8.2-EVT is not implemented, this field is RES0.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2 {E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.
This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**EnSCXT, bit [53]**

*When ARMv8.0-CSV2 is implemented:*

Enable Access to the **SCXTNUM_EL1** and **SCXTNUM_EL0** registers. The defined values are:

<table>
<thead>
<tr>
<th>EnSCXT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When (HCR_EL2.TGE==0 or HCR_EL2.E2H==0) and EL2 is enabled in the current Security state, EL1 and EL0 access to <strong>SCXTNUM_EL0</strong> and EL1 access to <strong>SCXTNUM_EL1</strong> is disabled by this mechanism, causing an exception to EL2, and the values of these registers to be treated as 0. When ((HCR_EL2.TGE==1 and HCR_EL2.E2H==1) and EL2 is enabled in the current Security state, EL0 access to <strong>SCXTNUM_EL0</strong> is disabled by this mechanism, causing an exception to EL2, and the value of this register to be treated as 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause accesses to <strong>SCXTNUM_EL0</strong> or <strong>SCXTNUM_EL1</strong> to be trapped.</td>
</tr>
</tbody>
</table>

When ARMv8.1-VHE is implemented, and the value of **HCR_EL2.E2H, TGE** is {1,1}, this bit has no effect on execution at EL0.

This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**TOCU, bit [52]**

*When ARMv8.2-EVT is implemented:*

Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of those cache maintenance instructions at EL1 or EL0 using AArch64, and at EL1 using AArch32, to EL2 when EL2 is enabled in the current Security state. This applies to the following instructions:

- When **SCTLR_EL1.UCI** is 1, HCR_EL2.(TGE, E2H) is not {1, 1}, and EL0 is using AArch64, **IC IVAU, DC CVAU**.
- When EL1 is using AArch64, **IC IVAU, IC IALLU, DC CVAU**.
- When EL1 is using AArch32, **ICIMVAU, ICIALLU, DCCMVAU**.

**Note**

An exception generated because an instruction is **UNDEFINED** at EL0 is higher priority than this trap to EL2. In addition:

- **IC IALLUIS** and **IC IALLU** are always **UNDEFINED** at EL0 using AArch64.
- **ICIMVAU, ICIALLU, ICIALLUS**, and **DCCMVAU** are always **UNDEFINED** at EL0 using AArch32.

<table>
<thead>
<tr>
<th>TOCU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Execution of the specified instructions are trapped to EL2.</td>
</tr>
</tbody>
</table>

If the Point of Unification is before any level of data cache, it is **IMPLEMENTATION DEFINED** whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.
If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.E2H, TGE is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AMVOFFEN, bit [51]

When ARMv8.6-AMU is implemented:

Activity Monitors Virtual Offsets Enable.

<table>
<thead>
<tr>
<th>AMVOFFEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Virtualization of the Activity Monitors is disabled. Indirect reads of the virtual offset registers are zero.</td>
</tr>
<tr>
<td>0b1</td>
<td>Virtualization of the Activity Monitors is enabled.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

TICAB, bit [50]

When ARMv8.2-EVT is implemented:

Trap ICIALUIS/IC IALLUIS cache maintenance instructions. Traps execution of those cache maintenance instructions at EL1 using AArch64, and at EL1 using AArch32, to EL2 when EL2 is enabled in the current Security state. This applies to the following instructions:

- When EL1 is using AArch64, IC IALLUIS.
- When EL1 is using AArch32, ICIALUIS.

<table>
<thead>
<tr>
<th>TICAB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 execution of the specified instructions is trapped to EL2.</td>
</tr>
</tbody>
</table>

If ARMv8.2-EVT is not implemented, this field is RES0.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.E2H, TGE is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TID4, bit [49]

When ARMv8.2-EVT is implemented:

Trap ID group 4. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:
AArch64:

- EL1 reads of CCSIDR EL1, CCSIDR2 EL1, CLIDR EL1, and CSSELR EL1.
- EL1 writes to CSSELR EL1.

AArch32:

- EL1 reads of CCSIDR, CCSIDR2, CLIDR, and CSSELR.
- EL1 writes to CSSELR.

<table>
<thead>
<tr>
<th>TID4</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>The specified EL1 and EL0 accesses to ID group 4 registers are trapped to EL2.</td>
</tr>
</tbody>
</table>

If ARMv8.2-EVT is not implemented, this field is RES0.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1, 1\}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [48]

Reserved, RES0.

FIEN, bit [47]

When ARMv8.4-RAS is implemented:

Fault Injection Enable. Unless this bit is set to 1, accesses to the ERXPFGCDN_EL1, ERXPFGCTL_EL1, and ERXPFGF_EL1 registers from EL1 generate a Trap exception to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18.

<table>
<thead>
<tr>
<th>FIEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to the specified registers from EL1 are trapped to EL2, when EL2 is enabled in the current Security state.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

If EL2 is disabled in the current Security state, the Effective value of HCR_EL2.FIEN is 0b1.

If ERRIDR_EL1.NUM is zero, meaning no error records are implemented, or no error record accessible using System registers is owned by a node that implements the RAS Common Fault Injection Model Extension, then this bit might be RES0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FWB, bit [46]

When ARMv8.4-S2FWB is implemented:

Defines the combined cacheability attributes in a 2 stage translation regime.
FWB

<table>
<thead>
<tr>
<th>FWB</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0 | When this bit is 0, then:  
|     | • The combination of stage 1 and stage 2 translations on memory type and cacheability attributes are as described in the Armv8.0 architecture. For more information see D4.5.4 Combining the stage 1 and stage 2 attributes  
|     | • The encoding of the stage 2 memory type and cacheability attributes in bits[5:2] of the stage 2 page or block descriptors are as described in the Armv8.0 architecture. |
| 0b1 | When this bit is 1, then:  
|     | • Bit[5] of stage 2 page or block descriptor is RES0.  
|     | • When bit[4] of stage 2 page or block descriptor is 1 and when:  
|     | ◦ Bits[3:2] of stage 2 page or block descriptor are 0b11, the resultant memory type and inner or outer cacheability attribute is the same as the stage 1 memory type and inner or outer cacheability attribute.  
|     | ◦ Bits[3:2] of stage 2 page or block descriptor are 0b10, the resultant memory type and attribute is Normal Write-Back.  
|     | ◦ Bits[3:2] of stage 2 page or block descriptor are 0b0x, the resultant memory type will be Normal Non-cacheable except where the stage 1 memory type was Device->attr< the resultant memory type will be Device->attr<  
|     | • When bit[4] of stage 2 page or block descriptor is 0 the memory type is Device, and when:  
|     | ◦ Bits[3:2] of stage 2 page or block descriptor are 0b00, the stage 2 memory type is Device-nGnRnE.  
|     | ◦ Bits[3:2] of stage 2 page or block descriptor are 0b01, the stage 2 memory type is Device-nGnRE.  
|     | ◦ Bits[3:2] of stage 2 page or block descriptor are 0b10, the stage 2 memory type is Device-nGRE.  
|     | ◦ Bits[3:2] of stage 2 page or block descriptor are 0b11, the stage 2 memory type is Device-GRE.  
|     | • If the stage 1 translation specifies a cacheable memory type, then the stage 1 cache allocation hint is applied to the final cache allocation hint where the final memory type is cacheable.  
|     | • If the stage 1 translation does not specify a cacheable memory type, then if the final memory type is cacheable, it is treated as read allocate, write allocate.  
|     | The stage 1 and stage 2 memory types are combined in the manner described in D4.5.4 Combining the stage 1 and stage 2 attributes |

In Secure state, this bit applies to both the Secure stage 2 translation and the Non-secure stage 2 translation.

This bit is permitted to be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NV2, bit [45]

When ARMv8.4-NV is implemented:

Nested Virtualization. Changes the behaviors of HCR_EL2.{NV, NV1} to provide a mechanism for hardware to transform reads and writes from System registers into reads and writes from memory.
TABLE 18-12

<table>
<thead>
<tr>
<th>NV2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This bit has no effect on the behavior of HCR_EL2.{NV, NV1}.</td>
</tr>
<tr>
<td>0b1</td>
<td>Redefines behavior of HCR_EL2{NV, NV1} to enable:</td>
</tr>
<tr>
<td></td>
<td>• Transformation of read/writes to registers into read/writes</td>
</tr>
<tr>
<td></td>
<td>to memory.</td>
</tr>
<tr>
<td></td>
<td>• Redirection of EL2 registers to EL1 registers.</td>
</tr>
</tbody>
</table>

When this bit is 0, the behavior of HCR_EL2.\{NV, NV1\} is as defined for ARMv8.3-NV.

When this is bit is 1, then any exception taken from EL1 and taken to EL1 causes SPSR_EL1.M[3:2] to be set to 0b10 and not 0b01.

This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**AT, bit [44]**

**When ARMv8.3-NV is implemented:**

Address Translation. EL1 execution of the following address translation instructions is trapped to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18:

- AT S1E0R, AT S1E0W, AT S1E1R, AT S1E1W, AT S1E1RP, AT S1E1WP

<table>
<thead>
<tr>
<th>AT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 execution of the specified instructions is trapped to EL2.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**NV1, bit [43]**

**When ARMv8.4-NV is implemented:**

Nested Virtualization.

<table>
<thead>
<tr>
<th>NV1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If HCR_EL2.{NV, NV2} are both 1, accesses executed from EL1 to</td>
</tr>
<tr>
<td></td>
<td>implemented EL12, EL02, or EL2 registers are transformed to loads and</td>
</tr>
<tr>
<td></td>
<td>stores.                   If HCR_EL2.NV2 is 0 or HCR_EL2.{NV, NV2} == {0, 1}, this</td>
</tr>
<tr>
<td></td>
<td>control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>If HCR_EL2.NV2 is 1, accesses executed from EL1 to implemented EL2</td>
</tr>
<tr>
<td></td>
<td>registers are transformed to loads and stores.</td>
</tr>
<tr>
<td></td>
<td>If HCR_EL2.NV2 is 0, EL1 accesses to VBAR_EL1, ELR_EL1, and</td>
</tr>
<tr>
<td></td>
<td>SPSR_EL1, are trapped to EL2, when EL2 is enabled in the current</td>
</tr>
<tr>
<td></td>
<td>Security state, reported using EC syndrome value 0x18.</td>
</tr>
</tbody>
</table>

If HCR_EL2.NV2 is 1, the value of HCR_EL2.NV1 defines which EL1 register accesses are transformed to loads and stores. These transformed accesses have priority over the trapping of registers.

The trapping of EL1 registers caused by other control bits has priority over the transformation of these accesses.

If a register is specified that is not implemented by an implementation, then access to that register are **UNDEFINED**.

For the list of registers affected, see Enhanced support for nested virtualization.

If HCR_EL2.\{NV, NV1, NV2\} are \{1, 0, 0\}, any exception taken from EL1, and taken to EL1, causes the SPSR_EL1.M[3:2] to be set to 0b10, and not 0b01.
If HCR_EL2.{NV, NV1, NV2} are \{1, 1, 0\}, then:

- The EL1 translation table Block and Page descriptors:
  - Bit[54] holds the PXN instead of the UXN.
  - Bit[53] is RES0.
  - Bit[6] is treated as 0 regardless of the actual value.
- If Hierarchical Permissions are enabled, the EL1 translation table Table descriptors are as follows:
  - Bit[61] is treated as 0 regardless of the actual value.
  - Bit[60] holds the PXNTable instead of the UXNTable.
  - Bit[59] is RES0.
- When executing at EL1, the PSTATE.PAN bit is treated as zero for all purposes except reading the value of the bit.
- When executing at EL1, the LDTR* instructions are treated as the equivalent LDR* instructions, and the STTR* instructions are treated as the equivalent STR* instructions.

If HCR_EL2.{NV, NV1, NV2} are \{0, 1, 0\}, then the behavior is a CONSTRAINED UNPREDICTABLE choice of:

- Behaving as if HCR_EL2.NV is 1 and HCR_EL2.NV1 is 1 for all purposes other than reading back the value of the HCR_EL2.NV bit.
- Behaving as if HCR_EL2.NV is 0 and HCR_EL2.NV1 is 0 for all purposes other than reading back the value of the HCR_EL2.NV1 bit.
- Behaving with regard to the HCR_EL2.NV and HCR_EL2.NV1 bits behavior as defined in the rest of this description.

This bit is permitted to be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

When ARMv8.3-NV is implemented:

Nested Virtualization. EL1 accesses to certain registers are trapped to EL2, when EL2 is enabled in the current Security state.

<table>
<thead>
<tr>
<th>NV1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>01</td>
<td>EL1 accesses to VBAR_EL1, ELR_EL1, SPSR_EL1 are trapped to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18.</td>
</tr>
</tbody>
</table>

If HCR_EL2.NV is 1 and HCR_EL2.NV1 is 0 then the following effects also apply:

- Any exception taken from EL1, and taken to EL1, causes the SPSR_EL1.M[3:2] to be set to 0b10, and not 0b01.

If the bits HCR_EL2.NV and HCR_EL2.NV1 are both set to 1 then following effects also apply:

- The EL1 translation table Block and Page descriptors:
  - Bit[54] holds the PXN instead of the UXN.
  - Bit[53] is RES0.
  - Bit[6] is treated as 0 regardless of the actual value.
- If Hierarchical Permissions are enabled, the EL1 translation table Table descriptors are as follows:
  - Bit[61] is treated as 0 regardless of the actual value.
  - Bit[60] holds the PXNTable instead of the UXNTable.
  - Bit[59] is RES0.
- When executing at EL1, the PSTATE.PAN bit is treated as zero for all purposes except reading the value of the bit.
- When executing at EL1, the LDTR* instructions are treated as the equivalent LDR* instructions, and the STTR* instructions are treated as the equivalent STR* instructions.

If HCR_EL2.NV is 0 and HCR_EL2.NV1 is 1 then the behavior is a CONSTRAINED UNPREDICTABLE choice of:

- Behaving as if HCR_EL2.NV is 1 and HCR_EL2.NV1 is 1 for all purposes other than reading back the value of the HCR_EL2.NV bit.
- Behaving as if HCR_EL2.NV is 0 and HCR_EL2.NV1 is 0 for all purposes other than reading back the value of the HCR_EL2.NV1 bit.
- Behaving with regard to the HCR_EL2.NV and HCR_EL2.NV1 bits behavior as defined in the rest of this description.

This bit is permitted to be cached in a TLB.
This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**NV, bit [42]**

*When ARMv8.4-NV is implemented:*

Nested Virtualization.

When HCR_EL2.NV2 is 1, redefines register accesses so that:

- Instructions accessing the Special purpose registers `SPSR_EL2` and `ELR_EL2` instead access `SPSR_EL1` and `ELR_EL1` respectively.
- Instructions accessing the System registers `ESR_EL2` and `FAR_EL2` instead access `ESR_EL1` and `FAR_EL1`.

When HCR_EL2.NV2 is 0, or if ARMv8.4-NV is not implemented, traps functionality that is permitted at EL2 and would be **UNDEFINED** at EL1 if this field was 0, when EL2 is enabled in the current Security state. This applies to the following operations:

- EL1 accesses to Special-purpose registers that are not **UNDEFINED** at EL2.
- EL1 accesses to System registers that are not **UNDEFINED** at EL2.
- Execution of EL1 or EL2 translation regime address translation and TLB maintenance instructions for EL2 and above.

<table>
<thead>
<tr>
<th>NV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When this bit is set to 0, HCR_EL2.NV2 == 0 for all purposes other than reading this register. This control does not cause any instructions to be trapped. When HCR_EL2.NV2 is 1, no ARMv8.4-NV functionality is implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>When HCR_EL2.NV2 is 0, or if ARMv8.4-NV is not implemented, EL1 accesses to the specified registers or the execution of the specified instructions are trapped to EL2, when EL2 is enabled in the current Security state. EL1 read accesses to the <code>CurrentEL</code> register return a value of 0x2. When HCR_EL2.NV2 is 1, this control redefines EL1 register accesses so that instructions accessing <code>SPSR_EL2</code>, <code>ELR_EL2</code>, <code>ESR_EL2</code>, and <code>FAR_EL2</code> instead access <code>SPSR_EL1</code>, <code>ELR_EL1</code>, <code>ESR_EL1</code>, and <code>FAR_EL1</code> respectively.</td>
</tr>
</tbody>
</table>

When HCR_EL2.NV2 is 0, or if ARMv8.4-NV is not implemented, then:

- The System or Special-purpose registers for which accesses are trapped and reported using EC syndrome value 0x18 are as follows:
  - Registers accessed using MRS or MSR with a name ending in `_EL2`, except `SP_EL2`.
  - Registers accessed using MRS or MSR with a name ending in `_EL12`.
  - Registers accessed using MRS or MSR with a name ending in `_EL02`.
  - Special-purpose registers `SPSR_irq`, `SPSR_abt`, `SPSR_und` and `SPSR_fiq`, accessed using MRS or MSR.
  - Special-purpose register `SP_EL1` accessed using the dedicated MRS or MSR instruction.
- The instructions for which the execution is trapped and reported using EC syndrome value 0x18 are as follows:
  - EL2 translation regime Address Translation instructions and TLB maintenance instructions.
  - EL1 translation regime Address Translation instructions and TLB maintenance instructions that are only accessible from EL2 and EL3.
- The instructions for which the execution is trapped as follows:
  - SMC in an implementation that does not include EL3 and when HCR_EL2.TSC is 1. HCR_EL2.TSC bit is RES0 in this case. This is reported using EC syndrome value 0x17.
  - The ERET, ERETTAA, and ERETAB instructions, reported using EC syndrome value 0x1A.

**Note**

The priority of this trap is higher than the priority of the HCR_EL2.API trap. If both of these bits are set so that EL1 execution of an ERETTAA or ERETAB instruction is trapped to EL2, then the syndrome reported is 0x1A.
This field resets to an architecturally unknown value.

When ARMv8.3-NV is implemented:

Nested Virtualization. Traps functionality that is permitted at EL2 and would be undefined at EL1 if this field was 0, when EL2 is enabled in the current Security state. This applies to the following operations:

- EL1 accesses to Special-purpose registers that are not undefined at EL2.
- EL1 accesses to System registers that are not undefined at EL2.
- Execution of EL1 or EL2 translation regime address translation and TLB maintenance instructions for EL2 and above.

The possible values are:

<table>
<thead>
<tr>
<th>NV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 accesses to the specified registers or the execution of the specified instructions are trapped to EL2, when EL2 is enabled in the current Security state. EL1 read accesses to the currentEL register return a value of 0x2.</td>
</tr>
</tbody>
</table>

The System or Special-purpose registers for which accesses are trapped and reported using EC syndrome value 0x18 are as follows:

- Registers accessed using MRS or MSR with a name ending in _EL2, except SP_EL2.
- Registers accessed using MRS or MSR with a name ending in _EL12.
- Registers accessed using MRS or MSR with a name ending in _EL02.
- Special-purpose registers SPSR_irq, SPSR_abt, SPSR_und and SPSR_fiq, accessed using MRS or MSR.
- Special-purpose register SP_EL1 accessed using the dedicated MRS or MSR instruction.

The instructions for which the execution is trapped and reported using EC syndrome value 0x18 are as follows:

- EL2 translation regime Address Translation instructions and TLB maintenance instructions.
- EL1 translation regime Address Translation instructions and TLB maintenance instructions that are only accessible from EL2 and EL3.

The execution of the ERET, ERETA, and ERETAB instructions are trapped and reported using EC syndrome value 0x1A

Note

The priority of this trap is higher than the priority of the HCR_EL2.API trap. If both of these bits are set so that EL1 execution of an ERETA or ERETAB instruction is trapped to EL2, then the syndrome reported is 0x1A.

The execution of the SMC instructions in an implementation that does not include EL3 and when HCR_EL2.TSC is 1 are trapped and reported using EC syndrome value 0x17. HCR_EL2.TSC bit is not res0 in this case.

This bit is permitted to be cached in a TLB.

This field resets to an architecturally unknown value.

Otherwise:

Reserved, res0.

API, bit [41]

When ARMv8.3-PAuth is implemented:

Controls the use of instructions related to Pointer Authentication:

- In EL0, when HCR_EL2.TGE==0 or HCR_EL2.E2H==0, and the associated SCTLR_EL1.En<N><M>==1.
- In EL1, the associated SCTLR_EL1.En<N><M>==1.
Traps are reported using EC syndrome value 0x09. The Pointer Authentication instructions trapped are:

- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB.
- PACGA, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZB.
- RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETTA, ERETTB, LDRAA and LDRAB.

<table>
<thead>
<tr>
<th>API</th>
<th>Meaning</th>

</table>

This bit has no effect on the EL2, EL2&0, or EL3 translation regimes.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2 {E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

RW, bit [31]

Execution state control for lower Exception levels:

<table>
<thead>
<tr>
<th>RW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Lower levels are all AArch32.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Execution state for EL1 is AArch64. The Execution state for EL0 is determined by the current value of PSTATE.nRW when executing at EL0.</td>
</tr>
</tbody>
</table>

If AArch32 state is not supported by the implementation at EL1, then this bit is RAO/WI.

In an implementation that includes EL3, when EL2 is not enabled in Secure state, the PE behaves as if this bit has the same value as the SCR_EL3.RW bit for all purposes other than a direct read or write access of HCR_EL2.

The RW bit is permitted to be cached in a TLB.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2 {E2H, TGE} is {1, 1}, this field behaves as 1 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

TRVM, bit [30]

Trap Reads of Virtual Memory controls. Traps EL1 reads of the virtual memory control registers to EL2, when EL2 is enabled in the current Security state, from both Execution states as follows:

- If EL1 is using AArch64 state, the following registers are trapped to EL2 and reported using EC syndrome value 0x18.
HCR_EL2, Hypervisor Configuration Register

- SCTLR_EL1, TTBR0_EL1, TTBR1_EL1, TCR_EL1, ESR_EL1, FAR_EL1, AFSR0_EL1, AFSR1_EL1, MAIR_EL1, AMAIR_EL1, CONTEXTIDR_EL1.

- If EL1 is using AArch32 state, accesses using MRC to the following registers are trapped to EL2 and reported using EC syndrome value 0x03, accesses using MRRC are trapped to EL2 and reported using EC syndrome value 0x04:
  - SCTLR, TTBR0, TTBR1, TTBCR, TTBCR2, DACR, DFSR, IFSR, DFAR, IFAR, ADFSR, AIIFSR, PRRR, NMRR, MAIR0, MAIR1, AMAIR0, AMAIR1, CONTEXTIDR.

<table>
<thead>
<tr>
<th>TRVM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 read accesses to the specified Virtual Memory controls are trapped to EL2, when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

**Note**

EL2 provides a second stage of address translation, that a hypervisor can use to remap the address map defined by a Guest OS. In addition, a hypervisor can trap attempts by a Guest OS to write to the registers that control the memory system. A hypervisor might use this trap as part of its virtualization of memory management.

This field resets to an architecturally **UNKNOWN** value.

**HCD, bit [29]**

HVC instruction disable. Disables EL1 execution of HVC instructions, from both Execution states, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x80.

<table>
<thead>
<tr>
<th>HCD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>HVC instruction execution is enabled at EL2 and EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>HVC instructions are <strong>UNDEFINED</strong> at EL2 and EL1. Any resulting exception is taken to the Exception level at which the HVC instruction is executed.</td>
</tr>
</tbody>
</table>

**Note**

HVC instructions are always **UNDEFINED** at EL0.

This bit is only implemented if EL3 is not implemented. Otherwise, it is **RES0**.

This field resets to an architecturally **UNKNOWN** value.

**TDZ, bit [28]**

Trap **DC ZVA** instructions. Traps EL0 and EL1 execution of **DC ZVA** instructions to EL2, when EL2 is enabled in the current Security state, from AArch64 state only, reported using EC syndrome value 0x18.

If ARMv8.5-MemTag is implemented, this trap also applies to **DC GVA** and **DC GZVA**.

<table>
<thead>
<tr>
<th>TDZ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>In AArch64 state, any attempt to execute an instruction this trap applies to at EL1, or at EL0 when the instruction is not <strong>UNDEFINED</strong> at EL0, is trapped to EL2 when EL2 is enabled in the current Security state. Reading the <strong>DCZID_EL0</strong> returns a value that indicates that the instructions this trap applies to are not supported.</td>
</tr>
</tbody>
</table>

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally **UNKNOWN** value.
TGE, bit [27]

Trap General Exceptions, from EL0.

<table>
<thead>
<tr>
<th>TGE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on execution at EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>When EL2 is not enabled in the current Security state, this control has no effect on execution at EL0. When EL2 is enabled in the current Security state, in all cases:</td>
</tr>
<tr>
<td></td>
<td>• All exceptions that would be routed to EL1 are routed to EL2.</td>
</tr>
<tr>
<td></td>
<td>• The SCTLR_EL1.M field, or the SCTLR.M field if EL1 is using AArch32, is treated as being 0 for all purposes other than returning the result of a direct read of SCTLR_EL1 or SCTLR.</td>
</tr>
<tr>
<td></td>
<td>• All virtual interrupts are disabled.</td>
</tr>
<tr>
<td></td>
<td>• Any IMPLEMENTATION DEFINED mechanisms for signaling virtual interrupts are disabled.</td>
</tr>
<tr>
<td></td>
<td>• An exception return to EL1 is treated as an illegal exception return.</td>
</tr>
<tr>
<td></td>
<td>• The MDCR_EL2.{TDRA, TDOSA, TDA, TDE} fields are treated as being 1 for all purposes other than returning the result of a direct read of MDCR_EL2.</td>
</tr>
</tbody>
</table>

In addition, when EL2 is enabled in the current Security state, if:

• HCR_EL2.E2H is 0, the Effective values of the HCR_EL2.{FMO, IMO, AMO} fields are 1.
• HCR_EL2.E2H is 1, the Effective values of the HCR_EL2.{FMO, IMO, AMO} fields are 0.

For further information on the behavior of this bit when E2H is 1, see Behavior of HCR_EL2.E2H.

HCR_EL2.TGE must not be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

TVM, bit [26]

Trap Virtual Memory controls. Traps EL1 writes to the virtual memory control registers to EL2, when EL2 is enabled in the current Security state, from both Execution states as follows:

• If EL1 is using AArch64 state, the following registers are trapped to EL2 and reported using EC syndrome value 0x18:
  ◦ SCTLR_EL1, TTBR0_EL1, TTBR1_EL1, TCR_EL1, ESR_EL1, FAR_EL1, AFSR0_EL1, AFSR1_EL1, MAIR_EL1, AMAIR_EL1, CONTEXTIDR_EL1.

• If EL1 is using AArch32 state, accesses using MCR to the following registers are trapped to EL2 and reported using EC syndrome value 0x83, accesses using MCRR are trapped to EL2 and reported using EC syndrome value 0x04:
  ◦ SCTLR, TTBR0, TTBR1, TTBCR, TTBCR2, DACR, DFSR, IFSR, DFAR, IFAR, ADFSR, AIFSR, PRR, NMRR, MAIR0, MAIR1, AMAIR0, AMAIR1, CONTEXTIDR.

<table>
<thead>
<tr>
<th>TVM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 write accesses to the specified EL1 virtual memory control registers are trapped to EL2, when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

TTLB, bit [25]

When ARMv8.4-TLBI is implemented:

Trap TLB maintenance instructions. Traps EL1 execution of TLB maintenance instructions to EL2, when EL2 is enabled in the current Security state, from both Execution states as follows:
When EL1 is using AArch64 state, the following instructions are trapped to EL2 and reported using EC syndrome value 0x18:

- TLBI VMALLE1, TLBI VAE1, TLBI ASIDE1, TLBI VAAE1, TLBI VALE1, TLBI VAALE1.
- TLBI VMALLE1IS, TLBI VAE1IS, TLBI ASIDE1IS, TLBI VAAE1IS, TLBI VALE1IS, TLBI VAALE1IS.
- TLBI VMALLE1OS, TLBI VAE1OS, TLBI ASIDE1OS, TLBI VAAE1OS, TLBI VALE1OS, TLBI VAALE1OS.
- TLBI RVAE1, TLBI RVAAE1, TLBI RVALE1, TLBI RVAALE1.
- TLBI RVAE1IS, TLBI RVAAE1IS, TLBI RVALE1IS, TLBI RVAALE1IS.
- TLBI RVAE1OS, TLBI RVAAE1OS, TLBI RVALE1OS, TLBI RVAALE1OS.

When EL1 is using AArch32 state, the following instructions are trapped to EL2 and reported using EC syndrome value 0x03:

- TLBIALLIS, TLBIMVAIS, TLBIASIDIS, TLBIMVALIS, TLBIMVAALIS.
- TLBIALL, TLBIMVA, TLBIASID, TLBIMVAL, TLBIMVAAL.
- ITLBIALL, ITLBIASID, ITLBPVAAL.
- DTLBIALL, DTLBIASID, DTLBI VAL.

### TTLB Meaning

<table>
<thead>
<tr>
<th>TTLB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 execution of the specified TLB maintenance instructions are trapped to EL2, when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

When \texttt{HCR\_EL2.TGE} is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

**Note**

The TLB maintenance instructions are **undefined** at EL0.

This field resets to an architecturally **unknown** value.

### Otherwise:

Trap TLB maintenance instructions. Traps EL1 execution of TLB maintenance instructions to EL2, when EL2 is enabled in the current Security state, from both Execution states. This applies to the following instructions:

- When EL1 is using AArch64, TLBI VMALLE1IS, TLBI VAE1IS, TLBI ASIDE1IS, TLBI VAAE1IS, TLBI VALE1IS, TLBI VAALE1IS, TLBI VMALLE1, TLBI VAE1, TLBI ASIDE1, TLBI VAAE1, TLBI VALE1, TLBI VAALE1.
- When EL1 is using AArch32, TLBIALLIS, TLBIMVAIS, TLBIASIDIS, TLBIMVALIS, TLBIMVAALIS, ITLBIALL, ITLBIASID, DTLBIALL, DTLBIASID, TLBIMVAAL.

<table>
<thead>
<tr>
<th>TTLB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 execution of the specified TLB maintenance instructions are trapped to EL2, when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

When \texttt{HCR\_EL2.TGE} is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally **unknown** value.

### TPU, bit [24]

Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of those cache maintenance instructions at EL1 or EL0 using AArch64, and at EL1 using AArch32, to EL2 when EL2 is enabled in the current Security state as follows:

- If EL0 is using AArch64 state and the value of \texttt{SCTLR\_EL1. UCI} is not 0, the following instructions are trapped to EL2 and reported with EC syndrome value 0x18:
  - IC IVAU, DC CVAU. If the value of \texttt{SCTLR\_EL1. UCI} is 0 these instructions are **undefined** at EL0 and any resulting exception is higher priority than this trap to EL2.
- If EL1 is using AArch64 state, the following instructions are trapped to EL2 and reported with EC syndrome value 0x18:
  - IC IVAU, IC IALLU, IC IALLUIS, DC CVAU.
- If EL1 is using AArch32 state, the following instructions are trapped to EL2 and reported with EC syndrome value 0x18:
  - TCIMVAU, TC IALLU, TC IALLUIS, DCCMVAU.
An exception generated because an instruction is **UNDEFINED** at EL0 is higher priority than this trap to EL2. In addition:

- **IC IALLUIS** and **IC IALLU** are always **UNDEFINED** at EL0 using AArch64.
- **ICIMVAU, IC IALLU, IC IALLUIS**, and **DCCMVAU** are always **UNDEFINED** at EL0 using AArch32.

<table>
<thead>
<tr>
<th>TPC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

If the Point of Unification is before any level of data cache, it is **IMPLEMENTATION DEFINED** whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is **IMPLEMENTATION DEFINED** whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When ARMv8.1-VHE is implemented, and the value of **HCR_EL2.\{E2H, TGE\}** is \{1, 1\}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally **UNKNOWN** value.

**TPCP, bit [23]**

*When ARMv8.2-DCPoP is implemented:*

Trap data or unified cache maintenance instructions that operate to the Point of Coherency or Persistence. Traps execution of those cache maintenance instructions at EL1 or EL0 using AArch64, and at EL1 using AArch32, to EL2 when EL2 is enabled in the current Security state as follows:

- If EL0 is using AArch64 state and the value of **SCTLR_EL1.\text{UCI}** is not 0, the following instructions are trapped to EL2 and reported using EC syndrome value 0x18:
  - **DC CIVAC, DC CVAC, DC CVAP.** If the value of **SCTLR_EL1.\text{UCI}** is 0 these instructions are **UNDEFINED** at EL0 and any resulting exception is higher priority than this trap to EL2.
- If EL1 is using AArch64 state, the following instructions are trapped to EL2 and reported using EC syndrome value 0x18:
  - **DC IVAC, DC CIVAC, DC CVAC, DC CVAP.**
- If EL1 is using AArch32 state, the following instructions are trapped to EL2 and reported using EC syndrome value 0x03:
  - **DCIMVAC, DCCIMVAC, DCCMVAC.**

If ARMv8.2-DCCVADP is implemented, this trap also applies to **DC CVADP**.

If ARMv8.5-MemTag is implemented, this trap also applies to **DC CIGVAC, DC CIGDVAC, DC IGVAC, DC IGDVAC, DC CGVAC, DC CGDVAC, DC CGVAP**, and **DC CGDVAP**.

If ARMv8.2-DCCVADP and ARMv8.5-MemTag are implemented, this trap also applies to **DC CGVADP** and **DC CGDVADP**.

An exception generated because an instruction is **UNDEFINED** at EL0 is higher priority than this trap to EL2. In addition:

- AArch64 instructions which invalidate by VA to the Point of Coherency are always **UNDEFINED** at EL0 using AArch64.
- **DCIMVAC, DCCIMVAC**, and **DCCMVAC** are always **UNDEFINED** at EL0 using AArch32.
- In Armv8.0 and Armv8.1, this field is named TPC. From Armv8.2 it is named TPCP.

<table>
<thead>
<tr>
<th>TPC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>
If the Point of Coherency is before any level of data cache, it is implementation defined whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If $HCR\_EL2\{E2H, TGE\}$ is set to $\{1, 1\}$, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally unknown value.

**Otherwise:**

Trap data or unified cache maintenance instructions that operate to the Point of Coherency. Traps execution of those cache maintenance instructions at EL1 or EL0 using AArch64, and at EL1 using AArch32, to EL2 when EL2 is enabled in the current Security state as follows:

- If EL0 is using AArch64 state and the value of $SCTL\_EL1\_UCI$ is not 0, accesses to the following registers are trapped and reported using EC syndrome value $0x18$:
  - $DC\_CIVAC$, $DC\_CVAC$. However, if the value of $SCTL\_EL1\_UCI$ is 0 these instructions are undefined at EL0 and any resulting exception is higher priority than this trap to EL2.
- If EL1 is using AArch64 state, accesses to $DC\_IVAC$, $DC\_CIVAC$, $DC\_CVAC$ are trapped and reported using EC syndrome value $0x18$.
- When EL1 is using AArch32, accesses to $DCIMVAC$, $DCCIMVAC$, and $DCCMVAC$ are trapped and reported using EC syndrome value $0x03$.

**Note**

- An exception generated because an instruction is undefined at EL0 is higher priority than this trap to EL2. In addition:
  - AArch64 instructions which invalidate by VA to the Point of Coherency are always undefined at EL0 using AArch64.
  - $DCIMVAC$, $DCCIMVAC$, and $DCCMVAC$ are always undefined at EL0 using AArch32.
- In Armv8.0 and Armv8.1, this field is named TPC. From Armv8.2 it is named TPCP.

<table>
<thead>
<tr>
<th>TPC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

If the Point of Coherency is before any level of data cache, it is implementation defined whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

When ARMv8.1-VHE is implemented, and the value of $HCR\_EL2\{E2H, TGE\}$ is $\{1, 1\}$, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally unknown value.

**TSW, bit [22]**

Trap data or unified cache maintenance instructions that operate by Set/Way. Traps execution of those cache maintenance instructions at EL1 using AArch64, and at EL1 using AArch32, to EL2 when EL2 is enabled in the current Security state as follows:

- If EL1 is using AArch64 state, accesses to $DC\_ISW$, $DC\_CSW$, $DC\_CISW$ are trapped to EL2, reported using EC syndrome value $0x18$.
- If EL1 is using AArch32 state, accesses to $DCISW$, $DCCSW$, $DCCISW$ are trapped to EL2, reported using EC syndrome value $0x03$.

If ARMv8.5-MemTag is implemented, this trap also applies to $DC\_IGSW$, $DC\_IGDSW$, $DC\_CGSW$, $DC\_CGDW$, $DC\_CIGSW$, and $DC\_CIGDSW$.

**Note**

An exception generated because an instruction is undefined at EL0 is higher priority than this trap to EL2, and these instructions are always undefined at EL0.
When `HCR_EL2.TGE` is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally `UNKNOWN` value.

**TACR, bit [21]**

Trap Auxiliary Control Registers. Traps EL1 accesses to the Auxiliary Control Registers to EL2, when EL2 is enabled in the current Security state, from both Execution states as follows:

- If EL1 is using AArch64 state, accesses to `ACTLR_EL1` to EL2, are trapped to EL2 and reported using EC syndrome value 0x18.
- If EL1 is using AArch32 state, accesses to `ACTLR` and, if implemented, `ACTLR2` are trapped to EL2 and reported using EC syndrome value 0x03.

<table>
<thead>
<tr>
<th>TACR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 accesses to the specified registers are trapped to EL2, when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

When `HCR_EL2.TGE` is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

---

**Note**

`ACTLR_EL1`, `ACTLR`, and `ACTLR2` are not accessible at EL0.

The Auxiliary Control Registers are **IMPLEMENTATION DEFINED** registers that might implement global control bits for the PE.

This field resets to an architecturally `UNKNOWN` value.

---

**TIDCP, bit [20]**

Trap **IMPLEMENTATION DEFINED** functionality. Traps EL1 accesses to the encodings reserved for **IMPLEMENTATION DEFINED** functionality to EL2, when EL2 is enabled in the current Security state as follows:

- In AArch64 state, access to any of the encodings in the following reserved encoding spaces are trapped and reported using EC syndrome 0x18:
  - **IMPLEMENTATION DEFINED** System instructions, which are accessed using SYS and SYSL, with CRn == {11, 15}.
  - **IMPLEMENTATION DEFINED** System registers, which are accessed using MRS and MSR with the S3_<op1>_<_Cn>_<_Cm>_<_op2> register name.
- In AArch32 state, MCR and MRC access to instructions with the following encodings are trapped and reported using EC syndrome 0x03:
  - All coproc==p15, CRn==c9, opc1 == {0-7}, CRm == {c0-c2, c5-c8}, opc2 == {0-7}.
  - All coproc==p15, CRn==c10, opc1 == {0-7}, CRm == {c0, c1, c4, c8}, opc2 == {0-7}.
  - All coproc==p15, CRn==c11, opc1 == {0-7}, CRm == {c0-c8, c15}, opc2 == {0-7}.

When the value of HCR_EL2.TIDCP is 1, it is **IMPLEMENTATION DEFINED** whether any of this functionality accessed from EL0 is trapped to EL2. If it is not, then it is **UNDEFINED**, and any attempt to access it from EL0 generates an exception that is taken to EL1.

<table>
<thead>
<tr>
<th>TIDCP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 accesses to or execution of the specified encodings reserved for <strong>IMPLEMENTATION DEFINED</strong> functionality are trapped to EL2, when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

An implementation can also include **IMPLEMENTATION DEFINED** registers that provide additional controls, to give finer-grained control of the trapping of **IMPLEMENTATION DEFINED** features.

---

**Note**
Arm expects the trapping of EL0 accesses to these functions to EL2 to be unusual, and used only when the hypervisor is virtualizing EL0 operation. Arm strongly recommends that unless the hypervisor must virtualize EL0 operation, an EL0 access to any of these functions is **UNDEFINED**, as it would be if the implementation did not include EL2. The PE then takes any resulting exception to EL1.

The trapping of accesses to these registers from EL1 is higher priority than an exception resulting from the register access being **UNDEFINED**.

This field resets to an architecturally **UNKNOWN** value.

### TSC, bit [19]

Trap SMC instructions. Traps EL1 execution of SMC instructions to EL2, when EL2 is enabled in the current Security state, from both Execution states.

If execution is in AArch64 state the trap is reported using EC syndrome value 0x17 and if execution is in AArch32 state, the trap is reported using EC syndrome value 0x13.

**Note**

HCR_EL2.TSC traps execution of the SMC instruction. It is not a routing control for the SMC exception. Trap exceptions and SMC exceptions have different preferred return addresses.

<table>
<thead>
<tr>
<th>TSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>
| 0b1 | If EL3 is implemented, then any attempt to execute an SMC instruction at EL1 using AArch64 or EL1 using AArch32 is trapped to EL2, when EL2 is enabled in the current Security state, regardless of the value of SCR_EL3.SMD. If EL3 is not implemented, ARMv8.3-NV is implemented, and HCR_EL2.NV is 1, then any attempt to execute an SMC instruction at EL1 using AArch64 is trapped to EL2, when EL2 is enabled in the current Security state. If EL3 is not implemented, and either ARMv8.3-NV is not implemented or HCR_EL2.NV is 0, then it is IMPLEMENTATION DEFINED whether:  
• Any attempt to execute an SMC instruction at EL1 is trapped to EL2, when EL2 is enabled in the current Security state.  
• Any attempt to execute an SMC instruction is **UNDEFINED**. |

In AArch32 state, the Armv8-A architecture permits, but does not require, this trap to apply to conditional SMC instructions that fail their condition code check, in the same way as with traps on other conditional instructions. SMC instructions are **UNDEFINED** at EL0.

If EL3 is not implemented and HCR_EL2.NV is 0, it is IMPLEMENTATION DEFINED whether this bit is:  

• RES0.  
• Implemented with the functionality as described in HCR_EL2.TSC.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field. This field resets to an architecturally **UNKNOWN** value.

### TID3, bit [18]

Trap ID group 3. Traps EL1 reads of group 3 ID registers to EL2, when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, reads of the following registers are trapped to EL2, reported using EC syndrome value 0x18:
In AArch64 state, \texttt{ID.MMFR4.EL1} and \texttt{ID.MMFR5.EL1} are trapped to EL2, unless implemented as RAZ, when it is \texttt{IMPLEMENTATION DEFINED} whether accesses to \texttt{ID.MMFR4.EL1} or \texttt{ID.MMFR5.EL1} are trapped to EL2, reported using EC syndrome value 0x18.

In AArch64 state, \texttt{ID.MMFR2.EL1} and \texttt{ID.ISAR6.EL1} are trapped to EL2, unless implemented as RAZ, when it is \texttt{IMPLEMENTATION DEFINED} whether accesses to \texttt{ID.MMFR2.EL1} or \texttt{ID.ISAR6.EL1} are trapped to EL2, reported using EC syndrome value 0x18.

In AArch64 state, \texttt{ID.DFR1.EL1} is trapped to EL2, unless implemented as RAZ, when it is \texttt{IMPLEMENTATION DEFINED} whether accesses to \texttt{ID.DFR1.EL1} are trapped to EL2, reported using EC syndrome value 0x18.

In AArch64 state, \texttt{ID.MMFR4.EL1} is trapped to EL2, unless implemented as RAZ then it is \texttt{IMPLEMENTATION DEFINED} whether accesses to \texttt{ID.MMFR4.EL1} are trapped to EL2, reported using EC syndrome value 0x18.

In AArch64 state, it is \texttt{IMPLEMENTATION DEFINED} whether this field traps MRS accesses to encodings in the following range that are not already mentioned in this field description, reported using EC syndrome value 0x18:
\begin{itemize}
  \item Op0 == 3, op1 == 0, CRn == c0, CRm == \{c2-c7\}, op2 == \{0-7\}.
\end{itemize}

In AArch32 state, MRC access to the following registers are trapped to EL2, reported using EC syndrome value 0x03:
\begin{itemize}
  \item \texttt{ID.MMFR4}, \texttt{ID.MMFR5}, \texttt{ID.MVFR0}, \texttt{MVFR1}, and \texttt{MVFR2}, reported using EC syndrome value 0x08.
\end{itemize}

In AArch32 state, \texttt{ID.ISAR6} is trapped to EL2, unless implemented as RAZ, when it is \texttt{IMPLEMENTATION DEFINED} whether accesses to \texttt{ID.ISAR6} are trapped to EL2, reported using EC syndrome value 0x03.

In AArch32 state, \texttt{ID.DFR1} is trapped to EL2, unless implemented as RAZ, when it is \texttt{IMPLEMENTATION DEFINED} whether accesses to \texttt{ID.DFR1} are trapped to EL2, reported using EC syndrome value 0x03.

In AArch32 state, it is \texttt{IMPLEMENTATION DEFINED} whether this bit traps MRS accesses to encodings that are not already mentioned, with coproc==p15, opc1 == 0, CRn == c0, CRm == \{c2-c7\}, opc2 == \{0-7\}.

\begin{table}[h]
\centering
\begin{tabular}{|c|l|}
\hline
\textbf{TID3} & \textbf{Meaning} \\
\hline
0b0 & This control does not cause any instructions to be trapped. \\
0b1 & The specified EL1 read accesses to ID group 3 registers are trapped to EL2, when EL2 is enabled in the current Security state. \\
\hline
\end{tabular}
\end{table}

When \texttt{HCR_EL2.TGE} is 1, the PE ignores the value of this field for all purposes other than a direct read of this field. This field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{TID2, bit [17]}

Trap ID group 2. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state, as follows:

\begin{itemize}
  \item If EL1 is using AArch64, reads of \texttt{CTR_EL0}, \texttt{CCSIDR_EL1}, \texttt{CCSIDR2_EL1}, \texttt{CLIDR_EL1}, and \texttt{CSSELR_EL1} are trapped to EL2, reported using EC syndrome value 0x18.
\end{itemize}
If EL0 is using AArch64 and the value of SCTLR_EL1 UCT is not 0, reads of CTR_EL0 are trapped to EL2, reported using EC syndrome value 0x18. If the value of SCTLR_EL1 UCT is 0 then EL0 reads of CTR_EL0 are UNDEFINED and any resulting exception takes precedence over this trap.

If EL1 is using AArch64, writes to CSSELR_EL1 are trapped to EL2, reported using EC syndrome value 0x18.

If EL1 is using AArch32, reads of CTR, CCSIDR, CCSIDR2, CLIDR, and CSSELR are trapped to EL2, reported using EC syndrome value 0x03.

If EL1 is using AArch32, writes to CSSELR are trapped to EL2, reported using EC syndrome value 0x03.

<table>
<thead>
<tr>
<th>TID2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>The specified EL1 and EL0 accesses to ID group 2 registers are trapped to EL2, when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

When ARMv8.1-VHE is implemented, and the value of HCR_EL2 {E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

TID1, bit [16]

Trap ID group 1. Traps EL1 reads of the following registers to EL2, when EL2 is enabled in the current Security state as follows:

- **In AArch64 state**, accesses of REVIDR_EL1, AIDR_EL1, reported using EC syndrome value 0x18.
- **In AArch32 state**, accesses of TCMTR, TLBTR, REVIDR, AIDR, reported using EC syndrome value 0x03.

<table>
<thead>
<tr>
<th>TID1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>The specified EL1 read accesses to ID group 1 registers are trapped to EL2, when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

TID0, bit [15]

Trap ID group 0. Traps the following register accesses to EL2:

- EL1 reads of the JIDR, reported using EC syndrome value 0x05.
- If the JIDR is RAZ from EL0, EL0 reads of the JIDR, reported using EC syndrome value 0x05.
- EL1 accesses using VMRS of the FPSID, reported using EC syndrome value 0x08.

**Note**

- It is IMPLEMENTATION DEFINED whether the JIDR is RAZ or UNDEFINED at EL0. If it is UNDEFINED at EL0 then any resulting exception takes precedence over this trap.
- The FPSID is not accessible at EL0 using AArch32.
- Writes to the FPSID are ignored, and not trapped by this control.

<table>
<thead>
<tr>
<th>TID0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>The specified EL1 read accesses to ID group 0 registers are trapped to EL2, when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

In an AArch64 only implementation, this bit is RES0.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2 {E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.
**TWE, bit [14]**

Traps EL0 and EL1 execution of WFE instructions to EL2, when EL2 is enabled in the current Security state, from both Execution states, reported using EC syndrome value 0x01.

<table>
<thead>
<tr>
<th>TWE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any attempt to execute a WFE instruction at EL0 or EL1 is trapped to EL2, when EL2 is enabled in the current Security state, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWE or SCTLR_EL1.nTWE.</td>
</tr>
</tbody>
</table>

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE can complete at any time, even without a Wakeup event, the traps on WFE are not guaranteed to be taken, even if the WFE is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information about when WFE instructions can cause the PE to enter a low-power state, see 'Wait for Event mechanism and Send event' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally unknown value.

**TWI, bit [13]**

Traps EL0 and EL1 execution of WFI instructions to EL2, when EL2 is enabled in the current Security state, from both Execution states, reported using EC syndrome value 0x01.

<table>
<thead>
<tr>
<th>TWI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any attempt to execute a WFI instruction at EL0 or EL1 is trapped to EL2, when EL2 is enabled in the current Security state, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWI or SCTLR_EL1.nTWI.</td>
</tr>
</tbody>
</table>

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFI can complete at any time, even without a Wakeup event, the traps on WFI are not guaranteed to be taken, even if the WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information about when WFI instructions can cause the PE to enter a low-power state, see 'Wait for Interrupt' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally unknown value.
Default Cacheability.

<td>• The PE behaves as if the value of the HCR_EL2.VM field is 1 for all</td>
</tr>
<tr>
<td></td>
<td>purposes other than returning the value of a direct read of HCR_EL2.</td>
</tr>
<tr>
<td></td>
<td>• The memory type produced by stage 1 of the EL1&amp;0 translation regime</td>
</tr>
<tr>
<td></td>
<td>is Normal Non-Shareable, Inner Write-Back Read-Allocate Write-</td>
</tr>
<tr>
<td></td>
<td>Allocate, Outer Write-Back Read-Allocate Write-Allocate.</td>
</tr>
</tbody>
</table>

This field has no effect on the EL2, EL2&0, and EL3 translation regimes.

This field is permitted to be cached in a TLB.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this field.

This field resets to an architecturally UNKNOWN value.

Barrier Shareability upgrade. This field determines the minimum shareability domain that is applied to any barrier instruction executed from EL1 or EL0:

<table>
<thead>
<tr>
<th>BSU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>Inner Shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Full system.</td>
</tr>
</tbody>
</table>

This value is combined with the specified level of the barrier held in its instruction, using the same principles as combining the shareability attributes from two stages of address translation.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0b00 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

Force broadcast. Causes the following instructions to be broadcast within the Inner Shareable domain when executed from EL1:

AArch32: BPIALL, TLBIALL, TLBIMVA, TLBISAD, DTLBIALL, DTLBIMVA, DTLBISAD, TLBIALL, TLTBIMVA, ITLBISAD, TLBIMVAA, ICIALL, TLBIVAL, TLBIVALA.

AArch64: TLBI VMALLE1, TLBI VAE1, TLBI ASIDE1, TLBI VAAE1, TLBI VALE1, TLBI VAALE1, IC IALLU, TLBI RVAE1, TLBI RVAE1, TLBI RVALE1, TLBI VRAALE1.

<table>
<thead>
<tr>
<th>FB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This field has no effect on the operation of the specified instructions.</td>
</tr>
<tr>
<td>0b1</td>
<td>When one of the specified instruction is executed at EL1, the instruction is broadcast within the Inner Shareable shareability domain.</td>
</tr>
</tbody>
</table>

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.
This field resets to an architecturally **UNKNOWN** value.

**VSE, bit [8]**

Virtual SError interrupt.

<table>
<thead>
<tr>
<th>VSE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This mechanism is not making a virtual SError interrupt pending.</td>
</tr>
<tr>
<td>0b1</td>
<td>A virtual SError interrupt is pending because of this mechanism.</td>
</tr>
</tbody>
</table>

The virtual SError interrupt is only enabled when the value of HCR_EL2.{TGE, AMO} is \(\{0, 1\}\).

This field resets to an architecturally **UNKNOWN** value.

**VI, bit [7]**

Virtual IRQ Interrupt.

<table>
<thead>
<tr>
<th>VI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This mechanism is not making a virtual IRQ pending.</td>
</tr>
<tr>
<td>0b1</td>
<td>A virtual IRQ is pending because of this mechanism.</td>
</tr>
</tbody>
</table>

The virtual IRQ is enabled only when the value of HCR_EL2.{TGE, IMO} is \(\{0, 1\}\).

This field resets to an architecturally **UNKNOWN** value.

**VF, bit [6]**

Virtual FIQ Interrupt.

<table>
<thead>
<tr>
<th>VF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This mechanism is not making a virtual FIQ pending.</td>
</tr>
<tr>
<td>0b1</td>
<td>A virtual FIQ is pending because of this mechanism.</td>
</tr>
</tbody>
</table>

The virtual FIQ is enabled only when the value of HCR_EL2.{TGE, FMO} is \(\{0, 1\}\).

This field resets to an architecturally **UNKNOWN** value.

**AMO, bit [5]**

Physical SError interrupt routing.

<table>
<thead>
<tr>
<th>AMO</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When executing at Exception levels below EL2, and EL2 is enabled in the current Security state:</td>
</tr>
<tr>
<td></td>
<td>• Physical SError interrupts are not taken to EL2.</td>
</tr>
<tr>
<td></td>
<td>• When the value of HCR_EL2.TGE is 0, if the PE is executing at EL2 using AArch64, physical SError interrupts are not taken unless they are routed to EL3 by the SCR_EL3.EA bit.</td>
</tr>
<tr>
<td></td>
<td>• Virtual SError interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>When executing at any Exception level, and EL2 is enabled in the current Security state:</td>
</tr>
<tr>
<td></td>
<td>• Physical SError interrupts are taken to EL2, unless they are routed to EL3.</td>
</tr>
<tr>
<td></td>
<td>• When the value of HCR_EL2.TGE is 0, then virtual SError interrupts are enabled.</td>
</tr>
</tbody>
</table>

If EL2 is enabled in the current Security state and the value of HCR_EL2.TGE is 1:

- Regardless of the value of the AMO bit physical asynchronous External aborts and SError interrupts target EL2 unless they are routed to EL3.
- When ARMv8.1-VHE is not implemented, or if HCR_EL2.E2H is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.
- When ARMv8.1-VHE is implemented and HCR_EL2.E2H is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.
HCR_EL2, Hypervisor Configuration Register

For more information, see 'Asynchronous exception routing' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1 (The AArch64 System Level Programmers' Model).

This field resets to an architecturally UNKNOWN value.

**IMO, bit [4]**

Physical IRQ Routing.

<table>
<thead>
<tr>
<th>IMO</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0 | When executing at Exception levels below EL2, and EL2 is enabled in the current Security state:  
  • Physical IRQ interrupts are not taken to EL2.  
  • When the value of HCR_EL2.TGE is 0, if the PE is executing at EL2 using AArch64, physical IRQ interrupts are not taken unless they are routed to EL3 by the SCR_EL3.IIRQ bit.  
  • Virtual IRQ interrupts are disabled. |
| 0b1 | When executing at any Exception level, and EL2 is enabled in the current Security state:  
  • Physical IRQ interrupts are taken to EL2, unless they are routed to EL3.  
  • When the value of HCR_EL2.TGE is 0, then Virtual IRQ interrupts are enabled. |

If EL2 is enabled in the current Security state, and the value of HCR_EL2.TGE is 1:

• Regardless of the value of the IMO bit, physical IRQ Interrupts target EL2 unless they are routed to EL3.
• When ARMv8.1-VHE is not implemented, or if HCR_EL2.E2H is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.
• When ARMv8.1-VHE is implemented and HCR_EL2.E2H is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see 'Asynchronous exception routing' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1.

This field resets to an architecturally UNKNOWN value.

**FMO, bit [3]**

Physical FIQ Routing.

<table>
<thead>
<tr>
<th>FMO</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0 | When executing at Exception levels below EL2, and EL2 is enabled in the current Security state:  
  • Physical FIQ interrupts are not taken to EL2.  
  • When the value of HCR_EL2.TGE is 0, if the PE is executing at EL2 using AArch64, physical FIQ interrupts are not taken unless they are routed to EL3 by the SCR_EL3.FIQ bit.  
  • Virtual FIQ interrupts are disabled. |
| 0b1 | When executing at any Exception level, and EL2 is enabled in the current Security state:  
  • Physical FIQ interrupts are taken to EL2, unless they are routed to EL3.  
  • When HCR_EL2.TGE is 0, then Virtual FIQ interrupts are enabled. |

If EL2 is enabled in the current Security state and the value of HCR_EL2.TGE is 1:

• Regardless of the value of the FMO bit, physical FIQ Interrupts target EL2 unless they are routed to EL3.
• When ARMv8.1-VHE is not implemented, or if HCR_EL2.E2H is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.
• When ARMv8.1-VHE is implemented and HCR_EL2.E2H is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see 'Asynchronous exception routing' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1.

This field resets to an architecturally UNKNOWN value.
PTW, bit [2]

Protected Table Walk. In the EL1&0 translation regime, a translation table access made as part of a stage 1 translation table walk is subject to a stage 2 translation. The combining of the memory type attributes from the two stages of translation means the access might be made to a type of Device memory. If this occurs, then the value of this bit determines the behavior:

<table>
<thead>
<tr>
<th>PTW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The translation table walk occurs as if it is to Normal Non-cacheable memory. This means it can be made speculatively.</td>
</tr>
<tr>
<td>0b1</td>
<td>The memory access generates a stage 2 Permission fault.</td>
</tr>
</tbody>
</table>

This field is permitted to be cached in a TLB.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field. This field resets to an architecturally UNKNOWN value.

SWIO, bit [1]

Set/Way Invalidation Override. Causes EL1 execution of the data cache invalidate by set/way instructions to perform a data cache clean and invalidate by set/way:

<table>
<thead>
<tr>
<th>SWIO</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on the operation of data cache invalidate by set/way instructions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Data cache invalidate by set/way instructions perform a data cache clean and invalidate by set/way.</td>
</tr>
</tbody>
</table>

When the value of this bit is 1:

AArch32: DCISW performs the same invalidation as a DCCISW instruction.

AArch64: DCISW performs the same invalidation as a DCISW instruction.

This bit can be implemented as RES1.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

VM, bit [0]

Virtualization enable. Enables stage 2 address translation for the EL1&0 translation regime, when EL2 is enabled in the current Security state.

<table>
<thead>
<tr>
<th>VM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL1&amp;0 stage 2 address translation disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1&amp;0 stage 2 address translation enabled.</td>
</tr>
</tbody>
</table>

When the value of this bit is 1, data cache invalidate instructions executed at EL1 perform a data cache clean and invalidate. For the invalidate by set/way instruction this behavior applies regardless of the value of the HCR_EL2.SWIO bit.

This bit is permitted to be cached in a TLB.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2. {E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

Accessing the HCR_EL2

Accesses to this register use the following encodings:
MRS <Xt>, HCR_EL2

<table>

The HDFGRTR_EL2 characteristics are:

**Purpose**

Provides controls for traps of MRS and MRC reads of debug, trace, PMU, and Statistical Profiling System registers.

**Configuration**

This register is present only when ARMv8.6-FGT is implemented. Otherwise, direct accesses to HDFGRTR_EL2 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HDFGRTR_EL2 is a 64-bit register.

**Field descriptions**

The HDFGRTR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Number</th>
<th>Description</th>
</tr>
</thead>

</tr>
</tbody>
</table>

If ARMv8.6-FGT is implemented, EL2 is implemented and enabled in the current Security state, then, regardless of the value of this bit, for each value n in the range UInt(MDCR_EL2.HPMN) to 30:

• If event counter n is not implemented, the following are UNDEFINED:
  ◦ In AArch64 state, a read of PMEVTYPER<\n>_EL0, or a read of PMXEVTYPER_EL0 when PMSELR_EL0 SEl == n.
  ◦ In AArch32 state, a read of PMEVTYPER<\n>, or a read of PMXEVTYPER when PMSELR.SEl == n.

• If event counter n is implemented, the following generate a Trap exception to EL2:
  ◦ At EL0 or EL1 using AArch64, a read of PMEVTYPER<\n>_EL0, or a read of PMXEVTYPER_EL0 when PMSELR_EL0.SEl == n, reported with EC syndrome value 0x18.
  ◦ At EL0 using AArch32, a read of PMEVTYPER<\n>, or a read of PMXEVTYPER when PMSELR.SEl == n, reported with EC syndrome value 0x03.

See also HDFGRTR_EL2.PMCCFILTR_EL0.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMEVCNTRn_EL0, bit [12]

When PMUv3 is implemented:

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

• At EL1 and EL0 using AArch64: MRS reads of PMEVCNTR<\n>_EL0 and PMXEVCNTR_EL0.

• At EL0 using Arch32 when EL1 is using AArch64: MRC reads of PMEVCNTR<\n> and PMXEVCNTR.
The operations listed above are not affected by this bit.

If EL2 is implemented and enabled in the current Security state, `HCR_EL2` (E2H,TE) != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or `SCR_EL3` FGTEn == 1, then, unless the read generates a higher priority exception:

- **MRS** reads at EL1 and EL0 using AArch64 of `PMEVCNTR<n>_EL0` and `PMXEVCNTR_EL0` are trapped to EL2 and reported with EC syndrome value \(0x18\).
- **MRC** reads at EL0 using AArch32 of `PMEVCNTR<n>` and `PMXEVCNTR` are trapped to EL2 and reported with EC syndrome value \(0x03\), unless the read generates a higher priority exception.

If ARMv8.6-FGT is implemented, EL2 is implemented and enabled in the current Security state, then, regardless of the value of this bit, for each value \(n\) in the range UInt(MDCR_EL2.HPMN) to 30:

- If event counter \(n\) is not implemented, the following are **UNDEFINED**:
  - In AArch64 state, a read of `PMEVCNTR<n>_EL0`, or a read of `PMXEVCNTR_EL0` when `PMSELR_EL0`.SEL == \(n\).
  - In AArch32 state, a read of `PMEVCNTR<n>`, or a read of `PMXEVCNTR` when `PMSELR`.SEL == \(n\).

- If event counter \(n\) is implemented, the following generate a Trap exception to EL2:
  - At EL0 or EL1 using AArch64, a read of `PMEVCNTR<n>_EL0`, or a read of `PMXEVCNTR_EL0` when `PMSELR_EL0`.SEL == \(n\), reported with EC syndrome value \(0x18\).
  - At EL0 using AArch32, a read of `PMEVCNTR<n>`, or a read of `PMXEVCNTR` when `PMSELR`.SEL == \(n\), reported with EC syndrome value \(0x03\).

In a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

### **OSDLR_EL1, bit [11]**

**When ARMv8.0-DoubleLock is implemented:**

Trap **MRS** reads of **OSDLR_EL1** at EL1 using AArch64 to EL2.

<table>
<thead>
<tr>
<th><strong>OSDLR_EL1</strong></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MRS reads of <strong>OSDLR_EL1</strong> are not affected by this bit.</td>

<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <strong>SCR_EL3.FGTEn</strong> == 1, MRS reads of <strong>OSLSR_EL1</strong> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to 0.

### Bit [8]

Reserved, RES0.

### DBGPRCR_EL1, bit [7]

Trap MRS reads of **DBGPRCR_EL1** at EL1 using AArch64 to EL2.

<table>
<thead>
<tr>
<th>DBGPRCR_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MRS reads of <strong>DBGPRCR_EL1</strong> are not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <strong>SCR_EL3.FGTEn</strong> == 1, MRS reads of <strong>DBGPRCR_EL1</strong> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to 0.

### DBGAUTHSTATUS_EL1, bit [6]

Trap MRS reads of **DBGAUTHSTATUS_EL1** at EL1 using AArch64 to EL2.

<table>
<thead>
<tr>
<th>DBGAUTHSTATUS_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MRS reads of <strong>DBGAUTHSTATUS_EL1</strong> are not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <strong>SCR_EL3.FGTEn</strong> == 1, MRS reads of <strong>DBGAUTHSTATUS_EL1</strong> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.</td>
</tr>
</tbody>
</table>
In a system where the PE resets into EL2, this field resets to 0.

**DBGCLAIM, bit [5]**

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- **DBGCLAIMCLR_EL1**
- **DBGCLAIMSET_EL1**

<table>
<thead>
<tr>
<th>DBGCLAIM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MRS reads of the System registers listed above are not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to 0.

**MDSCR_EL1, bit [4]**

Trap MRS reads of **MDSCR_EL1** at EL1 using AArch64 to EL2.

<table>
<thead>
<tr>
<th>MDSCR_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MRS reads of <strong>MDSCR_EL1</strong> are not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of <strong>MDSCR_EL1</strong> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to 0.

**DBGWVRn_EL1, bit [3]**

Trap MRS reads of **DBGWVR<n>_EL1** at EL1 using AArch64 to EL2.

<table>
<thead>
<tr>
<th>DBGWVRn_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>

HDFGWTR_EL2, Hypervisor Debug Fine-Grained Write Trap Register

The HDFGWTR_EL2 characteristics are:

**Purpose**

Provides controls for traps of MSR and MCR writes of debug, trace, PMU, and Statistical Profiling System registers.

**Configuration**

This register is present only when ARMv8.6-FGT is implemented. Otherwise, direct accesses to HDFGWTR_EL2 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HDFGWTR_EL2 is a 64-bit register.

**Field descriptions**

The HDFGWTR_EL2 bit assignments are:

The HFGITR_EL2 characteristics are:

**Purpose**

Provides controls for traps of execution of System instructions.

**Configuration**

This register is present only when ARMv8.6-FGT is implemented. Otherwise, direct accesses to HFGITR_EL2 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HFGITR_EL2 is a 64-bit register.

**Field descriptions**

The HFGITR_EL2 bit assignments are:

<table>

HFGRTR_EL2, Hypervisor Fine-Grained Read Trap Register

The HFGRTR_EL2 characteristics are:

**Purpose**

Provides controls for traps of MRS and MRC reads of System registers.

**Configuration**

This register is present only when ARMv8.6-FGT is implemented. Otherwise, direct accesses to HFGRTR_EL2 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HFGRTR_EL2 is a 64-bit register.

**Field descriptions**

The HFGRTR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>62</th>

APGAKey, bit [6]

When ARMv8.3-PAuth is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APGAKeyHi_EL1.
- APGAKeyLo_EL1.
### APGAKey

<table>
<thead>
<tr>
<th>APGAKey</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MRS reads of the System registers listed above are not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

### APDBKey, bit [5]

When ARMv8.3-PAuth is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APDBKeyHi_EL1
- APDBKeyLo_EL1

<table>
<thead>
<tr>
<th>APDBKey</th>

HFGWTR_EL2, Hypervisor Fine-Grained Write Trap Register

The HFGWTR_EL2 characteristics are:

**Purpose**

Provides controls for traps of MSR and MCR writes of System registers.

**Configuration**

This register is present only when ARMv8.6-FGT is implemented. Otherwise, direct accesses to HFGWTR_EL2 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HFGWTR_EL2 is a 64-bit register.

**Field descriptions**

The HFGWTR_EL2 bit assignments are:

<table>

In a system where the PE resets into EL2, this field resets to 0.

LORSA_EL1, bit [23]

When ARMv8.1-LOR is implemented:

Trap MSR writes of `LORSA_EL1` at EL1 using AArch64 to EL2.

<table>
<thead>
<tr>
<th>LORSA_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MSR writes of <code>LORSA_EL1</code> are not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <code>SCR_EL3.FGTEn == 1</code>, MSR writes of <code>LORSA_EL1</code> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

LORN_EL1, bit [22]

When ARMv8.1-LOR is implemented:

Trap MSR writes of `LORN_EL1` at EL1 using AArch64 to EL2.

<table>
<thead>
<tr>
<th>LORN_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MSR writes of <code>LORN_EL1</code> are not affected by this bit.</td>

  else
    HFGWTR_EL2 = X[t];
elsif PSTATE.EL == EL3 then
  HFGWTR_EL2 = X[t];
The HPFAR_EL2 characteristics are:

**Purpose**

Holds the faulting IPA for some aborts on a stage 2 translation taken to EL2.

**Configuration**

AArch64 System register HPFAR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HPFAR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HPFAR_EL2 is a 64-bit register.

**Field descriptions**

The HPFAR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>62</th>
<th>61</th>
<th>60</th>
<th>59</th>
<th>58</th>
<th>57</th>
<th>56</th>
<th>55</th>
<th>54</th>
<th>53</th>
<th>52</th>
<th>51</th>
<th>50</th>
<th>49</th>
<th>48</th>
<th>47</th>
<th>46</th>
<th>45</th>
<th>44</th>
<th>43</th>
<th>42</th>
<th>41</th>
<th>40</th>
<th>39</th>
<th>38</th>
<th>37</th>
<th>36</th>
<th>35</th>
<th>34</th>
<th>33</th>
<th>32</th>
</tr>
</thead>
<tbody>
<tr>
<td>NS</td>
<td>RES0</td>
<td>FIPA[51:48]</td>
<td>FIPA[47:12]</td>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Execution at EL1 or EL0 makes HPFAR_EL2 become UNKNOWN.

**NS, bit [63]**

When ARMv8.4-SecEL2 is implemented:

Faulting IPA address space.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Faulting IPA is from the Secure IPA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>Faulting IPA is from the Non-secure IPA space.</td>
</tr>
</tbody>
</table>

For data or instruction aborts taken to Non-secure EL2, this field is RES0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Bits [62:44]**

Reserved, RES0.

**FIPA[51:48], bits [43:40]**
When ARMv8.2-LPA is implemented:

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**FIPA[47:12], bits [39:4]**

Bits [47:12] of the faulting intermediate physical address.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

When ARMv8.2-LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use for the stage 1 translation, the FIPA[51:48] bits form the upper part of the address value. For implementations or stage 1 translation granules with fewer than 52 physical address bits the FIPA[51:48] bits are RES0.

The HPFAR_EL2 is written for:

- Translation or Access faults in the second stage of translation.
- An abort in the second stage of translation performed during the translation table walk of a first stage translation, caused by a Translation fault, an Access flag fault, or a Permission fault.
- A stage 2 Address size fault.

**Note**

The address held in this register is an address accessed by the instruction fetch or data access that caused the exception that gave rise to the instruction or data abort. It is the lowest address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores a mis-aligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

For all other exceptions taken to EL2, this register is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

**Bits [3:0]**

Reserved, RES0.

**Accessing the HPFAR_EL2**

Accesses to this register use the following encodings:

MRS <Xt>, HPFAR_EL2

HSTR_EL2, Hypervisor System Trap Register

The HSTR_EL2 characteristics are:

**Purpose**

Controls trapping to EL2 of EL1 or lower AArch32 accesses to the System register in the coproc == \[0b1111\] encoding space, by the CRn value used to access the register using MCR or MRC instruction. When the register is accessible using an MCRR or MRRC instruction, this is the CRm value used to access the register.

**Configuration**

AArch64 System register HSTR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HSTR[31:0].

If EL2 is not implemented, this register is `RES0` from EL3.

If no Exception level can use AArch32, then this register is `RES0`.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally `UNKNOWN` values.

**Attributes**

HSTR_EL2 is a 64-bit register.

**Field descriptions**

The HSTR_EL2 bit assignments are:

**Bits [63:16]**

Reserved, `RES0`.

T<\(n\)> , bit [\(n\) , for \(n = 0\) to \(15\)]

Fields T14 and T4 are `RES0`.

The remaining fields control whether EL0 and EL1 accesses, using MCR, MRC, MCRR, and MRRC instructions, to the System registers in the coproc == \[0b1111\] encoding space are trapped to EL2 as follows:

- MCR or MRC accesses to these registers that are trapped to EL2 are reported using EC syndrome value \[0x03\], unless the access is `UNDEFINED`.
- MCRR or MRRC accesses to these registers that are trapped to EL2 are reported using EC syndrome value \[0x04\], unless the access is `UNDEFINED`.

Page 760
This control has no effect on EL0 or EL1 accesses to System registers.

Any EL1 MCR or MRC access with coproc == 0b1111 and CRn == <n> is trapped to EL2. An EL0 MCR or MRC access with these values is trapped to EL2 only if the access is not UNDEFINED when the value of this field is 0.

Any EL1 MCRR or MRRC access with coproc == 0b1111 and CRm == <n> is trapped to EL2. An EL0 MCRR or MRRC access with these values is trapped to EL2 only if the access is not UNDEFINED when the value of this field is 0.

It is IMPLEMENTATION DEFINED whether a Non-secure EL0 access using AArch32 to these registers is trapped to EL2, or is UNDEFINED and generates an exception that is taken to Non-secure EL1. If the access is UNDEFINED, and generates an exception that is taken to Non-secure EL1 using AArch64, this is reported with EC syndrome value 0x00.

Note
Arm expects that trapping to EL2 of Non-secure EL0 accesses to these registers is unusual and used only when the hypervisor must virtualize EL0 operation. Arm recommends that, whenever possible, Non-secure EL0 accesses to these registers behave as they would if the implementation did not include EL2. This means that, if the architecture does not support the Non-secure EL0 access, then the register access instruction is treated as UNDEFINED and generates an exception that is taken to Non-secure EL1.

For example, when HSTR_EL2.T7 is 1, for instructions executed at EL1:

- An MCR or MRC instruction with coproc set to 0b1111 and <CRn> set to c7 is trapped to EL2.
- An MCRR or MRRC instruction with coproc set to 0b1111 and <CRm> set to c7 is trapped to EL2.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

**Accessing the HSTR_EL2**

Accesses to this register use the following encodings:

**Bits [63:0]**

Virtual address to use. No alignment restrictions apply to this VA.

**Executing the IC IVAU instruction**

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The instruction cache maintenance instruction (IC)' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

If EL0 access is enabled, when executed at EL0, this instruction requires read access permission to the VA, otherwise it is IMPLEMENTATION DEFINED whether it generates a Permission Fault, see 'Permission fault' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Accesses to this instruction use the following encodings:

**Bits [63:32]**

Reserved, RES0.

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

This field resets to 0.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

**Accessing the ICC_AP0R<n>_EL1**

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 0 active priorities) might result in UNPREDICTABLE behavior of the interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICC_AP0R1_EL1 is only implemented in implementations that support 6 or more bits of priority. ICC_AP0R2_EL1 and ICC_AP0R3_EL1 are only implemented in implementations that support 7 or more bits of priority. Unimplemented registers are UNDEFINED.

**Note**
The number of bits of preemption is indicated by \texttt{ICH\_VTR\_EL2\_PREbits}.

Writing to the active priority registers in any order other than the following order will result in \textsc{unpredictable} behavior:

- \texttt{ICC\_AP0R<n>_EL1}.
- Secure \texttt{ICC\_AP1R<n>_EL1}.
- Non-secure \texttt{ICC\_AP1R<n>_EL1}.

Accesses to this register use the following encodings:

**Bits [63:32]**

Reserved, RES0.

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

This field resets to 0.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

**Accessing the ICC_AP1R<n>_EL1**

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 1 active priorities) might result in UNPREDICTABLE behavior of the interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICC_AP1R1_EL1 is only implemented in implementations that support 6 or more bits of priority. ICC_AP1R2_EL1 and ICC_AP1R3_EL1 are only implemented in implementations that support 7 or more bits of priority. Unimplemented registers are UNDEFINED.
Note

The number of bits of preemption is indicated by `ICH_VTR_EL2.PREbits`.

Writing to the active priority registers in any order other than the following order will result in **UNPREDICTABLE** behavior:

- `ICC_AP0R<n>_EL1`
- Secure `ICC_AP1R<n>_EL1`
- Non-secure `ICC_AP1R<n>_EL1`

Accesses to this register use the following encodings:

**MRS <Xt>, ICC_AP1R<n>_EL1**

The ICC_ASGI1R_EL1 characteristics are:

**Purpose**

Generates Group 1 SGIs for the Security state that is not the current Security state.

**Configuration**

AArch64 System register ICC_ASGI1R_EL1 performs the same function as AArch32 System register ICC_ASGI1R.

Under certain conditions a write to ICC_ASGI1R_EL1 can generate Group 0 interrupts, see "Forwarding an SGI to a target PE".

**Attributes**

ICC_ASGI1R_EL1 is a 64-bit register.

**Field descriptions**

The ICC_ASGI1R_EL1 bit assignments are:

</tbody>
</table>

**Bits [63:56]**

Reserved, RES0.

**Aff3, bits [55:48]**

The affinity 3 value of the affinity path of the luster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

**RS, bits [47:44]**

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value (RS * 16) + n).

When ICC_CTLR_EL1.RSS==0, RS is RES0.

When ICC_CTLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a CONSTRAINED UNPREDICTABLE choice of:

- The write is ignored.
- The RS field is treated as 0.
Bits [43:41]

Reserved, RES0.

IRM, bit [40]

Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

<table>
<thead>
<tr>
<th>IRM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.&lt;target list&gt;.</td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupts routed to all PEs in the system, excluding &quot;self&quot;.</td>
</tr>
</tbody>
</table>

Aff2, bits [39:32]

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

Bits [31:28]

Reserved, RES0.

INTID, bits [27:24]

The INTID of the SGI.

Aff1, bits [23:16]

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

Note

This restricts a system to sending targeted SGIs to PEs with an affinity 0 number that is less than 16. If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

Accessing the ICC_ASGI1R_EL1

This register allows software executing in a Secure state to generate Non-secure Group 1 SGIs. It will also allow software executing in a Non-secure state to generate Secure Group 1 SGIs, if permitted by the settings of GICR_NSACR in the Redistributor corresponding to the target PE.
When `GICD_CTLR.DS==0`, Non-secure writes do not generate an interrupt for a target PE if not permitted by the `GICR_NSACR` register associated with the target PE. For more information see Use of control registers for SGI forwarding.

**Note**

Accesses at EL3 are treated as Secure regardless of the value of `SCR_EL3.NS`.

Accesses to this register use the following encodings:

MSR `ICC_ASGI1R_EL1`, `<Xt>`

ICC_BPR0_EL1, Interrupt Controller Binary Point Register 0

The ICC_BPR0_EL1 characteristics are:

**Purpose**

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption.

**Configuration**

AArch64 System register ICC_BPR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICC_BPR0[31:0].

Virtual accesses to this register update ICH_VMCR_EL2.VBPR0.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ICC_BPR0_EL1 is a 64-bit register.

**Field descriptions**

The ICC_BPR0_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>

</tbody>
</table>

This field resets to an architecturally UNKNOWN value.
Accessing the ICC_BPR0_EL1

The minimum binary point value is derived from the number of implemented priority bits. The number of priority bits is implementation defined, and reported by ICC_CTLR_EL1_PRIbits and ICC_CTLR_EL3_PRIbits.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is unknown.

Accesses to this register use the following encodings:

ICC_BPR1_EL1, Interrupt Controller Binary Point Register 1

The ICC_BPR1_EL1 characteristics are:

**Purpose**

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption.

**Configuration**

AArch64 System register ICC_BPR1_EL1 bits [31:0] (S) are architecturally mapped to AArch32 System register ICC_BPR1[31:0] (S).

AArch64 System register ICC_BPR1_EL1 bits [31:0] (NS) are architecturally mapped to AArch32 System register ICC_BPR1[31:0] (NS).

Virtual accesses to this register update ICH_VMCR_EL2.VBPR1.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ICC_BPR1_EL1 is a 64-bit register.

**Field descriptions**

The ICC_BPR1_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:3]**

Reserved, RES0.

**BinaryPoint, bits [2:0]**

If the GIC is configured to use separate binary point fields for Group 0 and Group 1 interrupts, the value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. For more information about priorities, see Priority grouping.

The minimum value of the Non-secure copy of this register is the minimum value of ICC_BPR0_EL1 + 1. The minimum value of the Secure copy of this register is the minimum value of ICC_BPR0_EL1.

If EL3 is implemented and ICC_CTLR_EL3.CBPR_EL1S is 1:

- When SCR_EL3.EEL2 is 1 and HCR_EL2.IMO is 1, Secure accesses to this register at EL1 access the state of ICV_BPR1_EL1.
- Otherwise, Secure accesses to this register at EL1 access the state of ICC_BPR0_EL1.

If EL3 is implemented and ICC_CTLR_EL3.CBPR_EL1NS is 1, Non-secure accesses to this register at EL1 or EL2 behave as follows, depending on the values of HCR_EL2.IMO and SCR_EL3.IRQ:
If EL3 is not implemented and ICC_CTLR_EL1.CBPR is 1, Non-secure accesses to this register at EL1 or EL2 behave as follows, depending on the values of HCR_EL2.IMO:

<table>
<thead>
<tr>
<th>HCR_EL2.IMO</th>
<th>SCR_EL3.IRQ</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>0b0</td>
<td>Non-secure EL1 and EL2 reads return ICC_BPR0_EL1 + 1 saturated to 0b111. Non-secure EL1 and EL2 writes are ignored.</td>
</tr>
<tr>
<td>0b0</td>
<td>0b1</td>
<td>Non-secure EL1 and EL2 accesses trap to EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>0b0</td>
<td>Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 reads return ICC_BPR0_EL1 + 1 saturated to 0b111. Non-secure EL2 writes are ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 accesses trap to EL3.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

### Accessing the ICC_BPR1_EL1

On a reset, the binary point field is UNKNOWN.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value.

Accesses to this register use the following encodings:

MRS <Xt>, ICC_BPR1_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>

ICC_CTLR_EL1, Interrupt Controller Control Register (EL1)

The ICC_CTLR_EL1 characteristics are:

**Purpose**

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

**Configuration**

AArch64 System register ICC_CTLR_EL1 bits [31:0] (S) are architecturally mapped to AArch32 System register ICC_CTLR[31:0] (S).

AArch64 System register ICC_CTLR_EL1 bits [31:0] (NS) are architecturally mapped to AArch32 System register ICC_CTLR[31:0] (NS).

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ICC_CTLR_EL1 is a 64-bit register.

**Field descriptions**

The ICC_CTLR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:20]</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
</table>

**ExtRange, bit [19]**

Extended INTID range (read-only).

<table>
<thead>
<tr>
<th>ExtRange</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>CPU interface does not support INTIDs in the range 1024..8191.</td>
</tr>
<tr>
<td>0b1</td>
<td>CPU interface supports INTIDs in the range 1024..8191</td>
</tr>
</tbody>
</table>

Note

Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.

If EL3 is implemented, ICC_CTLR_EL1.ExtRange is an alias of ICC_CTLR_EL3.ExtRange.
RSS, bit [18]

Range Selector Support. Possible values are:

<table>
<thead>
<tr>
<th>RSS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Targeted SGIs with affinity level 0 values of 0 - 15 are supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>Targeted SGIs with affinity level 0 values of 0 - 255 are supported.</td>
</tr>
</tbody>
</table>

This bit is read-only.

Bits [17:16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

<table>
<thead>
<tr>
<th>A3V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>The CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.</td>
</tr>
</tbody>
</table>

If EL3 is implemented, this bit is an alias of ICC_CTLR_EL3.A3V.

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports local generation of SEIs:

<table>
<thead>
<tr>
<th>SEIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CPU interface logic does not support local generation of SEIs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The CPU interface logic supports local generation of SEIs.</td>
</tr>
</tbody>
</table>

If EL3 is implemented, this bit is an alias of ICC_CTLR_EL3.SEIS.

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. The number of physical interrupt identifier bits supported:

<table>
<thead>
<tr>
<th>IDbits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>16 bits.</td>
</tr>
<tr>
<td>0b0001</td>
<td>24 bits.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If EL3 is implemented, this field is an alias of ICC_CTLR_EL3.IDbits.

PRIbits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).

Note

This field always returns the number of priority bits implemented, regardless of the Security state of the access or the value of GICD_CTRLR.DS.
For physical accesses, this field determines the minimum value of \texttt{ICC\_BPR0\_EL1}.

If EL3 is implemented, physical accesses return the value from \texttt{ICC\_CTRLR\_EL3} PRI bits.

If EL3 is not implemented, physical accesses return the value from this field.

**Bit [7]**

Reserved, RES0.

**PMHE, bit [6]**

Priority Mask Hint Enable. Controls whether the priority mask register is used as a hint for interrupt distribution:

<table>
<thead>
<tr>
<th>PMHE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disables use of ICC_PMR_EL1 as a hint for interrupt distribution.</td>
</tr>
<tr>
<td>0b1</td>
<td>Enables use of ICC_PMR_EL1 as a hint for interrupt distribution.</td>
</tr>
</tbody>
</table>

If EL3 is implemented, this bit is an alias of ICC\_CTRLR\_EL3 PMHE. Whether this bit can be written as part of an access to this register depends on the value of GICD\_CTRLR\_DS:

- If GICD\_CTRLR\_DS == 0, this bit is read-only.
- If GICD\_CTRLR\_DS == 1, this bit is read/write.

If EL3 is not implemented, it is IMPLEMENTATION DEFINED whether this bit is read-only or read-write:

- If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
- If this bit is read/write, it resets to zero.

**Bits [5:2]**

Reserved, RES0.

**EOImode, bit [1]**

EOI mode for the current Security state. Controls whether a write to an End of Interrupt register also deactivates the interrupt:

<table>
<thead>
<tr>
<th>EOImode</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR_EL1 are UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide priority drop functionality only. ICC_DIR_EL1 provides interrupt deactivation functionality.</td>
</tr>
</tbody>
</table>

The Secure ICC\_CTRLR\_EL1.EOIMode is an alias of ICC\_CTRLR\_EL3.EOIMode\_EL1S.

The Non-secure ICC\_CTRLR\_EL1.EOIMode is an alias of ICC\_CTRLR\_EL3.EOIMode\_EL1NS

**CBPR, bit [0]**

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 interrupts:

<table>
<thead>
<tr>
<th>CBPR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts only. ICC_BPR1_EL1 determines the preemption group for Group 1 interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICC_BPR0_EL1 determines the preemption group for both Group 0 and Group 1 interrupts.</td>
</tr>
</tbody>
</table>
If EL3 is implemented:

- This bit is an alias of ICC_CTLR_EL3.CBPR_EL1{S,NS} where S or NS corresponds to the current Security state.
- If GICD_CTLR.DS == 0, this bit is read-only.
- If GICD_CTLR.DS == 1, this bit is read/write.

If EL3 is not implemented, this bit is read/write.

This field resets to an architecturally UNKNOWN value.

**Accessing the ICC_CTLR_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, ICC_CTLR_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>

        ICC_CTLR_EL1_NS = X[t];
    end
ICC_CTLR_EL3, Interrupt Controller Control Register (EL3)

The ICC_CTLR_EL3 characteristics are:

**Purpose**

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

**Configuration**

AArch64 System register ICC_CTLR_EL3 bits [31:0] can be mapped to AArch32 System register ICC_MCTRL[31:0], but this is not architecturally mandated.

This register is present only when HaveEL(EL3). Otherwise, direct accesses to ICC_CTLR_EL3 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ICC_CTLR_EL3 is a 64-bit register.

**Field descriptions**

The ICC_CTLR_EL3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Range</th>
<th>Description</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:20</td>
<td>Reserved, RES0</td>
<td></td>
</tr>
<tr>
<td>19</td>
<td>ExtRange</td>
<td>Extended INTID range (read-only).</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>ExtRange</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>CPU interface does not support INTIDs in the range 1024..8191.</td>
</tr>
<tr>
<td></td>
<td>• Behaviour is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface.</td>
</tr>
<tr>
<td></td>
<td>Note</td>
</tr>
<tr>
<td></td>
<td>Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.</td>
</tr>
<tr>
<td>0b1</td>
<td>CPU interface supports INTIDs in the range 1024..8191.</td>
</tr>
<tr>
<td></td>
<td>• All INTIDs in the range 1024..8191 are treated as requiring deactivation.</td>
</tr>
</tbody>
</table>
RSS, bit [18]

Range Selector Support. Possible values are:

<table>
<thead>
<tr>
<th>RSS</th>
<th>Meaning</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Targeted SGIs with affinity level 0 values of 0 - 15 are supported.</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>Targeted SGIs with affinity level 0 values of 0 - 255 are supported.</td>
<td></td>
</tr>
</tbody>
</table>

This bit is read-only.

nDS, bit [17]

Disable Security not supported. Read-only and writes are ignored. Possible values are:

<table>
<thead>
<tr>
<th>nDS</th>
<th>Meaning</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CPU interface logic supports disabling of security.</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>The CPU interface logic does not support disabling of security, and requires that security is not disabled.</td>
<td></td>
</tr>
</tbody>
</table>

Bit [16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

<table>
<thead>
<tr>
<th>A3V</th>
<th>Meaning</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CPU interface logic does not support non-zero values of the Aff3 field in SGI generation System registers.</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>The CPU interface logic supports non-zero values of the Aff3 field in SGI generation System registers.</td>
<td></td>
</tr>
</tbody>
</table>

If EL3 is present, ICC_CTLR_EL1.AV3 is an alias of ICC_CTLR_EL3.A3V

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports generation of SEIs:

<table>
<thead>
<tr>
<th>SEIS</th>
<th>Meaning</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CPU interface logic does not support generation of SEIs.</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>The CPU interface logic supports generation of SEIs.</td>
<td></td>
</tr>
</tbody>
</table>

If EL3 is present, ICC_CTLR_EL1.SEIS is an alias of ICC_CTLR_EL3.SEIS

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. The number of physical interrupt identifier bits supported:

<table>
<thead>
<tr>
<th>IDbits</th>
<th>Meaning</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>16 bits.</td>
<td></td>
</tr>
<tr>
<td>0b001</td>
<td>24 bits.</td>
<td></td>
</tr>
</tbody>
</table>

All other values are reserved.

If EL3 is present, ICC_CTLR_EL1.IDbits is an alias of ICC_CTLR_EL3.IDbits

PRIbits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).
An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).

**Note**

This field always returns the number of priority bits implemented, regardless of the value of SCR_EL3.NS or the value of GICD_CTLR.DS.

The division between group priority and subpriority is defined in the binary point registers ICC_BPR0_EL1 and ICC_BPR1_EL1.

This field determines the minimum value of ICC_BPR0_EL1.

**Bit [7]**

Reserved, RES0.

**PMHE, bit [6]**

Priority Mask Hint Enable.

<table>
<thead>
<tr>
<th>PMHE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disables use of the priority mask register as a hint for interrupt distribution.</td>
</tr>
<tr>
<td>0b1</td>
<td>Enables use of the priority mask register as a hint for interrupt distribution.</td>
</tr>
</tbody>
</table>

Software must write ICC_PMR_EL1 to 0xFF before clearing this field to 0.

- An implementation might choose to make this field RAO/WI if priority-based routing is always used
- An implementation might choose to make this field RAZ/WI if priority-based routing is never used

If EL3 is present, ICC_CTLR_EL1.PMHE is an alias of ICC_CTLR_EL3.PMHE.

This field resets to 0.

**RM, bit [5]**

Routing Modifier. For legacy operation of EL1 software with GICC_CTLR.FIQen set to 1, this bit indicates whether interrupts can be acknowledged or observed as the Highest Priority Pending Interrupt, or whether a special INTID value is returned.

Possible values of this bit are:

<table>
<thead>
<tr>
<th>RM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure Group 0 and Non-secure Group 1 interrupts can be acknowledged and observed as the highest priority interrupt at the Secure Exception level where the interrupt is taken.</td>
</tr>
</tbody>
</table>
| 0b1 | When accessed at EL3 in AArch64 state:
  - Secure Group 0 interrupts return a special INTID value of 1020. This affects accesses to ICC_IAR0_EL1 and ICC_HPPIR0_EL1.
  - Non-secure Group 1 interrupts return a special INTID value of 1021. This affects accesses to ICC_IAR1_EL1 and ICC_HPPIR1_EL1. |

**Note**

The Routing Modifier bit is supported in AArch64 only. In systems without EL3 the behavior is as if the value is 0. Software must ensure this bit is 0 when the Secure copy of ICC_SRE_EL1.SRE is 1, otherwise system behavior is UNPREDICTABLE. In systems without EL3 or where the Secure copy of ICC_SRE_EL1.SRE is RAO/WI, this bit is RES0.

This field resets to an architecturally UNKNOWN value.
EOImode_EL1NS, bit [4]

EOI mode for interrupts handled at Non-secure EL1 and EL2. Controls whether a write to an End of Interrupt register also deactivates the interrupt:

<table>
<thead>
<tr>
<th>EOImode_EL1NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR_EL1 are UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide priority drop functionality only. ICC_DIR_EL1 provides interrupt deactivation functionality.</td>
</tr>
</tbody>
</table>

If EL3 is present, ICC_CTRLR_EL1(NS).EOImode is an alias of ICC_CTRLR_EL3.EOImode_EL1NS.

This field resets to an architecturally UNKNOWN value.

EOImode_EL1S, bit [3]

EOI mode for interrupts handled at Secure EL1. Controls whether a write to an End of Interrupt register also deactivates the interrupt:

<table>
<thead>
<tr>
<th>EOImode_EL1S</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR_EL1 are UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide priority drop functionality only. ICC_DIR_EL1 provides interrupt deactivation functionality.</td>
</tr>
</tbody>
</table>

If EL3 is present, ICC_CTRLR_EL1(S).EOImode is an alias of ICC_CTRLR_EL3.EOImode_EL1S.

This field resets to an architecturally UNKNOWN value.

EOImode_EL3, bit [2]

EOI mode for interrupts handled at EL3. Controls whether a write to an End of Interrupt register also deactivates the interrupt:

<table>
<thead>
<tr>
<th>EOImode_EL3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR_EL1 are UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide priority drop functionality only. ICC_DIR_EL1 provides interrupt deactivation functionality.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

CBPR_EL1NS, bit [1]

Common Binary Point Register, EL1 Non-secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Non-secure interrupts at EL1 and EL2:

<table>
<thead>
<tr>
<th>CBPR_EL1NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts only. ICC_BPR1_EL1 determines the preemption group for Non-secure Group 1 interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts and Non-secure Group 1 interrupts. Non-secure accesses to GICC_BPR and ICC_BPR1_EL1 access the state of ICC_BPR0_EL1.</td>
</tr>
</tbody>
</table>

If EL3 is present, ICC_CTRLR_EL1(NS).CBPR is an alias of ICC_CTRLR_EL3.CBPR_EL1NS.
This field resets to an architecturally **UNKNOWN** value.

**CBPR_EL1S, bit [0]**

Common Binary Point Register, EL1 Secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Secure interrupts at EL1:

<table>
<thead>
<tr>
<th>CBPR_EL1S</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0       | ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts only.  
           | ICC_BPR1_EL1 determines the preemption group for Secure Group 1 interrupts. |
| 0b1       | ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts and Secure Group 1 interrupts.  
           | Secure EL1 accesses to ICC_BPR1_EL1 access the state of ICC_BPR0_EL1. |

If EL3 is present, ICC_CTLR_EL1(S).CBPR is an alias of ICC_CTLR_EL3.CBPR_EL1S.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the ICC_CTLR_EL3**

Accesses to this register use the following encodings:

MRS <Xt>, ICC_CTLR_EL3

```assembly
<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b110</td>
<td>0b1100</td>
<td>0b1100</td>
<td>0b100</td>
</tr>
</tbody>
</table>
```

```assembly
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  UNDEFINED;
elsif PSTATE.EL == EL2 then
  UNDEFINED;
elsif PSTATE.EL == EL3 then
  if ICC_SRE_EL3.SRE == '0' then
    AArch64.SystemAccessTrap(EL3, 0x18);
  else
    return ICC_CTLR_EL3;

MSR ICC_CTLR_EL3, <Xt>

```assembly
<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b110</td>
<td>0b1100</td>
<td>0b1100</td>
<td>0b100</td>
</tr>
</tbody>
</table>
```

```assembly
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  UNDEFINED;
elsif PSTATE.EL == EL2 then
  UNDEFINED;
elsif PSTATE.EL == EL3 then
  if ICC_SRE_EL3.SRE == '0' then
    AArch64.SystemAccessTrap(EL3, 0x18);
  else
    ICC_CTLR_EL3 = X[t];
```
ICC_DIR_EL1, Interrupt Controller Deactivate Interrupt Register

The ICC_DIR_EL1 characteristics are:

**Purpose**

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified interrupt.

**Configuration**

AArch64 System register ICC_DIR_EL1 performs the same function as AArch32 System register ICC_DIR.

**Attributes**

ICC_DIR_EL1 is a 64-bit register.

**Field descriptions**

The ICC_DIR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-24</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>23-0</td>
<td>INTID, bits 23-0</td>
</tr>
</tbody>
</table>

**Bits [63:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID of the interrupt to be deactivated.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR_EL1.IDbits and ICC_CTLR_EL3.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

**Accessing the ICC_DIR_EL1**

There are two cases when writing to ICC_DIR_EL1 that were UNPREDICTABLE for a corresponding GICv2 write to GICC_DIR:

- When EOImode == 0. GICv3 implementations must ignore such writes. In systems supporting system error generation, an implementation might generate an SEI.
- When EOImode == 1 but no EOI has been issued. The interrupt will be de-activated by the Distributor, however the active priority in the CPU interface for the interrupt will remain set (because no EOI was issued).

Accesses to this register use the following encodings:

**MSR ICC_DIR_EL1, <Xt>**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>

        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        ICC_DIR_EL1 = X[t];
elsif PSTATE.EL == EL3 then
    if ICC_SRE_EL3.SRE == '0' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        ICC_DIR_EL1 = X[t];
The ICC_EOIR0_EL1 characteristics are:

**Purpose**

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified Group 0 interrupt.

**Configuration**

AArch64 System register ICC_EOIR0_EL1 performs the same function as AArch32 System register ICC_EOIR0.

**Attributes**

ICC_EOIR0_EL1 is a 64-bit register.

**Field descriptions**

The ICC_EOIR0_EL1 bit assignments are:

<table>

</tbody>
</table>

**Bits [63:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID from the corresponding ICC_IAR0_EL1 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR_EL1_IDbits and ICC_CTLR_EL3_IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the EOImode bit for the current Exception level and Security state is 0, a write to this register drops the priority for the interrupt, and also deactivates the interrupt.

If the EOImode bit for the current Exception level and Security state is 1, a write to this register only drops the priority for the interrupt. Software must write to ICC_DIR_EL1 to deactivate the interrupt.

The EOImode bit for the current Exception level and Security state is determined as follows:

- If EL3 is not implemented, the appropriate bit is ICC_CTLR_EL1 EOImode.
- If EL3 is implemented and the software is executing at EL3, the appropriate bit is ICC_CTLR_EL3 EOImode_EL3.
- If EL3 is implemented and the software is not executing at EL3, the bit depends on the current Security state:
  - If the software is executing in Secure state, the bit is ICC_CTLR_EL3 EOImode_EL1S.
  - If the software is executing in Non-secure state, the bit is ICC_CTLR_EL3 EOImode_EL1NS.
Accessing the \textbf{ICC\_EOIR0\_EL1}

A write to this register must correspond to the most recent valid read by this PE from an Interrupt Acknowledge Register, and must correspond to the INTID that was read from \textbf{ICC\_IAR0\_EL1}, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

A write of a Special INTID is ignored. See Special INTIDs, for more information.

Accesses to this register use the following encodings:

\begin{verbatim}
MSR ICC\_EOIR0\_EL1, <Xt>

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>

**ICC_HPPIR1_EL1, Interrupt Controller Highest Priority Pending Interrupt Register 1**

The ICC_HPPIR1_EL1 characteristics are:

**Purpose**

Indicates the highest priority pending Group 1 interrupt on the CPU interface.

**Configuration**

AArch64 System register ICC_HPPIR1_EL1 performs the same function as AArch32 System register ICC_HPPIR1.

**Attributes**

ICC_HPPIR1_EL1 is a 64-bit register.

**Field descriptions**

The ICC_HPPIR1_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-24</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>23-0</td>
<td>INTID</td>
</tr>
</tbody>
</table>

**Bits [63:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID of the highest priority pending interrupt, if that interrupt is observable at the current Security state and Exception level.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. These special INTIDs can be one of: 1020, 1021, or 1023. See Special INTIDs, for more information.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR_EL1.IDbits and ICC_CTLR_EL3.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

**Accessing the ICC_HPPIR1_EL1**

Accesses to this register use the following encodings:

```
MRS <Xt>, ICC_HPPIR1_EL1
```

            return ICC_HPPIR1_EL1;
The ICC_IAR0_EL1 characteristics are:

**Purpose**

The PE reads this register to obtain the INTID of the signaled Group 0 interrupt. This read acts as an acknowledge for the interrupt.

**Configuration**

AArch64 System register ICC_IAR0_EL1 performs the same function as AArch32 System register ICC_IAR0.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when PSTATE.\{I,F\} == \{0,0\}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. See Observability of the effects of accesses to the GIC registers, for more information.

**Attributes**

ICC_IAR0_EL1 is a 64-bit register.

ICC_IGRPEN1_EL3, Interrupt Controller Interrupt Group 1 Enable register (EL3)

The ICC_IGRPEN1_EL3 characteristics are:

**Purpose**

Controls whether Group 1 interrupts are enabled or not.

**Configuration**

AArch64 System register ICC_IGRPEN1_EL3 bits [31:0] can be mapped to AArch32 System register ICC_MGRPEN1[31:0], but this is not architecturally mandated.

This register is present only when HaveEL(EL3). Otherwise, direct accesses to ICC_IGRPEN1_EL3 are **UNDEFINED**.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

ICC_IGRPEN1_EL3 is a 64-bit register.

**Field descriptions**

The ICC_IGRPEN1_EL3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>62</td>
<td>EnableGrp1S</td>
<td>Enables Group 1 interrupts for the Secure state.</td>
</tr>
<tr>
<td>61</td>
<td>EnableGrp1NS</td>
<td>Enables Group 1 interrupts for the Non-secure state.</td>
</tr>
</tbody>
</table>

**Bits [63:2]**

Reserved, RES0.

**EnableGrp1S, bit [1]**

Enables Group 1 interrupts for the Secure state.

<table>
<thead>
<tr>
<th>EnableGrp1S</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Secure Group 1 interrupts are disabled.</td>
</tr>
<tr>
<td>1</td>
<td>Secure Group 1 interrupts are enabled.</td>
</tr>
</tbody>
</table>

The Secure ICC_IGRPEN1_EL1.Enable bit is a read/write alias of the ICC_IGRPEN1_EL3.EnableGrp1S bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

This field resets to 0.

**EnableGrp1NS, bit [0]**

Enables Group 1 interrupts for the Non-secure state.
**EnableGrp1NS** | **Meaning**
--- | ---
0b0 | Non-secure Group 1 interrupts are disabled.
0b1 | Non-secure Group 1 interrupts are enabled.

The Non-secure `ICC_IGRPEN1_EL1`.Enable bit is a read/write alias of the ICC_IGRPEN1_EL3.EnableGrp1NS bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

This field resets to 0.

        ICC_IGRPEN1_EL3 = X[t];
ICC_PMR_EL1, Interrupt Controller Interrupt Priority Mask Register

The ICC_PMR_EL1 characteristics are:

**Purpose**

Provides an interrupt priority filter. Only interrupts with a higher priority than the value in this register are signaled to the PE.

Writes to this register must be high performance and must ensure that no interrupt of lower priority than the written value occurs after the write, without requiring an ISB or an exception boundary.

**Configuration**

AArch64 System register ICC_PMR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICC_PMR[31:0].

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that writes to this register are self-synchronising. This ensures that no interrupts below the written PMR value will be taken after a write to this register is architecturally executed. See Observability of the effects of accesses to the GIC registers, for more information.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ICC_PMR_EL1 is a 64-bit register.

**Field descriptions**

The ICC_PMR_EL1 bit assignments are:

```
  63  62  61  60  59  58  57  56  55  54  53  52  51  50  49  48  47  46  45  44  43  42  41  40  39  38  37  36  35  34  33  32
  |       RES0       | Priority
  31  30  29  28  27  26  25  24  23  22  21  20  19  18  17  16  15  14  13  12  11  10  9  8  7  6  5  4  3  2  1  0
```

**Bits [63:8]**

Reserved, RES0.

**Priority, bits [7:0]**

The priority mask level for the CPU interface. If the priority of an interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

The possible priority field values are as follows:
### Implemented priority bits

<table>
<thead>
<tr>
<th>[7:0]</th>
<th>Possible priority field values</th>
<th>Number of priority levels</th>
</tr>
</thead>
<tbody>
<tr>
<td>[7:0]</td>
<td>0x00-0xFF (0-255), all values</td>
<td>256</td>
</tr>
<tr>
<td>[7:1]</td>
<td>0x00-0xFE (0-254), even values only</td>
<td>128</td>
</tr>
<tr>
<td>[7:2]</td>
<td>0x00-0xFC (0-252), in steps of 4</td>
<td>64</td>
</tr>
<tr>
<td>[7:3]</td>
<td>0x00-0xF8 (0-248), in steps of 8</td>
<td>32</td>
</tr>
<tr>
<td>[7:4]</td>
<td>0x00-0xF0 (0-240), in steps of 16</td>
<td>16</td>
</tr>
</tbody>
</table>

Unimplemented priority bits are RAZ/WI.

This field resets to 0.

ICC_RPR_EL1, Interrupt Controller Running Priority Register

The ICC_RPR_EL1 characteristics are:

**Purpose**

Indicates the Running priority of the CPU interface.

**Configuration**

AArch64 System register ICC_RPR_EL1 performs the same function as AArch32 System register ICC_RPR.

**Attributes**

ICC_RPR_EL1 is a 64-bit register.

**Field descriptions**

The ICC_RPR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:8]</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>[7:0]</td>
<td>Priority</td>
</tr>
</tbody>
</table>

**Bits [63:8]**

Reserved, RES0.

**Priority, bits [7:0]**

The current running priority on the CPU interface. This is the group priority of the current active interrupt.

If there are no active interrupts on the CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

The priority returned is the group priority as if the BPR for the current Exception level and Security state was set to the minimum value of BPR for the number of implemented priority bits.

**Note**

If 8 bits of priority are implemented the group priority is bits[7:1] of the priority.

**Accessing the ICC_RPR_EL1**

Software cannot determine the number of implemented priority bits from a read of this register.

Accesses to this register use the following encodings:

MRS <Xt>, ICC_RPR_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
</table>

    AArch64.SystemAccessTrap(EL3, 0x18);
  else
    return ICC_RPR_EL1;
The ICC_SGI0R_EL1 characteristics are:

**Purpose**

Generates Secure Group 0 SGIs.

**Configuration**

AArch64 System register ICC_SGI0R_EL1 performs the same function as AArch32 System register ICC_SGI0R.

**Attributes**

ICC_SGI0R_EL1 is a 64-bit register.

**Field descriptions**

The ICC_SGI0R_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>62</th>
<th>61</th>
<th>60</th>
<th>59</th>
<th>58</th>
<th>57</th>
<th>56</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [63:56]

Reserved, RES0.

Aff3, bits [55:48]

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

RS, bits [47:44]

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value ((RS * 16) + n).

When ICC_CTLR_EL1.RSS==0, RS is RES0.

When ICC_CTLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a CONSTRAINED UNPREDICTABLE choice of:

- The write is ignored.
- The RS field is treated as 0.

Bits [43:41]

Reserved, RES0.
Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

<table>
<thead>
<tr>
<th>IRM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.&lt;target list&gt;.</td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupts routed to all PEs in the system, excluding “self”.</td>
</tr>
</tbody>
</table>

**Aff2, bits [39:32]**

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

**Bits [31:28]**

Reserved, RES0.

**INTID, bits [27:24]**

The INTID of the SGI.

**Aff1, bits [23:16]**

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

**TargetList, bits [15:0]**

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

---

**Note**

This restricts a system to sending targeted SGIs to PEs with an affinity 0 number that is less than 16.

If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

---

**Accessing the ICC_SGI0R_EL1**

This register allows software executing in a Secure state to generate Group 0 SGIs. It will also allow software executing in a Non-secure state to generate Group 0 SGIs, if permitted by the settings of GICR_NSACR in the Redistributor corresponding to the target PE.

When GICD_CTRLR.DS==0, Non-secure writes do not generate an interrupt for a target PE if not permitted by the GICR_NSACR register associated with the target PE. For more information see Use of control registers for SGI forwarding.

---

**Note**
Accesses at EL3 are treated as Secure regardless of the value of SCR_EL3.NS.

Accesses to this register use the following encodings:

        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        ICC_SGI0R_EL1 = X[t];
    endif
The ICC_SGI1R_EL1 characteristics are:

**Purpose**
Generates Group 1 SGIs for the current Security state.

**Configuration**
AArch64 System register ICC_SGI1R_EL1 performs the same function as AArch32 System register ICC_SGI1R.
Under certain conditions a write to ICC_SGI1R_EL1 can generate Group 0 interrupts, see Forwarding an SGI to a target PE.

**Attributes**
ICC_SGI1R_EL1 is a 64-bit register.

**Field descriptions**
The ICC_SGI1R_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>62</td>
<td>Affinity 3 (Aff3)</td>
</tr>
<tr>
<td>55</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>47</td>
<td>RangeSelector (RS)</td>
</tr>
<tr>
<td>31</td>
<td>TargetList</td>
</tr>
</tbody>
</table>

**Bits [63:56]**
Reserved, RES0.

**Aff3, bits [55:48]**
The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.
If the IRM bit is 1, this field is RES0.

**RS, bits [47:44]**
RangeSelector
Controls which group of 16 values is represented by the TargetList field.
TargetList[n] represents aff0 value ((RS * 16) + n).
When ICC_CTLR_EL1.RSS==0, RS is RES0.
When ICC_CTLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a **CONSTRAINED UNPREDICTABLE** choice of:

- The write is ignored.
- The RS field is treated as 0.
Bits [43:41]
Reserved, RES0.

IRM, bit [40]
Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

<table>
<thead>
<tr>
<th>IRM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.&lt;target list&gt;.</td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupts routed to all PEs in the system, excluding &quot;self&quot;.</td>
</tr>
</tbody>
</table>

Aff2, bits [39:32]
The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.
If the IRM bit is 1, this field is RES0.

Bits [31:28]
Reserved, RES0.

INTID, bits [27:24]
The INTID of the SGI.

Aff1, bits [23:16]
The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.
If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]
Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.
If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

Note
This restricts a system to sending targeted SGIs to PEs with an affinity 0 number that is less than 16.
If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.
If the IRM bit is 1, this field is RES0.

Accessing the ICC_SGI1R_EL1

Note
Accesses at EL3 are treated as Secure regardless of the value of SCR_EL3.NS.
Accesses to this register use the following encodings:

**MSR ICC_SGI1R_EL1, <Xt>**

ICC_SRE_EL1, Interrupt Controller System Register Enable register (EL1)

The ICC_SRE_EL1 characteristics are:

### Purpose

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL1.

### Configuration

AArch64 System register ICC_SRE_EL1 bits [31:0] (S) are architecturally mapped to AArch32 System register ICC_SRE[31:0] (S).

AArch64 System register ICC_SRE_EL1 bits [31:0] (NS) are architecturally mapped to AArch32 System register ICC_SRE[31:0] (NS).

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

ICC_SRE_EL1 is a 64-bit register.

</tbody>
</table>

If EL3 is implemented and \texttt{GICD_CTLR.DS} == 0, this field is a read-only alias of \texttt{ICC_SRE_EL3.DIB}.

If EL3 is implemented and \texttt{GICD_CTLR.DS} == 1, and EL2 is not implemented, this field is a read-write alias of \texttt{ICC_SRE_EL3.DIB}.

If EL3 is not implemented or \texttt{GICD_CTLR.DS} == 1, and EL2 is implemented, this field is a read-only alias of \texttt{ICC_SRE_EL2.DIB}.

In systems that do not support IRQ bypass, this field is RAO/WI.

This field resets to 0.
DFB, bit [1]

Disable FIQ bypass.

<table>
<thead>
<tr>
<th>DFB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FIQ bypass enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>FIQ bypass disabled.</td>
</tr>
</tbody>
</table>

If EL3 is implemented and `GICD_CTRL.DS == 0`, this field is a read-only alias of `ICC_SRE_EL3.DFB`.

If EL3 is implemented and `GICD_CTRL.DS == 1`, and EL2 is not implemented, this field is a read-write alias of `ICC_SRE_EL3.DFB`.

If EL3 is not implemented or `GICD_CTRL.DS == 1`, and EL2 is implemented, this field is a read-only alias of `ICC_SRE_EL2.DFB`.

In systems that do not support FIQ bypass, this field is RAO/WI.

This field resets to 0.

SRE, bit [0]

System Register Enable.

<table>
<thead>
<tr>
<th>SRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The memory-mapped interface must be used. Access at EL1 to any ICC_* System register other than ICC_SRE_EL1 is trapped to EL1</td>
</tr>
<tr>
<td>0b1</td>
<td>The System register interface for the current Security state is enabled.</td>
</tr>
</tbody>
</table>

If software changes this bit from 1 to 0 in the Secure instance of this register, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

If EL3 is implemented and `ICC_SRE_EL3.SRE==0` the Secure copy of this bit is RAZ/WI. If `ICC_SRE_EL3.SRE` is changed from zero to one, the Secure copy of this bit becomes UNKNOWN.

If EL2 is implemented and `ICC_SRE_EL2.SRE==0` the Non-secure copy of this bit is RAZ/WI. If `ICC_SRE_EL2.SRE` is changed from zero to one, the Non-secure copy of this bit becomes UNKNOWN.

If EL3 is implemented and `ICC_SRE_EL3.SRE==0` the Non-secure copy of this bit is RAZ/WI. If `ICC_SRE_EL3.SRE` is changed from zero to one, the Non-secure copy of this bit becomes UNKNOWN.

GICv3 implementations that do not require GICv2 compatibility might choose to make this bit RAO/WI. The following options are supported:

- The Non-secure copy of `ICC_SRE_EL1.SRE` can be RAO/WI if `ICC_SRE_EL2.SRE` is also RAO/WI. This means all Non-secure software, including VMs using only virtual interrupts, must access the GIC using System registers.
- The Secure copy of `ICC_SRE_EL1.SRE` can be RAO/WI if `ICC_SRE_EL3.SRE` and `ICC_SRE_EL2.SRE` are also RAO/WI. This means that all Secure software must access the GIC using System registers and all Non-secure accesses to registers for physical interrupts must use System registers.

**Note**

A VM using only virtual interrupts might still use memory-mapped access if the Non-secure copy of `ICC_SRE_EL1.SRE` is not RAO/WI.

This field resets to 0.

**Accessing the ICC_SRE_EL1**

Execution with `ICC_SRE_EL1.SRE` set to 0 might make some System registers UNKNOWN.

Accesses to this register use the following encodings:
MRS <Xt>, ICC_SRE_EL1

<table>

ICC_SRE_EL2, Interrupt Controller System Register Enable register (EL2)

The ICC_SRE_EL2 characteristics are:

**Purpose**

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL2.

**Configuration**

AArch64 System register ICC_SRE_EL2 is architecturally mapped to AArch32 System register ICC_HSRE.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ICC_SRE_EL2 is a 64-bit register.

**Field descriptions**

The ICC_SRE_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>31</td>
<td>Enable</td>
<td>Enables lower Exception level access to ICC_SRE_EL1.</td>
</tr>
<tr>
<td>2</td>
<td>DIB</td>
<td>Disable IRQ bypass.</td>
</tr>
</tbody>
</table>

**Bits [63:4]**

Reserved, RES0.

**Enable, bit [3]**

Enable. Enables lower Exception level access to ICC_SRE_EL1.

<table>
<thead>
<tr>
<th>Enable</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When EL2 is implemented and enabled in the current Security state, EL1 accesses to ICC_SRE_EL1 trap to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 accesses to ICC_SRE_EL1 do not trap to EL2.</td>
</tr>
</tbody>
</table>

If ICC_SRE_EL2.SRE is RAO/WI, an implementation is permitted to make the Enable bit RAO/WI.

If ICC_SRE_EL2.SRE is 0, the Enable bit behaves as 1 for all purposes other than reading the value of the bit.

This field resets to an architecturally UNKNOWN value.

**DIB, bit [2]**

Disable IRQ bypass.
DIB, bit [0]

Disable IRQ bypass.

<table>
<thead>
<tr>
<th>DIB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IRQ bypass enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>IRQ bypass disabled.</td>
</tr>
</tbody>
</table>

If EL3 is implemented and \( \text{GICD_CTLR.DS} \) is 0, this field is a read-only alias of \( \text{ICC_SRE_EL3.DIB} \).

If EL3 is implemented and \( \text{GICD_CTLR.DS} \) is 1, this field is a read-write alias of \( \text{ICC_SRE_EL3.DIB} \).

In systems that do not support IRQ bypass, this bit is RAO/WI.

This field resets to 0.

DFB, bit [1]

Disable FIQ bypass.

<table>
<thead>
<tr>
<th>DFB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FIQ bypass enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>FIQ bypass disabled.</td>
</tr>
</tbody>
</table>

If EL3 is implemented and \( \text{GICD_CTLR.DS} \) is 0, this field is a read-only alias of \( \text{ICC_SRE_EL3.DFB} \).

If EL3 is implemented and \( \text{GICD_CTLR.DS} \) is 1, this field is a read-write alias of \( \text{ICC_SRE_EL3.DFB} \).

In systems that do not support FIQ bypass, this bit is RAO/WI.

This field resets to 0.

SRE, bit [0]

System Register Enable.

<table>
<thead>
<tr>
<th>SRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The memory-mapped interface must be used. Access at EL2 to any ICH_* or ICC_* register other than ( \text{ICC_SRE_EL1} ) or ( \text{ICC_SRE_EL2} ), is trapped to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>The System register interface to the ICH_* registers and the EL1 and EL2 ICC_* registers is enabled for EL2.</td>
</tr>
</tbody>
</table>

If software changes this bit from 1 to 0, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

If EL3 is implemented and \( \text{ICC_SRE_EL3.SRE} \) == 0 this bit is RAZ/WI. If \( \text{ICC_SRE_EL3.SRE} \) is changed from zero to one, this bit becomes UNKNOWN.

GICv3 implementations that do not require GICv2 compatibility might choose to make this bit RAO/WI, but this is only allowed if \( \text{ICC_SRE_EL3.SRE} \) is also RAO/WI.

This field resets to 0.

Accessing the ICC_SRE_EL2

Execution with \( \text{ICC_SRE_EL2.SRE} \) set to 0 might make some System registers UNKNOWN.

Accesses to this register use the following encodings:

ICC_SRE_EL3, Interrupt Controller System Register Enable register (EL3)

The ICC_SRE_EL3 characteristics are:

**Purpose**

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL3.

**Configuration**

AArch64 System register ICC_SRE_EL3 bits [31:0] can be mapped to AArch32 System register ICC_MSRE[31:0], but this is not architecturally mandated.

This register is present only when HaveEL(EL3). Otherwise, direct accesses to ICC_SRE_EL3 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ICC_SRE_EL3 is a 64-bit register.

**Field descriptions**

The ICC_SRE_EL3 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0 | RES0 | Enable | DIB | DBSRE |
| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |

**Bits [63:4]**

Reserved, RES0.

**Enable, bit [3]**

Enable. Enables lower Exception level access to ICC_SRE_EL1 and ICC_SRE_EL2.

<table>
<thead>
<tr>
<th>Enable</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL1 accesses to ICC_SRE_EL1 trap to EL3, unless these accesses are trapped to EL2 as a result of ICC_SRE_EL2.Enable == 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 accesses to ICC_SRE_EL1 trap to EL3. EL2 accesses to ICC_SRE_EL1 and ICC_SRE_EL2 do not trap to EL3.</td>
</tr>
</tbody>
</table>

If ICC_SRE_EL3.SRE is RAO/WI, an implementation is permitted to make the Enable bit RAO/WI.

If ICC_SRE_EL3.SRE is 0, the Enable bit behaves as 1 for all purposes other than reading the value of the bit.

This field resets to an architecturally UNKNOWN value.
DIB, bit [2]

Disable IRQ bypass.

<table>
<thead>
<tr>
<th>DIB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IRQ bypass enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>IRQ bypass disabled.</td>
</tr>
</tbody>
</table>

In systems that do not support IRQ bypass, this bit is RAO/WI.

This field resets to 0.

DFB, bit [1]

Disable FIQ bypass.

<table>
<thead>
<tr>
<th>DFB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FIQ bypass enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>FIQ bypass disabled.</td>
</tr>
</tbody>
</table>

In systems that do not support FIQ bypass, this bit is RAO/WI.

This field resets to 0.

SRE, bit [0]

System Register Enable.

<table>
<thead>
<tr>
<th>SRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The memory-mapped interface must be used. Access at EL3 to any ICH_* or ICC_* register other than ICC_SRE_EL1, ICC_SRE_EL2, or ICC_SRE_EL3 is trapped to EL3</td>
</tr>
<tr>
<td>0b1</td>
<td>The System register interface to the ICH_* registers and the EL1, EL2, and EL3 ICC_* registers is enabled for EL3</td>
</tr>
</tbody>
</table>

If software changes this bit from 1 to 0, the results are UNPREDICTABLE.

GICv3 implementations that do not require GICv2 compatibility might choose to make this bit RAO/WI.

This field resets to 0.

**Accessing the ICC_SRE_EL3**

This register is always System register accessible.

Accesses to this register use the following encodings:

MRS <Xt>, ICC_SRE_EL3

<table>
<thead>

  ICC_SRE_EL3 = X[t];
The ICH_AP0R<n>_EL2 characteristics are:

**Purpose**

Provides information about Group 0 virtual active priorities for EL2.

**Configuration**

AArch64 System register ICH_AP0R<n>_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_AP0R<n>[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ICH_AP0R<n>_EL2 is a 64-bit register.

**Field descriptions**

The ICH_AP0R<n>_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:32]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>P&lt;x&gt;</strong></td>
<td>There is no Group 0 interrupt active with this priority level, or all active Group 0 interrupts with this priority level have undergone priority-drop.</td>
</tr>
<tr>
<td>0b0</td>
<td>There is a Group 0 interrupt active with this priority level which has not undergone priority drop.</td>
</tr>
<tr>
<td>0b1</td>
<td>There is a Group 0 interrupt active with this priority level which has not undergone priority drop.</td>
</tr>
</tbody>
</table>

The correspondence between priority levels and bits depends on the number of bits of priority that are implemented.

If 5 bits of preemption are implemented (bits [7:3] of priority), then there are 32 preemption levels, and the active state of these preemption levels are held in ICH_AP0R0_EL2 in the bits corresponding to Priority[7:3].

If 6 bits of preemption are implemented (bits [7:2] of priority), then there are 64 preemption levels, and:

- The active state of preemption levels 0 - 124 are held in ICH_AP0R0_EL2 in the bits corresponding to 0:Priority[6:2].
The active state of preemption levels 128 - 252 are held in ICH_AP0R1_EL2 in the bits corresponding to 1:Priority[6:2].

If 7 bits of preemption are implemented (bits [7:1] of priority), then there are 128 preemption levels, and:

- The active state of preemption levels 0 - 62 are held in ICH_AP0R0_EL2 in the bits corresponding to 00:Priority[5:1].
- The active state of preemption levels 64 - 126 are held in ICH_AP0R1_EL2 in the bits corresponding to 01:Priority[5:1].
- The active state of preemption levels 128 - 190 are held in ICH_AP0R2_EL2 in the bits corresponding to 10:Priority[5:1].
- The active state of preemption levels 192 - 254 are held in ICH_AP0R3_EL2 in the bits corresponding to 11:Priority[5:1].

Note

Having the bit corresponding to a priority set to 1 in both ICH_AP0R<n>_EL2 and ICH_AP1R<n>_EL2 might result in UNPREDICTABLE behavior of the interrupt prioritization system for virtual interrupts.

This field resets to 0.

Software must ensure that ICH_AP0R<n>_EL2 is 0 for legacy VMs otherwise behaviour is UNPREDICTABLE. For more information about support for legacy VMs, see Support for legacy operation of VMs.

The active priorities for Group 0 and Group 1 interrupts for legacy VMs are held in ICH_AP1R<n>_EL2 and reads and writes to GICV_APR access ICH_AP1R<n>_EL2. This means that ICH_AP0R<n>_EL2 is inaccessible to legacy VMs.

### Accessing the ICH_AP0R<n>_EL2

ICH_AP0R_EL2 is only implemented in implementations that support 6 or more bits of preemption. ICH_AP0R2_EL2 and ICH_AP0R3_EL2 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

Note

The number of bits of preemption is indicated by ICH_VTR_EL2.PREbits

Writing to these registers with any value other than the last read value of the register (or 0x00000000 for a newly set up virtual machine) can result in UNPREDICTABLE behavior of the virtual interrupt prioritization system allowing either:

- Virtual interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution at EL1 or EL0.

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- ICH_AP0R<n>_EL2.
- ICH_AP1R<n>_EL2.

Having the bit corresponding to a priority set in both ICH_AP0R<n>_EL2 and ICH_AP1R<n>_EL2 can result in UNPREDICTABLE behavior of the interrupt prioritization system for virtual interrupts.

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>

ICH_AP1R<n>_EL2, Interrupt Controller Hyp Active Priorities Group 1 Registers, n = 0 - 3

The ICH_AP1R<n>_EL2 characteristics are:

**Purpose**

Provides information about Group 1 virtual active priorities for EL2.

**Configuration**

AArch64 System register ICH_AP1R<n>_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_AP1R<n>[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ICH_AP1R<n>_EL2 is a 64-bit register.

**Field descriptions**

The ICH_AP1R<n>_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

**Bits [63:32]**

Reserved, RES0.

**P<x>, bit [x], for x = 0 to 31**

Group 1 interrupt active priorities. Possible values of each bit are:

<table>
<thead>
<tr>
<th>P&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>There is no Group 1 interrupt active with this priority level, or all active Group 1 interrupts with this priority level have undergone priority-drop.</td>
</tr>
<tr>
<td>0b1</td>
<td>There is a Group 1 interrupt active with this priority level which has not undergone priority drop.</td>
</tr>
</tbody>
</table>

The correspondence between priority levels and bits depends on the number of bits of priority that are implemented.

If 5 bits of preemption are implemented (bits [7:3] of priority), then there are 32 preemption levels, and the active state of these preemption levels are held in ICH_AP1R0_EL2 in the bits corresponding to Priority[7:3].

If 6 bits of preemption are implemented (bits [7:2] of priority), then there are 64 preemption levels, and:

- The active state of preemption levels 0 - 124 are held in ICH_AP1R0_EL2 in the bits corresponding to Priority[6:2].
• The active state of preemption levels 128 - 252 are held in ICH_AP1R1_EL2 in the bits corresponding to 1:Priority[6:2].

If 7 bits of preemption are implemented (bits [7:1] of priority), then there are 128 preemption levels, and:

• The active state of preemption levels 0 - 62 are held in ICH_AP1R0_EL2 in the bits corresponding to 00:Priority[5:1].
• The active state of preemption levels 64 - 126 are held in ICH_AP1R1_EL2 in the bits corresponding to 01:Priority[5:1].
• The active state of preemption levels 128 - 190 are held in ICH_AP1R2_EL2 in the bits corresponding to 10:Priority[5:1].
• The active state of preemption levels 192 - 254 are held in ICH_AP1R3_EL2 in the bits corresponding to 11:Priority[5:1].

Note

Having the bit corresponding to a priority set to 1 in both ICH_AP0R<n>_EL2 and ICH_AP1R<n>_EL2 might result in UNPREDICTABLE behavior of the interrupt prioritization system for virtual interrupts.

This field resets to 0.

This register is always used for legacy VMs, regardless of the group of the virtual interrupt. Reads and writes to GICV_APR<n> access ICH_AP1R<n>_EL2. For more information about support for legacy VMs, see Support for legacy operation of VMs.

Accessing the ICH_AP1R<n>_EL2

ICH_AP1R_EL2 is only implemented in implementations that support 6 or more bits of preemption. ICH_AP1R2_EL2 and ICH_AP1R3_EL2 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

Note

The number of bits of preemption is indicated by ICH_VTR_EL2.PREbits.

Writing to these registers with any value other than the last read value of the register (or 0x00000000 for a newly set up virtual machine) can result in UNPREDICTABLE behavior of the virtual interrupt prioritization system allowing either:

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

ICH_EISR_EL2, Interrupt Controller End of Interrupt Status Register

The ICH_EISR_EL2 characteristics are:

**Purpose**

Indicates which List registers have outstanding EOI maintenance interrupts.

**Configuration**

AArch64 System register ICH_EISR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_EISR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

ICH_EISR_EL2 is a 64-bit register.

**Field descriptions**

The ICH_EISR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>62</th>
<th>61</th>
<th>60</th>
<th>59</th>
<th>58</th>
<th>57</th>
<th>56</th>

</tr>
</tbody>
</table>

**Bits [63:16]**

Reserved, RES0.

**Status<n>, bit [n], for n = 0 to 15**

EOI maintenance interrupt status bit for List register <n>:

<table>
<thead>
<tr>
<th>Status&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>List register &lt;n&gt;, ICH_LR&lt;n&gt;_EL2, does not have an EOI maintenance interrupt.</td>
</tr>
<tr>
<td>0b1</td>
<td>List register &lt;n&gt;, ICH_LR&lt;n&gt;_EL2, has an EOI maintenance interrupt that has not been handled.</td>
</tr>
</tbody>
</table>

For any ICH_LR<n>_EL2, the corresponding status bit is set to 1 if all of the following are true:

- ICH_LR<n>_EL2 State is 0b00.
- ICH_LR<n>_EL2 HW is 0.
- ICH_LR<n>_EL2 EOI (bit [41]) is 1, indicating that when the interrupt corresponding to that List register is deactivated, a maintenance interrupt is asserted.

Otherwise the status bit takes the value 0.

**Accessing the ICH_EISR_EL2**

ICH_ELRSR_EL2, Interrupt Controller Empty List Register Status Register

The ICH_ELRSR_EL2 characteristics are:

**Purpose**

These registers can be used to locate a usable List register when the hypervisor is delivering an interrupt to a VM.

**Configuration**

AArch64 System register ICH_ELRSR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_ELRSR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

ICH_ELRSR_EL2 is a 64-bit register.

**Field descriptions**

The ICH_ELRSR_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | Status<n>, bit [n], for n = 0 to 15 |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:16]**

Reserved, RES0.

**Status<n>, bit [n], for n = 0 to 15**

Status bit for List register <n>, ICH_LR<n>_EL2:

<table>
<thead>
<tr>
<th>Status&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>List register ICH_LR&lt;n&gt;_EL2, if implemented, contains a valid interrupt. Using this List register can result in overwriting a valid interrupt.</td>
</tr>
<tr>
<td>0b1</td>
<td>List register ICH_LR&lt;n&gt;_EL2 does not contain a valid interrupt. The List register is empty and can be used without overwriting a valid interrupt or losing an EOI maintenance interrupt.</td>
</tr>
</tbody>
</table>

For any List register <n>, the corresponding status bit is set to 1 if ICH_LR<n>_EL2 State is 0b00 and either ICH_LR<n>_EL2.HW is 1 or ICH_LR<n>_EL2.EOI (bit [41]) is 0.

Otherwise the status bit takes the value 0.

**Accessing the ICH_ELRSR_EL2**

Accesses to this register use the following encodings:

ICH_HCR_EL2, Interrupt Controller Hyp Control Register

The ICH_HCR_EL2 characteristics are:

**Purpose**

Controls the environment for VMs.

**Configuration**

AArch64 System register ICH_HCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register `ICH_HCR[31:0]`.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally *UNKNOWN* values.

**Attributes**

ICH_HCR_EL2 is a 64-bit register.

**Field descriptions**

The ICH_HCR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:32]</th>
</tr>
</thead>
<tbody>
<tr>
<td>EOIcount</td>
</tr>
<tr>
<td>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40</td>
</tr>
<tr>
<td>632616059585756555453525150494847</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**EOIcount, bits [31:27]**

This field is incremented whenever a successful write to a virtual EOIR or DIR register would have resulted in a virtual interrupt deactivation. That is either:

- A virtual write to EOIR with a valid interrupt identifier that is not in the LPI range (that is < 8192) when EOI mode is zero and no List Register was found.
- A virtual write to DIR with a valid interrupt identifier that is not in the LPI range (that is < 8192) when EOI mode is one and no List Register was found.

This allows software to manage more active interrupts than there are implemented List Registers.

It is **CONSTRAINED UNPREDICTABLE** whether a virtual write to EOIR that does not clear a bit in the Active Priorities registers (`ICH_AP0R<n>_EL2/ICH_AP1R<n>_EL2`) increments EOIcount. Permitted behaviors are:

- Increment EOIcount.
- Leave EOIcount unchanged.

This field resets to 0.
Bits [26:15]

Reserved, RES0.

**TDIR, bit [14]**

Trap EL1 writes to **ICC_DIR_EL1** and **ICV_DIR_EL1**.

<table>
<thead>
<tr>
<th>TDIR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL1 writes of <strong>ICC_DIR_EL1</strong> and <strong>ICV_DIR_EL1</strong> are not trapped to EL2, unless trapped by other mechanisms.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 writes of <strong>ICV_DIR_EL1</strong> are trapped to EL2. It is IMPLEMENTATION DEFINED whether writes of <strong>ICC_DIR_EL1</strong> are trapped. Not trapping <strong>ICC_DIR_EL1</strong> writes is DEPRECATED.</td>
</tr>
</tbody>
</table>

Support for this bit is OPTIONAL, with support indicated by **ICH_VTR_EL2**.

If the implementation does not support this trap, this bit is RES0.

Arm deprecates not including this trap bit.

This field resets to 0.

**TSEI, bit [13]**

Trap all locally generated SEIs. This bit allows the hypervisor to intercept locally generated SEIs that would otherwise be taken at EL1.

<table>
<thead>
<tr>
<th>TSEI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Locally generated SEIs do not cause a trap to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Locally generated SEIs trap to EL2.</td>
</tr>
</tbody>
</table>

If **ICH_VTR_EL2**.SEIS is 0, this bit is RES0.

This field resets to 0.

**TALL1, bit [12]**

Trap all EL1 accesses to ICC_* and ICV_* System registers for Group 1 interrupts to EL2.

<table>
<thead>
<tr>
<th>TALL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL1 accesses to ICC_* and ICV_* registers for Group 1 interrupts proceed as normal.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 accesses to ICC_* and ICV_* registers for Group 1 interrupts trap to EL2.</td>
</tr>
</tbody>
</table>

This field resets to 0.

**TALL0, bit [11]**

Trap all EL1 accesses to ICC_* and ICV_* System registers for Group 0 interrupts to EL2.

<table>
<thead>
<tr>
<th>TALL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL1 accesses to ICC_* and ICV_* registers for Group 0 interrupts proceed as normal.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 accesses to ICC_* and ICV_* registers for Group 0 interrupts trap to EL2.</td>
</tr>
</tbody>
</table>

This field resets to 0.

**TC, bit [10]**

Trap all EL1 accesses to System registers that are common to Group 0 and Group 1 to EL2.
<table>
<thead>
<tr>
<th>TC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL1 accesses to common registers proceed as normal.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 accesses to common registers trap to EL2.</td>
</tr>
</tbody>
</table>

This affects accesses to ICC_SGI0R_EL1, ICC_SGI1R_EL1, ICC_ASGI1R_EL1, ICC_CTLR_EL1, ICC_DIR_EL1, ICC_PMR_EL1, ICC_RPR_EL1, ICC_CTLR_EL1, ICC_DIR_EL1, ICC_PMR_EL1, and ICC_RPR_EL1.

This field resets to 0.

**Bits [9:8]**

Reserved, RES0.

**VGrp1DIE, bit [7]**

VM Group 1 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected vPE is disabled:

<table>
<thead>
<tr>
<th>VGrp1DIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled when ICH_VMCR_EL2.VENG1 is 0.</td>
</tr>
</tbody>
</table>

This field resets to 0.

**VGrp1EIE, bit [6]**

VM Group 1 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected vPE is enabled:

<table>
<thead>
<tr>
<th>VGrp1EIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled when ICH_VMCR_EL2.VENG1 is 1.</td>
</tr>
</tbody>
</table>

This field resets to 0.

**VGrp0DIE, bit [5]**

VM Group 0 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected vPE is disabled:

<table>
<thead>
<tr>
<th>VGrp0DIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled when ICH_VMCR_EL2.VENG0 is 0.</td>
</tr>
</tbody>
</table>

This field resets to 0.

**VGrp0EIE, bit [4]**

VM Group 0 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected vPE is enabled:

<table>
<thead>
<tr>
<th>VGrp0EIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled when ICH_VMCR_EL2.VENG0 is 1.</td>
</tr>
</tbody>
</table>

This field resets to 0.
NPIE, bit [3]

No Pending Interrupt Enable. Enables the signaling of a maintenance interrupt when there are no List registers with the State field set to 0b01 (pending):

<table>
<thead>
<tr>
<th>NPIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled while the List registers contain no interrupts in the pending state.</td>
</tr>
</tbody>
</table>

This field resets to 0.

LRENPIE, bit [2]

List Register Entry Not Present Interrupt Enable. Enables the signaling of a maintenance interrupt while the virtual CPU interface does not have a corresponding valid List register entry for an EOI request:

<table>
<thead>
<tr>
<th>LRENPIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt is asserted while the EOICount field is not 0.</td>
</tr>
</tbody>
</table>

This field resets to 0.

UIE, bit [1]

Underflow Interrupt Enable. Enables the signaling of a maintenance interrupt when the List registers are empty, or hold only one valid entry:

<table>
<thead>
<tr>
<th>UIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt is asserted if none, or only one, of the List register entries is marked as a valid interrupt.</td>
</tr>
</tbody>
</table>

This field resets to 0.

En, bit [0]

Enable. Global enable bit for the virtual CPU interface:

<table>
<thead>
<tr>
<th>En</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Virtual CPU interface operation disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Virtual CPU interface operation enabled.</td>
</tr>
</tbody>
</table>

When this field is set to 0:

- The virtual CPU interface does not signal any maintenance interrupts.
- The virtual CPU interface does not signal any virtual interrupts.
- A read of ICV_IAR0_EL1, ICV_IAR1_EL1, GICV_IAR or GICV_AIAR returns a spurious interrupt ID.

Note

This field is RES0 when SCR_EL3.{NS,EEL2} == {0,0}

This field resets to 0.

Accessing the ICH_HCR_EL2

Accesses to this register use the following encodings:

```
MRS <Xt>, ICH_HCR_EL2
```

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
</table>

ICH_LR<n>_EL2, Interrupt Controller List Registers, n = 0 - 15

The ICH_LR<n>_EL2 characteristics are:

**Purpose**

Provides interrupt context information for the virtual CPU interface.

**Configuration**

AArch64 System register ICH_LR<n>_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_LR<n>[31:0].

AArch64 System register ICH_LR<n>_EL2 bits [63:32] are architecturally mapped to AArch32 System register ICH_LRC<n>[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

If list register n is not implemented, then accesses to this register are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ICH_LR<n>_EL2 is a 64-bit register.

**Field descriptions**

The ICH_LR<n>_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>State</td>
<td>The state of the interrupt:</td>
</tr>
<tr>
<td>HW Group</td>
<td>RES0</td>
</tr>
<tr>
<td>vINTID</td>
<td></td>
</tr>
<tr>
<td>31-0</td>
<td>27-26</td>
</tr>
</tbody>
</table>

**State, bits [63:62]**

The state of the interrupt:

<table>
<thead>
<tr>
<th>State</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Invalid (Inactive).</td>
</tr>
<tr>
<td>0b01</td>
<td>Pending.</td>
</tr>
<tr>
<td>0b10</td>
<td>Active.</td>
</tr>
<tr>
<td>0b11</td>
<td>Pending and active.</td>
</tr>
</tbody>
</table>

The GIC updates these state bits as virtual interrupts proceed through the interrupt life cycle. Entries in the invalid state are ignored, except for the purpose of generating virtual maintenance interrupts.

For hardware interrupts, the pending and active state is held in the physical Distributor rather than the virtual CPU interface. A hypervisor must only use the pending and active state for software originated interrupts, which are typically associated with virtual devices, or SGIs.

This field resets to an architecturally UNKNOWN value.
HW, bit [61]

Indicates whether this virtual interrupt maps directly to a hardware interrupt, meaning that it corresponds to a physical interrupt. Deactivation of the virtual interrupt also causes the deactivation of the physical interrupt with the ID that the pINTID field indicates.

<table>
<thead>
<tr>
<th>HW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The interrupt is triggered entirely by software. No notification is sent to the Distributor when the virtual interrupt is deactivated.</td>
</tr>
<tr>
<td>0b1</td>
<td>The interrupt maps directly to a hardware interrupt. A deactivate interrupt request is sent to the Distributor when the virtual interrupt is deactivated, using the pINTID field from this register to indicate the physical interrupt ID.</td>
</tr>
</tbody>
</table>

If ICH_VMCR_EL2.VEOIM is 0, this request corresponds to a write to ICC_EOIR0_EL1 or ICC_EOIR1_EL1. Otherwise, it corresponds to a write to ICC_DIR_EL1.

This field resets to an architecturally UNKNOWN value.

Group, bit [60]

Indicates the group for this virtual interrupt.

<table>
<thead>
<tr>
<th>Group</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This is a Group 0 virtual interrupt. ICH_VMCR_EL2.VFIQEn determines whether it is signaled as a virtual IRQ or as a virtual FIQ, and ICH_VMCR_EL2.VENG0 enables signaling of this interrupt to the virtual machine.</td>
</tr>
<tr>
<td>0b1</td>
<td>This is a Group 1 virtual interrupt, signaled as a virtual IRQ. ICH_VMCR_EL2.VENG1 enables the signalling of this interrupt to the virtual machine. If ICH_VMCR_EL2.VCBPR is 0, then ICC_BPR1_EL1 determines if a pending Group 1 interrupt has sufficient priority to preempt current execution. Otherwise, ICH_LR&lt;n&gt;_EL2 determines preemption.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Bits [59:56]

Reserved, RES0.

Priority, bits [55:48]

The priority of this interrupt.

It is IMPLEMENTATION DEFINED how many bits of priority are implemented, though at least five bits must be implemented. Unimplemented bits are RES0 and start from bit[48] up to bit[50]. The number of implemented bits can be discovered from ICH_VTR_EL2.PRIBits.

This field resets to an architecturally UNKNOWN value.

Bits [47:45]

Reserved, RES0.

pINTID, bits [44:32]

Physical INTID, for hardware interrupts.

When ICH_LR<n>_EL2.HW is 0 (there is no corresponding physical interrupt), this field has the following meaning:

- Bits[44:42]: RES0.
- Bit[41]: EOI. If this bit is 1, then when the interrupt identified by vINTID is deactivated, a maintenance interrupt is asserted.
• Bits[40:32] : RES0.

When ICH_LR<n>_EL2.HW is 1 (there is a corresponding physical interrupt):

• This field indicates the physical INTID. This field is only required to implement enough bits to hold a valid value for the implemented INTID size. Any unused higher order bits are RES0.
• When ICC_CTLR_EL1.ExtRange is 0, then bits[44:42] of this field are RES0.
• If the value of pINTID is not a valid INTID, behavior is UNPREDICTABLE. If the value of pINTID indicates a PPI, this field applies to the PPI associated with this same physical PE ID as the virtual CPU interface requesting the deactivation.

A hardware physical identifier is only required in List Registers for interrupts that require deactivation. This means only 13 bits of Physical INTID are required, regardless of the number specified by ICC_CTLR_EL1.IDbits.

This field resets to an architecturally UNKNOWN value.

**vINTID, bits [31:0]**

Virtual INTID of the interrupt.

If the value of vINTID is 1020-1023 and ICH_LR<n>_EL2.State!=0b00 (Inactive), behavior is UNPREDICTABLE.

Behavior is UNPREDICTABLE if two or more List Registers specify the same vINTID when:

• ICH_LR<n>_EL2.State == 0b01.
• ICH_LR<n>_EL2.State == 0b10.
• ICH_LR<n>_EL2.State == 0b11.

It is IMPLEMENTATION DEFINED how many bits are implemented, though at least 16 bits must be implemented. Unimplemented bits are RES0. The number of implemented bits can be discovered from ICC_VTR_EL2.IDbits.

When ICC_SRE_EL1.SRE == 0, specifying a vINTID in the LPI range is UNPREDICTABLE.

---

**Note**

When a VM is using memory-mapped access to the GIC, software must ensure that the correct source PE ID is provided in bits[12:10].

This field resets to an architecturally UNKNOWN value.

**Accessing the ICH_LR<n>_EL2**

Accesses to this register use the following encodings:

**MRS <Xt>, ICH_LR<n>_EL2**

<table>

end if;
ICH_MISR_EL2, Interrupt Controller Maintenance Interrupt State Register

The ICH_MISR_EL2 characteristics are:

**Purpose**

Indicates which maintenance interrupts are asserted.

**Configuration**

AArch64 System register ICH_MISR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_MISR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ICH_MISR_EL2 is a 64-bit register.

**Field descriptions**

The ICH_MISR_EL2 bit assignments are:

<table>
<thead>

<td>No Pending maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when `ICH_HCR_EL2.NPIE==1` and no List register is in pending state.

This field resets to 0.

**LRENP, bit [2]**

List Register Entry Not Present.

<table>
<thead>
<tr>
<th>LRENP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>List Register Entry Not Present maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>List Register Entry Not Present maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when `ICH_HCR_EL2.LRENPIE==1` and `ICH_HCR_EL2.EOICount is non-zero. This field resets to 0.

**U, bit [1]**

Underflow.

<table>
<thead>
<tr>
<th>U</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Underflow maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Underflow maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when `ICH_HCR_EL2.UIE==1` and zero or one of the List register entries are marked as a valid interrupt, that is, if the corresponding `ICH_LR<n>_EL2.State` bits do not equal 0x0.
This field resets to 0.

**EOI, bit [0]**

End Of Interrupt.

<table>
<thead>
<tr>
<th>EOI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>End Of Interrupt maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>End Of Interrupt maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when at least one bit in **ICH_EISR_EL2** is 1.

This field resets to 0.

The U and NP bits do not include the status of any pending/active VSET packets because these bits control generation of interrupts that allow software management of the contents of the List Registers (which are not affected by VSET packets).

**Accessing the ICH_MISR_EL2**

Accesses to this register use the following encodings:

```
MRS <Xt>, ICH_MISR_EL2
```

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>

ICH_VMCR_EL2, Interrupt Controller Virtual Machine Control Register

The ICH_VMCR_EL2 characteristics are:

**Purpose**

Enables the hypervisor to save and restore the virtual machine view of the GIC state.

**Configuration**

AArch64 System register ICH_VMCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_VMCR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

ICH_VMCR_EL2 is a 64-bit register.

**Field descriptions**

The ICH_VMCR_EL2 bit assignments are:

**Bits [63:32]**

Reserved, RES0.

**VPMR, bits [31:24]**

Virtual Priority Mask. The priority mask level for the virtual CPU interface. If the priority of a pending virtual interrupt is higher than the value indicated by this field, the interface signals the virtual interrupt to the PE.

This field is an alias of ICH_VPMR_EL2.Priority.

**VBPR0, bits [23:21]**

Virtual Binary Point Register, Group 0. Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption, and also determines Group 1 interrupt preemption if ICH_VMCR_EL2.VCBPR == 1.

This field is an alias of ICH_BPR0_EL1.BinaryPoint.

The minimum value of this field is determined by ICH_VTR_EL2.PREbits. An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value.
**VBPR1, bits [20:18]**

Virtual Binary Point Register, Group 1. Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption if `ICH_VMCR_EL2.VCBPR == 0`.

This field is an alias of `ICV_BPR1_EL1.BinaryPoint`.

This field is always accessible to EL2 accesses, regardless of the setting of the `ICH_VMCR_EL2.VCBPR` field.

For Non-secure writes, the minimum value of this field is the minimum value of `ICH_VMCR_EL2.VBPR0` plus one.

For Secure writes, the minimum value of this field is the minimum value of `ICH_VMCR_EL2.VBPR0`.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value.

**Bits [17:10]**

Reserved, RES0.

**VEOIM, bit [9]**

Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt:

<table>
<thead>
<tr>
<th>VEOIM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><code>ICV_EOIR0_EL1</code> and <code>ICV_EOIR1_EL1</code> provide both priority drop and interrupt deactivation functionality. Accesses to <code>ICV_DIR_EL1</code> are UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b1</td>
<td><code>ICV_EOIR0_EL1</code> and <code>ICV_EOIR1_EL1</code> provide priority drop functionality only. <code>ICV_DIR_EL1</code> provides interrupt deactivation functionality.</td>
</tr>
</tbody>
</table>

This bit is an alias of `ICV_CTLR_EL1.EOImode`.

**Bits [8:5]**

Reserved, RES0.

**VCBPR, bit [4]**

Virtual Common Binary Point Register. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VCBPR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><code>ICV_BPR1_EL1</code> determines the preemption group for virtual Group 1 interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reads of <code>ICV_BPR1_EL1</code> return <code>ICV_BPR0_EL1</code> plus one, saturated to 0b111. Writes to <code>ICV_BPR1_EL1</code> are ignored.</td>
</tr>
</tbody>
</table>

This field is an alias of `ICV_CTLR_EL1.CBPR`.

**VFIQEn, bit [3]**

Virtual FIQ enable. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VFIQEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 0 virtual interrupts are presented as virtual IRQs.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 0 virtual interrupts are presented as virtual FIQs.</td>
</tr>
</tbody>
</table>

This bit is an alias of `GICV_CTLR.FIQEn`.

In implementations where the Non-secure copy of `ICC_SRE_EL1` SRE is always 1, this bit is RES1.
VAckCtl, bit [2]

Virtual AckCtl. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VAckCtl</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns an INTID of 1022.</td>
</tr>
<tr>
<td>0b1</td>
<td>If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns the INTID of the corresponding interrupt.</td>
</tr>
</tbody>
</table>

This bit is an alias of GICV_CTLR.AckCtl.

This field is supported for backwards compatibility with GICv2. Arm deprecates the use of this field.

In implementations where the Non-secure copy of ICC_SRE_EL1.SRE is always 1, this bit is RES0.

VENG1, bit [1]

Virtual Group 1 interrupt enable. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VENG1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Virtual Group 1 interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Virtual Group 1 interrupts are enabled.</td>
</tr>
</tbody>
</table>

This bit is an alias of ICV_IGRPEN1_EL1.Enable.

VENG0, bit [0]

Virtual Group 0 interrupt enable. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VENG0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Virtual Group 0 interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Virtual Group 0 interrupts are enabled.</td>
</tr>
</tbody>
</table>

This bit is an alias of ICV_IGRPEN0_EL1.Enable.

Accessing the ICH_VMCR_EL2

When EL2 is using System register access, EL1 using either System register or memory-mapped access must be supported.

Accesses to this register use the following encodings:

MRS <Xt>, ICH_VMCR_EL2

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>

        ICH_VMCR_EL2 = X[t];
    end

ICH_VTR_EL2, Interrupt Controller VGIC Type Register

The ICH_VTR_EL2 characteristics are:

**Purpose**

Reports supported GIC virtualisation features.

**Configuration**

AArch64 System register ICH_VTR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_VTR[31:0].

If EL2 is not implemented, all bits in this register are RES0 from EL3, except for nV4, which is RES1 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

ICH_VTR_EL2 is a 64-bit register.

**Field descriptions**

The ICH_VTR_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| PRIbits | PREbits | IDbits | SEISA3V | nV4 | TDS | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegs | ListRegions |  

**Bits [63:32]**

Reserved, RES0.

**PRIbits, bits [31:29]**

Priority bits. The number of virtual priority bits implemented, minus one.

An implementation must implement at least 32 levels of virtual priority (5 priority bits).

This field is an alias of ICV_CTLR_EL1.PRIbits.

**PREbits, bits [28:26]**

The number of virtual preemption bits implemented, minus one.

An implementation must implement at least 32 levels of virtual preemption priority (5 preemption bits).

The value of this field must be less than or equal to the value of ICH_VTR_EL2.PRIbits.

The maximum value of this field is 6, indicating 7 bits of preemption.

This field determines the minimum value of ICH_VMCR_EL2.VBPR0.

**IDbits, bits [25:23]**

The number of virtual interrupt identifier bits supported:
### IDbits

<table>
<thead>
<tr>
<th>IDbits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>16 bits.</td>
</tr>
<tr>
<td>0b001</td>
<td>24 bits.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field is an alias of `ICV_CTRLR_EL1.IDbits`.

### SEIS, bit [22]

SEI Support. Indicates whether the virtual CPU interface supports generation of SEIs:

<table>
<thead>
<tr>
<th>SEIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>The virtual CPU interface logic does not support generation of SEIs.</td>
</tr>
<tr>
<td>1</td>
<td>The virtual CPU interface logic supports generation of SEIs.</td>
</tr>
</tbody>
</table>

This bit is an alias of `ICV_CTRLR_EL1.SEIS`.

### A3V, bit [21]

Affinity 3 Valid. Possible values are:

<table>
<thead>
<tr>
<th>A3V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.</td>
</tr>
<tr>
<td>1</td>
<td>The virtual CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.</td>
</tr>
</tbody>
</table>

This bit is an alias of `ICV_CTRLR_EL1.A3V`.

### nV4, bit [20]

Direct injection of virtual interrupts not supported. Possible values are:

<table>
<thead>
<tr>
<th>nV4</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>The CPU interface logic supports direct injection of virtual interrupts.</td>
</tr>
<tr>
<td>1</td>
<td>The CPU interface logic does not support direct injection of virtual interrupts.</td>
</tr>
</tbody>
</table>

In GICv3 this bit is RES1.

### TDS, bit [19]

Separate trapping of EL1 writes to `ICV_DIR_EL1` supported.

<table>
<thead>
<tr>
<th>TDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Implementation does not support <code>ICH_HCR_EL2.TDIR</code>.</td>
</tr>
<tr>
<td>1</td>
<td>Implementation supports <code>ICH_HCR_EL2.TDIR</code>.</td>
</tr>
</tbody>
</table>

### Bits [18:5]

Reserved, RES0.

### ListRegs, bits [4:0]

The number of implemented List registers, minus one. For example, a value of 0b01111 indicates that the maximum of 16 List registers are implemented.
Accessing the ICH_VTR_EL2

Accesses to this register use the following encodings:

\[ \text{MRS } <\text{Xt}>, \text{ ICH_VTR_EL2} \]

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

ICV_AP0R<n>_EL1, Interrupt Controller Virtual Active Priorities Group 0 Registers, n = 0 - 3

The ICV_AP0R<n>_EL1 characteristics are:

**Purpose**

Provides information about virtual Group 0 active priorities.

**Configuration**

AArch64 System register ICV_AP0R<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_AP0R<n>[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ICV_AP0R<n>_EL1 is a 64-bit register.

**Field descriptions**

The ICV_AP0R<n>_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 |
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | IMPLEMENTATION DEFINED |

**Bits [63:32]**

Reserved, RES0.

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

**Accessing the ICV_AP0R<n>_EL1**

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 0 active priorities) might result in UNPREDICTABLE behavior of the virtual interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICV_AP0R1_EL1 is only implemented in implementations that support 6 or more bits of priority. ICV_AP0R2_EL1 and ICV_AP0R3_EL1 are only implemented in implementations that support 7 bits of priority. Unimplemented registers are UNDEFINED.

Writing to the active priority registers in any order other than the following order might result in UNPREDICTABLE behavior of the interrupt prioritization system:
ICV\_AP0R\_n\_EL1, Interrupt Controller Virtual Active Priorities Group 0 Registers, n = 0 - 3

- ICV\_AP0R\_n\_EL1.
- ICV\_AP1R\_n\_EL1.

Accesses to this register use the following encodings:

MRS <Xt>, ICV\_AP0R\_n\_EL1

<table>
<thead>
<tr>

ICV_AP1R<n>_EL1, Interrupt Controller Virtual Active Priorities Group 1 Registers, n = 0 - 3

The ICV_AP1R<n>_EL1 characteristics are:

**Purpose**

Provides information about virtual Group 1 active priorities.

**Configuration**

AArch64 System register ICV_AP1R<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_AP1R<n>[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ICV_AP1R<n>_EL1 is a 64-bit register.

**Field descriptions**

The ICV_AP1R<n>_EL1 bit assignments are:

|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [63:32]**

Reserved, RES0.

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

**Accessing the ICV_AP1R<n>_EL1**

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 1 active priorities) might result in UNPREDICTABLE behavior of the virtual interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICV_AP1R1_EL1 is only implemented in implementations that support 6 or more bits of priority. ICV_AP1R2_EL1 and ICV_AP1R3_EL1 are only implemented in implementations that support 7 bits of priority. Unimplemented registers are UNDEFINED.

Writing to the active priority registers in any order other than the following order might result in UNPREDICTABLE behavior of the interrupt prioritization system:
ICV_AP1R<n>_EL1, Interrupt Controller Virtual Active Priorities Group 1 Registers, n = 0 - 3

- ICV_AP0R<n>_EL1
- ICV_AP1R<n>_EL1.

Accesses to this register use the following encodings:

ICV_BPR0_EL1, Interrupt Controller Virtual Binary Point Register 0

The ICV_BPR0_EL1 characteristics are:

**Purpose**

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines virtual Group 0 interrupt preemption.

**Configuration**

AArch64 System register ICV_BPR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_BPR0[31:0].

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

ICV_BPR0_EL1 is a 64-bit register.

**Field descriptions**

The ICV_BPR0_EL1 bit assignments are:

| Bits [63:3] | Reserved, RES0. |
| BinaryPoint, bits [2:0] | The value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows: |

<table>
<thead>
<tr>
<th>Binary point value</th>
<th>Group priority field</th>
<th>Subpriority field</th>
<th>Field with binary point</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>[7:1]</td>
<td>[0]</td>
<td>ggggggg.s</td>
</tr>
<tr>
<td>1</td>
<td>[7:2]</td>
<td>[1:0]</td>
<td>gggggg.sss</td>
</tr>
<tr>
<td>2</td>
<td>[7:3]</td>
<td>[2:0]</td>
<td>gggggg.sss</td>
</tr>
<tr>
<td>3</td>
<td>[7:4]</td>
<td>[3:0]</td>
<td>gggggg.sss</td>
</tr>
<tr>
<td>4</td>
<td>[7:5]</td>
<td>[4:0]</td>
<td>ggg.sssss</td>
</tr>
<tr>
<td>5</td>
<td>[7:6]</td>
<td>[5:0]</td>
<td>gssssss</td>
</tr>
<tr>
<td>6</td>
<td>[7]</td>
<td>[6:0]</td>
<td>sssssss</td>
</tr>
<tr>
<td>7</td>
<td>No preemption</td>
<td>[7:0]</td>
<td>.ssssssss</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**Accessing the ICV_BPR0_EL1**

The minimum binary point value is derived from the number of implemented preemption bits, as shown in the following table:
## Number of implemented preemption bits vs. Minimum value of BPR0

<table>
<thead>
<tr>
<th>Number of implemented preemption bits</th>
<th>Minimum value of BPR0</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
<td>0</td>
</tr>
<tr>
<td>6</td>
<td>1</td>
</tr>
<tr>
<td>5</td>
<td>2</td>
</tr>
</tbody>
</table>

The number of implemented preemption bits is indicated by `ICH_VTR_EL2.PREbits`.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is `UNKNOWN`.

Accesses to this register use the following encodings:

The ICV_BPR1_EL1 characteristics are:

**Purpose**

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines virtual Group 1 interrupt preemption.

**Configuration**

AArch64 System register ICV_BPR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_BPR1[31:0].

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally unknown values.

**Attributes**

ICV_BPR1_EL1 is a 64-bit register.

**Field descriptions**

The ICV_BPR1_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit assignments</th>
<th>RES0</th>
<th>BinaryPoint</th>
</tr>
</thead>
<tbody>
<tr>
<td>63   62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</td>

<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:3]**

Reserved, RES0.

**BinaryPoint, bits [2:0]**

If the GIC is configured to use separate binary point fields for virtual Group 0 and virtual Group 1 interrupts, the value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

<table>
<thead>
<tr>
<th>Binary point value</th>
<th>Group priority field</th>
<th>Subpriority field</th>
<th>Field with binary point</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>.</td>
<td>.</td>
<td>.</td>
</tr>
<tr>
<td>1</td>
<td>[7:1]</td>
<td>[0]</td>
<td>gggggggg.s</td>
</tr>
<tr>
<td>2</td>
<td>[7:2]</td>
<td>[1:0]</td>
<td>ggggggg.ss</td>
</tr>
<tr>
<td>3</td>
<td>[7:3]</td>
<td>[2:0]</td>
<td>gggggg.sss</td>
</tr>
<tr>
<td>4</td>
<td>[7:4]</td>
<td>[3:0]</td>
<td>ggggg.sssss</td>
</tr>
<tr>
<td>5</td>
<td>[7:5]</td>
<td>[4:0]</td>
<td>gggg.sssss</td>
</tr>
<tr>
<td>6</td>
<td>[7:6]</td>
<td>[5:0]</td>
<td>gg.sssssss</td>
</tr>
<tr>
<td>7</td>
<td>[7]</td>
<td>[6:0]</td>
<td>g.sssssssss</td>
</tr>
</tbody>
</table>

Writing 0 to this field will set this field to its reset value.

If ICV_CTLR_EL1.CBPR is set to 1, Non-secure EL1 reads return ICV_BPR0_EL1 + 1 saturated to 0b111. Non-secure EL1 writes are ignored.
If `ICV_CTLR_EL1.CBPR` is set to 1, Secure EL1 reads return `ICV_BPR0_EL1`. Secure EL1 writes modify `ICV_BPR0_EL1`.

This field resets to an IMPLEMENTATION DEFINED non-zero value.

**Accessing the ICV_BPR1_EL1**

The reset value is IMPLEMENTATION DEFINED, but is equal to the minimum value of `ICV_BPR0_EL1` plus one.

An attempt to program the binary point field to a value less than the reset value sets the field to the reset value.

Accesses to this register use the following encodings:

ICV_CTLR_EL1, Interrupt Controller Virtual Control Register

The ICV_CTLR_EL1 characteristics are:

**Purpose**

Controls aspects of the behavior of the GIC virtual CPU interface and provides information about the features implemented.

**Configuration**

AArch64 System register ICV_CTLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_CTLR[31:0].

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

ICV_CTLR_EL1 is a 64-bit register.

**Field descriptions**

The ICV_CTLR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-20</td>
<td><strong>Reserved, RES0</strong></td>
</tr>
<tr>
<td>19</td>
<td><strong>ExtRange</strong></td>
</tr>
<tr>
<td>18-15</td>
<td><strong>PRIbits</strong></td>
</tr>
<tr>
<td>14-11</td>
<td><strong>IDbits</strong></td>
</tr>
<tr>
<td>10-9</td>
<td><strong>A3V</strong></td>
</tr>
<tr>
<td>8-5</td>
<td><strong>RSS</strong></td>
</tr>
<tr>
<td>4-0</td>
<td><strong>ExtRange</strong></td>
</tr>
</tbody>
</table>

**Bits [63:20]**

Reserved, RES0.

**ExtRange, bit [19]**

Extended INTID range (read-only).

<table>
<thead>
<tr>
<th>ExtRange</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0      | CPU interface does not support INTIDs in the range 1024..8191.  
  - Behaviour is **UNPREDICTABLE** if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface.  
  **Note**  
  Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them. |
| 0b1      | CPU interface supports INTIDs in the range 1024..8191  
  - All INTIDs in the range 1024..8191 are treated as requiring deactivation. |

ICV_CTLR_EL1.ExtRange is an alias of ICC_CTLR_EL1.ExtRange.
RSS, bit [18]

Range Selector Support. Possible values are:

<table>
<thead>
<tr>
<th>RSS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Targeted SGIs with affinity level 0 values of 0 - 15 are supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>Targeted SGIs with affinity level 0 values of 0 - 255 are supported.</td>
</tr>
</tbody>
</table>

This bit is read-only.

Bits [17:16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

<table>
<thead>
<tr>
<th>A3V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>The virtual CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.</td>
</tr>
</tbody>
</table>

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the virtual CPU interface supports local generation of SEIs:

<table>
<thead>
<tr>
<th>SEIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The virtual CPU interface logic does not support local generation of SEIs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The virtual CPU interface logic supports local generation of SEIs.</td>
</tr>
</tbody>
</table>

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. The number of virtual interrupt identifier bits supported:

<table>
<thead>
<tr>
<th>IDbits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>16 bits.</td>
</tr>
<tr>
<td>0b001</td>
<td>24 bits.</td>
</tr>
</tbody>
</table>

All other values are reserved.

PRibits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation must implement at least 32 levels of physical priority (5 priority bits).

Note

This field always returns the number of priority bits implemented.

The division between group priority and subpriority is defined in the binary point registers ICV_BPR0_EL1 and ICV_BPR1_EL1.

Bits [7:2]

Reserved, RES0.
EOI mode, bit [1]

Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt:

<table>
<thead>
<tr>
<th>EOI mode</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICV_EOIR0_EL1 and ICV_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICV_DIR_EL1 are UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICV_EOIR0_EL1 and ICV_EOIR1_EL1 provide priority drop functionality only. ICV_DIR_EL1 provides interrupt deactivation functionality.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

CBPR, bit [0]

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both virtual Group 0 and virtual Group 1 interrupts:

<table>
<thead>
<tr>
<th>CBPR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICV_BPR1_EL1 determines the preemption group for virtual Group 1 interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reads of ICV_BPR1_EL1 return ICV_BPR0_EL1 plus one, saturated to 0b111. Writes to ICV_BPR1_EL1 are ignored.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

ICV_DIR_EL1, Interrupt Controller Deactivate Virtual Interrupt Register

The ICV_DIR_EL1 characteristics are:

**Purpose**

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified virtual interrupt.

**Configuration**

AArch64 System register ICV_DIR_EL1 bits [31:0] performs the same function as AArch32 System register ICV_DIR[31:0].

**Attributes**

ICV_DIR_EL1 is a 64-bit register.

**Field descriptions**

The ICV_DIR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | INTID |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID of the virtual interrupt to be deactivated.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR_EL1.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

**Accessing the ICV_DIR_EL1**

When EOImode == 0, writes are ignored. In systems supporting system error generation, an implementation might generate an SEI.

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>
<td>0b1100</td>
<td>0b1011</td>
<td>0b001</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if ICC_SRE_EL1.SRE == '0' then
        AArch64.SystemAccessTrap(EL1, 0x18);
    elseif EL2Enabled() && !ELUsingAArch32(EL2) && ICH_HCR_EL2.TDIR == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elseif EL2Enabled() && !ELUsingAArch32(EL2) && ICH_HCR_EL2.TC == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elseif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.FMO == '1' then
        ICV_DIR_EL1 = X[t];
    elseif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.IMO == '1' then
        ICV_DIR_EL1 = X[t];
    elseif HaveEL(EL3) && !ELUsingAArch32(EL3) && SCR_EL3.<IRQ,FIQ> == '11' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        ICC_DIR_EL1 = X[t];
    endif
elseif PSTATE.EL == EL2 then
    if ICC_SRE_EL2.SRE == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elseif HaveEL(EL3) && !ELUsingAArch32(EL3) && SCR_EL3.<IRQ,FIQ> == '11' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        ICC_DIR_EL1 = X[t];
    endif
elseif PSTATE.EL == EL3 then
    if ICC_SRE_EL3.SRE == '0' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        ICC_DIR_EL1 = X[t];
    endif
The ICV_EOIR0_EL1 characteristics are:

**Purpose**
A PE writes to this register to inform the CPU interface that it has completed the processing of the specified virtual Group 0 interrupt.

**Configuration**
AArch64 System register ICV_EOIR0_EL1 performs the same function as AArch32 System register ICV_EOIR0.

**Attributes**
ICV_EOIR0_EL1 is a 64-bit register.

**Field descriptions**
The ICV_EOIR0_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:24</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>23:0</td>
<td>INTID</td>
</tr>
</tbody>
</table>

Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]
The INTID from the corresponding ICV_IAR0_EL1 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR_EL1.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the ICV_CTLR.EOiMode bit is 0, a write to this register drops the priority for the virtual interrupt, and also deactivates the virtual interrupt.

If the ICV_CTLR.EOiMode bit is 1, a write to this register only drops the priority for the virtual interrupt. Software must write to ICV_DIR_EL1 to deactivate the virtual interrupt.

**Accessing the ICV_EOIR0_EL1**
A write to this register must correspond to the most recent valid read by this vPE from a Virtual Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICV_IAR0_EL1, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

Accesses to this register use the following encodings:

```
MSR ICC_EOIR0_EL1, <Xt>
```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if ICC_SRE_EL1.SRE == '0' then

        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        ICC_EOIR0_EL1 = X[t];
    endif
ICV_EOIR1_EL1, Interrupt Controller Virtual End Of Interrupt Register 1

The ICV_EOIR1_EL1 characteristics are:

**Purpose**

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified virtual Group 1 interrupt.

**Configuration**

AArch64 System register ICV_EOIR1_EL1 performs the same function as AArch32 System register ICV_EOIR1.

**Attributes**

ICV_EOIR1_EL1 is a 64-bit register.

**Field descriptions**

**Bits [63:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID from the corresponding ICV_IAR1_EL1 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR_EL1.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the ICV_CTLR.EOImode bit is 0, a write to this register drops the priority for the virtual interrupt, and also deactivates the virtual interrupt.

If the ICV_CTLR.EOImode bit is 1, a write to this register only drops the priority for the virtual interrupt. Software must write to ICV_DIR_EL1 to deactivate the virtual interrupt.

**Accessing the ICV_EOIR1_EL1**

A write to this register must correspond to the most recent valid read by this vPE from a Virtual Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICV_IAR1_EL1, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

Accesses to this register use the following encodings:

```
MSR ICC_EOIR1_EL1, <Xt>
```

ICV_IAR0_EL1, Interrupt Controller Virtual Interrupt Acknowledge Register 0

The ICV_IAR0_EL1 characteristics are:

**Purpose**

The PE reads this register to obtain the INTID of the signaled virtual Group 0 interrupt. This read acts as an acknowledge for the interrupt.

**Configuration**

AArch64 System register ICV_IAR0_EL1 performs the same function as AArch32 System register ICV_IAR0.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when PSTATE.{I,F} == {0,0}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. See Observability of the effects of accesses to the GIC registers, for more information.

**Attributes**

ICV_IAR0_EL1 is a 64-bit register.

**Field descriptions**

The ICV_IAR0_EL1 bit assignments are:

ICV_IGRPEN0_EL1, Interrupt Controller Virtual Interrupt Group 0 Enable register

The ICV_IGRPEN0_EL1 characteristics are:

**Purpose**

Controls whether virtual Group 0 interrupts are enabled or not.

**Configuration**

AArch64 System register ICV_IGRPEN0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_IGRPEN0[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ICV_IGRPEN0_EL1 is a 64-bit register.

**Field descriptions**

The ICV_IGRPEN0_EL1 bit assignments are:

| Bits [63:1] | Reserved, RES0. |
| Bits [0] | Enables virtual Group 0 interrupts. |

<table>
<thead>
<tr>

ICV_IGRPEN1_EL1, Interrupt Controller Virtual Interrupt Group 1 Enable register

The ICV_IGRPEN1_EL1 characteristics are:

**Purpose**

Controls whether virtual Group 1 interrupts are enabled for the current Security state.

**Configuration**

AArch64 System register ICV_IGRPEN1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_IGRPEN1[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ICV_IGRPEN1_EL1 is a 64-bit register.

**Field descriptions**

The ICV_IGRPEN1_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

  end
ICV_PMR_EL1, Interrupt Controller Virtual Interrupt Priority Mask Register

The ICV_PMR_EL1 characteristics are:

**Purpose**

Provides a virtual interrupt priority filter. Only virtual interrupts with a higher priority than the value in this register are signaled to the PE.

**Configuration**

AArch64 System register ICV_PMR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_PMR[31:0].

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that writes to this register are self-synchronising. This ensures that no interrupts below the written PMR value will be taken after a write to this register is architecturally executed. See Observability of the effects of accesses to the GIC registers, for more information.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ICV_PMR_EL1 is a 64-bit register.

**Field descriptions**

The ICV_PMR_EL1 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 |

**Bits [63:8]**

Reserved, RES0.

**Priority, bits [7:0]**

The priority mask level for the virtual CPU interface. If the priority of a virtual interrupt is higher than the value indicated by this field, the interface signals the virtual interrupt to the PE.

The possible priority field values are as follows:

<table>
<thead>
<tr>
<th>Implemented priority bits</th>
<th>Possible priority field values</th>
<th>Number of priority levels</th>
</tr>
</thead>
<tbody>
<tr>
<td>[7:0]</td>
<td>0x00-0xFF (0-255), all values</td>
<td>256</td>
</tr>
<tr>
<td>[7:1]</td>
<td>0x00-0xFE (0-254), even values only</td>
<td>128</td>
</tr>
<tr>
<td>[7:2]</td>
<td>0x00-0xFC (0-252), in steps of 4</td>
<td>64</td>
</tr>
<tr>
<td>[7:3]</td>
<td>0x00-0xF8 (0-248), in steps of 8</td>
<td>32</td>
</tr>
<tr>
<td>[7:4]</td>
<td>0x00-0xF0 (0-240), in steps of 16</td>
<td>16</td>
</tr>
</tbody>
</table>
Unimplemented priority bits are RAZ/WI.

This field resets to an architecturally **UNKNOWN** value.

Bits [63:8]

Reserved, RES0.

Priority, bits [7:0]

The current running priority on the virtual CPU interface. This is the group priority of the current active virtual interrupt.

If there are no active interrupts on the virtual CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

The priority returned is the group priority as if the BPR for the current Exception level and Security state was set to the minimum value of BPR for the number of implemented priority bits.

**Note**

If 8 bits of priority are implemented the group priority is bits[7:1] of the priority.

**Accessing the ICV_RPR_EL1**

If there are no active interrupts on the virtual CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

Software cannot determine the number of implemented priority bits from a read of this register.

Accesses to this register use the following encodings:
MRS <Xt>, ICC_RPR_EL1

ID_AA64AFR1_EL1, AArch64 Auxiliary Feature Register 1

The ID_AA64AFR1_EL1 characteristics are:

**Purpose**

Reserved for future expansion of information about the IMPLEMENTATION DEFINED features of the PE in AArch64 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

**Configuration**

**Attributes**

ID_AA64AFR1_EL1 is a 64-bit register.

**Field descriptions**

The ID_AA64AFR1_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Positions</th>
<th>Bit Assignments</th>

The ID_AA64DFR0_EL1 characteristics are:

**Purpose**

Provides top level information about the debug system in AArch64 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

**Configuration**

The external register `EDDFR` gives information from this register.

**Attributes**

ID_AA64DFR0_EL1 is a 64-bit register.

**Field descriptions**

The ID_AA64DFR0_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:52]</td>
<td>Reserved, <code>RES0</code></td>

</tr>
</tbody>
</table>

**Bits [63:52]**

Reserved, `RES0`.

**MTPMU, bits [51:48]**

From Armv8.6:

Multi-threaded PMU extension. Defined values are:

<table>
<thead>
<tr>
<th>MTPMU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>ARMv8.6-MTPMU not implemented. If PMUv3 is implemented, it is IMPLEMENTATION DEFINED whether PMEVTYPER&lt;n&gt;_EL0.MT are read/write or <code>RES0</code>.</td>
</tr>
<tr>
<td>0b0001</td>
<td>ARMv8.6-MTPMU implemented and PMEVTYPER&lt;n&gt;_EL0.MT are read/write. When ARMv8.6-MTPMU is disabled, the Effective values of PMEVTYPER&lt;n&gt;_EL0.MT are 0.</td>
</tr>
<tr>
<td>0b1111</td>
<td>ARMv8.6-MTPMU not implemented. If PMUv3 is implemented, PMEVTYPER&lt;n&gt;_EL0.MT are <code>RES0</code>.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.6-MTPMU implements the functionality identified by the value 0b0001.

In an Armv8.6-compliant implementation that includes PMUv3, the value 0b0000 is not permitted.

In an implementation that does not include PMUv3, the value 0b0001 is not permitted.
Otherwise:

Reserved, RES0.

**TraceBuffer, bits [47:44]**

When TRBE is implemented:

Trace Buffer Extension version. Defined values are:

<table>
<thead>
<tr>
<th>TraceBuffer</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Trace Buffer Extension not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Trace Buffer Extension implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Otherwise:

Reserved, RES0.

**TraceFilt, bits [43:40]**

From Armv8.4:

Armv8.4 Self-hosted Trace Extension version. Defined values are:

<table>
<thead>
<tr>
<th>TraceFilt</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Armv8.4 Self-hosted Trace Extension not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Armv8.4 Self-hosted Trace Extension implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.4-Trace implements the functionality identified by the value 0b0001.

Otherwise:

Reserved, RES0.

**DoubleLock, bits [39:36]**

OS Double Lock implemented. Defined values are:

<table>
<thead>
<tr>
<th>DoubleLock</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>OS Double Lock implemented. OSDLR_EL1 is RW.</td>
</tr>
<tr>
<td>0b1111</td>
<td>OS Double Lock not implemented. OSDLR_EL1 is RAZ/WI.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.0-DoubleLock implements the functionality identified by the value 0b0000.

**PMSVer, bits [35:32]**

From Armv8.2:

Statistical Profiling Extension version. Defined values are:
<table>
<thead>
<tr>
<th>PMSVer</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Statistical Profiling Extension not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Statistical Profiling Extension implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As 0b0001 and also includes support for:</td>
</tr>
<tr>
<td></td>
<td>• The Event packet Alignment flag.</td>
</tr>
<tr>
<td></td>
<td>• If SVE is implemented, the Scalable Vector extensions to Statistical Profiling.</td>
</tr>
</tbody>
</table>

All other values are reserved.

SPE implements the functionality identified by the value 0b0001.

ARMv8.3-SPE implements the functionality added by the value 0b0010. If ARMv8.3-SPE is implemented, then ID_AA64FR0_EL1.PMSVer is not permitted to read as 0b0000 or 0b0001.

Otherwise:

Reserved, RES0.

**CTX_CMPs, bits [31:28]**

Number of breakpoints that are context-aware, minus 1. These are the highest numbered breakpoints.

**Bits [27:24]**

Reserved, RES0.

**WRPs, bits [23:20]**

Number of watchpoints, minus 1. The value of 0b0000 is reserved.

**Bits [19:16]**

Reserved, RES0.

**BRPs, bits [15:12]**

Number of breakpoints, minus 1. The value of 0b0000 is reserved.

**PMUVer, bits [11:8]**

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the Alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Defined values are:
### PMUVer

<table>
<thead>
<tr>
<th>PMUVer</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Performance Monitors Extension not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Performance Monitors Extension implemented, PMUv3.</td>
</tr>
</tbody>
</table>
| 0b0100 | PMUv3 for Armv8.1. As 0b0001, and also includes support for:  
  - Extended 16-bit PMEVTYPER\textsubscript{<n>}_EL0 evtCount field.  
  - If EL2 is implemented, the MDCR\_EL2 HPMD control bit. |
| 0b0101 | PMUv3 for Armv8.2. As 0b0100 and also includes support for the PMMIR\_EL1 register. |
| 0b0110 | PMUv3 for Armv8.4. As 0b0101 and also includes support for:  
  - 64-bit event counters.  
  - If EL2 is implemented, the MDCR\_EL2 HCCD control bit.  
  - If EL3 is implemented, the MDCR\_EL3 SCCD control bit. |
| 0b1111 | IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value in new implementations. |

All other values are reserved.

ARMv8.1-PMU implements the functionality identified by the value 0b0100.

ARMv8.4-PMU implements the functionality identified by the value 0b0101.

ARMv8.5-PMU implements the functionality identified by the value 0b0110.

In an Armv8.1-compliant implementation that includes PMUv3, the value 0b0001 is not permitted.

In an Armv8.4-compliant implementation that includes PMUv3, the value 0b0100 is not permitted.

In an Armv8.5-compliant implementation that includes PMUv3, the value 0b0101 is not permitted.

### TraceVer, bits [7:4]

Trace support. Indicates whether System register interface to a PE trace unit is implemented. Defined values are:

<table>
<thead>
<tr>
<th>TraceVer</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>PE trace unit System registers not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>PE trace unit System registers implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

When PE trace unit System registers are implemented, see TRCIDR1 for tracing capabilities of the trace unit.

### DebugVer, bits [3:0]

Debug architecture version. Indicates presence of Armv8 debug architecture. Defined values are:

<table>
<thead>
<tr>
<th>DebugVer</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0110</td>
<td>Armv8 debug architecture.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Armv8 debug architecture with Virtualization Host Extensions.</td>
</tr>
<tr>
<td>0b1000</td>
<td>Armv8.2 debug architecture</td>
</tr>
<tr>
<td>0b1001</td>
<td>Armv8.4 debug architecture</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.2-Debug adds the functionality identified by the value 0b1000.

- If Armv8.1-VHE is not implemented the only permitted value is 0b0110.
- In an Armv8.0 implementation the value 0b0100 is not permitted.

### Accessing the ID_AA64DFR0\_EL1

Accesses to this register use the following encodings:
MRS <Xt>, ID_AA64DFR0_EL1

</tbody>
</table>

**RNDR, bits [63:60]**

From Armv8.5:

Indicates support for Random Number instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>RNDR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No Random Number instructions are implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>RNDR and RNDRRS registers are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.5-RNG implements the functionality identified by the value 0b0001.

From Armv8.5, the permitted values are 0b0000 and 0b0001.

**TLB, bits [59:56]**

From Armv8.4:

Indicates support for Outer shareable and TLB range maintenance instructions. Defined values are:
### TLB

<table>
<thead>
<tr>
<th>TLB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Outer shareable and TLB range maintenance instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Outer shareable TLB maintenance instructions are implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Outer shareable and TLB range maintenance instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.4-TLBI implements the functionality identified by the values 0b0001 and 0b0010.

From Armv8.4, the only permitted value is 0b0010.

**Otherwise:**

Reserved, RES0.

### TS, bits [55:52]

Indicates support for flag manipulation instructions. Defined values are:

<table>
<thead>
<tr>
<th>TS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No flag manipulation instructions are implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>CFINV, RMIF, SETF16, and SETF8 instructions are implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>CFINV, RMIF, SETF16, SETF8, AXFLAG, and XAFLAG instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.4-CondM implements the functionality identified by the value 0b0001.

ARMv8.5-CondM implements the functionality identified by the value 0b0010.

From Armv8.4, the only permitted value is 0b0001.

From Armv8.5, the only permitted value is 0b0010.

### FHM, bits [51:48]

**From Armv8.2:**

Indicates whether FMLAL and FMLSL instructions are implemented.

<table>
<thead>
<tr>
<th>FHM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>FMLAL and FMLSL instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>FMLAL and FMLSL instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.2-FHM implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

**Otherwise:**

Reserved, RES0.

### DP, bits [47:44]

**From Armv8.2:**

Dot Product instructions implemented in AArch64 state. Defined values are:
<table>
<thead>
<tr>
<th>DP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No Dot Product instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>UDOT and SDOT instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.2-DotProd implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

Otherwise:

Reserved, RES0.

**SM4, bits [43:40]**

From Armv8.2:

SM4 instructions implemented in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>SM4</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No SM4 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SM4E and SM4EKEY instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If ARMv8.2-SM is not implemented the value 0b0001 is reserved.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

This field must have the same value as ID_AA64ISAR0_EL1.SM4.

Otherwise:

Reserved, RES0.

**SM3, bits [39:36]**

From Armv8.2:

SM3 instructions implemented in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>SM3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No SM3 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SM3SS1, SM3TT1A, SM3TT1B, SM3TT2A, SM3TT2B,</td>
</tr>
<tr>
<td></td>
<td>SM3PARTW1, and SM3PARTW2 instructions ...</td>
</tr>
</tbody>
</table>

All other values are reserved.

If ARMv8.2-SM is not implemented the value 0b0001 is reserved.

ARMv8.2-SM implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

This field must have the same value as ID_AA64ISAR0_EL1.SM3.

Otherwise:

Reserved, RES0.
SHA3, bits [35:32]

From Armv8.2:

SHA3 instructions implemented in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>SHA3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No SHA3 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EOR3, RAX1, XAR, and BCAX instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If Armv8.2-SHA is not implemented the value 0b0001 is reserved.

ARMv8.2-SHA implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR0_EL1.SHA1 is 0b0000, then this field must have the value 0b0000.

If the value of this field is 0b0001, then ID_AA64ISAR0_EL1.SHA2 must have the value 0b0010.

Otherwise:

Reserved, RES0.

RDM, bits [31:28]

From Armv8.1:

SQRDMLAH and SQRDMLSH instructions implemented in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>RDM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No SQRDMLAH and SQRDMLSH instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SQRDMLAH and SQRDMLSH instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.1-RDMA implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

TME, bits [27:24]

When TME is implemented:

Indicates whether TME instructions are implemented:

<table>
<thead>
<tr>
<th>TME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>TME instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>TCANCEL, TCOMMIT, TSTART, and TTEST instructions are implemented.</td>
</tr>
</tbody>
</table>

If HCR_EL2.TME == 0, reads of this field at EL1 return 0.

If SCR_EL3.TME == 0, reads of this field at EL1 or EL2 return 0.

All other values are reserved.
Otherwise:
Reserved, RES0.

Atomic, bits [23:20]

From Armv8.1:

Atomic instructions implemented in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>Atomic</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No Atomic instructions implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>LDADD, LDCLR, LDEOR, LDSET, LDSMAX, LDSMIN, LDUMAX, LDUMIN, CAS, CASP, and SWP instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.1-LSE implements the functionality identified by the value 0b0010.

From Armv8.1, the only permitted value is 0b0010.

Otherwise:
Reserved, RES0.

CRC32, bits [19:16]

CRC32 instructions implemented in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>CRC32</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No CRC32 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>CRC32B, CRC32H, CRC32W, CRC32X, CRC32CB, CRC32CH, CRC32CW, and CRC32CX instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.1, the only permitted value is 0b0001.

SHA2, bits [15:12]

SHA2 instructions implemented in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>SHA2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No SHA2 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 instructions implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As 0b0001, plus SHA512H, SHA512H2, SHA512SU0, and SHA512SU1 instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If ARMv8.2-SHA is not implemented the value 0b0010 is reserved.

From Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

If the value of ID_AA64ISAR0_EL1.SHA1 is 0b0000, then this field must have the value 0b0000.

If the value of this field is 0b0010, then ID_AA64ISAR0_EL1.SHA3 must have the value 0b0001.
SHA1, bits [11:8]

SHA1 instructions implemented in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>SHA1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No SHA1 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR0_EL1.SHA2 is 0b0000, then this field must have the value 0b0000.

AES, bits [7:4]

AES instructions implemented in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>AES</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No AES instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>AESE, AESD, AESMC, and AESIMC instructions implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, plus PMULL/PMULL2 instructions operating on 64-bit data quantities.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8, the permitted values are 0b0000, 0b0001, and 0b0010.

Bits [3:0]

Reserved, RES0.

Accessing the ID_AA64ISAR0_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ID_AA64ISAR0_EL1

```
if PSTATE.EL == EL0 then
  if IsFeatureImplemented("ARMv8.4-IDST") then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
      AArch64.SystemAccessTrap(EL2, 0x18);
    else
      AArch64.SystemAccessTrap(EL1, 0x18);
  else
    UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    return ID_AA64ISAR0_EL1;
elsif PSTATE.EL == EL2 then
  return ID_AA64ISAR0_EL1;
elsif PSTATE.EL == EL3 then
  return ID_AA64ISAR0_EL1;
```

Page 924
ID_AA64ISAR1_EL1, AArch64 Instruction Set Attribute Register 1

The ID_AA64ISAR1_EL1 characteristics are:

**Purpose**

Provides information about the features and instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

**Configuration**

**Attributes**

ID_AA64ISAR1_EL1 is a 64-bit register.

**Field descriptions**

The ID_AA64ISAR1_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-56</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>55-52</td>

</tbody>
</table>

**Bits [63:56]**

- Reserved, RES0.

**I8MM, bits [55:52]**

For Armv8.2:

Indicates support for Advanced SIMD and floating-point Int8 matrix multiplication instructions in AArch64 state. Defined values of this field are:

<table>
<thead>
<tr>
<th>I8MM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Int8 matrix multiplication instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SMMLA, SUDOT, UMMLA, USMMLA, and USDOT instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.2-I8MM implements the functionality identified by 0b0001.

From Armv8.6, the only permitted value is 0b0001.

**Otherwise:**

Reserved, RES0.
DGH, bits [51:48]

From Armv8.6:

Indicates presence of the Data Gathering Hint instruction. Defined values are:

<table>
<thead>
<tr>
<th>DGH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Data Gathering Hint is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Data Gathering Hint is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.0-DGH implements the functionality identified by 0b0001.

From ARMv8.0, the permitted values are 0b0000 and 0b0001.

If the DGH instruction has no effect in preventing the merging of memory accesses, the value of this field is 0.

Otherwise:

Reserved, RES0.

BF16, bits [47:44]

From Armv8.2:

Indicates support for Advanced SIMD and floating-point BFloat16 instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>BF16</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>BFloat16 instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>BFDOT, BFMLAL, BFMLAL2, BFMMMLA, BFCVT, and BFCVT2 instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.2-BF16 implements the functionality identified by 0b0001.

From ARMv8.6, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

SPECRES, bits [43:40]

Speculation invalidation instruction support in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>SPECRES</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>CFP RCTX, DVP RCTX, and CPP RCTX instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>CFP RCTX, DVP RCTX, and CPP RCTX instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8.5, the only permitted value is 0b0001.

SB, bits [39:36]

SB instruction support in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>SB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SB instruction is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SB instruction is implemented.</td>
</tr>
</tbody>
</table>
All other values are reserved.

From Armv8.5, the only permitted value is 0b0001.

**FRINTTS, bits [35:32]**

**From Armv8.5:**

Indicates whether FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are implemented. Defined values are:

<table>
<thead>
<tr>
<th>FRINTTS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8.5, the only permitted value is 0b0001.

**Otherwise:**

Reserved, RES0.

**GPI, bits [31:28]**

**From Armv8.3:**

Indicates whether an IMPLEMENTATION DEFINED algorithm is implemented in the PE for generic code authentication, in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>GPI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Generic Authentication using an IMPLEMENTATION DEFINED algorithm is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Generic Authentication using an IMPLEMENTATION DEFINED algorithm is implemented. This involves the PACGA instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR1_EL1.GPA is non-zero, this field must have the value 0b0000.

**Otherwise:**

Reserved, RES0.

**GPA, bits [27:24]**

**From Armv8.3:**

Indicates whether QARMA or Architected algorithm is implemented in the PE for generic code authentication, in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>GPA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Generic Authentication using an Architected algorithm is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Generic Authentication using the QARMA algorithm is implemented. This involves the PACGA instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8.3, the permitted values are 0b0000 and 0b0001.
If the value of ID_AA64ISAR1_EL1.GPI is non-zero, this field must have the value 0b0000.

Otherwise:

Reserved, RES0.

**LRPC, bits [23:20]**

From Armv8.4:

Indicates support for weaker release consistency, RCpc based model. Defined values are:

<table>
<thead>
<tr>
<th>LRPC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The LDAPUR*, STLUR*, and LDAPR* instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The LDAPR* instructions are implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>The LDAPUR*, STLUR*, and LDAPR* instructions are implemented.</td>
</tr>
</tbody>
</table>

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

In Armv8.3, the only permitted value is 0b0001. ARMv8.3-RCPC implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0010. ARMv8.4-RCPC implements the functionality identified by the value 0b0010.

All other values are reserved.

From Armv8.3:

Indicates support for weaker release consistency, RCpc based model. Defined values are:

<table>
<thead>
<tr>
<th>LRPC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The LDAPRB, LDAPRH and LDAPR instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The LDAPRB, LDAPRH and LDAPR instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.3-RCPC implements the functionality identified by the value 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

In Armv8.3, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

**FCMA, bits [19:16]**

From Armv8.3:

Indicates support for complex number addition and multiplication, where numbers are stored in vectors. Defined values are:

<table>
<thead>
<tr>
<th>FCMA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The FCMLA and FCADD instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The FCMLA and FCADD instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.
ARMv8.3-CompNum implements the functionality identified by the value $0b0001$.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is $0b0000$.

From Armv8.3, the only permitted value is $0b0001$.

Otherwise:

Reserved, RES0.

**JSCVT, bits [15:12]**

*From Armv8.3:*

Indicates support for javascript conversion from double precision floating point values to integers in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>JSCVT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>$0b0000$</td>
<td>The FJCVTZS instruction is not implemented.</td>
</tr>
<tr>
<td>$0b0001$</td>
<td>The FJCVTZS instruction is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.3.JSConv implements the functionality identified by $0b0001$.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is $0b0000$.

From Armv8.3, the only permitted value is $0b0001$.

Otherwise:

Reserved, RES0.

**API, bits [11:8]**

*From Armv8.3:*

Indicates whether an IMPLEMENTATION DEFINED algorithm is implemented in the PE for address authentication, in AArch64 state. This applies to all Pointer Authentication instructions other than the PACGA instruction. Defined values are:

<table>
<thead>
<tr>
<th>API</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>$0b0000$</td>
<td>Address Authentication using an IMPLEMENTATION DEFINED algorithm is not implemented.</td>
</tr>
<tr>
<td>$0b0001$</td>
<td>Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC() and HaveEnhancedPAC2() functions returning FALSE.</td>
</tr>
<tr>
<td>$0b0010$</td>
<td>Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC() function returning TRUE, and the HaveEnhancedPAC2() function returning FALSE.</td>
</tr>
<tr>
<td>$0b0011$</td>
<td>Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.</td>
</tr>
<tr>
<td>$0b0100$</td>
<td>Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.</td>
</tr>
<tr>
<td>$0b0101$</td>
<td>Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.</td>
</tr>
</tbody>
</table>
All other values are reserved.

ARMv8.3-PAuth implements the functionality added by the values 0b0000, 0b0001, and 0b0010.

ARMv8.3-PAuth2 implements the functionality added by the value 0b0011.

ARMv8.3-FPAC implements the functionality added by the values 0b0100 and 0b0101.

From Armv8.6, the permitted values are 0b0011, 0b0100, and 0b0101.

If the value of ID_AA64ISAR1_EL1.API is non-zero, this field must have the value 0b0000.

Otherwise:

Reserved, RES0.

APA, bits [7:4]

From Armv8.3:

Indicates whether QARMA or Architected algorithm is implemented in the PE for address authentication, in AArch64 state. This applies to all Pointer Authentication instructions other than the PACGA instruction. Defined values are:

<table>
<thead>
<tr>
<th>APA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Address Authentication using an Architected algorithm is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Address Authentication using the QARMA algorithm is implemented, with the HaveEnhancedPAC() and</td>
</tr>
<tr>
<td></td>
<td>HaveEnhancedPAC2() functions returning FALSE.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Address Authentication using the QARMA algorithm is implemented, with the HaveEnhancedPAC() function returning TRUE and the HaveEnhancedPAC2() function returning FALSE.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Address Authentication using the QARMA algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning FALSE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.</td>
</tr>
<tr>
<td>0b0100</td>
<td>Address Authentication using the QARMA algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Address Authentication using the QARMA algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.3-PAuth implements the functionality added by the values 0b0000, 0b0001, and 0b0010.

ARMv8.3-PAuth2 implements the functionality added by the value 0b0011.

ARMv8.3-FPAC implements the functionality added by the values 0b0100 and 0b0101.

From Armv8.6, the permitted values are 0b0011, 0b0100, and 0b0101.

If the value of the ID_AA64ISAR1_EL1.API is non-zero, this field must have the value 0b0000.

Otherwise:

Reserved, RES0.
**DPB, bits [3:0]**

**From Armv8.2:**

Data Persistence writeback. Indicates support for the DC CVAP and DC CVADP instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>DPB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>DC CVAP not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>DC CVAP supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>DC CVAP and DC CVADP supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.2-DCPoP implements the functionality identified by the value 0b0001.

ARMv8.2-DCCVADP implements the functionality identified by the value 0b0010.

From Armv8.2 to Armv8.4, the only permitted value is 0b0001.

From Armv8.5, the only permitted value is 0b0010

**Otherwise:**

Reserved, RES0.

If ID_AA64ISAR1_EL1.{API, APA} == {0, 0}, then:

- The TCR_EL1.{TBID,TBID0}, TCR_EL2.{TBID0,TBID1}, TCR_EL2.TBID and TCR_EL3.TBID bits are RES0.
- APIAKeyHi_EL1, APIAKeyLo_EL1, APIBKeyHi_EL1, APIBKeyLo_EL1, APDAKeyHi_EL1, APDAKeyLo_EL1, APDBKeyHi_EL1, APDBKeyLo_EL1 are not allocated.
- SCTLR_ELx.EnIA, SCTLR_ELx.EnIB, SCTLR_ELx.EnDA, SCTLR_ELx.EnDB are all RES0.

If ID_AA64ISAR1_EL1.{GPI, GPA, API, APA} == {0, 0, 0, 0}, then:

- HCR_EL2.APK and HCR_EL2.API are RES0.
- SCR_EL3.APK and SCR_EL3.API are RES0.

**Accessing the ID_AA64ISAR1_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, ID_AA64ISAR1_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>

</table>

**ECV, bits [63:60]**

**From Armv8.6:**

Presence of Enhanced Counter Virtualization. Defined values are:

<table>
<thead>
<tr>
<th>ECV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Enhanced Counter Virtualization is not implemented. Supports</td>
</tr>
<tr>
<td></td>
<td>CNTHTCTL_EL2, (ECV, EL1TVT, EL1TVCT, EL1NVPCT, EL1NVVCT, EVNTIS),</td>
</tr>
<tr>
<td></td>
<td>CNTKCTL_EL1, EVNTIS, CNTPCTSS_EL0 counter views, and</td>
</tr>
<tr>
<td></td>
<td>CNTVCTSS_EL0 counter views. Extends the PMSR_EL1, PCT, PMSR_EL2, PCT,</td>
</tr>
<tr>
<td></td>
<td>TRFCR_EL1, TS, and TRFCR_EL2, TS fields.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As 0b0001, and also includes support for CNTPOFF_EL2.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.6-ECV implements the functionality identified by the values 0b0001 and 0b0010.

From Armv8.6, the only permitted values are 0b0001 and 0b0010.

**Otherwise:**

Reserved, RES0.

**FGT, bits [59:56]**

**From Armv8.6:**

Presence of the Fine-Grained Trap controls:
• HAFGRTR_EL2, HDFGRTR_EL2, HDFGWTR_EL2, HFGRT0_EL2, HFGITR_EL2 and HFGWTR_EL2 registers, and their associated traps.
• MDCR_EL2 TDCC and MDCR_EL3.TDCC.
• SCR_EL3.FGTEn.

Defined values are:

<table>
<thead>
<tr>
<th>FGT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The fine-grained trap controls are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The fine-grained trap controls are implemented, and can generate</td>
</tr>
<tr>
<td></td>
<td>fine-grained traps of EL1 and EL0 functionality.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.6-FGT implements the functionality identified by the value 0b0001.

Otherwise:

Reserved, RES0.

Bits [55:48]

Reserved, RES0.

ExS, bits [47:44]

From Armv8.5:

Support for disabling context synchronizing exception entry and exit. Defined values are:

<table>
<thead>
<tr>
<th>ExS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>All exception entries and exits are context synchronization events.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Non-context synchronizing exception entry and exit are supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.5-CSEH implements the functionality identified by the value 0b0001.

Otherwise:

Reserved, RES0.

TGran4_2, bits [43:40]

From Armv8.5:

Support for 4KB memory granule size for stage 2. Defined values are:

<table>
<thead>
<tr>
<th>TGran4_2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>4KB Stage 2 granule is identified in the TGran4 field</td>
</tr>
<tr>
<td>0b0001</td>
<td>4KB granule not supported at stage 2</td>
</tr>
<tr>
<td>0b0010</td>
<td>4KB granule supported at stage 2</td>
</tr>
</tbody>
</table>

All other values are reserved.

The 0b0000 value is deprecated.

Otherwise:

Reserved, RES0.
**TGran64, bits [39:36]**

*From Arm v8.5:*

Support for 64KB memory granule size for stage 2. Defined values are:

<table>
<thead>
<tr>
<th>TGran64_2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>64KB Stage 2 granule is identified in the TGran64 field</td>
</tr>
<tr>
<td>0b0001</td>
<td>64KB granule not supported at stage 2</td>
</tr>
<tr>
<td>0b0010</td>
<td>64KB granule supported at stage 2</td>
</tr>
</tbody>
</table>

All other values are reserved.

The 0b0000 value is deprecated.

**Otherwise:**

Reserved, RES0.

---

**TGran16, bits [35:32]**

*From Arm v8.5:*

Support for 16KB memory granule size for stage 2. Defined values are:

<table>
<thead>
<tr>
<th>TGran16_2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>16KB Stage 2 granule is identified in the TGran16 field</td>
</tr>
<tr>
<td>0b0001</td>
<td>16KB granule not supported at stage 2</td>
</tr>
<tr>
<td>0b0010</td>
<td>16KB granule supported at stage 2</td>
</tr>
</tbody>
</table>

All other values are reserved.

The 0b0000 value is deprecated.

**Otherwise:**

Reserved, RES0.

---

**TGran4, bits [31:28]**

Support for 4KB memory translation granule size. Defined values are:

<table>
<thead>
<tr>
<th>TGran4</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>4KB granule supported.</td>
</tr>
<tr>
<td>0b1111</td>
<td>4KB granule not supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

---

**TGran64, bits [27:24]**

Support for 64KB memory translation granule size. Defined values are:

<table>
<thead>
<tr>
<th>TGran64</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>64KB granule supported.</td>
</tr>
<tr>
<td>0b1111</td>
<td>64KB granule not supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

---

**TGran16, bits [23:20]**

Support for 16KB memory translation granule size. Defined values are:
<table>
<thead>
<tr>
<th>TGran16</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>16KB granule not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>16KB granule supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**BigEndEL0, bits [19:16]**

Mixed-endian support at EL0 only. Defined values are:

<table>
<thead>
<tr>
<th>BigEndEL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No mixed-endian support at EL0. The <code>SCTLR_EL1.E0E</code> bit has a fixed value.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Mixed-endian support at EL0. The <code>SCTLR_EL1.E0E</code> bit can be configured.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field is invalid and is RES0 if the BigEnd field, bits [11:8], is not 0b0000.

**SNSMem, bits [15:12]**

Secure versus Non-secure Memory distinction. Defined values are:

<table>
<thead>
<tr>
<th>SNSMem</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Does not support a distinction between Secure and Non-secure Memory.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Does support a distinction between Secure and Non-secure Memory.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**BigEnd, bits [11:8]**

Mixed-endian configuration support. Defined values are:

<table>
<thead>
<tr>
<th>BigEnd</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No mixed-endian support. The <code>SCTLR_ELx.EE</code> bits have a fixed value.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Mixed-endian support. The <code>SCTLR_ELx.EE</code> and <code>SCTLR_EL1.E0E</code> bits can be configured.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**ASIDBits, bits [7:4]**

Number of ASID bits. Defined values are:

<table>
<thead>
<tr>
<th>ASIDBits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>8 bits.</td>
</tr>
<tr>
<td>0b0010</td>
<td>16 bits.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**PARange, bits [3:0]**

Physical Address range supported. Defined values are:
<table>
<thead>
<tr>
<th>PARange</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>32 bits, 4GB.</td>
</tr>
<tr>
<td>0b0001</td>
<td>36 bits, 64GB.</td>
</tr>
<tr>
<td>0b0010</td>
<td>40 bits, 1TB.</td>
</tr>
<tr>
<td>0b0011</td>
<td>42 bits, 4TB.</td>
</tr>
<tr>
<td>0b0100</td>
<td>44 bits, 16TB.</td>
</tr>
<tr>
<td>0b0101</td>
<td>48 bits, 256TB.</td>
</tr>
<tr>
<td>0b0110</td>
<td>52 bits, 4PB.</td>
</tr>
</tbody>
</table>

All other values are reserved.

The value 0b0110 is permitted only if the implementation includes ARMv8.2-LPA, otherwise it is reserved.

**Accessing the ID_AA64MMFR0_EL1**

Accesses to this register use the following encodings:

```
MRS <Xt>, ID_AA64MMFR0_EL1
```

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

elsif PSTATE.EL == EL3 then
  return ID_AA64MMFR0_EL1;
```
The ID_AA64MMFR1_EL1 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

**Configuration**

**Attributes**

ID_AA64MMFR1_EL1 is a 64-bit register.

**Field descriptions**

The ID_AA64MMFR1_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

**Bits [63:40]**

Reserved, RES0.

**ETS, bits [39:36]**

*From Armv8.0:*

Support for Enhanced Translation Synchronization. Defined values are:

<table>
<thead>
<tr>
<th>ETS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Enhanced Translation Synchronization is not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Enhanced Translation Synchronization is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.0-ETS implements the functionality identified by the value 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

**Otherwise:**

Reserved, RES0.

**TWED, bits [35:32]**

*From Armv8.6:*

Support for the configurable delayed trapping of WFE. Defined values are:
Meaning

<table>
<thead>
<tr>
<th>TWED</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Configurable delayed trapping of WFE is not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Configurable delayed trapping of WFE is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.6-TWED implements the functionality identified by the value 0b0001.

From Armv8.6, the permitted values are 0b0000 and 0b0001.

Otherwise:

Reserved, RES0.

**XNX, bits [31:28]**

From Armv8.2:

Support for execute-never control distinction by Exception level at stage 2. Defined values are:

<table>
<thead>
<tr>
<th>XNX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Distinction between EL0 and EL1 execute-never control at stage 2 not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Distinction between EL0 and EL1 execute-never control at stage 2 supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.2-TTS2UXN implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

**SpecSEI, bits [27:24]**

When RAS is implemented:

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:

<table>
<thead>
<tr>
<th>SpecSEI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The PE never generates an SError interrupt due to an External abort on a speculative read.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The PE might generate an SError interrupt due to an External abort on a speculative read.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Otherwise:

Reserved, RES0. This provides no information about whether the PE generates a speculative SError interrupt.

**PAN, bits [23:20]**

From Armv8.1:

Privileged Access Never. Indicates support for the PAN bit in PSTATE, SPSR_EL1, SPSR_EL2, SPSR_EL3, and DSPSR_EL0. Defined values are:
<table>
<thead>
<tr>
<th>PAN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>PAN not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>PAN supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>PAN supported and <strong>AT S1E1RP</strong> and <strong>AT S1E1WP</strong> instructions supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.1-PAN implements the functionality identified by the value 0b0001.

ARMv8.2-ATS1E1 implements the functionality added by the value 0b0010.

In Armv8.1, the only permitted value is 0b0001.

From Armv8.2, the only permitted value is 0b0010.

**Otherwise:**

Reserved, RES0.

**LO, bits [19:16]**

**From Armv8.1:**

LORegions. Indicates support for LORegions. Defined values are:

<table>
<thead>
<tr>
<th>LO</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>LORegions not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>LORegions supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.1-LOR implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

**Otherwise:**

Reserved, RES0.

**HPDS, bits [15:12]**

**From Armv8.1:**

Hierarchical permission disables bits in translation tables. Defined values are:

<table>
<thead>
<tr>
<th>HPDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Disabling of hierarchical controls not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Disabling of hierarchical controls supported with the <strong>TCR_EL1</strong>. {HPD1, HPD0}, <strong>TCR_EL2</strong>. HPD or <strong>TCR_EL2</strong>. {HPD1, HPD0}, and <strong>TCR_EL3</strong>. HPD bits.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for value 0b0001, and adds possible hardware allocation of bits[62:59] of the translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.1-HPD implements the functionality identified by the value 0b0001.

ARMv8.2-TTPBHA implements the functionality identified by the value 0b0010.

From Armv8.1, the value 0b0000 is not permitted.
Otherwise:

Reserved, RES0.

**VH, bits [11:8]**

**From Armv8.1:**

Virtualization Host Extensions. Defined values are:

<table>
<thead>
<tr>
<th>VH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Virtualization Host Extensions not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Virtualization Host Extensions supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.1-VHE implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

**VMIDBits, bits [7:4]**

**From Armv8.1:**

Number of VMID bits. Defined values are:

<table>
<thead>
<tr>
<th>VMIDBits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>8 bits</td>
</tr>
<tr>
<td>0b0010</td>
<td>16 bits</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.1-VMID16 implements the functionality identified by the value 0b0010.

From Armv8.1, the permitted values are 0b0000 and 0b0010.

Otherwise:

Reserved, RES0.

**HAFDBS, bits [3:0]**

**From Armv8.1:**

Hardware updates to Access flag and Dirty state in translation tables. Defined values are:

<table>
<thead>
<tr>
<th>HAFDBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Hardware update of the Access flag and dirty state are not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Hardware update of the Access flag is supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Hardware update of both the Access flag and dirty state is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.1-TTHM implements the functionality identified by the values 0b0001 and 0b0010.

From Armv8.1, the permitted values are 0b0000, 0b0001, and 0b0010.
Otherwise:

Reserved, RES0.

ID_AA64MMFR2_EL1, AArch64 Memory Model Feature Register 2

The ID_AA64MMFR2_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers see Principles of the ID scheme for fields in ID registers.

Configuration

This register is present only from Armv8.2. Otherwise, direct accesses to ID_AA64MMFR2_EL1 are RES0 from EL1, EL2, and EL3.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_AA64MMFR2_EL1 is a 64-bit register.

Field descriptions

The ID_AA64MMFR2_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

E0PD, bits [63:60]

From Armv8.5:

Indicates support for the E0PD mechanism. Defined values are:

<table>
<thead>
<tr>
<th>E0PD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>E0PDx mechanism is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>E0PDx mechanism is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.5-E0PD implements the functionality identified by the value 0b0001.

In Armv8.4, the permitted values are 0b0000 and 0b001.

From Armv8.5, the only permitted values is 0b0001.

Otherwise:

Reserved, RES0.
EVT, bits [59:56]

From Armv8.2:

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the HCR_EL2.\{TTLBOS, TTLBIS, TOCU, TICAB, TID4\} traps. Defined values are:

<table>
<thead>
<tr>
<th>EVT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>HCR_EL2.{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps are not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>HCR_EL2.{TOCU, TICAB, TID4} traps are supported. HCR_EL2.{TTLBOS, TTLBIS} traps are not supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>HCR_EL2.{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps are supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARmv8.2-EVT implements the functionality identified by the values 0b0001 and 0b0010.

From Armv8.1, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0010 when EL2 is implemented.

Otherwise:

Reserved, RES0.

BBM, bits [55:52]

From Armv8.4:

Allows identification of the requirements of the hardware to have break-before-make sequences when changing block size for a translation.

<table>
<thead>
<tr>
<th>BBM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Level 0 support for changing block size is supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Level 1 support for changing block size is supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Level 2 support for changing block size is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARmv8.4-TTRem implements the functionality identified by the values 0b0000, 0b0001, and 0b0010.

From Armv8.4, the permitted values are 0b0000, 0b0001, and 0b0010.

Otherwise:

Reserved, RES0.

TTL, bits [51:48]

From Armv8.4:

Indicates support for TTL field in address operations. Defined values are:

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>TLB maintenance instructions by address have bits[47:44] as RES0.</td>

<tr>
<td>0b0001</td>
<td>TLB maintenance instructions by address have bits[47:44] holding the TTL field.</td>
</tr>
</tbody>
</table>

All other values are reserved.
ARMv8.4-TTL implements the functionality identified by the value 0b0001.

This field affects TLBI IPAS2E1, TLBI IPAS2E1IS, TLBI IPAS2E1OS, TLBI IPAS2LE1, TLBI IPAS2LE1IS, TLBI IPAS2LE1OS, TLBI VAAE1, TLBI VAAE1IS, TLBI VAAE1OS, TLBI VALE1, TLBI VALE1IS, TLBI VALE1OS, TLBI VAE1, TLBI VAE1IS, TLBI VAE1OS, TLBI VAE2, TLBI VAE2IS, TLBI VAE2OS, TLBI VAE3, TLBI VAE3IS, TLBI VAE3OS, TLBI VALE1, TLBI VALE1IS, TLBI VALE1OS, TLBI VALE2, TLBI VALE2IS, TLBI VALE2OS, TLBI VALE3, TLBI VALE3IS, TLBI VALE3OS.

From Armv8.4, the only permitted value is 0b0001.

Otherwise:
Reserved, RES0.

Bits [47:44]
Reserved, RES0.

FWB, bits [43:40]

From Armv8.4:

Indicates support for HCR_EL2.FWB

<table>
<thead>
<tr>
<th>FWB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>HCR_EL2.FWB bit is not supported and the field is RES0</td>
</tr>
<tr>
<td>0b0001</td>
<td>HCR_EL2.FWB is supported.</td>
</tr>
</tbody>
</table>

If ARMv8.4-SecEL2 is implemented the only permitted value is 0b0001

All other values reserved.

This field resets to an architecturally unknown value.

Otherwise:
Reserved, RES0.

IDS, bits [39:36]

From Armv8.4:

Indicates the value of ESR_ELx.EC that reports an exception generated by a read access to the feature ID space.

Defined values are:

<table>
<thead>
<tr>
<th>IDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>An exception which is generated by a read access to the feature</td>
</tr>
<tr>
<td></td>
<td>ID space, other than a trap caused by HCR_EL2.TIDx, SCTLR_EL1.UCT, or</td>
</tr>
<tr>
<td></td>
<td>SCTLR_EL2.UCT, is reported by ESR_ELx.EC == 0x0.</td>
</tr>
<tr>
<td>0b0001</td>
<td>All exceptions generated by an AArch64 read access to the feature ID</td>
</tr>
<tr>
<td></td>
<td>space are reported by ESR_ELx.EC == 0x18.</td>
</tr>
</tbody>
</table>

All other values are reserved.

The Feature ID space is defined as the System register space in AArch64 with op0==3, op1=={0, 1, 3}, CRn==0, CRm=={0-7}, op2=={0-7}.

ARMv8.4-IDST implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.
**Otherwise:**
Reserved, RES0.

**AT, bits [35:32]**

From Armv8.4:

Identifies support for unaligned single-copy atomicity and atomic functions. Defined values are:

<table>
<thead>
<tr>
<th>AT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Unaligned single-copy atomicity and atomic functions are not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Unaligned single-copy atomicity and atomic functions with a 16-byte address range aligned to 16-bytes are supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.4-LSE implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

**Otherwise:**
Reserved, RES0.

**ST, bits [31:28]**

From Armv8.4:

Identifies support for small translation tables. Defined values are:

<table>
<thead>
<tr>
<th>ST</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The maximum value of the TCR_ELx.{T0SZ,T1SZ} and VTCR_EL2.T0SZ fields is 39.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The maximum value of the TCR_ELx.{T0SZ,T1SZ} and VTCR_EL2.T0SZ fields is 48 for 4KB and 16KB granules, and 47 for 64KB granules.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.4-TTST implements the functionality identified by the value 0b0001.

If ARMv8.4-SecEL2 is implemented the only permitted value is 0b0001.

In an implementation which does not support Secure EL2, the permitted values are 0b0000 and 0b0001.

**Otherwise:**
Reserved, RES0.

**NV, bits [27:24]**

From Armv8.3:

Nested Virtualization. If EL2 is implemented, indicates support for the use of nested virtualization. Defined values are:

<table>
<thead>
<tr>
<th>NV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Nested virtualization is not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The HCR_EL2.NV, HCR_EL2.NV1, HCR_EL2.AT bits are implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>The VNCR_EL2 register and the HCR_EL2.{AT, NV, NV1, NV2} bits are implemented.</td>
</tr>
</tbody>
</table>
All other values are reserved.

In Armv8.2, the only permitted value is \texttt{0b0000}.

In Armv8.3, the permitted values are:

\begin{itemize}
  \item When EL2 is not implemented, \texttt{0b0000}.
  \item When EL2 is implemented, \texttt{0b0001}.
\end{itemize}

The feature ARMv8.3-NV implements the functionality identified by the value \texttt{0b0001}.

In Armv8.4, the permitted values are:

\begin{itemize}
  \item When EL2 is not implemented, \texttt{0b0000}.
  \item When EL2 is implemented, \texttt{0b0010}.
\end{itemize}

The feature ARMv8.4-NV implements the functionality identified by the value \texttt{0b0010}.

\textbf{Otherwise:}

Reserved, \texttt{RES0}.

\textbf{CCIDX, bits [23:20]}

\textbf{From Armv8.3:}

Support for the use of revised \texttt{CCSIDR_EL1} register format. Defined values are:

\begin{center}
\begin{tabular}{|c|c|}
  \hline
  CCIDX & Meaning \tabularnewline
  \hline
  \texttt{0b0000} & 32-bit format implemented for all levels of the CCSIDR_EL1. \tabularnewline
  \texttt{0b0001} & 64-bit format implemented for all levels of the CCSIDR_EL1. \tabularnewline
  \hline
\end{tabular}
\end{center}

All other values are reserved.

This feature is identified as ARMv8.3-CCIDX.

From Armv8.3, the permitted values are \texttt{0b0000} and \texttt{0b0001}.

\textbf{Otherwise:}

Reserved, \texttt{RES0}.

\textbf{VARange, bits [19:16]}

\textbf{From Armv8.2:}

Indicates support for a larger virtual address. Defined values are:

\begin{center}
\begin{tabular}{|c|c|}
  \hline
  VARange & Meaning \tabularnewline
  \hline
  \texttt{0b0000} & VMSAv8-64 supports 48-bit VAs. \tabularnewline
  \texttt{0b0001} & VMSAv8-64 supports 52-bit VAs when using the 64KB translation granule. The other translation granules support 48-bit VAs. \tabularnewline
  \hline
\end{tabular}
\end{center}

All other values are reserved.

ARMv8.2-LVA implements the functionality identified by the value \texttt{0b0001}.

From Armv8.2, the permitted values are \texttt{0b0000} and \texttt{0b0001}.

\textbf{Otherwise:}

Reserved, \texttt{RES0}. 

Page 948
IESB, bits [15:12]

From Armv8.2:

Indicates support for the IESB bit in the SCTLR_ELx registers. Defined values are:

<table>
<thead>
<tr>
<th>IESB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>IESB bit in the SCTLR_ELx registers is not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>IESB bit in the SCTLR_ELx registers is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.2-IESB implements the functionality identified by the value 0b0001.

Otherwise:

Reserved, RES0.

LSM, bits [11:8]

From Armv8.2:

Indicates support for LSMAOE and nTLSMD bits in SCTLR_EL1 and SCTLR_EL2. Defined values are:

<table>
<thead>
<tr>
<th>LSM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>LSMAOE and nTLSMD bits not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>LSMAOE and nTLSMD bits supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.2-LSMAOC implements the functionality identified by the value 0b0001.

Otherwise:

Reserved, RES0.

UAO, bits [7:4]

From Armv8.2:

User Access Override. Defined values are:

<table>
<thead>
<tr>
<th>UAO</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>UAO not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>UAO supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.2-UAO implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

CnP, bits [3:0]

From Armv8.2:

Common not Private translations. Defined values are:
<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Common not Private translations not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Common not Private translations supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.2-TTCNP implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

**Accessing the ID_AA64MMFR2_EL1**

Accesses to this register use the following encodings:

```
MRS <Xt>, ID_AA64MMFR2_EL1
```

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>

        elsif PSTATE.EL == EL3 then
            return ID_AA64MMFR2_EL1;
```
The ID_AA64PFR0_EL1 characteristics are:

**Purpose**

Provides additional information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

**Configuration**

The external register EDPFR gives information from this register.

**Attributes**

ID_AA64PFR0_EL1 is a 64-bit register.

**Field descriptions**

The ID_AA64PFR0_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| CSV3 | CSV2 | RES0 | DIT | AMU | MPAM | SEL2 | SVE |
| RAS | GIC | AdvSIMD | FP | EL3 | EL2 | EL1 | EL0 |

**CSV3, bits [63:60]**

From Armv8.5:

Speculative use of faulting data. Defined values are:

<table>
<thead>
<tr>
<th>CSV3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>This Device does not disclose whether data loaded under speculation with a permission or domain fault can be used to form an address or generate condition codes or SVE predicate values to be used by instructions newer than the load in the speculative sequence</td>
</tr>
<tr>
<td>0b0001</td>
<td>Data loaded under speculation with a permission or domain fault cannot be used to form an address or generate condition codes or SVE predicate values to be used by instructions newer than the load in the speculative sequence</td>
</tr>
</tbody>
</table>

From Armv8.5, the only permitted value is 0b0001.

All other values are reserved.

**Otherwise:**

Reserved, RES0.
CSV2, bits [59:56]

From Armv8.5:

Speculative use of out of context branch targets. Defined values are:

<table>
<thead>
<tr>
<th>CSV2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>This Device does not disclose whether branch targets trained in one hardware described context can affect speculative execution in a different hardware described context.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Branch targets trained in one hardware described context can only affect speculative execution in a different hardware described context in a hard-to-determine way. Contexts do not include the SCXTNUM_ELx register contexts, and these registers are not supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Branch targets trained in one hardware described context can only affect speculative execution in a different hardware described context in a hard-to-determine way. Contexts include the SCXTNUM_ELx register contexts, and these registers are supported.</td>
</tr>
</tbody>
</table>

From Armv8.5 the only permitted values are 0b0001 or 0b0010.
All other values are reserved.

Otherwise:

Reserved, RES0.

Bits [55:52]

Reserved, RES0.

DIT, bits [51:48]

From Armv8.4:

Data Independent Timing. Defined values are:

<table>
<thead>
<tr>
<th>DIT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>AArch64 does not guarantee constant execution time of any instructions.</td>
</tr>
<tr>
<td>0b0001</td>
<td>AArch64 provides the PSTATE.DIT mechanism to guarantee constant execution time of certain instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.
ARMv8.4-DIT implements the functionality identified by the value 0b0001.
From Armv8.4, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

AMU, bits [47:44]

From Armv8.4:

Activity Monitors Extension. Defined values are:
<table>
<thead>
<tr>
<th>AMU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Activity Monitors Extension is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>AMUv1 for Armv8.4 is implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>AMUv1 for Armv8.6 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.</td>
</tr>
</tbody>
</table>

All other values are reserved.

AMUv1 implements the functionality identified by the value 0b0001.

ARMv8.6-AMU implements the functionality identified by the value 0b0010.

Otherwise:

Reserved, RES0.

**MPAM, bits [43:40]**

*From Armv8.2:*

MPAM Extension. Defined values are:

<table>
<thead>
<tr>
<th>MPAM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>MPAM is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>MPAM is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Otherwise:

Reserved, RES0.

**SEL2, bits [39:36]**

*From Armv8.4:*

Secure EL2. Defined values are:

<table>
<thead>
<tr>
<th>SEL2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Secure EL2 is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Secure EL2 is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Otherwise:

Reserved, RES0.

**SVE, bits [35:32]**

*From Armv8.2:*

Scalable Vector Extension. Defined values are:

<table>
<thead>
<tr>
<th>SVE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SVE architectural state and programmers’ model are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SVE architectural state and programmers’ model are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If implemented, refer to [ID_AA64ZFR0_EL1](#) for information about which SVE instructions are available.
Otherwise:

Reserved, RES0.

**RAS, bits [31:28]**

RAS Extension version. The defined values of this field are:

<table>
<thead>
<tr>
<th>RAS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No RAS Extension.</td>
</tr>
<tr>
<td>0b0001</td>
<td>RAS Extension present.</td>
</tr>
<tr>
<td>0b0010</td>
<td>ARMv8.4-RAS present. As 0b0001, and adds support for:</td>
</tr>
<tr>
<td></td>
<td>• If EL3 is implemented, ARMv8.4-DFE.</td>
</tr>
<tr>

<tr>
<td></td>
<td>SCRL_EL3 FIEN and HCR_EL2 FIEN trap controls, to support the optional</td>
</tr>
<tr>
<td></td>
<td>RAS Common Fault Injection Model Extension.</td>
</tr>
<tr>
<td></td>
<td>Error records accessed through System registers conform to RAS System</td>
</tr>
<tr>
<td></td>
<td>Architecture v1.1, which includes simplifications to ERR&lt;n&gt;STATUS and</td>
</tr>
<tr>
<td></td>
<td>support for the optional RAS Timestamp and RAS Common Fault Injection</td>
</tr>
<tr>
<td></td>
<td>Model Extensions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8.4, when ARMv8.4-DFE is not implemented, and ERRDR_EL1.NUM is zero, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010. Otherwise from Armv8.4 the only permitted value is 0b0010.

ARMv8.4-RAS implements the functionality identified by the value 0b0010.

In Armv8.2, the only permitted value is 0b0001.

In Armv8.1 and Armv8.0, the permitted values are 0b0000 and 0b0001.

**GIC, bits [27:24]**

System register GIC interface support. Defined values are:

<table>
<thead>
<tr>
<th>GIC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>GIC CPU interface system registers not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.</td>
</tr>
<tr>
<td>0b0011</td>
<td>System register interface to version 4.1 of the GIC CPU interface is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**AdvSIMD, bits [23:20]**

Advanced SIMD. Defined values are:

<table>
<thead>
<tr>
<th>AdvSIMD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Advanced SIMD is implemented, including support for the following SISD and SIMD operations:</td>
</tr>
<tr>
<td></td>
<td>• Integer byte, halfword, word and doubleword element operations.</td>
</tr>
<tr>
<td></td>
<td>• Single-precision and double-precision floating-point arithmetic.</td>
</tr>
<tr>
<td></td>
<td>• Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.</td>
</tr>
<tr>
<td>0b0001</td>
<td>As for 0b0000, and also includes support for half-precision floating-point arithmetic.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Advanced SIMD is not implemented.</td>
</tr>
</tbody>
</table>
All other values are reserved.

This field must have the same value as the FP field.

The permitted values are:

- **0b0000** in an implementation with Advanced SIMD support that does not include the ARMv8.2-FP16 extension.
- **0b0001** in an implementation with Advanced SIMD support that includes the ARMv8.2-FP16 extension.
- **0b1111** in an implementation without Advanced SIMD support.

**FP, bits [19:16]**

Floating-point. Defined values are:

<table>
<thead>
<tr>
<th>FP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Floating-point is implemented, and includes support for:</td>
</tr>
<tr>
<td></td>
<td>• Single-precision and double-precision floating-point types.</td>
</tr>
<tr>
<td></td>
<td>• Conversions between single-precision and half-precision data types,</td>
</tr>
<tr>
<td></td>
<td>• double-precision and half-precision data types.</td>
</tr>
<tr>
<td>0b0001</td>
<td>As for 0b0000, and also includes support for half-precision floating-</td>
</tr>
<tr>
<td></td>
<td>point arithmetic.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Floating-point is not implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field must have the same value as the AdvSIMD field.

The permitted values are:

- **0b0000** in an implementation with floating-point support that does not include the ARMv8.2-FP16 extension.
- **0b0001** in an implementation with floating-point support that includes the ARMv8.2-FP16 extension.
- **0b1111** in an implementation without floating-point support.

**EL3, bits [15:12]**

EL3 Exception level handling. Defined values are:

<table>
<thead>
<tr>
<th>EL3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL3 is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EL3 can be executed in AArch64 state only.</td>
</tr>
<tr>
<td>0b0010</td>
<td>EL3 can be executed in either AArch64 or AArch32 state.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**EL2, bits [11:8]**

EL2 Exception level handling. Defined values are:

<table>
<thead>
<tr>
<th>EL2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL2 is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EL2 can be executed in AArch64 state only.</td>
</tr>
<tr>
<td>0b0010</td>
<td>EL2 can be executed in either AArch64 or AArch32 state.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**EL1, bits [7:4]**

EL1 Exception level handling. Defined values are:

<table>
<thead>
<tr>
<th>EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>EL1 can be executed in AArch64 state only.</td>
</tr>
<tr>
<td>0b0010</td>
<td>EL1 can be executed in either AArch64 or AArch32 state.</td>
</tr>
</tbody>
</table>

All other values are reserved.
EL0, bits [3:0]

EL0 Exception level handling. Defined values are:

<table>
<thead>
<tr>
<th>EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>EL0 can be executed in AArch64 state only.</td>
</tr>
<tr>
<td>0b0010</td>
<td>EL0 can be executed in either AArch64 or AArch32 state.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Accessing the ID_AA64PFR0_EL1**

Accesses to this register use the following encodings:

**Bits [63:20]**

Reserved, RES0.

**MPAM_frac, bits [19:16]**

From Armv8.6:

MPAM Extension fractional field.

<table>
<thead>
<tr>
<th>MPAM_frac</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>If \texttt{ID-AA64PFR0_EL1.MPAM == 0b0000}, MPAM Extension not implemented. If \texttt{ID-AA64PFR0_EL1.MPAM == 0b0001}, MPAM Extension version 1.0 is implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>If \texttt{ID-AA64PFR0_EL1.MPAM == 0b0000}, implements MPAM version 0.1 which is like version 1.1 but reduces support for Secure PARTIDs. If \texttt{ID-AA64PFR0_EL1.MPAM == 0b0001}, implements MPAM extension version 1.1 and adds support for TIDR bit in MPAM2_EL2 to provide trapping of \texttt{MPAMIDR_EL1} when \texttt{MPAMHCR_EL2} is not present.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Otherwise:**

Reserved, RES0.

**RAS_frac, bits [15:12]**
From Armv8.4:

RAS Extension fractional field.

<table>
<thead>
<tr>
<th>RAS_frac</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>If ID_AA64PFR0_EL1.RAS == 0b0001, RAS Extension implemented.</td>

<td>If ID_AA64PFR0_EL1.RAS == 0b0001, as 0b0000 and adds support for:</td>
</tr>
<tr>
<td></td>
<td>• Additional ERXMISC&lt;m&gt; EL1 System registers.</td>
</tr>
<tr>
<td></td>
<td>• Additional System registers ERXPFGCDN_EL1, ERXPFGCTL_EL1, and ERXPFGF_EL1, and the SCR_EL3.FIEN and HCR_EL2.FIEN trap controls, to support the optional RAS Common Fault Injection Model Extension.</td>
</tr>
<tr>
<td></td>
<td>Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR&lt;n&gt;STATUS, and support for the optional RAS Timestamp and RAS Common Fault Injection Model Extensions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field is valid only if ID_AA64PFR0_EL1.RAS == 0b0001.

Otherwise:

Reserved, RES0.

MTE, bits [11:8]

From Armv8.5:

Support for the Memory Tagging Extension.

<table>
<thead>
<tr>
<th>MTE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Memory Tagging Extension is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Memory Tagging Extension instructions accessible at EL0 are implemented. Instructions and System Registers defined by the extension not configurably accessible at EL0 are Unallocated and other System Register fields defined by the extension are RES0.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Memory Tagging Extension is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.5-MemTag implements the functionality identified by the value 0b0001.

When ID_AA64PFR1_EL1.MTE != 0b0010:

• All register fields added to existing System registers and Special-purpose registers as part of the extension are RES0, and treated as 0.

• The following System registers are UNDEFINED:
  ◦ GMID_EL1, GCR_EL1, RGSR_EL1, TFSRE0_EL1, and TFSR_ELx.

• The following System instructions are UNDEFINED:
  ◦ DC CGSW, DC CIGSW, DC IGSW, DC CGDSW, DC CIGDSW, DC IGDSW, DC IGVAC, and DC IGDVAC.

• The following instructions are UNDEFINED:
  ◦ LDGM, STGM, and STZGM.

• The Tagged memory type encoding in MAIR_ELx is UNPREDICTABLE.
Otherwise:

Reserved, RES0.

**SSBS, bits [7:4]**

*From Armv8.5:*

Speculative Store Bypassing controls in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>SSBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>AArch64 provides no mechanism to control the use of Speculative Store Bypassing.</td>
</tr>
<tr>
<td>0b0001</td>
<td>AArch64 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe.</td>
</tr>
<tr>
<td>0b0010</td>
<td>AArch64 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypassing Safe, and the MSR and MRS instructions to directly read and write the PSTATE.SSBS field.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Otherwise:

Reserved, RES0.

**BT, bits [3:0]**

*From Armv8.5:*

Branch Target Identification mechanism support in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>BT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The Branch Target Identification mechanism is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The Branch Target Identification mechanism is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.5-BTI implements the functionality identified by the value 0b0001.

From Armv8.5, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

end
ID_AA64ZFR0_EL1, SVE Feature ID register 0

The ID_AA64ZFR0_EL1 characteristics are:

**Purpose**

Provides additional information about the implemented features of the AArch64 Scalable Vector Extension, when the ID_AA64PFR0_EL1.SVE field is not zero.

For general information about the interpretation of the ID registers see Principles of the ID scheme for fields in ID registers.

**Configuration**

This register is present only when SVE is implemented. Otherwise, direct accesses to ID_AA64ZFR0_EL1 are RAZ.

**Attributes**

ID_AA64ZFR0_EL1 is a 64-bit register.

**Field descriptions**

ID_AFR0_EL1, AArch32 Auxiliary Feature Register 0

The ID_AFR0_EL1 characteristics are:

**Purpose**

Provides information about the IMPLEMENTATION DEFINED features of the PE in AArch32 state.

Must be interpreted with the Main ID Register, MIDR_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

**Configuration**

AArch64 System register ID_AFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_AFR0[31:0].

In an implementation that supports only AArch64 state, this register is UNKNOWN.

**Attributes**

ID_AFR0_EL1 is a 64-bit register.

The ID_DFR0_EL1 characteristics are:

### Purpose

Provides top level information about the debug system in AArch32 state.

Must be interpreted with the Main ID Register, MIDR_EL1.

For general information about the interpretation of the ID registers see ‘Principles of the ID scheme for fields in ID registers’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

### Configuration

AArch64 System register ID_DFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_DFR0[31:0].

In an implementation that supports only AArch64 state, this register is UNKNOWN.

### Attributes

ID_DFR0_EL1 is a 64-bit register.

### Field descriptions

The ID_DFR0_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:32]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reserved, RES0</td>
<td></td>
</tr>
</tbody>
</table>

#### TraceFilt, bits [31:28]

Armv8.4 Self-hosted Trace Extension version. Defined values are:

<table>
<thead>
<tr>
<th>TraceFilt</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Armv8.4 Self-hosted Trace Extension not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Armv8.4 Self-hosted Trace Extension implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.4-Trace implements the functionality added by the value 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

#### PerfMon, bits [27:24]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the Alternative ID scheme described in ‘Alternative ID scheme used for the Performance Monitors Extension version’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.1.4.
Defined values are:

<table>
<thead>
<tr>
<th>PerfMon</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Performance Monitors Extension not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Performance Monitors Extension version 1 implemented, PMUv1.</td>
</tr>
<tr>

</tr>
<tr>
<td>0b0011</td>
<td>Performance Monitors Extension version 3 implemented, PMUv3.</td>
</tr>
<tr>
<td>0b0100</td>
<td>PMUv3 for Armv8.1. As 0b0011, and also includes support for:</td>
</tr>
<tr>
<td></td>
<td>• Extended 16-bit PMEVTYPER&lt;n&gt;.evtCount field.</td>
</tr>
<tr>
<td></td>
<td>• If EL2 is implemented, the HDCR.HPMD control bit.</td>
</tr>
<tr>
<td>0b0101</td>
<td>PMUv3 for Armv8.4. As 0b0100 and also includes support for the PMMR register.</td>
</tr>
<tr>
<td>0b0110</td>
<td>PMUv3 for Armv8.5. As 0b0101 and also includes support for:</td>
</tr>
<tr>
<td></td>
<td>• 64-bit event counters.</td>
</tr>
<tr>
<td></td>
<td>• If EL2 is implemented, the HDCR.HCCD control bit.</td>
</tr>
<tr>
<td></td>
<td>• If EL3 is implemented, the SPCR.SCCD control bit.</td>
</tr>
<tr>
<td>0b1111</td>
<td>IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value in new implementations.</td>
</tr>
</tbody>
</table>

ARMv8.1-PMU implements the functionality added by the value 0b0100.

ARMv8.4-PMU implements the functionality added by the value 0b0101.

ARMv8.5-PMU implements the functionality added by the value 0b0110.

All other values are reserved.

In any Armv8 implementation, the values 0b0001 and 0b0010 are not permitted.

From Armv8.1, the value 0b0011 is not permitted.

From Armv8.4, the value 0b0100 is not permitted.

From Armv8.5, the value 0b0101 is not permitted.

**Note**

In Armv7, the value 0b0000 can mean that PMUv1 is implemented. PMUv1 is not permitted in an Armv8 implementation.

**MProfDbg, bits [23:20]**

M Profile Debug. Support for memory-mapped debug model for M profile processors. Defined values are:

<table>
<thead>
<tr>
<th>MProfDbg</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for M profile Debug architecture, with memory-mapped access.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**MMapTrc, bits [19:16]**

Memory Mapped Trace. Support for memory-mapped trace model. Defined values are:

<table>
<thead>
<tr>
<th>MMapTrc</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for Arm trace architecture, with memory-mapped access.</td>
</tr>
</tbody>
</table>
All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

See the ETM Architecture Specification for more information.

**CopTrc, bits [15:12]**

Support for System registers-based trace model, using registers in the coproc == 0b1110 encoding space. Defined values are:

<table>
<thead>
<tr>
<th>CopTrc</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for Arm trace architecture, with System registers access.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

See the ETM Architecture Specification for more information.

**MMapDbg, bits [11:8]**

Memory Mapped Debug. Support for v7 memory-mapped debug model, for A and R profile processors.

In Armv8-A, this field is RES0.

The optional memory map defined by Armv8 is not compatible with Armv7.

**CopSDbg, bits [7:4]**

Support for a System registers-based Secure debug model, using registers in the coproc = 0b1110 encoding space, for an A profile processor that includes EL3.

If EL3 is not implemented and the implemented Security state is Non-secure state, this field is RES0. Otherwise, this field reads the same as bits [3:0].

**CopDbg, bits [3:0]**

Support for System registers-based debug model, using registers in the coproc == 0b1110 encoding space, for A and R profile processors. Defined values are:

<table>
<thead>
<tr>
<th>CopDbg</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Support for Armv6, v6 Debug architecture, with System registers access.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Support for Armv6, v6.1 Debug architecture, with System registers access.</td>
</tr>
<tr>
<td>0b0100</td>
<td>Support for Armv7, v7 Debug architecture, with System registers access.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Support for Armv7, v7.1 Debug architecture, with System registers access.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Support for Armv8 debug architecture, with System registers access.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Support for Armv8 debug architecture, with System registers access, and Virtualization Host extensions.</td>
</tr>
<tr>
<td>0b1000</td>
<td>Support for Armv8.2 debug architecture.</td>
</tr>
<tr>
<td>0b1001</td>
<td>Support for Armv8.4 debug architecture.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In any Armv8 implementation, the values 0b0000, 0b0010, 0b0011, 0b0100, and 0b0101 are not permitted.

If Armv8.1-VHE is not implemented, the only permitted value is 0b0110.

In an Armv8.0 implementation, the value 0b1000 is not permitted.

ID_DFR1_EL1, Debug Feature Register 1

The ID_DFR1_EL1 characteristics are:

**Purpose**

Provides top level information about the debug system in AArch32.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

**Configuration**

AArch64 System register ID_DFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_DFR1[31:0].

This register is present only from Armv8.6. Otherwise, direct accesses to ID_DFR1_EL1 are RES0.

**Attributes**

ID_DFR1_EL1 is a 64-bit register.

**Field descriptions**

The ID_DFR1_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

**Bits [63:4]**

Reserved, RES0.

**MTPMU, bits [3:0]**

From Armv8.6:

Multi-threaded PMU extension. Defined values are:

<table>
<thead>
<tr>
<th>MTPMU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>ARMv8.6-MTPMU not implemented. If PMUv3 is implemented, it is IMPLEMENTATION DEFINED whether</td>
</tr>
<tr>
<td></td>
<td>PMEVTYPER&lt;n&gt;_EL0.MT are read/write or RES0.</td>
</tr>
<tr>
<td>0b0001</td>
<td>ARMv8.6-MTPMU implemented and PMEVTYPER&lt;n&gt;_EL0.MT are read/write. When ARMv8.6-MTPMU is</td>
</tr>
<tr>
<td></td>
<td>disabled, the Effective values of PMEVTYPER&lt;n&gt;_EL0.MT are 0.</td>
</tr>
<tr>
<td>0b1111</td>
<td>ARMv8.6-MTPMU not implemented. If PMUv3 is implemented, PMEVTYPER&lt;n&gt;_EL0.MT are RES0.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.6-MTPMU implements the functionality identified by the value 0b0001.

In an Armv8.6-compliant implementation that includes PMUv3, the value 0b0000 is not permitted.

In an implementation that does not include PMUv3, the value 0b0001 is not permitted.
Otherwise:
Reserved, RES0.

Accessing the ID_DFR1_EL1

Accesses to this register use the following encodings:

\[
\text{MRS } <Xt>, \text{ ID_DFR1_EL1}
\]

<table>

elsif PSTATE.EL == EL3 then
  return ID_DFR1_EL1;
The ID_ISAR0_EL1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D7.1.3.

**Configuration**

AArch64 System register ID_ISAR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR0[31:0].

In an implementation that supports only AArch64 state, this register is UNKNOWN.

**Attributes**

ID_ISAR0_EL1 is a 64-bit register.

**Field descriptions**

The ID_ISAR0_EL1 bit assignments are:

</tr>
<tr>
<td>0010</td>
<td>As for 0001, and adds SDIV and UDIV in the A32 instruction set.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

**Debug, bits [23:20]**

Indicates the implemented Debug instructions. Defined values are:
### Debug

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>

<tr>
<td>0b0011</td>
<td>As for 0b0010, and adds generic MCRR and MRRC.</td>
</tr>
<tr>
<td>0b0100</td>
<td>As for 0b0011, and adds generic MCRR2 and MRRC2.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

### CmpBranch, bits [15:12]

Indicates the implemented combined Compare and Branch instructions in the T32 instruction set. Defined values are:

<table>
<thead>
<tr>
<th>CmpBranch</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds CBNZ and CBZ.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### BitField, bits [11:8]

Indicates the implemented BitField instructions. Defined values are:

<table>
<thead>
<tr>
<th>BitField</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds BFC, BFI, SBFX, and UBFX.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### BitCount, bits [7:4]

Indicates the implemented Bit Counting instructions. Defined values are:

<table>
<thead>
<tr>
<th>BitCount</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds CLZ.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### Swap, bits [3:0]

Indicates the implemented Swap instructions in the A32 instruction set. Defined values are:
<table>
<thead>
<tr>
<th>Swap</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds SWP and SWPB.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**Accessing the ID_ISAR0_EL1**

Accesses to this register use the following encodings:

**MRS <Xt>, ID_ISAR0_EL1**

```
<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>

    return ID_ISAR0_EL1;
end;
```
ID_ISAR1_EL1, AArch32 Instruction Set Attribute Register 1

The ID_ISAR1_EL1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D7.1.3.

**Configuration**

AArch64 System register ID_ISAR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR1[31:0].

In an implementation that supports only AArch64 state, this register is UNKNOWN.

**Attributes**

ID_ISAR1_EL1 is a 64-bit register.

**Field descriptions**

The ID_ISAR1_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

| RES0 | Jazelle | Interwork | Immediate | IfThen | Extend | Except_AR | Except | Endian |

**Bits [63:32]**

Reserved, RES0.

**Jazelle, bits [31:28]**

Indicates the implemented Jazelle extension instructions. Defined values are:

<table>
<thead>
<tr>
<th>Jazelle</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No support for Jazelle.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the BXJ instruction and the J bit in the PSR. This setting might indicate a trivial implementation of the Jazelle extension.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**Interwork, bits [27:24]**

Indicates the implemented Interworking instructions. Defined values are:
## Interwork, bits [5:0]

<table>
<thead>
<tr>
<th>Interwork</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the BX instruction, and the T bit in the PSR.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the BLX instruction. PC loads have BX-like behavior.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0010, and guarantees that data-processing instructions in the A32 instruction set with the PC as the destination and the S bit clear have BX-like behavior.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

## Immediate, bits [23:20]

Indicates the implemented data-processing instructions with long immediates. Defined values are:

<table>
<thead>
<tr>
<th>Immediate</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
</tbody>
</table>
| 0b0001    | Adds:  
|           | • The MOVT instruction.  
|           | • The MOV instruction encodings with zero-extended 16-bit immediates.  
|           | • The T32 ADD and SUB instruction encodings with zero-extended 12-bit immediates, and the other ADD, ADR, and SUB encodings cross-referenced by the pseudocode for those encodings. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

## IfThen, bits [19:16]

Indicates the implemented If-Then instructions in the T32 instruction set. Defined values are:

<table>
<thead>
<tr>
<th>IfThen</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the IT instructions, and the IT bits in the PSRs.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

## Extend, bits [15:12]

Indicates the implemented Extend instructions. Defined values are:

<table>
<thead>
<tr>
<th>Extend</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No scalar sign-extend or zero-extend instructions are implemented, where scalar instructions means non-Advanced SIMD instructions.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SXTB, SXTH, UXTB, and UXTH instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the SXTB16, SXTAB, SXTAB16, SXTAH, UXTB16, UXTAB, UXTAB16, and UXTHA instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

## Except_AR, bits [11:8]

Indicates the implemented A and R profile exception-handling instructions. Defined values are:
Except, bits [7:4]

Indicates the implemented exception-handling instructions in the A32 instruction set. Defined values are:

<table>
<thead>
<tr>
<th>Except</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented. This indicates that the User bank and Exception return forms of the LDM and STM instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the LDM (exception return), LDM (user registers), and STM (user registers) instruction versions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Endian, bits [3:0]

Indicates the implemented Endian instructions. Defined values are:

<table>
<thead>
<tr>
<th>Endian</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SETEND instruction, and the E bit in the PSRs.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

**Accessing the ID_ISAR1_EL1**

Accesses to this register use the following encodings:

```plaintext
MRS <Xt>, ID_ISAR1_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>
<td>0b0000</td>
<td>0b0010</td>
<td>0b001</td>
</tr>
</tbody>
</table>
```

if PSTATE.EL == EL0 then

        else
            return ID_ISAR1_EL1;
    elsif PSTATE.EL == EL2 then
        return ID_ISAR1_EL1;
    elsif PSTATE.EL == EL3 then
        return ID_ISAR1_EL1;
```
**ID_ISAR2_EL1, AArch32 Instruction Set Attribute Register 2**

The ID_ISAR2_EL1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

**Configuration**

AArch64 System register ID_ISAR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_ISAR2][31:0].

In an implementation that supports only AArch64 state, this register is **UNKNOWN**.

**Attributes**

ID_ISAR2_EL1 is a 64-bit register.

**Field descriptions**

The ID_ISAR2_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Reversal</th>
<th>PSR_AR</th>
<th>MultU</th>
<th>MultS</th>
<th>Mult</th>
<th>MultiAccessInt</th>
<th>MemHint</th>
<th>LoadStore</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>62</td>
<td>61</td>
<td>60</td>
<td>59</td>
<td>58</td>
<td>57</td>
<td>56</td>
</tr>
<tr>
<td>55</td>
<td>54</td>
<td>53</td>
<td>52</td>
<td>51</td>
<td>50</td>
<td>49</td>
<td>48</td>
</tr>
<tr>
<td>47</td>
<td>46</td>
<td>45</td>
<td>44</td>
<td>43</td>
<td>42</td>
<td>41</td>
<td>40</td>
</tr>
<tr>
<td>39</td>
<td>38</td>
<td>37</td>
<td>36</td>
<td>35</td>
<td>34</td>
<td>33</td>
<td>32</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, **RES0**.

**Reversal, bits [31:28]**

Indicates the implemented Reversal instructions. Defined values are:

<table>
<thead>
<tr>
<th>Reversal</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the REV, REV16, and REVSH instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the RBIT instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0010.

**PSR_AR, bits [27:24]**

Indicates the implemented A and R profile instructions to manipulate the PSR. Defined values are:
<table>
<thead>
<tr>
<th>PSR_AR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the MRS and MSR instructions, and the exception return forms of data-processing instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

The exception return forms of the data-processing instructions are:

- In the A32 instruction set, data-processing instructions with the PC as the destination and the S bit set. These instructions might be affected by the WithShifts attribute.
- In the T32 instruction set, the SUBS PC,LR,#N instruction.

**MultU, bits [23:20]**

Indicates the implemented advanced unsigned Multiply instructions. Defined values are:

<table>
<thead>
<tr>
<th>MultU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the UMULL and UMLAL instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the UMAAL instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0010.

**MultS, bits [19:16]**

Indicates the implemented advanced signed Multiply instructions. Defined values are:

<table>
<thead>
<tr>
<th>MultS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SMULL and SMLAL instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the SMLAB, SMLABT, SMLALBB, SMLALBT, SMLALTB, SMLATT, SMLAWB, SMLAWT, SMLBB, SMLBT, SMLTB, SMULBB, SMUBLT, SMULT, SMULWB, and SMULWT instructions. Also adds the Q bit in the PSRs.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0010, and adds the SMLAD, SMLADX, SMLAD, SMLALDX, SMLSD, SMLSDX, SMLSLD, SMLSLDX, SMLLA, SMLAR, SMLLS, SMLLSR, SMMLSR, SMUL, SMULR, SMUAD, SMUADX, SMUSD, and SMUSDX instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0011.

**Mult, bits [15:12]**

Indicates the implemented additional Multiply instructions. Defined values are:

<table>
<thead>
<tr>
<th>Mult</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No additional instructions implemented. This means only MUL is implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the MLA instruction.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the MLS instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0010.

**MultiAccessInt, bits [11:8]**

Indicates the support for interruptible multi-access instructions. Defined values are:
### MultiAccessInt

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No support. This means the LDM and STM instructions are not interruptible.</td>
</tr>
<tr>
<td>0b0001</td>
<td>LDM and STM instructions are restartable.</td>
</tr>
<tr>
<td>0b0010</td>
<td>LDM and STM instructions are continuable.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

### MemHint, bits [7:4]

Indicates the implemented Memory Hint instructions. Defined values are:

<table>
<thead>
<tr>
<th>MemHint</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the PLD instruction.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Adds the PLD instruction. (0b0001 and 0b0010 have identical effects.)</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0001 (or 0b0010), and adds the PLI instruction.</td>
</tr>
<tr>
<td>0b0100</td>
<td>As for 0b0011, and adds the PLDW instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0100.

### LoadStore, bits [3:0]

Indicates the implemented additional load/store instructions. Defined values are:

<table>
<thead>
<tr>
<th>LoadStore</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No additional load/store instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the LDRD and STRD instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the Load Acquire (LDAB, LDAH, LDA, LDAEXB, LDAEXH, LDAEX, LDAEXD) and Store Release (STLB, STLH, STL, STLEXB, STLEXH, STLEX, STLEXD) instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0010.

### Accessing the ID_ISAR2_EL1

Accesses to this register use the following encodings:

\[
\text{MRS <Xt>, ID_ISAR2_EL1}
\]

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b00</td>
<td>0b0000</td>
<td>0b0010</td>
<td>0b010</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    if IsFeatureImplemented("ARMv8.4-IDST") then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_ISAR2_EL1;
elsif PSTATE.EL == EL2 then
    return ID_ISAR2_EL1;
elsif PSTATE.EL == EL3 then
    return ID_ISAR2_EL1;
The ID_ISAR3_EL1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D7.1.3.

**Configuration**

AArch64 System register ID_ISAR3_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR3[31:0].

In an implementation that supports only AArch64 state, this register is UNKNOWN.

**Attributes**

ID_ISAR3_EL1 is a 64-bit register.

**Field descriptions**

The ID_ISAR3_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-32</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>31-28</td>
<td>Indicates the implemented T32EE instructions. Defined values are:</td>
</tr>
<tr>
<td></td>
<td>T32EE</td>
</tr>
<tr>
<td>31-24</td>
<td>T32EE</td>
</tr>
<tr>
<td>27-24</td>
<td>T32EE</td>
</tr>
<tr>
<td>23-20</td>
<td>T32EE</td>
</tr>
<tr>
<td>19-16</td>
<td>T32EE</td>
</tr>
<tr>
<td>15-12</td>
<td>T32EE</td>
</tr>
<tr>
<td>11-8</td>
<td>T32EE</td>
</tr>
<tr>
<td>7-4</td>
<td>T32EE</td>
</tr>
<tr>
<td>3-0</td>
<td>T32EE</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**T32EE, bits [31:28]**

Indicates the implemented T32EE instructions. Defined values are:

<table>
<thead>
<tr>
<th>T32EE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the ENTERX and LEAVEX instructions, and modifies the load behavior to include null checking.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**TrueNOP, bits [27:24]**

Indicates the implemented true NOP instructions. Defined values are:
<table>
<thead>
<tr>
<th>TrueNOP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented. This means there are no NOP instructions that do not have any register dependencies.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds true NOP instructions in both the T32 and A32 instruction sets. This also permits additional NOP-compatible hints.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**T32Copy, bits [23:20]**

Indicates the support for T32 non flag-setting MOV instructions. Defined values are:

<table>
<thead>
<tr>
<th>T32Copy</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported. This means that in the T32 instruction set, encoding T1 of the MOV (register) instruction does not support a copy from a low register to a low register.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds support for T32 instruction set encoding T1 of the MOV (register) instruction, copying from a low register to a low register.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**TabBranch, bits [19:16]**

Indicates the implemented Table Branch instructions in the T32 instruction set. Defined values are:

<table>
<thead>
<tr>
<th>TabBranch</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the TBB and TBH instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**SynchPrim, bits [15:12]**

Used in conjunction with ID_ISAR3_EL1.AArch32 Instruction Set Attribute Register 3 to indicate the implemented Synchronization Primitive instructions. Defined values are:

<table>
<thead>
<tr>
<th>SynchPrim</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>If SynchPrim frac == 0b0000, no Synchronization Primitives implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>If SynchPrim frac == 0b0000, adds the LDREX and STREX instructions. If SynchPrim frac == 0b0011, also adds the CLREX, LDREXB, STREXB, and STREXH instructions. If SynchPrim frac == 0b0000, as for [0b0001, 0b0011] and also adds the LDREXD and STREXD instructions.</td>
</tr>
</tbody>
</table>

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is 0b0010.

**SVC, bits [11:8]**

Indicates the implemented SVC instructions. Defined values are:

<table>
<thead>
<tr>
<th>SVC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SVC instruction.</td>
</tr>
</tbody>
</table>
All other values are reserved.

In Armv8-A, the only permitted value is \( 0b0001 \).

**SIMD, bits [7:4]**

Indicates the implemented SIMD instructions. Defined values are:

<table>
<thead>
<tr>
<th>SIMD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SSAT and USAT instructions, and the Q bit in the PSRs.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0001, and adds the PKHBT, PKHTB, QADD16, QADD8, QASX, QSUB16, QSUB8, QSA, SADD16, SADD8, SASX, SEL, SHADD16, SHADD8, SHAX, SHSUB16, SHSUB8, SHAX, SSAT16, SSUB16, SSUB8, SSAX, SXTAB16, SXTB16, UADD16, UADD8, UASX, UHADD16, UHADD8, UHAX, UHSUB16, UHUB8, UHSAX, UQADD16, UQADD8, UQASX, UQSUB16, UQSUB8, UQASX, USAD8, USADA8, USAT16, USUB16, USUB8, USAX, UXTAB16, and UXTB16 instructions. Also adds support for the GE[3:0] bits in the PSRs.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

The SIMD field relates only to implemented instructions that perform SIMD operations on the general-purpose registers. In an implementation that supports floating-point and Advanced SIMD instructions, MVFR0, MVFR1, and MVFR2 give information about the implemented Advanced SIMD instructions.

**Saturate, bits [3:0]**

Indicates the implemented Saturate instructions. Defined values are:

<table>
<thead>
<tr>
<th>Saturate</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented. This means no non-Advanced SIMD saturate instructions are implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the QADD, QDADD, QDSUB, and QSUB instructions, and the Q bit in the PSRs.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**Accessing the ID_ISAR3_EL1**

Accesses to this register use the following encodings:

\[
\text{MRS } <Xt>, \text{ ID_ISAR3_EL1}
\]

\[
\begin{array}{|c|c|c|c|c|}
\hline
\text{op0} & \text{op1} & \text{CRn} & \text{CRm} & \text{op2} \\
\hline
0b11 & 0b000 & 0b0000 & 0b0010 & 0b011 \\
\hline
\end{array}
\]
if PSTATE.EL == EL0 then
    if IsFeatureImplemented("ARMv8.4-IDST") then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        end
    else
        UNDEFINED;
    end
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_ISAR3_EL1;
    end
elsif PSTATE.EL == EL2 then
    return ID_ISAR3_EL1;
elsif PSTATE.EL == EL3 then
    return ID_ISAR3_EL1;
**ID_ISAR4_EL1, AArch32 Instruction Set Attribute Register 4**

The ID_ISAR4_EL1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D7.1.3.

**Configuration**

AArch64 System register ID_ISAR4_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR4[31:0].

In an implementation that supports only AArch64 state, this register is UNKNOWN.

**Attributes**

ID_ISAR4_EL1 is a 64-bit register.

**Field descriptions**

The ID_ISAR4_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-32</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>31-28</td>
<td>SWP_frac</td>
</tr>
<tr>
<td>27-24</td>
<td>PSR_M</td>
</tr>
<tr>
<td>23-20</td>
<td>SynchPrim_frac</td>
</tr>
<tr>
<td>19-16</td>
<td>Barrier</td>
</tr>
<tr>
<td>15-12</td>
<td>SMC</td>
</tr>
<tr>
<td>11-8</td>
<td>Writeback</td>
</tr>
<tr>
<td>7-4</td>
<td>WithShifts</td>
</tr>
<tr>
<td>3-0</td>
<td>Unpriv</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**SWP_frac, bits [31:28]**

Indicates support for the memory system locking the bus for SWP or SWPB instructions. Defined values are:

<table>
<thead>
<tr>
<th>SWP_frac</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SWP or SWPB instructions not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SWP or SWPB implemented but only in a uniprocessor context. SWP and SWPB do not guarantee whether memory accesses from other masters can come between the load memory access and the store memory access of the SWP or SWPB.</td>
</tr>
</tbody>
</table>

All other values are reserved. This field is valid only if the ID_ISAR0_Swap_instrs field is 0b0000.

In Armv8-A, the only permitted value is 0b0000.

**PSR_M, bits [27:24]**

Indicates the implemented M profile instructions to modify the PSRs. Defined values are:
<table>
<thead>
<tr>
<th>PSR_M</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the M profile forms of the CPS, MRS, and MSR instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**SynchPrim_frac, bits [23:20]**

Used in conjunction with ID_ISAR3. SynchPrim to indicate the implemented Synchronization Primitive instructions. Possible values are:

<table>
<thead>
<tr>
<th>SynchPrim_frac</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>If SynchPrim == 0b0000, no Synchronization Primitives implemented. If</td>
</tr>
<tr>
<td></td>
<td>SynchPrim == 0b0001, adds the LDREX and STREX instructions. If</td>
</tr>
<tr>
<td></td>
<td>SynchPrim == 0b0010, also adds the CLREX, LDREXB, LDREXH, STREXB,</td>
</tr>
<tr>
<td></td>
<td>STREXH, LDREXD, and STREXD instructions.</td>
</tr>
<tr>
<td>0b0011</td>
<td>If SynchPrim == 0b0001, adds the LDREX, STREX, CLREX, LDREXB, LDREXH,</td>
</tr>
<tr>
<td></td>
<td>STREXH, STREXB, and STREXH instructions.</td>
</tr>
</tbody>
</table>

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is 0b0000.

**Barrier, bits [19:16]**

Indicates the implemented Barrier instructions in the A32 and T32 instruction sets. Defined values are:

<table>
<thead>
<tr>
<th>Barrier</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented. Barrier operations are provided only as System</td>
</tr>
<tr>
<td></td>
<td>instructions in the (coproc==0b1111) encoding space.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the DMB, DSB, and ISB barrier instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**SMC, bits [15:12]**

Indicates the implemented SMC instructions. Defined values are:

<table>
<thead>
<tr>
<th>SMC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SMC instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0001 and 0b0000.

If EL1 cannot use AArch32, then this field has the value 0b0000.

**Writeback, bits [11:8]**

Indicates the support for Writeback addressing modes. Defined values are:

<table>
<thead>
<tr>
<th>Writeback</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Basic support. Only the LDM, STM, PUSH, POP, SRS, and RFE instructions</td>
</tr>
<tr>
<td></td>
<td>support writeback addressing modes. These instructions support all of</td>
</tr>
<tr>
<td></td>
<td>their writeback addressing modes.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds support for all of the writeback addressing modes.</td>
</tr>
</tbody>
</table>

Page 990
All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**WithShifts, bits [7:4]**

Indicates the support for instructions with shifts. Defined values are:

<table>
<thead>
<tr>
<th>WithShifts</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Nonzero shifts supported only in MOV and shift instructions.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds support for shifts of loads and stores over the range LSL 0-3.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0001, and adds support for other constant shift options, both on load/store and other instructions.</td>
</tr>
<tr>
<td>0b0100</td>
<td>As for 0b0011, and adds support for register-controlled shift options.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0100.

**Unpriv, bits [3:0]**

Indicates the implemented unprivileged instructions. Defined values are:

<table>
<thead>
<tr>
<th>Unpriv</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented. No T variant instructions are implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the LDRBT, LDRT, STRBT, and STRT instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the LDRHT, LDRSBT, LDRSHT, and STRHT instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

**Accessing the ID_ISAR4_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, ID_ISAR4_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>
<td>0b0000</td>
<td>0b0010</td>
<td>0b100</td>
</tr>
</tbody>
</table>

```c
if PSTATE.EL == EL0 then

  elsif PSTATE.EL == EL3 then
    return ID_ISAR4_EL1;
```
ID_ISAR5_EL1, AArch32 Instruction Set Attribute Register 5

The ID_ISAR5_EL1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, and ID_ISAR4_EL1.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D7.1.3.

**Configuration**

AArch64 System register ID_ISAR5_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR5[31:0].

In an implementation that supports only AArch64 state, this register is UNKNOWN.

**Attributes**

ID_ISAR5_EL1 is a 64-bit register.

**Field descriptions**

The ID_ISAR5_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| VCMA | RDM | RES0 | CRC32 | SHA2 | SHA1 | AES | SEVL |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:32]**

Reserved, RES0.

**VCMA, bits [31:28]**

From Armv8.3:

Indicates AArch32 support for complex number addition and multiplication where numbers are stored in vectors. Defined values are:

<table>
<thead>
<tr>
<th>VCMA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00000</td>
<td>The VCMLA and VCADD instructions are not implemented in AArch32.</td>
</tr>
<tr>
<td>00001</td>
<td>The VCMLA and VCADD instructions are implemented in AArch32.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.3-CompNum implements the functionality identified by 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, the only permitted value is 0b0001.
Otherwise:
Reserved, RES0.

**RDM, bits [27:24]**

**From Armv8.1:**

Indicates whether the VQRDMLAH and VQRDMLSH instructions are implemented in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>RDM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No VQRDMLAH and VQRDMLSH instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>VQRDMLAH and VQRDMLSH instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.1-RDMA implements the functionality identified by the value 0b0001.

In Armv8.0, the only permitted value is 0b0000.

From Armv8.1, the only permitted value is 0b0001.

Otherwise:
Reserved, RES0.

**Bits [23:20]**

Reserved, RES0.

**CRC32, bits [19:16]**

Indicates whether the CRC32 instructions are implemented in AArch32 state.

<table>
<thead>
<tr>
<th>CRC32</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No CRC32 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CH, and CRC32CW instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.1, the only permitted value is 0b0001.

**SHA2, bits [15:12]**

Indicates whether the SHA2 instructions are implemented in AArch32 state.

<table>
<thead>
<tr>
<th>SHA2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No SHA2 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

**SHA1, bits [11:8]**

Indicates whether the SHA1 instructions are implemented in AArch32 state.
<table>
<thead>
<tr>
<th>SHA1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No SHA1 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

**AES, bits [7:4]**

Indicates whether the AES instructions are implemented in AArch32 state.

<table>
<thead>
<tr>
<th>AES</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No AES instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>AESE,AESD,AESMC, and AESIMC implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, plus VMULL (polynomial) instructions operating on 64-bit data quantities.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0010.

**SEVL, bits [3:0]**

Indicates whether the SEVL instruction is implemented in AArch32 state.

<table>
<thead>
<tr>
<th>SEVL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SEVL is implemented as a NOP.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SEVL is implemented as Send Event Local.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**Accessing the ID_ISAR5_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, ID_ISAR5_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

ID_ISAR6_EL1, AArch32 Instruction Set Attribute Register 6

The ID_ISAR6_EL1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1 and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

**Configuration**

AArch64 System register ID_ISAR6_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR6[31:0].

This register is present only from Armv8.2. Otherwise, direct accesses to ID_ISAR6_EL1 are RES0. In an implementation that supports only AArch64 state, this register is UNKNOWN.

**Attributes**

ID_ISAR6_EL1 is a 64-bit register.

**Field descriptions**

The ID_ISAR6_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | I8MM | BF16 | SPECRES | SB | FHM | DP | JSCVT |

**Bits [63:28]**

Reserved, RES0.

**I8MM, bits [27:24]**

From Armv8.2:

Indicates support for Advanced SIMD and floating-point Int8 matrix multiplication instructions in AArch32 state. Defined values of this field are:

<table>
<thead>
<tr>
<th>I8MM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Int8 matrix multiplication instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>VSMMLA, VSUDOT, VUMMLA, VUSMMLA, and VUSDOT instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.2-AA32I8MM implements the functionality identified by 0b0001.
Otherwise:

Reserved, RES0.

**BF16, bits [23:20]**

From Armv8.2:

Indicates support for Advanced SIMD and floating-point BFloat16 instructions in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>BF16</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>BFloat16 instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>VCVT, VCVTB, VCVTT, VDOT, VFMA, and VMMLA instructions with BF16 operand or result types are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARmv8.2-AA32BF16 implements the functionality identified by 0b0001.

Otherwise:

Reserved, RES0.

**SPECRES, bits [19:16]**

Indicates support for Speculation invalidation instruction in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>SPECRES</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>CFPRCTX, DVPRCTX, and CPPRCTX instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>CFPRCTX, DVPRCTX, and CPPRCTX instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8.5, the only permitted value is 0b0001.

**SB, bits [15:12]**

Indicates support for SB instruction in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>SB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SB instruction is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SB instruction is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8.5, the only permitted value is 0b0001.

**FHM, bits [11:8]**

Indicates support for Advanced SIMD and floating-point VFMAL and VFMSL instructions in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>FHM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>VFMAL and VMFSL instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>VFMAL and VMFSL instructions are implemented.</td>
</tr>
</tbody>
</table>

ARmv8.2-FHM implements the functionality identified by the value 0b0001.

In Armv8.0 and Armv8.1, the only permitted value is 0b0000.

In Armv8.2, the permitted values are 0b0000 and 0b0001.
**DP, bits [7:4]**

Indicates the support for dot product instructions in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No dot product instructions are implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>VUDOT and VSDOT instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.2-DotProd implements the functionality identified by the value 0b0001.

In Armv8.0 and Armv8.1, the only permitted value is 0b0000.

In Armv8.2, the permitted values are 0b0000 and 0b0001.

**JSCVT, bits [3:0]**

From Armv8.3:

Indicates support for the Javascript conversion instruction in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The VJCVT instruction is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The VJCVT instruction is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.3-JSConv implements the functionality identified by 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, the only permitted value is 0b0001.

**Otherwise:**

Reserved, RES0.

**Accessing the ID_ISAR6_EL1**

Accesses to this register use the following encodings:

### ID_MMFR0_EL1, AArch32 Memory Model Feature Register 0

The ID_MMFR0_EL1 characteristics are:

#### Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with ID_MMFR1_EL1, ID_MMFR2_EL1, ID_MMFR3_EL1, and ID_MMFR4_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

#### Configuration

AArch64 System register ID_MMFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR0[31:0].

In an implementation that supports only AArch64 state, this register is **UNKNOWN**.

#### Attributes

ID_MMFR0_EL1 is a 64-bit register.

#### Field descriptions

The ID_MMFR0_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit assignments</th>
<th>RES0</th>
<th>InnerShr</th>
<th>FCSE</th>
<th>AuxReg</th>
<th>TCM</th>
<th>ShareLvl</th>
<th>OuterShr</th>
<th>PMSA</th>
<th>VMSA</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [31:28]</td>
<td>19</td>
<td>18</td>
<td>17</td>
<td>16</td>
<td>15</td>
<td>14</td>
<td>13</td>
<td>12</td>
<td>11</td>
</tr>
<tr>
<td>Bits [27:20]</td>
<td>9</td>
<td>8</td>
<td>7</td>
<td>6</td>
<td>5</td>
<td>4</td>
<td>3</td>
<td>2</td>
<td>1</td>
</tr>
<tr>

<td>0</td>
</tr>
</tbody>
</table>

#### Bits [63:32]

Reserved, RES0.

#### InnerShr, bits [31:28]

Innermost Shareability. Indicates the innermost shareability domain implemented. Defined values are:

<table>
<thead>
<tr>
<th>InnerShr</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Implemented as Non-cacheable.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Implemented with hardware coherency support.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Shareability ignored.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the permitted values are 0b0000, 0b0001, and 0b1111.

This field is valid only if the implementation supports two levels of shareability, as indicated by ID_MMFR0_EL1.ShareLvl having the value 0b0001.

When ID_MMFR0_EL1.ShareLvl is zero, this field is UNK.
**FCSE, bits [27:24]**

Indicates whether the implementation includes the FCSE. Defined values are:

<table>
<thead>
<tr>
<th>FCSE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for FCSE.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the only permitted value is 0b0000.

**AuxReg, bits [23:20]**

Auxiliary Registers. Indicates support for Auxiliary registers. Defined values are:

<table>
<thead>
<tr>
<th>AuxReg</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for Auxiliary Control Register only.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Support for Auxiliary Fault Status Registers (AIFSR and ADFSR) and Auxiliary Control Register.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the only permitted value is 0b0010.

**Note**

Accesses to unimplemented Auxiliary registers are UNDEFINED.

**TCM, bits [19:16]**

Indicates support for TCMs and associated DMAs. Defined values are:

<table>
<thead>
<tr>
<th>TCM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support is IMPLEMENTATION DEFINED. Armv7 requires this setting.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Support for TCM only, Armv6 implementation.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Support for TCM and DMA, Armv6 implementation.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

**ShareLvl, bits [15:12]**

Shareability Levels. Indicates the number of shareability levels implemented. Defined values are:

<table>
<thead>
<tr>
<th>ShareLvl</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>One level of shareability implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Two levels of shareability implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the only permitted value is 0b0001.

**OuterShr, bits [11:8]**

Outermost Shareability. Indicates the outermost shareability domain implemented. Defined values are:
### OuterShr

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Implemented as Non-cacheable.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Implemented with hardware coherency support.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Shareability ignored.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the permitted values are 0b0000, 0b0001, and 0b1111.

### PMSA, bits [7:4]

Indicates support for a PMSA. Defined values are:

<table>
<thead>
<tr>
<th>PMSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for IMPLEMENTATION DEFINED PMSA</td>
</tr>
<tr>
<td>0b0010</td>
<td>Support for PMSAv6, with a Cache Type Register implemented.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Support for PMSAv7, with support for memory subsections, Armv7-R profile.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

### VMSA, bits [3:0]

Indicates support for a VMSA. Defined values are:

<table>
<thead>
<tr>
<th>VMSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for IMPLEMENTATION DEFINED VMSA</td>
</tr>
<tr>
<td>0b0010</td>
<td>Support for VMSAv6, with Cache and TLB Type Registers implemented.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Support for VMSAv7, with support for remapping and the Access flag, Armv7-A profile.</td>
</tr>
<tr>
<td>0b0100</td>
<td>As for 0b0011, and adds support for the PXN bit in the Short-descriptor translation table format descriptors.</td>
</tr>
<tr>
<td>0b0101</td>
<td>As for 0b0100, and adds support for the Long-descriptor translation table format.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0101.

### Accessing the ID_MMFR0_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, ID_MMFR0_EL1
```

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>

ID_MMFR1_EL1, AArch32 Memory Model Feature Register 1

The ID_MMFR1_EL1 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with ID_MMFR0_EL1, ID_MMFR2_EL1, ID_MMFR3_EL1, and ID_MMFR4_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

**Configuration**

AArch64 System register ID_MMFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR1[31:0].

In an implementation that supports only AArch64 state, this register is **UNKNOWN**.

**Attributes**

ID_MMFR1_EL1 is a 64-bit register.

**Field descriptions**

The ID_MMFR1_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | BPred | L1TstCln | L1Uni | L1Hvd | L1UniSW | L1HvdSW | L1UniVA | L1HvdVA |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:32]**

Reserved, RES0.

**BPred, bits [31:28]**

Branch Predictor. Indicates branch predictor management requirements. Defined values are:
### L1TstCln, bits [27:24]
