AMCNTENSET0, Activity Monitors Count Enable Set Register 0

The AMCNTENSET0 characteristics are:

**Purpose**

Enable control bits for the architected activity monitors event counters, \texttt{AMEVCNTR0<n>}. 

**Configuration**

AArch32 System register AMCNTENSET0 bits [31:0] are architecturally mapped to AArch64 System register \texttt{AMCNTENSET0_EL0[31:0]}. 

AArch32 System register AMCNTENSET0 bits [31:0] are architecturally mapped to External register \texttt{AMCNTENSET0[31:0]}. 

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET0 are UNDEFINED. 

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

AMCNTENSET0 is a 32-bit register.

**Field descriptions**

The AMCNTENSET0 bit assignments are:

<table>

**Bits [31:16]**

Reserved, RES0.

**P<n>, bit [n], for n = 0 to 15**

Activity monitor event counter enable bit for \texttt{AMEVCNTR0<n>}. 

Bits [31:16] are RES0. Bits [15:N] are RAZ/WI. N is the value in \texttt{AMCGCR.CG0NC}. 

Possible values of each bit are:

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that \texttt{AMEVCNTR0&lt;n&gt;} is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that \texttt{AMEVCNTR0&lt;n&gt;} is enabled. When written, enables \texttt{AMEVCNTR0&lt;n&gt;}.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.

AMCNTENSET1, Activity Monitors Count Enable Set Register 1

The AMCNTENSET1 characteristics are:

**Purpose**

Enable control bits for the auxiliary activity monitors event counters, AMEVCTR1<n>.

**Configuration**

AArch32 System register AMCNTENSET1 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENSET1_EL0[31:0].

AArch32 System register AMCNTENSET1 bits [31:0] are architecturally mapped to External register AMCNTENSET1[31:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET1 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

AMCNTENSET1 is a 32-bit register.

**Field descriptions**

The AMCNTENSET1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | P<n>, bit [n] |

**Bits [31:16]**

Reserved, RES0.

**P<n>, bit [n], for n = 0 to 15**

Activity monitor event counter enable bit for AMEVCTR1<n>.

Bits [31:16] are RES0. Bits [15:N] are RAZ/WI. N is the value in AMCGCR.CG1NC.

Possible values of each bit are:

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that AMEVCTR1&lt;n&gt; is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that AMEVCTR1&lt;n&gt; is enabled. When written, enables AMEVCTR1&lt;n&gt;.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.
Accessing the AMCNTENSET1

If the number of auxiliary activity monitor event counters implemented is zero, reads and writes of AMCNTENSET1 are constrained unpredictable, and the following behaviors are permitted:

- Accesses to the register are undefined.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.

Note

The number of auxiliary activity monitor counters implemented is zero when AMCFGR.NCG == 0b0000.

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>

AMEVCNTR0<\(n\)>, Activity Monitors Event Counter Registers 0, \(n = 0 - 15\)

The AMEVCNTR0<\(n\)> characteristics are:

**Purpose**

Provides access to the architected activity monitor event counters.

**Configuration**

AArch32 System register AMEVCNTR0<\(n\)> bits [63:0] are architecturally mapped to AArch64 System register AMEVCNTR0<\(n\>_EL0[63:0].

AArch32 System register AMEVCNTR0<\(n\)> bits [63:0] are architecturally mapped to External register AMEVCNTR0<\(n\> [63:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR0<\(n\)> are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

AMEVCNTR0<\(n\)> is a 64-bit register.

**Field descriptions**

The AMEVCNTR0<\(n\)> bit assignments are:

\[
\begin{array}{ccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccc
Accesses to the register are UNDEFINED.
Accesses to the register behave as RAZ/WI.
Accesses to the register execute as a NOP.

Note

**AMCGCR.CG0NC** identifies the number of architected activity monitor event counters.

Accesses to this register use the following encodings:

\[
\text{MRRC}\{c\}\{q\} <\text{coproc}>, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{Rt2}>, <\text{CRm}>
\]

AMEVCNTR1<n>, Activity Monitors Event Counter Registers 1, n = 0 - 15

The AMEVCNTR1<n> characteristics are:

Purpose

Provides access to the auxiliary activity monitor event counters.

Configuration

AArch32 System register AMEVCNTR1<n> bits [63:0] are architecturally mapped to AArch64 System register AMEVCNTR1<n>_EL0[63:0].

AArch32 System register AMEVCNTR1<n> bits [63:0] are architecturally mapped to External register AMEVCNTR1<n>[63:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR1<n> are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AMEVCNTR1<n> is a 64-bit register.

Field descriptions

The AMEVCNTR1<n> bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ACNT | ACNT |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

ACNT, bits [63:0]

Auxiliary activity monitor event counter n.

Value of auxiliary activity monitor event counter n, where n is the number of this register and is a number from 0 to 15.

If ARMv8.6-AMU is implemented, HCR_EL2.AMVOFFEN is 1, SCR_EL3.AMVOFFEN is 1, HCR_EL2 {E2H, TGE} is not {1,1}, EL2 is using AArch64 and is implemented in the current Security state, and AMCR_EL0.CG1RZ is 0, reads to these registers at EL0 or EL1 return (PCount<63:0> - AMEVCNTVOFF1<n>_EL2<63:0>).

PCount is the physical count returned when AMEVCNTR1<n> is read from EL2 or EL3.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

On a Cold reset, this field resets to 0.

Accessing the AMEVCNTR1<n>

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVCNTR1<n> are CONstrained UNPREDICTABLE, and the following behaviors are permitted:
• Accesses to the register are UNDEFINED.
• Accesses to the register behave as RAZ/WI.
• Accesses to the register execute as a NOP.

**Note**

AMCGCR.CG1NC identifies the number of auxiliary activity monitor event counters.

Accesses to this register use the following encodings:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

AMEVTYPER0<n>, Activity Monitors Event Type
Registers 0, n = 0 - 15

The AMEVTYPER0<n> characteristics are:

**Purpose**

Provides information on the events that an architected activity monitor event counter AMEVCNTR0<n> counts.

**Configuration**

AArch32 System register AMEVTYPER0<n> bits [31:0] are architecturally mapped to AArch64 System register AMEVTYPER0<n>_EL0[31:0].

AArch32 System register AMEVTYPER0<n> bits [31:0] are architecturally mapped to External register AMEVTYPER0<n>[31:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER0<n> are UNDEFINED.

**Attributes**

AMEVTYPER0<n> is a 32-bit register.

**Field descriptions**

The AMEVTYPER0<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

**Bits [31:16]**

Reserved, RES0.

**evtCount, bits [15:0]**

Event to count. The event number of the event that is counted by the architected activity monitor event counter AMEVCNTR0<n>. The value of this field is architecturally mandated for each architected counter.

The following table shows the mapping between required event numbers and the corresponding counters:

<table>
<thead>
<tr>
<th>evtCount</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x0011</td>
<td>Processor frequency cycles</td>
<td>When n == 0</td>
</tr>
<tr>
<td>0x4004</td>
<td>Constant frequency cycles</td>
<td>When n == 1</td>
</tr>
<tr>
<td>0x0008</td>
<td>Instructions retired</td>
<td>When n == 2</td>
</tr>
<tr>
<td>0x4005</td>
<td>Memory stall cycles</td>
<td>When n == 3</td>
</tr>
</tbody>
</table>

**Accessing the AMEVTYPER0<n>**

If <n> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVTYPER0<n> are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
**Note**

AMCGCR.CG0NC identifies the number of architected activity monitor event counters.

Accesses to this register use the following encodings:

The AMEVTYPER1<n> characteristics are:

**Purpose**

Provides information on the events that an auxiliary activity monitor event counter AMEVCTR1<n> counts.

**Configuration**

AArch32 System register AMEVTYPER1<n> bits [31:0] are architecturally mapped to AArch64 System register AMEVTYPER1<n>_EL0[31:0].

AArch32 System register AMEVTYPER1<n> bits [31:0] are architecturally mapped to External register AMEVTYPER1<n>[31:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER1<n> are UNDEFINED.

**Attributes**

AMEVTYPER1<n> is a 32-bit register.

**Field descriptions**

The AMEVTYPER1<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | evtCount |

**Bits [31:16]**

Reserved, RES0.

**evtCount, bits [15:0]**

Event to count. The event number of the event that is counted by the auxiliary activity monitor event counter AMEVCTR1<n>.

It is IMPLEMENTATION DEFINED what values are supported by each counter.

If software writes a value to this field which is not supported by the corresponding counter AMEVCTR1<n>, then:

- It is UNPREDICTABLE which event will be counted.
- The value read back is UNKNOWN.

The event counted by AMEVCTR1<n> might be fixed at implementation. In this case, the field is read-only and writes are UNDEFINED.

If the corresponding counter AMEVCTR1<n> is enabled, writes to this register have UNPREDICTABLE results.

**Accessing the AMEVTYPER1<n>**

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVTYPER1<n> are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:
• Accesses to the register are **UNDEFINED**.
• Accesses to the register behave as RAZ/WI.
• Accesses to the register execute as a NOP.

**Note**

AMCGCR.CG1NC identifies the number of auxiliary activity monitor event counters.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q}> \{coproc\}, \{#\}<opc1>, \{CRn\}, \{CRm\}[^{<opc2>}]
\]

AMUSERENR, Activity Monitors User Enable Register

The AMUSERENR characteristics are:

**Purpose**

Global user enable register for the activity monitors. Enables or disables EL0 access to the activity monitors. AMUSERENR is applicable to both the architected and the auxiliary counter groups.

**Configuration**

AArch32 System register AMUSERENR bits [31:0] are architecturally mapped to AArch64 System register AMUSERENR_EL0[31:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMUSERENR are UNDEFINED.

**Attributes**

AMUSERENR is a 32-bit register.

**Field descriptions**

The AMUSERENR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>30</td>
<td>RES0</td>
</tr>
<tr>
<td>29</td>
<td>EN</td>
</tr>
</tbody>
</table>

**Bits [31:1]**

Reserved, RES0.

**EN, bit [0]**

Traps EL0 accesses to the activity monitors registers to EL1.

<table>
<thead>
<tr>
<th>EN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 accesses to the activity monitors registers are trapped to EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped. Software can access all activity monitor registers at EL0.</td>
</tr>
</tbody>
</table>

**Note**

- AMUSERENR can always be read at EL0 and is not governed by this bit.

**Accessing the AMUSERENR**

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>

APSR, Application Program Status Register

The APSR characteristics are:

**Purpose**

Hold program status and control information.

**Configuration**

**Attributes**

APSR is a 32-bit register.

**Field descriptions**

The APSR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| N  | Z  | C  | V  | Q  | RES0 | GE  | RES0 | RES1 | RES0 |

**N, bit [31]**

Negative condition flag. Set to bit [31] of the result of the last flag-setting instruction. If the result is regarded as a two's complement signed integer, then N is set to 1 if the result was negative, and N is set to 0 if the result was positive or zero.

**Z, bit [30]**

Zero condition flag. Set to 1 if the result of the last flag-setting instruction was zero, and to 0 otherwise. A result of zero often indicates an equal result from a comparison.

**C, bit [29]**

Carry condition flag. Set to 1 if the last flag-setting instruction resulted in a carry condition, for example an unsigned overflow on an addition.

**V, bit [28]**

Overflow condition flag. Set to 1 if the last flag-setting instruction resulted in an overflow condition, for example a signed overflow on an addition.

**Q, bit [27]**

Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

**Bits [26:20]**

Reserved, RES0.

**GE, bits [19:16]**

Greater than or Equal flags, for parallel addition and subtraction.
Bits [15:5]

Reserved, RES0.

Bit [4]

Reserved, RES1.

Bits [3:0]

Reserved, RES0.

It is permitted that, on a read of APSR:

- Bit[22] returns the value of PSTATE.PAN
- Bit[9] returns the value of PSTATE.E.
- Bit[4:0] returns the value of PSTATE.M[4:0]

Note

This is an exception to the general rule that an UNKNOWN field must not return information that cannot be obtained, at the current Privilege level, by an architected mechanism.

For more information see The Application Program State Register.

Accessing the APSR

APSR can be read using the MRS instruction and written using the MSR (register) or MSR (immediate) instructions. For more details, see MRS, MSR (register), and MSR (immediate) in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
The ATS12NSOPR characteristics are:

**Purpose**

Performs stage 1 and 2 address translations as defined for PL1 and the Non-secure state, with permissions as if reading from the given virtual address.

**Configuration**

**Attributes**

ATS12NSOPR is a 32-bit System instruction.

**Field descriptions**

The ATS12NSOPR input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Input address for translation</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Input address for translation. The resulting address can be read from the PAR.

This System instruction takes a VA as input. The resulting address is the PA that is the output address of the stage 2 translation.

**Executing the ATS12NSOPR instruction**

Accesses to this instruction use the following encodings:

\[\text{MCR}\{<c>\}{<q>} \text{<coproc>, \{#<opc1>, <Rt>, <CRn>, <CRm>, \{#<opc2>\}\} }\]

ATS1CPR, Address Translate Stage 1 Current state PL1 Read

The ATS1CPR characteristics are:

**Purpose**

Performs stage 1 address translation as defined for PL1 and the current Security state, with permissions as if reading from the given virtual address.

**Configuration**

**Attributes**

ATS1CPR is a 32-bit System instruction.

**Field descriptions**

The ATS1CPR input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Bits [31:0] Input address for translation</td>
</tr>
</tbody>
</table>

Input address for translation. The resulting address can be read from the PAR.

This System instruction takes a VA as input. If EL2 is implemented and enabled in the current Security state, the resulting address is the IPA that is the output address of the stage 1 translation. Otherwise, the resulting address is a PA.

**Executing the ATS1CPR instruction**

Accesses to this instruction use the following encodings:

BPIALL, Branch Predictor Invalidate All

The BPIALL characteristics are:

**Purpose**

Invalidate all entries from branch predictors.

**Configuration**

In an implementation where the branch predictors are architecturally invisible, this instruction can execute as a NOP.

**Attributes**

BPIALL is a 32-bit System instruction.

**Field descriptions**

BPIALL ignores the value in the register specified by the instruction encoding. Software does not have to write a value to the register before issuing this instruction.

**Executing the BPIALL instruction**

The PE ignores the value of <Rt>. Software does not have to write a value to this register before issuing this instruction.

When HCR.FB is 1, at Non-secure EL1 this instruction executes as a BPIALLIS.

Accesses to this instruction use the following encodings:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>

BPIALLIS, Branch Predictor Invalidate All, Inner Shareable

The BPIALLIS characteristics are:

**Purpose**

Invalidate all entries from branch predictors Inner Shareable.

**Configuration**

In an implementation where the branch predictors are architecturally invisible, this instruction can execute as a NOP.

**Attributes**

BPIALLIS is a 32-bit System instruction.

**Field descriptions**

BPIALLIS ignores the value in the register specified by the instruction encoding. Software does not have to write a value to the register before issuing this instruction.

**Executing the BPIALLIS instruction**

The PE ignores the value of \(<Rt>\). Software does not have to write a value to this register before issuing this instruction.

Accesses to this instruction use the following encodings:

\[
\text{MCR}\{<c>\}{<q>} <\text{coproc}>, \{#\}<\text{opc1}>, <Rt>, <\text{CRn}>, <\text{CRm}>, \{#\}<\text{opc2}>

elsif PSTATE.EL == EL3 then
    BPIMVA(R[t]);
CCSIDR, Current Cache Size ID Register

The CCSIDR characteristics are:

**Purpose**

Provides information about the architecture of the currently selected cache.

When ARMv8.3-CCIDX is implemented, this register is used in conjunction with CCSIDR2.

**Configuration**

AArch32 System register CCSIDR bits [31:0] are architecturally mapped to AArch64 System register CCSIDR_EL1[31:0].

The implementation includes one CCSIDR for each cache that it can access. CSSELR and the Security state select which Cache Size ID Register is accessible.

**Attributes**

CCSIDR is a 32-bit register.

**Field descriptions**

The CCSIDR bit assignments are:

**When ARMv8.3-CCIDX is implemented:**

| Bit 31 | Bit 30 | Bit 29 | Bit 28 | Bit 27 | Bit 26 | Bit 25 | Bit 24 | Bit 23 | Bit 22 | Bit 21 | Bit 20 | Bit 19 | Bit 18 | Bit 17 | Bit 16 | Bit 15 | Bit 14 | Bit 13 | Bit 12 | Bit 11 | Bit 10 | Bit 9  | Bit 8  | Bit 7  | Bit 6  | Bit 5  | Bit 4  | Bit 3  | Bit 2  | Bit 1  | Bit 0 |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| RES0   |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |
| Associativity |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |
| LineSize |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |

**Note**

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

**Bits [31:24]**

Reserved, RES0.

**Associativity, bits [23:3]**

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

**LineSize, bits [2:0]**

(Log2(Number of bytes in cache line)) - 4. For example:

For a line length of 16 bytes: Log2(16) = 4, LineSize entry = 0. This is the minimum line length.

For a line length of 32 bytes: Log2(32) = 5, LineSize entry = 1.
Otherwise:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| UNKNOWN | NumSets | Associativity | LineSize |

Note

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

Bits [31:28]

Reserved, UNKNOWN.

NumSets, bits [27:13]

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

Associativity, bits [12:3]

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

LineSize, bits [2:0]

(Log₂(Number of bytes in cache line)) - 4. For example:

For a line length of 16 bytes: Log₂(16) = 4, LineSize entry = 0. This is the minimum line length.

For a line length of 32 bytes: Log₂(32) = 5, LineSize entry = 1.

Accessing the CCSIDR

If CSSEL.R.Level is programmed to a cache level that is not implemented, then on a read of the CCSIDR the behavior is CONSTRAINED UNPREDICTABLE, and can be one of the following:

- The CCSIDR read is treated as NOP.
- The CCSIDR read is UNDEFINED.
- The CCSIDR read returns an UNKNOWN value.

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b001</td>
<td>0b0000</td>
<td>0b0000</td>
<td>0b000</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID2 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID4 == '1' then

CCSIDR2, Current Cache Size ID Register 2

The CCSIDR2 characteristics are:

**Purpose**

When ARMv8.3-CCIDX is implemented, in conjunction with CCSIDR, provides information about the architecture of the currently selected cache.

When ARMv8.3-CCIDX is not implemented, this register is not implemented.

**Configuration**

AArch32 System register CCSIDR2 bits [31:0] are architecturally mapped to AArch64 System register CCSIDR2_EL1[31:0].

This register is present only when ARMv8.3-CCIDX is implemented. Otherwise, direct accesses to CCSIDR2 are UNDEFINED.

The implementation includes one CCSIDR2 for each cache that it can access. CSSEL and the Security state select which Cache Size ID Register is accessible.

**Attributes**

CCSIDR2 is a 32-bit register.

**Field descriptions**

The CCSIDR2 bit assignments are:

    return CCSIDR2;
elsif PSTATE.EL == EL3 then
    return CCSIDR2;
The CFPRCTX characteristics are:

**Purpose**

Control Flow Prediction Restriction by Context applies to all Control Flow Prediction Resources that predict execution based on information gathered within the target execution context or contexts.

When this instruction is complete and synchronized, control flow prediction does not permit later speculative execution within the target execution context to be observable through side channels.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

**Note**

This instruction does not require the invalidation of prediction structures so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

**Configuration**

This instruction is present only when ARMv8.0-PredInv is implemented. Otherwise, direct accesses to CFPRCTX are UNDEFINED.

**Attributes**

CFPRCTX is a 32-bit System instruction.

**Field descriptions**

The CFPRCTX input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>GVMID[NS]</td>
</tr>
<tr>
<td>29</td>
<td>EL</td>
</tr>
<tr>
<td>28</td>
<td>VMID</td>
</tr>
<tr>
<td>27</td>
<td>RES0</td>
</tr>
<tr>
<td>26</td>
<td>GASID</td>
</tr>
<tr>
<td>25</td>
<td>ASID</td>
</tr>
</tbody>
</table>

**Bits [31:28]**

Reserved, RES0.

**GVMID, bit [27]**

Execution of this instruction applies to all VMIDs or a specified VMID.

<table>
<thead>
<tr>
<th>VMID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Applies to specified VMID for an EL0 or EL1 context. For all other contexts this field is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Applies to all VMIDs for an EL0 or EL1 context. For all other contexts this field is RES0.</td>
</tr>
</tbody>
</table>
If the instruction is executed at EL0 or EL1, then this field has an Effective value of 0.

**NS, bit [26]**

Security State.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure state.</td>
</tr>
</tbody>
</table>

If the instruction is executed in Non-secure state, this field has an Effective value of 1.

**EL, bits [25:24]**

Exception Level.

<table>
<thead>
<tr>
<th>EL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>EL0.</td>
</tr>
<tr>
<td>0b01</td>
<td>EL1.</td>
</tr>
<tr>
<td>0b10</td>
<td>EL2.</td>
</tr>
<tr>
<td>0b11</td>
<td>EL3.</td>
</tr>
</tbody>
</table>

If the instruction is executed at an exception level lower than the specified level, this instruction is treated as a NOP.

**VMID, bits [23:16]**

Only applies when bit[27] is 0 and either of:

- an EL1 context.
- an EL0 context when \( HCR_{EL2}.E2H==0 \) or \( HCR_{EL2}.TGE==0 \) or EL2 is using AArch32 state.

Otherwise this field is RES0.

When the instruction is executed at EL1 then this field is treated as the current VMID.

When the instruction is executed at EL0 and \( HCR_{EL2}.E2H==0 \) or \( HCR_{EL2}.TGE==0 \) or ELUsingAArch32(EL2)) then this field is treated as the current VMID.

When the instruction is executed at EL0 and \( HCR_{EL2}.E2H==1 \) and \( HCR_{EL2}.TGE==1 \) and !ELUsingAArch32(EL2)) then this field is ignored.

**Bits [15:9]**

Reserved, RES0.

**GASID, bit [8]**

Execution of this instruction applies to all ASIDs or a specified ASID.

<table>
<thead>
<tr>
<th>GASID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Applies to specified ASID for an EL0 context. For all other contexts this field is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Applies to all ASID for an EL0 context. For all other contexts this field is RES0.</td>
</tr>
</tbody>
</table>

If the instruction is executed at EL0, then this field is treated as 0.

**ASID, bits [7:0]**

Only applies for an EL0 context and when bit[8] is 0.

Otherwise this field is RES0.

When the instruction is executed at EL0 then this field is treated as the current ASID.
Executing the CFPRCTX instruction

Accesses to this instruction use the following encodings:

\[
\text{MCR}\{c\}\{q\} \text{coproc}, \#\text{opc1}, \text{Rt}, \text{CRn}, \text{CRm}\{, \#\text{opc2}\}
\]

CLIDR, Cache Level ID Register

The CLIDR characteristics are:

**Purpose**

Identifies the type of cache, or caches, that are implemented at each level and can be managed using the architected cache maintenance instructions that operate by set/way, up to a maximum of seven levels. Also identifies the Level of Coherence (LoC) and Level of Unification (LoU) for the cache hierarchy.

**Configuration**

AArch32 System register CLIDR bits [31:0] are architecturally mapped to AArch64 System register `CLIDR_EL1[31:0]`.

**Attributes**

CLIDR is a 32-bit register.

**Field descriptions**

The CLIDR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>

<tr>
<td>0b10</td>
<td>L2 cache is the highest Inner Cacheable level.</td>
</tr>
<tr>
<td>0b11</td>
<td>L3 cache is the highest Inner Cacheable level.</td>
</tr>
</tbody>
</table>

**LoUU, bits [29:27]**

Level of Unification Uniprocessor for the cache hierarchy.

**LoC, bits [26:24]**

Level of Coherence for the cache hierarchy.

**LoUIS, bits [23:21]**

Level of Unification Inner Shareable for the cache hierarchy.

**Ctype<n>, bits [3(n-1)+2:3(n-1)], for n = 1 to 7**

Cache Type fields. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy. Possible values of each field are:
### Ctype<n>

<table>
<thead>
<tr>
<th>Ctype&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>No cache.</td>
</tr>
<tr>
<td>0b001</td>
<td>Instruction cache only.</td>
</tr>
<tr>
<td>0b010</td>
<td>Data cache only.</td>
</tr>
<tr>
<td>0b011</td>
<td>Separate instruction and data caches.</td>
</tr>
<tr>
<td>0b100</td>
<td>Unified cache.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If software reads the Cache Type fields from Ctype1 upwards, once it has seen a value of 000, no caches that can be managed using the architected cache maintenance instructions that operate by set/way exist at further-out levels of the hierarchy. So, for example, if Ctype3 is the first Cache Type field with a value of 000, the values of Ctype4 to Ctype7 must be ignored.

## Accessing the CLIDR

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>

CNTFRQ, Counter-timer Frequency register

The CNTFRQ characteristics are:

### Purpose

This register is provided so that software can discover the frequency of the system counter. It must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

### Configuration

AArch32 System register CNTFRQ bits [31:0] are architecturally mapped to AArch64 System register CNTFRQ_EL0[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

CNTFRQ is a 32-bit register.

### Field descriptions

The CNTFRQ bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| **Clock frequency** |

#### Bits [31:0]

Clock frequency. Indicates the system counter clock frequency, in Hz.

This field resets to an architecturally UNKNOWN value.

### Accessing the CNTFRQ

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>

The CNTHCTL characteristics are:

**Purpose**

Controls the generation of an event stream from the physical counter, and access from Non-secure EL1 modes to the physical counter and the Non-secure EL1 physical timer.

**Configuration**

AArch32 System register CNTHCTL bits [31:0] are architecturally mapped to AArch64 System register CNTHCTL_EL2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTHCTL is a 32-bit register.

**Field descriptions**

The CNTHCTL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | EVNTIS | RES0 | EVNTI | EVNTDIR | EVNTEN | PL1PCEN | PL1PCTEN |

**Bits [31:18]**

Reserved, RES0.

**EVNTIS, bit [17]**

When ARMv8.6-ECV is implemented:

Controls the scale of the generation of the event stream.

<table>
<thead>
<tr>
<th>EVNTIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CNTHCTL.EVNTI field applies to CNTPCT[15:0].</td>
</tr>
<tr>
<td>0b1</td>
<td>The CNTHCTL.EVNTI field applies to CNTPCT[23:8].</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [16:8]**

Reserved, RES0.
EVNTI, bits [7:4]

Selects which bit (0 to 15) of the counter register \texttt{CNTPCT} is the trigger for the event stream generated from that counter, when that stream is enabled.

This field resets to an architecturally \texttt{UNKNOWN} value.

EVNTDIR, bit [3]

Controls which transition of the counter register \texttt{CNTPCT} trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

<table>
<thead>
<tr>
<th>EVNTDIR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A 0 to 1 transition of the trigger bit triggers an event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A 1 to 0 transition of the trigger bit triggers an event.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally \texttt{UNKNOWN} value.

EVNTE, bit [2]

Enables the generation of an event stream from the counter register \texttt{CNTPCT}:

<table>
<thead>
<tr>
<th>EVNTE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disables the event stream.</td>
</tr>
<tr>
<td>0b1</td>
<td>Enables the event stream.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally \texttt{UNKNOWN} value.

PL1PCEN, bit [1]

Traps Non-secure EL0 and EL1 accesses to the physical timer registers to Hyp mode:

<table>
<thead>
<tr>
<th>PL1PCEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL0 and EL1 accesses to the \texttt{CNTP_CTL}, \texttt{CNTP_CVAL}, and \texttt{CNTP_TVAL} are trapped to Hyp mode, unless the it is trapped by \texttt{CNTKCTL.PL0PTEN}.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

This field resets to an architecturally \texttt{UNKNOWN} value.

PL1PCTEN, bit [0]

Traps Non-secure EL0 and EL1 accesses to the physical counter register to Hyp mode:

<table>
<thead>
<tr>
<th>PL1PCTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL0 and EL1 accesses to the \texttt{CNTPCT} are trapped to Hyp mode, unless it is trapped by \texttt{CNTKCTL.PL0PCTEN}.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

This field resets to an architecturally \texttt{UNKNOWN} value.

Accessing the CNTHCTL

Accesses to this register use the following encodings:
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b100</td>
<td>0b1110</td>
<td>0b0001</td>
<td>0b000</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  UNDEFINED;
elsif PSTATE.EL == EL2 then
  return CNTHCTL;
elsif PSTATE.EL == EL3 then
  return CNTHCTL;

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b100</td>
<td>0b1110</td>
<td>0b0001</td>
<td>0b000</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  UNDEFINED;
elsif PSTATE.EL == EL2 then
  CNTHCTL = R[t];
elsif PSTATE.EL == EL3 then
  CNTHCTL = R[t];
The CNTHP_CTL characteristics are:

### Purpose

Control register for the Hyp mode physical timer.

### Configuration

AArch32 System register CNTHP_CTL bits [31:0] are architecturally mapped to AArch64 System register CNTHP_CTL_EL2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

CNTHP_CTL is a 32-bit register.

### Field descriptions

The CNTHP_CTL bit assignments are:

<table>
<thead>
<tr>
<th>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>
<th>RES0</th>
<th>ISTATUS</th>
<th>IMASK</th>
<th>ENABLE</th>
</tr>
</thead>
</table>

#### Bits [31:3] RES0

Reserved, RES0.

#### ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see ‘Operation of the CompareValue views of the timers’ and ‘Operation of the TimerValue views of the timers’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, chapter D6.

This bit is read-only.

#### IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:
**IMASK, bit [4]**

Meaning for IMASK:
- **0b0**: Timer interrupt is not masked by the IMASK bit.
- **0b1**: Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

In a system where the PE resets into EL2 or EL3, this field resets to an architecturally **UNKNOWN** value.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from **CNTHP_TVAL** continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

**Accessing the CNTHP_CTL**

Accesses to this register use the following encodings:

\[
\text{MRC} \{<c>\} \{<q>\} \text{<coproc>}, \{#\text{<opc1>}, \text{<Rt>}, \text{<CRn>}, \text{<CRm>}, \{#\text{<opc2>}}

| **CompareValue** |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

### CompareValue, bits [63:0]

Holds the EL2 physical timer CompareValue.

When CNTHP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHP_CTL.ISTATUS is set to 1.
- If CNTHP_CTL.IMASK is 0, an interrupt is generated.

When CNTHP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

This field resets to an architecturally UNKNOWN value.

### Accessing the CNTHP_CVAL

Accesses to this register use the following encodings:

    endif
The CNTHP_TVAL characteristics are:

**Purpose**

Holds the timer value for the Hyp mode physical timer.

**Configuration**

AArch32 System register CNTHP_TVAL bits [31:0] are architecturally mapped to AArch64 System register CNTHP_TVAL_EL2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTHP_TVAL is a 32-bit register.

**Field descriptions**

The CNTHP_TVAL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | TimerValue |

**TimerValue, bits [31:0]**

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If CNTHP_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHP_CTL.ENABLE is 1, the value returned is (CNTHP_CVAL - CNTPCT).

On a write of this register, CNTHP_CVAL is set to (CNTPCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CNTHP_CVAL) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHP_CTL.ISTATUS is set to 1.
- If CNTHP_CTL.IMASK is 0, an interrupt is generated.

When CNTHP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

The CNTHPS_CTL characteristics are:

### Purpose

Provides AArch32 access to the Secure EL2 physical timer.

### Note

The Secure EL2 timer is implemented by ARMv8.4-SecEL2. It is only accessible from AArch32 state when EL2 is using AArch64 and the value of SCR_EL3.{EEL2, NS} is \{1, 0\}.

### Configuration

AArch32 System register CNTHPS_CTL bits [31:0] are architecturally mapped to AArch64 System register CNTHPS_CTL_EL2[31:0].

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to CNTHPS_CTL are undefined.

RW fields in this register reset to architecturally unknown values.

### Attributes

CNTHPS_CTL is a 32-bit register.

### Field descriptions

The CNTHPS_CTL bit assignments are:

<table>

</tr>
<tr>
<td>0</td>
<td>ENABLE</td>
</tr>
</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the CNTHPS_CTL.ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the CNTHPS_CTL.ENABLE bit is 0, the ISTATUS field is unknown.

For more information see ‘Operation of the CompareValue views of the timers’ and ‘Operation of the TimerValue views of the timers’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, chapter D6.
This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>

For more information, see the description of the ISTATUS bit.

This field resets to an architecturally **UNKNOWN** value.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from **CNTHPS_TVAL_EL2** continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the CNTHPS_CTL**

This register is accessed using the encoding for **CNTP_CTL**.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} \text{ <coproc>, (#)<opc1>, <Rt>, <CRn>, <CRm>{, (#)<opc2>}}
\]

**CNTHPS_CVAL, Counter-timer Secure Physical Timer CompareValue Register (EL2)**

The CNTHPS_CVAL characteristics are:

**Purpose**

Provides AArch32 access to the compare value for the Secure EL2 physical timer.

**Note**

The Secure EL2 timer is implemented by ARMv8.4-SecEL2. It is only accessible from AArch32 state when EL2 is using AArch64 and the value of SCR_EL3.{EEL2, NS} is {1, 0}.

**Configuration**

AArch32 System register CNTHPS_CVAL bits [63:0] are architecturally mapped to AArch64 System register CNTHPS_CVAL_EL2[63:0].

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to CNTHPS_CVAL are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTHPS_CVAL is a 64-bit register.

**Field descriptions**

The CNTHPS_CVAL bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|    |
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|    |    |    |    |    |    |    |    |    |    | CompareValue |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |

**CompareValue, bits [63:0]**

Holds the EL2 physical timer CompareValue.

When CNTHPS_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHPS_CTL_EL2.ISTATUS is set to 1.
- If CNTHPS_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHPS_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

This field resets to an architecturally UNKNOWN value.
Accessing the CNTHPS_CVAL

This register is accessed using the encoding for CNTP_CVAL.

Accesses to this register use the following encodings:

\[
\text{MRRC}{(<c>}{<q>}) \text{ proc, } \{#\text{opc1}\}, \text{ <Rt>, <Rt2>, <CRm>}
\]

  endif
endif
The CNTHPS_TVAL characteristics are:

**Purpose**

Provides AArch32 access to the timer value for the Secure EL2 physical timer.

**Note**

The Secure EL2 timer is implemented by ARMv8.4-SecEL2. It is only accessible from AArch32 state when EL2 is using AArch64 and the value of \( \text{SCR EL3} \) \{EEL2, NS\} is \{1, 0\}.

**Configuration**

AArch32 System register CNTHPS_TVAL bits \[31:0\] are architecturally mapped to AArch64 System register \( \text{CNTHPS_TVAL EL2}[31:0] \).

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to CNTHPS_TVAL are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTHPS_TVAL is a 32-bit register.

**Field descriptions**

The CNTHPS_TVAL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**TimerValue, bits [31:0]**

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If \( \text{CNTHPS_CTL_EL2 ENABLE} \) is 0, the value returned is UNKNOWN.
- If \( \text{CNTHPS_CTL_EL2 ENABLE} \) is 1, the value returned is \( (\text{CNTHPS_CVAL_EL2} - \text{CNTPCT_EL0}) \).

On a write of this register, \( \text{CNTHPS_CVAL_EL2} \) is set to \( (\text{CNTPCT_EL0} + \text{TimerValue}) \), where TimerValue is treated as a signed 32-bit integer.

When \( \text{CNTHPS_CTL_EL2 ENABLE} \) is 1, the timer condition is met when \( (\text{CNTPCT_EL0} - \text{CNTHPS_CVAL_EL2}) \) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- \( \text{CNTHPS_CTL_EL2 ISTATUS} \) is set to 1.
- If \( \text{CNTHPS_CTL_EL2 IMASK} \) is 0, an interrupt is generated.

When \( \text{CNTHPS_CTL_EL2 ENABLE} \) is 0, the timer condition is not met, but \( \text{CNTPCT_EL0} \) continues to count, so the TimerValue view appears to continue to count down.
This field resets to an architecturally **UNKNOWN** value.

**Accessing the CNTHPS_TVAL**

This register is accessed using the encoding for **CNTP_TVAL**.

Accesses to this register use the following encodings:

\[ \text{MRC}\{<c>\}{<q>}\ <\text{coproc}, \{#\}<\text{opc1}, \ <Rt>, \ <CRn>, \ <CRm}\{, \{#\}<\text{opc2}\} \]

CNTHV_CTL, Counter-timer Virtual Timer Control register (EL2)

The CNTHV_CTL characteristics are:

**Purpose**

Provides AArch32 access to the control register for the EL2 virtual timer.

**Note**

The EL2 virtual timer is implemented by ARMv8.1-VHE. It is only accessible from AArch32 state when EL0 is using AArch32, EL2 is using AArch64, and the value of HCR_EL2.(E2H, TGE) is {1, 1}.

**Configuration**

AArch32 System register CNTHV_CTL bits [31:0] are architecturally mapped to AArch64 System register CNTHV_CTL_EL2[31:0].

This register is present only when ARMv8.1-VHE is implemented. Otherwise, direct accesses to CNTHV_CTL are UNDEFINED.

**Attributes**

CNTHV_CTL is a 32-bit register.

**Field descriptions**

The CNTHV_CTL bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-3</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>2</td>
<td>ISTATUS</td>
</tr>
<tr>
<td>1</td>
<td>IMASK</td>
</tr>
<tr>
<td>0</td>
<td>ENABLE</td>
</tr>
</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see 'Operation of the CompareValue views of the timers' and 'Operation of the TimerValue views of the timers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, chapter D6.

This bit is read-only.
**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>

For more information, see the description of the ISTATUS bit.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHV_TVAL continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

**Accessing the CNTHV_CTL**

This register is accessed using the encoding for CNTHV_CTL.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#<\text{opc1}>\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>\{, \{#<\text{opc2}>\}\}
\]

<table>
<thead>
<tr>

eelsif PSTATE.EL == EL2 then
  CNTV_CTL = R[t];
eelsif PSTATE.EL == EL3 then
  CNTV_CTL = R[t];
The CNTHV_CVAL characteristics are:

**Purpose**

Provides AArch32 access to the compare value for the EL2 virtual timer.

**Note**

The EL2 virtual timer is implemented by ARMv8.1-VHE. It is only accessible from AArch32 state when EL0 is using AArch32, EL2 is using AArch64, and the value of HCR_EL2.{E2H, TGE} is {1, 1}.

**Configuration**

AArch32 System register CNTHV_CVAL bits [63:0] are architecturally mapped to AArch64 System register CNTHV_CVAL_EL2[63:0]. This register is present only when ARMv8.1-VHE is implemented. Otherwise, direct accesses to CNTHV_CVAL are UNDEFINED.

**Attributes**

CNTHV_CVAL is a 64-bit register.

**Field descriptions**

The CNTHV_CVAL bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |

**CompareValue, bits [63:0]**

Holds the EL2 virtual timer CompareValue.

When CNTHV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHV_CTL.ISTATUS is set to 1.
- If CNTHV_CTL.IMASK is 0, an interrupt is generated.

When CNTHV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

**Accessing the CNTHV_CVAL**

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
  if !ELUsingAArch32(EL1) && !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && CNTKCTL_EL1.EL0VTEN == '0' then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
      AArch64.AArch32SystemAccessTrap(EL2, 0x04);
    else
      AArch64.AArch32SystemAccessTrap(EL1, 0x04);
  elsif EL2Enabled() && CNTKCTL.PL0VTEN == '0' then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then

        CNTV_CVAL = R[t2]:R[t];
The CNTHV_TVAL characteristics are:

**Purpose**

Provides AArch32 access to the timer value for the EL2 virtual timer.

---

**Note**

The EL2 virtual timer is implemented by ARMv8.1-VHE. It is only accessible from AArch32 state when EL0 is using AArch32, EL2 is using AArch64, and the value of HCR_EL2.(E2H, TGE) is {1, 1}.

---

**Configuration**

AArch32 System register CNTHV_TVAL bits [31:0] are architecturally mapped to AArch64 System register CNTHV_TVAL_EL2[31:0].

This register is present only when ARMv8.1-VHE is implemented. Otherwise, direct accesses to CNTHV_TVAL are UNDEFINED.

**Attributes**

CNTHV_TVAL is a 32-bit register.

**Field descriptions**

The CNTHV_TVAL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | TimerValue

**TimerValue, bits [31:0]**

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If CNTHV_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHV_CTL.ENABLE is 1, the value returned is (CNTHV_CVAL - CNTVCT).

On a write of this register, CNTHV_CVAL is set to (CNTVCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CNTHV_CVAL) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHV_CTL.ISTATUS is set to 1.
- If CNTHV_CTL.IMASK is 0, an interrupt is generated.

When CNTHV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count, so the TimerValue view appears to continue to count down.
Accessing the CNTHV_TVAL

This register is accessed using the encoding for CNTV_TVAL.

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>

The CNTHVS_CTL characteristics are:

**Purpose**

Provides AArch32 access to the Secure EL2 virtual timer.

**Note**

The Secure EL2 timer is implemented by ARMv8.4-SecEL2. It is only accessible from AArch32 state when EL2 is using AArch64 and the value of `SCR_EL3.{EEL2, NS}` is {1, 0}.

**Configuration**

AArch32 System register CNTHVS_CTL bits [31:0] are architecturally mapped to AArch64 System register `CNTHVS_CTL_EL2[31:0]`.

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to CNTHVS_CTL are UNDEFINED.

**Attributes**

CNTHVS_CTL is a 32-bit register.

**Field descriptions**

The CNTHVS_CTL bit assignments are:

<table>
<thead>
<tr>
<th>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>
<th>RES0</th>
<th>ISTATUS</th>
<th>IMASK</th>
<th>ENABLE</th>
</tr>
</thead>
</table>

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see 'Operation of the CompareValue views of the timers' and 'Operation of the TimerValue views of the timers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, chapter D8.

This bit is read-only.
**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>

For more information, see the description of the ISTATUS bit.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHVS_TVAL continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

**Accessing the CNTHVS_CTL**

This register is accessed using the encoding for CNTV_CTL.

Accesses to this register use the following encodings:

\[ \text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>\{, \{#\}<\text{opc2}>\} \]

**CompareValue, bits [63:0]**

Holds the EL2 virtual timer CompareValue.

When CNTHVS_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHVS_CTL.ISTATUS is set to 1.
- If CNTHVS_CTL.IMASK is 0, an interrupt is generated.

When CNTHVS_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

**Accessing the CNTHVS_CVAL**

This register is accessed using the encoding for CNTV_CVAL.
Accesses to this register use the following encodings:

\[
\text{MRRC}\{<c>}\{<q}\} \ <\text{coproc}\>, \ {#}<\text{opc1}\>, \ <\text{Rt}\>, \ <\text{Rt2}\>, \ <\text{CRm}\>
\]

\[
\begin{array}{|c|c|c|}
\hline
\text{coproc} & \text{CRm} & \text{opc1} \\
\hline
0b1111 & 0b1110 & 0b0011 \\
\hline
\end{array}
\]

if PSTATE.EL == EL0 then

CNTHVS_TVAL, Counter-timer Secure Virtual Timer TimerValue Register (EL2)

The CNTHVS_TVAL characteristics are:

**Purpose**

Provides AArch32 access to the timer value for the Secure EL2 virtual timer.

**Note**

The Secure EL2 timer is implemented by ARMv8.4-SecEL2. It is only accessible from AArch32 state when EL2 is using AArch64 and the value of $\text{SCR}_\text{EL3}$.{$\text{EEL2}, \text{NS}$} is {1, 0}.

**Configuration**

AArch32 System register CNTHVS_TVAL bits [31:0] are architecturally mapped to AArch64 System register $\text{CNTHVS_TVAL}_\text{EL2}[31:0]$.

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to CNTHVS_TVAL are UNDEFINED.

**Attributes**

CNTHVS_TVAL is a 32-bit register.

**Field descriptions**

The CNTHVS_TVAL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**TimerValue, bits [31:0]**

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If $\text{CNTHVS_CTL}_\text{ENABLE}$ is 0, the value returned is UNKNOWN.
- If $\text{CNTHVS_CTL}_\text{ENABLE}$ is 1, the value returned is ($\text{CNTHVS_CVAL}$ - $\text{CNTVCT}$).

On a write of this register, $\text{CNTHVS_CVAL}$ is set to ($\text{CNTVCT}$ + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When $\text{CNTHVS_CTL}_\text{ENABLE}$ is 1, the timer condition is met when ($\text{CNTVCT}$ - $\text{CNTHVS_CVAL}$) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- $\text{CNTHVS_CTL}_\text{ISTATUS}$ is set to 1.
- If $\text{CNTHVS_CTL}_\text{IMASK}$ is 0, an interrupt is generated.

When $\text{CNTHVS_CTL}_\text{ENABLE}$ is 0, the timer condition is not met, but $\text{CNTVCT}$ continues to count, so the TimerValue view appears to continue to count down.
Accessing the CNTHVS_TVAL

This register is accessed using the encoding for CNTV_TVAL.

Accesses to this register use the following encodings:

\[
\text{MRC\{<c>\}{<q>} <coproc>, \{#\}<opc1>, <Rt>, <CRn>, <CRm>{, \{#\}<opc2}>}
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b1110</td>
<td>0b0011</td>
<td>0b000</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then

    CNTV_TVAL = R[t];
endif
CNTKCTL, Counter-timer Kernel Control register

The CNTKCTL characteristics are:

**Purpose**

Controls the generation of an event stream from the virtual counter, and access from EL0 modes to the physical counter, virtual counter, EL1 physical timers, and the virtual timer.

**Configuration**

AArch32 System register CNTKCTL bits [31:0] are architecturally mapped to AArch64 System register CNTKCTL_EL1[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTKCTL is a 32-bit register.

**Field descriptions**

The CNTKCTL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | EVNTIS | RES0 | PLOPTEN | PLOVTEN | EVNTIE | EVNTDIR | EVNTEN | PLOVCTEN | PLOPCTEN |

**Bits [31:18]**

Reserved, RES0.

**EVNTIS, bit [17]**

When ARMv8.6-ECV is implemented:

Controls the scale of the generation of the event stream.

<table>
<thead>
<tr>
<th>EVNTIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CNTKCTL.EVNTI field applies to CNTVCT[15:0].</td>
</tr>
<tr>
<td>0b1</td>
<td>The CNTKCTL.EVNTI field applies to CNTVCT[23:8].</td>
</tr>
</tbody>
</table>

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [16:10]**

Reserved, RES0.

**PLOPTEN, bit [9]**

Traps PL0 accesses to the physical timer registers to Undefined mode.
**PL0PTEN**

<table>
<thead>
<tr>
<th>PL0PTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PL0 accesses to the CNTP_CTL, CNTP_CVAL, and CNTP_TVAL registers are trapped to Undefined mode.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**PL0VTEN, bit [8]**

Traps PL0 accesses to the virtual timer registers to Undefined mode.

<table>
<thead>
<tr>
<th>PL0VTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PL0 accesses to the CNTV_CTL, CNTV_CVAL, and CNTV_TVAL registers are trapped to Undefined mode.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**EVNTI, bits [7:4]**

Selects which bit (0 to 15) of the counter register CNTVCT is the trigger for the event stream generated from that counter, when that stream is enabled.

This field resets to an architecturally **UNKNOWN** value.

**EVNTDIR, bit [3]**

Controls which transition of the counter register CNTVCT trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

<table>
<thead>
<tr>
<th>EVNTDIR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A 0 to 1 transition of the trigger bit triggers an event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A 1 to 0 transition of the trigger bit triggers an event.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**EVNTEN, bit [2]**

Enables the generation of an event stream from the counter register CNTVCT.

<table>
<thead>
<tr>
<th>EVNTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disables the event stream.</td>
</tr>
<tr>
<td>0b1</td>
<td>Enables the event stream.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**PL0VCTEN, bit [1]**

Traps PL0 accesses to the frequency register and virtual counter register to Undefined mode.

<table>
<thead>
<tr>
<th>PL0VCTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PL0 accesses to the CNTVCT are trapped to Undefined mode. PL0 accesses to the CNTFRQ register are trapped to Undefined mode, if CNTKCTL.PLOPCTEN is also 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**PL0PCTEN, bit [0]**

Traps PL0 accesses to the frequency register and physical counter register to Undefined mode.
PL0PCTEN | Meaning
---|---
0b0 | PL0 accesses to the CNTPCT are trapped to Undefined mode.
PL0 accesses to the CNTFRQ register are trapped to Undefined mode, if CNTKCTL.PL0VCTEN is also 0.
0b1 | This control does not cause any instructions to be trapped.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTKCTL**

Accesses to this register use the following encodings:

\[
\text{MRC\{<c>\}{<q>} \langle coproc\rangle, \{#\}<opc1>, <Rt>, <CRn>, <CRm>\{, \{#\}<opc2>\}}
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b1110</td>
<td>0b0001</td>
<td>0b000</td>
</tr>
</tbody>
</table>

\[
\text{if PSTATE.EL == EL0 then UNDEFINED;}
\text{elsif PSTATE.EL == EL1 then return CNTKCTL;}
\text{elsif PSTATE.EL == EL2 then return CNTKCTL;}
\text{elsif PSTATE.EL == EL3 then return CNTKCTL;}
\]

\[
\text{MCR\{<c>\}{<q>} \langle coproc\rangle, \{#\}<opc1>, <Rt>, <CRn>, <CRm>\{, \{#\}<opc2>\}}
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b1110</td>
<td>0b0001</td>
<td>0b000</td>
</tr>
</tbody>
</table>

\[
\text{if PSTATE.EL == EL0 then UNDEFINED;}
\text{elsif PSTATE.EL == EL1 then CNTKCTL = R[t];}
\text{elsif PSTATE.EL == EL2 then CNTKCTL = R[t];}
\text{elsif PSTATE.EL == EL3 then CNTKCTL = R[t];}
\]
The CNTP_CTL characteristics are:

**Purpose**

Control register for the EL1 physical timer.

**Configuration**

AArch32 System register CNTP_CTL bits [31:0] are architecturally mapped to AArch64 System register CNTP_CTL_EL0[31:0].

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 they apply only to the Secure instance of the register. Otherwise, RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

CNTP_CTL is a 32-bit register.

**Field descriptions**

The CNTP_CTL bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>ISTATUS</td>
<td>IMASK</td>
<td>ENABLE</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is **UNKNOWN**.

For more information see 'Operation of the CompareValue views of the timers' and 'Operation of the TimerValue views of the timers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, chapter D6.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:
Meaning

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>

For more information, see the description of the ISTATUS bit.

This field resets to an architecturally unknown value.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from **CNTP_TVAL** continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

This field resets to 0.

**Accessing the CNTP_CTL**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>

The CNTP_CVAL characteristics are:

**Purpose**

Holds the compare value for the EL1 physical timer.

**Configuration**

AArch32 System register CNTP_CVAL bits [63:0] are architecturally mapped to AArch64 System register CNTP_CVAL_EL0[63:0].

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

CNTP_CVAL is a 64-bit register.

**Field descriptions**

The CNTP_CVAL bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |

**CompareValue**, bits [63:0]

Holds the EL1 physical timer CompareValue.

When CNTP_CTL ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTP_CTL.ISTATUS is set to 1.
- If CNTP_CTL.IMASK is 0, an interrupt is generated.

When CNTP_CTL ENABLE is 0, the timer condition is not met, but CNTPCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are **RES0**.

The value of this field is treated as zero-extended in all counter calculations.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the CNTP_CVAL**

The CNTP_TVAL characteristics are:

**Purpose**

Holds the timer value for the EL1 physical timer.

**Configuration**

AArch32 System register CNTP_TVAL bits [31:0] are architecturally mapped to AArch64 System register CNTP_TVAL_EL0[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTP_TVAL is a 32-bit register.

**Field descriptions**

The CNTP_TVAL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| TimerValue |    |

**TimerValue, bits [31:0]**

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If CNTP_CTL.ENABLE is 0, the value returned is **UNKNOWN**.
- If CNTP_CTL.ENABLE is 1, the value returned is (CNTP_CVAL - CNTPCT).

On a write of this register, CNTP_CVAL is set to (CNTPCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CNTP_CVAL) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTP_CTL.ISTATUS is set to 1.
- If CNTP_CTL.IMASK is 0, an interrupt is generated.

When CNTP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

CNTPCTSS, Counter-timer Self-Synchronized Physical Count register

The CNTPCTSS characteristics are:

**Purpose**

Holds the 64-bit physical count value.

**Configuration**

AArch32 System register CNTPCTSS bits [63:0] are architecturally mapped to AArch64 System register CNTPCTSS_EL0[63:0].

This register is present only when ARMv8.6-ECV is implemented. Otherwise, direct accesses to CNTPCTSS are UNDEFINED.

All reads to the CNTPCTSS occur in program order relative to reads to CNTPCT or CNTPCTSS.

This register is a self-synchronised view of the CNTPCT counter, and cannot be read speculatively.

**Attributes**

CNTPCTSS is a 64-bit register.

**Field descriptions**

The CNTPCTSS bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

        return CNTPCTSS;
    endif
endif
CNTV_CTL, Counter-timer Virtual Timer Control register

The CNTV_CTL characteristics are:

**Purpose**

Control register for the virtual timer.

**Configuration**

AArch32 System register CNTV_CTL bits [31:0] are architecturally mapped to AArch64 System register CNTV_CTL_EL0[31:0].

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTV_CTL is a 32-bit register.

**Field descriptions**

The CNTV_CTL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | ISTATUS | IMASK | ENABLE |

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see 'Operation of the CompareValue views of the timers' and 'Operation of the TimerValue views of the timers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, chapter D6.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:
<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>

For more information, see the description of the ISTATUS bit.

This field resets to an architecturally **UNKNOWN** value.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from `CNTV_TVAL` continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

This field resets to 0.

**Accessing the CNTV_CTL**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>

**CompareValue, bits [63:0]**

Holds the EL1 virtual timer CompareValue.

When CNTV_CTL ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTV_CTL ISTATUS is set to 1.
- If CNTV_CTL IMASK is 0, an interrupt is generated.

When CNTV_CTL ENABLE is 0, the timer condition is not met, but CNTVCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTV_CVAL**

Accesses to this register use the following encodings:

```
MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

<table>

    CNTV_CVAL = R[t2]:R[t];
  endif
else
  CNTV_CVAL = R[t2]:R[t];
endif
The CNTV_TVAL characteristics are:

**Purpose**

Holds the timer value for the virtual timer.

**Configuration**

AArch32 System register CNTV_TVAL bits [31:0] are architecturally mapped to AArch64 System register CNTV_TVAL_EL0[31:0].

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

CNTV_TVAL is a 32-bit register.

**Field descriptions**

The CNTV_TVAL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**TimerValue, bits [31:0]**

The TimerValue view of the virtual timer.

On a read of this register:

- If **CNTV_CTL.ENABLE** is 0, the value returned is **UNKNOWN**.
- If **CNTV_CTL.ENABLE** is 1, the value returned is (**CNTV_CVAL** - **CNTVCT**).

On a write of this register, **CNTV_CVAL** is set to (**CNTVCT** + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When **CNTV_CTL.ENABLE** is 1, the timer condition is met when (**CNTVCT** - **CNTP_CVAL**) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- **CNTV_CTL.ISTATUS** is set to 1.
- If **CNTV_CTL.IMASK** is 0, an interrupt is generated.

When **CNTV_CTL.ENABLE** is 0, the timer condition is not met, but **CNTVCT** continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the CNTV_TVAL**

Accesses to this register use the following encodings:

$$\text{MRC\{<c>\}{<q>}} \ <\text{coproc}, \ \{\#<opc1>, \ \langle\text{Rt}\rangle, \ \langle\text{CRn}\rangle, \ \langle\text{CRm}\rangle, \ \{\#<opc2>\}}$$

CNTVCT, Counter-timer Virtual Count register

The CNTVCT characteristics are:

**Purpose**

Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value minus the virtual offset visible in CNTVOFF.

**Configuration**

AArch32 System register CNTVCT bits [63:0] are architecturally mapped to AArch64 System register CNTVCT_EL0[63:0].

The value of this register is the same as the value of CNTPCT in the following conditions:

- When EL2 is not implemented.
- When EL2 is implemented and is using AArch64, HCR_EL2.E2H, TGE is {1, 1}, and this register is read from Non-secure EL0.

All reads to the CNTVCT occur in program order relative to reads to CNTVCTSS or CNTVCT.

**Attributes**

CNTVCT is a 64-bit register.

**Field descriptions**

The CNTVCT bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Virtual count value</th>
</tr>
</thead>
<tbody>
<tr>

CNTVCTSS, Counter-timer Self-Synchronized Virtual Count register

The CNTVCTSS characteristics are:

**Purpose**

Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value visible in CNTPCT minus the virtual offset visible in CNTVOFF.

**Configuration**

AArch32 System register CNTVCTSS bits [63:0] are architecturally mapped to AArch64 System register CNTVCTSS_EL0[63:0].

This register is present only when ARMv8.6-ECV is implemented. Otherwise, direct accesses to CNTVCTSS are UNDEFINED.

All reads to the CNTVCTSS occur in program order relative to reads to CNTPCT or CNTVCTSS.

This register is a self-synchronised view of the CNTPCT counter, and cannot be read speculatively.

**Attributes**

CNTVCTSS is a 64-bit register.

**Field descriptions**

The CNTVCTSS bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Self-Synchronized Virtual count value</td>
</tr>
<tr>
<td>62</td>

    return CNTVCTSS;
  elsif PSTATE.EL == EL3 then
    return CNTVCTSS;
CNTVOFF, Counter-timer Virtual Offset register

The CNTVOFF characteristics are:

**Purpose**

Holds the 64-bit virtual offset. This is the offset between the physical count value visible in CNTPCT and the virtual count value visible in CNTVCT.

**Configuration**

AArch32 System register CNTVOFF bits [63:0] are architecturally mapped to AArch64 System register CNTVOFF_EL2[63:0].

If EL2 is not implemented, this register is RES0 from EL3 and the virtual counter uses a fixed virtual offset of zero.

**Note**

When EL2 is implemented and is using AArch64, if HCR_EL2.{E2H, TGE} is \{1, 1\}, the virtual counter uses a fixed virtual offset of zero when CNTVCT is read from Non-secure EL0.

When EL2 is implemented and can use AArch32, on a reset into an Exception level that is using AArch32 this register resets to an IMPLEMENTATION DEFINED value that might be UNKNOWN.

**Attributes**

CNTVOFF is a 64-bit register.

**Field descriptions**

The CNTVOFF bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Virtual offset**

Virtual offset.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTVOFF**

Accesses to this register use the following encodings:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

MCRR{<c>}{<q>}<coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
CONTEXTIDR, Context ID Register

The CONTEXTIDR characteristics are:

**Purpose**

Identifies the current Process Identifier and, when using the Short-descriptor translation table format, the Address Space Identifier.

The value of the whole of this register is called the Context ID and is used by:

- The debug logic, for Linked and Unlinked Context ID matching.
- The trace logic, to identify the current process.

The significance of this register is for debug and trace use only.

**Configuration**

AArch32 System register CONTEXTIDR bits [31:0] are architecturally mapped to AArch64 System register CONTEXTIDR_EL1[31:0].

The register format depends on whether address translation is using the Long-descriptor or the Short-descriptor translation table format.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CONTEXTIDR is a 32-bit register.

**Field descriptions**

The CONTEXTIDR bit assignments are:

**When TTBCR.EAE == 0:**

![Field assignments for TTBCR.EAE == 0]

PROCID, bits [31:8]

Process Identifier. This field must be programmed with a unique value that identifies the current process.

This field resets to an architecturally UNKNOWN value.

ASID, bits [7:0]

Address Space Identifier. This field is programmed with the value of the current ASID.

This field resets to an architecturally UNKNOWN value.

**When TTBCR.EAE == 1:**

![Field assignments for TTBCR.EAE == 1]
**PROCID, bits [31:0]**

Process Identifier. This field must be programmed with a unique value that identifies the current process.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the CONTEXTIDR**

Accesses to this register use the following encodings:

\[
\text{MRC} \{<c>\} \{<q>\} <\text{coproc}>, \{#<\text{opc1}>\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>\{, \{#<\text{opc2}>\}\}
\]

CPACR, Architectural Feature Access Control Register

The CPACR characteristics are:

**Purpose**

Controls access to trace, and to Advanced SIMD and floating-point functionality from EL0, EL1, and EL3.

In an implementation that includes EL2, the CPACR has no effect on instructions executed at EL2.

**Configuration**

AArch32 System register CPACR bits [31:0] are architecturally mapped to AArch64 System register CPACR_EL1[31:0].

Bits in the NSACR control Non-secure access to the CPACR fields. See the field descriptions for more information.

**Note**

In the register field descriptions, controls are described as applying at specified Privilege levels. This is because, in Secure state, a PL1 control:

- Applies to execution in a Secure EL3 mode when EL3 is using AArch32.
- Applies to execution in a Secure EL1 mode when EL3 is using AArch64.

See ‘Security state, Exception levels, and AArch32 execution privilege’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G1.7.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CPACR is a 32-bit register.

**Field descriptions**

The CPACR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ASE | DIS | RES | 0 | TR | CD | DIS | RES | 0 | cp11 | cp10 | RES | 0 |

**ASEDIS, bit [31]**

Disables PL0 and PL1 execution of Advanced SIMD instructions.

<table>
<thead>
<tr>
<th>ASE</th>
<th>DIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control permits execution of Advanced SIMD instructions at PL0 and PL1.</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>All instruction encodings that are Advanced SIMD instruction encodings, but are not also floating-point instruction encodings, are UNDEFINED at PL0 and PL1.</td>
<td></td>
</tr>
</tbody>
</table>

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0. Otherwise, it is IMPLEMENTATION DEFINED whether this field is implemented as a RW field. If it is not implemented as a RW field, it is RAZ/WI.
If EL3 is implemented and is using AArch32, and the value of NSACR.NSASEDIS is 1, this field behaves as RAO/WI in Non-secure state, regardless of its actual value. This applies even if the field is implemented as RAZ/WI.

For the list of instructions affected by this field, see ‘Controls of Advanced SIMD operation that do not apply to floating-point operation’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section E1.

See the description of CPACR.cp10 for a list of other controls that can disable or trap execution of Advanced SIMD instructions in AArch32 state.

This field resets to 0.

**Bits [30:29]**

Reserved, RES0.

**TRCDIS, bit [28]**

Traps PL0 and PL1 System register accesses to all implemented trace registers to Undefined mode.

<table>
<thead>
<tr>
<th>TRCDIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on PL0 and PL1 System register accesses to trace registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>PL0 and PL1 System register accesses to all implemented trace registers are trapped to Undefined mode.</td>
</tr>
</tbody>
</table>

If the implementation does not include a PE trace unit, or does not include a System register interface to the PE trace unit registers, this field is RES0. Otherwise, it is IMPLEMENTATION DEFINED whether this field is implemented as a RW field. If it is not implemented as a RW field, it is RAZ/WI.

If EL3 is implemented and is using AArch32, and the value of NSACR.NSSTRCDIS is 1, this field behaves as RAO/WI in Non-secure state, regardless of its actual value. This applies even if the field is implemented as RAZ/WI.

**Note**

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the implementation includes an ETMv4 implementation, EL0 accesses to the trace registers are UNDEFINED.
- The architecture does not provide traps on trace register accesses through the optional memory-mapped external debug interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

This field resets to an architecturally UNKNOWN value.

**Bits [27:24]**

Reserved, RES0.

**cp11, bits [23:22]**

The value of this field is ignored. If this field is programmed with a different value to the cp10 field then this field is UNKNOWN on a direct read of the CPACR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

In Non-secure state, if EL3 is implemented and is using AArch32, when the value of NSACR.cp10 is 0, this field behaves as RAZ/WI, regardless of its actual value.

This field resets to 0.

**cp10, bits [21:20]**

Defines the access rights for the floating-point and Advanced SIMD functionality. Possible values of the field are:
The floating-point and Advanced SIMD features controlled by these fields are:

- Execution of any floating-point or Advanced SIMD instruction.
- Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
- Any access to the FPSCR, FPSID, MVFR0, MVFR1, MVFR2, or FPEXC System registers.

### Note

The CPACR has no effect on floating-point and Advanced SIMD accesses from PL2. These can be disabled by the HCPTR.TCP10 field.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

In Non-secure state, if EL3 is implemented and is using AArch32, when the value of NSACR.cp10 is 0, this field behaves as RAZ/WI, regardless of its actual value.

Execution of floating-point and Advanced SIMD instructions in AArch32 state can be disabled or trapped by the following controls:

- CPACR.cp10, or, if executing at EL0, CPACR_EL1.FPEN.
- FPEXC.EN.
- If executing in Non-secure state:
  - HCPTR.TCP10, or if EL2 is using AArch64, CPTR_EL2.TFP.
  - NSACR.cp10, or if EL3 is using AArch64, CPTR_EL3.TFP.
- For Advanced SIMD instructions only:
  - CPACR.ASEDIS.
  - If executing in Non-secure state, HCPTR.TASE and NSACR.NSTRCDIS.

See the descriptions of the controls for more information.

This field resets to 0.

### Bits [19:0]

Reserved, RES0.

The CPPRCTX characteristics are:

**Purpose**

Cache Prefetch Prediction Restriction by Context applies to all Cache Allocation Resources that predict cache allocations based on information gathered within the target execution context or contexts.

When this instruction is complete and synchronized, cache prefetch prediction does not permit later speculative execution within the target execution context to be observable through side channels.

This instruction applies to all:

- Instruction caches.
- Data caches.
- TLB prefetching hardware used by the executing PE that applies to the supplied context or contexts.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

**Note**

This instruction does not require the invalidation of Cache Allocation Resources so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

**Configuration**

This instruction is present only when ARMv8.0-PredInv is implemented. Otherwise, direct accesses to CPPRCTX are UNDEFINED.

**Attributes**

CPPRCTX is a 32-bit System instruction.

**Field descriptions**

The CPPRCTX input value bit assignments are:

```

```

**Bits [31:28]**

Reserved, RES0.

**GVMID, bit [27]**

Execution of this instruction applies to all VMIDs or a specified VMID.
GVMID

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Applies to specified VMID for an EL0 or EL1 context. For all other contexts this field is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Applies to all VMIDs for an EL0 or EL1 context. For all other contexts this field is RES0.</td>
</tr>
</tbody>
</table>

If the instruction is executed at EL0 or EL1, then this field has an Effective value of 0.

NS, bit [26]

Security State.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure state.</td>
</tr>
</tbody>
</table>

If the instruction is executed in Non-secure state, this field is treated as 1.

EL, bits [25:24]

Exception Level.

<table>
<thead>
<tr>
<th>EL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>EL0.</td>
</tr>
<tr>
<td>0b01</td>
<td>EL1.</td>
</tr>
<tr>
<td>0b10</td>
<td>EL2.</td>
</tr>
<tr>
<td>0b11</td>
<td>EL3.</td>
</tr>
</tbody>
</table>

If the instruction is executed at an exception level lower than the specified level, this instruction is treated as a NOP.

VMID, bits [23:16]

Only applies when bit[27] is 0 and either:

- an EL1 context.
- an EL0 context when \( \text{HCR_EL2.E2H} == 0 \) or \( \text{HCR_EL2.TGE} == 0 \) or EL2 is using AArch32 state.

Otherwise this field is RES0.

When the instruction is executed at EL1 then this field is treated as the current VMID.

When the instruction is executed at EL0 and \( \text{HCR_EL2.E2H} == 0 \) or \( \text{HCR_EL2.TGE} == 0 \) or \( \text{ELUsingAArch32(EL2)} \) then this field is treated as the current VMID.

When the instruction is executed at EL0 and \( \text{HCR_EL2.E2H} == 1 \) and \( \text{HCR_EL2.TGE} == 1 \) and \( \text{ELUsingAArch32(EL2)} \) then this field is ignored.

Bits [15:9]

Reserved, RES0.

GASID, bit [8]

Execution of this instruction applies to all ASIDs or a specified ASID.

<table>
<thead>
<tr>
<th>GASID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Applies to specified ASID for an EL0 context. For all other contexts this field is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Applies to all ASID for an EL0 context. For all other contexts this field is RES0.</td>
</tr>
</tbody>
</table>

If the instruction is executed at EL0, then this field has an Effective value of 0.
ASID, bits [7:0]

Only applies for an EL0 context and when bit[8] is 0.

Otherwise this field is RES0.

When the instruction is executed at EL0 then this field is treated as the current ASID.

Executing the CPPRCTX instruction

Accesses to this instruction use the following encodings:

\[
\text{MCR}{\langle c \rangle}{\langle q \rangle} \langle \text{coproc} \rangle, \{\#\langle \text{opcl} \rangle, \langle \text{Rt} \rangle, \langle \text{CRn} \rangle, \langle \text{CRm} \rangle, \{\#\langle \text{opc2} \rangle \}
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b0111</td>
<td>0b0011</td>
<td>0b111</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
  if !ELUsingAArch32(EL1) && !EL2Enabled() && HCR_EL2.<E2H,TGE> == '1' &&&& SCTLR_EL1.EnRCTX == '0' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
  else
    AArch64.AArch32SystemAccessTrap(EL1, 0x03);
  endif
else
  if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
  else
    UNDEFINED;
  endif
endif

elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.<E2H,TGE> != '11' && HSTR_EL2.T7 == '1' then
  AArch64.AArch32SystemAccessTrap(EL2, 0x03);
else
  if EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T7 == '1' then
    AArch32.TakeHypTrapException(0x03);
  elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR_EL2.NV == '1' then
    AArch64.SystemAccessTrap(EL2, 0x03);
  else
    CPPRCTX(R[t]);
  endif
endif

elsif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T7 == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
  elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T7 == '1' then
    AArch32.TakeHypTrapException(0x03);
  elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR_EL2.NV == '1' then
    AArch64.SystemAccessTrap(EL2, 0x03);
  else
    CPPRCTX(R[t]);
  endif
elsif PSTATE.EL == EL2 then
  CPPRCTX(R[t]);
elsif PSTATE.EL == EL3 then
  CPPRCTX(R[t]);

CPSR, Current Program Status Register

The CPSR characteristics are:

**Purpose**

Holds PE status and control information.

**Configuration**

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CPSR is a 32-bit register.

**Field descriptions**

The CPSR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| N  | Z  | C  | V  | Q  | RES0 | SSBS | PAN | DIT | RES0 | GE | RES0 | E | A | I | F | RES0 | RES1 | M |

**N, bit [31]**

Negative condition flag. Set to bit[31] of the result of the last flag-setting instruction. If the result is regarded as a two's complement signed integer, then N is set to 1 if the result was negative, and N is set to 0 if the result was positive or zero.

**Z, bit [30]**

Zero condition flag. Set to 1 if the result of the last flag-setting instruction was zero, and to 0 otherwise. A result of zero often indicates an equal result from a comparison.

**C, bit [29]**

Carry condition flag. Set to 1 if the last flag-setting instruction resulted in a carry condition, for example an unsigned overflow on an addition.

**V, bit [28]**

Overflow condition flag. Set to 1 if the last flag-setting instruction resulted in an overflow condition, for example a signed overflow on an addition.

**Q, bit [27]**

Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

**Bits [26:24]**

Reserved, RES0.

**SSBS, bit [23]**
When ARMv8.0-SSBS is implemented:

Speculative Store Bypass Safe.

Prohibits speculative loads or stores which might practically allow a cache timing side channel.

A cache timing side channel might be exploited where a load or store uses an address that is derived from a register that is being loaded from memory using a load instruction speculatively read from a memory location. If PSTATE.SSBS is enabled, the address derived from the load instruction might be from earlier in the coherence order than the latest store to that memory location with the same virtual address.

<table>
<thead>
<tr>
<th>SSBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hardware is not permitted to load or store speculatively in the manner described.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hardware is permitted to load or store speculatively in the manner described.</td>
</tr>
</tbody>
</table>

The value of this bit is usually set to the value described by the SCTLR.DSSBS bit on exceptions to any mode except Hyp mode, and the value described by HSCTLR.DSSBS on exceptions to Hyp mode.

This field resets to an implementation defined value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never.

<table>
<thead>
<tr>
<th>PAN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The translation system is the same as Armv8.0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Disables privileged read and write accesses to addresses accessible at EL0.</td>
</tr>
</tbody>
</table>

The value of this bit is usually preserved on taking an exception, except in the following situations:

- When the target of the exception is EL1, and the value of the SCTLR.SPAN bit for the current Security state is 0, this bit is set to 1.
- When the target of the exception is EL3, from Secure state, and the value of the Secure SCTLR.SPAN is 0, this bit is set to 1.
- When the target of the exception is EL3, from Non-secure state, this bit is set to 0 regardless of the value of the Secure SCTLR.SPAN bit.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When ARMv8.4-DIT is implemented:

Data Independent Timing.
The architecture makes no statement about the timing properties of any instructions.

The architecture requires that:

- The timing of every load and store instruction is insensitive to the value of the data being loaded or stored.
- For certain data processing instructions, the instruction takes a time which is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- For certain data processing instructions, the response of the instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

The data processing instructions affected by this bit are:

- All cryptographic instructions. These instructions are:
  - AESD, ASE, AESIMC, AESMC, SHA1C, SHA1H, SHA1M, SHA1P, SHA1SU0, SHA1SU1, SHA256H, SHA256H2, SHA256SU0, and SHA256SU1.

- A subset of those instructions which use the general-purpose register file. For these instructions, the effects of CPSR.DIT apply only if they do not use R15 as either their source or destination and pass their condition execution check. The instructions are:

- A subset of those instructions which use the general-purpose register file. For these instructions, the effects of CPSR.DIT do not depend on these instructions passing their condition execution check. These instructions are:
  - ADC (immediate), ADC (register), ADCA (register), ADCS (register), ADD (immediate), ADD (register), ADDS (immediate), ADDS (register), AND (immediate), AND (register), ANDS (immediate), ANDS (register), ASR (immediate), ASR (register), ASRS (immediate), ASRS (register), BIC (immediate), BIC (register), BICS (immediate), BICS (register), EOR (immediate), EOR (register), EORS (register), EORS (register), LSL (immediate), LSL (register), LSLS (immediate), LSLS (register), LSR (immediate), LSR (register), LSRS (immediate), LSRS (register), MOV (immediate), MOV (register), MOV(S) (immediate), MOV(S) (register), MVNS (immediate), MVNS (register), MVNS (immediate), MVNS (register), ORR (immediate), ORR (register), ORRS (immediate), ORRS (register), ROR (immediate), ROR (register), RORS (immediate), RORS (register), RSB (immediate), RSB (register), RSB(S) (immediate), RSB(S) (register), RSC (immediate), RSC (register), RSC(S) (immediate), RSC(S) (register), SUB (immediate), SUB (register), SUBS (immediate), and SUBS (register).

- A subset of those instructions which use the SIMD&FP register file. For these instructions, the effects of CPSR.DIT apply only if they pass their condition execution check. These instructions are:
  - CRC32B, CRC32H, CRC32W, CRC32WB, CRC32CH, CRC32CW, VABA*, VABD*, VABS, VACGE, VACGT, VACLE, VACL, VADD (integer), VADDH, VADDL, VADDV, VAND, VBIC, VBIT, VBSL, VCGE, VCGT, VCLE, VCLS, VCLT, VCLZ, VCMP, VCMPX, VCNT, VDUP, VEOR, VEXT, VHADD, VHSUB, VMAX (integer), VMIN (integer), VMR (integer), VMRL (integer), VMRAL, VMLS (integer), VMLS, VMOV, VMOVQ, VMOVN, VMUL (integer and polynomial), VMULL (integer and polynomial), VMVN, VNEG, VORN, VORR, VPADAL, VPADD (integer), VPADDL, VPMAX (integer),
VPMIN (integer), VRADDHN, VREV*, VRHADD, VRSHL, VRSHR, VSHLHN, VRSRA, VRSUBHN, VSELEQ, VSELGE, VSELGT, VSELVS, VSHL, VSHLHN, VSHR, VSLI, VSLRA, VSRI, VSUB (integer), VSUBHN, VSUBL, VSWP, VTBX, VTBN, VTST, VUZP, and VZIP

This field resets to 0.

Otherwise:

Reserved, RES0.

Bit [20]

Reserved, RES0.

GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

Bits [15:10]

Reserved, RES0.

E, bit [9]

Endianness state bit. Controls the load and store endianness for data accesses:

<table>
<thead>
<tr>
<th>E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Little-endian operation</td>
</tr>
<tr>
<td>0b1</td>
<td>Big-endian operation.</td>
</tr>
</tbody>
</table>

Instruction fetches ignore this bit.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

A, bit [8]

SError interrupt mask bit. The possible values of this bit are:

<table>
<thead>
<tr>
<th>A</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Exception not masked.</td>
</tr>
<tr>
<td>0b1</td>
<td>Exception masked.</td>
</tr>
</tbody>
</table>

I, bit [7]

IRQ mask bit. The possible values of this bit are:

<table>
<thead>
<tr>
<th>I</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Exception not masked.</td>
</tr>
<tr>
<td>0b1</td>
<td>Exception masked.</td>
</tr>
</tbody>
</table>
F, bit [6]

FIQ mask bit. The possible values of this bit are:

<table>
<thead>
<tr>
<th>F</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Exception not masked.</td>
</tr>
<tr>
<td>0b1</td>
<td>Exception masked.</td>
</tr>
</tbody>
</table>

Bit [5]

Reserved, RES0.

Bit [4]

Reserved, RES1.

M, bits [3:0]

Current PE mode. Possible values are:

<table>
<thead>
<tr>
<th>M</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>User.</td>
</tr>
<tr>
<td>0b0001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b0010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Supervisor.</td>
</tr>
<tr>
<td>0b0100</td>
<td>Monitor.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Abort.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Hyp.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b1111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Accessing the CPSR

CPSR can be read using the MRS instruction and written using the MSR (register) or MSR (immediate) instructions. For more details, see MRS, MSR (register), and MSR (immediate) in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
CSSEL R, Cache Size Selection Register

The CSSEL R characteristics are:

**Purpose**

Selects the current Cache Size ID Register, CSIDR, by specifying the required cache level and the cache type, which is either instruction cache or data cache.

If ARMv8.3-CCIDX is implemented, CSSEL R also selects the current CSIDR 2.

**Configuration**

AArch32 System register CSSEL R bits [31:0] are architecturally mapped to AArch64 System register CSSEL R_EL1[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CSSEL R is a 32-bit register.

**Field descriptions**

The CSSEL R bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| RES0 | Level | InD |

**Bits [31:4]**

Reserved, RES0.

**Level, bits [3:1]**

Cache level of required cache. Permitted values are:

<table>
<thead>
<tr>
<th>Level</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Level 1 cache.</td>
</tr>
<tr>
<td>0b001</td>
<td>Level 2 cache.</td>
</tr>
<tr>
<td>0b010</td>
<td>Level 3 cache.</td>
</tr>
<tr>
<td>0b011</td>
<td>Level 4 cache.</td>
</tr>
<tr>
<td>0b100</td>
<td>Level 5 cache.</td>
</tr>
<tr>
<td>0b101</td>
<td>Level 6 cache.</td>
</tr>
<tr>
<td>0b110</td>
<td>Level 7 cache.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If CSSEL R.Level is programmed to a cache level that is not implemented, then the value for this field on a read of CSSEL R is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

**InD, bit [0]**

Instruction not Data bit. Permitted values are:
<table>
<thead>
<tr>
<th>InD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Data or unified cache.</td>
</tr>
<tr>
<td>0b1</td>
<td>Instruction cache.</td>
</tr>
</tbody>
</table>

If CSSELR.Level is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR is **UNKNOWN**.

This field resets to an architecturally **UNKNOWN** value.

### Accessing the CSSELR

Accesses to this register use the following encodings:

\[
\text{MRC\{}<c>\}\{}<q>\} \text{<coproc>, \{#<opc1>, <Rt>, <CRn>, <CRm>\}, \{#<opc2>\}}
\]

<table>
<thead>

</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Data cache clean to the Point of Unification is required for instruction to data coherence, unless CLIDR.LoC == 0b000 or (CLIDR.LoUIS == 0b000 &amp;&amp; CLIDR.LoUU == 0b000).</td>
</tr>
<tr>
<td>0b1</td>
<td>Data cache clean to the Point of Unification is not required for instruction to data coherence.</td>
</tr>
</tbody>
</table>
CTR, Cache Type Register

A value of 0b0000 indicates that this register does not provide Cache writeback granule information and either:

- The architectural maximum of 512 words (2KB) must be assumed.
- The Cache writeback granule can be determined from maximum cache line size encoded in the Cache Size ID Registers.

Values greater than 0b1001 are reserved.

Arm recommends that an implementation that does not support cache write-back implements this field as 0b0001. This applies, for example, to an implementation that supports only write-through caches.

**ERG, bits [23:20]**

Exclusives reservation granule. \( \log_2 \) of the number of words of the maximum size of the reservation granule that has been implemented for the Load-Exclusive and Store-Exclusive instructions.

The use of the value 0b0000 is deprecated.

The value 0b0001 and values greater than 0b1001 are reserved.

**DminLine, bits [19:16]**

\( \log_2 \) of the number of words in the smallest cache line of all the data caches and unified caches that are controlled by the PE.

**L1lp, bits [15:14]**

Level 1 instruction cache policy. Indicates the indexing and tagging policy for the L1 instruction cache. Possible values of this field are:

<table>
<thead>
<tr>
<th>L1lp</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>VMID aware Physical Index, Physical tag (VPIPT)</td>
</tr>
<tr>
<td>0b01</td>
<td>ASID-tagged Virtual Index, Virtual Tag (AIVVT)</td>
</tr>
<tr>
<td>0b10</td>
<td>Virtual Index, Physical Tag (VIPT)</td>
</tr>
<tr>
<td>0b11</td>
<td>Physical Index, Physical Tag (PIPT)</td>
</tr>
</tbody>
</table>

The value 0b01 is reserved in Armv8.

The value 0b00 is permitted only in an implementation that includes ARMv8.2-PIPTV, otherwise the value is reserved.

**Bits [13:4]**

Reserved, RES0.

**IminLine, bits [3:0]**

\( \log_2 \) of the number of words in the smallest cache line of all the instruction caches that are controlled by the PE.

**Accessing the CTR**

Accesses to this register use the following encodings:

DACR, Domain Access Control Register

The DACR characteristics are:

**Purpose**

 Defines the access permission for each of the sixteen memory domains.

**Configuration**

AArch32 System register DACR bits [31:0] are architecturally mapped to AArch64 System register DACR32_EL2[31:0].

This register has no function when TTBCR.EAE is set to 1, to select the Long-descriptor translation table format.

RW fields in this register reset to architecturally \textit{UNKNOWN} values.

**Attributes**

DACR is a 32-bit register.

**Field descriptions**

The DACR bit assignments are:

\[
\begin{array}{cccccccccccccccc}
\text{D15} & \text{D14} & \text{D13} & \text{D12} & \text{D11} & \text{D10} & \text{D9} & \text{D8} & \text{D7} & \text{D6} & \text{D5} & \text{D4} & \text{D3} & \text{D2} & \text{D1} & \text{D0} \\
\end{array}
\]

\textbf{D<n>}, bits [2n+1:2n], for n = 0 to 15

Domain n access permission, where n = 0 to 15. Permitted values are:

<table>
<thead>
<tr>
<th>D&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>No access. Any access to the domain generates a Domain fault.</td>
</tr>
<tr>
<td>0b01</td>
<td>Client. Accesses are checked against the permission bits in the translation tables.</td>
</tr>
<tr>
<td>0b11</td>
<td>Manager. Accesses are not checked against the permission bits in the translation tables.</td>
</tr>
</tbody>
</table>

The value 0b10 is reserved.

This field resets to an architecturally \textit{UNKNOWN} value.

**Accessing the DACR**

Accesses to this register use the following encodings:

\[
\text{MRC\{<c>\}{<q}> } \text{<coproc>, \{#\}<opc1>, <Rt>, <CRn>, <CRm>, \{#\}<opc2>}
\]

\[
\begin{array}{|c|c|c|c|}
\hline
\text{coproc} & \text{opc1} & \text{CRn} & \text{CRm} \\
\hline
0b1111 & 0b000 & 0b0011 & 0b0000 \\
\hline
\end{array}
\]

DBGAUTHSTATUS, Debug Authentication Status register

The DBGAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

Configuration

AArch32 System register DBGAUTHSTATUS bits [31:0] are architecturally mapped to AArch64 System register DBGAUTHSTATUS_EL1[31:0].

AArch32 System register DBGAUTHSTATUS bits [31:0] are architecturally mapped to External register DBGAUTHSTATUS_EL1[31:0].

This register is required in all implementations.

Attributes

DBGAUTHSTATUS is a 32-bit register.

Field descriptions

The DBGAUTHSTATUS bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:8]

Reserved, RES0.

SNID, bits [7:6]

When ARMv8.4-Debug is implemented:

Secure Non-Invasive Debug.

This field has the same value as DBGAUTHSTATUS.SID.

Otherwise:

Secure Non-Invasive Debug.

<table>
<thead>
<tr>
<th>SNID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Not implemented. EL3 is not implemented and the Effective value of SCR_NS is 1.</td>
</tr>
<tr>
<td>0b10</td>
<td>Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE.</td>
</tr>
<tr>
<td>0b11</td>
<td>Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE.</td>
</tr>
</tbody>
</table>

All other values are reserved.
**SID, bits [5:4]**

Secure Invasive Debug.

<table>
<thead>
<tr>
<th>SID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>0b00</code></td>
<td>Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 1.</td>

</thead>
</table>
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && MDCR_EL2.<TDE,TDA> != '00' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x05);
  elsif EL2Enabled() && ELUsingAArch32(EL2) && HDCR.<TDE,TDA> != '00' then
    AArch32.TakeHypTrapException(0x05);
  elsif HaveEL(EL3) && !ELUsingAArch32(EL3) && MDCR_EL3.TDA == '1' then
    AArch64.AArch32SystemAccessTrap(EL3, 0x05);
  else
    return DBGAUTHSTATUS;
  endif
elsif PSTATE.EL == EL2 then
  if HaveEL(EL3) && !ELUsingAArch32(EL3) && MDCR_EL3.TDA == '1' then
    AArch64.AArch32SystemAccessTrap(EL3, 0x05);
  else
    return DBGAUTHSTATUS;
  endif
elsif PSTATE.EL == EL3 then
  return DBGAUTHSTATUS;
endif
Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n> characteristics are:

**Purpose**

Holds control information for a breakpoint. Forms breakpoint n together with value register DBGBVR<n>. If EL2 is implemented and this breakpoint supports Context matching, DBGBVR<n> can be associated with a Breakpoint Extended Value Register DBGBXVR<n> for VMID matching.

**Configuration**

AArch32 System register DBGBCR<n> bits [31:0] are architecturally mapped to AArch64 System register DBGBCR<n>_EL1[31:0].

AArch32 System register DBGBCR<n> bits [31:0] are architecturally mapped to External register DBGBCR<n>_EL1[31:0].

If breakpoint n is not implemented then accesses to this register are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

DBGBCR<n> is a 32-bit register.

**Field descriptions**

The DBGBCR<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | BT | LBN | SSC | HMC | RES0 | BAS | RES0 | PMC | E |

When the E field is zero, all the other fields in the register are ignored.

**Bits [31:24]**

Reserved, RES0.

**BT, bits [23:20]**

Breakpoint Type. Possible values are:
### Table: DBGBCR<\text{n}>, Debug Breakpoint Control Registers, \text{n} = 0 - 15

<table>
<thead>
<tr>
<th>BT</th>

</tbody>
</table>

For more information on Breakpoints and their constraints, see 'Breakpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G2.9 and 'Reserved DBGBCR<\text{n}>.BT values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G2 (AArch32 Self-hosted Debug).

The following resets apply:

- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
- On a Warm reset, the value of this field is unchanged.

### LBN, bits [19:16]

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an **UNKNOWN** value.

This field is ignored when the value of DBGBCR<\text{n}>.E is 0.

The following resets apply:

- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
- On a Warm reset, the value of this field is unchanged.

### SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint \text{n} is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the \{HMC, SSC, PMC\} fields.
For more information, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, and 'Reserved DBGBCR<n>.{SSC, HMC, PMC} values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

**HMC, bit [13]**

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the SSC, bits [15:14] description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G2 (AArch32 Self-hosted Debug).

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

**Bits [12:9]**

Reserved, RES0.

**BAS, bits [8:5]**

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints, the permitted values are:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Match instruction at</th>
<th>Constraint for debuggers</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0011</td>
<td>DBGBVR&lt;n&gt;</td>
<td>Use for T32 instructions</td>
</tr>
<tr>
<td>0b1100</td>
<td>DBGBVR&lt;n&gt;+2</td>
<td>Use for T32 instructions</td>
</tr>
<tr>
<td>0b1111</td>
<td>DBGBVR&lt;n&gt;</td>
<td>Use for A32 instructions</td>
</tr>
</tbody>
</table>

All other values are reserved. For more information, see 'Reserved DBGBCR<n>.BAS values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G2 (AArch32 Self-hosted Debug).

For more information on using the BAS field in Address Match breakpoints, see 'Using the BAS field in Address Match breakpoints' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G2 (AArch32 Self-hosted Debug).

For Address mismatch breakpoints in an AArch32 stage 1 translation regime, the permitted values are:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Step instruction at</th>
<th>Constraint for debuggers</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>-</td>
<td>Use for a match anywhere breakpoint</td>
</tr>
<tr>
<td>0b0011</td>
<td>DBGBVR&lt;n&gt;</td>
<td>Use for T32 instructions</td>
</tr>
<tr>
<td>0b1100</td>
<td>DBGBVR&lt;n&gt;+2</td>
<td>Use for T32 instructions</td>
</tr>
<tr>
<td>0b1111</td>
<td>DBGBVR&lt;n&gt;</td>
<td>Use for A32 instructions</td>
</tr>
</tbody>
</table>

All other values are reserved. For more information, see 'Reserved DBGBCR<n>.BAS values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G2 (AArch32 Self-hosted Debug).

For more information on using the BAS field in address mismatch breakpoints, see 'Using the BAS field in Address Match breakpoints' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G2 (AArch32 Self-hosted Debug).

For Context matching breakpoints, this field is RES1 and ignored.
The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

**Bits [4:3]**

Reserved, RES0.

**PMC, bits [2:1]**

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the DBGBCR<n>.SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G2 (AArch32 Self-hosted Debug).

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

**E, bit [0]**

Enable breakpoint DBGBVR<n>. Possible values are:

<table>
<thead>
<tr>
<th>E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Breakpoint disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Breakpoint enabled.</td>
</tr>
</tbody>
</table>

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

**Accessing the DBGBCR<n>**

Accesses to this register use the following encodings:

$$MRC\langle c\rangle\langle q\rangle \langle coproc\rangle, \langle#\rangle\langle opc1\rangle, \langle Rt\rangle, \langle CRn\rangle, \langle CRm\rangle, \langle#\rangle\langle opc2\rangle$$

<table>

The DBGBVR<n> characteristics are:

**Purpose**

Holds a value for use in breakpoint matching, either the virtual address of an instruction or a context ID. Forms breakpoint n together with control register DBGBCR<n>. If EL2 is implemented and this breakpoint supports Context matching, DBGBVR<n> can be associated with a Breakpoint Extended Value Register DBGBXVR<n> for VMID matching.

**Configuration**

AArch32 System register DBGBVR<n> bits [31:0] are architecturally mapped to AArch64 System register DBGBVR<n> EL1[31:0].

AArch32 System register DBGBVR<n> bits [31:0] are architecturally mapped to External register DBGBVR<n> EL1[31:0].

If breakpoint n is not implemented then accesses to this register are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

How this register is interpreted depends on the value of DBGBCR<n>.BT.

- When DBGBCR<n>.BT is 0b0x0x, this register holds a virtual address.
- When DBGBCR<n>.BT is 0bxx1x, this register holds a Context ID.

For other values of DBGBCR<n>.BT, this register is RES0.

Some breakpoints might not support Context ID comparison. For more information, see the description of the DBGDIR CTX_CMPs field.

**Field descriptions**

The DBGBVR<n> bit assignments are:

**When DBGBCR<n>.BT == 0b0x0x:**

**VA[31:2]**

Bits[31:2] of the address value for comparison.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.
Bits [1:0]

Reserved, RES0.

When DBGBCR<n>.BT == 0b001x:

ContextID

ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against CONTEXTIDR_EL2 when all of the following are true:

- ARMv8.1-VHE is implemented.
- HCR_EL2.{E2H, TGE} is {1,1}.
- The PE is executing at EL0.
- EL2 is enabled in the current Security state, and is using AArch64.

Otherwise, the value is compared against CONTEXTIDR.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

When DBGBCR<n>.BT == 0b101x and HaveEL(EL2):

ContextID

ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

When DBGBCR<n>.BT == 0bx11x, HaveEL(EL2) and ARMv8.1-VHE is implemented:

ContextID

ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

Accessing the DBGBVR<n>

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && MDCLR_EL2.<TDE,TDA> != '00' then

    else
        DBGBVR[UInt(CRm<3:0>)] = R[t];
    end
The DBGBXVR<n> characteristics are:

**Purpose**

Holds a value for use in breakpoint matching, to support VMID matching. Used in conjunction with a control register DBGBCR<n> and a value register DBGBVR<n>, where EL2 is implemented and breakpoint n supports Context matching.

**Configuration**

AArch32 System register DBGBXVR<n> bits [31:0] are architecturally mapped to AArch64 System register DBGBVR<n>_EL1[63:32].

AArch32 System register DBGBXVR<n> bits [31:0] are architecturally mapped to External register DBGBVR<n>_EL1[63:32].

Accesses to this register are UNDEFINED in any of the following cases:

- Breakpoint n is not implemented.
- Breakpoint n does not support Context matching.
- EL2 is not implemented.

For more information, see the description of the DBGDIDR.CTX_CMPs field.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

How this register is interpreted depends on the value of DBGBCR<n>.BT.

- When DBGBCR<n>.BT is 0b10xx, this register holds a VMID.
- When DBGBCR<n>.BT is 0b11xx, this register holds a Context ID.

For other values of DBGBCR<n>.BT, this register is RES0.

**Field descriptions**

The DBGBXVR<n> bit assignments are:

<table>
<thead>
<tr>
<th>Bits 31:16</th>
<th>VMID[15:8]</th>
<th>VMID[7:0]</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**When DBGBCR<n>.BT == 0b10xx and HaveEL(EL2):**

Reserved, RES0.

**VMID[15:8], bits [15:8]**

When ARMv8.1-VMID16 is implemented:

Extension to VMID[7:0]. See VMID[7:0] for more details.
The following resets apply:

- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
- On a Warm reset, the value of this field is unchanged.

**Otherwise:**

Reserved, RES0.

**VMID[7:0], bits [7:0]**

VMID value for comparison.

The VMID is 8 bits in the following cases.

- EL2 is using AArch32.
- ARMv8.1-VMID16 is not implemented.

When ARMv8.1-VMID16 is implemented and EL2 is using AArch64, it is IMPLEMENTATION DEFINED whether the VMID is 8 bits or 16 bits.

VMID[15:8] is RES0 if any of the following applies:

- The implementation has an 8-bit VMID.
- VTCR_EL2.VS has a value of 0.
- EL2 is using AArch32.

The following resets apply:

- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
- On a Warm reset, the value of this field is unchanged.

**When DBGBCR<n>.BT == 0b11xx and HaveEL(EL2):**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

    DBGBXVR[UInt(CRm<3:0>)] = R[t];
DBGCLAIMCLR, Debug CLAIM Tag Clear register

The DBGCLAIMCLR characteristics are:

**Purpose**

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0.

The architecture does not define any functionality for the CLAIM tag bits.

**Note**

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the DBGCLAIMSET register.

**Configuration**

AArch32 System register DBGCLAIMCLR bits [31:0] are architecturally mapped to AArch64 System register DBGCLAIMCLR_EL1[31:0].

AArch32 System register DBGCLAIMCLR bits [31:0] are architecturally mapped to External register DBGCLAIMCLR_EL1[31:0].

An implementation must include eight CLAIM tag bits.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally *UNKNOWN* values.

**Attributes**

DBGCLAIMCLR is a 32-bit register.

**Field descriptions**

The DBGCLAIMCLR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-8</td>
<td>RAZ/SBZ</td>
</tr>
<tr>
<td>7-0</td>
<td>CLAIM</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

**CLAIM, bits [7:0]**

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.

Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

On a Cold reset, this field resets to 0.
Accessing the DBGCLAIMCLR

Accesses to this register use the following encodings:

\[
\text{MRC\{<c>\}{<q>} <coproc>, \{#\}<opc1>, <Rt>, <CRn>, <CRm>, \{#\}<opc2>}
\]

<table>
<thead>

  else
    DebuggerClaimCLR = R[t];
elsif PSTATE.EL == EL3 then
  DebuggerClaimCLR = R[t];
The DBGCLAIMSET characteristics are:

**Purpose**

Used by software to set the CLAIM tag bits to 1.

The architecture does not define any functionality for the CLAIM tag bits.

**Note**

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the DBGCLAIMCLR register.

**Configuration**

AArch32 System register DBGCLAIMSET bits [31:0] are architecturally mapped to AArch64 System register DBGCLAIMSET_EL1[31:0].

AArch32 System register DBGCLAIMSET bits [31:0] are architecturally mapped to External register DBGCLAIMSET_EL1[31:0].

An implementation must include eight CLAIM tag bits.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

DBGCLAIMSET is a 32-bit register.

**Field descriptions**

The DBGCLAIMSET bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RAZ/SBZ | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| CLAIM    | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

**Bits [31:8]**

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

**CLAIM, bits [7:0]**

Set CLAIM tag bits.

This field is RAO.

Writing a 1 to one of these bits sets the corresponding CLAIM tag bit to 1. This is an indirect write to the CLAIM tag bits. A single write operation can set multiple CLAIM tag bits to 1.

Writing 0 to one of these bits has no effect.

On a Cold reset, this field resets to 0.
## Accessing the DBGCLAIMSET

Accesses to this register use the following encodings:

DBGDCINT, DCC Interrupt Enable Register

The DBGDCINT characteristics are:

**Purpose**

Enables interrupt requests to be signaled based on the DCC status flags.

**Configuration**

AArch32 System register DBGDCINT bits [31:0] are architecturally mapped to AArch64 System register MDCCINT_EL1[31:0].

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally *UNKNOWN* values.

**Attributes**

DBGDCINT is a 32-bit register.

**Field descriptions**

The DBGDCINT bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>30</td>
<td>RX, DCC interrupt request enable control for DTRRX. Enables a common COMMIRQ interrupt request to be signaled based on the DCC status flags.</td>
</tr>
<tr>
<td>29</td>
<td>TX, DCC interrupt request enable control for DTRTX. Enables a common COMMIRQ interrupt request to be signaled based on the DCC status flags.</td>
</tr>
<tr>
<td>28</td>

</tr>
</tbody>
</table>

**Bit [31]**

Reserved, RES0.

**RX, bit [30]**

DCC interrupt request enable control for DTRRX. Enables a common COMMIRQ interrupt request to be signaled based on the DCC status flags.

<table>
<thead>
<tr>
<th>RX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No interrupt request generated by DTRRX.</td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupt request will be generated on RXfull == 1.</td>
</tr>
</tbody>
</table>

If legacy COMMRX and COMMTX signals are implemented, then these are not affected by the value of this bit.

On a Warm reset, this field resets to 0.

**TX, bit [29]**

DCC interrupt request enable control for DTRTX. Enables a common COMMIRQ interrupt request to be signaled based on the DCC status flags.

<table>
<thead>
<tr>
<th>TX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No interrupt request generated by DTRTX.</td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupt request will be generated on TXfull == 0.</td>
</tr>
</tbody>
</table>

If legacy COMMRX and COMMTX signals are implemented, then these are not affected by the value of this bit.

On a Warm reset, this field resets to 0.
Bits [28:0]

Reserved, RES0.

The DBGDEVID characteristics are:

**Purpose**

Adds to the information given by the `DBGDIDR` by describing other features of the debug implementation.

**Configuration**

This register is required in all implementations.

**Attributes**

DBGDEVID is a 32-bit register.

**Field descriptions**

The DBGDEVID bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>CIDMask</td>
</tr>
<tr>
<td>28</td>
<td>AuxRegs</td>
</tr>
<tr>
<td>25</td>
<td>DoubleLock</td>
</tr>
<tr>
<td>22</td>
<td>VirtExtns</td>
</tr>
<tr>
<td>19</td>
<td>VectorCatch</td>
</tr>
<tr>
<td>16</td>
<td>BPAddrMask</td>
</tr>
<tr>
<td>13</td>
<td>WPAddrMask</td>
</tr>
<tr>
<td>10</td>
<td>PCSample</td>
</tr>
</tbody>
</table>

**CIDMask, bits [31:28]**

Indicates the level of support for the Context ID matching breakpoint masking capability. Permitted values of this field are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Context ID masking is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Context ID masking is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved. The value of this for Armv8 is 0b0000.

**AuxRegs, bits [27:24]**

Indicates support for Auxiliary registers. Permitted values for this field are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for External Debug Auxiliary Control Register, <code>EDACR</code>.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**DoubleLock, bits [23:20]**

OS Double Lock implemented. Defined values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>OS Double Lock is not implemented. <code>DBGOSDLR</code> is RAZ/ WI.</td>
</tr>
<tr>
<td>0b0001</td>
<td>OS Double Lock is implemented. <code>DBGOSDLR</code> is RW.</td>
</tr>
</tbody>
</table>

ARMv8.0-DoubleLock implements the functionality identified by the value 0b0001.

All other values are reserved.
VirtExtns, bits [19:16]

Indicates whether EL2 is implemented. Permitted values of this field are:

<table>
<thead>
<tr>
<th>VirtExtns</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL2 is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EL2 is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

VectorCatch, bits [15:12]

Defines the form of Vector Catch exception implemented. Permitted values of this field are:

<table>
<thead>
<tr>
<th>VectorCatch</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Address matching Vector Catch exception implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Exception matching Vector Catch exception implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

BPAddrMask, bits [11:8]

Indicates the level of support for the instruction address matching breakpoint masking capability. Permitted values of this field are:

<table>
<thead>
<tr>
<th>BPAddrMask</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Breakpoint address masking might be implemented. If not implemented, DBGBCR&lt;n&gt;[28:24] is RAZ/WI.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Breakpoint address masking is implemented.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Breakpoint address masking is not implemented. DBGBCR&lt;n&gt;[28:24] is RES0.</td>
</tr>
</tbody>
</table>

All other values are reserved. The value of this for Armv8 is 0b1111.

WPAddrMask, bits [7:4]

Indicates the level of support for the data address matching watchpoint masking capability. Permitted values of this field are:

<table>
<thead>
<tr>
<th>WPAddrMask</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Watchpoint address masking might be implemented. If not implemented, DBGWCR&lt;n&gt;.MASK (Address mask) is RAZ/WI.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Watchpoint address masking is implemented.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Watchpoint address masking is not implemented. DBGWCR&lt;n&gt;.MASK (Address mask) is RES0.</td>
</tr>
</tbody>
</table>

All other values are reserved. The value of this for Armv8 is 0b0001.

PCSample, bits [3:0]

Indicates the level of PC Sample-based Profiling support using external debug registers. Permitted values of this field are:

<table>
<thead>
<tr>
<th>PCSample</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>PC Sample-based Profiling Extension is not implemented in the external debug registers space.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Only EDPCSR and EDCIDSR are implemented. This option is only permitted if EL3 and EL2 are not implemented.</td>
</tr>
<tr>
<td>0b0011</td>
<td>EDPCSR, EDCIDSR, and EDVIDSR are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

When ARMv8.2-PCSample is implemented, the only permitted value is 0b0000.
Note

ARMv8.2-PCSample implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of PMDEVID.PCSample.

DBGIDR, Debug ID Register

The DBGIDR characteristics are:

**Purpose**

Specifies which version of the Debug architecture is implemented, and some features of the debug implementation.

**Configuration**

If EL1 cannot use AArch32 then the implementation of this register is *optional* and deprecated.

**Attributes**

DBGIDR is a 32-bit register.

**Field descriptions**

The DBGIDR bit assignments are:

```
   31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
| WRPs | BRPs | CTX_CMPs | Version | RES1 | nSUHD_imp | RES0 | SE_imp | RES0 |
```

**WRPs, bits [31:28]**

The number of watchpoints implemented, minus 1.

Permitted values of this field are from \texttt{0b0001} for 2 implemented watchpoints, to \texttt{0b1111} for 16 implemented watchpoints.

The value of \texttt{0b0000} is reserved.

If AArch64 is implemented, this field has the same value as \texttt{ID_AA64DFR0_EL1.WRPs}.

**BRPs, bits [27:24]**

The number of breakpoints implemented, minus 1.

Permitted values of this field are from \texttt{0b0001} for 2 implemented breakpoint, to \texttt{0b1111} for 16 implemented breakpoints.

The value of \texttt{0b0000} is reserved.

If AArch64 is implemented, this field has the same value as \texttt{ID_AA64DFR0_EL1.BRPs}.

**CTX_CMPs, bits [23:20]**

The number of breakpoints that can be used for Context matching, minus 1.

Permitted values of this field are from \texttt{0b0000} for 1 Context matching breakpoint, to \texttt{0b1111} for 16 Context matching breakpoints.

The Context matching breakpoints must be the highest addressed breakpoints. For example, if six breakpoints are implemented and two are Context matching breakpoints, they must be breakpoints 4 and 5.

If AArch64 is implemented, this field has the same value as \texttt{ID_AA64DFR0_EL1.CTX_CMPs}.
**Version, bits [19:16]**

The Debug architecture version. Defined values are:

<table>
<thead>
<tr>
<th>Version</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>Armv6, v6 Debug architecture.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Armv6, v6.1 Debug architecture.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Armv7, v7 Debug architecture, with baseline CP14 registers implemented.</td>
</tr>
<tr>
<td>0b0100</td>
<td>Armv7, v7 Debug architecture, with all CP14 registers implemented.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Armv7, v7.1 Debug architecture.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Armv8, v8 Debug architecture.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Armv8.1, v8 Debug architecture, with Virtualization Host Extensions.</td>
</tr>
<tr>
<td>0b1000</td>
<td>Armv8.2, v8.2 Debug architecture.</td>
</tr>
<tr>
<td>0b1001</td>
<td>Armv8.4, v8.4 Debug architecture.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In any Armv8 implementation, the values 0b0001, 0b0010, 0b0011, 0b0100, and 0b0101 are not permitted.

- If ARMv8.1-VHE is not implemented, the only permitted value is 0b0110.
- In an Armv8.0 implementation, the value 0b1000 or higher is not permitted.

**Bit [15]**

Reserved, RES1.

**nSUHD_imp, bit [14]**

In Armv7-A, was Secure User Halting Debug not implemented.

The value of this bit must match the value of the SE_imp bit.

**Bit [13]**

Reserved, RES0.

**SE_imp, bit [12]**

EL3 implemented. The meanings of the values of this bit are:

<table>
<thead>
<tr>
<th>SE_imp</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL3 not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL3 implemented.</td>
</tr>
</tbody>
</table>

The value of this bit must match the value of the nSUHD_imp bit.

**Bits [11:0]**

Reserved, RES0.

**Accessing the DBGDIDR**

Arm deprecates any access to this register from EL0.

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
  if !ELUsingAArch32(EL1) && MDSCR_EL1.TDCC == '1' then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then

DBGDRAR, Debug ROM Address Register

The DBGDRAR characteristics are:

**Purpose**

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system. Armv8 deprecates any use of this register.

**Configuration**

AArch32 System register DBGDRAR bits [63:0] are architecturally mapped to AArch64 System register MDRAR_EL1[63:0].

If EL1 cannot use AArch32 then the implementation of this register is **OPTIONAL** and deprecated.

**Attributes**

DBGDRAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, bits [31:0] are read.

**Field descriptions**

The DBGDRAR bit assignments are:

</tbody>
</table>

**Bits [63:48]**

Reserved, RES0.

**ROMADDR[47:12], bits [47:12]**

Bits[47:12] of the ROM table physical address.

If the physical address size in bits (PAsize) is less than 48 then the register bits corresponding to ROMADDR [47:PAsize] are RES0.

Bits [11:0] of the ROM table physical address are zero.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is **IMPLEMENTATION DEFINED** whether the ROM table is also accessible in Secure memory.

**Bits [11:2]**

Reserved, RES0.

**Valid, bits [1:0]**

This field indicates whether the ROM Table address is valid. The permitted values of this field are:
Valid | Meaning
--- | ---
0b00 | ROM Table address is not valid. Software must ignore ROMADDR.
0b11 | ROM Table address is valid.

Other values are reserved.

**Accessing the DBGDRAR**

Accesses to this register use the following encodings:

DBGDSAR, Debug Self Address Register

The DBGDSAR characteristics are:

**Purpose**

In earlier versions of the Arm Architecture, this register defines the offset from the base address defined in DBGDRAR of the physical base address of the debug registers for the PE. Armv8 deprecates any use of this register.

**Configuration**

If EL1 cannot use AArch32 then the implementation of this register is **OPTIONAL** and deprecated.

**Attributes**

DBGDSAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, bits [31:0] are read.

**Field descriptions**

The DBGDSAR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>62</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>61</td>
<td>Reserved, RAZ.</td>
</tr>
<tr>
<td>60</td>
<td>Reserved, RAZ.</td>
</tr>
<tr>
<td>...</td>
<td>...</td>
</tr>
</tbody>
</table>

**Bits [63:2]**

Reserved, RES0.

**Bits [1:0]**

Reserved, RAZ.

This field indicates whether the debug self address offset is valid. For ARMv8, this field is always 0b00, the offset is not valid.

**Accessing the DBGDSAR**

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#<opc1>, <Rt>, <CRn>, <CRm>{, {#<opc2>}}

**DBGDCRext, Debug Status and Control Register, External View**

The DBGDCRext characteristics are:

**Purpose**

Main control register for the debug implementation.

**Configuration**

AArch32 System register DBGDCRext bits [31:0] are architecturally mapped to AArch64 System register MDSCR_EL1[31:0].

AArch32 System register DBGDCRext bits [15:2] are architecturally mapped to AArch32 System register DBGDCRint[15:2].

This register is required in all implementations.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

DBGDCRext is a 32-bit register.

**Field descriptions**

The DBGDCRext bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| TFO | RXfull | TXfull | RES0 | RXOTXU | RES0 | INTdis | TDA | RES0 | SC2 | NS | SPNIDdis | SPIDdis | MDBGen | HDRES0 | UDCCdis | RES0 | ERROR |

**TFO, bit [31]**

*When ARMv8.4-Trace is implemented:*

Trace Filter override. Used for save/restore of EDSCR.TFO.

When the OS Lock is unlocked, DBGOSLSR.OSLK == 0, software must treat this bit as UNK/SBZP.

When the OS Lock is locked, DBGOSLSR.OSLK == 1, this bit holds the value of EDSCR.TFO. Reads and writes of this bit are indirect accesses to EDSCR.TFO.

Accessing this field has the following behavior:

- When DBGOSLSR.OSLK == 1, access to this field is **RW**.
- When DBGOSLSR.OSLK == 0, access to this field is **RO**.

**Otherwise:**

Reserved, RES0.

**RXfull, bit [30]**

DTRRX full. Used for save/restore of EDSCR.RXfull.
When \texttt{DBGOSLSR.OSLK} == 0, software must treat this bit as UNK/SBZP.

When \texttt{DBGOSLSR.OSLK} == 1, this bit holds the value of \texttt{EDSCR.RXfull}. Reads and writes of this bit are indirect accesses to \texttt{EDSCR.RXfull}.

Arm deprecates use of this bit other than for save/restore. Use \texttt{DBGDSCRint} to access the DTRRX full status.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When \texttt{DBGOSLSR.OSLK} == 1, access to this field is \texttt{RW}.
- When \texttt{DBGOSLSR.OSLK} == 0, access to this field is \texttt{RO}.

**TXfull, bit [29]**

DTRTX full. Used for save/restore of \texttt{EDSCR.TXfull}.

When \texttt{DBGOSLSR.OSLK} == 0, software must treat this bit as UNK/SBZP.

When \texttt{DBGOSLSR.OSLK} == 1, this bit holds the value of \texttt{EDSCR.TXfull}. Reads and writes of this bit are indirect accesses to \texttt{EDSCR.TXfull}.

Arm deprecates use of this bit other than for save/restore. Use \texttt{DBGDSCRint} to access the DTRTX full status.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When \texttt{DBGOSLSR.OSLK} == 1, access to this field is \texttt{RW}.
- When \texttt{DBGOSLSR.OSLK} == 0, access to this field is \texttt{RO}.

**Bit [28]**

Reserved, RES0.

**RXO, bit [27]**

Used for save/restore of \texttt{EDSCR.RXO}.

When \texttt{DBGOSLSR.OSLK} == 0, software must treat this bit as UNK/SBZP.

When \texttt{DBGOSLSR.OSLK} == 1, this bit holds the value of \texttt{EDSCR.RXO}. Reads and writes of this bit are indirect accesses to \texttt{EDSCR.RXO}.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When \texttt{DBGOSLSR.OSLK} == 1, access to this field is \texttt{RW}.
- When \texttt{DBGOSLSR.OSLK} == 0, access to this field is \texttt{RO}.

**TXU, bit [26]**

Used for save/restore of \texttt{EDSCR.TXU}.

When \texttt{DBGOSLSR.OSLK} == 0, software must treat this bit as UNK/SBZP.

When \texttt{DBGOSLSR.OSLK} == 1, this bit holds the value of \texttt{EDSCR.TXU}. Reads and writes of this bit are indirect accesses to \texttt{EDSCR.TXU}.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When \texttt{DBGOSLSR.OSLK} == 1, access to this field is \texttt{RW}.
- When \texttt{DBGOSLSR.OSLK} == 0, access to this field is \texttt{RO}. 
Bits [25:24]
Reserved, RES0.

INTdis, bits [23:22]
Used for save/restore of EDSCR.INTdis.
When DBGOSLRSR.OSLK == 0, this field is RO, and software must treat it as UNK/SBZP.
When DBGOSLRSR.OSLK == 1, this field is RW and holds the value of EDSCR.INTdis. Reads and writes of this field are indirect accesses to EDSCR.INTdis.
The architected behavior of this field determines the value it returns after a reset.
Accessing this field has the following behavior:
- When DBGOSLRSR.OSLK == 1, access to this field is RW.
- When DBGOSLRSR.OSLK == 0, access to this field is RO.

TDA, bit [21]
Used for save/restore of EDSCR.TDA.
When DBGOSLRSR.OSLK == 0, software must treat this bit as UNK/SBZP.
When DBGOSLRSR.OSLK == 1, this bit holds the value of EDSCR.TDA. Reads and writes of this bit are indirect accesses to EDSCR.TDA.
The architected behavior of this field determines the value it returns after a reset.
Accessing this field has the following behavior:
- When DBGOSLRSR.OSLK == 1, access to this field is RW.
- When DBGOSLRSR.OSLK == 0, access to this field is RO.

Bit [20]
Reserved, RES0.

SC2, bit [19]
When ARMv8.0-PCSample is implemented, ARMv8.1-VHE is implemented and ARMv8.2-PCSample is not implemented:
Used for save/restore of EDSCR.SC2.
When DBGOSLRSR.OSLK == 0, software must treat this bit as UNK/SBZP.
When DBGOSLRSR.OSLK == 1, this bit holds the value of EDSCR.SC2. Reads and writes of this bit are indirect accesses to EDSCR.SC2.
Accessing this field has the following behavior:
- When DBGOSLRSR.OSLK == 1, access to this field is RW.
- When DBGOSLRSR.OSLK == 0, access to this field is RO.

Otherwise:
Reserved, RES0.

NS, bit [18]
Non-secure status. Returns the inverse of IsSecure().
Arm deprecates use of this field.

Access to this field is **RO**.

**SPNIDdis, bit [17]**

*When HaveEL(EL3):*

Secure privileged profiling disabled status bit.

<table>
<thead>
<tr>
<th>SPNIDdis</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Profiling allowed in Secure privileged modes.</td>
</tr>
<tr>
<td>0b1</td>
<td>Profiling prohibited in Secure privileged modes.</td>
</tr>
</tbody>
</table>

This field reads as 0 if any of the following applies, and reads as 1 otherwise:

- ARMv8.2-Debug is not implemented and ExternalSecureNoninvasiveDebugEnabled() returns TRUE.
- EL3 is using AArch32 and the value of SDCR.SPME is 1.
- EL3 is using AArch64 and the value of MDCR_EL3.SPME is 1.

Arm deprecates use of this field.

Access to this field is **RO**.

**Otherwise:**

Reserved, RES0.

**SPIDdis, bit [16]**

*When HaveEL(EL3):*

Secure privileged AArch32 invasive self-hosted debug disabled status bit. The value of this bit depends on the value of SDCR.SPD and the pseudocode function AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled().

<table>
<thead>
<tr>
<th>SPIDdis</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Self-hosted debug enabled in Secure privileged AArch32 modes.</td>
</tr>
<tr>
<td>0b1</td>
<td>Self-hosted debug disabled in Secure privileged AArch32 modes.</td>
</tr>
</tbody>
</table>

This bit reads as 1 if any of the following is true and reads as 0 otherwise:

- EL3 is using AArch32 and SDCR.SPD has the value 0b10.
- EL3 is using AArch64 and MDCR_EL3.SPD32 has the value 0b10.
- EL3 is using AArch32, SDCR.SPD has the value 0b00, and AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled() returns FALSE.
- EL3 is using AArch64, MDCR_EL3.SPD32 has the value 0b00, and AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled() returns FALSE.

Arm deprecates use of this field.

Access to this field is **RO**.

**Otherwise:**

Reserved, RES0.

**MDBGen, bit [15]**

Monitor debug events enable. Enable Breakpoint, Watchpoint, and Vector Catch exceptions.
### MDBGen

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

### HDE, bit [14]

Used for save/restore of EDSCR.HDE.

When DBGOSLSR.OSLK == 0, software must treat this bit as UNK/SBZP.

When DBGOSLSR.OSLK == 1, this bit holds the value of EDSCR.HDE. Reads and writes of this bit are indirect accesses to EDSCR.HDE.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When DBGOSLSR.OSLK == 1, access to this field is **RW**.
- When DBGOSLSR.OSLK == 0, access to this field is **RO**.

### Bit [13]

Reserved, RES0.

### UDCCdis, bit [12]

Traps EL0 accesses to the DCC registers to Undefined mode.

<table>
<thead>
<tr>
<th>UDCCdis</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped. EL0 accesses to the DBGDSCRint, DBGDTRRXint, DBGDTRTXint, DBGDIIDR, DBGDSAR, and DBGDRAR are trapped to Undefined mode.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped. EL0 accesses to the DBGDSCRint, DBGDTRRXint, DBGDTRTXint, DBGDIIDR, DBGDSAR, and DBGDRAR are trapped to Undefined mode.</td>
</tr>
</tbody>
</table>

**Note**

All accesses to these registers are trapped, including LDC and STC accesses to DBGDTRTXint and DBGDTRRXint, and MRRC accesses to DBGDSAR and DBGDRAR.

Traps of EL0 accesses to the DBGDTRRXint and DBGDTRTXint are ignored in Debug state.

On a Warm reset, this field resets to 0.

### Bits [11:7]

Reserved, RES0.

### ERR, bit [6]

Used for save/restore of EDSCR.ERR.

When DBGOSLSR.OSLK == 0, software must treat this bit as UNK/SBZP.

When DBGOSLSR.OSLK == 1, this bit holds the value of EDSCR.ERR. Reads and writes of this bit are indirect accesses to EDSCR.ERR.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:
• When DBGOSLSR.OSLK == 1, access to this field is **RW**.
• When DBGOSLSR.OSLK == 0, access to this field is **RO**.

### MOE, bits [5:2]

Method of Entry for debug exception. When a debug exception is taken to an Exception level using AArch32, this field is set to indicate the event that caused the exception:

<table>
<thead>
<tr>
<th>MOE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>Breakpoint.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Software breakpoint (BKPT) instruction.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Vector catch.</td>
</tr>
<tr>
<td>0b1010</td>
<td>Watchpoint.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Bits [1:0]

Reserved, **RES0**.

### Accessing the DBGDSCRext

Individual fields within this register might have restricted accessibility when the OS lock is unlocked, **DBGOSLSR.OSLK** == 0. See the field descriptions for more detail.

Accesses to this register use the following encodings:

```plaintext
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>

    DBGDSCRext = R[t];
The DBGDSCRint characteristics are:

**Purpose**

Main control register for the debug implementation. This is an internal, read-only view.

**Configuration**

AArch32 System register DBGDSCRint bits [30:29] are architecturally mapped to AArch64 System register MDCCSR_EL0[30:29].

AArch32 System register DBGDSCRint bits [15:2] are architecturally mapped to AArch32 System register DBGDSCRext[15:2].

This register is required in all implementations.

DBGDSCRint.{NS, SPNIDdis, SPIDis, MDBGen, UDCCdis, MOE} are **UNKNOWN** when the register is accessed at EL0. However, although these values are not accessible at EL0 by instructions that are neither **UNPREDICTABLE** nor return **UNKNOWN** values, it is permissible for an implementation to return the values of DBGDSCRext.{NS, SPNIDdis, SPIDis, MDBGen, UDCCdis, MOE} for these fields at EL0.

It is also permissible for an implementation to return the same values as defined for a read of DBGDSCRint at EL1 or above. (This is the case even if the implementation does not support AArch32 at EL1 or above.)

**Attributes**

DBGDSCRint is a 32-bit register.

**Field descriptions**

The DBGDSCRint bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RXfull | TXfull | RES0 | NS | SPNIDdis | SPIDis | MDBGen | RES0 | UDCCdis | RES0 | MOE | RES0 |

**Bit [31]**

Reserved, RES0.

**RXfull, bit [30]**

DTRRX full. Read-only view of the equivalent bit in the EDSRC.

**TXfull, bit [29]**

DTRTX full. Read-only view of the equivalent bit in the EDSRC.

**Bits [28:19]**

Reserved, RES0.
NS, bit [18]

Non-secure status.
Read-only view of the equivalent bit in the DBGDSCRext. Arm deprecates use of this field.

SPNIDdis, bit [17]

Secure privileged non-invasive debug disable.
Read-only view of the equivalent bit in the DBGDSCRext. Arm deprecates use of this field.

SPIDdis, bit [16]

Secure privileged invasive debug disable.
Read-only view of the equivalent bit in the DBGDSCRext. Arm deprecates use of this field.

MDBGen, bit [15]

Monitor debug events enable.
Read-only view of the equivalent bit in the DBGDSCRext.

Bits [14:13]

Reserved, RES0.

UDCCdis, bit [12]

User mode access to Debug Communications Channel disable.
Read-only view of the equivalent bit in the DBGDSCRext. Arm deprecates use of this field.

Bits [11:6]

Reserved, RES0.

MOE, bits [5:2]

Method of Entry for debug exception. When a debug exception is taken to an Exception level using AArch32, this field is set to indicate the event that caused the exception:

<table>
<thead>
<tr>
<th>MOE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>Breakpoint</td>
</tr>
<tr>
<td>0b0011</td>

DBGDTRRXext, Debug OS Lock Data Transfer Register, Receive, External View

The DBGDTRRXext characteristics are:

**Purpose**

Used for save/restore of DBGDTRRXint. It is a component of the Debug Communications Channel.

**Configuration**

AArch32 System register DBGDTRRXext bits [31:0] are architecturally mapped to AArch64 System register OSDTRRX_EL1[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

DBGDTRRXext is a 32-bit register.

**Field descriptions**

The DBGDTRRXext bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Update DTRRX without side-effect</td>
</tr>
</tbody>
</table>

*Update DTRRX without side-effect.*

Writes to this register update the value in DTRRX and do not change RXfull.

Reads of this register return the last value written to DTRRX and do not change RXfull.

For the full behavior of the Debug Communications Channel, see ‘The Debug Communication Channel and Instruction Transfer Register’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, chapter H4.

This field resets to an architecturally UNKNOWN value.

**Accessing the DBGDTRRXext**

Arm deprecates reads and writes of DBGDTRRXext through the System register interface when the OS Lock is unlocked, DBGOSLSR.OSLK == 0.

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

DBGDTRRXint, Debug Data Transfer Register, Receive

The DBGDTRRXint characteristics are:

**Purpose**

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. See Arch64-DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communications Channel.

**Configuration**

AArch32 System register DBGDTRRXint bits [31:0] are architecturally mapped to AArch64 System register DBGDTRRX_EL0[31:0].

AArch32 System register DBGDTRRXint bits [31:0] are architecturally mapped to External register DBGDTRRX_EL0[31:0].

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

DBGDTRRXint is a 32-bit register.

**Field descriptions**

The DBGDTRRXint bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Update DTRRX |

**Bits [31:0]**

Update DTRRX.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRRX.
- If RXfull is set to 0, return an **UNKNOWN** value.

After the read, RXfull is cleared to 0.

For the full behavior of the Debug Communications Channel, see The Debug Communication Channel and Instruction Transfer Register.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the DBGDTRRXint**

Data can be stored to memory from this register using STC.

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

    if PSTATE.M != M32_Monitor && SDCR.TDCC == '1' then
        AArch32.TakeMonitorTrapException();
    else
        DBGDTRTXext = R[t];
The DBGDTRTXint characteristics are:

**Purpose**

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. See DBGDTRX_EL0 for additional architectural mappings. It is a component of the Debug Communication Channel.

**Configuration**

AArch32 System register DBGDTRTXint bits [31:0] are architecturally mapped to AArch64 System register DBGDTRX_EL0[31:0].

AArch32 System register DBGDTRTXint bits [31:0] are architecturally mapped to External register DBGDTRX_EL0[31:0].

RW fields in this register reset to architecturally \textit{UNKNOWN} values.

**Attributes**

DBGDTRTXint is a 32-bit register.

**Field descriptions**

The DBGDTRTXint bit assignments are:

\[
\begin{array}{cccccccccccccccccccccc}
\hline
\end{array}
\]

Return DTRTX

**Bits [31:0]**

Return DTRTX.

Writes to this register:

- If TXfull is set to 1, set DTRTX to \textit{UNKNOWN}.
- If TXfull is set to 0, update the value in DTRTX.

After the write, TXfull is set to 1.

For the full behavior of the Debug Communications Channel, see The Debug Communication Channel and Instruction Transfer Register.

On a Cold reset, this field resets to an architecturally \textit{UNKNOWN} value.

**Accessing the DBGDTRTXint**

Data can be loaded from memory into this register using LDC (immediate) and LDC (literal).

Accesses to this register use the following encodings:

\[
\text{MCR}\{<c>\}{<q>}\ <\text{coproc}, \ {#}\{<opc1>, \ <Rt>, \ <CRn>, \ <CRm>{, \ {#}\{<opc2>}}
\]

\[
\begin{array}{cccccc}
\text{coproc} & \text{opc1} & \text{CRn} & \text{CRm} & \text{opc2} \\
\end{array}
\]

DBGOSDLR, Debug OS Double Lock Register

The DBGOSDLR characteristics are:

**Purpose**

Locks out the external debug interface.

**Configuration**

AArch32 System register DBGOSDLR bits [31:0] are architecturally mapped to AArch64 System register OSDLR_EL1[31:0].

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

DBGOSDLR is a 32-bit register.

**Field descriptions**

The DBGOSDLR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 |

**Bits [31:1]**

Reserved, RES0.

**DLK, bit [0]**

When ARMv8.0-DoubleLock is implemented:

OS Double Lock control bit.

<table>
<thead>
<tr>
<th>DLK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>OS Double Lock unlocked.</td>
</tr>
<tr>
<td>0b1</td>
<td>OS Double Lock locked, if DBGPRCR, CORENPDRQ (Core no powerdown request) bit is set to 0 and the PE is in Non-debug state.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RAZ/WI.

**Accessing the DBGOSDLR**

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && ELUsingAArch32(EL2) && MDCR_EL2.<TDE,TDOSA> != '00' &&
    (IsFeatureImplemented("ARMv8.0-DoubleLock") || boolean IMPLEMENTATION_DEFINED "Trapped by MDCR_EL2.TDOSA") then
    AArch64.AArch32SystemAccessTrap(EL2, 0x05);
  elsif EL2Enabled() && ELUsingAArch32(EL2) && HDCR.<TDE,TDOSA> != '00' &&
    (IsFeatureImplemented("ARMv8.0-DoubleLock") || boolean IMPLEMENTATION_DEFINED "Trapped by HDCR.TDOSA") then
    AArch32.TakeHypTrapException(0x05);
  elsif HaveEL(EL3) && ELUsingAArch32(EL3) && MDCR_EL3.TDOSA == '1' &&
    (IsFeatureImplemented("ARMv8.0-DoubleLock") || boolean IMPLEMENTATION_DEFINED "Trapped by MDCR_EL3.TDOSA") then
    AArch64.AArch32SystemAccessTrap(EL3, 0x05);
  else
    return DBGOSDLR;
  end
elsif PSTATE.EL == EL2 then
  if HaveEL(EL3) && ELUsingAArch32(EL3) && MDCR_EL3.TDOSA == '1' &&
    (IsFeatureImplemented("ARMv8.0-DoubleLock") || boolean IMPLEMENTATION_DEFINED "Trapped by MDCR_EL3.TDOSA") then
    AArch64.AArch32SystemAccessTrap(EL3, 0x05);
  else
    DBGOSDLR = R[t];
  end
elsif PSTATE.EL == EL3 then
  DBGOSDLR = R[t];
else
  DBGOSDLR = R[t];
end

The DBGOSECCR characteristics are:

**Purpose**

Provides a mechanism for an operating system to access the contents of EDECCR that are otherwise invisible to software, so it can save/restore the contents of EDECCR over powerdown on behalf of the external debugger.

**Configuration**

AArch32 System register DBGOSECCR bits [31:0] are architecturally mapped to AArch64 System register OSECCR_EL1[31:0].

AArch32 System register DBGOSECCR bits [31:0] are architecturally mapped to External register EDECCR[31:0].

If DBGOSLSR.OSLK == 0 then DBGOSECCR returns an UNKNOWN value on reads and ignores writes.

**Attributes**

DBGOSECCR is a 32-bit register.

**Field descriptions**

The DBGOSECCR bit assignments are:

**When DBGOSLSR.OSLK == 1:**

<table>
<thead>
<tr>
<th>Bit</th>

DBGOSLAR, Debug OS Lock Access Register

The DBGOSLAR characteristics are:

**Purpose**

Provides a lock for the debug registers. The OS Lock also disables some debug exceptions and debug events.

**Configuration**

AArch32 System register DBGOSLAR bits [31:0] are architecturally mapped to AArch64 System register OSLAR_EL1[31:0].

AArch32 System register DBGOSLAR bits [31:0] are architecturally mapped to External register OSLAR_EL1[31:0].

**Attributes**

DBGOSLAR is a 32-bit register.

**Field descriptions**

The DBGOSLAR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>

OS Lock Access, bits [31:0]

OS Lock Access. Writing the value 0xC5ACCE55 to the DBGOSLAR sets the OS lock to 1. Writing any other value sets the OS lock to 0.

Use DBGOSLRSR.OSLK to check the current status of the lock.

**Accessing the DBGOSLAR**

Accesses to this register use the following encodings:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>

DBGOSLRS, Debug OS Lock Status Register

The DBGOSLRS characteristics are:

**Purpose**

Provides status information for the OS Lock.

**Configuration**

AArch32 System register DBGOSLRS bits [31:0] are architecturally mapped to AArch64 System register OSLSR_EL1[31:0].

The OS Lock status is also visible in the external debug interface through EDPRSR.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

DBGOSLRS is a 32-bit register.

**Field descriptions**

The DBGOSLRS bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:4]**

Reserved, RES0.

**OSLM[1], bit [3]**

This field is bit[1] of OSLM[1:0].

OS lock model implemented. Identifies the form of OS save and restore mechanism implemented.

<table>
<thead>
<tr>
<th>OSLM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>OS Lock not implemented.</td>
</tr>
<tr>
<td>0b10</td>
<td>OS Lock implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved. In an Armv8 implementation the value 0b00 is not permitted.

The OSLM field is split as follows:

- OSLM[1] is DBGOSLRS[3].
- OSLM[0] is DBGOSLRS[0].

**nTT, bit [2]**

Not 32-bit access. This bit is always RAZ. It indicates that a 32-bit access is needed to write the key to the OS Lock Access Register.

**OSLK, bit [1]**

OS Lock Status. The possible values are:
### OSLK

<table>
<thead>
<tr>
<th>OSLK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>OS Lock unlocked.</td>
</tr>
<tr>
<td>0b1</td>
<td>OS Lock locked.</td>
</tr>
</tbody>
</table>

The OS Lock is locked and unlocked by writing to the OS Lock Access Register.

The following resets apply:

- On a Cold reset, this field resets to 1.
- On a Warm reset, the value of this field is unchanged.

#### OSLM[0], bit [0]

This field is bit[0] of OSLM[1:0].

See OSLM[1] for the field description.

### Accessing the DBGOSLSR

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} \text{ <coproc>, \{#\}<opc1>, <Rt>, <CRn>, <CRm>{, \{#\}<opc2>}\}
\]

<table>

DBGPRCR, Debug Power Control Register

The DBGPRCR characteristics are:

**Purpose**

Controls behavior of the PE on powerdown request.

**Configuration**

AArch32 System register DBGPRCR bits [31:0] are architecturally mapped to AArch64 System register DBGPRCR_EL1[31:0].

Bit [0] of this register is mapped to EDPRCR.CORENPDRQ, bit [0] of the external view of this register.

The other bits in these registers are not mapped to each other.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

DBGPRCR is a 32-bit register.

**Field descriptions**

The DBGPRCR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>30</td>
<td>CORENPDRQ</td>
</tr>
</tbody>
</table>

**Bits [31:1]**

Reserved, RES0.

**CORENPDRQ, bit [0]**

*When ARMv8.3-DoPD is implemented:*

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the **IMPLEMENTATION DEFINED** nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

<table>
<thead>
<tr>
<th>CORENPDRQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If the system responds to a powerdown request, it powers down Core power domain.</td>
</tr>
<tr>
<td>0b1</td>
<td>If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.</td>
</tr>
</tbody>
</table>

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is **IMPLEMENTATION DEFINED** whether this bit is reset to the Cold reset value on exit from an **IMPLEMENTATION DEFINED** software-visible retention state. For more information about retention states see Core power domain power states.

**Note**
Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The following resets apply:

- On a Cold reset, this field is set to 1 if the powerup request is implemented and the powerup request has been asserted, and is set to 0 otherwise.
- On a Warm reset, the value of this field is unchanged.

**Otherwise:**

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

<table>
<thead>
<tr>
<th>CORENPDRQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If the system responds to a powerdown request, it powers down Core power domain.</td>
</tr>
<tr>
<td>0b1</td>
<td>If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.</td>
</tr>
</tbody>
</table>

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of EDPRCR COREPURQ on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see Core power domain power states.

**Note**

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The following resets apply:

- On a Cold reset, this field resets to the value in EDPRCR COREPURQ.
- On a Warm reset, the value of this field is unchanged.

**Accessing the DBGPRCR**

Accesses to this register use the following encodings:

\[

**DBGVCR, Debug Vector Catch Register**

The DBGVCR characteristics are:

**Purpose**

Controls Vector Catch debug events.

**Configuration**

AArch32 System register DBGVCR bits [31:0] are architecturally mapped to AArch64 System register DBGVCR32_EL2[31:0].

This register is required in all implementations.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

DBGVCR is a 32-bit register.

**Field descriptions**

The DBGVCR bit assignments are:

**When HaveEL(EL3) and ELUsingAArch32(EL3):**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**NSF, bit [31]**

FIQ vector catch enable in Non-secure state.

The exception vector offset is 0x1C.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**NSI, bit [30]**

IRQ vector catch enable in Non-secure state.

The exception vector offset is 0x18.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [29]**

Reserved, RES0.

**NSD, bit [28]**

Data Abort vector catch enable in Non-secure state.

The exception vector offset is 0x10.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
NSP, bit [27]

Prefetch Abort vector catch enable in Non-secure state.

The exception vector offset is 0x0C.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSS, bit [26]

Supervisor Call (SVC) vector catch enable in Non-secure state.

The exception vector offset is 0x08.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSU, bit [25]

Undefined Instruction vector catch enable in Non-secure state.

The exception vector offset is 0x04.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [24:16]

Reserved, RES0.

MF, bit [15]

FIQ vector catch enable in Monitor mode.

The exception vector offset is 0x1C.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

MI, bit [14]

IRQ vector catch enable in Monitor mode.

The exception vector offset is 0x18.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

MD, bit [12]

Data Abort vector catch enable in Monitor mode.

The exception vector offset is 0x10.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

MP, bit [11]

Prefetch Abort vector catch enable in Monitor mode.

The exception vector offset is 0x0C.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**MS, bit [10]**

Secure Monitor Call (SMC) vector catch enable in Monitor mode.

The exception vector offset is 0x08.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [9:8]**

Reserved, **RES0**.

**SF, bit [7]**

FIQ vector catch enable in Secure state.

The exception vector offset is 0x1C.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**SI, bit [6]**

IRQ vector catch enable in Secure state.

The exception vector offset is 0x18.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [5]**

Reserved, **RES0**.

**SD, bit [4]**

Data Abort vector catch enable in Secure state.

The exception vector offset is 0x10.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**SP, bit [3]**

Prefetch Abort vector catch enable in Secure state.

The exception vector offset is 0x0C.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**SS, bit [2]**

Supervisor Call (SVC) vector catch enable in Secure state.

The exception vector offset is 0x08.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**SU, bit [1]**

Undefined Instruction vector catch enable in Secure state.

The exception vector offset is 0x04.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Bit [0]

Reserved, RES0.

**When HaveEL(EL3) and !ELUsingAArch32(EL3):**

The DBGWCR<n> characteristics are:

**Purpose**

Holds control information for a watchpoint. Forms watchpoint n together with value register DBGWVR<n>.

**Configuration**

AArch32 System register DBGWCR<n> bits [31:0] are architecturally mapped to AArch64 System register DBGWCR<n>_EL1[31:0].

AArch32 System register DBGWCR<n> bits [31:0] are architecturally mapped to External register DBGWCR<n>_EL1[31:0].

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

DBGWCR<n> is a 32-bit register.

**Field descriptions**

The DBGWCR<n> bit assignments are:

```
+---------------+---------------+---------------+---------------+---------------+---------------+---------------+---------------+---------------+
<p>| 31            | 30            | 29            | 28            | 27            | 26            | 25            | 24            | 23            |</p>
<table>
<thead>
<tr>
<th>RES0</th>
<th>MASK</th>
<th>RES0</th>
<th>WT</th>
<th>LBN</th>
<th>SSC</th>
<th>HMC</th>
<th>BAS</th>
<th>LSC</th>
</tr>
</thead>
<tbody>
<tr>
<td>22</td>
<td>21</td>
<td>20</td>
<td>19</td>
<td>18</td>
<td>17</td>
<td>16</td>
<td>15</td>
<td>14</td>
</tr>
<tr>
<td></td>
<td>ME</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>13</td>
<td>12</td>
<td>11</td>
<td>10</td>
<td>9</td>
<td>8</td>
<td>7</td>
<td>6</td>
<td>5</td>
</tr>
<tr>
<td></td>
<td></td>
<td>ME</td>
<td>ME</td>
<td>ME</td>
<td>ME</td>
<td>ME</td>
<td>ME</td>
<td>ME</td>
</tr>
<tr>
<td>4</td>
<td>3</td>
<td>2</td>
<td>1</td>
<td>0</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>ME</td>
<td>ME</td>
<td>ME</td>
<td>ME</td>
<td>ME</td>
<td>ME</td>
<td>ME</td>
<td>ME</td>
<td>ME</td>
</tr>
</tbody>
</table>
```

When the E field is zero, all the other fields in the register are ignored.

**Bits [31:29]**

Reserved, RES0.

**MASK, bits [28:24]**

Address mask. Only objects up to 2GB can be watched using a single mask.

<table>
<thead>
<tr>
<th>MASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00000</td>
<td>No mask.</td>
</tr>
<tr>
<td>0b00001</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b00010</td>
<td>Reserved.</td>
</tr>
</tbody>
</table>

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b111111 masking 31 address bits (0x7FFFFFFF mask for address).
The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

**Bits [23:21]**

Reserved, RES0.

**WT, bit [20]**

Watchpoint type. Possible values are:

<table>
<thead>
<tr>
<th>WT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Unlinked data address match.</td>
</tr>
<tr>
<td>0b1</td>
<td>Linked data address match.</td>
</tr>
</tbody>
</table>

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

**LBN, bits [19:16]**

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

**SSC, bits [15:14]**

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

For more information, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, and 'Reserved DBGCR<n>.{SSC, HMC, PMC} values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

**HMC, bit [13]**

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G2 (AArch32 Self-hosted Debug).

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.
**BAS, bits [12:5]**

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by DBGWVR<\text{n}>, is being watched.

<table>
<thead>
<tr>
<th>BAS</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0bxxxxxxx1</td>
<td>Match byte at DBGWVR&lt;\text{n}&gt;</td>
</tr>
<tr>
<td>0bxxxxxx1x</td>
<td>Match byte at DBGWVR&lt;\text{n}&gt;+1</td>
</tr>
<tr>
<td>0bxxxxxx1xx</td>
<td>Match byte at DBGWVR&lt;\text{n}&gt;+2</td>
</tr>
<tr>
<td>0bxxxxxxx1xx</td>
<td>Match byte at DBGWVR&lt;\text{n}&gt;+3</td>
</tr>
</tbody>
</table>

In cases where DBGWVR<\text{n}> addresses a double-word:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Description, if DBGWVR&lt;\text{n}&gt;[2] == 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0bxxx1xxxx</td>
<td>Match byte at DBGWVR&lt;\text{n}&gt;+4</td>
</tr>
<tr>
<td>0bx1xxxxxx</td>
<td>Match byte at DBGWVR&lt;\text{n}&gt;+5</td>
</tr>
<tr>
<td>0bx1xxxxxx</td>
<td>Match byte at DBGWVR&lt;\text{n}&gt;+6</td>
</tr>
<tr>
<td>0b1xxxxxxx</td>
<td>Match byte at DBGWVR&lt;\text{n}&gt;+7</td>
</tr>
</tbody>
</table>

The valid values for BAS are non-zero binary numbers all of whose set bits are contiguous. All other values are reserved and must not be used by software. See 'Reserved DBGWCR<\text{n}>.BAS values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G2 (AArch32 Self-hosted Debug).

The following resets apply:

- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
- On a Warm reset, the value of this field is unchanged.

**LSC, bits [4:3]**

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

<table>
<thead>
<tr>
<th>LSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>Match instructions that load from a watchpointed address.</td>
</tr>
<tr>
<td>0b10</td>
<td>Match instructions that store to a watchpointed address.</td>
</tr>
<tr>
<td>0b11</td>
<td>Match instructions that load from or store to a watchpointed address.</td>
</tr>
</tbody>
</table>

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

The following resets apply:

- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
- On a Warm reset, the value of this field is unchanged.

**PAC, bits [2:1]**

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint \text{n} is generated. This field must be interpreted along with the SSC and HMC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G2 (AArch32 Self-hosted Debug).

The following resets apply:

- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
- On a Warm reset, the value of this field is unchanged.
E, bit [0]

Enable watchpoint n. Possible values are:

<table>
<thead>
<tr>
<th>E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Watchpoint disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Watchpoint enabled.</td>
</tr>
</tbody>
</table>

The following resets apply:

- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
- On a Warm reset, the value of this field is unchanged.

The DBGWVR<n> characteristics are:

### Purpose

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register DBGWCR<n>.

### Configuration

AArch32 System register DBGWVR<n> bits [31:0] are architecturally mapped to AArch64 System register DBGWVR<n>_EL1[31:0].

AArch32 System register DBGWVR<n> bits [31:0] are architecturally mapped to External register DBGWVR<n>_EL1[31:0].

If watchpoint n is not implemented then accesses to this register are **UNDEFINED**.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally **UNKNOWN** values.

### Attributes

DBGWVR<n> is a 32-bit register.

### Field descriptions

The DBGWVR<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

DCCIMVAC, Data Cache line Clean and Invalidate by VA to PoC

The DCCIMVAC characteristics are:

**Purpose**

Clean and Invalidate data or unified cache line by virtual address to PoC.

**Configuration**

AArch32 System instruction DCCIMVAC performs the same function as AArch64 System instruction DCIVAC.

**Attributes**

DCCIMVAC is a 32-bit System instruction.

**Field descriptions**

The DCCIMVAC input value bit assignments are:

    elsif PSTATE.EL == EL2 then
        DCCIMVAC(R[t]);
    elsif PSTATE.EL == EL3 then
        DCCIMVAC(R[t]);

The DCCISW characteristics are:

**Purpose**

Clean and Invalidate data or unified cache line by set/way.

**Configuration**

AArch32 System instruction DCCISW performs the same function as AArch64 System instruction DC_CISW.

**Attributes**

DCCISW is a 32-bit System instruction.

**Field descriptions**

The DCCISW input value bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>

</table>

**SetWay, bits [31:4]**

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

A = Log2(ASSOCIATIVITY), L = Log2(LINELEN), B = (L + S), S = Log2(NSETS).

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

**Level, bits [3:1]**

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

**Bit [0]**

Reserved, RES0.

**Executing the DCCISW instruction**

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings:

\[

DFAR, Data Fault Address Register

The DFAR characteristics are:

**Purpose**

Holds the virtual address of the faulting address that caused a synchronous Data Abort exception.

**Configuration**

AArch32 System register DFAR bits [31:0] are architecturally mapped to AArch64 System register FAR_EL1[31:0].

AArch32 System register DFAR bits [31:0] (S) are architecturally mapped to AArch32 System register HDFAR[31:0] when HaveEL(EL2), HaveEL(EL3) and HighestELUsingAArch32().

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

DFAR is a 32-bit register.

**Field descriptions**

The DFAR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| VA of faulting address of synchronous Data Abort exception |

**Bits [31:0]**

VA of faulting address of synchronous Data Abort exception.

This field resets to an architecturally UNKNOWN value.

**Accessing the DFAR**

Accesses to this register use the following encodings:

\[MRC{\langle c\rangle}{\langle q\rangle} \langle coproc\rangle, \{#\}\langle opc1\rangle, \langle Rt\rangle, \langle CRn\rangle, \langle CRm\rangle, \{#\}\langle opc2\rangle\]\n

    end if;
DFSR, Data Fault Status Register

The DFSR characteristics are:

**Purpose**

Holds status information about the last data fault.

**Configuration**

AArch32 System register DFSR bits [31:0] are architecturally mapped to AArch64 System register ESR_EL1[31:0].

The current translation table format determines which format of the register is used.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

DFSR is a 32-bit register.

**Field descriptions**

The DFSR bit assignments are:

When TTBCR.EAE == 0:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    | RES0 | FnV | AET | CM | Ext | WnR | FS[4] | LPAE | RES0 | Domain | FS[3:0] |

**Bits [31:17]**

Reserved, RES0.

**FnV, bit [16]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<table>
<thead>
<tr>
<th>FnV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>DFAR is valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>DFAR is not valid, and holds an UNKNOWN value.</td>
</tr>
</tbody>
</table>

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Data Abort exceptions.

This field resets to an architecturally UNKNOWN value.

**AET, bits [15:14]**

Asynchronous Error Type. When the RAS Extension is implemented, this field describes the state of the PE after taking an asynchronous Data Abort exception. Possible values are:

<table>
<thead>
<tr>
<th>AET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Uncontainable error (UC) or uncategorized.</td>
</tr>
<tr>
<td>0b01</td>
<td>Unrecoverable error (UEU).</td>
</tr>
<tr>
<td>0b10</td>
<td>Restartable error (UEO) or Corrected error (CE).</td>
</tr>
<tr>
<td>0b11</td>
<td>Recoverable error (UER).</td>
</tr>
</tbody>
</table>
When the RAS Extension is not implemented, or on a synchronous Data Abort, this field is RES0.

**Note**

Armv8.2 requires the implementation of the RAS Extension.

In the event of multiple errors taken as a single SError interrupt exception, the overall state of the PE is reported.

**Note**

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

This field resets to an architecturally UNKNOWN value.

### CM, bit [13]

Cache maintenance fault. For synchronous faults, this bit indicates whether a cache maintenance instruction generated the fault. The possible values of this bit are:

<table>
<thead>
<tr>
<th>CM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Abort not caused by execution of a cache maintenance instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Abort caused by execution of a cache maintenance instruction, or on an address translation.</td>
</tr>
</tbody>
</table>

On a synchronous Data Abort on a translation table walk, this bit is UNKNOWN.

On an asynchronous fault, this bit is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

### ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

This field resets to an architecturally UNKNOWN value.

### WnR, bit [11]

Write not Read bit. Indicates whether the abort was caused by a write or a read instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>WnR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Abort caused by a read instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Abort caused by a write instruction.</td>
</tr>
</tbody>
</table>

For faults on the cache maintenance and address translation System instructions in the (coproc==0b1111) encoding space this bit always returns a value of 1.

This field resets to an architecturally UNKNOWN value.

### FS[4], bit [10]

This field is bit[4] of FS[4:0].

Fault status bits. Possible values of FS[4:0] are:
<table>
<thead>
<tr>
<th>FS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00001</td>
<td>Alignment fault</td>
</tr>
<tr>
<td>0b00010</td>
<td>Debug exception</td>
</tr>
<tr>
<td>0b00011</td>
<td>Access flag fault, level 1</td>
</tr>
<tr>
<td>0b00100</td>
<td>Fault on instruction cache maintenance</td>
</tr>
<tr>
<td>0b00101</td>
<td>Translation fault, level 1</td>
</tr>
<tr>
<td>0b00110</td>
<td>Access flag fault, level 2</td>
</tr>
<tr>
<td>0b00111</td>
<td>Translation fault, level 2</td>
</tr>
<tr>
<td>0b01000</td>
<td>Synchronous External abort, not on translation table walk</td>
</tr>
<tr>
<td>0b01001</td>
<td>Domain fault, level 1</td>
</tr>
<tr>
<td>0b01011</td>
<td>Domain fault, level 2</td>
</tr>
<tr>
<td>0b01100</td>
<td>Synchronous External abort, on translation table walk, level 1</td>
</tr>
<tr>
<td>0b01101</td>
<td>Permission fault, level 1</td>
</tr>
<tr>
<td>0b01110</td>
<td>Synchronous External abort, on translation table walk, level 2</td>
</tr>
<tr>
<td>0b01111</td>
<td>Permission fault, level 2</td>
</tr>
<tr>
<td>0b10000</td>
<td>TLB conflict abort</td>
</tr>
<tr>
<td>0b10100</td>
<td>IMPLEMENTATION DEFINED fault (Lockdown fault)</td>
</tr>
<tr>
<td>0b10101</td>
<td>IMPLEMENTATION DEFINED fault (Unsupported Exclusive access fault)</td>
</tr>
<tr>
<td>0b10110</td>
<td>SError interrupt</td>
</tr>
<tr>
<td>0b11000</td>
<td>SError interrupt, from a parity or ECC error on memory access</td>
</tr>
<tr>
<td>0b11001</td>
<td>Synchronous parity or ECC error on memory access, not on translation table walk</td>
</tr>
<tr>
<td>0b11100</td>
<td>Synchronous parity or ECC error on translation table walk, level 1</td>
</tr>
<tr>
<td>0b11110</td>
<td>Synchronous parity or ECC error on translation table walk, level 2</td>
</tr>
</tbody>
</table>

All other values are reserved.

When the RAS Extension is implemented, 0b11000, 0b11001, 0b11100, and 0b11110, are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Short-descriptor translation table lookup' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

The FS field is split as follows:

- FS[4] is DFSR[10].
- FS[3:0] is DFSR[3:0].

This field resets to an architecturally UNKNOWN value.

**LPAE, bit [9]**

On taking a Data Abort exception, this bit is set as follows:

<table>
<thead>
<tr>
<th>LPAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Using the Short-descriptor translation table formats.</td>
</tr>
<tr>
<td>0b1</td>
<td>Using the Long-descriptor translation table formats.</td>
</tr>
</tbody>
</table>

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

This field resets to an architecturally UNKNOWN value.

**Bit [8]**

Reserved, RES0.

**Domain, bits [7:4]**

The domain of the fault address.

Arm deprecates any use of this field, see ‘The Domain field in the DFSR’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
This field is **UNKNOWN** for certain faults where the DFSR is updated and reported using the Short-descriptor FSR encodings, see 'Validity of Domain field on faults that update the DFSR when using the Short-descriptor encodings' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally **UNKNOWN** value.

**FS[3:0], bits [3:0]**

This field is bits[3:0] of FS[4:0].

**When TTBCR.EAE == 1:**

|   | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|---|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|   | RES0 | FnV | AET | CM | Ext | WnR | RES0 | PAE | Res0 | STATUS |

**Bits [31:17]**

Reserved, **RES0**.

**FnV, bit [16]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<table>
<thead>
<tr>
<th>FnV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>DFAR is valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>DFAR is not valid, and holds an <strong>UNKNOWN</strong> value.</td>
</tr>
</tbody>
</table>

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is **RES0** for all other Data Abort exceptions.

This field resets to an architecturally **UNKNOWN** value.

**AET, bits [15:14]**

Asynchronous Error Type. When the RAS Extension is implemented, this field describes the state of the PE after taking an asynchronous Data Abort exception. Possible values are:

<table>
<thead>
<tr>
<th>AET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Uncontainable error (UC) or un categorized.</td>
</tr>
<tr>
<td>0b01</td>
<td>Unrecoverable error (UEU).</td>
</tr>
<tr>
<td>0b10</td>
<td>Restartable error (UEO) or Corrected error (CE).</td>
</tr>
<tr>
<td>0b11</td>
<td>Recoverable error (UER).</td>
</tr>
</tbody>
</table>

When the RAS Extension is not implemented, or on a synchronous Data Abort, this field is **RES0**.

**Note**

Armv8.2 requires the implementation of the RAS Extension.

In the event of multiple errors taken as a single SError interrupt exception, the overall state of the PE is reported.

**Note**

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

This field resets to an architecturally **UNKNOWN** value.
CM, bit [13]

Cache maintenance fault. For synchronous faults, this bit indicates whether a cache maintenance instruction generated the fault. The possible values of this bit are:

<table>
<thead>
<tr>
<th>CM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Abort not caused by execution of a cache maintenance instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Abort caused by execution of a cache maintenance instruction.</td>
</tr>
</tbody>
</table>

On a synchronous Data Abort on a translation table walk, this bit is UNKNOWN.

On an asynchronous fault, this bit is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

This field resets to an architecturally UNKNOWN value.

Write not Read bit. Indicates whether the abort was caused by a write or a read instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>WnR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Abort caused by a read instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Abort caused by a write instruction.</td>
</tr>
</tbody>
</table>

For faults on the cache maintenance and address translation System instructions in the (coproc==0b1111) encoding space this bit always returns a value of 1.

This field resets to an architecturally UNKNOWN value.

Bit [10]

Reserved, RES0.

LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

<table>
<thead>
<tr>
<th>LPAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Using the Short-descriptor translation table formats.</td>
</tr>
<tr>
<td>0b1</td>
<td>Using the Long-descriptor translation table formats.</td>
</tr>
</tbody>
</table>

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

This field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status bits. Possible values of this field are:
### Status

<table>
<thead>
<tr>
<th>Status</th>
<th>Meaning</th>
</tr>

**DISR, Deferred Interrupt Status Register**

The DISR characteristics are:

**Purpose**
Records that an SError interrupt has been consumed by an ESB instruction.

**Configuration**
AArch32 System register DISR bits [31:0] are architecturally mapped to AArch64 System register DISR_EL1[31:0] when the highest implemented Exception level is using AArch64.

This register is present only when RAS is implemented. Otherwise, direct accesses to DISR are UNDEFINED. RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**
DISR is a 32-bit register.

**Field descriptions**
The DISR bit assignments are:

**When the ESB instruction is executed at EL2:**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| A  | RES0 | AET | EA | RES0 | DFSC |

**A, bit [31]**
Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

This field resets to an architecturally UNKNOWN value.

**Bits [30:12]**
Reserved, RES0.

**AET, bits [11:10]**
Asynchronous Error Type. See the description of HSR.AET for an SError interrupt.

This field resets to an architecturally UNKNOWN value.

**EA, bit [9]**
External abort Type. See the description of HSR.EA for an SError interrupt.

This field resets to an architecturally UNKNOWN value.

**Bits [8:6]**
Reserved, RES0.
**DFSC, bits [5:0]**

Fault Status Code. See the description of HSR.DFSC for an SError interrupt.

This field resets to an architecturally **UNKNOWN** value.

**When the ESB instruction is executed at EL0 or EL1 and where TTBCR.EAE == 0:**

**A, bit [31]**

Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

This field resets to an architecturally **UNKNOWN** value.

**Bits [30:16]**

Reserved, RES0.

**AET, bits [15:14]**

Asynchronous Error Type. See the description of DFSR.AET for an SError interrupt.

This field resets to an architecturally **UNKNOWN** value.

**Bit [13]**

Reserved, RES0.

**ExT, bit [12]**

External abort Type. See the description of DFSR.ExT for an SError interrupt.

This field resets to an architecturally **UNKNOWN** value.

**Bit [11]**

Reserved, RES0.

**FS[4], bit [10]**

This field is bit[4] of FS[4:0].

Fault Status Code. See the description of DFSR.FS for an SError interrupt.

The FS field is split as follows:

- FS[4] is DISR[10].
- FS[3:0] is DISR[3:0].

This field resets to an architecturally **UNKNOWN** value.

**LPAE, bit [9]**

Format.

<table>

| A  | RES0 | AET | RES0 | ExT | RES0 | LPAE | RES0 | STATUS |

**A, bit [31]**

Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

This field resets to an architecturally **UNKNOWN** value.

**Bits [30:16]**

Reserved, RES0.

**AET, bits [15:14]**

Asynchronous Error Type. See the description of **DFSR.AET** for an SError interrupt.

This field resets to an architecturally **UNKNOWN** value.

**Bit [13]**

Reserved, RES0.

**ExT, bit [12]**

External abort Type. See the description of **DFSR.ExT** for an SError interrupt.

This field resets to an architecturally **UNKNOWN** value.

**Bits [11:10]**

Reserved, RES0.

**LPAE, bit [9]**

Format.

<table>
<thead>
<tr>
<th>LPAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>Using the Long-descriptor translation table format.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**Bits [8:6]**

Reserved, RES0.
STATUS, bits [5:0]

Fault Status Code. See the description of DFSR, DFSC for an SError interrupt.

This field resets to an architecturally UNKNOWN value.

Accessing the DISR

An indirect write to DISR made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of DISR occurring in program order after the ESB instruction.

DISR is RAZ/WI if EL3 is implemented, the PE is in Non-debug state, and any of the following apply:

- EL3 is using AArch64, SCR_EL3.EA == 1, and any of the following apply:
  - The PE is executing at EL2.
  - The PE is executing at EL1 and ((SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0) || HCR_EL2.AMO == 0).
- EL3 is using AArch32, SCR.EA == 1, and any of the following apply:
  - The PE is executing at EL2.
  - The PE is executing at EL1 and (SCR.NS == 0 || HCR.AMO == 0).

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

DSPSR, Debug Saved Program Status Register

The DSPSR characteristics are:

**Purpose**

Holds the saved process state for Debug state. On entering Debug state, PSTATE information is written to this register. On exiting Debug state, values are copied from this register to PSTATE.

**Configuration**

AArch32 System register DSPSR bits [31:0] are architecturally mapped to AArch64 System register DSPSR_EL0[31:0].

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

DSPSR is a 32-bit register.

**Field descriptions**

The DSPSR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| N  | Z  | C  | V  | Q  | IT[1:0] | DIT | SSBS | PAN | SS | IL | GE | IT[7:2] | E | A | I | F | T | M[4:0] |

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on entering Debug state, and copied to PSTATE.N on exiting Debug state.

This field resets to an architecturally **UNKNOWN** value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on entering Debug state, and copied to PSTATE.Z on exiting Debug state.

This field resets to an architecturally **UNKNOWN** value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on entering Debug state, and copied to PSTATE.C on exiting Debug state.

This field resets to an architecturally **UNKNOWN** value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on entering Debug state, and copied to PSTATE.V on exiting Debug state.

This field resets to an architecturally **UNKNOWN** value.
Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on entering Debug state, and copied to PSTATE.Q on exiting Debug state.

This field resets to an architecturally **UNKNOWN** value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on entering Debug state, and copied to PSTATE.IT[1:0] on exiting Debug state.

On exiting Debug state DSPSR.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

**DIT, bit [24]**

*When ARMv8.4-DIT is implemented:*

Data Independent Timing. Set to the value of PSTATE.DIT on entering Debug state, and copied to PSTATE.DIT on exiting Debug state.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**SSBS, bit [23]**

*When ARMv8.0-SSBS is implemented:*

Speculative Store Bypass. Set to the value of PSTATE.SSBS on entering Debug state, and copied to PSTATE.SSBS on exiting Debug state.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**PAN, bit [22]**

*When ARMv8.1-PAN is implemented:*

Privileged Access Never. Set to the value of PSTATE.PAN on entering Debug state, and copied to PSTATE.PAN on exiting Debug state.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE.SS on entering Debug state, and conditionally copied to PSTATE.SS on exiting Debug state.

This field resets to an architecturally **UNKNOWN** value.
IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on entering Debug state, and copied to PSTATE.IL on exiting Debug state.

This field resets to an architecturally **UNKNOWN** value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on entering Debug state, and copied to PSTATE.GE on exiting Debug state.

This field resets to an architecturally **UNKNOWN** value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on entering Debug state, and copied to PSTATE.IT[7:2] on exiting Debug state.

DSPSR.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on entering Debug state, and copied to PSTATE.E on exiting Debug state.

If the implementation does not support big-endian operation, DSPSR.E is **RES0**. If the implementation does not support little-endian operation, DSPSR.E is **RES1**. On exiting Debug state, if the implementation does not support big-endian operation at the Exception level being returned to, DSPSR.E is **RES0**, and if the implementation does not support little-endian operation at the Exception level being returned to, DSPSR.E is **RES1**.

This field resets to an architecturally **UNKNOWN** value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on entering Debug state, and copied to PSTATE.A on exiting Debug state.

This field resets to an architecturally **UNKNOWN** value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on entering Debug state, and copied to PSTATE.I on exiting Debug state.

This field resets to an architecturally **UNKNOWN** value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on entering Debug state, and copied to PSTATE.F on exiting Debug state.

This field resets to an architecturally **UNKNOWN** value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on entering Debug state, and copied to PSTATE.T on exiting Debug state.

This field resets to an architecturally **UNKNOWN** value.
**M[4:0], bits [4:0]**

Mode. Set to the value of PSTATE.M[4:0] on entering Debug state, and copied to PSTATE.M[4:0] on exiting Debug state.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>

Other values are reserved. If DSPSR.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, exiting Debug state is an illegal return event, as described in 'Illegal return events from AArch32 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

**Accessing the DSPSR**

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} \langle\text{coproc}\rangle, \{\#\langle\text{opc1}\rangle, \langle\text{Rt}\rangle, \langle\text{CRn}\rangle, \langle\text{CRm}\rangle\}\{, \{\#\langle\text{opc2}\rangle}\}
\]

The DTLBIALL characteristics are:

**Purpose**

Invalidate all cached copies of translation table entries from data TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
  - Would be required for the EL1&0 translation regime.
  - Match the current VMID, if EL2 is implemented and enabled in the current Security state.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at EL2, the stage 1 or stage 2 translation table entries that would be required for the Non-secure PL1&0 translation regime and matches the current VMID.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

**Configuration**

**Attributes**

DTLBIALL is a 32-bit System instruction.

**Field descriptions**

DTLBIALL ignores the value in the register specified by the instruction encoding. Software does not have to write a value to the register before issuing this instruction.

**Executing the DTLBIALL instruction**

Accesses to this instruction use the following encodings:

\[
\text{MCR}\{<c>\}{<q>\} \text{<coproc>, } \{\#}\text{<opc1>, } <\text{Rt}, >, <\text{CRn}, >, <\text{CRm}\{, \{\#}\text{<opc2}>}
\]

DTLBIASID, Data TLB Invalidate by ASID match

The DTLBIASID characteristics are:

**Purpose**

Invalidate all cached copies of translation table entries from data TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- If EL2 is implemented, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

**Configuration**

**Attributes**

DTLBIASID is a 32-bit System instruction.

**Field descriptions**

The DTLBIASID input value bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

DTLBIMVA, Data TLB Invalidate by VA

The DTLBIMVA characteristics are:

**Purpose**

Invalidate all cached copies of translation table entries from data TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

**Configuration**

**Attributes**

  DTLBIMVA(R[t]);
elsif PSTATE.EL == EL3 then
  DTLBIMVA(R[t]);

The DVRCTX characteristics are:

**Purpose**

Data Value Prediction Restriction by Context applies to all Data Value Prediction Resources that predict execution based on information gathered within the target execution context or contexts.

When this instruction is complete and synchronized, data value prediction does not permit later speculative execution within the target execution context to be observable through side channels.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

**Note**

This instruction does not require the invalidation of prediction structures so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

**Configuration**

This instruction is present only when ARMv8.0-PredInv is implemented. Otherwise, direct accesses to DVRCTX are UNDEFINED.

**Attributes**

DVRCTX is a 32-bit System instruction.

**Field descriptions**

The DVRCTX input value bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:28]**

Reserved, RES0.

**GVMID, bit [27]**

Execution of this instruction applies to all VMIDs or a specified VMID.

<table>
<thead>
<tr>
<th>GVMID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Applies to specified VMID for an EL0 or EL1 context. For all other contexts this field is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Applies to all VMIDs for an EL0 or EL1 context. For all other contexts this field is RES0.</td>
</tr>
</tbody>
</table>
If the instruction is executed at EL0 or EL1, then this field has an Effective value of 0.

**NS, bit [26]**

Security State.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure state.</td>
</tr>
</tbody>
</table>

If the instruction is executed in Non-secure state, this field has an Effective value of 1.

**EL, bits [25:24]**

Exception Level

<table>
<thead>
<tr>
<th>EL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>EL0.</td>
</tr>
<tr>
<td>0b01</td>
<td>EL1.</td>
</tr>
<tr>
<td>0b10</td>
<td>EL2.</td>
</tr>
<tr>
<td>0b11</td>
<td>EL3.</td>
</tr>
</tbody>
</table>

If the instruction is executed at an exception level lower than the specified level, this instruction is treated as a NOP.

**VMID, bits [23:16]**

Only applies when bit[27] is 0 and either:
- an EL1 context.
- an EL0 context when (HCR_EL2.E2H==0 or HCR_EL2.TGE==0) or EL2 is using AArch32 state.

Otherwise this field is RES0.

When the instruction is executed at EL1 then this field is treated as the current VMID.

When the instruction is executed at EL0 and (HCR_EL2.E2H==0 or HCR_EL2.TGE==0 or ELUsingAArch32(EL2)) then this field is treated as the current VMID.

When the instruction is executed at EL0 and (HCR_EL2.E2H==1 and HCR_EL2.TGE==1 and !ELUsingAArch32(EL2)) then this field is ignored.

**Bits [15:9]**

Reserved, RES0.

**GASID, bit [8]**

Execution of this instruction applies to all ASIDs or a specified ASID.

<table>
<thead>
<tr>
<th>GASID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Applies to specified ASID for an EL0 context. For all other contexts this field is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Applies to all ASID for an EL0 context. For all other contexts this field is RES0.</td>
</tr>
</tbody>
</table>

If the instruction is executed at EL0, then this field has an Effective value of 0.

**ASID, bits [7:0]**

Only applies for an EL0 context and when bit[8] is 0.

Otherwise this field is RES0.

When the instruction is executed at EL0 then this field is treated as the current ASID.
Executing the DVPRCTX instruction

Accesses to this instruction use the following encodings:

\[
\text{MCR}\{<c>\}\{<q>\} \text{<coproc>}, \{#\} \text{<opc1>}, \text{<Rt>}, \text{<CRn>}, \text{<CRm>}, \{#\} \text{<opc2>}

ELR_hyp, Exception Link Register (Hyp mode)

The ELR_hyp characteristics are:

**Purpose**

When taking an exception to Hyp mode, holds the address to return to.

**Configuration**

AArch32 System register ELR_hyp bits [31:0] are architecturally mapped to AArch64 System register ELR_EL2[31:0]. On a reset into an Exception level that is using AArch32 ELR_hyp is **UNKNOWN**.

**Attributes**

ELR_hyp is a 32-bit register.

**Field descriptions**

The ELR_hyp bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [31:0]**

Return address.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the ELR_hyp**

ELR_hyp is accessible only at Hyp mode and Monitor mode. For more details, see MRS (banked register) and MSR (banked register) in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Accesses to this register use the following encodings:

**MRS{<c>}{<q>} <Rd>, ELR_hyp**

<table>
<thead>
<tr>
<th>R</th>
<th>M</th>
<th>M1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>0b1</td>
<td>0b1110</td>
</tr>
</tbody>
</table>

**MSR{<c>}{<q>} ELR_hyp, <Rn>**

<table>
<thead>
<tr>
<th>R</th>
<th>M</th>
<th>M1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>0b1</td>
<td>0b1110</td>
</tr>
</tbody>
</table>
The ERRIDR characteristics are:

**Purpose**

Defines the highest numbered index of the error records that can be accessed through the Error Record System registers.

**Configuration**

AArch32 System register ERRIDR bits [31:0] are architecturally mapped to AArch64 System register `ERRIDR_EL1[31:0]`.

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRIDR are `UNDEFINED`.

**Attributes**

ERRIDR is a 32-bit register.

**Field descriptions**

The ERRIDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>15-0</td>
<td>NUM, highest numbered index of the records plus one. Zero indicates no records can be accessed through the Error Record System registers. Each implemented record is owned by a node. A node might own multiple records.</td>
</tr>
</tbody>
</table>

**Accessing the ERRIDR**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>

ERRSELR, Error Record Select Register

The ERRSELR characteristics are:

**Purpose**

Selects an error record to be accessed through the Error Record System registers.

**Configuration**

AArch32 System register ERRSELR bits [31:0] are architecturally mapped to AArch64 System register `ERRSELR_EL1[31:0]`.

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRSELR are **UNDEFINED**.

If `ERRIDR` indicates that zero error records are implemented, then it is **IMPLEMENTATION DEFINED** whether ERRSELR is **UNDEFINED** or `RES0`.

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

ERRSELR is a 32-bit register.

**Field descriptions**

The ERRSELR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>

</tbody>
</table>

**Bits [31:16]**

Reserved, `RES0`.

**SEL, bits [15:0]**

Selects the error record accessed through the ERX registers.

If ERRSELR.SEL is set to a value greater than or equal to `ERRIDR.NUM`, then all of the following apply:

- The value read back from ERRSELR.SEL is **UNKNOWN**.
- One of the following occurs:
  - An **UNKNOWN** error record is selected.
  - The ERX* registers are RAZ/WI.
  - ERX* register reads and writes are NOPs.
  - ERX* register reads and writes are **UNDEFINED**.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the ERRSELR**

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T5 == '1' then

ERXCTRL2, Selected Error Record Control Register 2

The ERXCTRL2 characteristics are:

**Purpose**

Accesses bits [63:32] of `ERR<n>CTRL` for the error record selected by `ERRSELR.SEL`.

**Configuration**

AArch32 System register ERXCTRL2 bits [31:0] are architecturally mapped to AArch64 System register `ERXCTRL_EL1[63:32]`.

This register is present only when RAS is implemented. Otherwise, direct accesses to ERXCTRL2 are **UNDEFINED**.

**Attributes**

ERXCTRL2 is a 32-bit register.

**Field descriptions**

The ERXCTRL2 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

Bits [63:32] of ERR<n>CTRL

**Accessing the ERXCTRL2**

If `ERRIDR.NUM == 0` or `ERRSELR.SEL` is set to a value greater than or equal to `ERRIDR.NUM`, then one of the following occurs:

- An **UNKNOWN** record is selected.
- ERXCTRL2 is RAZ/WI.
- Direct reads and writes of ERXCTRL2 are NOPs.
- Direct reads and writes of ERXCTRL2 are **UNDEFINED**.

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#<opc1>}, <Rt>, <CRn>, <CRm>{, {#<opc2>}}
```

The ERXMISC5 characteristics are:

**Purpose**

Accesses bits [63:32] of ERR\textless{}n\textgreater{}MISC2 for the error record selected by ERRSELR.SEL.

**Configuration**

AArch32 System register ERXMISC5 bits [31:0] are architecturally mapped to AArch64 System register ERXMISC2_EL1[63:32].

This register is present only when ARMv8.4-RAS is implemented. Otherwise, direct accesses to ERXMISC5 are UNDEFINED.

**Attributes**

ERXMISC5 is a 32-bit register.

**Field descriptions**

The ERXMISC5 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bits [63:32] of ERR\textless{}n\textgreater{}MISC2 |

**Bits [31:0]**

ERXMISC5 accesses bits [63:32] of ERR\textless{}n\textgreater{}MISC2, where n is the value in ERRSELR.SEL.

**Accessing the ERXMISC5**

If ERRIDR.NUM == 0 or ERRSELR.SEL is set to a value greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An **UNKNOWN** record is selected.
- ERXMISC5 is RAZ/WI.
- Direct reads and writes of ERXMISC5 are NOPs.
- Direct reads and writes of ERXMISC5 are UNDEFINED.

Accesses to this register use the following encodings:

\[ \text{MRC}\{\text{<c>}\}\{\text{<q>}\} \text{ <coproc>, \{#\<opc1>, \<Rt>, \<CRn>, \<CRm>\} \{\#\<opc2>\} } \]

    endif
ERXSTATUS, Selected Error Record Primary Status Register

The ERXSTATUS characteristics are:

**Purpose**

Accesses bits [31:0] of `ERR<n>STATUS` for the error record selected by `ERRSELr_SEL`.

**Configuration**

AArch32 System register ERXSTATUS bits [31:0] are architecturally mapped to AArch64 System register `ERXSTATUS_EL1[31:0]`.

This register is present only when RAS is implemented. Otherwise, direct accesses to ERXSTATUS are `UNDEFINED`.

**Attributes**

ERXSTATUS is a 32-bit register.

**Field descriptions**

The ERXSTATUS bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [31:0] of ERR&lt;n&gt;STATUS</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:0]**

ERXSTATUS accesses bits [31:0] of `ERR<n>STATUS`, where n is the value in `ERRSELr_SEL`.

**Accessing the ERXSTATUS**

If `ERRIDr_NUM == 0` or `ERRSELr_SEL` is set to a value greater than or equal to `ERRIDr_NUM`, then one of the following occurs:

- An `UNKNOWN` record is selected.
- ERXSTATUS is RAZ/WI.
- Direct reads and writes of ERXSTATUS are NOPs.
- Direct reads and writes of ERXSTATUS are `UNDEFINED`.

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#<opc1>, <Rt>, <CRn>, <CRm>{, {#<opc2>}}
```

<table>

        else
            ERXSTATUS = R[t];
FCSEIDR, FCSE Process ID register

The FCSEIDR characteristics are:

**Purpose**

Identifies whether the Fast Context Switch Extension (FCSE) is implemented.

From Armv8, the FCSE is not implemented, so this register is RAZ/WI. Software can access this register to determine that the implementation does not include the FCSE.

**Configuration**

**Attributes**

FCSEIDR is a 32-bit register.

**Field descriptions**

The FCSEIDR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>

FPEXC, Floating-Point Exception Control register

The FPEXC characteristics are:

**Purpose**

Provides a global enable for the implemented Advanced SIMD and floating-point functionality, and reports floating-point status information.

**Configuration**

AArch32 System register FPEXC bits [31:0] are architecturally mapped to AArch64 System register FPEXC32_EL2[31:0].

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

FPEXC is a 32-bit register.

**Field descriptions**

The FPEXC bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>EX</td>
<td>Exception bit. From Armv8, this bit is RAZ/WI.</td>
</tr>
<tr>
<td></td>
<td>EN</td>
<td>Enables access to the Advanced SIMD and floating-point functionality from all Exception levels, except that setting this field to 0 does not disable the following:</td>
</tr>
<tr>
<td>0</td>
<td>0b0</td>
<td>VMSR accesses to the [<strong>FPEXC</strong> or <strong>FPSID</strong>.]</td>
</tr>
<tr>
<td></td>
<td>0b1</td>
<td>VMRS accesses from the [<strong>FPEXC</strong>, <strong>FPSID</strong>, <strong>MVFR0</strong>, <strong>MVFR1</strong>, or <strong>MVFR2</strong>.]</td>
</tr>
</tbody>
</table>

Execution of floating-point and Advanced SIMD instructions in AArch32 state can be disabled or trapped by the following controls:

- **CPACR**, cp10, or, if executing at EL0, **CPACR_EL1.FPEN**.
- **FPEXC.EN**.
- If executing in Non-secure state:
  - **HCTR**, TCP10, or if EL2 is using AArch64, **CPR_EL2.TFP**.
  - **NSACR**, cp10, or if EL3 is using AArch64, **CPR_EL3.TFP**.
- For Advanced SIMD instructions only:
If executing in Non-secure state, HCPTR.TASE and NSACR.NSTRCDIS.

See the descriptions of the controls for more information.

**Note**

When executing at EL0 using AArch32:

- If EL1 is using AArch64 then behavior is as if the value of FPEXC.EN is 1.
- If EL2 is using AArch64 and enabled in the current Security state, and the value of HCR_EL2.{RW, TGE} is \{1, 1\}, then the behavior is as if the value of FPEXC.EN is 1.
- If EL2 is using AArch64 and enabled in the current Security state, and the value of HCR_EL2.{RW, TGE} is \{0, 1\}, then it is IMPLEMENTATION DEFINED whether the behavior is:
  - As if the value of FPEXC.EN is 1.
  - Determined by the value of FPEXC.EN, as described in this field description. However, Arm deprecates using the value of FPEXC.EN to determine behavior.

This field resets to 0.

**DEX, bit [29]**

Defined synchronous exception on floating-point execution.

This field identifies whether a synchronous exception generated by the attempted execution of an instruction was generated by an unallocated encoding. The instruction must be in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr() returning TRUE. This field also indicates whether the FPEXC.TFV field is valid.

The meaning of this bit is:

<table>
<thead>
<tr>
<th>DEX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The exception was generated by the attempted execution of an unallocated instruction in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr(). If FPEXC.TFV is RW then it is invalid and UNKNOWN. If FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} are RW then they are invalid and UNKNOWN.</td>
</tr>
<tr>
<td>0b1</td>
<td>The exception was generated during the execution of an unallocated encoding. FPEXC.TFV is valid and indicates the cause of the exception.</td>
</tr>
</tbody>
</table>

On an exception that sets this bit to 1 the exception-handling routine must clear this bit to 0.

On an implementation that both does not support trapping of floating-point exceptions and implements the FPSCR.{Stride, Len} fields as RAZ, this bit is RES0.

This field resets to an architecturally UNKNOWN value.

**FP2V, bit [28]**

FPINST2 instruction valid bit. From Armv8, this bit is RES0.

This field resets to an architecturally UNKNOWN value.

**VV, bit [27]**

VECITR valid bit. From Armv8, this bit is RES0.

This field resets to an architecturally UNKNOWN value.
TFV, bit [26]

Trapped Fault Valid bit. Valid only when the value of FPEXC.DEX is 1. When valid, it indicates the cause of the exception and therefore whether the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are valid.

<table>
<thead>
<tr>
<th>TFV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The exception was caused by the execution of a floating-point VABS, VADD, VDIV, VFMA, VFMS, VFNMA, VFNMS, VMLA, VMLS, VMOV, VMUL, VNEG, VNMLA, VNMLS, VNMLU, VSDIV, VSQRT, or VSUB instruction when one or both of FPCR, {Stride, Len} was non-zero. If the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are RW then they are invalid and UNKNOWN.</td>
</tr>
<tr>
<td>0b1</td>
<td>FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} indicate the presence of trapped floating-point exceptions that had occurred at the time of the exception. Bits are set for all trapped exceptions that had occurred at the time of the exception.</td>
</tr>
</tbody>
</table>

This bit returns a status value and ignores writes.

When the value of FPEXC.DEX is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On an implementation that supports the trapping of floating-point exceptions and implements FPCR, {Stride, Len} as RAZ, this bit is RAO/WI.

This field resets to an architecturally UNKNOWN value.

Bits [25:11]

Reserved, RES0.

VECITR, bits [10:8]

Vector iteration count. From Armv8, this field is RES1.

This field resets to an architecturally UNKNOWN value.

IDF, bit [7]

Input Denormal trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Input Denormal exception occurred while FPCR, IDE was 1:

<table>
<thead>
<tr>
<th>IDF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Input Denormal exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Input Denormal exception has occurred.</td>
</tr>
</tbody>
</table>

Input Denormal exceptions can occur only when FPCR, FZ is 1.

Note

A half-precision floating-point value that is flushed to zero because the value of FPCR, FZ16 is 1 does not generate an Input Denormal exception.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

This field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.
IXF, bit [4]

Inexact trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Inexact exception occurred while `FPSCR.IXE` was 1:

<table>
<thead>
<tr>
<th>IXF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Inexact exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Inexact exception has occurred.</td>
</tr>
</tbody>
</table>

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and **UNKNOWN**.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

This field resets to an architecturally **UNKNOWN** value.

UFF, bit [3]

Underflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Underflow exception occurred while `FPSCR.UFE` was 1:

<table>
<thead>
<tr>
<th>UFF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Underflow exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Underflow exception has occurred.</td>
</tr>
</tbody>
</table>

Underflow trapped exceptions can occur:

- On half-precision data-processing instructions only when `FPSCR.FZ16` is 0.
- Otherwise only when `FPSCR.FZ` is 0.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and **UNKNOWN**.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

This field resets to an architecturally **UNKNOWN** value.

OFF, bit [2]

Overflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Overflow exception occurred while `FPSCR.OFE` was 1:

<table>
<thead>
<tr>
<th>OFF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Overflow exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Overflow exception has occurred.</td>
</tr>
</tbody>
</table>

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and **UNKNOWN**.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

This field resets to an architecturally **UNKNOWN** value.

DZF, bit [1]

Divide by Zero trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether a Divide by Zero exception occurred while `FPSCR.DZE` was 1:

<table>
<thead>
<tr>
<th>DZF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Divide by Zero exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Divide by Zero exception has occurred.</td>
</tr>
</tbody>
</table>

This bit must be cleared to 0 by the exception-handling routine.
When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and **UNKNOWN**.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

This field resets to an architecturally **UNKNOWN** value.

**IOF, bit [0]**

Invalid Operation trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Invalid Operation exception occurred while **FPSCR.IOE** was 1:

<table>
<thead>
<tr>
<th>IOF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Invalid Operation exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Invalid Operation exception has occurred.</td>
</tr>
</tbody>
</table>

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and **UNKNOWN**.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the FPEXC**

Accesses to this register use the following encodings:

FPEXC, Floating-Point Exception Control register
FPSCR, Floating-Point Status and Control Register

The FPSCR characteristics are:

**Purpose**

Provides floating-point system status information and control.

**Configuration**

The named fields in this register map to the equivalent fields in the AArch64 FPCR and FPSR.

It is IMPLEMENTATION DEFINED whether the Len and Stride fields can be programmed to non-zero values, which will cause some AArch32 floating-point instruction encodings to be UNDEFINED, or whether these fields are RAZ.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

FPSCR is a 32-bit register.

**Field descriptions**

The FPSCR bit assignments are:

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
N | Z | V | Q | A | H | P | D | N | F | Z | R | M | o | d | e | S | t | r | i | d | e | F | Z | 1 | 6
```

**N, bit [31]**

Negative condition flag. This is updated by floating-point comparison operations.

This field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero condition flag. This is updated by floating-point comparison operations.

This field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry condition flag. This is updated by floating-point comparison operations.

This field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow condition flag. This is updated by floating-point comparison operations.

This field resets to an architecturally UNKNOWN value.
QC, bit [27]

Cumulative saturation bit, Advanced SIMD only. This bit is set to 1 to indicate that an Advanced SIMD integer
operation has saturated since 0 was last written to this bit.

This field resets to an architecturally **UNKNOWN** value.

AHP, bit [26]

Alternative half-precision control bit:

<table>
<thead>
<tr>
<th>AHP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IEEE half-precision format selected.</td>
</tr>
<tr>
<td>0b1</td>
<td>Alternative half-precision format selected.</td>
</tr>
</tbody>
</table>

This bit is only used for conversions between half-precision floating-point and other floating-point formats.

The data-processing instructions added as part of the ARMv8.2-FP16 extension always use the IEEE half-precision
format, and ignore the value of this bit.

This field resets to an architecturally **UNKNOWN** value.

DN, bit [25]

Default NaN mode control bit:

<table>
<thead>
<tr>
<th>DN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>NaN operands propagate through to the output of a floating-point operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any operation involving one or more NaNs returns the Default NaN.</td>
</tr>
</tbody>
</table>

The value of this bit only controls scalar floating-point arithmetic. Advanced SIMD arithmetic always uses the Default NaN setting, regardless of the value of the DN bit.

This field resets to an architecturally **UNKNOWN** value.

FZ, bit [24]

Flush-to-zero mode control bit:

<table>
<thead>
<tr>
<th>FZ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard.</td>
</tr>
<tr>
<td>0b1</td>
<td>Flush-to-zero mode enabled.</td>
</tr>
</tbody>
</table>

The value of this bit only controls scalar floating-point arithmetic. Advanced SIMD arithmetic always uses the Flush-to-zero setting, regardless of the value of the FZ bit.

This bit has no effect on half-precision calculations.

This field resets to an architecturally **UNKNOWN** value.

RMode, bits [23:22]

Rounding Mode control field. The encoding of this field is:

<table>
<thead>
<tr>
<th>RMode</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Round to Nearest (RN) mode.</td>
</tr>
<tr>
<td>0b01</td>
<td>Round towards Plus Infinity (RP) mode.</td>
</tr>
<tr>
<td>0b10</td>
<td>Round towards Minus Infinity (RM) mode.</td>
</tr>
<tr>
<td>0b11</td>
<td>Round towards Zero (RZ) mode.</td>
</tr>
</tbody>
</table>

The specified rounding mode is used by almost all scalar floating-point instructions. Advanced SIMD arithmetic always uses the Round to Nearest setting, regardless of the value of the RMode bits.
This field resets to an architecturally **UNKNOWN** value.

**Stride, bits [21:20]**

It is **IMPLEMENTATION DEFINED** whether this field is RW or RAZ.

If this field is RW and is set to a value other than zero, some floating-point instruction encodings are **UNDEFINED**. The instruction pseudocode identifies these instructions.

Arm strongly recommends that software never sets this field to a value other than zero.

The value of this field is ignored when processing Advanced SIMD instructions.

This field resets to an architecturally **UNKNOWN** value.

**FZ16, bit [19]**

*When ARMv8.2-FP16 is implemented:*

Flush-to-zero mode control bit on half-precision data-processing instructions:

<table>
<thead>
<tr>
<th>FZ16</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard.</td>
</tr>
<tr>
<td>0b1</td>
<td>Flush-to-zero mode enabled.</td>
</tr>
</tbody>
</table>

The value of this bit applies to both scalar and Advanced SIMD floating-point half-precision calculations.

This field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, **RES0**.

**Len, bits [18:16]**

It is **IMPLEMENTATION DEFINED** whether this field is RW or RAZ.

If this field is RW and is set to a value other than zero, some floating-point instruction encodings are **UNDEFINED**. The instruction pseudocode identifies these instructions.

Arm strongly recommends that software never sets this field to a value other than zero.

The value of this field is ignored when processing Advanced SIMD instructions.

This field resets to an architecturally **UNKNOWN** value.

**IDE, bit [15]**

Input Denormal floating-point exception trap enable. Possible values are:

<table>
<thead>
<tr>
<th>IDE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Untrapped exception handling selected. If the floating-point exception occurs then the IDC bit is set to 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the IDC bit. The trap handling software can decide whether to set the IDC bit to 1.</td>
</tr>
</tbody>
</table>

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is **RAZ/WI**.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

This field resets to an architecturally **UNKNOWN** value.
Reserved, RES0.

**IXE, bit [12]**

Inexact floating-point exception trap enable. Possible values are:

<table>
<thead>
<tr>
<th>IXE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Untrapped exception handling selected. If the floating-point exception occurs then the IXC bit is set to 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the IXC bit. The trap handling software can decide whether to set the IXC bit to 1.</td>
</tr>
</tbody>
</table>

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

This field resets to an architecturally **UNKNOWN** value.

**UFE, bit [11]**

Underflow floating-point exception trap enable. Possible values are:

<table>
<thead>
<tr>
<th>UFE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Untrapped exception handling selected. If the floating-point exception occurs then the UFC bit is set to 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the UFC bit. The trap handling software can decide whether to set the UFC bit to 1.</td>
</tr>
</tbody>
</table>

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

This field resets to an architecturally **UNKNOWN** value.

**OFE, bit [10]**

Overflow floating-point exception trap enable. Possible values are:

<table>
<thead>
<tr>
<th>OFE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Untrapped exception handling selected. If the floating-point exception occurs then the OFC bit is set to 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the OFC bit. The trap handling software can decide whether to set the OFC bit to 1.</td>
</tr>
</tbody>
</table>

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

This field resets to an architecturally **UNKNOWN** value.

**DZE, bit [9]**

Divide by Zero floating-point exception trap enable. Possible values are:
DZE, bit [9]

Untrapped exception handling selected. If the floating-point exception occurs then the DZC bit is set to 1.

Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the DZC bit. The trap handling software can decide whether to set the DZC bit to 1.

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

This field resets to an architecturally UNKNOWN value.

IOE, bit [8]

Invalid Operation floating-point exception trap enable. Possible values are:

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

This field resets to an architecturally UNKNOWN value.

IDC, bit [7]

Input Denormal cumulative floating-point exception bit. This bit is set to 1 to indicate that the Input Denormal floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the IDE bit.

Advanced SIMD instructions set this bit if the Input Denormal floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the IDE bit.

This field resets to an architecturally UNKNOWN value.

Reserved, RES0.

IXC, bit [4]

Inexact cumulative floating-point exception bit. This bit is set to 1 to indicate that the Inexact floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the IXE bit.

Advanced SIMD instructions set this bit if the Inexact floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the IXE bit.

This field resets to an architecturally UNKNOWN value.

UFC, bit [3]

Underflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Underflow floating-point exception has occurred since 0 was last written to this bit.
How VFP instructions update this bit depends on the value of the UFE bit.

Advanced SIMD instructions set this bit if the Underflow floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the UFE bit.

This field resets to an architecturally **UNKNOWN** value.

**OFC, bit [2]**

Overflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Overflow floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the OFE bit.

Advanced SIMD instructions set this bit if the Overflow floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the OFE bit.

This field resets to an architecturally **UNKNOWN** value.

**DZC, bit [1]**

Divide by Zero cumulative floating-point exception bit. This bit is set to 1 to indicate that the Divide by Zero floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the DZE bit.

Advanced SIMD instructions set this bit if the Divide by Zero floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the DZE bit.

This field resets to an architecturally **UNKNOWN** value.

**IOC, bit [0]**

Invalid Operation cumulative floating-point exception bit. This bit is set to 1 to indicate that the Invalid Operation floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the IOE bit.

Advanced SIMD instructions set this bit if the Invalid Operation floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the IOE bit.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the FPSCR**

Accesses to this register use the following encodings:

```
VMRS{<c>}{<q>} <Rt>, <spec_reg>
```

<table>
<thead>
<tr>
<th>reg</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>

**FPSID, Floating-Point System ID register**

The FPSID characteristics are:

**Purpose**

Provides top-level information about the floating-point implementation.

This register largely duplicates information held in the MIDR. Arm deprecates use of it.

**Configuration**

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

FPSID is a 32-bit register.

**Field descriptions**

The FPSID bit assignments are:

<table>
<thead>
<tr>
<th>Implementer</th>
<th>SW</th>
<th>Subarchitecture</th>
<th>PartNum</th>
<th>Variant</th>
<th>Revision</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 30 29</td>
<td>28 27</td>
<td>26 25 24 23</td>
<td>22 21</td>
<td>20 19</td>
<td>18 17 16</td>
</tr>
</tbody>
</table>

**Implementer, bits [31:24]**

Implementer codes are the same as those used for the MIDR.

For an implementation by Arm this field is 0x41, the ASCII code for A.

This field resets to an architecturally **UNKNOWN** value.

**SW, bit [23]**

Software bit. Defined values are:

<table>
<thead>
<tr>
<th>SW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The implementation provides a hardware implementation of the floating-point instructions.</td>
</tr>
<tr>
<td>0b1</td>
<td>The implementation supports only software emulation of the floating-point instructions.</td>
</tr>
</tbody>
</table>

In Armv8-A the only permitted value is 0b0.

This field resets to an architecturally **UNKNOWN** value.

**Subarchitecture, bits [22:16]**

Subarchitecture version number. For an implementation by Arm, defined values are:
**Subarchitecture** | **Meaning**  
--- | ---  
0b0000000 | VFPv1 architecture with an IMPLEMENTATION DEFINED subarchitecture.  
0b0000001 | VFPv2 architecture with Common VFP subarchitecture v1.  
0b0000010 | VFPv3 architecture, or later, with Common VFP subarchitecture v2. The VFP architecture version is indicated by the \( \text{MVFR0} \) and \( \text{MVFR1} \) registers.  
0b0000011 | VFPv3 architecture, or later, with Null subarchitecture. The entire floating-point implementation is in hardware, and no software support code is required. The VFP architecture version is indicated by the \( \text{MVFR0} \) and \( \text{MVFR1} \) registers. This value can be used only by an implementation that does not support the trap enable bits in the \( \text{FPSCR} \).  
0b0000100 | VFPv3 architecture, or later, with Common VFP subarchitecture v3, and support for trap enable bits in \( \text{FPSCR} \). The VFP architecture version is indicated by the \( \text{MVFR0} \) and \( \text{MVFR1} \) registers.  

For a subarchitecture designed by Arm the most significant bit of this field, register bit[22], is 0. Values with a most significant bit of 0 that are not listed here are reserved.

When the subarchitecture designer is not Arm, the most significant bit of this field, register bit[22], must be 1. Each implementer must maintain its own list of subarchitectures it has designed, starting at subarchitecture version number 0x40.

In Armv8-A the permitted values are 0b0000011 and 0b0000100.

This field resets to an architecturally UNKNOWN value.

**PartNum, bits [15:8]**

An IMPLEMENTATION DEFINED part number for the floating-point implementation, assigned by the implementer.

This field resets to an architecturally UNKNOWN value.

**Variant, bits [7:4]**

An IMPLEMENTATION DEFINED variant number. Typically, this field distinguishes between different production variants of a single product.

This field resets to an architecturally UNKNOWN value.

**Revision, bits [3:0]**

An IMPLEMENTATION DEFINED revision number for the floating-point implementation.

This field resets to an architecturally UNKNOWN value.

**Accessing the FPSID**

Accesses to this register use the following encodings:

\[
\text{VMRS}\{<c>\}{<q>} \ <Rt>, \ <\text{spec\_reg}> 
\]

HACR, Hyp Auxiliary Configuration Register

The HACR characteristics are:

Purpose

Controls trapping to Hyp mode of IMPLEMENTATION DEFINED aspects of Non-secure EL1 or EL0 operation.

Configuration

AArch32 System register HACR bits [31:0] are architecturally mapped to AArch64 System register HACR_EL2[31:0]. If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

HACR is a 32-bit register.

Field descriptions

The HACR bit assignments are:

HACTLR2, Hyp Auxiliary Control Register 2

The HACTLR2 characteristics are:

**Purpose**

Provides additional space to the HACTLR register to hold *IMPLEMENTATION DEFINED* trap functionality.

**Configuration**

AArch32 System register HACTLR2 bits [31:0] are architecturally mapped to AArch64 System register ACTLR_EL2[63:32].

In Armv8.0 and Armv8.1, it is *IMPLEMENTATION DEFINED* whether this register is implemented, or whether it causes *UNDEFINED* exceptions when accessed. The implementation of this register can be detected by examining *ID_MMFR4.AC2*.

From Armv8.2 this register must be implemented.

RW fields in this register reset to architecturally *UNKNOWN* values.

**Attributes**

HACTLR2 is a 32-bit register.

**Field descriptions**

The HACTLR2 bit assignments are:

<table>

HAMAIR1, Hyp Auxiliary Memory Attribute Indirection Register 1

The HAMAIR1 characteristics are:

**Purpose**

Provides IMPLEMENTATION DEFINED memory attributes for the memory attribute encodings defined by HMAIR1. These IMPLEMENTATION DEFINED attributes can only provide additional qualifiers for the memory attribute encodings, and cannot change the memory attributes defined in HMAIR1.

**Configuration**

AArch32 System register HAMAIR1 bits [31:0] are architecturally mapped to AArch64 System register AMAIR_EL2[63:32].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HAMAIR1 is a 32-bit register.

**Field descriptions**

The HAMAIR1 bit assignments are:

If an implementation does not provide any IMPLEMENTATION DEFINED memory attributes, this register is RES0.

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

**Accessing the HAMAIR1**

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}\{<q>\} \ <\text{coproc}>\, \{#\}<\text{opc1}>\, \,<\text{Rt}>\, \,<\text{CRn}>\, \,<\text{CRm}>\, \{\#\}<\text{opc2}>\]

The HCPTR characteristics are:

**Purpose**

**Controls:**

- Trapping to Hyp mode of Non-secure access, at EL1 or EL0, to trace, and to Advanced SIMD and floating-point functionality.
- Hyp mode access to trace, and to Advanced SIMD and floating-point functionality.

**Note**

Accesses to this functionality:

- From Non-secure modes other than Hyp mode are also affected by settings in the CPACR and NSACR.
- From Hyp mode are also affected by settings in the NSACR.

Exceptions generated by the CPACR and NSACR controls are higher priority than those generated by the HCPTR controls.

**Configuration**

AArch32 System register HCPTR bits [31:0] are architecturally mapped to AArch64 System register CPTR_EL2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HCPT is a 32-bit register.

**Field descriptions**

The HCPTR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| TCPAC | TAM | RES0 | TTA | RES0 | TASE | RES0 | RES1 | TCP11 | TCP10 | RES1 |

**TCPAC, bit [31]**

Traps Non-secure EL1 accesses to the CPACR to Hyp mode.

<table>
<thead>
<tr>
<th>TCPAC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 accesses to the CPACR are trapped to Hyp mode.</td>
</tr>
</tbody>
</table>

**Note**

The CPACR is not accessible at EL0.

In a system where the PE resets into EL2 or EL3, this field resets to 0.
**TAM, bit [30]**

When AMUv1 is implemented:

Trap Activity Monitor access. Traps Non-secure EL1 and EL0 accesses to all Activity Monitor registers to EL2.

<table>
<thead>
<tr>
<th>TAM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses from Non-secure EL1 and EL0 to Activity Monitor registers are not trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses from Non-secure EL1 and EL0 to Activity Monitor registers are trapped to Hyp mode.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bits [29:21]**

Reserved, RES0.

**TTA, bit [20]**

Traps Non-secure System register accesses to all implemented trace registers to Hyp mode.

<table>
<thead>
<tr>
<th>TTA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>
| 0b1  | Any Non-secure System register access to an implemented trace register is trapped to Hyp mode, unless the access is trapped to EL1 by a CPACR or NSACR control, or the access is from Non-secure EL0 and the definition of the register in the appropriate trace architecture specification indicates that the register is not accessible from EL0. A trapped instruction generates:  
  • A Hyp Trap exception, if the exception is taken from Non-secure EL0 or EL1.  
  • An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode. |

If the implementation does not include a PE trace unit, or does not include a System register interface to the PE trace unit registers, it is IMPLEMENTATION DEFINED whether this bit:

- Is RES0.
- Is RES1.
- Can be written from Hyp mode, and from Secure Monitor mode when SCR.NS is 1.

If EL3 is implemented and is using AArch32, and the value of NSACR.NSTRCDIS is 1, in Non-secure state this field behaves as RAO/WI, regardless of its actual value.

**Note**

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the implementation includes an ETMv4 implementation, EL0 accesses to the trace registers are UNDEFINED, and a resulting Undefined Instruction exception is higher priority than a HCPTR.TTA Hyp Trap exception.
- The architecture does not provide traps on trace register accesses through the optional memory-mapped debug interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

In a system where the PE resets into EL2 or EL3, this field resets to 0.
Bits [19:16]
Reserved, RES0.

TASE, bit [15]
Traps Non-secure execution of Advanced SIMD instructions to Hyp mode when the value of HC PTR.TCP10 is 0.

<table>
<thead>
<tr>
<th>TASE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the value of HC PTR.TCP10 is 0, any attempt to execute an Advanced SIMD instruction in Non-secure state is trapped to Hyp mode, unless it is trapped to EL1 by a CPACR or NSACR control. A trapped instruction generates:</td>
</tr>
<tr>
<td></td>
<td>• A Hyp Trap exception, if the exception is taken from Non-secure EL0 or EL1.</td>
</tr>
<tr>
<td></td>
<td>• An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode.</td>
</tr>
</tbody>
</table>

When the value of HC PTR.TCP10 is 1, the value of this field is ignored.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES1. Otherwise, it is IMPLEMENTATION DEFINED whether this field is implemented as a RW field. If it is not implemented as a RW field, then it is RAZ/WI.

If EL3 is implemented and is using AArch32, and the value of NSACR.NSASEDIS is 1, in Non-secure state this field behaves as RAO/WI, regardless of its actual value. This applies even if the field is implemented as RAZ/WI.

For the list of instructions affected by this field, see ‘Controls of Advanced SIMD operation that do not apply to floating-point operation’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section E1.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

Bit [14]
Reserved, RES0.

Bits [13:12]
Reserved, RES1.

TCP11, bit [11]
The value of this field is ignored. If this field is programmed with a different value to the TCP10 bit then this field is UNKNOWN on a direct read of the HC PTR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES1.

If EL3 is implemented and is using AArch32, and the value of NSACR.cp10 is 0, in Non-secure state this field behaves as RAO/WI, regardless of its actual value.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

TCP10, bit [10]
Trap Non-secure accesses to Advanced SIMD and floating-point functionality to Hyp mode:
Meaning

<table>
<thead>
<tr>
<th>TCP10</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any attempted access to Advanced SIMD and floating-point functionality from Non-secure state is trapped to Hyp mode, unless it is trapped to EL1 by a CPACR or NSACR control. A trapped instruction generates:</td>
</tr>
<tr>
<td></td>
<td>• A Hyp Trap exception, if the exception is taken from Non-secure EL0 or EL1.</td>
</tr>
<tr>
<td></td>
<td>• An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode.</td>
</tr>
</tbody>
</table>

The Advanced SIMD and floating-point features controlled by these fields are:

- Execution of any floating-point or Advanced SIMD instruction.
- Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
- Any access to the FPSCR, FPSID, MVFR0, MVFR1, MVFR2, or FPXCR System registers.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES1.

If EL3 is implemented and is using AArch32, and the value of NSACR.cp10 is 0, in Non-secure state this field behaves as RAO/WI, regardless of its actual value.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

Bits [9:0]

Reserved, RES1.

Accessing the HCPTTR

HCR, Hyp Configuration Register

The HCR characteristics are:

**Purpose**

Provides configuration controls for virtualization, including defining whether various Non-secure operations are trapped to Hyp mode.

**Configuration**

AArch32 System register HCR bits [31:0] are architecturally mapped to AArch64 System register \texttt{HCR\_EL2[31:0]}.

If EL2 is not implemented, this register is \texttt{RES0} from EL3.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally \texttt{UNKNOWN} values.

**Attributes**

HCR is a 32-bit register.

**Field descriptions**

The HCR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>

</tbody>
</table>

**TRVM, bit [30]**

Trap Reads of Virtual Memory controls. Traps Non-secure EL1 reads of the virtual memory control registers to EL2, when EL2 is enabled in the current Security state.

The registers for which read accesses are trapped are as follows:

- SCTLR
- TTBR0, TTBR1
- TTBCR
- TTBCR2
- DACR
- DFSR
- IFSR
- DFAR
- IFAR
- ADFSR
- AIFSR
- PRRR
- NMRR
- MAIR0
- MAIR1
- AMAIR0
- AMAIR1
- CONTEXTIDR

<table>
<thead>
<tr>
<th>TRVM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 read accesses to the specified Virtual Memory controls are trapped to EL2.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2 or EL3, this field resets to 0.

**HCD, bit [29]**

HVC instruction disable. Disables Non-secure EL1 and EL2 execution of HVC instructions, when EL2 is enabled in the current Security state.
### HCD

<table>
<thead>
<tr>
<th>HCD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>HVC instruction execution is enabled at EL2 and EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>HVC instructions are UNDEFINED at EL2 and Non-secure EL1. The Undefined Instruction exception is taken to the Exception level at which the HVC instruction is executed.</td>
</tr>
</tbody>
</table>

**Note**

HVC instructions are always UNDEFINED at EL0.

This bit is only implemented if EL3 is not implemented. Otherwise, it is RES0.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

### Bit [28]

Reserved, RES0.

### TGE, bit [27]

Trap General Exceptions, from Non-secure EL0.

<table>
<thead>
<tr>
<th>TGE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on execution at EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>When EL2 is not enabled in the current Security state, this control has no effect on execution at EL0. When EL2 is enabled in the current Security state, then:</td>
</tr>
<tr>
<td></td>
<td>• All exceptions that would be routed to EL1 are routed to EL2.</td>
</tr>
<tr>
<td></td>
<td>• The SCTLR.M bit is treated as being 0 for all purposes other than returning the result of a direct read of SCTLR.</td>
</tr>
<tr>
<td></td>
<td>• The HCR.{FMO,IMO,AMO} bits are treated as being 1 for all purposes other than returning the result of a direct read of HCR.</td>
</tr>
<tr>
<td></td>
<td>• All virtual interrupts are disabled.</td>
</tr>
<tr>
<td></td>
<td>• Any IMPLEMENTATION DEFINED mechanisms for signaling virtual interrupts are disabled.</td>
</tr>
<tr>
<td></td>
<td>• An exception return to EL1 is treated as an illegal exception return.</td>
</tr>
<tr>
<td></td>
<td>• Monitor mode execution of an MSR or CPS instruction that changes CPSR.M to a Non-secure EL1 mode is an illegal change to PSTATE.M. For more information see 'Illegal changes to PSTATE.M' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G1 (The AArch32 System Level Programmers' Model).</td>
</tr>
</tbody>
</table>

Also, when HCR.TGE is 1:

- If EL3 is using AArch32, an attempt to change from a Secure PL1 mode to a Non-secure EL1 mode by changing SCR.NS from 0 to 1 results in SCR.NS remaining as 0.
- The HDCR.{TDRA, TDOSA, TDA, TDE} bits are ignored and treated as being 1 other than for the purpose of a direct read of HDCR.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

### TVM, bit [26]

Trap Virtual Memory controls. Traps Non-secure EL1 writes to the virtual memory control registers to EL2, when EL2 is enabled in the current Security state.

The registers for which write accesses are trapped are as follows:

SCTLR, TTBR0, TTBR1, TTBCR, TTBCR2, DACR, DFSR, IPSR, DFAR, IFAR, ADFSR, AIFSRR, PRRR, NMRR, MAIR0, MAIR1, AMAIR0, AMAIR1, CONTEXTIDR.
TVM, bit [25]

This control does not cause any instructions to be trapped.

Non-secure EL1 write accesses to the specified virtual memory control registers are trapped to EL2.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

TTLB, bit [25]

Trap TLB maintenance instructions. Traps Non-secure EL1 execution of a TLBI instruction to EL2, when EL2 is enabled in the current Security state.

This applies to the following instructions:

- TLBIAVALL, TLBIMVAIS, TLBIAVAIN, TLBVAIS, TLBVAIM, ITLBIALL, ITLBMVA, ITLBIASID, ITLBIALL, ITLBMVAA, ITLBIMVAA, ITLBIMVAAL, TLBIMVAAL

TTLB, bit [25]

This control does not cause any instructions to be trapped.

Non-secure EL1 accesses to the specified TLB maintenance instructions are trapped to EL2.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

TPU, bit [24]

Trap cache maintenance instructions that operate to the Point of Unification. Traps Non-secure EL1 execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state.

This applies to the following instructions:

- ICIMVAL, ICIAVALL, ICIAVALLUIS, DCIMVAU.

Note

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

TPU, bit [24]

This control does not cause any instructions to be trapped.

Non-secure EL1 execution of the specified cache maintenance instructions is trapped to EL2.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

TPC, bit [23]

Trap data or unified cache maintenance instructions that operate to the Point of Coherency. Traps Non-secure EL1 execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state.

This applies to the following instructions:

- DCIMVAU, DCCIMVAU, DCCIMVAU.

Note

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.
If the Point of Coherency is before any level of data cache, it is implementation defined whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

**TSW, bit [22]**

Trap data or unified cache maintenance instructions that operate by Set/Way. Traps Non-secure EL1 execution of those cache maintenance instructions by set/way to EL2, when EL2 is enabled in the current Security state.

This applies to the following instructions:

- DCISW, DCCSW, DCCISW.

Note

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always undefined at EL0.

<table>
<thead>
<tr>
<th>TSW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 execution of the specified cache maintenance instructions is trapped to EL2.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2 or EL3, this field resets to 0.

**TAC, bit [21]**

Trap Auxiliary Control Registers. Traps Non-secure EL1 accesses to the Auxiliary Control Registers to EL2, when EL2 is enabled in the current Security state, from both Execution states.

This applies to the following register accesses:

ACTLR and, if implemented, ACTLR2.

<table>
<thead>
<tr>
<th>TAC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 accesses to the specified registers are trapped to EL2.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2 or EL3, this field resets to 0.

**TIDCP, bit [20]**

Trap implementation defined functionality. Traps Non-secure EL1 accesses to the encodings for implementation defined System Registers to EL2, when EL2 is enabled in the current Security state.

MCR and MRC instructions accessing the following encodings:

- All coproc==p15, CRn==c9, Opcode1 = {0-7}, CRm == {c0-c2, c5-c8}, opcode2 == {0-7}.
- All coproc==p15, CRn==c10, Opcode1 =={0-7}, CRm == {c0, c1, c4, c8}, opcode2 == {0-7}.
- All coproc==p15, CRn==c11, Opcode1=={0-7}, CRm == {c0-c8, c15}, opcode2 == {0-7}.

When HCR.TIDCP is set to 1, it is implementation defined whether any of this functionality accessed from Non-secure EL0 is trapped to EL2. Otherwise, it is undefined and the PE takes an Undefined Instruction exception to Non-secure Undefined mode.
### TIDCP

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 accesses to the specified System register encodings for IMPLEMENTATION DEFINED functionality are trapped to EL2.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2 or EL3, this field resets to 0.

### TSC, bit [19]

Traps SMC instructions. Traps Non-secure EL1 execution of SMC instructions to Hyp mode.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any attempt to execute an SMC instruction at Non-secure EL1 is trapped to Hyp mode, regardless of the value of SCR.SCD.</td>
</tr>
</tbody>
</table>

The Armv8-A architecture permits, but does not require, this trap to apply to conditional SMC instructions that fail their condition code check, in the same way as with traps on other conditional instructions.

**Note**
- This trap is only implemented if the implementation includes EL3.
- SMC instructions are always UNDEFINED at PL0.
- This bit traps execution of the SMC instruction. It is not a routing control for the SMC exception. Hyp Trap exceptions and SMC exceptions have different preferred return addresses.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

### TID3, bit [18]

Traps Non-secure EL1 reads of the following registers to EL2, when EL2 is enabled in the current Security state, as follows:

- ID_PFR0, ID_PFR1, ID_DFR0, ID_AFR0, ID_MMFR0, ID_MMFR1, ID_MMFR2, ID_MMFR3, ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, ID_ISAR4, ID_ISAR5, MVFR0, MVFR1, MVFR2.
- ID_MMFR4 and ID_MMFR5 are trapped unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_MMFR4 or ID_MMFR5 are trapped.
- ID_ISAR6 is trapped unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_ISAR6 are trapped.
- ID_DFR1 is trapped unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_DFR1 are trapped.
- It is IMPLEMENTATION DEFINED whether this bit traps MRC accesses to registers not already mentioned, with coproc==p15, opc1 == 0, CRn == c0, CRm == \{c2-c7\}, opc2 == \{0-7\}.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>The specified Non-secure EL1 read accesses to ID group 3 registers are trapped to EL2.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2 or EL3, this field resets to 0.

### TID2, bit [17]

Trap ID group 2. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

- Non-secure EL1 and EL0 reads of the CTR, CCSIDR, CCSIDR2, CLIDR, and CSSEL.R.
- Non-secure EL1 and EL0 writes to the CSSEL.R.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>The specified Non-secure EL1 and EL0 accesses to ID group 2 registers are trapped to EL2.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2 or EL3, this field resets to 0.
**TID1, bit [16]**

Trap ID group 1. Traps Non-secure EL1 reads of the following registers to EL2, when EL2 is enabled in the current Security state:

- **TCMTR**, **TLBTR**, **REVIDR**, **AIDR**.

<table>
<thead>
<tr>
<th>TID1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>The specified Non-secure EL1 read accesses to ID group 1 registers are trapped to EL2.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2 or EL3, this field resets to 0.

**TID0, bit [15]**

Trap ID group 0. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

- Non-secure EL1 reads of the **JIDR** and **FPSID**.
- If the **JIDR** is RAZ from Non-secure EL0, Non-secure EL0 reads of the **JIDR**.

**Note**

- It is IMPLEMENTATION DEFINED whether the **JIDR** is RAZ or UNDEFINED at EL0. If it is UNDEFINED at EL0 then the Undefined Instruction exception takes precedence over this trap.
- The **FPSID** is not accessible at EL0.
- Writes to the **FPSID** are ignored, and not trapped by this control.

<table>
<thead>
<tr>
<th>TID0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>The specified Non-secure EL1 read accesses to ID group 0 registers are trapped to EL2.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2 or EL3, this field resets to 0.

**TWE, bit [14]**

Traps Non-secure EL0 and EL1 execution of WFE instructions to EL2, when EL2 is enabled in the current Security state.

<table>
<thead>
<tr>
<th>TWE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any attempt to execute a WFE instruction at Non-secure EL0 or EL1 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWE.</td>
</tr>
</tbody>
</table>

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE can complete at any time, even without a Wakeup event, the traps on WFE are not guaranteed to be taken, even if the WFE is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

**TWI, bit [13]**

Traps Non-secure EL0 and EL1 execution of WFI instructions to EL2, when EL2 is enabled in the current Security state.
TWI

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFI can complete at any time, even without a Wakeup event, the traps on WFI are not guaranteed to be taken, even if the WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

**DC, bit [12]**

Default Cacheability.

<table>
<thead>
<tr>
<th>DC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on the Non-secure EL1&amp;0 translation regime.</td>
</tr>
<tr>
<td>0b1</td>
<td>In Non-secure state:</td>
</tr>
<tr>
<td></td>
<td>• The SCTLR.M field behaves as 0 for all purposes other than a direct read of the value of the field.</td>
</tr>
<tr>
<td></td>
<td>• The HCR.VM field behaves as 1 for all purposes other than a direct read of the value of the field.</td>
</tr>
<tr>
<td></td>
<td>• The memory type produced by the first stage of the EL1&amp;0 translation regime is Normal Non-Shareable, Inner Write-Back Read-Allocate Write-Allocate, Outer Write-Back Read-Allocate Write-Allocate.</td>
</tr>
</tbody>
</table>

This field has no effect on the EL2 and EL3 translation regimes.

This field is permitted to be cached in a TLB.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

**BSU, bits [11:10]**

Barrier Shareability upgrade. This field determines the minimum shareability domain that is applied to any barrier instruction executed from Non-secure EL1 or Non-secure EL0:

<table>
<thead>
<tr>
<th>BSU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>Inner Shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Full system.</td>
</tr>
</tbody>
</table>

This value is combined with the specified level of the barrier held in its instruction, using the same principles as combining the shareability attributes from two stages of address translation.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

**FB, bit [9]**

Force broadcast. Causes the following instructions to be broadcast within the Inner Shareable domain when executed from Non-secure EL1:

- BPIALL, TLBIALL, TLBIMVA, TLBIASID, DTLBIALL, DTLBIMVA, DTLBIASID, ITLBIALL, ITLBMVA, ITLBIASID, TLBIMVAA, ICIALLU, TLBIMVAL, TLBIMVAAL.
Meaning

0b0 This field has no effect on the operation of the specified instructions.

0b1 When one of the specified instruction is executed at Non-secure EL1, the instruction is broadcast within the Inner Shareable shareability domain.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

**VA, bit [8]**

Virtual SError interrupt exception.

<table>
<thead>
<tr>
<th>VA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This mechanism is not making a virtual SError interrupt pending.</td>
</tr>
<tr>
<td>0b1</td>
<td>A virtual SError interrupt is pending because of this mechanism.</td>
</tr>
</tbody>
</table>

The virtual SError interrupt is enabled only when the value of HCR.{TGE, AMO} is \{0, 1\}.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

**VI, bit [7]**

Virtual IRQ exception.

<table>
<thead>
<tr>
<th>VI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This mechanism is not making a virtual IRQ pending.</td>
</tr>
<tr>
<td>0b1</td>
<td>A virtual IRQ is pending because of this mechanism.</td>
</tr>
</tbody>
</table>

The virtual IRQ is enabled only when the value of HCR.{TGE, IMO} is \{0, 1\}.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

**VF, bit [6]**

Virtual FIQ exception.

<table>
<thead>
<tr>
<th>VF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This mechanism is not making a virtual FIQ pending.</td>
</tr>
<tr>
<td>0b1</td>
<td>A virtual FIQ is pending because of this mechanism.</td>
</tr>
</tbody>
</table>

The virtual FIQ is enabled only when the value of HCR.{TGE, FMO} is \{0, 1\}.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

**AMO, bit [5]**

SError interrupt Mask Override. When this bit is set to 1, it overrides the effect of CPSR.A, and enables virtual exception signaling by the VA bit.

If the value of HCR.TGE is 0, then virtual SError interrupts are enabled in Non-secure state.

If the value of HCR.TGE is 1, then in Non-secure state the HCR.AMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

In a system where the PE resets into EL2 or EL3, this field resets to 0.
IMO, bit [4]

IRQ Mask Override. When this bit is set to 1, it overrides the effect of CPSR.I, and enables virtual exception signaling by the VI bit.

If the value of HCR.TGE is 0, then Virtual IRQ interrupts are enabled in the Non-secure state.

If the value of HCR.TGE is 1, then in Non-secure state the HCR.IMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

FMO, bit [3]

FIQ Mask Override. When this bit is set to 1, it overrides the effect of CPSR.F, and enables virtual exception signaling by the VF bit.

If the value of HCR.TGE is 0, then Virtual FIQ interrupts are enabled in the Non-secure state.

If the value of HCR.TGE is 1, then in Non-secure state the HCR.FMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

PTW, bit [2]

Protected Table Walk. In the Non-secure PL1&0 translation regime, a translation table access made as part of a stage 1 translation table walk is subject to a stage 2 translation. The combining of the memory type attributes from the two stages of translation means the access might be made to a type of Device memory. If this occurs then the value of this bit determines the behavior:

<table>
<thead>
<tr>
<th>PTW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The translation table walk occurs as if it is to Normal Non-cacheable memory. This means it can be made speculatively.</td>
</tr>
<tr>
<td>0b1</td>
<td>The memory access generates a stage 2 Permission fault.</td>
</tr>
</tbody>
</table>

This field is permitted to be cached in a TLB.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

SWIO, bit [1]

Set/Way Invalidation Override. Causes Non-secure EL1 execution of the data cache invalidate by set/way instructions to perform a data cache clean and invalidate by set/way.

<table>
<thead>
<tr>
<th>SWIO</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on the operation of data cache invalidate by set/way instructions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Data cache invalidate by set/way instructions perform a data cache clean and invalidate by set/way.</td>
</tr>
</tbody>
</table>

When this bit is set to 1, DCISW performs the same invalidation as a DCCISW instruction.

As a result of changes to the behavior of DCISW, this bit is redundant in Armv8. This bit can be implemented as RES1.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

VM, bit [0]

Virtualization enable. Enables stage 2 address translation for the Non-secure EL1&0 translation regime.

<table>
<thead>
<tr>
<th>VM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL1&amp;0 stage 2 address translation disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1&amp;0 stage 2 address translation enabled.</td>
</tr>
</tbody>
</table>
If the HCR.DC bit is set to 1, then the behavior of the PE when executing in a Non-secure mode other than Hyp mode is consistent with HCR.VM being 1, regardless of the actual value of HCR.VM, other than the value returned by an explicit read of HCR.VM.

When the value of this bit is 1, data cache invalidate instructions executed at Non-secure EL1 perform a data cache clean and invalidate. For the invalidate by set/way instruction this behavior applies regardless of the value of the HCR.SWIO bit.

This bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

**Accessing the HCR**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b100</td>
<td>0b0001</td>
<td>0b0001</td>
<td>0b000</td>
</tr>
</tbody>
</table>

```
if PSTATE.EL == EL0 then
  UNDEFINED;
elif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
elif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
    AArch32.TakeHypTrapException(0x03);
else
  UNDEFINED;
elifs PSTATE.EL == EL2 then
  return HCR;
elifs PSTATE.EL == EL3 then
  if SCR.NS == '0' then
    UNDEFINED;
elelse
    return HCR;
```

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b100</td>
<td>0b0001</td>
<td>0b0001</td>
<td>0b000</td>
</tr>
</tbody>
</table>

```

  if SCR.NS == '0' then
    UNDEFINED;
elelse
    HCR = R[t];
```
HCR2, Hyp Configuration Register 2

The HCR2 characteristics are:

**Purpose**

Provides additional configuration controls for virtualization.

**Configuration**

AArch32 System register HCR2 bits [31:0] are architecturally mapped to AArch64 System register HCR_EL2[63:32].

If EL2 is not implemented, this register is RES0 from EL3.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HCR2 is a 32-bit register.

**Field descriptions**

The HCR2 bit assignments are:

<table>
<thead>

<td></td>
</tr>
</tbody>
</table>

**Bits [31:23]**

Reserved, RES0.

**TTLBIS, bit [22]**

When ARMv8.2-EVT is implemented:

Trap TLB maintenance instructions that operate on the Inner Shareable domain. Traps execution of the following TLB maintenance instructions at EL1 to EL2:

- TLBIALLIS
- TLBIMVAIS
- TLBIASIDIS
- TLBIMVAIS
- TLBIMVALIS
- TLBIMVALIS

<table>
<thead>
<tr>
<th>TTLBIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 execution of the specified TLB maintenance instructions is trapped to EL2.</td>
</tr>
</tbody>
</table>

If ARMv8.2-EVT is not implemented, this field is RES0.

When ARMv8.1-VHE and the value of HCR_EL2.E2H, TGE is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

**Otherwise:**

Reserved, RES0.
Bit [21]

Reserved, RES0.

TOCU, bit [20]

When ARMv8.2-EVT is implemented:

Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of those cache maintenance instructions at EL1 or EL0 using AArch64, and at EL1 using AArch32, to EL2.

This applies to the following instructions:

- When Non-secure EL0 is using AArch64, **IC IVAU**, **DC CVAU**. However, if the value of **SCTLR_EL1**.UCI is 0 these instructions are **UNDEFINED** at EL0 and any resulting exception is higher priority than this trap to EL2.
- When EL1 is using AArch64, **IC IVAU**, **IC IALLU**, **DC CVAU**.
- When Non-secure EL1 is using AArch32, **ICIMVAU**, **ICIALLU**, **DCCMVAU**.

Note

An exception generated because an instruction is **UNDEFINED** at EL0 is higher priority than this trap to EL2. In addition:

- **IC IALLUIS** and **IC IALLU** are always **UNDEFINED** at EL0 using AArch64.
- **ICIMVAU**, **ICIALLU**, **ICIALLUI**, and **DCCMVAU** are always **UNDEFINED** at EL0 using AArch32.

<table>
<thead>
<tr>
<th><strong>TOCU</strong></th>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure execution of the specified cache maintenance instructions is trapped to EL2.</td>
</tr>
</tbody>
</table>

If ARMv8.2-EVT is not implemented, this field is RES0.

If the Point of Unification is before any level of data cache, it is **IMPLEMENTATION DEFINED** whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is **IMPLEMENTATION DEFINED** whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When ARMv8.1-VHE is implemented, and the value of **HCR_EL2**.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

Otherwise:

Reserved, RES0.

Bit [19]

Reserved, RES0.

TICAB, bit [18]

When ARMv8.2-EVT is implemented:

Trap ICIALLUIS cache maintenance instructions. Traps execution of those cache maintenance instructions at EL1 to EL2.

This applies to the following instructions:

**ICIALLUI**.
TICAB  

<table>
<thead>
<tr>
<th>TICAB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 execution of the specified cache maintenance instructions is trapped to EL2.</td>
</tr>
</tbody>
</table>

If Armv8.2-EVT is not implemented, this field is RES0.

If the Point of Unification is before any level of instruction cache, it is implementation defined whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When Armv8.1-VHE and the value of HCR_EL2.(E2H, TGE) is \{1, 1\}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

Otherwise:

Reserved, RES0.

TID4, bit [17]

When Armv8.2-EVT is implemented:

Trap ID group 4. Traps the following register accesses to EL2:

- EL1 reads of CCSIDR, CCSIDR2, CLIDR, and CSSELR.
- EL1 writes to CSSELR.

<table>
<thead>
<tr>
<th>TID4</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>The specified Non-secure EL1 and EL0 accesses to ID group 4 registers are trapped to EL2.</td>
</tr>
</tbody>
</table>

If Armv8.2-EVT is not implemented, this field is RES0.

When Armv8.1-VHE is implemented and the value of HCR_EL2.(E2H, TGE) is \{1, 1\}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

Otherwise:

Reserved, RES0.

Bits [16:7]

Reserved, RES0.

MIOCNCE, bit [6]

Mismatched Inner/Outer Cacheable Non-Coherency Enable, for the Non-secure PL1&0 translation regime.

<table>
<thead>
<tr>
<th>MIOCNCE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For the Non-secure PL1&amp;0 translation regime, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there must be no loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.</td>
</tr>
<tr>
<td>0b1</td>
<td>For the Non-secure PL1&amp;0 translation regime, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there might be a loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.</td>
</tr>
</tbody>
</table>

For more information see 'Mismatched memory attributes' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section E2 (The AArch32 Application Level Memory Model).
This field can be implemented as RAZ/WI.

In a system where the PE resets into EL2 or EL3, this field resets to an architecturally **UNKNOWN** value.

**TEA, bit [5]**

Route synchronous External abort exceptions from EL0 and EL1 to EL2. If the RAS Extension is implemented, the possible values of this bit are:

<table>
<thead>
<tr>
<th>TEA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not route synchronous External abort exceptions from Non-secure EL0 and EL1 to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Route synchronous External abort exceptions from Non-secure EL0 and EL1 to EL2, if not routed to EL3.</td>
</tr>
</tbody>
</table>

When the RAS Extension is not implemented, this field is **RES0**.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

**TERR, bit [4]**

**When RAS is implemented:**

Trap Error record accesses from EL1 to EL2. Trap accesses to the following registers from EL1 to EL2:

- ERRIDR
- ERRSELR
- ERXADDR
- ERXADDR2
- ERXCTRL
- ERXCTRL2
- ERXFR
- ERXFR2
- ERXCTLR
- ERXCTLR2
- ERXFR
- ERXFR2
- ERXCTLR
- ERXCTLR2
- ERXSTATUS
- ERXMISR4
- ERXMISR5
- ERXMISR6
- ERXMISR7

<table>
<thead>
<tr>
<th>TERR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to the specified registers from EL1 generate a Trap exception to EL2.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**

Reserved, **RES0**.

**Bits [3:2]**

Reserved, **RES0**.

**ID, bit [1]**

Stage 2 Instruction access cacheability disable. For the Non-secure PL1&0 translation regime, when **HCR.VM==1**, this control forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

<table>
<thead>
<tr>
<th>ID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on stage 2 of the Non-secure PL1&amp;0 translation regime.</td>
</tr>
<tr>
<td>0b1</td>
<td>For the Non-secure PL1&amp;0 translation regime, forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.</td>
</tr>
</tbody>
</table>

This bit has no effect on the EL2 translation regime.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**CD, bit [0]**

Stage 2 Data access cacheability disable. When **HCR.VM==1**, this forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable for the Non-secure PL1&0 translation regime.
This control has no effect on stage 2 of the Non-secure PL1&0 translation regime for data accesses and translation table walks.

For the Non-secure PL1&0 translation regime, forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

This bit has no effect on the EL2 translation regime.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

**Accessing the HCR2**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b100</td>
<td>0b0001</td>
<td>0b0001</td>
<td>0b100</td>
</tr>
</tbody>
</table>

```
if PSTATE.EL == EL0 then

The HDCR characteristics are:

**Purpose**

Controls the trapping to Hyp mode of Non-secure accesses, at EL1 or lower, to functions provided by the debug and trace architectures and the Performance Monitors Extension.

**Configuration**

AArch32 System register HDCR bits [31:0] are architecturally mapped to AArch64 System register MDCR_EL2[31:0].

If EL2 is not implemented, this register is RES0 from EL3, and other than for a direct read of the register, the PE behaves as if HDCR.HPMN == PMCR.N.

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HDCR is a 32-bit register.

**Field descriptions**

The HDCR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | MTPME | TDCCH | HPRES0 | HCCD | RES0 | TTRFRES0 | HPMD | RES0 | TDRATDOSA | DATDE | HPME | TPM | TPMCR | HPMD |

**Bits [31:29]**

Reserved, RES0.

**MTPME, bit [28]**

When ARMv8.6-MTPMU is implemented and !HaveEL(EL3):

Multi-threaded PMU Enable. Enables use of the PMEVTYPE<\n> MT bits.

<table>
<thead>
<tr>
<th>MTPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ARMv8.6-MTPMU is disabled. The Effective value of PMEVTYPE&lt;\n&gt; MT is zero.</td>
</tr>
<tr>
<td>0b1</td>
<td>PMEVTYPE&lt;\n&gt; MT bits not affected by this bit.</td>
</tr>
</tbody>
</table>

If ARMv8.6-MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this bit is 0.

On a Cold reset, in a system where the PE resets into EL2 or EL3, this field resets to 1.

**Otherwise:**

Reserved, RES0.
**TDCC, bit [27]**

When ARMv8.6-FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel at EL1 and EL0 to EL2.

<table>
<thead>
<tr>
<th>TDCC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any register accesses to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state, accesses to the DCC registers at EL1 and EL0 generate a Hyp Trap exception, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.</td>
</tr>
</tbody>
</table>

The DCC registers trapped by this control are:

- DBGDTRRXext, DBGDTRTXext, DBGDSCRint, DBGDCINT, and, when the PE is in Non-debug state, DBGDTRRXint and DBGDTRTXint.

The traps are reported with EC syndrome value:

- 0x05 for trapped MRC and MCR accesses with coproc == 0b1110.
- 0x06 for trapped LDC to DBGDTRTXint and STC from DBGDTRRXint.

When the PE is in Debug state, HDCR.TDCC does not trap any accesses to:

- DBGDTRRXint and DBGDTRTXint.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**HLP, bit [26]**

When ARMv8.5-PMU is implemented:

Hypervisor Long event counter enable. Determines when unsigned overflow is recorded by a counter overflow bit.

<table>
<thead>
<tr>
<th>HLP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counter overflow on increment that causes unsigned overflow of PMEVCNTR&lt;n&gt;[31:0].</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counter overflow on increment that causes unsigned overflow of PMEVCNTR&lt;n&gt;[63:0].</td>
</tr>
</tbody>
</table>

If the highest implemented Exception level is using AArch32, it is **IMPLEMENTATION DEFINED** whether this bit is read/write or RAZ/WI.

If HDCR.HPMN is less than PMCR.N, this bit affects the operation of event counters in the range [HDCR.HPMN..(PMCR.N-1)]. Otherwise this bit has no effect on the operation of the event counters.

**Note**

The effect of HDCR.HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state.

For more information see the description of the HDCR.HPMN field.

**Note**
PMECNTR cannot be accessed directly in AArch32 state.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bits [25:24]**

Reserved, RES0.

**HCCD, bit [23]**

When ARMv8.5-PMU is implemented:

Hypervisor Cycle Counter Disable. Prohibits PMCCNTR from counting at EL2.

<table>
<thead>
<tr>
<th>HCCD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counting by PMCCNTR is not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Cycle counting by PMCCNTR is prohibited at EL2.</td>
</tr>
</tbody>
</table>

This bit does not affect the CPU_CYCLES event or any other event that counts cycles.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bits [22:20]**

Reserved, RES0.

**TTRF, bit [19]**

When ARMv8.4-Trace is implemented:

Traps use of the Trace Filter Control registers at EL1 to EL2.

<table>
<thead>
<tr>
<th>TTRF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to TRFCR at EL1 are not affected by this control bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to TRFCR at EL1 generate a Hyp Trap exception.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bit [18]**

Reserved, RES0.
**HPMD, bit [17]**

*When ARMv8.1-PMU is implemented:*

Guest Performance Monitors Disable. This control prohibits event counting at EL2.

<table>
<thead>
<tr>
<th>HPMD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counting allowed in Hyp mode.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counting prohibited in Hyp mode.</td>
</tr>
<tr>
<td></td>
<td>If ARMv8.2-Debug is not implemented, event counting is</td>
</tr>
<tr>
<td></td>
<td>prohibited unless enabled by the IMPLEMENTATION DEFINED</td>
</tr>
<tr>
<td></td>
<td>authentication interface</td>
</tr>
<tr>
<td></td>
<td>ExternalSecureNoninvasiveDebugEnabled()</td>
</tr>
</tbody>
</table>

This control applies only to:

- The event counters in the range [0..(HDCR.HPMN-1)].
- If PMCR.DP is set to 1, PMCCNTR.

The other event counters are unaffected. When PMCR.DP is set to 0, PMCCNTR is unaffected.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bits [16:12]**

Reserved, RES0.

**TDRA, bit [11]**

Trap Debug ROM Address register access. Traps Non-secure EL0 and EL1 System register accesses to the Debug ROM registers to Hyp mode.

<table>
<thead>
<tr>
<th>TDRA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL0 and EL1 System register accesses to the DBGDRAR or DBGDSAR are trapped to Hyp mode, unless it is trapped by DBGDSCRext.UDCCdis.</td>
</tr>
</tbody>
</table>

If HCR.TGE or HDCR.TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**TDOSA, bit [10]**

*When ARMv8.0-DoubleLock is implemented:*

Trap debug OS-related register access. Traps Non-secure EL1 System register accesses to the powerdown debug registers to Hyp mode.

<table>
<thead>
<tr>
<th>TDOSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 System register accesses to the powerdown debug registers are trapped to Hyp mode.</td>
</tr>
</tbody>
</table>

The registers for which accesses are trapped are as follows:

- DBGOSLAR, DBGOSLAR, DBGOSDLR, and DBGPRCR.
- Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

**Note**
These registers are not accessible at EL0.

If HCR.TGE or HDCR.TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Trap debug OS-related register access. Traps Non-secure EL1 System register accesses to the powerdown debug registers to Hyp mode.

<table>
<thead>
<tr>
<th>TDOSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 System register accesses to the powerdown debug registers are trapped to Hyp mode.</td>
</tr>
</tbody>
</table>

The registers for which accesses are trapped are as follows:

- DBGOSLSR, DBGOSLR, and DBGPRCR.
- Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

It is IMPLEMENTATION DEFINED whether accesses to DBGOSDLR are trapped.

Note

These registers are not accessible at EL0.

If HCR.TGE or HDCR.TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TDA, bit [9]

Trap debug access. Traps Non-secure EL0 and EL1 System register accesses to those debug System registers in the (coproc==0b1110) encoding space that are not trapped by either of the following:

- HDCR.TDRA.
- HDCR.TDOSA.

<table>
<thead>
<tr>
<th>TDA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL0 or EL1 System register accesses to the debug registers, other than the registers trapped by HDCR.TDRA and HDCR.TDOSA, are trapped to Hyp mode, unless it is trapped by DBGDSCRxext.UDCCdis.</td>
</tr>
</tbody>
</table>

Traps of AArch32 accesses to DBGDTRRXint and DBGDTRTXint are ignored in Debug state.

If HCR.TGE or HDCR.TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TDE, bit [8]

Trap Debug exceptions. The possible values of this bit are:

<table>
<thead>
<tr>
<th>TDE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on the routing of debug exceptions, and has no effect on Non-secure accesses to debug registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>Debug exceptions generated at EL1 or EL0 are routed to EL2 when enabled in the current Security state. The HDCR.{TDRA, TDOSA, TDA} fields are treated as being 1 for all purposes other than returning the result of a direct read of the register.</td>
</tr>
</tbody>
</table>
When \( \text{HCR.TGE} = 1 \), the PE behaves as if the value of this field is 1 for all purposes other than returning the value of a direct read of the register.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**HPME, bit [7]**

*When PMUv3 is implemented:*

[\( \text{HDCR.HPMN..(N-1)} \)] event counters enable.

<table>
<thead>
<tr>
<th>HPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counters in the range [( \text{HDCR.HPMN..(PMCR.N-1)} )] are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counters in the range [( \text{HDCR.HPMN..(PMCR.N-1)} )] are enabled by ( \text{PMCNTENSET} ).</td>
</tr>
</tbody>
</table>

If \( \text{HDCR.HPMN} \) is less than \( \text{PMCR.N} \), the event counters in the range [\( \text{HDCR.HPMN..(PMCR.N-1)} \)], are enabled and disabled by this bit. Otherwise this bit has no effect on the operation of the event counters.

**Note**

The effect of \( \text{HDCR.HPMN} \) on the operation of this bit applies regardless of whether EL2 is enabled in the current Security state.

For more information see the description of the HPMN field.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally \text{UNKNOWN} value.

**Otherwise:**

Reserved, \text{RES0}.

**TPM, bit [6]**

*When PMUv3 is implemented:*

Trap Performance Monitors accesses. Traps Non-secure EL0 and EL1 accesses to all Performance Monitors registers to Hyp mode.

<table>
<thead>
<tr>
<th>TPM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL0 and EL1 accesses to all Performance Monitors registers are trapped to Hyp mode.</td>
</tr>
</tbody>
</table>

**Note**

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**

Reserved, \text{RES0}.

**TPMCR, bit [5]**

*When PMUv3 is implemented:*

Trap \( \text{PMCR} \) accesses. Traps Non-secure EL0 and EL1 accesses to the \( \text{PMCR} \) to Hyp mode.
**TPMCR**

<table>
<thead>
<tr>
<th>Meanings</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

**Note**

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**HPMN, bits [4:0]**

When PMUv3 is implemented:

Defines the number of event counters that are accessible from Non-secure EL1 modes, and from Non-secure EL0 modes if unprivileged access is enabled.

If HPMN is less than **PMCR.N**, HPMN divides the event counters into two ranges, [0..(HPMN-1)] and [HPMN..(**PMCR.N-1**)].

For an event counter in the range [0..(HPMN-1)]:

- The counter is accessible from EL1 and EL2, and from EL0 if unprivileged access to the counters is enabled.
- If ARMv8.5-PMU is implemented, **PMCR.LP** determines whether the counter overflows at **PMEVCNTR<n>[31:0]** or **PMEVCNTR<n>[63:0]**.
- **PMCR.E** enables the operation of counters in this range.

**Note**

If HPMN is equal to **PMCR.N**, this applies to all event counters.

If HPMN is less than **PMCR.N**, for an event counter in the range [HPMN..(**PMCR.N-1**)]:

- The counter is accessible only from EL2 and from Secure state.
- If ARMv8.5-PMU is implemented, **HDCR.HLP** determines whether the counter overflows at **PMEVCNTR<n>[31:0]** or **PMEVCNTR<n>[63:0]**.
- **HDCR.HPME** enables the operation of counters in this range.

If this field is set to 0, or to a value larger than **PMCR.N**, then the following **CONSTRAINED UNPREDICTABLE** behaviors apply:

- The value returned by a direct read of **HDCR.HPMN** is **UNKNOWN**.
- Either:
  - An **UNKNOWN** number of counters are reserved for EL2 use. That is, the PE behaves as if **HDCR.HPMN** is set to an **UNKNOWN** non-zero value less than or equal to **PMCR.N**.
  - All counters are reserved for EL2 use, meaning no counters are accessible from Non-secure EL1 and Non-secure EL0.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in **PMCR.N**.

**Otherwise:**

Reserved, RES0.

**Accessing the HDCR**

Accesses to this register use the following encodings:
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

HDFAR, Hyp Data Fault Address Register

The HDFAR characteristics are:

**Purpose**

Holds the virtual address of the faulting address that caused a synchronous Data Abort exception that is taken to Hyp mode.

**Configuration**

AArch32 System register HDFAR bits [31:0] are architecturally mapped to AArch64 System register `FAR_EL2[31:0]`.

AArch32 System register HDFAR bits [31:0] are architecturally mapped to AArch32 System register `DFAR[31:0] (S)` when `HaveEL(EL2)`, `HaveEL(EL3)` and `HighestELUsingAArch32()`.

If EL2 is not implemented, this register is `RES0` from EL3.

RW fields in this register reset to architecturally `UNKNOWN` values.

**Attributes**

HDFAR is a 32-bit register.

**Field descriptions**

The HDFAR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>VA of faulting address of synchronous Data Abort exception taken to Hyp mode</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

VA of faulting address of synchronous Data Abort exception taken to Hyp mode.

On a Prefetch Abort exception, this register is `UNKNOWN`.

Any execution in a Non-secure EL1 or Non-secure EL0 mode makes this register `UNKNOWN`.

This field resets to an architecturally `UNKNOWN` value.

**Accessing the HDFAR**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>

HIFAR, Hyp Instruction Fault Address Register

The HIFAR characteristics are:

**Purpose**
Holds the virtual address of the faulting address that caused a synchronous Prefetch Abort exception that is taken to Hyp mode.

**Configuration**
AArch32 System register HIFAR bits [31:0] are architecturally mapped to AArch64 System register `FAR_EL2[63:32]`.

AArch32 System register HIFAR bits [31:0] are architecturally mapped to AArch32 System register `IFAR[31:0] (S)` when HaveEL(EL2), HaveEL(EL3) and HighestELUsingAArch32().

If EL2 is not implemented, this register is `RES` from EL3.

RW fields in this register reset to architecturally `UNKNOWN` values.

**Attributes**
HIFAR is a 32-bit register.

**Field descriptions**
The HIFAR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>VA of faulting address of synchronous Prefetch Abort exception taken to Hyp mode</td>
</tr>
</tbody>
</table>

**Bits [31:0]**
VA of faulting address of synchronous Prefetch Abort exception taken to Hyp mode.

On a Data Abort exception, this register is `UNKNOWN`.

Any execution in a Non-secure EL1 or Non-secure EL0 mode makes this register `UNKNOWN`.

This field resets to an architecturally `UNKNOWN` value.

**Accessing the HIFAR**
Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} \ <\text{coproc}, \ \#<\text{opc1}, \ <\text{Rt}, \ <\text{CRn}, \ <\text{CRm}, \ \#, \ #<\text{opc2}>}
\]

HMAIR0, Hyp Memory Attribute Indirection Register 0

The HMAIR0 characteristics are:

**Purpose**

Along with [HMAIR1](#), provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations for memory accesses from Hyp mode.

AttrIndx[2] indicates the HMAIR register to be used:

- When AttrIndx[2] is 0, HMAIR0 is used.
- When AttrIndx[2] is 1, [HMAIR1](#) is used.

**Configuration**

AArch32 System register HMAIR0 bits [31:0] are architecturally mapped to AArch64 System register [MAIR_EL2[31:0]](#).

If EL2 is not implemented, this register is res0 from EL3.

RW fields in this register reset to architecturally [UNKNOWN](#) values.

**Attributes**

HMAIR0 is a 32-bit register.

**Field descriptions**

The HMAIR0 bit assignments are:

**When TTBCR.EAE == 1:**

<table>
<thead>
<tr>
<th>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>
<th>Attr3</th>
<th>Attr2</th>
<th>Attr1</th>
<th>Attr0</th>
</tr>
</thead>
</table>

**Attr<n>**, bits [8n+7:8n], for n = 0 to 3

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIndx[2:0] gives the value of <n> in Attr<n>.
- AttrIndx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

<table>
<thead>
<tr>
<th>Attr&lt;n&gt;[7:4]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Device memory. See encoding of Attr&lt;n&gt;[3:0] for the type of Device memory.</td>
</tr>
<tr>
<td>0b00RW, RW</td>
<td>Normal memory, Outer Write-Through Transient.</td>
</tr>
<tr>
<td>not 0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01RW, RW</td>
<td>Normal memory, Outer Write-Back Transient.</td>
</tr>
<tr>
<td>not 0b01</td>
<td>Normal memory, Outer Write-Through Non-transient.</td>
</tr>
<tr>
<td>0b10RW</td>
<td>Normal memory, Outer Write-Back Non-transient.</td>
</tr>
</tbody>
</table>

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

---

Page 2508
### Attr\(\text{n}\)[3:0]

<table>
<thead>
<tr>
<th>Attr(\text{n})[3:0]</th>
<th>Meaning when Attr(\text{n})[7:4] is 0b0000</th>
<th>Meaning when Attr(\text{n})[7:4] is not 0b0000</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Device-(\text{n})GnRnE memory</td>
<td>UNPREDICTABLE</td>
</tr>
<tr>
<td>0b00RW, RW not 0b00</td>
<td>UNPREDICTABLE</td>
<td>Normal memory, Inner Write-Through Transient</td>

</tr>
<tr>
<td>0b11RW, RW not 0b00</td>
<td>UNPREDICTABLE</td>
<td>Normal memory, Inner Write-Back Non-transient</td>
</tr>
</tbody>
</table>

\(R = \) Inner Read-Allocate policy, \(W = \) Inner Write-Allocate policy.

The \(R\) and \(W\) bits in some Attr\(\text{n}\) fields have the following meanings:

<table>
<thead>
<tr>
<th>R or W</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No Allocate</td>
</tr>
<tr>
<td>0b1</td>
<td>Allocate</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

### Accessing the HMAIR0

Accesses to this register use the following encodings:

\[
\text{MRC}\{c\}\{q\} \; <\text{coproc}>, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#\}<\text{opc2}>

HMAIR1, Hyp Memory Attribute Indirection Register 1

The HMAIR1 characteristics are:

**Purpose**

Along with HMAIR0, provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations for memory accesses from Hyp mode.

AttrIndx[2] indicates the HMAIR register to be used:

- When AttrIndx[2] is 0, HMAIR0 is used.
- When AttrIndx[2] is 1, HMAIR1 is used.

**Configuration**

AArch32 System register HMAIR1 bits [31:0] are architecturally mapped to AArch64 System register MAIR_EL2[63:32].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HMAIR1 is a 32-bit register.

**Field descriptions**

The HMAIR1 bit assignments are:

**When TTBCR.EAE == 1:**

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Attr7 | Attr6 | Attr5 | Attr4 |

**Attr<n>, bits [8(n-4)+7:8(n-4)], for n = 4 to 7**

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIndx[2:0] gives the value of <n> in Attr<n>.
- AttrIndx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

<table>
<thead>
<tr>
<th>Attr&lt;n&gt;[7:4]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Device memory. See encoding of Attr&lt;n&gt;[3:0] for the type of Device memory.</td>
</tr>
<tr>
<td>0b00RW, RW, not 0b00</td>
<td>Normal memory, Outer Write-Through Transient.</td>
</tr>
<tr>
<td>0b0100</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01RW, RW, not 0b00</td>
<td>Normal memory, Outer Write-Back Transient.</td>
</tr>
<tr>
<td>0b10RW</td>
<td>Normal memory, Outer Write-Through Non-transient.</td>
</tr>
<tr>
<td>0b11RW</td>
<td>Normal memory, Outer Write-Back Non-transient.</td>
</tr>
</tbody>
</table>

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

...
### Attr<\text{n}>[3:0]  
<table>
<thead>
<tr>
<th>\text{Meaning when Attr&lt;\text{n}&gt;[7:4] is 0b0000}</th>
<th>\text{Meaning when Attr&lt;\text{n}&gt;[7:4] is not 0b0000}</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Device-nGnRnE memory</td>
</tr>
<tr>
<td>0b00RW, RW not 0b00</td>
<td>UNPREDICTABLE</td>
</tr>
<tr>
<td>0b0100</td>
<td>Device-nGnRE memory</td>
</tr>
<tr>
<td>0b01RW, RW not 0b00</td>
<td>UNPREDICTABLE</td>
</tr>
<tr>
<td>0b1000</td>
<td>Device-nGRE memory</td>
</tr>
<tr>
<td>0b10RW, RW not 0b00</td>
<td>UNPREDICTABLE</td>
</tr>
<tr>
<td>0b1100</td>
<td>Device-GRE memory</td>
</tr>
<tr>
<td>0b11RW, RW not 0b00</td>
<td>UNPREDICTABLE</td>
</tr>
</tbody>
</table>

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<\text{n}> fields have the following meanings:

<table>
<thead>
<tr>
<th>R or W</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No Allocate</td>
</tr>
<tr>
<td>0b1</td>
<td>Allocate</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

### Accessing the HMAIR1

    else
        HPFAR = R[t];
HRMR, Hyp Reset Management Register

The HRMR characteristics are:

**Purpose**

If EL2 is the highest implemented Exception level and this register is implemented:

- A write to the register at EL2 can request a Warm reset.
- If EL2 can use AArch32 and AArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

**Configuration**

AArch32 System register HRMR bits [31:0] are architecturally mapped to AArch64 System register RMR_EL2[31:0]. Only implemented if EL2 is the highest implemented Exception level. In this case:

- If EL2 can use AArch32 and AArch64 then this register must be implemented.
- If EL2 cannot use AArch64 then it is IMPLEMENTATION DEFINED whether the register is implemented.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HRMR is a 32-bit register.

**Field descriptions**

The HRMR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 |    |    |    |    |
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [31:2]**

Reserved, RES0.

**RR, bit [1]**

Reset Request. Setting this bit to 1 requests a Warm reset.

This field resets to 0.

**AA64, bit [0]**

When EL2 can use AArch64, determines which Execution state the PE boots into after a Warm reset:

<table>
<thead>
<tr>
<th>AA64</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>AArch32.</td>
</tr>
<tr>
<td>0b1</td>
<td>AArch64.</td>
</tr>
</tbody>
</table>

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If EL2 cannot use AArch64 this bit is RAZ/WI.

When implemented as a RW field, this field resets to 0 on a Cold reset.
**Accessing the HRMR**

Accesses to this register use the following encodings:

\[
\text{MRC}\{c\}\{q\} \text{<coproc>, \{#<opc1>, <Rt>, <CRn>, <CRm}\}, \{#<opc2}\}
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b111</td>
<td>0b100</td>
<td>0b1100</td>
<td>0b0000</td>
<td>0b010</td>
</tr>
</tbody>
</table>

\[
\text{if PSTATE.EL == EL1 && EL2Enabled() && ELUsingAArch32(EL2) && HSTR_EL2.T12 == '1' then}
\]
\[
\text{AArch64.AArch32SystemAccessTrap(EL2, 0x03);}
\]
\[
\text{elsif PSTATE.EL == EL1 && EL2Enabled() && ELUsingAA Arch32(EL2) && HSTR.T12 == '1' then}
\]
\[
\text{AArch32.TakeHypTrapException(0x03);}
\]
\[
\text{elsif PSTATE.EL == EL2 && IsHighestEL(EL2) then}
\]
\[
\text{return HRMR;}
\]
\[
\text{else}
\]
\[
\text{UNDEFINED;}
\]

\[
\text{MCR}\{c\}\{q\} \text{<coproc>, \{#<opc1>, <Rt>, <CRn>, <CRm}\}, \{#<opc2}\}
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b111</td>
<td>0b100</td>
<td>0b1100</td>
<td>0b0000</td>
<td>0b010</td>
</tr>
</tbody>
</table>

\[
\text{if PSTATE.EL == EL1 && EL2Enabled() && ELUSingAArch32(EL2) && HSTR_EL2.T12 == '1' then}
\]
\[
\text{AArch64.AArch32SystemAccessTrap(EL2, 0x03);}
\]
\[
\text{elsif PSTATE.EL == EL1 && EL2Enabled() && ELUsingAA arch32(EL2) && HSTR.T12 == '1' then}
\]
\[
\text{AArch32.TakeHypTrapException(0x03);}
\]
\[
\text{elsif PSTATE.EL == EL2 && IsHighestEL(EL2) then}
\]
\[
\text{HRMR = R[t];}
\]
\[
\text{else}
\]
\[
\text{UNDEFINED;}
\]
HSCTLR, Hyp System Control Register

The HSCTLR characteristics are:

**Purpose**

Provides top level control of the system operation in Hyp mode.

**Configuration**

AArch32 System register HSCTLR bits [31:0] are architecturally mapped to AArch64 System register SCTLR_EL2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HSCTLR is a 32-bit register.

**Field descriptions**

The HSCTLR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| DSSBS| T32RE| S32RE| ERE| RES0| RES1| WXN| RES0| RES1| RES0| RES0| RES1| RES0| SEDIT| RES0| CP15BEN| RES0| LSMAOE| nTLS|

**DSSBS**, bit [31]

When ARMv8.0-SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry. The defined values are:

<table>
<thead>
<tr>
<th>DSSBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PSTATE.SSBS is set to 0 on an exception to Hyp mode.</td>
</tr>
<tr>
<td>0b1</td>
<td>PSTATE.SSBS is set to 1 on an exception to Hyp mode.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an IMPLEMENTATION DEFINED value.

**Otherwise:**

Reserved, RES0.

**TE**, bit [30]

T32 Exception Enable. This bit controls whether exceptions to EL2 are taken to A32 or T32 state:

<table>
<thead>
<tr>
<th>TE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Exceptions, including reset, taken to A32 state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Exceptions, including reset, taken to T32 state.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.
Bits [29:28]
Reserved, RES1.

Bits [27:26]
Reserved, RES0.

EE, bit [25]

The value of the PSTATE.E bit on entry to Hyp mode, the endianness of stage 1 translation table walks in the EL2 translation regime, and the endianness of stage 2 translation table walks in the PL1&0 translation regime.

The possible values of this bit are:

<table>
<thead>
<tr>
<th>EE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Little-endian. PSTATE.E is cleared to 0 on entry to Hyp mode.</td>
</tr>
<tr>
<td></td>
<td>Stage 1 translation table walks in the EL2 translation regime, and</td>
</tr>
<tr>
<td></td>
<td>stage 2 translation table walks in the PL1&amp;0 translation regime are</td>
</tr>
<tr>
<td></td>
<td>little-endian.</td>
</tr>
<tr>
<td>0b1</td>
<td>Big-endian. PSTATE.E is set to 1 on entry to Hyp mode.</td>
</tr>
<tr>
<td></td>
<td>Stage 1 translation table walks in the EL2 translation regime, and</td>
</tr>
<tr>
<td></td>
<td>stage 2 translation table walks in the PL1&amp;0 translation regime are</td>
</tr>
<tr>
<td></td>
<td>big-endian.</td>
</tr>
</tbody>
</table>

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

In a system where the PE resets into EL2, this field resets to an implementation defined value.

Bit [24]
Reserved, RES0.

Bits [23:22]
Reserved, RES1.

Bits [21:20]
Reserved, RES0.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL2 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

<table>
<thead>
<tr>
<th>WXN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on memory access permissions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any region that is writable in the EL2 translation regime is</td>
</tr>
<tr>
<td></td>
<td>forced to XN for accesses from software executing at EL2.</td>
</tr>
</tbody>
</table>

This bit applies only when HSCTRL.M bit is set.

The WXN bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an architecturally unknown value.

Bit [18]
Reserved, RES1.
Bit [17]

Reserved, RES0.

Bit [16]

Reserved, RES1.

Bits [15:13]

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL2:

<table>
<thead>
<tr>
<th>I</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All instruction access to Normal memory from EL2 are Non-cacheable for all levels of instruction and unified cache. If the value of HSCTLR.M is 0, instruction accesses from stage 1 of the EL2 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>All instruction access to Normal memory from EL2 can be cached at all levels of instruction and unified cache. If the value of HSCTLR.M is 0, instruction accesses from stage 1 of the EL2 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.</td>
</tr>
</tbody>
</table>

This bit has no effect on the PL1&0 translation regime.

In a system where the PE resets into EL2, this field resets to 0.

Bit [11]

Reserved, RES1.

Bits [10:9]

Reserved, RES0.

SED, bit [8]

SETEND instruction disable. Disables SETEND instructions at EL2.

<table>
<thead>
<tr>
<th>SED</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>SETEND instruction execution is enabled at EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>SETEND instructions are UNDEFINED at EL2.</td>
</tr>
</tbody>
</table>

If the implementation does not support mixed-endian operation at EL2, this bit is RES1.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

ITD, bit [7]

IT Disable. Disables some uses of IT instructions at EL2.
**ITD**

<table>
<thead>
<tr>
<th>ITD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All IT instruction functionality is enabled at EL2.</td>
</tr>
</tbody>
</table>
| 0b1 | Any attempt at EL2 to execute any of the following is *undefined*:  
  - All encodings of the IT instruction with hw1[3:0]!=1000.  
  - All encodings of the subsequent instruction with the following values for hw1:  
    - 11xxxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.  
    - 1011xxxxxxxxxxxx: All instructions in Miscellaneous 16-bit instructions.  
    - 10100xxxxxxxxxx: ADD Rd, PC, #imm  
    - 01001xxxxxxxxxx: LDR Rd, [PC, #imm]  
    - 01001xxxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.  
    - 010001xxxx111111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn.  
  These instructions are always *undefined*, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.  
  It is implementation defined whether the IT instruction is treated as:  
  - A 16-bit instruction, that can only be followed by another 16-bit instruction.  
  - The first half of a 32-bit instruction.  
  This means that, for the situations that are *undefined*, either the second 16-bit instruction or the 32-bit instruction is *undefined*. An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction. |

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is constrained unpredictable. For more information see 'Changes to an ITD control by an instruction in an IT block' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section E1.2.4

ITD is optional, but if it is implemented in the *SCTLR* then it must also be implemented in the *HSCTLR*. If it is not implemented then this bit is RAZ/WI.

In a system where the PE resets into EL2, this field resets to an architecturally unknown value.

**Bit [6]**

Reserved, RES0.

**CP15BEN, bit [5]**

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL2:

<table>
<thead>
<tr>
<th>CP15BEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL2 execution of the <em>CP15DMB, CP15DSB</em>, and <em>CP15ISB</em> instructions is <em>undefined</em>.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL2 execution of the <em>CP15DMB, CP15DSB</em>, and <em>CP15ISB</em> instructions is enabled.</td>
</tr>
</tbody>
</table>

CP15BEN is optional, but if it is implemented in the *SCTLR* then it must also be implemented in the *HSCTLR*. If it is not implemented then this bit is RAO/WI.

In a system where the PE resets into EL2, this field resets to an architecturally unknown value.

**LSMAOE, bit [4]**

*When Armv8.2-LSMAOC is implemented:*

Load Multiple and Store Multiple Atomicity and Ordering Enable.
LSMAOE, bit [0]
For all memory accesses at EL2, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.

<table>
<thead>
<tr>
<th>LSMAOE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For all memory accesses at EL2, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.</td>
</tr>
<tr>
<td>0b1</td>
<td>The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL2 is as defined for Armv8.0.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to 1.

Otherwise:

Reserved, RES1.

nTLSMD, bit [3]
When ARMv8.2-LSMAOC is implemented:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

<table>
<thead>
<tr>
<th>nTLSMD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL2 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.</td>
</tr>
<tr>
<td>0b1</td>
<td>All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL2 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to 1.

Otherwise:

Reserved, RES1.

C, bit [2]
Cacheability control, for data accesses at EL2:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All data access to Normal memory from EL2, and all accesses to the EL2 translation tables, are Non-cacheable for all levels of data and unified cache.</td>
</tr>
<tr>
<td>0b1</td>
<td>All data access to Normal memory from EL2, and all accesses to the EL2 translation tables, can be cached at all levels of data and unified cache.</td>
</tr>
</tbody>
</table>

This bit has no effect on the PL1&0 translation regime.

In a system where the PE resets into EL2, this field resets to 0.

A, bit [1]
Alignment check enable. This is the enable bit for Alignment fault checking at EL2:
Meaning

Alignment fault checking disabled when executing at EL2. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element or data elements being accessed.

Alignment fault checking enabled when executing at EL2. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element or data elements being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL2 stage 1 address translation. Possible values of this bit are:

<table>
<thead>
<tr>
<th>M</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL2 stage 1 address translation disabled. See the HSCTRL.R1 field for the behavior of instruction accesses to Normal memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL2 stage 1 address translation enabled.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to 0.

Accessing the HSCTRL

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>

HSR, Hyp Syndrome Register

The HSR characteristics are:

**Purpose**

Holds syndrome information for an exception taken to Hyp mode.

**Configuration**

AArch32 System register HSR bits [31:0] are architecturally mapped to AArch64 System register ESR_EL2[31:0]. If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HSR is a 32-bit register.

**Field descriptions**

The HSR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| EC | IL | ISS |

Execution in any Non-secure PE mode other than Hyp mode makes this register UNKNOWN.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL2, the value of HSR is UNKNOWN. The value written to HSR must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

**EC, bits [31:26]**

Exception Class. Indicates the reason for the exception that this register holds information about. Possible values of this field are:
<table>
<thead>
<tr>
<th>EC</th>
<th>Meaning</th>
<th>ISS</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>Unknown reason.</td>
<td>ISS encoding for exceptions with an unknown reason</td>
</tr>
<tr>
<td>0b000001</td>
<td>Trapped WFI or WFE instruction execution. Conditional WFE and WFI instructions that fail their condition code check do not cause an exception.</td>
<td>ISS encoding for Exception from a WFI or WFE instruction</td>
</tr>
<tr>
<td>0b000011</td>
<td>Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC 0b000000.</td>
<td>ISS encoding for Exception from an MCR or MRC access</td>
</tr>
<tr>
<td>0b000100</td>
<td>Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC 0b000000.</td>

<td>ISS encoding for Exception from a Prefetch Abort</td>
</tr>
<tr>
<td>0b100010</td>
<td>PC alignment fault exception.</td>
<td>ISS encoding for Exception from an Illegal state or PC alignment fault</td>
</tr>
</tbody>
</table>
Data Abort from a lower Exception level.

Data Abort taken without a change in Exception level.

All other EC values are reserved by Arm, and:

- Unused values in the range `0b000000 - 0b101100` (`0x0 - 0x2C`) are reserved for future use for synchronous exceptions.
- Unused values in the range `0b101101 - 0b111111` (`0x2D - 0x3F`) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is **CONSTRAINED UNPREDICTABLE**, as described in 'Reserved values in System and memory-mapped registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section K1.2.2.

This field resets to an architecturally **UNKNOWN** value.

### IL, bit [25]

Instruction length bit. Indicates the size of the instruction that has been trapped to Hyp mode. When this bit is valid, possible values of this bit are:

<table>
<thead>
<tr>
<th>IL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>16-bit instruction trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>32-bit instruction trapped.</td>
</tr>
</tbody>
</table>

This field is **RES1** and not valid for the following cases:

- When the EC field is `0b000000`, indicating an exception with an unknown reason.
- Prefetch Aborts.
- Data Aborts for which the HSR.ISS.ISV field is 0.
- When the EC value is `0b001110`, indicating an Illegal state exception.

**Note**

This is a change from the behavior in Armv7, where the IL field is UNK/SBZP for the corresponding cases.

The IL field is not valid and is **UNKNOWN** on an exception from a PC alignment fault.

This field resets to an architecturally **UNKNOWN** value.

### ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

#### ISS encoding for exceptions with an unknown reason

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 |

**Bits [24:0]**

Reserved, **RES0**.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or is not accessible in the current PE mode in the current Security state, including:
- A read access using a System register encoding pattern that is not allocated for reads or that does not permit reads in the current PE mode and Security state.
- A write access using a System register encoding pattern that is not allocated for writes or that does not permit writes in the current PE mode and Security state.
- Instruction encodings that are unallocated.
- Instruction encodings for instructions not implemented in the implementation.

- In Debug state, the attempted execution of an instruction bit pattern that not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that not accessible in Non-debug state.
- The attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the SCTLR. {ITD, SED, CP15BEN} control bits.
- Attempted execution of:
  - An HVC instruction when disabled by HCR.HCD, SCR.HCE, or SCR_EL3.HCE.
  - An SMC instruction when disabled by SCR.SCD or SCR_EL3.SMD.
  - An HLT instruction when disabled by EDSCR.HDE.
- An exception generated because of the attempted execution of an MSR (Banked register) or MRS (Banked register) instruction that would access a Banked register that is not accessible from the Security state and PE mode at which the instruction was executed.

An exception is generated only if the constrained unpredictable behavior of the instruction is that it is undefined, see 'MSR/MRS Banked registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section K1.1.29 (Constrained Unpredictable behavior of EL2 features).

- Attempted execution, in Debug state, of:
  - A DCPS1 instruction in Non-secure state from EL0 when EL2 is using AArch32 and the value of HCR.TGE is 1.
  - A DCPS2 instruction at EL1 or EL0 when EL2 is not implemented, or when EL3 is using AArch32 and the value of SCR.NS is 0, or when EL3 is using AArch64 and the value of SCR_EL3.NS is 0.
  - A DCPS3 instruction when EL3 is not implemented, or when the value of EDSCR.SDD is 1.
- In Debug state when the value of EDSCR.SDD is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.

'Undefined Instruction exception, when HCR.TGE is set to 1' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G1 (The AArch32 System Level Programmers’ Model), describes the configuration settings for a trap that returns an HSR.EC value of 0b000000.

**ISS encoding for Exception from a WFI or WFE instruction**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| CV | COND | RES0 | TI |

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.
**COND, bits [23:20]**

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to \(0b1110\).

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to \(0b1110\), the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is **IMPLEMENTATION DEFINED** whether:

- CV is set to 0 and COND is set to an **UNKNOWN** value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is **IMPLEMENTATION DEFINED** whether the COND field is set to \(0b1110\), or to the value of any condition that applied to the instruction.

This field resets to an architecturally **UNKNOWN** value.

**Bits [19:1]**

Reserved, RES0.

**TI, bit [0]**

Trapped instruction. Possible values of this bit are:

<table>
<thead>
<tr>
<th>TI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>WFI trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>WFE trapped.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

'Trapping use of the WFI and WFE instructions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G1 (The AArch32 System Level Programmers' Model), describes the configuration settings for this trap.

**ISS encoding for Exception from an MCR or MRC access**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is **IMPLEMENTATION DEFINED** whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally **UNKNOWN** value.
**COND, bits [23:20]**

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to $0b1110$.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to $0b1110$, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is implementation defined whether:

- CV is set to 0 and COND is set to an unknown value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is implementation defined whether the COND field is set to $0b1110$, or to the value of any condition that applied to the instruction.

This field resets to an architecturally unknown value.

**Opc2, bits [19:17]**

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value $0b000$.

This field resets to an architecturally unknown value.

**Opc1, bits [16:14]**

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value $0b111$.

This field resets to an architecturally unknown value.

**CRn, bits [13:10]**

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

This field resets to an architecturally unknown value.

**Bit [9]**

Reserved, RES0.

**Rt, bits [8:5]**

The Rt value from the issued instruction, the general-purpose register used for the transfer.

This field resets to an architecturally unknown value.

**CRm, bits [4:1]**

The CRm value from the issued instruction.
For a trapped VMRS access, holds the value \(0b0000\).

This field resets to an architecturally **UNKNOWN** value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>(0b0)</td>
<td>Write to System register space. MCR instruction.</td>
</tr>
<tr>
<td>(0b1)</td>
<td>Read from System register space. MRC or VMRS instruction.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

The following sections describe configuration settings for traps that are reported using EC value \(0b000011\):

- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to the ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G1 (The AArch32 System Level Programmers’ Model).
- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to lockdown, DMA, and TCM operations' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G1.
- 'Traps to Hyp mode of Non-secure EL1 accesses to the Auxiliary Control Register' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G1.
- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Performance Monitors registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G1.
- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Activity Monitors registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G1.
- 'Traps to Hyp mode of Non-secure EL1 accesses to the CPACR' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G1.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

**Opc1, bits [19:16]**

The Opc1 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

**Bits [15:14]**

Reserved, RES0.

**Rt2, bits [13:10]**

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer.

This field resets to an architecturally UNKNOWN value.

**Bit [9]**

Reserved, RES0.

**Rt, bits [8:5]**

The Rt value from the issued instruction, the first general-purpose register used for the transfer.
This field resets to an architecturally **UNKNOWN** value.

**CRm, bits [4:1]**

The CRm value from the issued instruction.

This field resets to an architecturally **UNKNOWN** value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Write to System register space. MCRR instruction.</td>

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is **IMPLEMENTATION DEFINED** whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally **UNKNOWN** value.

**COND, bits [23:20]**

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:
If the instruction is conditional, COND is set to the condition code field value from the instruction.
If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

**imm8, bits [19:12]**

The immediate value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

**Bits [11:9]**

Reserved, RES0.

**Rn, bits [8:5]**

The Rn value from the issued instruction. Valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction.

When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

**Offset, bit [4]**

Indicates whether the offset is added or subtracted:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Subtract offset.</td>
</tr>
<tr>
<td>0b1</td>
<td>Add offset.</td>
</tr>
</tbody>
</table>

This bit corresponds to the U bit in the instruction encoding.

This field resets to an architecturally UNKNOWN value.

**AM, bits [3:1]**

Addressing mode. The permitted values of this field are:
The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is **CONSTRAINED UNPREDICTABLE**, as described in 'Unallocated values in fields of AArch32 System registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section K1.1.11.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits \{P, W\} in the instruction encoding.

This field resets to an architecturally **UNKNOWN** value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Write to memory. STC instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read from memory. LDC instruction.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

'Trapping general Non-secure System register accesses to debug registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G1 describes the configuration settings for the trap that is reported using EC value 0b000110.

**ISS encoding for Exception from an access to SIMD or floating-point functionality, resulting from HCPTR**

```
24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
| CV | COND | RES0 | TA RES0 | coproc |
```

Excludes exceptions that occur because Advanced SIMD and floating-point functionality is not implemented, or because the value of \(HCR\).TGE or \(HCR\_EL2\).TGE is 1. These are reported with EC value 0b000000.

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is **IMPLEMENTATION DEFINED** whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally **UNKNOWN** value.

**COND, bits [23:20]**

The condition code for the trapped instruction.
When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to $0b1110$.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to $0b1110$, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to $0b1110$, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

**Bits [19:6]**

Reserved, RES0.

**TA, bit [5]**

Indicates trapped use of Advanced SIMD functionality. The possible values of this bit are:

<table>
<thead>
<tr>
<th>TA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>$0b0$</td>
<td>Exception was not caused by trapped use of Advanced SIMD functionality.</td>
</tr>
<tr>
<td>$0b1$</td>
<td>Exception was caused by trapped use of Advanced SIMD functionality.</td>
</tr>
</tbody>
</table>

Any use of an Advanced SIMD instruction that is not also a floating-point instruction that is trapped to Hyp mode because of a trap configured in the HCPTR sets this bit to 1.

For a list of these instructions, see 'Controls of Advanced SIMD operation that do not apply to floating-point operation' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section E1.

This field resets to an architecturally UNKNOWN value.

**Bit [4]**

Reserved, RES0.

**coproc, bits [3:0]**

When the TA field returns the value 1, this field returns the value 1010, otherwise this field is RES0.

This field resets to an architecturally UNKNOWN value.

The following sections describe the configuration settings for the traps that are reported using EC value $0b001111$:

**ISS encoding for Exception from HVC or SVC instruction execution**
Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, this is the value of the imm16 field of the issued instruction.

For an SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

The HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

‘Supervisor Call exception, when HCR.TGE is set to 1’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G1 (The AArch32 System Level Programmers’ Model), describes the configuration settings for the trap reported with EC value 0b010001.

ISS encoding for Exception from SMC instruction execution

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| CV | COND | CCKNOWLEDGEPASS | RES0 |

CV, bit [24]

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is only valid if CCKNOWLEDGEPASS is 1, otherwise it is RES0.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:
• With COND set to 0b1110, the value for unconditional.
• With the COND value held in the instruction.

When a T32 instruction is trapped, it is implementation defined whether:

• CV is set to 0 and COND is set to an unknown value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
• CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is implementation defined whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is only valid if CCKNOWNPASS is 1, otherwise it is res0.

This field resets to an architecturally unknown value.

**CCKNOWNPASS, bit [19]**

Indicates whether the instruction might have failed its condition code check.

<table>
<thead>
<tr>
<th>CCKNOWNPASS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The instruction was unconditional, or was conditional and passed its condition code check.</td>
</tr>
<tr>
<td>0b1</td>
<td>The instruction was conditional, and might have failed its condition code check.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally unknown value.

**Bits [18:0]**

Reserved, res0.

‘Traps to Hyp mode of Non-secure EL1 execution of SMC instructions’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G1 (The AArch32 System Level Programmers’ Model), describes the configuration settings for this trap, for instructions executed in Non-secure EL1.

**ISS encoding for Exception from a Prefetch Abort**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|---|---|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| RES0 | FnVEA | RES0S1PTW | RES0 | IFSC |

**Bits [24:11]**

Reserved, res0.

**FnV, bit [10]**

FAR not valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<table>
<thead>
<tr>
<th>FnV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>HIFAR is valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>HIFAR is not valid, and holds an unknown value.</td>
</tr>
</tbody>
</table>

This field is only valid if the IFSC code is 0b1000000. It is res0 for all other aborts.

This field resets to an architecturally unknown value.

**EA, bit [9]**

External abort type. This bit can provide an implementation defined classification of External aborts.
For any abort other than an External abort this bit returns a value of 0.

This field resets to an architecturally **UNKNOWN** value.

**Bit [8]**

Reserved, RES0.

**S1PTW, bit [7]**

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

<table>
<thead>
<tr>
<th>S1PTW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault not on a stage 2 translation for a stage 1 translation table walk.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault on the stage 2 translation of an access for a stage 1 translation table walk.</td>
</tr>
</tbody>
</table>

For any abort other than a stage 2 fault this bit is RES0.

This field resets to an architecturally **UNKNOWN** value.

**Bit [6]**

Reserved, RES0.

**IFSC, bits [5:0]**

Instruction Fault Status Code. Possible values of this field are:

<table>
<thead>
<tr>
<th>IFSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00000</td>
<td>Address size fault, translation table base register.</td>
</tr>
<tr>
<td>0b00001</td>
<td>Address size fault, level 1.</td>
</tr>
<tr>
<td>0b00010</td>
<td>Address size fault, level 2.</td>
</tr>
<tr>
<td>0b00011</td>
<td>Address size fault, level 3.</td>
</tr>
<tr>
<td>0b00101</td>
<td>Translation fault, level 1.</td>
</tr>
<tr>
<td>0b00110</td>
<td>Translation fault, level 2.</td>
</tr>
<tr>
<td>0b00111</td>
<td>Translation fault, level 3.</td>
</tr>
<tr>
<td>0b01000</td>
<td>Access flag fault, level 1.</td>
</tr>
<tr>
<td>0b01001</td>
<td>Access flag fault, level 2.</td>
</tr>
<tr>
<td>0b01010</td>
<td>Access flag fault, level 3.</td>
</tr>
<tr>
<td>0b01100</td>
<td>Permission fault, level 1.</td>
</tr>
<tr>
<td>0b01101</td>
<td>Permission fault, level 2.</td>
</tr>
<tr>
<td>0b01110</td>
<td>Permission fault, level 3.</td>
</tr>
<tr>
<td>0b01111</td>
<td>Permission fault, level 3.</td>
</tr>
<tr>
<td>0b010000</td>
<td>Synchronous External abort, not on translation table walk.</td>
</tr>
<tr>
<td>0b010101</td>
<td>Synchronous External abort, on translation table walk, level 1.</td>
</tr>
<tr>
<td>0b010110</td>
<td>Synchronous External abort, on translation table walk, level 2.</td>
</tr>
<tr>
<td>0b010111</td>
<td>Synchronous External abort, on translation table walk, level 3.</td>
</tr>
<tr>
<td>0b011000</td>
<td>Synchronous parity or ECC error on memory access, not on translation table walk.</td>
</tr>
<tr>
<td>0b011101</td>
<td>Synchronous parity or ECC error on memory access on translation table walk, level 1.</td>
</tr>
<tr>
<td>0b011110</td>
<td>Synchronous parity or ECC error on memory access on translation table walk, level 2.</td>
</tr>
<tr>
<td>0b011111</td>
<td>Synchronous parity or ECC error on memory access on translation table walk, level 3.</td>
</tr>
<tr>
<td>0b100010</td>
<td>Debug exception.</td>
</tr>
<tr>
<td>0b110000</td>
<td>TLB conflict abort.</td>
</tr>
</tbody>
</table>

All other values are reserved.
When the RAS Extension is implemented, 0b011000, 0b011101, 0b011110, and 0b011111, are reserved.

**Note**

Armv8.2 requires the implementation of the RAS Extension.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Long-selector translation table lookup' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

This field resets to an architecturally **UNKNOWN** value.

The following sections describe cases where Prefetch Abort exceptions can be routed to Hyp mode, generating exceptions that are reported in the HSR with EC value 0b100000:

- ‘Abort exceptions, when HCR.TGE is set to 1’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G1 (The AArch32 System Level Programmers' Model).

### ISS encoding for Exception from an Illegal state or PC alignment fault

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>24-0</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

For more information about the Illegal state exception, see:

For more information about the PC alignment fault exception, see 'Branching to an unaligned PC' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, appendix A.

### ISS encoding for Exception from a Data Abort

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>24-0</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

**ISV, bit [24]**

Instruction syndrome valid. Indicates whether the syndrome information in ISS[23:14] is valid.

<table>
<thead>
<tr>
<th>ISV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No valid instruction syndrome. ISS[23:14] are RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>ISS[23:14] hold a valid instruction syndrome.</td>
</tr>
</tbody>
</table>

This bit is 0 for all faults except Data Aborts generated by stage 2 address translations for which all the following apply to the instruction that generated the Data Abort exception:

- The instruction is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STL, or STRBT instruction.
• The instruction is not performing register writeback.
• The instruction is not using the PC as a source or destination register.

For these cases, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, as described in 'Data Aborts in Memory access mode' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H4.3.2 (Memory access mode), and otherwise indicates whether ISS[23:14] hold a valid syndrome.

**Note**

In the A32 instruction set, LDR*T and STR*T instructions always perform register writeback and therefore never return a valid instruction syndrome.

When the RAS Extension is implemented, ISV is 0 for any synchronous External abort.

ISV is set to 0 on a stage 2 abort on a stage 1 translation table walk.

When the RAS Extension is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

This field resets to an architecturally UNKNOWN value.

**SAS, bits [23:22]**

Syndrome Access Size. When ISV is 1, indicates the size of the access attempted by the faulting operation.

<table>
<thead>
<tr>
<th>SAS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Byte</td>
</tr>
<tr>
<td>0b01</td>
<td>Halfword</td>
</tr>
<tr>
<td>0b10</td>
<td>Word</td>
</tr>
<tr>
<td>0b11</td>
<td>Doubleword</td>
</tr>
</tbody>
</table>

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

**SSE, bit [21]**

Syndrome Sign Extend. When ISV is 1, for a byte, halfword, or word load operation, indicates whether the data item must be sign extended. For these cases, the possible values of this bit are:

<table>
<thead>
<tr>
<th>SSE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sign-extension not required.</td>
</tr>
<tr>
<td>0b1</td>
<td>Data item must be sign-extended.</td>
</tr>
</tbody>
</table>

For all other operations this bit is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

**Bit [20]**

Reserved, RES0.

**SRT, bits [19:16]**

Syndrome Register transfer. When ISV is 1, the register number of the Rt operand of the faulting instruction.

This field is UNKNOWN when the value of ISV is UNKNOWN.
This field is **RES0** when the value of ISV is 0.

This field resets to an architecturally **UNKNOWN** value.

**Bit [15]**

Reserved, **RES0**.

**AR, bit [14]**

Acquire/Release. When ISV is 1, the possible values of this bit are:

<table>
<thead>
<tr>
<th>AR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Instruction did not have acquire/release semantics.</td>
</tr>
<tr>
<td>0b1</td>
<td>Instruction did have acquire/release semantics.</td>
</tr>
</tbody>
</table>

This field is **UNKNOWN** when the value of ISV is **UNKNOWN**.

This field is **RES0** when the value of ISV is 0.

This field resets to an architecturally **UNKNOWN** value.

**Bits [13:12]**

Reserved, **RES0**.

**AET, bits [11:10]**

**When RAS is implemented:**

Asynchronous Error Type.

When the RAS Extension is implemented and the value returned in the DFSC field is 0b010001, describes the state of the PE after taking the SError interrupt exception. The possible values of this field are:

<table>
<thead>
<tr>
<th>AET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Uncontainable error (UC) or uncategorized.</td>
</tr>
<tr>
<td>0b01</td>
<td>Unrecoverable error (UEU).</td>
</tr>
<tr>
<td>0b10</td>
<td>Restartable error (UEO) or Corrected error (CE).</td>
</tr>
<tr>
<td>0b11</td>
<td>Recoverable error (UER).</td>
</tr>
</tbody>
</table>

On a synchronous Data Abort, this field is **RES0**.

If multiple errors are taken as a single SError interrupt exception, the overall state of the PE is reported. For example, if both a Recoverable and Unrecoverable error occurred, the state is Unrecoverable.

**Note**

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

When the RAS Extension is not implemented, or when DFSC is not 0b010001:

- Bit[11] is **RES0**.
- Bit[10] forms the FnV field.

**Note**

Armv8.2 requires the implementation of the RAS Extension.

This field resets to an architecturally **UNKNOWN** value.
Otherwise:

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<table>
<thead>
<tr>
<th>FnV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>HDFAR is valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>HDFAR is not valid, and holds an \textit{UNKNOWN} value.</td>
</tr>
</tbody>
</table>

When the RAS Extension is not implemented, this field is valid only if DFSC is 0b010000. It is \textit{RES}0 for all other aborts.

When the RAS Extension is implemented:

- If DFSC is 0b010000, this field is valid.
- If DFSC is 0b010001, this bit forms part of the AET field, becoming AET[0].
- This field is \textit{RES}0 for all other aborts.

\textbf{Note}

Armv8.2 requires the implementation of the RAS Extension.

This field resets to an architecturally \textit{UNKNOWN} value.

\textbf{EA, bit [9]}

External abort type. This bit can provide an \textit{IMPLEMENTATION DEFINED} classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field resets to an architecturally \textit{UNKNOWN} value.

\textbf{CM, bit [8]}

Cache maintenance. For a synchronous fault, identifies fault that comes from a cache maintenance or address translation instruction. For synchronous faults, the possible values of this bit are:

<table>
<thead>
<tr>
<th>CM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault not generated by a cache maintenance or address translation instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault generated by a cache maintenance or address translation instruction.</td>
</tr>
</tbody>
</table>

For an asynchronous Data Abort exception, this bit is 0.

This field resets to an architecturally \textit{UNKNOWN} value.

\textbf{S1PTW, bit [7]}

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

<table>
<thead>
<tr>
<th>S1PTW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault not on a stage 2 translation for a stage 1 translation table walk.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault on the stage 2 translation of an access for a stage 1 translation table walk.</td>
</tr>
</tbody>
</table>

For any abort other than a stage 2 fault this bit is \textit{RES}0.

This field resets to an architecturally \textit{UNKNOWN} value.
**WnR, bit [6]**

Write not Read. Indicates whether a synchronous abort was caused by a write instruction or a read instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>WnR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Abort caused by a read instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Abort caused by a write instruction.</td>
</tr>
</tbody>
</table>

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

On an asynchronous Data Abort:

- When the RAS Extension is not implemented, this bit is **UNKNOWN**.
- When the RAS Extension is implemented, this bit is **RES0**.

**Note**

Armv8.2 requires the implementation of the RAS Extension.

This field resets to an architecturally **UNKNOWN** value.

**DFSC, bits [5:0]**

Data Fault Status Code. Possible values of this field are:

<table>
<thead>
<tr>
<th>DFSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00000</td>
<td>Address size fault, translation table base register.</td>
</tr>
<tr>
<td>0b00001</td>
<td>Address size fault, level 1.</td>
</tr>
<tr>
<td>0b00010</td>
<td>Address size fault, level 2.</td>
</tr>
<tr>
<td>0b00011</td>
<td>Address size fault, level 3.</td>
</tr>
<tr>
<td>0b00101</td>
<td>Translation fault, level 1.</td>
</tr>
<tr>
<td>0b00110</td>
<td>Translation fault, level 2.</td>
</tr>
<tr>
<td>0b00111</td>
<td>Translation fault, level 3.</td>
</tr>
<tr>
<td>0b01001</td>
<td>Access flag fault, level 1.</td>
</tr>
<tr>
<td>0b01010</td>
<td>Access flag fault, level 2.</td>
</tr>
<tr>
<td>0b01011</td>
<td>Access flag fault, level 3.</td>
</tr>
<tr>
<td>0b01101</td>
<td>Permission fault, level 1.</td>
</tr>
<tr>
<td>0b01110</td>
<td>Permission fault, level 2.</td>
</tr>
<tr>
<td>0b01111</td>
<td>Permission fault, level 3.</td>
</tr>
<tr>
<td>0b10000</td>
<td>Synchronous External abort, not on translation table walk.</td>
</tr>
<tr>
<td>0b10001</td>
<td><strong>S</strong>Error interrupt.</td>
</tr>
<tr>
<td>0b10101</td>
<td>Synchronous External abort, on translation table walk, level 1.</td>
</tr>
<tr>
<td>0b10110</td>
<td>Synchronous External abort, on translation table walk, level 2.</td>
</tr>
<tr>
<td>0b10111</td>
<td>Synchronous External abort, on translation table walk, level 3.</td>
</tr>
<tr>
<td>0b11000</td>
<td>Synchronous parity or ECC error on memory access, not on translation table walk.</td>
</tr>
<tr>
<td>0b11001</td>
<td><strong>S</strong>Error interrupt from a parity or ECC error on memory access.</td>
</tr>
<tr>
<td>0b11101</td>
<td>Synchronous parity or ECC error on memory access on translation table walk, level 1.</td>
</tr>
<tr>
<td>0b11110</td>
<td>Synchronous parity or ECC error on memory access on translation table walk, level 2.</td>
</tr>
<tr>
<td>0b11111</td>
<td>Synchronous parity or ECC error on memory access on translation table walk, level 3.</td>
</tr>
<tr>
<td>0b10000</td>
<td>Alignment fault.</td>
</tr>
<tr>
<td>0b10001</td>
<td>Debug exception.</td>
</tr>
<tr>
<td>0b11000</td>
<td>TLB conflict abort.</td>
</tr>
<tr>
<td>0b11100</td>
<td><strong>IMPLEMENTATION</strong> DEFINED fault (Lockdown).</td>
</tr>
<tr>
<td>0b11101</td>
<td><strong>IMPLEMENTATION</strong> DEFINED fault (Unsupported Exclusive access).</td>
</tr>
</tbody>
</table>

All other values are reserved.
When the RAS Extension is implemented, \(0b011000, 0b011001, 0b011101, 0b011110,\) and \(0b011111,\) are reserved.

For more information about the lookup level associated with a fault, see ‘The level associated with MMU faults on a Long-descriptor translation table lookup’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

This field resets to an architecturally **UNDEFINED** value.

The following describe cases where Data Abort exceptions can be routed to Hyp mode, generating exceptions that are reported in the HSR with EC value \(0b100100\):

HSTR, Hyp System Trap Register

The HSTR characteristics are:

**Purpose**

Controls trapping to Hyp mode of Non-secure accesses, at EL1 or lower, to System registers in the coproc == 0b1111 encoding space:

- By the CRn value used to access the register using MCR or MRC instruction.
- By the CRm value used to access the register using MCRR or MRRC instruction.

**Configuration**

AArch32 System register HSTR bits [31:0] are architecturally mapped to AArch64 System register HSTR_EL2[31:0]. If EL2 is not implemented, this register is RES0 from EL3.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HSTR is a 32-bit register.

**Field descriptions**

The HSTR bit assignments are:

|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| RES0 | T15 | T14 | T13 | T12 | T11 | T10 | T9 | T8 | T7 | T6 | T5 | T4 | T3 | T2 | T1 | T0 |

**Bits [31:16]**

Reserved, RES0.

**T<n>, bit [n], for n = 0 to 15**

Fields T14 and T4 are RES0.

The remaining fields control whether Non-secure EL0 and EL1 accesses, using MCR, MRC, MCRR, and MRRC instructions, to the System registers in the coproc == 0b1111 encoding space are trapped to Hyp mode:

<table>
<thead>
<tr>
<th>T&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on Non-secure EL0 or EL1 accesses to System registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any Non-secure EL1 MCR or MRC access with coproc == 0b1111 and CRn == &lt;n&gt; is trapped to Hyp mode. A Non-secure EL0 MCR or MRC access with these values is trapped to Hyp mode only if the access is not UNDEFINED when the value of this field is 0. Any Non-secure EL1 MCRR or MRRC access with coproc == 0b1111 and CRm == &lt;n&gt; is trapped to Hyp mode. A Non-secure EL0 MCRR or MRRC access with these values is trapped to Hyp mode only if the access is not UNDEFINED when the value of this field is 0.</td>
</tr>
</tbody>
</table>

For example, when HSTR.T7 is 1, for instructions executed at Non-secure EL1:
• An MCR or MRC instruction with coproc set to 0b1111 and CRn set to c7 is trapped to Hyp mode.
• An MCRR or MRRC instruction with coproc set to 0b1111 and CRm set to c7 is trapped to Hyp mode.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

**Accessing the HSTR**

Accesses to this register use the following encodings:

**MRC{c}{q} {<coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>}, {#}<opc2>**

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b100</td>
<td>0b0001</td>
<td>0b0001</td>
<td>0b011</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
 UNDEFINED;
elif PSTATE.EL == EL1 then
 if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
  AArch64.AArch32SystemAccessTrap(EL2, 0x03);
elif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
  AArch32.TakeHypTrapException(0x03);
else
  UNDEFINED;
elsif PSTATE.EL == EL2 then
 return HSTR;
elif PSTATE.EL == EL3 then
 if SCR.NS == '0' then
  UNDEFINED;
else
  return HSTR;

**MCR{c}{q} {<coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>}, {#}<opc2>**

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b100</td>
<td>0b0001</td>
<td>0b0001</td>
<td>0b011</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
 UNDEFINED;
elif PSTATE.EL == EL1 then
 if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
  AArch64.AArch32SystemAccessTrap(EL2, 0x03);
elif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
  AArch32.TakeHypTrapException(0x03);
else
  UNDEFINED;
elsif PSTATE.EL == EL2 then
 HSTR = R[t];
elif PSTATE.EL == EL3 then
 if SCR.NS == '0' then
  UNDEFINED;
else
  HSTR = R[t];
HTCR, Hyp Translation Control Register

The HTCR characteristics are:

**Purpose**

The control register for stage 1 of the EL2 translation regime.

**Note**

This stage of translation always uses the Long-descriptor translation table format.

**Configuration**

AArch32 System register HTCR bits [31:0] are architecturally mapped to AArch64 System register TCR_EL2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HTCR is a 32-bit register.

**Field descriptions**

The HTCR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES1.</td>
</tr>
<tr>
<td>30</td>
<td>IMPLEMENTATION DEFINED, bit [30]</td>
</tr>
<tr>
<td>29</td>
<td>IMPLEMENTATION DEFINED.</td>
</tr>
<tr>
<td>28</td>
<td>This field resets to an architecturally UNKNOWN value.</td>
</tr>
<tr>
<td>27</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>26</td>
<td>HWU62, bit [28]</td>
</tr>
<tr>
<td>25</td>
<td>When ARMv8.2-TTPBHA is implemented:</td>
</tr>
<tr>
<td>24</td>
<td>Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.</td>
</tr>
</tbody>
</table>
# HTCR, Hyp Translation Control Register

<table>
<thead>
<tr>
<th>HWU62</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of HTCR.HPD is 0.

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

## HWU61, bit [27]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU61</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of HTCR.HPD is 0.

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

## HWU60, bit [26]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU60</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of HTCR.HPD is 0.

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

## HWU59, bit [25]
When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU59</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of HTCR.HPD is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD, bit [24]

When ARMv8.2-AA32HPD is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the PL2 translation regime.

<table>
<thead>
<tr>
<th>HPD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hierarchical permissions are enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hierarchical permissions are disabled.</td>
</tr>
</tbody>
</table>

When disabled, the permissions are treated as if the bits are zero.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES1.

Bits [22:14]

Reserved, RES0.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using HTTBR.

<table>
<thead>
<tr>
<th>SH0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Unallocated values in fields of AArch32 System registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section K1.1.11.

This field resets to an architecturally UNKNOWN value.
**ORGN0, bits [11:10]**

Outer cacheability attribute for memory associated with translation table walks using **HTTBR**.

<table>
<thead>
<tr>
<th>ORGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**IRGN0, bits [9:8]**

Inner cacheability attribute for memory associated with translation table walks using **HTTBR**.

<table>
<thead>
<tr>
<th>IRGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**Bits [7:3]**

Reserved, RES0.

**T0SZ, bits [2:0]**

The size offset of the memory region addressed by **HTTBR**. The region size is $2^{(32-T0SZ)}$ bytes.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the HTCR**

Accesses to this register use the following encodings:

```
MRC{<c>{<q>}} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>

    UNDEFINED;
HTPIDR, Hyp Software Thread ID Register

The HTPIDR characteristics are:

**Purpose**

Provides a location where software running in Hyp mode can store thread identifying information that is not visible to Non-secure software executing at EL0 or EL1, for hypervisor management purposes.

The PE makes no use of this register.

**Configuration**

AArch32 System register HTPIDR bits [31:0] are architecturally mapped to AArch64 System register TPIDR_EL2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

---

**Note**

The PE never updates this register.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HTPIDR is a 32-bit register.

**Field descriptions**

The HTPIDR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>

HTRFCR, Hyp Trace Filter Control Register

The HTRFCR characteristics are:

**Purpose**

Provides EL2 controls for Trace.

**Configuration**

AArch32 System register HTRFCR bits [31:0] are architecturally mapped to AArch64 System register TRFCR_EL2[31:0].

This register is present only when ARMv8.4-Trace is implemented. Otherwise, direct accesses to HTRFCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from Monitor mode when SCR.NS == 1.

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HTRFCR is a 32-bit register.

**Field descriptions**

The HTRFCR bit assignments are:

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |
|--------------------------------|---------------------------------|---------------------------------|
| RES0                          | TS                              | RES0CXRES0E2TRE                  |

**Bits [31:7]**

Reserved, RES0.

**TS, bits [6:5]**

Timestamp Control. Controls which timebase is used for trace timestamps.

<table>
<thead>
<tr>
<th>TS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The timestamp is controlled by TRFCR.TS.</td>
</tr>
<tr>
<td>0b01</td>
<td>Virtual timestamp. The traced timestamp is the physical counter value minus the value of CNTVOFF.</td>
</tr>
<tr>
<td>0b11</td>
<td>Physical timestamp. The traced timestamp is the physical counter value.</td>
</tr>
</tbody>
</table>

When SelfHostedTraceEnabled() == FALSE, this field is ignored.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Bit [4]**

Reserved, RES0.
**CX, bit [3]**

VMID Trace Enable.

<table>
<thead>
<tr>
<th>CX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>VMID tracing is not allowed.</td>
</tr>
<tr>
<td>0b1</td>
<td>VMID tracing is allowed.</td>
</tr>
</tbody>
</table>

When `SelfHostedTraceEnabled() == FALSE`, this field is ignored.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Bit [2]**

Reserved, RES0.

**E2TRE, bit [1]**

EL2 Trace Enable.

<table>
<thead>
<tr>
<th>E2TRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Tracing is prohibited at EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Tracing is allowed at EL2.</td>
</tr>
</tbody>
</table>

When `SelfHostedTraceEnabled() == FALSE`, this field is ignored.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**E0HTRE, bit [0]**

EL0 Trace Enable.

<table>
<thead>
<tr>
<th>E0HTRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Tracing is prohibited at EL0 when <code>HCR.TGE == 1</code>.</td>
</tr>
<tr>
<td>0b1</td>
<td>Tracing is allowed at EL0 when <code>HCR.TGE == 1</code>.</td>
</tr>
</tbody>
</table>

This field is ignored if any of the following are true:

- The PE is in Secure state.
- `SelfHostedTraceEnabled() == FALSE`.
- `HCR.TGE == 0`.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Accessing the HTRFCR**

Accesses to this register use the following encodings:

\[
\text{MRC\{<c>\}{<q>} <coproc>, \{#<opc1>, <Rt>, <CRn>, <CRm>{, \{#<opc2>\}\}}} 
\]

<table>
<thead>
<tr>

    HTRFCR = R[t];
The HTTBR characteristics are:

**Purpose**

Holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL2 translation regime, and other information for this translation regime.

**Configuration**

AArch32 System register HTTBR bits [47:1] are architecturally mapped to AArch64 System register TTBR0_EL2[47:1].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HTTBR is a 64-bit register.

**Field descriptions**

The HTTBR bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | BADDR | BADDR |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:48]**

Reserved, RES0.

**BADDR, bits [47:1]**

Translation table base address, bits[47:x]. Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of HTCR.T0SZ as follows:

- If HTCR.T0SZ is 0 or 1, x = 5 - HTCR.T0SZ.
- If HTCR.T0SZ is greater than 1, x = 14 - HTCR.T0SZ.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

This field resets to an architecturally UNKNOWN value.
CnP, bit [0]

When ARMv8.2-TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by HTTBR is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of HTTBR.CnP is 1.

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The translation table entries pointed to by HTTBR are permitted to differ from corresponding entries for HTTBR for other PEs in the Inner Shareable domain. This is not affected by the value of HTTBR.CnP on those other PEs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The translation table entries pointed to by HTTBR are the same as the translation table entries pointed to by HTTBR on every other PE in the Inner Shareable domain for which the value of HTTBR.CnP is 1.</td>
</tr>
</tbody>
</table>

**Note**

If the value of the HTTBR.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those HTTBRs do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Accessing the HTTBR**

Accesses to this register use the following encodings:

ICC_AP0R<n>, Interrupt Controller Active Priorities
Group 0 Registers, n = 0 - 3

The ICC_AP0R<n> characteristics are:

**Purpose**

Provides information about Group 0 active priorities.

**Configuration**

AArch32 System register ICC_AP0R<n> bits [31:0] are architecturally mapped to AArch64 System register
ICC_AP0R<n>_EL1[31:0].

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception
level that is using AArch32. Otherwise, RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

ICC_AP0R<n> is a 32-bit register.

**Field descriptions**

The ICC_AP0R<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**IMPLEMENTATION DEFINED, bits [31:0]**

**IMPLEMENTATION DEFINED.**

This field resets to 0.

The contents of these registers are **IMPLEMENTATION DEFINED** with the one architectural requirement that the value
0x00000000 is consistent with no interrupts being active.

**Accessing the ICC_AP0R<n>**

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are
no Group 0 active priorities) might result in **UNPREDICTABLE** behavior of the interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICC_AP0R1 is only implemented in implementations that support 6 or more bits of preemption. ICC_AP0R2 and
ICC_AP0R3 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are
**UNDEFINED**.

**Note**

The number of bits of preemption is indicated by **ICH_VTR.PREbits**.

Writing to the active priority registers in any order other than the following order will result in **UNPREDICTABLE**
behavior:

- ICC_AP0R<n>. 
Secure ICC_AP1R
Non-secure ICC_AP1R

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#\}<\text{opc2}>
\]

ICC_AP1R<n>, Interrupt Controller Active Priorities Group 1 Registers, n = 0 - 3

The ICC_AP1R<n> characteristics are:

### Purpose

Provides information about Group 1 active priorities.

### Configuration

AArch32 System register ICC_AP1R<n> bits [31:0] (S) are architecturally mapped to AArch64 System register ICC_AP1R<n>_EL1[31:0] (S).

AArch32 System register ICC_AP1R<n> bits [31:0] (NS) are architecturally mapped to AArch64 System register ICC_AP1R<n>_EL1[31:0] (NS).

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 they apply only to the Secure instance of the register. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

ICC_AP1R<n> is a 32-bit register.

### Field descriptions

The ICC_AP1R<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

This field resets to 0.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

### Accessing the ICC_AP1R<n>

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 1 active priorities) might result in UNPREDICTABLE behavior of the interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICC_AP1R1 is only implemented in implementations that support 6 or more bits of preemption. ICC_AP1R2 and ICC_AP1R3 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

### Note

The number of bits of preemption is indicated by ICH_VTR.PREbits.
Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- **ICC_AP0R<n>**
- Secure ICC_AP1R<n>
- Non-secure ICC_AP1R<n>

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

The ICC_ASGI1R characteristics are:

**Purpose**

Generates Group 1 SGIs for the Security state that is not the current Security state.

**Configuration**

AArch32 System register ICC_ASGI1R performs the same function as AArch64 System register ICC_ASGI1R_EL1.

Under certain conditions a write to ICC_ASGI1R can generate Group 0 interrupts, see Forwarding an SGI to a target PE.

**Attributes**

ICC_ASGI1R is a 64-bit register.

**Field descriptions**

The ICC_ASGI1R bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | **Aff3** | RS | RES0 | **IRM** | **Aff2** | **TargetList** |
| RES0 | INTID | Aff1 | | | | |

**Bits [63:56]**

Reserved, RES0.

**Aff3, bits [55:48]**

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

**RS, bits [47:44]**

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value ((RS * 16) + n).

When ICC_CTLR_EL1.RSS==0, RS is RES0.

When ICC_CTLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a constrained unpredictable choice of:

- The write is ignored.
- The RS field is treated as 0.
Bits [43:41]  
Reserved, RES0.

IRM, bit [40]  
Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

<table>
<thead>
<tr>
<th>IRM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.&lt;target list&gt;.</td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupts routed to all PEs in the system, excluding &quot;self&quot;.</td>
</tr>
</tbody>
</table>

Aff2, bits [39:32]  
The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

Bits [31:28]  
Reserved, RES0.

INTID, bits [27:24]  
The INTID of the SGI.

Aff1, bits [23:16]  
The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]  
Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is **IMPLEMENTATION DEFINED** whether, in such cases, a Distributor can signal a system error.

**Note**  
This restricts a system to sending targeted SGIs to PEs with an affinity 0 number that is less than 16. If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

**Accessing the ICC_ASGI1R**  
This register allows software executing in a Secure state to generate Non-secure Group 1 SGIs. It will also allow software executing in a Non-secure state to generate Secure Group 1 SGIs, if permitted by the settings of **GICR_NSACR** in the Redistributor corresponding to the target PE.
When \( \text{GICD_CTLR.DS}==0 \), non-secure writes do not generate an interrupt for a target PE if not permitted by the \( \text{GICR_NSACR} \) register associated with the target PE. For more information see Use of control registers for SGI forwarding.

**Note**

Accesses from Secure Monitor mode are treated as Secure regardless of the value of \( \text{SCR.NS} \).

Accesses to this register use the following encodings:

\[
\text{MCRR\{<c>\}{<q>\} <coproc>, \{#\}<opc1>, <Rt>, <Rt2>, <CRm>}
\]

This field resets to an architecturally unknown value.

**Accessing the ICC_BPR0**

The minimum binary point value is derived from the number of implemented priority bits. The number of priority bits is implementation defined, and reported by ICC_CTLR.PRIbits and ICC_MCTLR.PRIbits.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is set to the minimum supported value.

Accesses to this register use the following encodings:

  ICC_BPR0 = R[t];
The ICC_BPR1 characteristics are:

**Purpose**

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption.

**Configuration**

AArch32 System register ICC_BPR1 bits [31:0] (S) are architecturally mapped to AArch64 System register ICC_BPR1_EL1[31:0] (S).

AArch32 System register ICC_BPR1 bits [31:0] (NS) are architecturally mapped to AArch64 System register ICC_BPR1_EL1[31:0] (NS).

In GIC implementations supporting two Security states, this register is Banked.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 they apply only to the Secure instance of the register. Otherwise, RW fields in this register reset to architecturally unknown values.

**Attributes**

ICC_BPR1 is a 32-bit register.

**Field descriptions**

The ICC_BPR1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 | BinaryPoint |

**Bits [31:3]**

Reserved, RES0.

**BinaryPoint, bits [2:0]**

If the GIC is configured to use separate binary point fields for Group 0 and Group 1 interrupts, the value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. For more information about priorities, see Priority grouping.

Writing 0 to this field will set this field to its reset value.

If EL3 is implemented and ICC_MCTLR_CBPR_EL1S is 1:

- Accesses to this register at EL3 not in Monitor mode access the state of ICC_BPR0.
- When SCR_EL3.EEL2 is 1 and HCR_EL2.IMO is 1, Secure accesses to this register at EL1 access the state of ICC_BPR1.
- Otherwise, Secure accesses to this register at EL1 access the state of ICC_BPR0.

If EL3 is implemented and ICC_MCTLR_CBPR_EL1NS is 1, Non-secure accesses to this register at EL1 or EL2 behave as follows, depending on the values of HCR.IMO and SCR.IRQ:
If EL3 is not implemented and ICC_CTLR.CBPR is 1, Non-secure accesses to this register at EL1 or EL2 behave as follows, depending on the values of HCR.IMO:

<table>
<thead>
<tr>
<th>HCR.IMO</th>
<th>SCR_IRQ</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>0b0</td>
<td>Non-secure EL1 and EL2 reads return ( \text{ICC_BPR0} + 1 ) saturated to 0b111. Non-secure EL1 and EL2 writes are ignored.</td>
</tr>
<tr>
<td>0b0</td>
<td>0b1</td>
<td>Non-secure EL1 and EL2 accesses trap to EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>0b0</td>
<td>Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 reads return ( \text{ICC_BPR0} + 1 ) saturated to 0b111. Non-secure EL2 writes ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 accesses trap to EL3.</td>
</tr>
</tbody>
</table>

This field resets to an IMPLEMENTATION DEFINED non-zero value.

**Accessing the ICC_BPR1**

When the PE resets into an Exception level that is using AArch32, the reset value is equal to:

- For the Secure copy of the register, the minimum value of ICC_BPR0 plus one.
- For the Non-secure copy of the register, the minimum value of ICC_BPR0.

Where the minimum value of ICC_BPR0 is IMPLEMENTATION DEFINED.

If EL3 is not implemented:

- If the PE is Secure this reset value is (minimum value of ICC_BPR0 plus one).
- If the PE is Non-secure this reset value is (minimum value of ICC_BPR0).

An attempt to program the binary point field to a value less than the reset value sets the field to the reset value.

Accesses to this register use the following encodings:

\[ \text{MRC}\{<c>\}{<q>} \ <\text{coproc}> , \{#\}<\text{opc1}> , \ <\text{Rt}> , \ <\text{CRn}> , \ <\text{CRm}> , \{#\}<\text{opc2}> \]

**ICC_CTLR, Interrupt Controller Control Register**

The ICC_CTLR characteristics are:

**Purpose**

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

**Configuration**

AArch32 System register ICC_CTLR bits [31:0] (S) are architecturally mapped to AArch64 System register ICC_CTLR_EL1[31:0] (S).

AArch32 System register ICC_CTLR bits [31:0] (NS) are architecturally mapped to AArch64 System register ICC_CTLR_EL1[31:0] (NS).

**Attributes**

ICC_CTLR is a 32-bit register.

**Field descriptions**

The ICC_CTLR bit assignments are:

| Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit | Bit |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| RES0| ExtRange | RSS | RES0 | A3V | SEIS | IDbits | PRIbits | RES0 | PMHE | RES0 | EOImode | CBPR |

**Bits [31:20]**

Reserved, RES0.

**ExtRange, bit [19]**

Extended INTID range (read-only).

<table>
<thead>
<tr>
<th>ExtRange</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>CPU interface does not support INTIDs in the range 1024..8191. Behaviour is <strong>UNPREDICTABLE</strong> if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface.</td>
</tr>
<tr>
<td>0b1</td>
<td>CPU interface supports INTIDs in the range 1024..8191. All INTIDs in the range 1024..8191 are treated as requiring deactivation.</td>
</tr>
</tbody>
</table>

**Note**

Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.

If EL3 is implemented, ICC_CTLR_EL1.ExtRange is an alias of ICC_CTLR_EL3.ExtRange.

**RSS, bit [18]**

Range Selector Support. Possible values are:
RSS

<table>
<thead>
<tr>
<th>RSS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Targeted SGIs with affinity level 0 values of 0 - 15 are supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>Targeted SGIs with affinity level 0 values of 0 - 255 are supported.</td>
</tr>
</tbody>
</table>

This bit is read-only.

**Bits [17:16]**

Reserved, RES0.

**A3V, bit [15]**

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

<table>
<thead>
<tr>
<th>A3V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>The CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.</td>
</tr>
</tbody>
</table>

If EL3 is implemented and using AArch32, this bit is an alias of ICC_MCTLR.A3V.

If EL3 is implemented and using AArch64, this bit is an alias of ICC_CTLR_EL3.A3V.

**SEIS, bit [14]**

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports local generation of SEIs:

<table>
<thead>
<tr>
<th>SEIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CPU interface logic does not support local generation of SEIs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The CPU interface logic supports local generation of SEIs.</td>
</tr>
</tbody>
</table>

If EL3 is implemented and using AArch32, this bit is an alias of ICC_MCTLR.SEIS.

If EL3 is implemented and using AArch64, this bit is an alias of ICC_CTLR_EL3.SEIS.

**IDbits, bits [13:11]**

Identifier bits. Read-only and writes are ignored. The number of physical interrupt identifier bits supported:

<table>
<thead>
<tr>
<th>IDbits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>16 bits.</td>
</tr>
<tr>
<td>0b001</td>
<td>24 bits.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If EL3 is implemented and using AArch32, this field is an alias of ICC_MCTLR.IDbits.

If EL3 is implemented and using AArch64, this field is an alias of ICC_CTLR_EL3.IDbits.

**PRIbits, bits [10:8]**

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).

**Note**
This field always returns the number of priority bits implemented, regardless of the Security state of the access or the value of \texttt{GICD\_CTRL\_DS}.

The division between group priority and subpriority is defined in the binary point registers \texttt{ICC\_BPR0} and \texttt{ICC\_BPR1}.

If EL3 is implemented and using AArch32, physical accesses return the value from \texttt{ICC\_MCTLR\_PRI} bits.

If EL3 is implemented and using AArch64, physical accesses return the value from \texttt{ICC\_CTRL\_EL3\_PRI} bits.

If EL3 is not implemented, physical accesses return the value from this field.

\textbf{Bit [7]}

Reserved, \texttt{RES0}.

\textbf{PMHE, bit [6]}

Priority Mask Hint Enable. Controls whether the priority mask register is used as a hint for interrupt distribution:

<table>
<thead>
<tr>
<th>PMHE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disables use of \texttt{ICC_PMR} as a hint for interrupt distribution.</td>
</tr>
<tr>
<td>0b1</td>
<td>Enables use of \texttt{ICC_PMR} as a hint for interrupt distribution.</td>
</tr>
</tbody>
</table>

If EL3 is implemented:

- If EL3 is using AArch32, this bit is an alias of \texttt{ICC\_MCTLR\_PMHE}.
- If EL3 is using AArch64, this bit is an alias of \texttt{ICC\_CTRL\_EL3\_PMHE}.
- If \texttt{GICD\_CTRL\_DS} == 0, this bit is read-only.
- If \texttt{GICD\_CTRL\_DS} == 1, this bit is read/write.

If EL3 is not implemented, it is \texttt{IMPLEMENTATION DEFINED} whether this bit is read-only or read-write:

- If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
- If this bit is read/write, it resets to zero.

\textbf{Bits [5:2]}

Reserved, \texttt{RES0}.

\textbf{EOImode, bit [1]}

EOI mode for the current Security state. Controls whether a write to an End of Interrupt register also deactivates the interrupt:

<table>
<thead>
<tr>
<th>EOImode</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>\texttt{ICC_EOIR0} and \texttt{ICC_EOIR1} provide both priority drop and interrupt deactivation functionality. Accesses to \texttt{ICC_DIR} are \texttt{UNPREDICTABLE}.</td>
</tr>
<tr>
<td>0b1</td>
<td>\texttt{ICC_EOIR0} and \texttt{ICC_EOIR1} provide priority drop functionality only. \texttt{ICC_DIR} provides interrupt deactivation functionality.</td>
</tr>
</tbody>
</table>

If EL3 is implemented:

- If EL3 is using AArch32, this bit is an alias of \texttt{ICC\_MCTLR\_EOImode\_EL1\{S, NS\}} where S or NS corresponds to the current Security state.
- If EL3 is using AArch64, this bit is an alias of \texttt{ICC\_CTRL\_EL3\_EOImode\_EL1\{S, NS\}} where S or NS corresponds to the current Security state.

If EL3 is not implemented, it is \texttt{IMPLEMENTATION DEFINED} whether this bit is read-only or read-write:

- If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
- If this bit is read/write, it resets to zero.
**CBPR, bit [0]**

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 interrupts:

<table>
<thead>
<tr>
<th>CBPR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICC_BPR0 determines the preemption group for Group 0 interrupts only.</td>
</tr>
<tr>
<td></td>
<td>ICC_BPR1 determines the preemption group for Group 1 interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICC_BPR0 determines the preemption group for both Group 0 and Group 1 interrupts.</td>
</tr>
</tbody>
</table>

If EL3 is implemented:

- If EL3 is using AArch32, this bit is an alias of ICC_MCTLR.CBPR_EL1{S,NS} where S or NS corresponds to the current Security state.
- If EL3 is using AArch64, this bit is an alias of ICC_CTLR_EL3.CBPR_EL1{S,NS} where S or NS corresponds to the current Security state.
- If GICD_CTLR.DS == 0, this bit is read-only.
- If GICD_CTLR.DS == 1, this bit is read/write.

If EL3 is not implemented, it is IMPLEMENTATION DEFINED whether this bit is read-only or read-write:

- If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
- If this bit is read/write, it resets to zero.

**Accessing the ICC_CTLR**

    else
      ICC_CTLR_NS = R[t];
The ICC_DIR characteristics are:

**Purpose**

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified interrupt.

**Configuration**

AArch32 System register ICC_DIR performs the same function as AArch64 System register ICC_DIR_EL1.

**Attributes**

ICC_DIR is a 32-bit register.

**Field descriptions**

The ICC_DIR bit assignments are:

|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| RES0 | INTID |

**Bits [31:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID of the interrupt to be deactivated.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR.IDbits and ICC_MCTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

**Accessing the ICC_DIR**

There are two cases when writing to ICC_DIR_EL1 that were UNPREDICTABLE for a corresponding GICv2 write to GICC_DIR:

- When EOImode == 0. GICv3 implementations must ignore such writes. In systems supporting system error generation, an implementation might generate an SEI.
- When EOImode == 1 but no EOI has been issued. The interrupt will be de-activated by the Distributor, however the active priority in the CPU interface for the interrupt will remain set (because no EOI was issued).

Accesses to this register use the following encodings:

\[\text{MCR}\{<c>\}{<q>} \{<coproc>, \{<opc1>, <Rt>, <CRn>, <CRm>{, \{<opc2>}\}\}\} \]

\[\begin{array}{|c|c|c|c|c|}
\hline
\text{coproc} & \text{opc1} & \text{CRn} & \text{CRm} & \text{opc2} \\
\hline
0b1111 & 0b000 & 0b1100 & 0b1011 & 0b001 \\
\hline
\end{array}\]

ICC_EOIR0, Interrupt Controller End Of Interrupt Register 0

The ICC_EOIR0 characteristics are:

**Purpose**

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified Group 0 interrupt.

**Configuration**

AArch32 System register ICC_EOIR0 performs the same function as AArch64 System register ICC_EOIR0_EL1.

**Attributes**

ICC_EOIR0 is a 32-bit register.

**Field descriptions**

The ICC_EOIR0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  | RES0 | INTID |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

**Bits [31:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID from the corresponding ICC_IAR0 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR.IDbits and ICC_MCTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the EOImode bit for the current Exception level and Security state is 0, a write to this register drops the priority for the interrupt, and also deactivates the interrupt.

If the EOImode bit for the current Exception level and Security state is 1, a write to this register only drops the priority for the interrupt. Software must write to ICC_DIR to deactivate the interrupt.

The appropriate EOImode bit varies as follows:

- If EL3 is not implemented, the appropriate bit is ICC_CTLR EOImode.
- If EL3 is implemented and the software is executing in Monitor mode, the appropriate bit is ICC_MCTLR EOImode_EL3.
- If EL3 is implemented and the software is not executing in Monitor mode, the bit depends on the current Security state:
  - If the software is executing in Secure state, the bit is ICC_CTLR EOImode in the Secure instance of ICC_CTLR. This is an alias of ICC_MCTLR EOImode_EL1S.
  - If the software is executing in Non-secure state, the bit is ICC_CTLR EOImode in the Non-secure instance of ICC_CTLR. This is an alias of ICC_MCTLR EOImode_EL1NS.
Accessing the ICC_EOIR0

A write to this register must correspond to the most recent valid read by this PE from an Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICC_IAR0, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

A write of a Special INTID is ignored. See Special INTIDs, for more information.

Accesses to this register use the following encodings:

\[
\text{MCR}\{<c>\}{<q>} <\text{coproc}>, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#\}<\text{opc2}>
\]

</tbody>
</table>

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID from the corresponding ICC_IAR1 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR.IDbits and ICC_MCTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the EOImode bit for the current Exception level and Security state is 0, a write to this register drops the priority for the interrupt, and also deactivates the interrupt.

If the EOImode bit for the current Exception level and Security state is 1, a write to this register only drops the priority for the interrupt. Software must write to ICC_DIR to deactivate the interrupt.

The appropriate EOImode bit varies as follows:

- If EL3 is not implemented, the appropriate bit is ICC_CTLR EOImode.
- If EL3 is implemented and the software is executing in Monitor mode, the appropriate bit is ICC_MCTLR.EOImode_EL3.
- If EL3 is implemented and the software is not executing in Monitor mode, the bit depends on the current Security state:
  - If the software is executing in Secure state, the bit is ICC_CTLR.EOImode in the Secure instance of ICC_CTLR. This is an alias of ICC_MCTLR.EOImode_EL1S.
  - If the software is executing in Non-secure state, the bit is ICC_CTLR.EOImode in the Non-secure instance of ICC_CTLR. This is an alias of ICC_MCTLR.EOImode_EL1NS.
Accessing the ICC_EOIR1

A write to this register must correspond to the most recent valid read by this PE from an Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICC_IAR1, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

A write of a Special INTID is ignored. See Special INTIDs, for more information.

ICC_HSRE, Interrupt Controller Hyp System Register Enable register

The ICC_HSRE characteristics are:

**Purpose**

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL2.

**Configuration**

AArch32 System register ICC_HSRE bits [31:0] are architecturally mapped to AArch64 System register ICC_SRE_EL2[31:0].

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ICC_HSRE is a 32-bit register.

**Field descriptions**

The ICC_HSRE bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>Enable</td>
<td>DIB</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:4]**

Reserved, RES0.

**Enable, bit [3]**

Enable. Enables lower Exception level access to ICC_SRE.

<table>
<thead>
<tr>
<th>Enable</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL1 accesses to ICC_SRE trap to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 accesses to ICC_SRE do not trap to EL2.</td>
</tr>
</tbody>
</table>

If ICC_HSRE.SRE is RAO/WI, an implementation is permitted to make the Enable bit RAO/WI.

If ICC_HSRE.SRE is 0, the Enable bit behaves as 1 for all purposes other than reading the value of the bit.

This field resets to an architecturally UNKNOWN value.

**DIB, bit [2]**

Disable IRQ bypass.

<table>
<thead>
<tr>
<th>DIB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IRQ bypass enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>IRQ bypass disabled.</td>
</tr>
</tbody>
</table>

If EL3 is implemented and GICD_CTLR.DS is 0, this field is a read-only alias of ICC_MSRE.DIB.
If EL3 is implemented and `GICD_CTLR.DS` is 1, this field is a read-write alias of `ICC_MSRE.DIB`. In systems that do not support IRQ bypass, this bit is RAO/WI.

This field resets to 0.

**DFB, bit [1]**

Disable FIQ bypass.

<table>
<thead>
<tr>
<th>DFB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FIQ bypass enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>FIQ bypass disabled.</td>
</tr>
</tbody>
</table>

If EL3 is implemented and `GICD_CTLR.DS` is 0, this field is a read-only alias of `ICC_MSRE.DFB`.

In systems that do not support FIQ bypass, this bit is RAO/WI.

This field resets to 0.

**SRE, bit [0]**

System Register Enable.

<table>
<thead>
<tr>
<th>SRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The memory-mapped interface must be used. Accesses at EL2 or below to</td>
</tr>
<tr>
<td></td>
<td>any ICH_* System register, or any EL1 or EL2 ICC_* register other than</td>
</tr>
<tr>
<td></td>
<td><code>ICC_SRE</code> or <code>ICC_HSRE</code>, are UNDEFINED.</td>
</tr>
<tr>
<td>0b1</td>
<td>The System register interface to the ICH_* registers and the EL1 and</td>
</tr>
<tr>
<td></td>
<td>EL2 ICC_* registers is enabled for EL2.</td>
</tr>
</tbody>
</table>

If software changes this bit from 1 to 0, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

If EL3 is implemented and using AArch64:

- When `ICC_SRE_EL3.SRE==0` this bit is RAZ/WI.

If EL3 is implemented using AArch32:

- When `ICC_MSRE.SRE==0` this bit is RAZ/WI.

This field resets to 0.

**Accessing the ICC_HSRE**

The GIC architecture permits, but does not require, that registers can be shared between memory-mapped registers and the equivalent System registers. This means that if the memory-mapped registers have been accessed while `ICC_HSRE.SRE==0`, then the System registers might be modified. Therefore, software must only rely on the reset values of the System registers if there has been no use of the GIC functionality while the memory-mapped registers are in use. Otherwise, the System register values must be treated as UNKNOWN.

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b100</td>
<td>0b1100</td>
<td>0b1001</td>
<td>0b101</td>
</tr>

    end
The ICC_IAR0 characteristics are:

**Purpose**

The PE reads this register to obtain the INTID of the signaled Group 0 interrupt. This read acts as an acknowledge for the interrupt.

**Configuration**

AArch32 System register ICC_IAR0 performs the same function as AArch64 System register ICC_IAR0_EL1.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when PSTATE.{I,F} == {0,0}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. See Observability of the effects of accesses to the GIC registers, for more information.

**Attributes**

ICC_IAR0 is a 32-bit register.

**Field descriptions**

The ICC_IAR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Bit Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-24</td>
<td>RES0</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>23-0</td>
<td>INTID</td>
<td>The INTID of the signaled interrupt.</td>
</tr>
</tbody>
</table>

**INTID, bits [23:0]**

This is the INTID of the highest priority pending interrupt, if that interrupt is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged at the current Security state and Exception level.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. These special INTIDs can be one of: 1020, 1021, or 1023. See Special INTIDs, for more information.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR.IDbits and ICC_MCTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

**Accessing the ICC_IAR0**

Accesses to this register use the following encodings:

<td>Group 0 interrupts are enabled.</td>
</tr>
</tbody>
</table>

Virtual accesses to this register update ICH_VMCR.VENG0.

This field resets to 0.

**Accessing the ICC_IGRPEN0**

The lowest Exception level at which this register can be accessed is governed by the Exception level to which FIQ is routed. This routing depends on SCR.FIQ, SCR.NS and HCR.FMO.

If an interrupt is pending within the CPU interface when Enable becomes 0, the interrupt must be released to allow the Distributor to forward the interrupt to a different PE.

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
  UNDEFINED;

ICC_IGRPEN1, Interrupt Controller Interrupt Group 1 Enable register

The ICC_IGRPEN1 characteristics are:

**Purpose**

Controls whether Group 1 interrupts are enabled for the current Security state.

**Configuration**

AArch32 System register ICC_IGRPEN1 bits [31:0] (S) are architecturally mapped to AArch64 System register ICC_IGRPEN1_EL1[31:0] (S).

AArch32 System register ICC_IGRPEN1 bits [31:0] (NS) are architecturally mapped to AArch64 System register ICC_IGRPEN1_EL1[31:0] (NS).

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 they apply only to the Secure instance of the register. Otherwise, RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

ICC_IGRPEN1 is a 32-bit register.

**Field descriptions**

The ICC_IGRPEN1 bit assignments are:

|   | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|---|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|   | RES0 | Enable |

**Bits [31:1]**

Reserved, RES0.

**Enable, bit [0]**

Enables Group 1 interrupts for the current Security state.

<table>
<thead>
<tr>
<th>Enable</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 1 interrupts are disabled for the current Security state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 1 interrupts are enabled for the current Security state.</td>
</tr>
</tbody>
</table>

Virtual accesses to this register update **ICH_VMCR.VENG1**.

If EL3 is present:

- This bit is a read/write alias of **ICC_MGRPEN1_EnableGrp1{S, NS}** as appropriate if EL3 is using AArch32, or **ICC_IGRPEN1_EL3_EnableGrp1{S, NS}** as appropriate if EL3 is using AArch64.
- When this register is accessed at EL3, the copy of this register appropriate to the current setting of SCR.NS is accessed.

This field resets to 0.
Accessing the ICC_IGRPEN1

The lowest Exception level at which this register can be accessed is governed by the Exception level to which IRQ is routed. This routing depends on SCR.IRQ, SCR.NS and HCR.IMO.

If an interrupt is pending within the CPU interface when Enable becomes 0, the interrupt must be released to allow the Distributor to forward the interrupt to a different PE.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#\}<\text{opc2}>
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b1100</td>
<td>0b1100</td>
<td>0b111</td>
</tr>
</tbody>
</table>

The ICC_MCTLR characteristics are:

**Purpose**

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

**Configuration**

AArch32 System register ICC_MCTLR bits [31:0] can be mapped to AArch64 System register ICC_CTLR_EL3[31:0], but this is not architecturally mandated.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

ICC_MCTLR is a 32-bit register.

**Field descriptions**

The ICC_MCTLR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | ExtRange | RSSnDS | RES0 | A3V | SEIS | IDbits | PRIbits | RES0 | PMH | RM | E0Imode_EL1NS | E0Imode_EL1S | CBPR_EL1NS | CBPR_EL1S |

**Bits [31:20]**

Reserved, RES0.

**ExtRange, bit [19]**

Extended INTID range (read-only).

<table>
<thead>
<tr>
<th>ExtRange</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>CPU interface does not support INTIDs in the range 1024..8191. Behavior is <strong>UNPREDICTABLE</strong> if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface.</td>
</tr>
</tbody>
</table>

**Note**

Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.

| 0b1      | CPU interface supports INTIDs in the range 1024..8191. All INTIDs in the range 1024..8191 are treated as requiring deactivation. |

**RSS, bit [18]**

Range Selector Support. Possible values are:
RSS

<table>
<thead>
<tr>
<th>RSS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Targeted SGIs with affinity level 0 values of 0 - 15 are supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>Targeted SGIs with affinity level 0 values of 0 - 255 are supported.</td>
</tr>
</tbody>
</table>

This bit is read-only.

**nDS, bit [17]**

Disable Security not supported. Read-only and writes are ignored. Possible values are:

<table>
<thead>
<tr>
<th>nDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CPU interface logic supports disabling of security.</td>
</tr>
<tr>
<td>0b1</td>
<td>The CPU interface logic does not support disabling of security, and requires that security is not disabled.</td>
</tr>
</tbody>
</table>

**Bit [16]**

Reserved, RES0.

**A3V, bit [15]**

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

<table>
<thead>
<tr>
<th>A3V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CPU interface logic does not support non-zero values of the Aff3 field in SGI generation System registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>The CPU interface logic supports non-zero values of the Aff3 field in SGI generation System registers.</td>
</tr>
</tbody>
</table>

If EL3 is present, ICC_CTLR.AV3 is an alias of ICC_MCTLR.A3V

**SEIS, bit [14]**

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports generation of SEIs:

<table>
<thead>
<tr>
<th>SEIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CPU interface logic does not support generation of SEIs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The CPU interface logic supports generation of SEIs.</td>
</tr>
</tbody>
</table>

If EL3 is present, ICC_CTLR.SEIS is an alias of ICC_MCTLR.SEIS

**IDbits, bits [13:11]**

Identifier bits. Read-only and writes are ignored. The number of physical interrupt identifier bits supported:

<table>
<thead>
<tr>
<th>IDbits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>16 bits.</td>
</tr>
<tr>
<td>0b001</td>
<td>24 bits.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If EL3 is present, ICC_CTLR.IDbits is an alias of ICC_MCTLR.IDbits

**PRIbits, bits [10:8]**

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).
This field always returns the number of priority bits implemented, regardless of the value of SCR.NS or the value of GICD_CTRLR.DS.

The division between group priority and subpriority is defined in the binary point registers ICC_BPR0 and ICC_BPR1. This field determines the minimum value of ICC_BPR0.

**Bit [7]**

Reserved, RES0.

**PMHE, bit [6]**

Priority Mask Hint Enable.

<table>
<thead>
<tr>
<th>PMHE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disables use of the priority mask register as a hint for interrupt distribution.</td>
</tr>
<tr>
<td>0b1</td>
<td>Enables use of the priority mask register as a hint for interrupt distribution.</td>
</tr>
</tbody>
</table>

Software must write ICC_PMR to 0xFF before clearing this field to 0.

An implementation might choose to make this field RAO/WI.

If EL3 is present, ICC_CTRLR.PMHE is an alias of ICC_MCTLR.PMHE. This field resets to 0.

**RM, bit [5]**

SBZ.

The equivalent bit in AArch64 is the Routing Modifier bit. This feature is not supported when EL3 is using AArch32. This field resets to an architecturally UNKNOWN value.

**EOImode_EL1NS, bit [4]**

EOI mode for interrupts handled at Non-secure EL1 and EL2. Controls whether a write to an End of Interrupt register also deactivates the interrupt:

<table>
<thead>
<tr>
<th>EOImode_EL1NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICC_EOIR0 and ICC_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR are UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICC_EOIR0 and ICC_EOIR1 provide priority drop functionality only. ICC_DIR provides interrupt deactivation functionality.</td>
</tr>
</tbody>
</table>

If EL3 is present, ICC_CTRLR(NS).EOImode is an alias of ICC_MCTLR.EOImode_EL1NS. This field resets to an architecturally UNKNOWN value.

**EOImode_EL1S, bit [3]**

EOI mode for interrupts handled at Secure EL1. Controls whether a write to an End of Interrupt register also deactivates the interrupt:
EOImode_EL1S, bit [0]

EOI mode for interrupts handled at EL1. Controls whether a write to an End of Interrupt register also deactivates the interrupt:

<table>
<thead>
<tr>
<th>EOImode_EL1S</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICC_EOIR0 and ICC_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR are UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICC_EOIR0 and ICC_EOIR1 provide priority drop functionality only. ICC_DIR provides interrupt deactivation functionality.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

EOImode_EL3, bit [2]

EOI mode for interrupts handled at EL3. Controls whether a write to an End of Interrupt register also deactivates the interrupt:

<table>
<thead>
<tr>
<th>EOImode_EL3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICC_EOIR0 and ICC_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR are UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICC_EOIR0 and ICC_EOIR1 provide priority drop functionality only. ICC_DIR provides interrupt deactivation functionality.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

CBPR_EL1NS, bit [1]

Common Binary Point Register, EL1 Non-secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Non-secure interrupts at EL1 and EL2:

<table>
<thead>
<tr>
<th>CBPR_EL1NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICC_BPR0 determines the preemption group for Group 0 interrupts only. ICC_BPR1 determines the preemption group for Non-secure Group 1 interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICC_BPR0 determines the preemption group for Group 0 interrupts and Non-secure Group 1 interrupts. Non-secure accesses to GICC_BPR and ICC_BPR1 access the state of ICC_BPR0.</td>
</tr>
</tbody>
</table>

If EL3 is present, ICC_MCTRL(NS).CBPR is an alias of ICC_MCTRL.CBPR_EL1NS.

This field resets to an architecturally UNKNOWN value.

CBPR_EL1S, bit [0]

Common Binary Point Register, EL1 Secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Secure interrupts in Secure non-Monitor modes:

<table>
<thead>
<tr>
<th>CBPR_EL1S</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICC_BPR0 determines the preemption group for Group 0 interrupts only. ICC_BPR1 determines the preemption group for Secure Group 1 interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICC_BPR0 determines the preemption group for Group 0 interrupts and Secure Group 1 interrupts. Secure EL1 accesses, or EL3 accesses when not in Monitor mode, to ICC_BPR1 access the state of ICC_BPR0.</td>
</tr>
</tbody>
</table>

If EL3 is present, ICC_MCTRL(S).CBPR is an alias of ICC_MCTRL.CBPR_EL1S.

This field resets to an architecturally UNKNOWN value.
Accessing the ICC_MCTLR

This register is only accessible when executing in Monitor mode.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>\{, \{#\}<\text{opc2}>\}
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b110</td>
<td>0b110</td>
<td>0b110</td>
<td>0b100</td>
</tr>
</tbody>
</table>

\[
\text{MCR}\{<c>\}{<q>} <\text{coproc}>, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>\{, \{#\}<\text{opc2}>\}
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b110</td>
<td>0b110</td>
<td>0b110</td>
<td>0b100</td>
</tr>
</tbody>
</table>

```
ICC_MGRPEN1, Interrupt Controller Monitor Interrupt Group 1 Enable register

The ICC_MGRPEN1 characteristics are:

**Purpose**

Controls whether Group 1 interrupts are enabled or not.

**Configuration**

AArch32 System register ICC_MGRPEN1 bits [31:0] can be mapped to AArch64 System register ICC_IGRPEN1_EL3[31:0], but this is not architecturally mandated.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ICC_MGRPEN1 is a 32-bit register.

**Field descriptions**

The ICC_MGRPEN1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 |    |    | EnableGrp1SEnableGrp1NS |

**Bits [31:2]**

Reserved, RES0.

**EnableGrp1S, bit [1]**

Enables Group 1 interrupts for the Secure state.

<table>
<thead>
<tr>
<th>EnableGrp1S</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure Group 1 interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure Group 1 interrupts are enabled.</td>
</tr>
</tbody>
</table>

The Secure ICC_IGRPEN1.Enable bit is a read/write alias of the ICC_MGRPEN1.EnableGrp1S bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

This field resets to 0.

**EnableGrp1NS, bit [0]**

Enables Group 1 interrupts for the Non-secure state.

<table>
<thead>
<tr>
<th>EnableGrp1NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure Group 1 interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure Group 1 interrupts are enabled.</td>
</tr>
</tbody>
</table>

The Non-secure ICC_IGRPEN1.Enable bit is a read/write alias of the ICC_MGRPEN1.EnableGrp1NS bit.
If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

This field resets to 0.

## Accessing the ICC_MGRPEN1

If an interrupt is pending within the CPU interface when an Enable bit becomes 0, the interrupt must be released to allow the Distributor to forward the interrupt to a different PE.

This register is only accessible when executing in Monitor mode.

Accesses to this register use the following encodings:

\[
\text{MRC} \{<c>\} \{<q>\} <\text{coproc}>, \{#<\text{opc1}>\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#<\text{opc2}>\}
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b110</td>
<td>0b1100</td>
<td>0b1100</td>
<td>0b111</td>
</tr>
</tbody>
</table>

The ICC_MSRE characteristics are:

**Purpose**

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL3.

**Configuration**

AArch32 System register ICC_MSRE bits [31:0] can be mapped to AArch64 System register ICC_SRE_EL3[31:0], but this is not architecturally mandated.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

ICC_MSRE is a 32-bit register.

**Field descriptions**

The ICC_MSRE bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | Enable | DIB | DFB | SRE |

**Bits [31:4]**

Reserved, RES0.

**Enable, bit [3]**

Enable. Enables lower Exception level access to ICC_SRE and ICC_HSRE.

<table>
<thead>
<tr>
<th>Enable</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure EL1 accesses to Secure ICC_SRE trap to EL3. EL2 accesses to Non-secure ICC_SRE and ICC_HSRE trap to EL3. Non-secure EL1 accesses to ICC_SRE trap to EL3, unless these accesses are trapped to EL2 as a result of ICC_HSRE.Enable == 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure EL1 accesses to Secure ICC_SRE do not trap to EL3. EL2 accesses to Non-secure ICC_SRE and ICC_HSRE do not trap to EL3. Non-secure EL1 accesses to ICC_SRE do not trap to EL3.</td>
</tr>
</tbody>
</table>

If ICC_MSRE.SRE is RAO/WI, an implementation is permitted to make the Enable bit RAO/WI.

If ICC_MSRE.SRE is 0, the Enable bit behaves as 1 for all purposes other than reading the value of the bit.

This field resets to an architecturally **UNKNOWN** value.
**DIB, bit [2]**

Disable IRQ bypass.

<table>
<thead>
<tr>
<th>DIB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IRQ bypass enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>IRQ bypass disabled.</td>
</tr>
</tbody>
</table>

In systems that do not support IRQ bypass, this bit is RAO/WI.

This field resets to 0.

**DFB, bit [1]**

Disable FIQ bypass.

<table>
<thead>
<tr>
<th>DFB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FIQ bypass enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>FIQ bypass disabled.</td>
</tr>
</tbody>
</table>

In systems that do not support FIQ bypass, this bit is RAO/WI.

This field resets to 0.

**SRE, bit [0]**

System Register Enable.

<table>
<thead>
<tr>
<th>SRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The memory-mapped interface must be used. Accesses at EL3 or below to any ICH_* System register, or any EL1, EL2, or EL3 ICC_* register other than ICC_SRE, ICC_HSRE, or ICC_MSRE, are UNDEFINED.</td>
</tr>
<tr>
<td>0b1</td>
<td>The System register interface to the ICH_* registers and the EL1, EL2, and EL3 ICC_* registers is enabled for EL3.</td>
</tr>
</tbody>
</table>

If software changes this bit from 1 to 0, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

This field resets to 0.

**Accessing the ICC_MSRE**

This register is always System register accessible.

The GIC architecture permits, but does not require, that registers can be shared between memory-mapped registers and the equivalent System registers. This means that if the memory-mapped registers have been accessed while ICC_MSRE.SRE==0, then the System registers might be modified. Therefore, software must only rely on the reset values of the System registers if there has been no use of the GIC functionality while the memory-mapped registers are in use. Otherwise, the System register values must be treated as UNKNOWN.

This register is only accessible when executing in Monitor mode.

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>

ICC_PMР, Interrupt Controller Interrupt Priority Mask Register

The ICC_PMР characteristics are:

**Purpose**

Provides an interrupt priority filter. Only interrupts with a higher priority than the value in this register are signaled to the PE.

**Configuration**

AArch32 System register ICC_PMР bits [31:0] are architecturally mapped to AArch64 System register ICC_PMР_EL1[31:0].

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that writes to this register are self-synchronising. This ensures that no interrupts below the written PMR value will be taken after a write to this register is architecturally executed. See Observability of the effects of accesses to the GIC registers, for more information.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ICC_PMР is a 32-bit register.

**Field descriptions**

The ICC_PMР bit assignments are:

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

**Bits [31:8]**

Reserved, RES0.

**Priority, bits [7:0]**

The priority mask level for the CPU interface. If the priority of an interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

The possible priority field values are as follows:

<table>
<thead>
<tr>
<th>Implemented priority bits</th>
<th>Possible priority field values</th>
<th>Number of priority levels</th>
</tr>
</thead>
<tbody>
<tr>
<td>[7:0]</td>
<td>0x00-0xFF (0-255), all values</td>
<td>256</td>
</tr>
<tr>
<td>[7:1]</td>
<td>0x00-0xFE (0-254), even values only</td>
<td>128</td>
</tr>
<tr>
<td>[7:2]</td>
<td>0x00-0xFC (0-252), in steps of 4</td>
<td>64</td>
</tr>
<tr>
<td>[7:3]</td>
<td>0x00-0xF8 (0-248), in steps of 8</td>
<td>32</td>
</tr>
<tr>
<td>[7:4]</td>
<td>0x00-0xF0 (0-240), in steps of 16</td>
<td>16</td>
</tr>
</tbody>
</table>
Unimplemented priority bits are RAZ/WI.

This field resets to 0.

**Accessing the ICC_PMR**

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}\{<q>\} \text{ <coproc>, \#<opc1>, <Rt>, <CRn>, <CRm>\{, \#<opc2}\}}
\]

<table>

**ICC_RPR, Interrupt Controller Running Priority Register**

The ICC_RPR characteristics are:

**Purpose**

Indicates the Running priority of the CPU interface.

**Configuration**

AArch32 System register ICC_RPR performs the same function as AArch64 System register ICC_RPR_EL1.

**Attributes**

ICC_RPR is a 32-bit register.

**Field descriptions**

The ICC_RPR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 | Priority |

**Bits [31:8]**

Reserved, RES0.

**Priority, bits [7:0]**

The current running priority on the CPU interface. This is the group priority of the current active interrupt.

The priority returned is the group priority as if the BPR for the current Exception level and Security state was set to the minimum value of BPR for the number of implemented priority bits.

---

**Note**

If 8 bits of priority are implemented the group priority is bits[7:1] of the priority.

---

**Accessing the ICC_RPR**

If there are no active interrupts on the CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

Software cannot determine the number of implemented priority bits from a read of this register.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}\{<q>\} <\text{coproc}>, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}\{, \{#\}<\text{opc2}>}
\]

<table>
<thead>
<tr>

ICC_SGI0R, Interrupt Controller Software Generated Interrupt Group 0 Register

The ICC_SGI0R characteristics are:

**Purpose**

Generates Secure Group 0 SGIs.

**Configuration**

AArch32 System register ICC_SGI0R performs the same function as AArch64 System register ICC_SGI0R_EL1.

**Attributes**

ICC_SGI0R is a 64-bit register.

**Field descriptions**

The ICC_SGI0R bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-56</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>47-44</td>
<td>RS</td>
</tr>
<tr>
<td>43-41</td>
<td>INTID</td>

</tr>
<tr>
<td>23-16</td>
<td>Aff2</td>
</tr>
<tr>
<td>15-8</td>
<td>RS</td>
</tr>
<tr>
<td>7-4</td>
<td>RES0</td>
</tr>
<tr>
<td>3-0</td>
<td>INTID</td>
</tr>
</tbody>
</table>

**Bits [63:56]**

Reserved, RES0.

**Aff3, bits [55:48]**

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

**RS, bits [47:44]**

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value ((RS * 16) + n).

When ICC_CTRLR_EL1.RSS==0, RS is RES0.

When ICC_CTRLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a constrained unpredictable choice of:

- The write is ignored.
- The RS field is treated as 0.

**Bits [43:41]**

Reserved, RES0.
**Interrupt Routing Mode.** Determines how the generated interrupts are distributed to PEs. Possible values are:

<table>
<thead>
<tr>
<th>IRM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.&lt;target list&gt;</td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupts routed to all PEs in the system, excluding &quot;self&quot;.</td>
</tr>
</tbody>
</table>

**Aff2, bits [39:32]**

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

**Bits [31:28]**

Reserved, RES0.

**INTID, bits [27:24]**

The INTID of the SGI.

**Aff1, bits [23:16]**

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

**TargetList, bits [15:0]**

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

**Note**

This restricts a system to sending targeted SGIs to PEs with an affinity 0 number that is less than 16. If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

**Accessing the ICC_SGI0R**

This register allows software executing in a Secure state to generate Group 0 SGIs. It will also allow software executing in a Non-secure state to generate Group 0 SGIs, if permitted by the settings of **GICR_NSACR** in the Redistributor corresponding to the target PE.

When **GICD_CTLR**.DS==0, Non-secure writes do not generate an interrupt for a target PE if not permitted by the **GICR_NSACR** register associated with the target PE. For more information see Use of control registers for SGI forwarding.

**Note**
Accesses from Secure Monitor mode are treated as Secure regardless of the value of SCR.NS.

Accesses to this register use the following encodings:

\[
\text{MCRR}\{c\}\{q\} \begin{array}{c|c|c}
\text{coproc} & \text{CRm} & \text{opc1} \\
\hline
0b1111 & 0b1100 & 0b0010
\end{array}
\]

ICC_SGI1R, Interrupt Controller Software Generated Interrupt Group 1 Register

The ICC_SGI1R characteristics are:

**Purpose**

Generates Group 1 SGIs for the current Security state.

**Configuration**

AArch32 System register ICC_SGI1R performs the same function as AArch64 System register ICC_SGI1R_EL1.

Under certain conditions a write to ICC_SGI1R can generate Group 0 interrupts, see Forwarding an SGI to a target PE.

**Attributes**

ICC_SGI1R is a 64-bit register.

**Field descriptions**

The ICC_SGI1R bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | Aff3 | RES0 | Aff1 | RS | RES0 | IRM | Aff2 | TargetList |

**Bits [63:56]**

Reserved, RES0.

**Aff3, bits [55:48]**

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

**RS, bits [47:44]**

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value ((RS * 16) + n).

When ICC_CTLR_EL1.RSS==0, RS is RES0.

When ICC_CTLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a CONSTRAINED UNPREDICTABLE choice of:

- The write is ignored.
- The RS field is treated as 0.
**Bits [43:41]**

Reserved, RES0.

**IRM, bit [40]**

Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

<table>
<thead>
<tr>
<th>IRM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.&lt;target list&gt;.</td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupts routed to all PEs in the system, excluding &quot;self&quot;.</td>
</tr>
</tbody>
</table>

**Aff2, bits [39:32]**

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

**Bits [31:28]**

Reserved, RES0.

**INTID, bits [27:24]**

The INTID of the SGI.

**Aff1, bits [23:16]**

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

**TargetList, bits [15:0]**

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATIONDEFINED whether, in such cases, a Distributor can signal a system error.

**Note**

This restricts a system to sending targeted SGIs to PEs with an affinity 0 number that is less than 16. If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

**Accessing the ICC_SGI1R**

**Note**

Accesses from Secure Monitor mode are treated as Secure regardless of the value of SCR.NS.
Accesses to this register use the following encodings:

}
ICC_SRE, Interrupt Controller System Register Enable register

The ICC_SRE characteristics are:

**Purpose**

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL0 and EL1.

**Configuration**

AArch32 System register ICC_SRE bits [31:0] (S) are architecturally mapped to AArch64 System register ICC_SRE_EL1[31:0] (S).

AArch32 System register ICC_SRE bits [31:0] (NS) are architecturally mapped to AArch64 System register ICC_SRE_EL1[31:0] (NS).

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 they apply only to the Secure instance of the register. Otherwise, RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

ICC_SRE is a 32-bit register.

**Field descriptions**

The ICC_SRE bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**DIB, bit [2]**

Disable IRQ bypass.

<table>
<thead>
<tr>
<th>DIB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IRQ bypass enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>IRQ bypass disabled.</td>
</tr>
</tbody>
</table>

If EL3 is implemented and GICD_CTLR_DS == 0, this field is a read-only alias of ICC_MSRE.DIB.

If EL3 is implemented and GICD_CTLR_DS == 1, and EL2 is not implemented, this field is a read-write alias of ICC_MSRE.DIB.

If EL3 is not implemented or GICD_CTLR_DS == 1, and EL2 is implemented, this field is a read-only alias of ICC_HSRE.DIB.

In systems that do not support IRQ bypass, this field is RAO/WI.

This field resets to 0.
**DFB, bit [1]**

Disable FIQ bypass.

<table>
<thead>
<tr>
<th>DFB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FIQ bypass enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>FIQ bypass disabled.</td>
</tr>
</tbody>
</table>

If EL3 is implemented and $GICD\_CTRL.DS == 0$, this field is a read-only alias of $ICC\_MSRE.DFB$. If EL3 is implemented and $GICD\_CTRL.DS == 1$, and EL2 is not implemented, this field is a read-write alias of $ICC\_MSRE.DFB$. If EL3 is not implemented or $GICD\_CTRL.DS == 1$, and EL2 is implemented, this field is a read-only alias of $ICC\_HSRE.DFB$. In systems that do not support FIQ bypass, this field is RAO/WI. This field resets to 0.

**SRE, bit [0]**

System Register Enable.

<table>
<thead>
<tr>
<th>SRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The memory-mapped interface must be used. Accesses at EL1 to any ICC_* System register other than ICC_SRE are UNDEFINED.</td>
</tr>
<tr>
<td>0b1</td>
<td>The System register interface for the current Security state is enabled.</td>
</tr>
</tbody>
</table>

If software changes this bit from 1 to 0 in the Secure instance of this register, the results are UNPREDICTABLE. If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI. If EL3 is implemented and using AArch64:

- When $ICC\_SRE\_EL3.SRE==0$ the Secure copy of this bit is RAZ/WI.
- When $ICC\_SRE\_EL3.SRE==0$ the Non-secure copy of this bit is RAZ/WI.

If EL3 is implemented and using AArch32:

- When $ICC\_MSRE.SRE==0$ the Secure copy of this bit is RAZ/WI.
- When $ICC\_MSRE.SRE==0$ the Non-secure copy of this bit is RAZ/WI.

If EL2 is implemented and using AArch64:

- When $ICC\_SRE\_EL2.SRE==0$ the Non-secure copy of this bit is RAZ/WI.

If EL2 is implemented and using AArch32:

- When $ICC\_HSRE.SRE==0$ the Non-secure copy of this bit is RAZ/WI.

This field resets to 0.

**Accessing the ICC_SRE**

The GIC architecture permits, but does not require, that registers can be shared between memory-mapped registers and the equivalent System registers. This means that if the memory-mapped registers have been accessed while ICC_SRE.SRE==0, then the System registers might be modified. Therefore, software must only rely on the reset values of the System registers if there has been no use of the GIC functionality while the memory-mapped registers are in use. Otherwise, the System register values must be treated as UNKNOWN.

Accesses to this register use the following encodings:
MRC{<c>}{<q>}, <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b1100</td>
<td>0b1100</td>
<td>0b101</td>
</tr>
</tbody>
</table>

    ICC_SRE_S = R[t];
  else
    ICC_SRE_NS = R[t];
  endif
endif
ICH_AP0R<n>, Interrupt Controller Hyp Active Priorities Group 0 Registers, n = 0 - 3

The ICH_AP0R<n> characteristics are:

**Purpose**

Provides information about Group 0 active priorities for EL2.

**Configuration**

AArch32 System register ICH_AP0R<n> bits [31:0] are architecturally mapped to AArch64 System register ICH_AP0R<n>_EL2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ICH_AP0R<n> is a 32-bit register.

**Field descriptions**

The ICH_AP0R<n> bit assignments are:

<table>
<thead>
<tr>
<th>P&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>There is no Group 0 interrupt active at the priority corresponding to that bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>There is a Group 0 interrupt active at the priority corresponding to that bit.</td>
</tr>
</tbody>
</table>

The correspondence between priority levels and bits depends on the number of bits of priority that are implemented.

If 5 bits of preemption are implemented (bits [7:3] of priority), then there are 32 preemption levels, and the active state of these preemption levels are held in ICH_AP0R0 in the bits corresponding to Priority[7:3].

If 6 bits of preemption are implemented (bits [7:2] of priority), then there are 64 preemption levels, and:

- The active state of preemption levels 0 - 124 are held in ICH_AP0R0 in the bits corresponding to 0:Priority[6:2].
- The active state of preemption levels 128 - 252 are held in ICH_AP0R1 in the bits corresponding to 1:Priority[6:2].

If 7 bits of preemption are implemented (bits [7:1] of priority), then there are 128 preemption levels, and:

- The active state of preemption levels 0 - 62 are held in ICH_AP0R0 in the bits corresponding to 00:Priority[5:1].
- The active state of preemption levels 64 - 126 are held in ICH_AP0R1 in the bits corresponding to 01:Priority[5:1].
- The active state of preemption levels 128 - 190 are held in ICH_AP0R2 in the bits corresponding to 10:Priority[5:1].
The active state of preemption levels 192 - 254 are held in ICH_AP0R3 in the bits corresponding to 11:Priority[5:1].

**Note**

Having the bit corresponding to a priority set to 1 in both ICH_AP0R<n> and ICH_AP1R<n> might result in **UNPREDICTABLE** behavior of the interrupt prioritization system for virtual interrupts.

This field resets to 0.

### Accessing the ICH_AP0R<n>

ICH_AP0R1 is only implemented in implementations that support 6 or more bits of preemption. ICH_AP0R2 and ICH_AP0R3 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are **UNDEFINED**.

**Note**

The number of bits of preemption is indicated by ICH_VTR.PREbits

Writing to the active priority registers in any order other than the following order will result in **UNPREDICTABLE** behavior:

- ICH_AP0R<n>
- ICH_AP1R<n>

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#<\text{opc1}>\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#<\text{opc2}>\}

ICH_AP1R<n>, Interrupt Controller Hyp Active Priorities Group 1 Registers, n = 0 - 3

The ICH_AP1R<n> characteristics are:

**Purpose**

Provides information about Group 1 active priorities for EL2.

**Configuration**

AArch32 System register ICH_AP1R<n> bits [31:0] are architecturally mapped to AArch64 System register ICH_AP1R<n>_EL2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ICH_AP1R<n> is a 32-bit register.

**Field descriptions**

The ICH_AP1R<n> bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>P&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>0b0</td>
<td>There is no Group 1 interrupt active at the priority corresponding to that bit.</td>
</tr>
<tr>
<td>31</td>
<td>0b1</td>
<td>There is a Group 1 interrupt active at the priority corresponding to that bit.</td>
</tr>
</tbody>
</table>

The correspondence between priority levels and bits depends on the number of bits of priority that are implemented.

If 5 bits of preemption are implemented (bits [7:3] of priority), then there are 32 preemption levels, and the active state of these preemption levels are held in ICH_AP1R0 in the bits corresponding to Priority[7:3].

If 6 bits of preemption are implemented (bits [7:2] of priority), then there are 64 preemption levels, and:

- The active state of preemption levels 0 - 124 are held in ICH_AP1R0 in the bits corresponding to 0:Priority[6:2].
- The active state of preemption levels 128 - 252 are held in ICH_AP1R1 in the bits corresponding to 1:Priority[6:2].

If 7 bits of preemption are implemented (bits [7:1] of priority), then there are 128 preemption levels, and:

- The active state of preemption levels 0 - 62 are held in ICH_AP1R0 in the bits corresponding to 00:Priority[5:1].
- The active state of preemption levels 64 - 126 are held in ICH_AP1R1 in the bits corresponding to 01:Priority[5:1].
- The active state of preemption levels 128 - 190 are held in ICH_AP1R2 in the bits corresponding to 10:Priority[5:1].
• The active state of preemption levels 192 - 254 are held in ICH_AP1R3 in the bits corresponding to 11:Priority[5:1].

**Note**

Having the bit corresponding to a priority set to 1 in both ICH_AP0R<n> and ICH_AP1R<n> might result in **UNPREDICTABLE** behavior of the interrupt prioritization system for virtual interrupts.

This field resets to 0.

### Accessing the ICH_AP1R<n>

ICH_AP1R1 is only implemented in implementations that support 6 or more bits of preemption. ICH_AP1R2 and ICH_AP1R3 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are **UNDEFINED**.

**Note**

The number of bits of preemption is indicated by ICH_VTR.PREbits

Writing to the active priority registers in any order other than the following order will result in **UNPREDICTABLE** behavior:

- ICH_AP0R<n>
- ICH_AP1R<n>

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}\{<q>\} <\text{coproc}>, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}\}{, \{#\}<\text{opc2}\} \\
\]

ICH_EISR, Interrupt Controller End of Interrupt Status Register

The ICH_EISR characteristics are:

**Purpose**

Indicates which List registers have outstanding EOI maintenance interrupts.

**Configuration**

AArch32 System register ICH_EISR bits [31:0] are architecturally mapped to AArch64 System register ICH_EISR_EL2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ICH_EISR is a 32-bit register.

**Field descriptions**

The ICH_EISR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>Status&lt;0&gt;, bit [0]</td>

</tr>
<tr>
<td>15</td>
<td>Status&lt;15&gt;, bit [15]</td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**Status<n>, bit [n], for n = 0 to 15**

EOI maintenance interrupt status bit for List register <n>:

<table>
<thead>
<tr>
<th>Status&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>List register &lt;n&gt;, ICH_LR&lt;n&gt;, does not have an EOI maintenance interrupt.</td>
</tr>
<tr>
<td>0b1</td>
<td>List register &lt;n&gt;, ICH_LR&lt;n&gt;, has an EOI maintenance interrupt that has not been handled.</td>
</tr>
</tbody>
</table>

For any ICH_LR<n>, the corresponding status bit is set to 1 if all of the following are true:

- ICH_LRC<n>.State is 0b00.
- ICH_LRC<n>.HW is 0.
- ICH_LRC<n>.EOI (bit [9]) is 1, indicating that when the interrupt corresponding to that List register is deactivated, a maintenance interrupt is asserted.

This field resets to 0.

**Accessing the ICH_EISR**

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T12 == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
  elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T12 == '1' then
    AArch32.TakeHypTrapException(0x03);
  else
    UNDEFINED;
elsif PSTATE.EL == EL2 then
  if ICC_HSRE.SRE == '0' then
    UNDEFINED;
  else
    return ICH_EISR;
else
  PSTATE.EL == EL3 then
    if ICC_MSRE.SRE == '0' then
      UNDEFINED;
    else
      return ICH_EISR;
ICH_ELRSR, Interrupt Controller Empty List Register Status Register

The ICH_ELRSR characteristics are:

**Purpose**

Indicates which List registers contain valid interrupts.

**Configuration**

AArch32 System register ICH_ELRSR bits [31:0] are architecturally mapped to AArch64 System register ICH_ELRSR_EL2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

ICH_ELRSR is a 32-bit register.

**Field descriptions**

The ICH_ELRSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>RES0</td>
</tr>
<tr>
<td>16-0</td>
<td>Status&lt;n&gt;, bit [n], for n = 0 to 15</td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**Status<n>, bit [n], for n = 0 to 15**

Status bit for List register <n>, ICH_LR<n>:

<table>
<thead>
<tr>
<th>Status&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>List register ICH_LR&lt;n&gt;, if implemented, contains a valid interrupt. Using this List register can result in overwriting a valid interrupt.</td>
</tr>
<tr>
<td>0b1</td>
<td>List register ICH_LR&lt;n&gt; does not contain a valid interrupt. The List register is empty and can be used without overwriting a valid interrupt or losing an EOI maintenance interrupt.</td>
</tr>
</tbody>
</table>

For any List register <n>, the corresponding status bit is set to 1 if ICH_LRC<n>.State is 0b00 and either ICH_LRC<n>.HW is 1 or ICH_LRC<n>.EOI (bit [9]) is 0.

**Accessing the ICH_ELRSR**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>

      AArch32.TakeHypTrapException(0x03);
   else
      UNDEFINED;
   end if;
elsif PSTATE.EL == EL2 then
   if ICC_HSRE.SRE == '0' then
      UNDEFINED;
   else
      return ICH_ELRSR;
   end if;
elsif PSTATE.EL == EL3 then
   if ICC_MSRE.SRE == '0' then
      UNDEFINED;
   else
      return ICH_ELRSR;
   end if;
ICH_HCR, Interrupt Controller Hyp Control Register

The ICH_HCR characteristics are:

**Purpose**

Controls the environment for VMs.

**Configuration**

AArch32 System register ICH_HCR bits [31:0] are architecturally mapped to AArch64 System register ICH_HCR_EL2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ICH_HCR is a 32-bit register.

**Field descriptions**

The ICH_HCR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 |
| EOIcount | RES0 | TDIR | TSE | TALL1 | TALL0 | TCRES0 | VGrp1DIE | VGrp1EIE | VGrp0DIE | VGrp0EIE | NPIE | LRENPIE | UIE | En |

**EOIcount, bits [31:27]**

This field is incremented whenever a successful write to a virtual EOIR or DIR register would have resulted in a virtual interrupt deactivation. That is either:

- A virtual write to EOIR with a valid interrupt identifier that is not in the LPI range (that is < 8192) when EOI mode is zero and no List Register was found.
- A virtual write to DIR with a valid interrupt identifier that is not in the LPI range (that is < 8192) when EOI mode is one and no List Register was found.

This allows software to manage more active interrupts than there are implemented List Registers.

It is CONSTRAINED UNPREDICTABLE whether a virtual write to EOIR that does not clear a bit in the Active Priorities registers (ICH_AP0R<n>/ICH_AP1R<n>) increments EOIcount. Permitted behaviors are:

- Increment EOIcount.
- Leave EOIcount unchanged.

This field resets to 0.

**Bits [26:15]**

Reserved, RES0.

**TDIR, bit [14]**

Trap Non-secure EL1 writes to ICC_DIR and ICV_DIR.
ICH_HCR, Interrupt Controller Hyp Control Register

<table>
<thead>
<tr>
<th>TDIR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL1 writes of ICC_DIR and ICV_DIR are not trapped to EL2, unless trapped by other mechanisms.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 writes of ICV_DIR are trapped to EL2. It is IMPLEMENTATION DEFINED whether Non-secure writes of ICC_DIR are trapped. Not trapping ICC_DIR writes is DEPRECATED.</td>
</tr>
</tbody>
</table>

Support for this bit is OPTIONAL, with support indicated by ICH_VTR.

If the implementation does not support this trap, this bit is RES0.

Arm deprecates not including this trap bit.

This field resets to 0.

TSEI, bit [13]

Trap all locally generated SEIs. This bit allows the hypervisor to intercept locally generated SEIs that would otherwise be taken at Non-secure EL1.

<table>
<thead>
<tr>
<th>TSEI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Locally generated SEIs do not cause a trap to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Locally generated SEIs trap to EL2.</td>
</tr>
</tbody>
</table>

If ICH_VTR.SEIS is 0, this bit is RES0.

This field resets to 0.

TALL1, bit [12]

Trap all Non-secure EL1 accesses to ICC_* and ICV_* System registers for Group 1 interrupts to EL2.

<table>
<thead>
<tr>
<th>TALL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL1 accesses to ICC_* and ICV_* registers for Group 1 interrupts proceed as normal.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 accesses to ICC_* and ICV_* registers for Group 1 interrupts trap to EL2.</td>
</tr>
</tbody>
</table>

This field resets to 0.

TALL0, bit [11]

Trap all Non-secure EL1 accesses to ICC_* and ICV_* System registers for Group 0 interrupts to EL2.

<table>
<thead>
<tr>
<th>TALL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL1 accesses to ICC_* and ICV_* registers for Group 0 interrupts proceed as normal.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 accesses to ICC_* and ICV_* registers for Group 0 interrupts trap to EL2.</td>
</tr>
</tbody>
</table>

This field resets to 0.

TC, bit [10]

Trap all Non-secure EL1 accesses to System registers that are common to Group 0 and Group 1 to EL2.

<table>
<thead>
<tr>
<th>TC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL1 accesses to common registers proceed as normal.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 accesses to common registers trap to EL2.</td>
</tr>
</tbody>
</table>

This affects accesses to ICC_SGI0R, ICC_SGI1R, ICC_ASGI1R, ICC_CTLR, ICC_DIR, ICC_PMR, ICC_RPR, ICV_CTLR, ICV_DIR, ICV_PMR, and ICV_RPR.

This field resets to 0.
Reserved, RES0.

**VGrp1DIE, bit [7]**

VM Group 1 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected vPE is disabled:

<table>
<thead>
<tr>
<th>VGrp1DIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled when ICH_VMCR.VENG1 is 0.</td>
</tr>
</tbody>
</table>

This field resets to 0.

**VGrp1EIE, bit [6]**

VM Group 1 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected vPE is enabled:

<table>
<thead>
<tr>
<th>VGrp1EIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled when ICH_VMCR.VENG1 is 1.</td>
</tr>
</tbody>
</table>

This field resets to 0.

**VGrp0DIE, bit [5]**

VM Group 0 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected vPE is disabled:

<table>
<thead>
<tr>
<th>VGrp0DIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled when ICH_VMCR.VENG0 is 0.</td>
</tr>
</tbody>
</table>

This field resets to 0.

**VGrp0EIE, bit [4]**

VM Group 0 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected vPE is enabled:

<table>
<thead>
<tr>
<th>VGrp0EIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled when ICH_VMCR.VENG0 is 1.</td>
</tr>
</tbody>
</table>

This field resets to 0.

**NPIE, bit [3]**

No Pending Interrupt Enable. Enables the signaling of a maintenance interrupt when there are no List registers with the State field set to 0b01 (pending):

<table>
<thead>
<tr>
<th>NPIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled while the List registers contain no interrupts in the pending state.</td>
</tr>
</tbody>
</table>

This field resets to 0.
**LRENPIE, bit [2]**

List Register Entry Not Present Interrupt Enable. Enables the signaling of a maintenance interrupt while the virtual CPU interface does not have a corresponding valid List register entry for an EOI request:

<table>
<thead>
<tr>
<th>LRENPIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt is asserted while the EOIcount field is not 0.</td>
</tr>
</tbody>
</table>

This field resets to 0.

**UIE, bit [1]**

Underflow Interrupt Enable. Enables the signaling of a maintenance interrupt when the List registers are empty, or hold only one valid entry:

<table>
<thead>
<tr>
<th>UIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt is asserted if none, or only one, of the List register entries is marked as a valid interrupt.</td>
</tr>
</tbody>
</table>

This field resets to 0.

**En, bit [0]**

Enable. Global enable bit for the virtual CPU interface:

<table>
<thead>
<tr>
<th>En</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Virtual CPU interface operation disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Virtual CPU interface operation enabled.</td>
</tr>
</tbody>
</table>

When this field is set to 0:

- The virtual CPU interface does not signal any maintenance interrupts.
- The virtual CPU interface does not signal any virtual interrupts.
- A read of ICV_IAR0, ICV_IAR1, GICV_IAR or GICV_AIAR returns a spurious interrupt ID.

This field resets to 0.

**Accessing the ICH_HCR**

Accesses to this register use the following encodings:

ICH_LRC<n>, Interrupt Controller List Registers, n = 0 - 15

The ICH_LRC<n> characteristics are:

**Purpose**

Provides interrupt context information for the virtual CPU interface.

**Configuration**

AArch32 System register ICH_LRC<n> bits [31:0] are architecturally mapped to AArch64 System register ICH_LR<n>_EL2[63:32].

If EL2 is not implemented, this register is RES0 from EL3.

If list register n is not implemented, then accesses to this register are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ICH_LRC<n> is a 32-bit register.

**Field descriptions**

The ICH_LRC<n> bit assignments are:

<table>

**State, bits [31:30]**

The state of the interrupt:

<table>
<thead>
<tr>
<th>State</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Invalid (Inactive).</td>
</tr>
<tr>
<td>0b01</td>
<td>Pending.</td>
</tr>
<tr>
<td>0b10</td>
<td>Active.</td>
</tr>
<tr>
<td>0b11</td>
<td>Pending and active.</td>
</tr>
</tbody>
</table>

The GIC updates these state bits as virtual interrupts proceed through the interrupt life cycle. Entries in the invalid state are ignored, except for the purpose of generating virtual maintenance interrupts.

For hardware interrupts, the pending and active state is held in the physical Distributor rather than the virtual CPU interface. A hypervisor must only use the pending and active state for software originated interrupts, which are typically associated with virtual devices, or SGIs.

This field resets to 0.

**HW, bit [29]**

Indicates whether this virtual interrupt maps directly to a hardware interrupt, meaning that it corresponds to a physical interrupt. Deactivation of the virtual interrupt also causes the deactivation of the physical interrupt with the INTID that the pINTID field indicates.
<table>
<thead>
<tr>
<th>HW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The interrupt is triggered entirely by software. No notification is sent to the Distributor when the virtual interrupt is deactivated.</td>
</tr>
<tr>
<td>0b1</td>
<td>The interrupt maps directly to a hardware interrupt. A deactivate interrupt request is sent to the Distributor when the virtual interrupt is deactivated, using the pINTID field from this register to indicate the physical INTID. If ICH_VMCR VEOIM is 0, this request corresponds to a write to ICC_EOIR0 or ICC_EOIR1. Otherwise, it corresponds to a write to ICC_DIR.</td>
</tr>
</tbody>
</table>

This field resets to 0.

**Group, bit [28]**

Indicates the group for this virtual interrupt.

<table>
<thead>
<tr>
<th>Group</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This is a Group 0 virtual interrupt. ICH_VMCR VFIQEn determines whether it is signaled as a virtual IRQ or as a virtual FIQ, and ICH_VMCR VENG0 enables signaling of this interrupt to the virtual machine.</td>
</tr>
<tr>
<td>0b1</td>
<td>This is a Group 1 virtual interrupt, signaled as a virtual IRQ. ICH_VMCR VENG1 enables the signaling of this interrupt to the virtual machine. If ICH_VMCR VCBPR is 0, then ICC_BPR1 determines if a pending Group 1 interrupt has sufficient priority to preempt current execution. Otherwise, ICH_LR&lt;n&gt; determines preemption.</td>
</tr>
</tbody>
</table>

This field resets to 0.

**Bits [27:24]**

Reserved, RES0.

**Priority, bits [23:16]**

The priority of this interrupt.

It is implementation defined how many bits of priority are implemented, though at least five bits must be implemented. Unimplemented bits are RES0 and start from bit[16] up to bit[18]. The number of implemented bits can be discovered from ICH_VTR.PRIbits.

This field resets to 0.

**Bits [15:13]**

Reserved, RES0.

**pINTID, bits [12:0]**

Physical INTID, for hardware interrupts.

When ICH_LRC<n>.HW is 0 (there is no corresponding physical interrupt), this field has the following meaning:

- Bits[12:10] : RES0.
- Bit[9] : EOI. If this bit is 1, then when the interrupt identified by vINTID is deactivated, an EOI maintenance interrupt is asserted.
- Bits[8:0] : Reserved, RES0.

When ICH_LRC<n>.HW is 1 (there is a corresponding physical interrupt):

- This field indicates the physical INTID. This field is only required to implement enough bits to hold a valid value for the implemented INTID size. Any unused higher order bits are RES0.
• When ICC_CTLR_EL1.ExtRange is 0, then bits[44:42] of this field are RES0.
• If the value of pINTID is not a valid INTID, behavior is UNPREDICTABLE. If the value of pINTID indicates a PPI, this field applies to the PPI associated with this same physical PE ID as the virtual CPU interface requesting the deactivation.

A hardware physical identifier is only required in List Registers for interrupts that require deactivation. This means only 13 bits of Physical INTID are required, regardless of the number specified by ICC_CTLR.IDbits.

This field resets to 0.

**Accessing the ICH_LRC<n>**

ICH_LRC<n> and ICH_LRC<n> can be updated independently.

    end if;
ICH_LR<n>, Interrupt Controller List Registers, n = 0 - 15

The ICH_LR<n> characteristics are:

**Purpose**

Provides interrupt context information for the virtual CPU interface.

**Configuration**

AArch32 System register ICH_LR<n> bits [31:0] are architecturally mapped to AArch64 System register ICH_LR<n>_EL2[31:0].  
If EL2 is not implemented, this register is RES0 from EL3.  
If list register n is not implemented, then accesses to this register are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ICH_LR<n> is a 32-bit register.

**Field descriptions**

The ICH_LR<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    | vINTID |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**vINTID, bits [31:0]**

Virtual INTID of the interrupt.  
If the value of vINTID is 1020-1023 and ICH_LRC<n>.State!=0b00 (Inactive), behavior is UNPREDICTABLE.  
Behavior is UNPREDICTABLE if two or more List Registers specify the same vINTID when:

- ICH_LRC<n>.State == 01.  
- ICH_LRC<n>.State == 10.  
- ICH_LRC<n>.State == 11.  

It is IMPLEMENTATION DEFINED how many bits are implemented, though at least 16 bits must be implemented. Unimplemented bits are RES0. The number of implemented bits can be discovered from ICH_VTR.IDbits.

**Note**

When a VM is using memory-mapped access to the GIC, software must ensure that the correct source PE ID is provided in bits[12:10].

This field resets to 0.

**Accessing the ICH_LR<n>**

ICH_LR<n> and ICH_LRC<n> can be updated independently.
Accesses to this register use the following encodings:

ICH_MISR, Interrupt Controller Maintenance Interrupt State Register

The ICH_MISR characteristics are:

**Purpose**

Indicates which maintenance interrupts are asserted.

**Configuration**

AArch32 System register ICH_MISR bits [31:0] are architecturally mapped to AArch64 System register ICH_MISR_EL2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ICH_MISR is a 32-bit register.

**Field descriptions**

The ICH_MISR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Number</th>
<th>Bit Description</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-8</td>
<td>RES0</td>
<td>Reserved, RES0</td>

<td>VGrp1E</td>
<td>vPE Group 1 Enabled. Maintenance Interrupt asserted when ICH_HCR.VGrp1EIE==1 and ICH_VMCR.VMGrp1En==1. This field resets to 0.</td>
</tr>
</tbody>
</table>
VGrp0D, bit [5]

vPE Group 0 Disabled.

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>vPE Group 0 Disabled maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>vPE Group 0 Disabled maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when ICH_HCR.VGrp0DIE==1 and ICH_VMCR.VMGrp0En==0. This field resets to 0.

VGrp0E, bit [4]

vPE Group 0 Enabled.

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>vPE Group 0 Enabled maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>vPE Group 0 Enabled maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when ICH_HCR.VGrp0EIE==1 and ICH_VMCR.VMGrp0En==1. This field resets to 0.

NP, bit [3]

No Pending.

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No Pending maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>No Pending maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when ICH_HCR.NPIE==1 and no List register is in pending state. This field resets to 0.

LRENP, bit [2]

List Register Entry Not Present.

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>List Register Entry Not Present maintenance interrupt not asserted.</td>

</tr>
</tbody>
</table>

This maintenance interrupt is asserted when ICH_HCR.LRENPIE==1 and ICH_HCR.EOICount is non-zero. This field resets to 0.

U, bit [1]

Underflow.

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Underflow maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Underflow maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when ICH_HCR.UIE==1 and zero or one of the List register entries are marked as a valid interrupt, that is, if the corresponding ICH_LRC<n>.State bits do not equal 0x0. This field resets to 0.
**EOI, bit [0]**

End Of Interrupt.

<table>
<thead>
<tr>
<th>EOI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>End Of Interrupt maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>End Of Interrupt maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when at least one bit in `ICH_EISR` is 1.

This field resets to 0.

**Accessing the ICH_MISR**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

ICH_VMCR, Interrupt Controller Virtual Machine Control Register

The ICH_VMCR characteristics are:

**Purpose**

Enables the hypervisor to save and restore the virtual machine view of the GIC state.

**Configuration**

AArch32 System register ICH_VMCR bits [31:0] are architecturally mapped to AArch64 System register ICH_VMCR_EL2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ICH_VMCR is a 32-bit register.

**Field descriptions**

The ICH_VMCR bit assignments are:

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 | VPMR VBPR0 VBPR1 RES0 VEOIM RES0 VCBPR VFIQEn VAckCtl VENG1 VENG0 |
|----------------------------------------------------------------------------------------------------------------------------------|

**VPMR, bits [31:24]**

Virtual Priority Mask. The priority mask level for the virtual CPU interface. If the priority of a pending virtual interrupt is higher than the value indicated by this field, the interface signals the virtual interrupt to the PE.

This field is an alias of ICV_PMR.Priority.

This field resets to an architecturally UNKNOWN value.

**VBPR0, bits [23:21]**

Virtual Binary Point Register, Group 0. Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption, and also determines Group 1 interrupt preemption if ICH_VMCR.VCBPR == 1.

This field is an alias of ICV_BPR0.BinaryPoint.

This field resets to an architecturally UNKNOWN value.

**VBPR1, bits [20:18]**

Virtual Binary Point Register, Group 1. Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption if ICH_VMCR.VCBPR == 0.

This field is an alias of ICV_BPR1.BinaryPoint.

This field resets to an architecturally UNKNOWN value.
Bits [17:10]

Reserved, RES0.

**VEOIM, bit [9]**

Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt:

<table>
<thead>
<tr>
<th>VEOIM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICV_EOIR0 and ICV_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICV_DIR are UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICV_EOIR0 and ICV_EOIR1 provide priority drop functionality only. ICV_DIR provides interrupt deactivation functionality.</td>
</tr>
</tbody>
</table>

This bit is an alias of ICV_CTLR.EOImode.

This field resets to an architecturally UNKNOWN value.

**Bits [8:5]**

Reserved, RES0.

**VCBPR, bit [4]**

Virtual Common Binary Point Register. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VCBPR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICV_BPR0 determines the preemption group for virtual Group 0 interrupts only. ICV_BPR1 determines the preemption group for virtual Group 1 interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICV_BPR0 determines the preemption group for both virtual Group 0 and virtual Group 1 interrupts. Reads of ICV_BPR1 return ICV_BPR0 plus one, saturated to 0b111. Writes to ICV_BPR1 are ignored.</td>
</tr>
</tbody>
</table>

This field is an alias of ICV_CTLR.CBPR.

This field resets to an architecturally UNKNOWN value.

**VFIQEn, bit [3]**

Virtual FIQ enable. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VFIQEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 0 virtual interrupts are presented as virtual IRQs.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 0 virtual interrupts are presented as virtual FIQs.</td>
</tr>
</tbody>
</table>

This bit is an alias of GICV_CTLR.FIQEn.

In implementations where the Non-secure copy of ICC_SRE.SRE is always 1, this bit is RES1.

This field resets to an architecturally UNKNOWN value.

**VAckCtl, bit [2]**

Virtual AckCtl. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VAckCtl</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns an INTID of 1022.</td>
</tr>
<tr>
<td>0b1</td>
<td>If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns the INTID of the corresponding interrupt.</td>
</tr>
</tbody>
</table>
This bit is an alias of GICV_CTLR.AckCtl.

This field is supported for backwards compatibility with GICv2. Arm deprecates the use of this field.

In implementations where the Non-secure copy of ICC_SRE.SRE is always 1, this bit is \texttt{RES0}.

This field resets to an architecturally \texttt{UNKNOWN} value.

**VENG1, bit [1]**

Virtual Group 1 interrupt enable. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VENG1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Virtual Group 1 interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Virtual Group 1 interrupts are enabled.</td>
</tr>
</tbody>
</table>

This bit is an alias of ICV_IGRPEN1.Enable.

This field resets to an architecturally \texttt{UNKNOWN} value.

**VENG0, bit [0]**

Virtual Group 0 interrupt enable. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VENG0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Virtual Group 0 interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Virtual Group 0 interrupts are enabled.</td>
</tr>
</tbody>
</table>

This bit is an alias of ICV_IGRPEN0.Enable.

This field resets to an architecturally \texttt{UNKNOWN} value.

**Accessing the \texttt{ICH_VMCR}**

When EL2 is using System register access, EL1 using either System register or memory-mapped access must be supported.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>\{,#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{,#\}<\text{opc2}> \\
\]

\[

ICH_VTR, Interrupt Controller VGIC Type Register

The ICH_VTR characteristics are:

**Purpose**

Reports supported GIC virtualisation features.

**Configuration**

AArch32 System register ICH_VTR bits [31:0] are architecturally mapped to AArch64 System register ICH_VTR_EL2[31:0].

If EL2 is not implemented, all bits in this register are RES0 from EL3, except for nV4, which is RES1 from EL3.

**Attributes**

ICH_VTR is a 32-bit register.

**Field descriptions**

The ICH_VTR bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PRIbits</td>
<td>Priority bits. The number of virtual priority bits implemented, minus one. An implementation must implement at least 32 levels of virtual priority (5 priority bits). This field is an alias of ICV_CTLR.PRIbits.</td>
</tr>
<tr>
<td>PREbits</td>
<td>The number of virtual preemption bits implemented, minus one. An implementation must implement at least 32 levels of virtual preemption priority (5 preemption bits). The value of this field must be less than or equal to the value of ICH_VTR.PRIbits.</td>
</tr>
<tr>
<td>IDbits</td>
<td>The number of virtual interrupt identifier bits supported:</td>
</tr>
<tr>
<td>SEIS</td>
<td>SEI Support. Indicates whether the virtual CPU interface supports generation of SEIs:</td>
</tr>
</tbody>
</table>

PRIbits, bits [31:29]

Preemption bits. The number of virtual preemption bits implemented, minus one.

An implementation must implement at least 32 levels of virtual preemption priority (5 preemption bits).

This field is an alias of ICV_CTLR.PRIbits.

PREbits, bits [28:26]

The number of virtual preemption bits implemented, minus one.

An implementation must implement at least 32 levels of virtual preemption priority (5 preemption bits).

The value of this field must be less than or equal to the value of ICH_VTR.PRIbits.

IDbits, bits [25:23]

The number of virtual interrupt identifier bits supported:

<table>
<thead>
<tr>
<th>IDbits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>16 bits.</td>
</tr>
<tr>
<td>0b001</td>
<td>24 bits.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field is an alias of ICV_CTLR.IDbits.

SEIS, bit [22]

SEI Support. Indicates whether the virtual CPU interface supports generation of SEIs:
<table>
<thead>
<tr>
<th>SEIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The virtual CPU interface logic does not support generation of SEIs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The virtual CPU interface logic supports generation of SEIs.</td>
</tr>
</tbody>
</table>

This bit is an alias of `ICV_CTLR.SEIS`.

### A3V, bit [21]

**Affinity 3 Valid. Possible values are:**

<table>
<thead>
<tr>
<th>A3V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>The virtual CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.</td>
</tr>
</tbody>
</table>

This bit is an alias of `ICV_CTLR.A3V`.

### nV4, bit [20]

**Direct injection of virtual interrupts not supported. Possible values are:**

<table>
<thead>
<tr>
<th>nV4</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CPU interface logic supports direct injection of virtual interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>The CPU interface logic does not support direct injection of virtual interrupts.</td>
</tr>
</tbody>
</table>

In GICv3 this bit is `RES1`.

### TDS, bit [19]

**Separate trapping of Non-secure EL1 writes to `ICV_DIR` supported.**

<table>
<thead>
<tr>
<th>TDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Implementation does not support <code>ICH_HCR.TDIR</code>.</td>
</tr>
<tr>
<td>0b1</td>
<td>Implementation supports <code>ICH_HCR.TDIR</code>.</td>
</tr>
</tbody>
</table>

### Bits [18:5]

Reserved, `RES0`.

### ListRegs, bits [4:0]

The number of implemented List registers, minus one. For example, a value of 0b01111 indicates that the maximum of 16 List registers are implemented.

### Accessing the ICH_VTR

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b100</td>
<td>0b1100</td>
<td>0b1011</td>
<td>0b001</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then

    return ICH_VTR;

ICIALLU, Instruction Cache Invalidate All to PoU

The ICIALLU characteristics are:

**Purpose**

Invalidate all instruction caches to PoU. If branch predictors are architecturally visible, also flush branch predictors.

**Configuration**

AArch32 System instruction ICIALLU performs the same function as AArch64 System instruction IC IALLU.

**Attributes**

ICIALLU is a 32-bit System instruction.

**Field descriptions**

ICIALLU ignores the value in the register specified by the instruction encoding. Software does not have to write a value to the register before issuing this instruction.

**Executing the ICIALLU instruction**

The PE ignores the value of <Rt>. Software does not have to write a value to this register before issuing this instruction.

When HCR.FB is 1, at Non-secure EL1 this instruction executes as a ICIALLUIS.

Accesses to this instruction use the following encodings:

\[
\text{MCR}\{<c>\}{<q>} <\text{coproc}>, \{#<\text{opc1}>\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#<\text{opc2}>\}
\]

<table>
<thead>

  ICIALLU();
elsif PSTATE.EL == EL3 then
  ICIALLU();
ICIALLUIS, Instruction Cache Invalidate All to PoU, Inner Shareable

The ICIALLUIS characteristics are:

**Purpose**

Invalidate all instruction caches Inner Shareable to PoU. If branch predictors are architecturally visible, also flush branch predictors.

**Configuration**

AArch32 System instruction ICIALLUIS performs the same function as AArch64 System instruction IC IALLUIS.

**Attributes**

ICIALLUIS is a 32-bit System instruction.

**Field descriptions**

ICIALLUIS ignores the value in the register specified by the instruction encoding. Software does not have to write a value to the register before issuing this instruction.

**Executing the ICIALLUIS instruction**

The PE ignores the value of <Rt>. Software does not have to write a value to this register before issuing this instruction.

Accesses to this instruction use the following encodings:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>

elsif PSTATE.EL == EL3 then
    ICIALLU();
ICIMVAU, Instruction Cache line Invalidate by VA to PoU

The ICIMVAU characteristics are:

**Purpose**
Invalidate instruction cache line by virtual address to PoU.

**Configuration**
AArch32 System instruction ICIMVAU performs the same function as AArch64 System instruction IC IVAU.

**Attributes**
ICIMVAU is a 32-bit System instruction.

**Field descriptions**
The ICIMVAU input value bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Virtual address to use**

**Bits [31:0]**
Virtual address to use. No alignment restrictions apply to this VA.

**Executing the ICIMVAU instruction**
Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see ‘AArch32 instruction cache maintenance instruction (IC*)’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Accesses to this instruction use the following encodings:

\[
\text{MCR} \{<c>\}{<q>} \text{ <coproc>}, \{#<opc1>\}, \text{ <Rt>}, \text{ <CRn>}, \text{<CRm>}, \{#<opc2>\}
\]

The ICV_AP0R\(n\) characteristics are:

### Purpose

Provides information about virtual Group 0 active priorities.

### Configuration

AArch32 System register ICV_AP0R\(n\) bits [31:0] are architecturally mapped to AArch64 System register ICV_AP0R\(n\)_EL1[31:0].

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally \texttt{UNKNOWN} values.

### Attributes

ICV_AP0R\(n\) is a 32-bit register.

### Field descriptions

The ICV_AP0R\(n\) bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>

</tr>
</tbody>
</table>

\texttt{IMPLEMENTATION DEFINED}

**IMPLEMENTATION DEFINED, bits [31:0]**

\texttt{IMPLEMENTATION DEFINED}.

This field resets to 0.

The contents of these registers are \texttt{IMPLEMENTATION DEFINED} with the one architectural requirement that the value \texttt{0x00000000} is consistent with no interrupts being active.

### Accessing the ICV_AP0R\(n\)

Writing to these registers with any value other than the last read value of the register (or \texttt{0x00000000} when there are no Group 0 active priorities) might result in \texttt{UNPREDICTABLE} behavior of the virtual interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICV_AP0R1 is only implemented in implementations that support 6 or more bits of priority. ICV_AP0R2 and ICV_AP0R3 are only implemented in implementations that support 7 bits of priority. Unimplemented registers are \texttt{UNDEFINED}.

Writing to the active priority registers in any order other than the following order might result in \texttt{UNPREDICTABLE} behavior of the interrupt prioritization system:

- ICV_AP0R\(n\).
- ICV_AP1R\(n\).

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
  UNDEFINED;
elif PSTATE.EL == EL1 then
    if EL2Enabled() && ELUsingAArch32(EL2) && HSTR_EL2.T12 == '1' then

    endif

The ICV_AP1R<n> characteristics are:

**Purpose**

Provides information about virtual Group 1 active priorities.

**Configuration**

AArch32 System register ICV_AP1R<n> bits [31:0] are architecturally mapped to AArch64 System register ICV_AP1R<n>_EL1[31:0].

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 they apply only to the Secure instance of the register. Otherwise, RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

ICV_AP1R<n> is a 32-bit register.

**Field descriptions**

The ICV_AP1R<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| **IMPLEMENTATION DEFINED** |

**IMPLEMENTATION DEFINED, bits [31:0]**

**IMPLEMENTATION DEFINED.**

This field resets to 0.

The contents of these registers are **IMPLEMENTATION DEFINED** with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

**Accessing the ICV_AP1R<n>**

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 1 active priorities) might result in **UNPREDICTABLE** behavior of the virtual interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICV_AP1R1 is only implemented in implementations that support 6 or more bits of priority. ICV_AP1R2 and ICV_AP1R3 are only implemented in implementations that support 7 bits of priority. Unimplemented registers are **UNDEFINED**.

Writing to the active priority registers in any order other than the following order might result in **UNPREDICTABLE** behavior of the interrupt prioritization system:

- ICV_AP0R<n>.
- ICV_AP1R<n>.

<tr>
<td>7</td>
<td>No preemption</td>
<td>[7:0]</td>
<td>.ssssssssss</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**Accessing the ICV_BPR0**

The minimum binary point value is derived from the number of implemented priority bits. The number of priority bits is IMPLEMENTATION DEFINED, and reported by ICV_CTLR PRibits.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is set to the minimum supported value.

</tr>
<tr>
<td>7</td>
<td>[7]</td>
<td>[6:0]</td>
<td>g.sssssss</td>
</tr>
</tbody>
</table>

Writing 0 to this field will set this field to its reset value.

If ICV_CTLR CBPR is set to 1, Non-secure EL1 reads return ICV_BPR0 + 1 saturated to 0b111. Non-secure EL1 writes are ignored.

This field resets to an IMPLEMENTATION DEFINED non-zero value.
Accessing the ICV_BPR1

The reset value is `IMPLEMENTATION DEFINED`, but is equal to the minimum value of `ICV_BPR0` plus one.

An attempt to program the binary point field to a value less than the reset value sets the field to the reset value.

ICV_CTLR, Interrupt Controller Virtual Control Register

The ICV_CTLR characteristics are:

**Purpose**

Controls aspects of the behavior of the GIC virtual CPU interface and provides information about the features implemented.

**Configuration**

AArch32 System register ICV_CTLR bits [31:0] are architecturally mapped to AArch64 System register ICV_CTLR_EL1[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ICV_CTLR is a 32-bit register.

**Field descriptions**

The ICV_CTLR bit assignments are:

|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | ExtRange | RSS | RES0 | A3V | SEIS | IDbits | PRIbits | RES0 | EOImode | CBPR |

**Bits [31:20]**

Reserved, RES0.

**ExtRange, bit [19]**

Extended INTID range (read-only).

<table>
<thead>
<tr>
<th>ExtRange</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>CPU interface does not support INTIDs in the range 1024..8191. Behaviour is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface.</td>
</tr>
</tbody>
</table>

**Note**

Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.

<table>
<thead>
<tr>
<th>ExtRange</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>CPU interface supports INTIDs in the range 1024..8191. All INTIDs in the range 1024..8191 are treated as requiring deactivation.</td>
</tr>
</tbody>
</table>

ICV_CTLR.ExtRange is an alias of ICC_CTLR.ExtRange.

**RSS, bit [18]**

Range Selector Support. Possible values are:
**RSS**

<table>
<thead>
<tr>
<th>RSS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Targeted SGIs with affinity level 0 values of 0 - 15 are supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>Targeted SGIs with affinity level 0 values of 0 - 255 are supported.</td>
</tr>
</tbody>
</table>

This bit is read-only.

**Bits [17:16]**

Reserved, RES0.

**A3V, bit [15]**

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

<table>
<thead>
<tr>
<th>A3V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>The virtual CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.</td>
</tr>
</tbody>
</table>

**SEIS, bit [14]**

SEI Support. Read-only and writes are ignored. Indicates whether the virtual CPU interface supports local generation of SEIs:

<table>
<thead>
<tr>
<th>SEIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The virtual CPU interface logic does not support local generation of SEIs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The virtual CPU interface logic supports local generation of SEIs.</td>
</tr>
</tbody>
</table>

**IDbits, bits [13:11]**

Identifier bits. Read-only and writes are ignored. The number of virtual interrupt identifier bits supported:

<table>
<thead>
<tr>
<th>IDbits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>16 bits.</td>
</tr>
<tr>
<td>0b001</td>
<td>24 bits.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**PRIbits, bits [10:8]**

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation must implement at least 32 levels of physical priority (5 priority bits).

**Note**

This field always returns the number of priority bits implemented.

The division between group priority and subpriority is defined in the binary point registers `ICV_BPR0` and `ICV_BPR1`.

**Bits [7:2]**

Reserved, RES0.

**EOImode, bit [1]**

Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt:
**EOImode**

<table>
<thead>
<tr>
<th>EOImode</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><strong>ICV_EOIR0</strong> and <strong>ICV_EOIR1</strong> provide both priority drop and interrupt deactivation functionality. Accesses to <strong>ICV_DIR</strong> are <strong>UNPREDICTABLE</strong>.</td>
</tr>
<tr>
<td>0b1</td>
<td><strong>ICV_EOIR0</strong> and <strong>ICV_EOIR1</strong> provide priority drop functionality only. <strong>ICV_DIR</strong> provides interrupt deactivation functionality.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**CBPR, bit [0]**

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both virtual Group 0 and virtual Group 1 interrupts:

<table>
<thead>
<tr>
<th>CBPR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><strong>ICV_BPR0</strong> determines the preemption group for virtual Group 0 interrupts only. <strong>ICV_BPR1</strong> determines the preemption group for virtual Group 1 interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td><strong>ICV_BPR0</strong> determines the preemption group for both virtual Group 0 and virtual Group 1 interrupts. Reads of <strong>ICV_BPR1</strong> return <strong>ICV_BPR0</strong> plus one, saturated to 0b111. Writes to <strong>ICV_BPR1</strong> are ignored.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**Accessing the ICV_CTLR**

ICV_DIR, Interrupt Controller Deactivate Virtual Interrupt Register

The ICV_DIR characteristics are:

**Purpose**

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified virtual interrupt.

**Configuration**

AArch32 System register ICV_DIR bits [31:0] performs the same function as AArch64 System register ICV_DIR_EL1[31:0].

**Attributes**

ICV_DIR is a 32-bit register.

**Field descriptions**

The ICV_DIR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-24</td>
<td>RES0</td>
</tr>
<tr>
<td>23-0</td>
<td>INTID</td>
</tr>
</tbody>
</table>

**Bits [31:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID of the virtual interrupt to be deactivated.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

**Accessing the ICV_DIR**

When EOImode == 0, writes are ignored. In systems supporting system error generation, an implementation might generate an SEI.

Accesses to this register use the following encodings:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>

    UNDEFINED;
  else
    ICC_DIR = R[t];
ICV_EOIR0, Interrupt Controller Virtual End Of Interrupt Register 0

The ICV_EOIR0 characteristics are:

**Purpose**

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified virtual Group 0 interrupt.

**Configuration**

AArch32 System register ICV_EOIR0 performs the same function as AArch64 System register ICV_EOIR0_EL1.

**Attributes**

ICV_EOIR0 is a 32-bit register.

**Field descriptions**

The ICV_EOIR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-24</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>23-0</td>
<td>INTID</td>
</tr>
</tbody>
</table>

**Bits [31:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID from the corresponding ICV_IAR0 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the ICV_CTLR.EOImode bit is 0, a write to this register drops the priority for the virtual interrupt, and also deactivates the virtual interrupt.

If the ICV_CTLR.EOImode bit is 1, a write to this register only drops the priority for the virtual interrupt. Software must write to ICV_DIR to deactivate the virtual interrupt.

**Accessing the ICV_EOIR0**

A write to this register must correspond to the most recent valid read by this vPE from a Virtual Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICV_IAR0, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

Accesses to this register use the following encodings:

ICV_EOIR1, Interrupt Controller Virtual End Of Interrupt Register 1

The ICV_EOIR1 characteristics are:

**Purpose**

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified virtual Group 1 interrupt.

**Configuration**

AArch32 System register ICV_EOIR1 performs the same function as AArch64 System register ICV_EOIR1_EL1.

**Attributes**

ICV_EOIR1 is a 32-bit register.

**Field descriptions**

The ICV_EOIR1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit pos</th>
<th>Bit assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>23</td>
<td>INTID</td>
<td>The INTID from the corresponding ICV_IAR1 access.</td>
</tr>
</tbody>
</table>

**Bits [31:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID from the corresponding ICV_IAR1 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the ICV_CTLR.EOImode bit is 0, a write to this register drops the priority for the virtual interrupt, and also deactivates the virtual interrupt.

If the ICV_CTLR.EOImode bit is 1, a write to this register only drops the priority for the virtual interrupt. Software must write to ICV_DIR to deactivate the virtual interrupt.

**Accessing the ICV_EOIR1**

A write to this register must correspond to the most recent valid read by this vPE from a Virtual Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICV_IAR1, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

Accesses to this register use the following encodings:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

ICV_IAR0, Interrupt Controller Virtual Interrupt Acknowledge Register 0

The ICV_IAR0 characteristics are:

**Purpose**

The PE reads this register to obtain the INTID of the signaled virtual Group 0 interrupt. This read acts as an acknowledge for the interrupt.

**Configuration**

AArch32 System register ICV_IAR0 performs the same function as AArch64 System register ICV_IAR0_EL1.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when PSTATE.{I,F} == {0,0}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. See Observability of the effects of accesses to the GIC registers, for more information.

**Attributes**

ICV_IAR0 is a 32-bit register.

**Field descriptions**

The ICV_IAR0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | INTID |

**Bits [31:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID of the signaled virtual interrupt.

This is the INTID of the highest priority pending virtual interrupt, if that interrupt is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. This special INTID can take the value 1023 only. See Special INTIDs, for more information.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

ICV_IGRPEN0, Interrupt Controller Virtual Interrupt Group 0 Enable register

The ICV_IGRPEN0 characteristics are:

**Purpose**

Controls whether virtual Group 0 interrupts are enabled or not.

**Configuration**

AArch32 System register ICV_IGRPEN0 bits [31:0] are architecturally mapped to AArch64 System register `ICV_IGRPEN0_EL1[31:0]`.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ICV_IGRPEN0 is a 32-bit register.

**Field descriptions**

The ICV_IGRPEN0 bit assignments are:

ICV_IGRPEN1, Interrupt Controller Virtual Interrupt Group 1 Enable register

The ICV_IGRPEN1 characteristics are:

**Purpose**

Controls whether virtual Group 1 interrupts are enabled for the current Security state.

**Configuration**

AArch32 System register ICV_IGRPEN1 bits [31:0] are architecturally mapped to AArch64 System register ICV_IGRPEN1_EL1[31:0].

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 they apply only to the Secure instance of the register. Otherwise, RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

ICV_IGRPEN1 is a 32-bit register.

**Field descriptions**

The ICV_IGRPEN1 bit assignments are:

<table>

The ICV_PMR characteristics are:

**Purpose**

Provides a virtual interrupt priority filter. Only virtual interrupts with a higher priority than the value in this register are signaled to the PE.

**Configuration**

AArch32 System register ICV_PMR bits [31:0] are architecturally mapped to AArch64 System register ICV_PMR_EL1[31:0].

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that writes to this register are self-synchronising. This ensures that no interrupts below the written PMR value will be taken after a write to this register is architecturally executed. See Observability of the effects of accesses to the GIC registers, for more information.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ICV_PMR is a 32-bit register.

**Field descriptions**

**Bits [31:8]**

Reserved, RES0.

**Priority, bits [7:0]**

The priority mask level for the virtual CPU interface. If the priority of a virtual interrupt is higher than the value indicated by this field, the interface signals the virtual interrupt to the PE.

The possible priority field values are as follows:

<table>
<thead>
<tr>
<th>Implemented priority bits</th>
<th>Possible priority field values</th>
<th>Number of priority levels</th>
</tr>
</thead>
<tbody>
<tr>
<td>[7:0]</td>
<td>0x00-0xFF (0-255), all values</td>
<td>256</td>
</tr>
<tr>
<td>[7:1]</td>
<td>0x00-0xFE (0-254), even values only</td>
<td>128</td>
</tr>
<tr>
<td>[7:2]</td>
<td>0x00-0xFC (0-252), in steps of 4</td>
<td>64</td>
</tr>
<tr>
<td>[7:3]</td>
<td>0x00-0xFB (0-248), in steps of 8</td>
<td>32</td>
</tr>
<tr>
<td>[7:4]</td>
<td>0x00-0xF0 (0-240), in steps of 16</td>
<td>16</td>
</tr>
</tbody>
</table>
Unimplemented priority bits are RAZ/WI.

This field resets to 0.

ICV_RPR, Interrupt Controller Virtual Running Priority Register

The ICV_RPR characteristics are:

**Purpose**

Indicates the Running priority of the virtual CPU interface.

**Configuration**

AArch32 System register ICV_RPR performs the same function as AArch64 System register ICV_RPR_EL1.

**Attributes**

ICV_RPR is a 32-bit register.

**Field descriptions**

The ICV_RPR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**Priority, bits [7:0]**

The current running priority on the virtual CPU interface. This is the group priority of the current active virtual interrupt.

The priority returned is the group priority as if the BPR for the current Exception level and Security state was set to the minimum value of BPR for the number of implemented priority bits.

---

**Note**

If 8 bits of priority are implemented the group priority is bits[7:1] of the priority.

---

**Accessing the ICV_RPR**

If there are no active interrupts on the virtual CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

Software cannot determine the number of implemented priority bits from a read of this register.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#<\text{opc1}>\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#<\text{opc2}>\}

ID_DFR0, Debug Feature Register 0

The ID_DFR0 characteristics are:

**Purpose**

Provides top level information about the debug system in AArch32 state.

Must be interpreted with the Main ID Register, MIDR.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G7.1.3.

**Configuration**

AArch32 System register ID_DFR0 bits [31:0] are architecturally mapped to AArch64 System register ID_DFR0_EL1[31:0].

**Attributes**

ID_DFR0 is a 32-bit register.

**Field descriptions**

The ID_DFR0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| TraceFilt | PerfMon | MProfDbg | MMapTrc | CopTrc | MMapDbg | CopSDbg | CopDbg |

**TraceFilt, bits [31:28]**

Armv8.4 Self-hosted Trace Extension version. Defined values are:

<table>
<thead>
<tr>
<th>TraceFilt</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Armv8.4 Self-hosted Trace Extension not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Armv8.4 Self-hosted Trace Extension implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.4-Trace implements the functionality added by the value 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

**PerfMon, bits [27:24]**

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in Alternative ID scheme used for the Performance Monitors Extension version.

Defined values are:
**PerfMon**

| \(0b0000\) | Performance Monitors Extension not implemented. |
| \(0b0001\) | Performance Monitors Extension version 1 implemented, PMUv1. |
| \(0b0010\) | Performance Monitors Extension version 2 implemented, PMUv2. |
| \(0b0011\) | Performance Monitors Extension version 3 implemented, PMUv3. |
| \(0b0100\) | PMUv3 for Armv8.1. As \(0b0011\), and also includes support for:  
  * Extended 16-bit PMEVTYPE<\(n\>).evtCount field.  
  * If EL2 is implemented, the HDCR.HPMD control bit. |
| \(0b0101\) | PMUv3 for Armv8.4. As \(0b0100\) and also includes support for the PMMIR register. |
| \(0b0110\) | PMUv3 for Armv8.5. As \(0b0101\) and also includes support for:  
  * 64-bit event counters.  
  * If EL2 is implemented, the HDCR.HCCD control bit.  
  * If EL3 is implemented, the SDCR.SCCD control bit. |
| \(0b1111\) | IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value in new implementations. |

ARMv8.1-PMU implements the functionality added by the value \(0b0100\).

ARMv8.4-PMU implements the functionality added by the value \(0b0101\).

ARMv8.5-PMU implements the functionality added by the value \(0b0110\).

All other values are reserved.

In any Armv8 implementation, the values \(0b0001\) and \(0b0010\) are not permitted.

From Armv8.1, the value \(0b0011\) is not permitted.

From Armv8.4, the value \(0b0100\) is not permitted.

From Armv8.5, the value \(0b0101\) is not permitted.

**Note**

In Armv7, the value \(0b0000\) can mean that PMUv1 is implemented. PMUv1 is not permitted in an Armv8 implementation.

---

**MProfDbg, bits [23:20]**

M Profile Debug. Support for memory-mapped debug model for M profile processors. Defined values are:

<table>
<thead>
<tr>
<th>MProfDbg</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>(0b0000)</td>
<td>Not supported.</td>
</tr>
<tr>
<td>(0b0001)</td>
<td>Support for M profile Debug architecture, with memory-mapped access.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is \(0b0000\).

**MMapTrc, bits [19:16]**

Memory Mapped Trace. Support for memory-mapped trace model. Defined values are:

<table>
<thead>
<tr>
<th>MMapTrc</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>(0b0000)</td>
<td>Not supported.</td>
</tr>
<tr>
<td>(0b0001)</td>
<td>Support for Arm trace architecture, with memory-mapped access.</td>
</tr>
</tbody>
</table>

All other values are reserved.
In Armv8-A, the permitted values are 0b0000 and 0b0001.

See the ETM Architecture Specification for more information.

**CopTrc, bits [15:12]**

Support for System registers-based trace model, using registers in the coproc == 0b1110 encoding space. Defined values are:

<table>
<thead>
<tr>
<th>CopTrc</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for Arm trace architecture, with System registers access.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

See the ETM Architecture Specification for more information.

**MMapDbg, bits [11:8]**

Memory Mapped Debug. Support for v7 memory-mapped debug model, for A and R profile processors.

In Armv8-A, this field is RES0.

The optional memory map defined by Armv8 is not compatible with Armv7.

**CopSDbg, bits [7:4]**

Support for a System registers-based Secure debug model, using registers in the coproc == 0b1110 encoding space, for an A profile processor that includes EL3.

If EL3 is not implemented and the implemented Security state is Non-secure state, this field is RES0. Otherwise, this field reads the same as bits [3:0].

**CopDbg, bits [3:0]**

Support for System registers-based debug model, using registers in the coproc == 0b1110 encoding space, for A and R profile processors. Defined values are:

<table>
<thead>
<tr>
<th>CopDbg</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Support for Armv6, v6 Debug architecture, with System registers access.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Support for Armv6, v6.1 Debug architecture, with System registers access.</td>
</tr>
<tr>
<td>0b0100</td>
<td>Support for Armv7, v7 Debug architecture, with System registers access.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Support for Armv7, v7.1 Debug architecture, with System registers access.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Support for Armv8 debug architecture, with System registers access.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Support for Armv8 debug architecture, with System registers access, and Virtualization Host extensions.</td>
</tr>
<tr>
<td>0b1000</td>
<td>Support for Armv8.2 debug architecture.</td>
</tr>
<tr>
<td>0b1001</td>
<td>Support for Armv8.4 debug architecture.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In any Armv8 implementation, the values 0b0000, 0b0010, 0b0011, 0b0100, and 0b0101 are not permitted.

If ARMv8.1-VHE is not implemented, the only permitted value is 0b0110.

In an Armv8.0 implementation, the value 0b1000 is not permitted.
Accessing the ID_DFR0

Accesses to this register use the following encodings:

\[

ID_ISAR0, Instruction Set Attribute Register 0

The ID_ISAR0 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR1, ID_ISAR2, ID_ISAR3, ID_ISAR4, and ID_ISAR5.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G7.1.3.

**Configuration**

AArch32 System register ID_ISAR0 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR0_EL1[31:0].

**Attributes**

ID_ISAR0 is a 32-bit register.

**Field descriptions**

The ID_ISAR0 bit assignments are:

<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds SDIV and UDIV in the A32 instruction set.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0010.

**Debug, bits [23:20]**

Indicates the implemented Debug instructions. Defined values are:

<table>
<thead>
<tr>
<th>Debug</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds BKPT.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.
Coproc, bits [19:16]

Indicates the implemented System register access instructions. Defined values are:

<table>
<thead>
<tr>
<th>Coproc</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented, except for instructions separately attributed by the architecture to provide access to AArch32 System registers and System instructions.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds generic CDP, LDC, MCR, MRC, and STC.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds generic CDP2, LDC2, MCR2, MRC2, and STC2.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0010, and adds generic MCRR and MRRC.</td>
</tr>
<tr>
<td>0b0100</td>
<td>As for 0b0011, and adds generic MCRR2 and MRRC2.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

CmpBranch, bits [15:12]

Indicates the implemented combined Compare and Branch instructions in the T32 instruction set. Defined values are:

<table>
<thead>
<tr>
<th>CmpBranch</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds CBNZ and CBZ.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

BitField, bits [11:8]

Indicates the implemented BitField instructions. Defined values are:

<table>
<thead>
<tr>
<th>BitField</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds BFC, BFI, SBFX, and UBFX.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

BitCount, bits [7:4]

Indicates the implemented Bit Counting instructions. Defined values are:

<table>
<thead>
<tr>
<th>BitCount</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds CLZ.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

Swap, bits [3:0]

Indicates the implemented Swap instructions in the A32 instruction set. Defined values are:

<table>
<thead>
<tr>
<th>Swap</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds SWP and SWPB.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.
Accessing the ID_ISAR0

Accesses to this register use the following encodings:

\[ \text{MRC}\{c\}\{q\} \text{ <coproc>}, \{#\text{<opc1>}, \text{<Rt>}, \text{<CRn>}, \text{<CRm>}, \{#\text{<opc2>}} \]  

<table>
<thead>
<tr>
<th>coproc</th>

\end{align*}
\]
The ID_ISAR1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state. Must be interpreted with ID_ISAR0, ID_ISAR2, ID_ISAR3, ID_ISAR4, and ID_ISAR5.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G7.1.3.

**Configuration**

AArch32 System register ID_ISAR1 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR1_EL1[31:0].

**Attributes**

ID_ISAR1 is a 32-bit register.

**Field descriptions**

The ID_ISAR1 bit assignments are:

|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
| Jazelle | Interwork | Immediate | IfThen | Extend | Except_AR | Except | Endian |

**Jazelle, bits [31:28]**

Indicates the implemented Jazelle extension instructions. Defined values are:

<table>
<thead>
<tr>
<th>Jazelle</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No support for Jazelle.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the BXJ instruction, and the J bit in the PSR. This setting might indicate a trivial implementation of the Jazelle extension.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

**Interwork, bits [27:24]**

Indicates the implemented Interworking instructions. Defined values are:

<table>
<thead>
<tr>
<th>Interwork</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the BX instruction, and the T bit in the PSR.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the BLX instruction. PC loads have BX-like behavior.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0010, and guarantees that data-processing instructions in the A32 instruction set with the PC as the destination and the S bit clear have BX-like behavior.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0011.
Immediate, bits [23:20]

Indicates the implemented data-processing instructions with long immediates. Defined values are:

<table>
<thead>
<tr>
<th>Immediate</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds:</td>
</tr>
<tr>
<td></td>
<td>• The MOVT instruction</td>
</tr>
<tr>
<td></td>
<td>• The MOV instruction encodings with zero-extended 16-bit immediates.</td>
</tr>
<tr>
<td></td>
<td>• The T32 ADD and SUB instruction encodings with zero-extended 12-bit</td>
</tr>
<tr>
<td></td>
<td>immediates, and the other ADD, ADR, and SUB encodings cross-referenced</td>
</tr>
<tr>
<td></td>
<td>by the pseudocode for those encodings.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

IfThen, bits [19:16]

Indicates the implemented If-Then instructions in the T32 instruction set. Defined values are:

<table>
<thead>
<tr>
<th>IfThen</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the IT instructions, and the IT bits in the PSRs.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

Extend, bits [15:12]

Indicates the implemented Extend instructions. Defined values are:

<table>
<thead>
<tr>
<th>Extend</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No scalar sign-extend or zero-extend instructions are implemented,</td>
</tr>
<tr>
<td></td>
<td>where scalar instructions means non-Advanced SIMD instructions.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SXTB, SXTH, UXTB, and UXTH instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the SXTB16, SXTAB, SXTAB16,</td>
</tr>
<tr>
<td></td>
<td>SXTAH, UXTB16, UXTAB, UXTAB16, and UXTAH instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0010.

Except_AR, bits [11:8]

Indicates the implemented A and R profile exception-handling instructions. Defined values are:

<table>
<thead>
<tr>
<th>Except_AR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SRS and RFE instructions, and the A and R profile forms of the</td>
</tr>
<tr>
<td></td>
<td>CPS instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

Except, bits [7:4]

Indicates the implemented exception-handling instructions in the A32 instruction set. Defined values are:
Except | Meaning
--- | ---
0b0000 | Not implemented. This indicates that the User bank and Exception return forms of the LDM and STM instructions are not implemented.
0b0001 | Adds the LDM (exception return), LDM (user registers), and STM (user registers) instruction versions.

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

**Endian, bits [3:0]**

Indicates the implemented Endian instructions. Defined values are:

<table>
<thead>
<tr>
<th>Endian</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SETEND instruction, and the E bit in the PSRs.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

**Accessing the ID_ISAR1**

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{<\text{opc1}>\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{<\text{opc2}>\}
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b0000</td>
<td>0b0010</td>
<td>0b001</td>
</tr>
</tbody>
</table>

ID_ISAR2, Instruction Set Attribute Register 2

The ID_ISAR2 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR3, ID_ISAR4, and ID_ISAR5.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G7.1.3.

**Configuration**

AArch32 System register ID_ISAR2 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR2_EL1[31:0].

**Attributes**

ID_ISAR2 is a 32-bit register.

**Field descriptions**

The ID_ISAR2 bit assignments are:

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Reversal | PSR_AR | MultU | MultS | Mult | MultiAccessInt | MemHint | LoadStore |

**Reversal, bits [31:28]**

Indicates the implemented Reversal instructions. Defined values are:

<table>
<thead>
<tr>
<th>Reversal</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the REV, REV16, and REVSH instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the RBIT instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0010.

**PSR_AR, bits [27:24]**

Indicates the implemented A and R profile instructions to manipulate the PSR. Defined values are:

<table>
<thead>
<tr>
<th>PSR_AR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the MRS and MSR instructions, and the exception return forms of data-processing instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

The exception return forms of the data-processing instructions are:

- In the A32 instruction set, data-processing instructions with the PC as the destination and the S bit set. These instructions might be affected by the WithShifts attribute.
- In the T32 instruction set, the SUBS PC,LR,#N instruction.
MultU, bits [23:20]

Indicates the implemented advanced unsigned Multiply instructions. Defined values are:

<table>
<thead>
<tr>
<th>MultU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the UMULL and UMLAL instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the UMAAL instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0010.

MultS, bits [19:16]

Indicates the implemented advanced signed Multiply instructions. Defined values are:

<table>
<thead>
<tr>
<th>MultS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SMULL and SMLAL instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the SMLABB, SMLABT, SMLALBB, SMLALBT, SMLALTB, SMLALTT, SMLATB, SMLATT, SMLAWB, SMLAWT, SMLUBB, SMLULT, SMLUTB, SMLUTT, SMLUWB, and SMLUWT instructions. Also adds the Q bit in the PSRs.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0010, and adds the SMLAD, SMLADX, SMLALD, SMLALDX, SMLSD, SMLSDX, SMLSLD, SMLSDLX, SMMUL, SMMULR, SMMULM, SMMULM, SMUSD, and SMUSDX instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0011.

Mult, bits [15:12]

Indicates the implemented additional Multiply instructions. Defined values are:

<table>
<thead>
<tr>
<th>Mult</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No additional instructions implemented. This means only MUL is implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the MLA instruction.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the MLS instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0010.

MultiAccessInt, bits [11:8]

Indicates the support for interruptible multi-access instructions. Defined values are:

<table>
<thead>
<tr>
<th>MultiAccessInt</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No support. This means the LDM and STM instructions are not interruptible.</td>
</tr>
<tr>
<td>0b0001</td>
<td>LDM and STM instructions are restartable.</td>
</tr>
<tr>
<td>0b0010</td>
<td>LDM and STM instructions are continuable.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

MemHint, bits [7:4]

Indicates the implemented Memory Hint instructions. Defined values are:
MemHint | Meaning
--- | ---
0b0000 | None implemented.
0b0001 | Adds the PLD instruction.
0b0010 | Adds the PLD instruction. (0b0001 and 0b0010 have identical effects.)
0b0011 | As for 0b0001 (or 0b0010), and adds the PLI instruction.
0b0100 | As for 0b0011, and adds the PLDW instruction.

All other values are reserved.

In Armv8-A the only permitted value is 0b0100.

### LoadStore, bits [3:0]

Indicates the implemented additional load/store instructions. Defined values are:

<table>
<thead>
<tr>
<th>LoadStore</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No additional load/store instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the LDRD and STRD instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the Load Acquire (LDAB, LDAH, LDA, LDAEXB, LDAEXH, LDAEX, LDAEXD) and Store Release (STLB, STLH, STL, STLEXB, STLEXH, STLEX, STLEXD) instructions.</td>
</tr>
<tr>
<td>0b0100</td>
<td>As for 0b0011, and adds the PLDW instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0010.

### Accessing the ID_ISAR2

Accesses to this register use the following encodings:

\[
\text{MRC\{<c>\}{<q>} <coproc>, \{#\}<opc1>, <Rt>, <CRn>, <CRm>\{, \{#\}<opc2>\}}
\]

<table>
<thead>
<tr>
<th>proc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b0000</td>
<td>0b0010</td>
<td>0b010</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TID3 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return ID_ISAR2;
    elsif PSTATE.EL == EL2 then
        return ID_ISAR2;
    elsif PSTATE.EL == EL3 then
        return ID_ISAR2;

ID_ISAR3, Instruction Set Attribute Register 3

The ID_ISAR3 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID_ISAR0](#), [ID_ISAR1](#), [ID_ISAR2](#), [ID_ISAR4](#), and [ID_ISAR5](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G7.1.3.

**Configuration**

AArch32 System register ID_ISAR3 bits [31:0] are architecturally mapped to AArch64 System register [ID_ISAR3_EL1][31:0].

**Attributes**

ID_ISAR3 is a 32-bit register.

**Field descriptions**

The ID_ISAR3 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| T32EE | TrueNOP | T32Copy | TabBranch | SynchPrim | SVC | SIMD | Saturate |

**T32EE, bits [31:28]**

Indicates the implemented T32EE instructions. Defined values are:

<table>
<thead>
<tr>
<th>T32EE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the ENTERX and LEAVEX instructions, and modifies the load behavior to include null checking.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

**TrueNOP, bits [27:24]**

Indicates the implemented true NOP instructions. Defined values are:

<table>
<thead>
<tr>
<th>TrueNOP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented. This means there are no NOP instructions that do not have any register dependencies.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds true NOP instructions in both the T32 and A32 instruction sets. This also permits additional NOP-compatible hints.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.
**T32Copy, bits [23:20]**

Indicates the support for T32 non flag-setting MOV instructions. Defined values are:

<table>
<thead>
<tr>
<th>T32Copy</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported. This means that in the T32 instruction set, encoding T1 of the MOV (register) instruction does not support a copy from a low register to a low register.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds support for T32 instruction set encoding T1 of the MOV (register) instruction, copying from a low register to a low register.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

**TabBranch, bits [19:16]**

Indicates the implemented Table Branch instructions in the T32 instruction set. Defined values are:

<table>
<thead>
<tr>
<th>TabBranch</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the TBB and TBH instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

**SynchPrim, bits [15:12]**

Used in conjunction with ID_ISAR4.SynchPrim_frac to indicate the implemented Synchronization Primitive instructions. Defined values are:

<table>
<thead>
<tr>
<th>SynchPrim</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>If SynchPrim_frac == 0b000, no Synchronization Primitives implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>If SynchPrim_frac == 0b000, adds the LDREX and STREX instructions. If SynchPrim_frac == 0b011, also adds the CLREX, LDREXB, STREXB, and STREXH instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>If SynchPrim_frac == 0b000, as for [0b001, 0b011] and also adds the LDREXD and STREXD instructions.</td>
</tr>
</tbody>
</table>

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A the only permitted value is 0b0010.

**SVC, bits [11:8]**

Indicates the implemented SVC instructions. Defined values are:

<table>
<thead>
<tr>
<th>SVC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SVC instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

**SIMD, bits [7:4]**

Indicates the implemented SIMD instructions. Defined values are:
### SIMD

<table>
<thead>
<tr>
<th>SIMD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SSAT and USAT instructions, and the Q bit in the PSRs.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0001, and adds the PKHTB, PKHTB, QADD16, QADD8, QASX, QSUB16, QSUB8, QSAX, SADD16, SADD8, SASX, SEL, SHADD16, SHADD8, SHASX, SHSUB16, SHSUB8, SHSAX, SSAT16, SSUB16, SSUB8, SSAX, SXTAB16, SXTB16, UADD16, UADD8, UASX, UHADD16, UHADD8, UHASX, UHSUB16, UHSUB8, UHSAX, UQADD16, UQADD8, UQASX, UQSUB16, UQSUB8, UQSAX, USAD8, USADA8, USAT16, USUB16, USUB8, USAX, UXTAB16, and UXTB16 instructions. Also adds support for the GE[3:0] bits in the PSRs.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0011.

The SIMD field relates only to implemented instructions that perform SIMD operations on the general-purpose registers. In an implementation that supports floating-point and Advanced SIMD instructions, MVFR0, MVFR1, and MVFR2 give information about the implemented Advanced SIMD instructions.

### Saturate, bits [3:0]

Indicates the implemented Saturate instructions. Defined values are:

<table>
<thead>
<tr>
<th>Saturate</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented. This means no non-Advanced SIMD saturate instructions are implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the QADD, QDADD, QDSUB, and QSUB instructions, and the Q bit in the PSRs.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

### Accessing the ID_ISAR3

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b0000</td>
<td>0b0010</td>
<td>0b011</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);

    AArch32.TakeHypTrapException(0x03);
  else
    return ID_ISAR3;
  endif
elsif PSTATE.EL == EL2 then
  return ID_ISAR3;
elsif PSTATE.EL == EL3 then
  return ID_ISAR3;
```
ID_ISAR4, Instruction Set Attribute Register 4

The ID_ISAR4 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with `ID_ISAR0`, `ID_ISAR1`, `ID_ISAR2`, `ID_ISAR3`, and `ID_ISAR5`.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G7.1.3.

**Configuration**

AArch32 System register ID_ISAR4 bits [31:0] are architecturally mapped to AArch64 System register `ID_ISAR4_EL1[31:0]`.

**Attributes**

ID_ISAR4 is a 32-bit register.

**Field descriptions**

The ID_ISAR4 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>SWP_frac</strong></td>
<td><strong>PSR_M</strong></td>
<td><strong>SynchPrim_frac</strong></td>
<td><strong>Barrier</strong></td>
<td><strong>SMC</strong></td>
<td><strong>Writeback</strong></td>
<td><strong>WithShifts</strong></td>
<td><strong>Unpriv</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**SWP_frac, bits [31:28]**

Indicates support for the memory system locking the bus for SWP or SWPB instructions. Defined values are:

<table>
<thead>
<tr>
<th>SWP_frac</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SWP or SWPB instructions not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SWP or SWPB implemented but only in a uniprocessor context. SWP and SWPB do not guarantee whether memory accesses from other masters can come between the load memory access and the store memory access of the SWP or SWPB.</td>
</tr>
</tbody>
</table>

All other values are reserved. This field is valid only if the `ID_ISAR0`.Swap_instrs field is 0b0000.

In Armv8-A the only permitted value is 0b0000.

**PSR_M, bits [27:24]**

Indicates the implemented M profile instructions to modify the PSRs. Defined values are:

<table>
<thead>
<tr>
<th>PSR_M</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the M profile forms of the CPS, MRS, and MSR instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.
**SynchPrim_frac, bits [23:20]**

Used in conjunction with ID_ISAR3.SynchPrim to indicate the implemented Synchronization Primitive instructions. Possible values are:

<table>
<thead>
<tr>
<th>SynchPrim_frac</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>If SynchPrim == 0b0000, no Synchronization Primitives implemented. If SynchPrim == 0b0001, adds the LDREX and STREX instructions. If SynchPrim == 0b0010, also adds the CLREX, LDREXB, LDREXH, STREXB, STREXH, LDREXD, and STREXD instructions.</td>
</tr>
<tr>
<td>0b0011</td>
<td>If SynchPrim == 0b0001, adds the LDREX, STREX, CLREX, LDREXB, LDREXH, STREXB, and STREXH instructions.</td>
</tr>
</tbody>
</table>

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A the only permitted value is 0b0000.

**Barrier, bits [19:16]**

Indicates the implemented Barrier instructions in the A32 and T32 instruction sets. Defined values are:

<table>
<thead>
<tr>
<th>Barrier</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented. Barrier operations are provided only as System instructions in the (coproc==0b1111) encoding space.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the DMB, DSB, and ISB barrier instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

**SMC, bits [15:12]**

Indicates the implemented SMC instructions. Defined values are:

<table>
<thead>
<tr>
<th>SMC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SMC instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

**Writeback, bits [11:8]**

Indicates the support for Writeback addressing modes. Defined values are:

<table>
<thead>
<tr>
<th>Writeback</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Basic support. Only the LDM, STM, PUSH, POP, SRS, and RFE instructions support writeback addressing modes. These instructions support all of their writeback addressing modes.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds support for all of the writeback addressing modes.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

**WithShifts, bits [7:4]**

Indicates the support for instructions with shifts. Defined values are:
All other values are reserved.

In Armv8-A the only permitted value is 0b0100.

### Unpriv, bits [3:0]

Indicates the implemented unprivileged instructions. Defined values are:

<table>
<thead>
<tr>
<th>Unpriv</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented. No T variant instructions are implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the LDRBT, LDRT, STRBT, and STRT instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the LDRHT, LDRSBT, LDRSHT, and STRHT instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0010.

### Accessing the ID_ISAR4

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b0000</td>
<td>0b0010</td>
<td>0b100</td>
</tr>
</tbody>
</table>

```ruby
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
  elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
    AArch32.TakeHypTrapException(0x03);
  elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
  elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TID3 == '1' then
    AArch32.TakeHypTrapException(0x03);
  else
    return ID_ISAR4;
  elsif PSTATE.EL == EL2 then
    return ID_ISAR4;
elsif PSTATE.EL == EL3 then
  return ID_ISAR4;
```

ID_ISAR5, Instruction Set Attribute Register 5

The ID_ISAR5 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, and ID_ISAR4.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G7.1.3.

**Configuration**

AArch32 System register ID_ISAR5 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR5_EL1[31:0].

**Attributes**

ID_ISAR5 is a 32-bit register.

**Field descriptions**

The ID_ISAR5 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| VCMA | RDM | RES0 | CRC32 | SHA2 | SHA1 | AES | SEVL |

**VCMA, bits [31:28]**

From Armv8.3:

Indicates AArch32 support for complex number addition and multiplication where numbers are stored in vectors. Defined values are:

<table>
<thead>
<tr>
<th>VCMA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The VCMLA and VCADD instructions are not implemented in AArch32.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The VCMLA and VCADD instructions are implemented in AArch32.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8.0, Armv8.1 and Armv8.2 the only permitted value is 0b0000.

From Armv8.3 the only permitted value is 0b0001. This feature is identified as ARMv8.3-CompNum.

Otherwise:

Reserved, RES0.

**RDM, bits [27:24]**

From Armv8.1:

Indicates whether the VQRDMLAH and VQRDMLSH instructions are implemented in AArch32 state. Defined values are:
<table>
<thead>
<tr>
<th>RDM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No VQRDMLAH and VQRDMLSH instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>VQRDMLAH and VQRDMLSH instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.1-RDMA implements the functionality identified by the value 0b0001.

From Armv8.1 the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

Bits [23:20]

Reserved, RES0.

CRC32, bits [19:16]

Indicates whether the CRC32 instructions are implemented in AArch32 state.

<table>
<thead>
<tr>
<th>CRC32</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No CRC32 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CH, and CRC32CW instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8.0 the permitted values are 0b0000 and 0b0001.

From Armv8.1 the only permitted value is 0b0001.

SHA2, bits [15:12]

Indicates whether the SHA2 instructions are implemented in AArch32 state.

<table>
<thead>
<tr>
<th>SHA2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No SHA2 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

SHA1, bits [11:8]

Indicates whether the SHA1 instructions are implemented in AArch32 state.

<table>
<thead>
<tr>
<th>SHA1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No SHA1 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

AES, bits [7:4]

Indicates whether the AES instructions are implemented in AArch32 state.
### AES

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No AES instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>AESE, AESD, AESMC, and AESIMC implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, plus VMULL (polynomial) instructions operating on 64-bit data quantities.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

### SEVL, bits [3:0]

Indicates whether the SEVL instruction is implemented in AArch32 state.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SEVL is implemented as a NOP.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SEVL is implemented as Send Event Local.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

### Accessing the ID_ISAR5

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td></td>
<td></td>
<td>0b101</td>
</tr>
</tbody>
</table>

```latex
\begin{verbatim}
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
  elsif EL2Enabled() && ELUsingAAArch32(EL2) && HSTR.T0 == '1' then
    AArch32.TakeHypTrapException(0x03);
  elsif EL2Enabled() && !ELUsingAAArch32(EL2) && HCR_EL2.TID3 == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
  elsif EL2Enabled() && ELUsingAAArch32(EL2) && HCR.TID3 == '1' then
    AArch32.TakeHypTrapException(0x03);
  else
    return ID_ISAR5;
  end
elsif PSTATE.EL == EL2 then
  return ID_ISAR5;
elsif PSTATE.EL == EL3 then
  return ID_ISAR5;
end
\end{verbatim}
```
ID_ISAR6, Instruction Set Attribute Register 6

The ID_ISAR6 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, ID_ISAR4 and ID_ISAR5.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G7.1.3.

**Configuration**

AArch32 System register ID_ISAR6 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR6_EL1[31:0].

This register is present only from Armv8.2. Otherwise, direct accesses to ID_ISAR6 are RES0 from EL1, EL2, and EL3.

**Attributes**

ID_ISAR6 is a 32-bit register.

**Field descriptions**

The ID_ISAR6 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | I8MM | BF16 | SPECRES | SB | FHM | DP | JSCVT |

**Bits [31:28]**

Reserved, RES0.

**I8MM, bits [27:24]**

**When ARMv8.2-AA32I8MM is implemented:**

Indicates support for Advanced SIMD and floating-point Int8 matrix multiplication instructions in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>I8MM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Int8 matrix multiplication instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>VSMMMLA, VSUDOT, VUMMLA, VUSMMLA, and VUSDOT instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.2-AA32I8MM implements the functionality identified by 0b0001.

**Otherwise:**

Reserved, RES0.
BF16, bits [23:20]

When ARMv8.2-AA32BF16 is implemented:

Indicates support for Advanced SIMD and floating-point BF16 instructions in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>BF16</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>BF16 instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>VCVT, VCVTB, VCVTT, VDOT, VFMA, and VMMAL instructions with BF16 operand or result types are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.2-AA32BF16 implements the functionality identified by 0b0001.

Otherwise:

Reserved, RES0.

SPECRES, bits [19:16]

Indicates support for Speculation invalidation instructions in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>SPECRES</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>CFPRCTX, DVPRCTX, and CPPRCTX instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>CFPRCTX, DVPRCTX, and CPPRCTX instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8.5, the only permitted value is 0b0001.

SB, bits [15:12]

Indicates support for SB instruction in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>SB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SB instruction is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SB instruction is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8.5, the only permitted value is 0b0001.

FHM, bits [11:8]

From Armv8.2:

Indicates support for Advanced SIMD and floating-point VFMA and VFMSL instructions in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>FHM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>VFMA and VFMSL instructions not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>VFMA and VFMSL instructions implemented.</td>
</tr>
</tbody>
</table>

ARMv8.2-FHM implements the functionality identified by the value 0b0001.

Otherwise:

Reserved, RES0.

DP, bits [7:4]
From Armv8.2:

Indicates support for dot product instructions in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>DP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No dot product instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>VUDOT and VSDOT instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.2-DotProd implements the functionality identified by the value 0b0001.

Otherwise:

Reserved, RES0.

JSCVT, bits [3:0]

From Armv8.3:

Indicates support for the Javascript conversion instruction in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>JSCVT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The VJCVT instruction is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The VJCVT instruction is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8.0, Armv8.1 and Armv8.2 the only permitted value is 0b0000.

From Armv8.3 the only permitted value is 0b0001. This feature is identified as ARMv8.3.JSConv.

Otherwise:

Reserved, RES0.

**Accessing the ID_ISAR6**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b0000</td>
<td>0b0010</td>
<td>0b111</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then

elsif PSTATE.EL == EL2 then
    return ID_ISAR6;
elsif PSTATE.EL == EL3 then
    return ID_ISAR6;
endif
The ID_MMFR0 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with ID_MMFR1, ID_MMFR2, ID_MMFR3, and ID_MMFR4.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G7.1.3.

**Configuration**

AArch32 System register ID_MMFR0 bits [31:0] are architecturally mapped to AArch64 System register ID_MMFR0_EL1[31:0].

**Attributes**

ID_MMFR0 is a 32-bit register.

**Field descriptions**

The ID_MMFR0 bit assignments are:

<table>
<thead>
<tr>
<th>InnerShr</th>
<th>FCSE</th>
<th>AuxReg</th>
<th>TCM</th>
<th>ShareLvl</th>
<th>OuterShr</th>
<th>PMSA</th>
<th>VMSA</th>
</tr>
</thead>
</table>

**InnerShr, bits [31:28]**

Innermost Shareability. Indicates the innermost shareability domain implemented. Defined values are:

<table>
<thead>
<tr>
<th>InnerShr</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Implemented as Non-cacheable.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Implemented with hardware coherency support.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Shareability ignored.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the permitted values are 0b0000, 0b0001, and 0b1111.

This field is valid only if the implementation supports two levels of shareability, as indicated by ID_MMFR0.ShareLvl having the value 0b0001.

When ID_MMFR0.ShareLvl is zero, this field is UNK.

**FCSE, bits [27:24]**

Indicates whether the implementation includes the FCSE. Defined values are:

<table>
<thead>
<tr>
<th>FCSE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for FCSE.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the only permitted value is 0b0000.
AuxReg, bits [23:20]

Auxiliary Registers. Indicates support for Auxiliary registers. Defined values are:

<table>
<thead>
<tr>
<th>AuxReg</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for Auxiliary Control Register only.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Support for Auxiliary Fault Status Registers (AIFSR and ADFSР) and Auxiliary Control Register.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the only permitted value is 0b0010.

Note

Accesses to unimplemented Auxiliary registers are UNDEFINED.

TCM, bits [19:16]

Indicates support for TCMs and associated DMAs. Defined values are:

<table>
<thead>
<tr>
<th>TCM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support is IMPLEMENTATION DEFINED. Armv7 requires this setting.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Support for TCM only. Armv6 implementation.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Support for TCM and DMA, Armv6 implementation.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

ShareLvl, bits [15:12]

Shareability Levels. Indicates the number of shareability levels implemented. Defined values are:

<table>
<thead>
<tr>
<th>ShareLvl</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>One level of shareability implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Two levels of shareability implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the only permitted value is 0b0001.

OuterShr, bits [11:8]

Outermost Shareability. Indicates the outermost shareability domain implemented. Defined values are:

<table>
<thead>
<tr>
<th>OuterShr</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Implemented as Non-cacheable.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Implemented with hardware coherency support.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Shareability ignored.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the permitted values are 0b0000, 0b0001, and 0b1111.

PMSA, bits [7:4]

Indicates support for a PMSA. Defined values are:
### PMSA

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for IMPLEMENTATION DEFINED PMSA.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Support for PMSAv6, with a Cache Type Register implemented.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Support for PMSAv7, with support for memory subsections. Armv7-R profile.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

### VMSA, bits [3:0]

Indicates support for a VMSA. Defined values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for IMPLEMENTATION DEFINED VMSA.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Support for VMSAv6, with Cache and TLB Type Registers implemented.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Support for VMSAv7, with support for remapping and the Access flag. Armv7-A profile.</td>
</tr>
<tr>
<td>0b0100</td>
<td>As for 0b0011, and adds support for the PXN bit in the Short-descriptor translation table format descriptors.</td>
</tr>
<tr>
<td>0b0101</td>
<td>As for 0b0100, and adds support for the Long-descriptor translation table format.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0101.

### Accessing the ID_MMFR0

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#\}<\text{opc2}>
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b0000</td>
<td>0b0001</td>
<td>0b100</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() & !ELUsingAArch32(EL2) & HSTR_EL2.T0 == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
  elsif EL2Enabled() & ELUsingAArch32(EL2) & HSTR.T0 == '1' then
    AArch32.TakeHypTrapException(0x03);
  elsif EL2Enabled() & !ELUsingAArch32(EL2) & HCR_EL2.TID3 == '1' then

  elsif EL2Enabled() & ELUsingAArch32(EL2) & HCR.TID3 == '1' then
    AArch32.TakeHypTrapException(0x03);
else
  return ID_MMFR0;
elsif PSTATE.EL == EL2 then
  return ID_MMFR0;
elsif PSTATE.EL == EL3 then
  return ID_MMFR0;
The ID_MMFR1 characteristics are:

### Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with ID_MMFR0, ID_MMFR2, ID_MMFR3, and ID_MMFR4.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G7.1.3.

### Configuration

AArch32 System register ID_MMFR1 bits [31:0] are architecturally mapped to AArch64 System register ID_MMFR1_EL1[31:0].

### Attributes

ID_MMFR1 is a 32-bit register.

### Field descriptions

The ID_MMFR1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-28</td>
<td><strong>BPred</strong></td>
</tr>
<tr>
<td>27-24</td>
<td><strong>L1TstCln</strong></td>
</tr>
<tr>
<td>23-20</td>
<td><strong>L1Uni</strong></td>
</tr>
<tr>
<td>19-16</td>
<td><strong>L1Hvd</strong></td>
</tr>
<tr>
<td>15-12</td>
<td><strong>L1UniSW</strong></td>
</tr>
<tr>
<td>11-8</td>
<td><strong>L1HvdSW</strong></td>
</tr>
<tr>
<td>7-4</td>
<td><strong>L1UniVA</strong></td>
</tr>
<tr>
<td>3-0</td>
<td><strong>L1HvdVA</strong></td>
</tr>
</tbody>
</table>

#### BPred, bits [31:28]

Branch Predictor. Indicates branch predictor management requirements. Defined values are:

<table>
<thead>
<tr>
<th>BPred</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No branch predictor, or no MMU present. Implies a fixed MPU configuration.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Branch predictor requires flushing on:</td>
</tr>
<tr>
<td></td>
<td>• Enabling or disabling a stage of address translation.</td>
</tr>
<tr>
<td></td>
<td>• Writing new data to instruction locations.</td>
</tr>
<tr>
<td></td>
<td>• Writing new mappings to the translation tables.</td>
</tr>
<tr>
<td></td>
<td>• Changes to the TTBR0, TTBR1, or TTBCR registers.</td>
</tr>
<tr>
<td></td>
<td>• Changes to the ContextID or ASID, or to the FCSE ProcessID if this is supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Branch predictor requires flushing on:</td>
</tr>
<tr>
<td></td>
<td>• Enabling or disabling a stage of address translation.</td>
</tr>
<tr>
<td></td>
<td>• Writing new data to instruction locations.</td>
</tr>
<tr>
<td></td>
<td>• Writing new mappings to the translation tables.</td>
</tr>
<tr>
<td></td>
<td>• Any change to the TTBR0, TTBR1, or TTBCR registers without a change to the corresponding ContextID or ASID, or FCSE ProcessID if this is supported.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Branch predictor requires flushing only on writing new data to instruction locations.</td>
</tr>
<tr>
<td>0b0100</td>
<td>For execution correctness, branch predictor requires no flushing at any time.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0010, 0b0011, or 0b0100. For values other than 0b0000 and 0b0100 the Arm Architecture Reference Manual, or the product documentation, might give more information about the required maintenance.
**L1TstCln, bits [27:24]**

Level 1 cache Test and Clean. Indicates the supported Level 1 data cache test and clean operations, for Harvard or unified cache implementations. Defined values are:

<table>
<thead>
<tr>
<th>L1TstCln</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported Level 1 data cache test and clean operations are:</td>
</tr>
<tr>
<td></td>
<td>• Test and clean data cache.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0001, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Test, clean, and invalidate data cache.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

**L1Uni, bits [23:20]**

Level 1 Unified cache. Indicates the supported entire Level 1 cache maintenance operations for a unified cache implementation. Defined values are:

<table>
<thead>
<tr>
<th>L1Uni</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported entire Level 1 cache operations are:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate cache, including branch predictor if appropriate.</td>
</tr>
<tr>
<td></td>
<td>• Invalidate branch predictor, if appropriate.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0001, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Clean cache, using a recursive model that uses the cache dirty status bit.</td>
</tr>
<tr>
<td></td>
<td>• Clean and invalidate cache, using a recursive model that uses the cache dirty status bit.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

**L1Hvd, bits [19:16]**

Level 1 Harvard cache. Indicates the supported entire Level 1 cache maintenance operations for a Harvard cache implementation. Defined values are:

<table>
<thead>
<tr>
<th>L1Hvd</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported entire Level 1 cache operations are:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate instruction cache, including branch predictor if appropriate.</td>
</tr>
<tr>
<td></td>
<td>• Invalidate branch predictor, if appropriate.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0001, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate data cache.</td>
</tr>
<tr>
<td></td>
<td>• Invalidate data cache and instruction cache, including branch predictor if appropriate.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0010, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Clean data cache, using a recursive model that uses the cache dirty status bit.</td>
</tr>
<tr>
<td></td>
<td>• Clean and invalidate data cache, using a recursive model that uses the cache dirty status bit.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

**L1UniSW, bits [15:12]**

Level 1 Unified cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a unified cache implementation. Defined values are:
L1UniSW, bits [7:4]

Level 1 Unified cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a unified cache implementation. Defined values are:

<table>
<thead>
<tr>
<th>L1UniVA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported Level 1 unified cache line maintenance operations by VA are:</td>
</tr>
<tr>
<td></td>
<td>• Clean cache line by VA.</td>
</tr>
<tr>
<td></td>
<td>• Invalidate cache line by VA.</td>
</tr>
<tr>
<td></td>
<td>• Clean and invalidate cache line by VA.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0001, and adds:</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0010, and adds:</td>
</tr>
</tbody>
</table>

All other values are reserved.
In Armv8-A the only permitted value is 0b0000.

L1HvdVA, bits [3:0]

Level 1 Harvard cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a Harvard cache implementation. Defined values are:

<table>
<thead>
<tr>
<th>L1HvdVA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported Level 1 Harvard cache line maintenance operations by VA are:</td>
</tr>
<tr>
<td></td>
<td>• Clean data cache line by VA.</td>
</tr>
<tr>
<td></td>
<td>• Clean and invalidate data cache line by VA.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0001, and adds:</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0010, and adds:</td>
</tr>
</tbody>
</table>

All other values are reserved.
In Armv8-A the only permitted value is 0b0000.
Meaning

0b0000  None supported.
0b0001  Supported Level 1 Harvard cache line maintenance operations by VA are:
  • Clean data cache line by VA.
  • Invalidate data cache line by VA.
  • Clean and invalidate data cache line by VA.
  • Clean instruction cache line by VA.
0b0010  As for 0001, and adds:
  • Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

**Accessing the ID_MMFR1**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b0000</td>
<td>0b0001</td>
<td>0b101</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then

elsif PSTATE.EL == EL2 then
    return ID_MMFR1;
elsif PSTATE.EL == EL3 then
    return ID_MMFR1;
ID_MMFR2, Memory Model Feature Register 2

The ID_MMFR2 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with ID_MMFR0, ID_MMFR1, ID_MMFR3, and ID_MMFR4.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G7.1.3.

**Configuration**

AArch32 System register ID_MMFR2 bits [31:0] are architecturally mapped to AArch64 System register ID_MMFR2_EL1[31:0].

**Attributes**

ID_MMFR2 is a 32-bit register.

**Field descriptions**

The ID_MMFR2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:28</td>
<td>HWAccFlg</td>
</tr>
<tr>
<td>27:24</td>
<td>WFIStall</td>
</tr>
<tr>
<td>23:20</td>
<td>MemBarr</td>
</tr>
<tr>
<td>19:16</td>
<td>UniTLB</td>
</tr>
<tr>
<td>15:12</td>
<td>HvdTLB</td>
</tr>
<tr>
<td>11:8</td>
<td>L1HvdRng</td>
</tr>
<tr>
<td>7:4</td>
<td>L1HvdBG</td>
</tr>
<tr>
<td>3:0</td>
<td>L1HvdFG</td>
</tr>
</tbody>
</table>

**HWAccFlg, bits [31:28]**

Hardware Access Flag. In earlier versions of the Arm Architecture, this field indicates support for a Hardware Access flag, as part of the VMSAv7 implementation. Defined values are:

<table>
<thead>
<tr>
<th>HWAccFlg</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for VMSAv7 Access flag, updated in hardware.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the only permitted value is 0b000.

**WFIStall, bits [27:24]**

Wait For Interrupt Stall. Indicates the support for Wait For Interrupt (WFI) stalling. Defined values are:

<table>
<thead>
<tr>
<th>WFIStall</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for WFI stalling.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the permitted values are 0b000 and 0b001.

**MemBarr, bits [23:20]**

Memory Barrier. Indicates the supported memory barrier System instructions in the (coproc==1111) encoding space:
MemBarr

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported memory barrier System instructions are:</td>
</tr>
<tr>
<td></td>
<td>• Data Synchronization Barrier (DSB).</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b001, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Instruction Synchronization Barrier (ISB).</td>
</tr>
<tr>
<td></td>
<td>• Data Memory Barrier (DMB).</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the only permitted value is 0b010.

Arm deprecates the use of these operations. ID_ISAR4.Barrier_inhrs indicates the level of support for the preferred barrier instructions.

UniTLB, bits [19:16]

Unified TLB. Indicates the supported TLB maintenance operations, for a unified TLB implementation. Defined values are:

<table>
<thead>
<tr>
<th>UniTLB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported unified TLB maintenance operations are:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate all entries in the TLB.</td>
</tr>
<tr>
<td></td>
<td>• Invalidate TLB entry by VA.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b001, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate TLB entries by ASID match.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b010, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate instruction TLB and data TLB entries by VA All ASID. This is a shared unified TLB operation</td>
</tr>
<tr>
<td>0b0100</td>
<td>As for 0b011, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate Hyp mode unified TLB entry by VA.</td>
</tr>
<tr>
<td></td>
<td>• Invalidate entire Non-secure PL1&amp;0 unified TLB.</td>
</tr>
<tr>
<td></td>
<td>• Invalidate entire Hyp mode unified TLB.</td>
</tr>
<tr>
<td>0b0101</td>
<td>As for 0b100, and adds the following operations: TLBIMVALIS, TLBIMVAALIS, TLBIMVALHIS, TLBIMVAL, TLBIMVAAL, TLBIMVALH.</td>
</tr>
<tr>
<td>0b0110</td>
<td>As for 0b101, and adds the following operations: TLBIIPAS2IS, TLBIIPAS2LIS, TLBIIPAS2, TLBIIPAS2L.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b110.

HvdTLB, bits [15:12]

If the Unified TLB field (UniTLB, bits [19:16]) is not 0000, then the meaning of this field is implementation defined. Arm deprecates the use of this field by software.

L1HvdRng, bits [11:8]

Level 1 Harvard cache Range. Indicates the supported Level 1 cache maintenance range operations, for a Harvard cache implementation. Defined values are:

<table>
<thead>
<tr>
<th>L1HvdRng</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported Level 1 Harvard cache maintenance range operations are:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate data cache range by VA.</td>
</tr>
<tr>
<td></td>
<td>• Invalidate instruction cache range by VA.</td>
</tr>
<tr>
<td></td>
<td>• Clean data cache range by VA.</td>
</tr>
<tr>
<td></td>
<td>• Clean and invalidate data cache range by VA.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the only permitted value is 0b0000.
L1HvdBG, bits [7:4]

Level 1 Harvard cache Background fetch. Indicates the supported Level 1 cache background fetch operations, for a Harvard cache implementation. When supported, background fetch operations are non-blocking operations. Defined values are:

<table>
<thead>
<tr>
<th>L1HvdBG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported Level 1 Harvard cache background fetch operations are:</td>
</tr>
<tr>
<td></td>
<td>• Fetch instruction cache range by VA.</td>
</tr>
<tr>
<td></td>
<td>• Fetch data cache range by VA.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the only permitted value is 0b0000.

L1HvdFG, bits [3:0]

Level 1 Harvard cache Foreground fetch. Indicates the supported Level 1 cache foreground fetch operations, for a Harvard cache implementation. When supported, foreground fetch operations are blocking operations. Defined values are:

<table>
<thead>
<tr>
<th>L1HvdFG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported Level 1 Harvard cache foreground fetch operations are:</td>
</tr>
<tr>
<td></td>
<td>• Fetch instruction cache range by VA.</td>
</tr>
<tr>
<td></td>
<td>• Fetch data cache range by VA.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the only permitted value is 0b0000.

Accessing the ID_MMFR2

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}\{<q>\} <\text{coproc}, \{#<opc1>, <Rt>, <CRn>, <CRm}\{, \{#<opc2>\}}
\]

### Table

<table>

ID_MMFR3, Memory Model Feature Register 3

The ID_MMFR3 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with ID_MMFR0, ID_MMFR1, ID_MMFR2, and ID_MMFR4.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G7.1.3.

**Configuration**

AArch32 System register ID_MMFR3 bits [31:0] are architecturally mapped to AArch64 System register ID_MMFR3_EL1[31:0].

**Attributes**

ID_MMFR3 is a 32-bit register.

**Field descriptions**

The ID_MMFR3 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Supersec | CMemSz | CohWalk | PAN | MaintBcst | BPMaint | CMaintSW | CMaintVA |

**Supersec, bits [31:28]**

Supersections. On a VMSA implementation, indicates whether Supersections are supported. Defined values are:

<table>
<thead>
<tr>
<th>Supersec</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Supersections supported.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Supersections not supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b1111.

**CMemSz, bits [27:24]**

Cached Memory Size. Indicates the physical memory size supported by the caches. Defined values are:

<table>
<thead>
<tr>
<th>CMemSz</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>4GB, corresponding to a 32-bit physical address range.</td>
</tr>
<tr>
<td>0b0001</td>
<td>64GB, corresponding to a 36-bit physical address range.</td>
</tr>
<tr>
<td>0b0010</td>
<td>1TB or more, corresponding to a 40-bit or larger physical address range.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000, 0b0001, and 0b0010.
CohWalk, bits [23:20]

Coherent Walk. Indicates whether Translation table updates require a clean to the Point of Unification. Defined values are:

<table>
<thead>
<tr>
<th>CohWalk</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Updates to the translation tables require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Updates to the translation tables do not require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

PAN, bits [19:16]

From Armv8.1:

Privileged Access Never. Indicates support for the PAN bit in CPSR, SPSR, and DSPSR in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>PAN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>PAN not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>PAN supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>PAN supported and ATS1CPRP and ATS1CPWP instructions supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.1-PAN implements the functionality identified by the value 0b0001.

ARMv8.2-ATS1E1 implements the functionality added by the value 0b0010.

In Armv8.1 the value 0b0000 is not permitted.

From Armv8.2, the only permitted value is 0b0010.

Otherwise:

Reserved, RES0.

MaintBcst, bits [15:12]

Maintenance Broadcast. Indicates whether Cache, TLB, and branch predictor operations are broadcast. Defined values are:

<table>
<thead>
<tr>
<th>MaintBcst</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Cache, TLB, and branch predictor operations only affect local structures.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Cache and branch predictor operations affect structures according to shareability and defined behavior of instructions. TLB operations only affect local structures.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Cache, TLB, and branch predictor operations affect structures according to shareability and defined behavior of instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0010.
**BPMAint, bits [11:8]**

Branch Predictor Maintenance. Indicates the supported branch predictor maintenance operations in an implementation with hierarchical cache maintenance operations. Defined values are:

<table>
<thead>
<tr>
<th>BPMAint</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported branch predictor maintenance operations are:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate all branch predictors.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0001, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate branch predictors by VA.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0010.

**CMaintSW, bits [7:4]**

Cache Maintenance by Set/Way. Indicates the supported cache maintenance operations by set/way, in an implementation with hierarchical caches. Defined values are:

<table>
<thead>
<tr>
<th>CMaintSW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported hierarchical cache maintenance instructions by set/way are:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate data cache by set/way.</td>
</tr>
<tr>
<td></td>
<td>• Clean data cache by set/way.</td>
</tr>
<tr>
<td></td>
<td>• Clean and invalidate data cache by set/way.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

In a unified cache implementation, the data cache maintenance operations apply to the unified caches.

**CMaintVA, bits [3:0]**

Cache Maintenance by Virtual Address. Indicates the supported cache maintenance operations by VA, in an implementation with hierarchical caches. Defined values are:

<table>
<thead>
<tr>
<th>CMaintVA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported hierarchical cache maintenance operations by VA are:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate data cache by VA.</td>
</tr>
<tr>
<td></td>
<td>• Clean data cache by VA.</td>
</tr>
<tr>
<td></td>
<td>• Clean and invalidate data cache by VA.</td>
</tr>
<tr>
<td></td>
<td>• Invalidate instruction cache by VA.</td>
</tr>
<tr>
<td></td>
<td>• Invalidate all instruction cache entries.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

In a unified cache implementation, data cache maintenance operations apply to the unified caches, and the instruction cache maintenance instructions are not implemented.

**Accessing the ID_MMFR3**

Accesses to this register use the following encodings:

MRC{{<c>}{<q>}}<coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>
<th>proc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
</table>
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TID3 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return ID_MMFR3;
    endif
elsif PSTATE.EL == EL2 then
    return ID_MMFR3;
elsif PSTATE.EL == EL3 then
    return ID_MMFR3;
ID_MMFR4, Memory Model Feature Register 4

The ID_MMFR4 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with [ID_MMFR0](#), [ID_MMFR1](#), [ID_MMFR2](#), and [ID_MMFR3](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G7.1.3.

**Configuration**

AArch32 System register ID_MMFR4 bits [31:0] are architecturally mapped to AArch64 System register [ID_MMFR4_EL1](#)[31:0].

**Attributes**

ID_MMFR4 is a 32-bit register.

**Field descriptions**

The ID_MMFR4 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| EVT | CCIDX | LSM | HPDS | CnP | XNX | AC2 | SpecSEI |

**EVT, bits [31:28]**

**When ARMv8.2-EVT is implemented:**

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the [HCR2](#).{TTLBIS, TOCU, TICAB, TID4} traps. Defined values are:

<table>
<thead>
<tr>
<th>EVT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td><a href="#">HCR2</a>.{TTLBIS, TOCU, TICAB, TID4} traps are not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td><a href="#">HCR2</a>.{TOCU, TICAB, TID4} traps are supported.</td>
</tr>
<tr>
<td></td>
<td><a href="#">HCR2</a>.TTLBIS trap is not supported</td>
</tr>
<tr>
<td>0b0010</td>
<td><a href="#">HCR2</a>.{TTLBIS, TOCU, TICAB, TID4} traps are supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8.0, the only permitted value is 0b0000.

From Armv8.1, the permitted values are 0b0000, 0b0001, and 0b0010.

From Armv8.5, the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0010 when EL2 is implemented. This feature is identified as ARMv8.2-EVT.

**Otherwise:**

Reserved, RES0.

**CCIDX, bits [27:24]**
**From Armv8.3:**

Support for use of the revised CCSIDR format and the presence of the CCSIDR2 is indicated. Defined values are:

<table>
<thead>
<tr>
<th>CCIDX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>32-bit format implemented for all levels of the CCSIDR, and the</td>
</tr>
<tr>
<td></td>
<td>CCSIDR2 register is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>64-bit format implemented for all levels of the CCSIDR, and the</td>
</tr>
<tr>
<td></td>
<td>CCSIDR2 register is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8.3, the permitted values are 0b0000 and 0b0001. This feature is identified as ARMv8.3-CCIDX.

**Otherwise:**

Reserved, RAZ.

**LSM, bits [23:20]**

**From Armv8.2:**

Indicates support for LSMAOE and nTLSMD bits in HSCTRL and SCTLR. Defined values are:

<table>
<thead>
<tr>
<th>LSM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>LSMAOE and nTLSMD bits not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>LSMAOE and nTLSMD bits supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.2-LSMAOC implements the functionality identified by the value 0b0001.

**Otherwise:**

Reserved, RAZ.

**HPDS, bits [19:16]**

**From Armv8.2:**

Hierarchical permission disables bits in translation tables. Defined values are:

<table>
<thead>
<tr>
<th>HPDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Disabling of hierarchical controls not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supports disabling of hierarchical controls using the TTBCR2, HPD0, TTBCR2 HPD1, and HTCR HPD bits.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for value 0b0001, and adds possible hardware allocation of bits[62:59] of the translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED USE.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.2-AA32HPD implements the functionality identified by the value 0b0001.

ARMv8.2-TTPBHA implements the functionality added by the value 0b0010.

**Note**

The value 0b0000 implies that the encoding for TTBCR2 is UNDEFINED.

---

ID_MMFR4, Memory Model Feature Register 4
Otherwise:

Reserved, RAZ.

**CnP, bits [15:12]**

From Armv8.2:

Common not Private translations. Defined values are:

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Common not Private translations not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Common not Private translations supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.2-TTCNP implements the functionality identified by the value 0b0001.

From Armv8.2 the only permitted value is 0b0001.

Otherwise:

Reserved, RAZ.

**XNX, bits [11:8]**

From Armv8.2:

Support for execute-never control distinction by Exception level at stage 2. Defined values are:

<table>
<thead>
<tr>
<th>XNX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Distinction between EL0 and EL1 execute-never control at stage 2 not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Distinction between EL0 and EL1 execute-never control at stage 2 supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.2-TTS2UXN implements the functionality identified by the value 0b0001.

When ARMv8.2-TTS2UXN is implemented:

- If all of the following conditions are true it is IMPLEMENTATION DEFINED whether the value of ID_MMFR4.XNX is 0b0000 or 0b0001:
  - ID_AA64MMFR1_EL1.XNX ==1.
  - EL2 cannot use AArch32.
  - EL1 can use AArch32.
- If EL2 can use AArch32 then the only permitted value is 0b0001.

Otherwise:

Reserved, RAZ.

**AC2, bits [7:4]**

Indicates the extension of the ACTLR and HACTLR registers using ACTLR2 and HACTLR2. Defined values are:

<table>
<thead>
<tr>
<th>AC2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>ACTLR2 and HACTLR2 are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>ACTLR2 and HACTLR2 are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8.0 and Armv8.1 the permitted values are 0b0000 and 0b0001.
From Armv8.2, the only permitted value is 0b0001.

**SpecSEI, bits [3:0]**

**When RAS is implemented:**

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:

<table>
<thead>
<tr>
<th>SpecSEI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The PE never generates an SError interrupt due to an External abort on a speculative read.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The PE might generate an SError interrupt due to an External abort on a speculative read.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Otherwise:**

Reserved, RES0. This provides no information about whether the PE generates a speculative SError interrupt.

**Accessing the ID_MMFR4**

Accesses to this register use the following encodings:

MRC{<c>}{<q>}, <coproc>, {{#}<opc1>}, <Rt>, <CRn>, <CRm>{{#}<opc2>}

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>

        return ID_MMFR4;
    end
elsif PSTATE.EL == EL2 then
    return ID_MMFR4;
elsif PSTATE.EL == EL3 then
    return ID_MMFR4;
else
    return ID_MMFR4;
end
```
ID_MMFR5, Memory Model Feature Register 5

The ID_MMFR5 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see ‘Principles of the ID scheme for fields in ID registers’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G7.1.3.

**Configuration**

AArch32 System register ID_MMFR5 bits [31:0] are architecturally mapped to AArch64 System register ID_MMFR5_EL1[31:0].

**Attributes**

ID_MMFR5 is a 32-bit register.

**Field descriptions**

The ID_MMFR5 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 | ETS |

**Bits [31:4]**

Reserved, RES0.

**ETS, bits [3:0]**

**From Armv8.0:**

Support for Enhanced Translation Synchronization. Defined values are:

<table>
<thead>
<tr>
<th>ETS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Enhanced Translation Synchronization is not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Enhanced Translation Synchronization is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.0-ETS implements the functionality identified by the value 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

**Otherwise:**

Reserved, RES0.

**Accessing the ID_MMFR5**

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
  elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
    AArch32.TakeHypTrapException(0x03);
  elsif EL2Enabled() && !ELUsingAArch32(EL2) && (!IsZero(ID_MMFR5) || boolean IMPLEMENTATION_DEFINED "ID_MMFR5 trapped by HCR_EL2.TID3") && HCR_EL2.TID3 == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
  elsif EL2Enabled() && ELUsingAArch32(EL2) && (!IsZero(ID_MMFR5) || boolean IMPLEMENTATION_DEFINED "ID_MMFR5 trapped by HCR.TID3") && HCR.TID3 == '1' then
    AArch32.TakeHypTrapException(0x03);
  else
    return ID_MMFR5;
  elsif PSTATE.EL == EL2 then
    return ID_MMFR5;
  elsif PSTATE.EL == EL3 then
    return ID_MMFR5;
}
ID_PFR0, Processor Feature Register 0

The ID_PFR0 characteristics are:

**Purpose**

Gives top-level information about the instruction sets and other features supported by the PE in AArch32 state.

Must be interpreted with ID_PFR1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G7.1.3.

**Configuration**

AArch32 System register ID_PFR0 bits [31:0] are architecturally mapped to AArch64 System register ID_PFR0_EL1[31:0].

**Attributes**

ID_PFR0 is a 32-bit register.

**Field descriptions**

The ID_PFR0 bit assignments are:

|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RAS | DIT | AMU | CSV2 | State3 | State2 | State1 | State0 |

**RAS, bits [31:28]**

RAS Extension version.

<table>
<thead>
<tr>
<th>RAS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No RAS Extension.</td>
</tr>
<tr>
<td>0b0001</td>
<td>RAS Extension present.</td>
</tr>
<tr>
<td>0b0010</td>
<td>ARMv8.4-RAS present. As 0b0001, and adds support for additional ERXMISC&lt;rn&gt; System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR&lt;n&gt;STATUS and support for the optional RAS Timestamp Extension.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8.4, when ARMv8.4-DFE is not implemented, and ERRIDR.NUM is zero, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010. Otherwise from Armv8.4 the only permitted value is 0b0010.

ARMv8.4-RAS implements the functionality identified by the value 0b0010. In Armv8.2, the only permitted value is 0b0001. In Armv8.1 and Armv8.0, the permitted values are 0b0000 and 0b0001.

**DIT, bits [27:24]**

*From Armv8.4:*

Data Independent Timing. Defined values are:
All other values are reserved.

ARMv8.4-DIT implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

**AMU, bits [23:20]**

From Armv8.4:

Activity Monitors Extension. Defined values are:

<table>
<thead>
<tr>
<th>AMU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Activity Monitors Extension is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>AMUv1 for Armv8.4 is implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>AMUv1 for Armv8.6 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.</td>
</tr>
</tbody>
</table>

All other values are reserved.

AMUv1 implements the functionality identified by the value 0b0001.

ARMv8.6-AMU implements the functionality identified by the value 0b0010.

Otherwise:

Reserved, RES0.

**CSV2, bits [19:16]**

From Armv8.5:

Speculative use of out of context branch targets. Defined values are:

<table>
<thead>
<tr>
<th>CSV2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>This Device does not disclose whether branch targets trained in one hardware described context can affect speculative execution in a different hardware described context.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Branch targets trained in one hardware described context can only affect speculative execution in a different hardware described context in a hard-to-determine way.</td>
</tr>
</tbody>
</table>

From Armv8.5, the only permitted value is 0b0001.

All other values are reserved.

Otherwise:

Reserved, RES0.

**State3, bits [15:12]**

T32EE instruction set support. Defined values are:
### State3

<table>
<thead>
<tr>
<th>State3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>T32EE instruction set implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

### State2, bits [11:8]

Jazelle extension support. Defined values are:

<table>
<thead>
<tr>
<th>State2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Jazelle extension implemented, without clearing of JOSCR.CV on exception entry.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Jazelle extension implemented, with clearing of JOSCR.CV on exception entry.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

### State1, bits [7:4]

T32 instruction set support. Defined values are:

<table>
<thead>
<tr>
<th>State1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>T32 instruction set not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>T32 encodings before the introduction of Thumb-2 technology implemented:</td>
</tr>
<tr>
<td></td>
<td>• All instructions are 16-bit.</td>
</tr>
<tr>
<td></td>
<td>• A BL or BLX is a pair of 16-bit instructions</td>
</tr>
<tr>
<td></td>
<td>• 32-bit instructions other than BL and BLX cannot be encoded.</td>
</tr>
<tr>
<td>0b0011</td>
<td>T32 encodings after the introduction of Thumb-2 technology implemented, for all 16-bit and 32-bit T32 basic instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0011.

### State0, bits [3:0]

A32 instruction set support. Defined values are:

<table>
<thead>
<tr>
<th>State0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>A32 instruction set not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>A32 instruction set implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

### Accessing the ID_PFR0

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b00</td>
<td>0b0000</td>
<td>0b0001</td>
<td>0b000</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TID3 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return ID_PFR0;
    elsif PSTATE.EL == EL2 then
        return ID_PFR0;
elsif PSTATE.EL == EL3 then
    return ID_PFR0;
The ID_PFR1 characteristics are:

**Purpose**

Gives information about the AArch32 programmers' model.

Must be interpreted with ID_PFR0.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G7.1.3.

**Configuration**

AArch32 System register ID_PFR1 bits [31:0] are architecturally mapped to AArch64 System register ID_PFR1_EL1[31:0].

**Attributes**

ID_PFR1 is a 32-bit register.

**Field descriptions**

The ID_PFR1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| GIC | Virt_frac | Sec_frac | GenTimer | Virtualization | MProgMod | Security | ProgMod |

**GIC, bits [31:28]**

System register GIC CPU interface. Defined values are:

<table>
<thead>
<tr>
<th>GIC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>GIC CPU interface system registers not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.</td>
</tr>
<tr>
<td>0b0011</td>
<td>System register interface to version 4.1 of the GIC CPU interface is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Virt_frac, bits [27:24]**

Virtualization fractional field. When the Virtualization field is 0b0000, determines the support for features from the ARMv7 Virtualization Extensions. Defined values are:

<table>
<thead>
<tr>
<th>Virt_frac</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No features from the ARMv7 Virtualization Extensions are implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The following features of the ARMv7 Virtualization Extensions are implemented:</td>
</tr>
<tr>
<td></td>
<td>• The SCR.SIF bit, if EL3 is implemented.</td>
</tr>
<tr>
<td></td>
<td>• The modifications to the SCR.AW and SCR.FW bits described in the Virtualization Extensions, if EL3 is implemented.</td>
</tr>
<tr>
<td></td>
<td>• The MSR (banked register) and MRS (banked register) instructions.</td>
</tr>
<tr>
<td></td>
<td>• The ERET instruction.</td>
</tr>
</tbody>
</table>
All other values are reserved.

In Armv8-A the permitted values are:

- 0b0000 when EL2 is implemented.
- 0b0001 when EL2 is not implemented.

This field is only valid when the value of ID_PFR1.Virtualization is 0, otherwise it holds the value 0b0000.

---

**Note**

The ID ISAR registers do not identify whether the instructions added by the ARMv7 Virtualization Extensions are implemented.

---

### Sec_frac, bits [23:20]

Security fractional field. When the Security field is 0b0000, determines the support for features from the ARMv7 Security Extensions. Defined values are:

<table>
<thead>
<tr>
<th>Sec_frac</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No features from the ARMv7 Security Extensions are implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The following features from the ARMv7 Security Extensions are implemented:</td>
</tr>
<tr>
<td></td>
<td>• The VBAR register.</td>
</tr>
<tr>
<td></td>
<td>• The TTBCR.PD0 and TTBCR.PD1 bits.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, plus the ability to access Secure or Non-secure physical memory is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are:

- 0b0000 when EL3 is implemented.
- 0b0001 or 0b0010 when EL3 is not implemented.

This field is only valid when the value of ID_PFR1.Security is 0, otherwise it holds the value 0b0000.

### GenTimer, bits [19:16]

Generic Timer support. Defined values are:

<table>
<thead>
<tr>
<th>GenTimer</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Generic Timer is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Generic Timer is implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Generic Timer is implemented, and also includes support for CNTHCTL.EVNTIS and CNTKCTL.EVNTIS fields, and CNTPCTSS and CNTVCVSS counter views.</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.6-ECV implements the functionality identified by the value 0b0010.

From Armv8.0 to Armv8.4, the only permitted value is 0b0001.

From Armv8.6, the only permitted value is 0b0010.

### Virtualization, bits [15:12]

Virtualization support. Defined values are:
Virtualization

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>EL2, Hyp mode, and the HVC instruction not implemented.</td>
</tr>
<tr>
<td>EL2, Hyp mode, the HVC instruction, and all the features described by</td>
</tr>
<tr>
<td>Virt_frac == 0b0001 implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0001 when EL2 is implemented.

In an implementation that includes EL2, if EL2 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

Note

The ID_ISARs do not identify whether the HVC instruction is implemented.

MProgMod, bits [11:8]

M profile programmers' model support. Defined values are:

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not supported.</td>
</tr>
<tr>
<td>Support for two-stack programmers' model.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

Security, bits [7:4]

Security support. Defined values are:

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>EL3, Monitor mode, and the SMC instruction not implemented.</td>
</tr>
<tr>
<td>EL3, Monitor mode, the SMC instruction, and all the features described</td>
</tr>
<tr>
<td>by Sec_frac == 0b0001 implemented.</td>
</tr>
<tr>
<td>As for 0b0001, and adds the ability to set the NSACR.RFR bit.</td>
</tr>
<tr>
<td>Not permitted in Armv8 as the NSACR.RFR bit is RES0.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are:

- 0b0000 when EL3 is not implemented.
- 0b0001 when EL3 is implemented.

In an implementation that includes EL3, if EL3 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

ProgMod, bits [3:0]

Support for the standard programmers' model for ARMv4 and later. Model must support User, FIQ, IRQ, Supervisor, Abort, Undefined, and System modes. Defined values are:

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not supported.</td>
</tr>
<tr>
<td>Supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.
In Armv8-A the only permitted value is \(0b0001\).

### Accessing the ID_PFR1

Accesses to this register use the following encodings:

\[
\text{MRC}\{c\}\{q\} \langle\text{coproc}\rangle, \\#\langle\text{opc1}\rangle, \langle\text{Rt}\rangle, \langle\text{CRn}\rangle, \langle\text{CRm}\rangle, \\#\langle\text{opc2}\rangle
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b0000</td>
<td>0b0001</td>
<td>0b001</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
   UNDEFINED;
elsif PSTATE.EL == EL1 then

      AArch64.AArch32SystemAccessTrap(EL2, 0x03);
   elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
      AArch32.TakeHypTrapException(0x03);
   else
      return ID_PFR1;
   endif
elsif PSTATE.EL == EL2 then
   return ID_PFR1;
elsif PSTATE.EL == EL3 then
   return ID_PFR1;
endif
ID_PFR2, Processor Feature Register 2

The ID_PFR2 characteristics are:

**Purpose**

Gives information about the AArch32 programmers' model.

Must be interpreted with ID_PFR0 and ID_PFR1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G7.1.3.

**Configuration**

AArch32 System register ID_PFR2 bits [31:0] are architecturally mapped to AArch64 System register ID_PFR2_EL1[31:0].

**Attributes**

ID_PFR2 is a 32-bit register.

**Field descriptions**

The ID_PFR2 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RAS_frac | SSBS | CSV3 |

**Bits [31:12]**

Reserved, RES0.

**RAS_frac, bits [11:8]**

From Armv8.4:

RAS Extension fractional field.

<table>
<thead>
<tr>
<th>RAS_frac</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>If ID_PFR0.RAS == 0b0001, RAS Extension implemented.</td>

</tr>
</tbody>
</table>

All other values are reserved.

This field is valid only if ID_PFR0.RAS == 0b0001.

**Otherwise:**

Reserved, RES0.

**SSBS, bits [7:4]**
From Armv8.5:

Speculative Store Bypassing controls in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>SSBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>AArch32 provides no mechanism to control the use of Speculative Store Bypassing.</td>
</tr>
<tr>
<td>0b0001</td>
<td>AArch32 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe.</td>
</tr>
</tbody>
</table>

From Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

All other values are reserved.

Otherwise:

Reserved, RES0.

CSV3, bits [3:0]

From Armv8.5:

Speculative use of faulting data. Defined values are:

<table>
<thead>
<tr>
<th>CSV3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>This Device does not disclose whether data loaded under speculation with a permission or domain fault can be used to form an address or generate condition codes or SVE predicate values to be used by instructions newer than the load in the speculative sequence</td>

IFAR, Instruction Fault Address Register

The IFAR characteristics are:

**Purpose**

Holds the virtual address of the faulting address that caused a synchronous Prefetch Abort exception.

**Configuration**

AArch32 System register IFAR bits [31:0] are architecturally mapped to AArch64 System register [FAR_EL1][63:32].

AArch32 System register IFAR bits [31:0] (S) are architecturally mapped to AArch32 System register [HIFAR][31:0] when HaveEL(EL2), HaveEL(EL3) and HighestELUsingAArch32().

AArch32 System register IFAR bits [31:0] (S) are architecturally mapped to AArch64 System register [FAR_EL2][63:32] when HaveEL(EL2).

RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

IFAR is a 32-bit register.

**Field descriptions**

The IFAR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| **VA of faulting address of synchronous Prefetch Abort exception** |

**Bits [31:0]**

VA of faulting address of synchronous Prefetch Abort exception.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the IFAR**

Accesses to this register use the following encodings:

\[

IFSR, Instruction Fault Status Register

The IFSR characteristics are:

**Purpose**

Holds status information about the last instruction fault.

**Configuration**

AArch32 System register IFSR bits [31:0] are architecturally mapped to AArch64 System register IFSR32_EL2[31:0].

The current translation table format determines which format of the register is used.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

IFSR is a 32-bit register.

**Field descriptions**

The IFSR bit assignments are:

When TTBCR.EAE == 0:

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     | RES0 | FnV | RES0 | ExT | RES0 | FS[4] | LPAE | RES0 | FS[3:0] |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

**Bits [31:17]**

Reserved, RES0.

**FnV, bit [16]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<table>
<thead>
<tr>
<th>FnV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IFAR is valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>IFAR is not valid, and holds an UNKNOWN value.</td>
</tr>
</tbody>
</table>

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

This field resets to an architecturally UNKNOWN value.

**Bits [15:13]**

Reserved, RES0.

**ExT, bit [12]**

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.
This field resets to an architecturally **UNKNOWN** value.

**Bit [11]**

Reserved, **RES0**.

**FS[4], bit [10]**

This field is bit[4] of FS[4:0].

<table>
<thead>
<tr>
<th>FS</th>
<th>Meaning</th>

<td>Synchronous parity or ECC error on translation table walk, level 1</td>
</tr>
<tr>
<td>0b11110</td>
<td>Synchronous parity or ECC error on translation table walk, level 2</td>
</tr>
</tbody>
</table>

All other values are reserved.

When the RAS Extension is implemented, 0b11001, 0b11100, and 0b11110, are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Short-descriptor translation table lookup' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

The FS field is split as follows:

- FS[4] is IFSR[10].
- FS[3:0] is IFSR[3:0].

This field resets to an architecturally **UNKNOWN** value.

**LPAE, bit [9]**

On taking a Data Abort exception, this bit is set as follows:

<table>
<thead>
<tr>
<th>LPAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Using the Short-descriptor translation table formats.</td>
</tr>
<tr>
<td>0b1</td>
<td>Using the Long-descriptor translation table formats.</td>
</tr>
</tbody>
</table>

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

This field resets to an architecturally **UNKNOWN** value.

**Bits [8:4]**

Reserved, **RES0**.
FS[3:0], bits [3:0]

This field is bits[3:0] of FS[4:0].

When TTBCR.EAE == 1:

ISR, Interrupt Status Register

The ISR characteristics are:

**Purpose**

Shows the pending status of the IRQ, FIQ, or SError.

When executing at EL2, EL3, or Secure EL1, when SCR_EL3.EEL2 == 0b0, this shows the pending status of the physical interrupts.

When executing at Non-secure EL1, or at Secure EL1, when SCR_EL3.EEL2 == 0b01:

- If the HCR.{IMO,FMO,AMO} bit has a value of 1, the corresponding ISR.{I,F,A} bit shows the pending status of the virtual IRQ, FIQ, or SError.
- If the HCR.{IMO,FMO,AMO} bit has a value of 0, the corresponding ISR.{I,F,A} bit shows the pending status of the physical IRQ, FIQ, or SError.

**Configuration**

AArch32 System register ISR bits [31:0] are architecturally mapped to AArch64 System register **ISR_EL1[31:0]**.

**Attributes**

ISR is a 32-bit register.

**Field descriptions**

The ISR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Res0 | A | I | F | Res0 |

**Bits [31:9]**

Reserved, Res0.

**A, bit [8]**

SError interrupt pending bit:

<table>
<thead>
<tr>
<th>A</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No pending SError interrupt.</td>
</tr>
<tr>
<td>0b1</td>
<td>An SError interrupt is pending.</td>
</tr>
</tbody>
</table>

If the SError interrupt is edge-triggered, this field is cleared to zero when the physical SError interrupt is taken.

**I, bit [7]**

IRQ pending bit. Indicates whether an IRQ interrupt is pending:

<table>
<thead>
<tr>
<th>I</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No pending IRQ.</td>
</tr>
<tr>
<td>0b1</td>
<td>An IRQ interrupt is pending.</td>
</tr>
</tbody>
</table>

ITLBIALL, Instruction TLB Invalidate All

The ITLBIALL characteristics are:

**Purpose**

Invalidate all cached copies of translation table entries from instruction TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
  - Would be required for the EL1&0 translation regime.
  - Match the current VMID, if EL2 is implemented and enabled in the current Security state.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at EL2, the stage 1 or stage 2 translation table entries that would be required for the Non-secure PL1&0 translation regime and matches the current VMID.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

**Configuration**

**Attributes**

ITLBIALL is a 32-bit System instruction.

**Field descriptions**

ITLBIALL ignores the value in the register specified by the instruction encoding. Software does not have to write a value to the register before issuing this instruction.

**Executing the ITLBIALL instruction**

Accesses to this instruction use the following encodings:

\[
\text{MCR}\{<c>\}{<q>} \ <\text{coproc}>, \{#\}<\text{opc1}>, \ <\text{Rt}>, \ <\text{CRn}>, \ <\text{CRm}>, \ {, \{#\}<\text{opc2}>}\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b1000</td>
<td>0b0101</td>
<td>0b000</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T8 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T8 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TTLB == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR.TTLB == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        ITLBIALL();
    end if;
elsif PSTATE.EL == EL2 then
    ITLBIALL();
elsif PSTATE.EL == EL3 then
    ITLBIALL();
end if;
The ITLBIASID characteristics are:

**Purpose**

Invalidate all cached copies of translation table entries from instruction TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- If EL2 is implemented, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

**Configuration**

**Attributes**

ITLBIASID is a 32-bit System instruction.

    ITLBIASID(R[t]);

The ITLBIMVA characteristics are:

**Purpose**

Invalidate all cached copies of translation table entries from instruction TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

**Configuration**

**Attributes**

ITLBIMVA is a 32-bit System instruction.

**Field descriptions**

The ITLBIMVA input value bit assignments are:

MAIR0, Memory Attribute Indirection Register 0

The MAIR0 characteristics are:

**Purpose**

Along with MAIR1, provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations.

AttrIndx[2] indicates the MAIR register to be used:

- When AttrIndx[2] is 0, MAIR0 is used.
- When AttrIndx[2] is 1, MAIR1 is used.

**Configuration**

AArch32 System register MAIR0 bits [31:0] are architecturally mapped to AArch64 System register MAIR_EL1[31:0] when TTBCR.EAE == 1.

MAIR0 and PRRR are the same register, with a different view depending on the value of TTBCR.EAE:

- When it is set to 0, the register is as described in PRRR.
- When it is set to 1, the register is as described in MAIR0.

When EL3 is using AArch32, write access to MAIR0(S) is disabled when the CP15SDISABLE signal is asserted HIGH. RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

MAIR0 is a 32-bit register.

**Field descriptions**

The MAIR0 bit assignments are:

**When TTBCR.EAE == 1:**

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Attr<n>, bits [8n+7:8n], for n = 0 to 3**

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIndx[2:0] gives the value of <n> in Attr<n>.
- AttrIndx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

<table>
<thead>
<tr>
<th>Attr&lt;n&gt;[7:4]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Device memory. See encoding of Attr&lt;n&gt;[3:0] for the type of Device memory.</td>
</tr>
<tr>
<td>0b00RW, RW</td>
<td>Normal memory, Outer Write-Through Transient.</td>
</tr>
<tr>
<td>not 0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b0100</td>
<td>Normal memory, Outer Write-Back Transient.</td>
</tr>
<tr>
<td>0b01RW, RW</td>
<td>Normal memory, Outer Write-Back Non-transient.</td>
</tr>
<tr>
<td>not 0b01</td>
<td>Normal memory, Outer Write-Through Non-transient.</td>
</tr>
<tr>
<td>0b10RW</td>
<td>Normal memory, Outer Write-Back Non-transient.</td>
</tr>
<tr>
<td>0b11RW</td>
<td>Normal memory, Outer Write-Back Non-transient.</td>
</tr>
</tbody>
</table>
R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

<table>
<thead>
<tr>
<th>Attr&lt;n&gt;[3:0]</th>
<th>Meaning when Attr&lt;n&gt;[7:4] is 0b0000</th>
<th>Meaning when Attr&lt;n&gt;[7:4] is not 0b0000</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>UNPREDICTABLE</td>
<td>Normal memory, Inner Write-Through Transient</td>
</tr>
<tr>
<td>0b00RW, RW</td>
<td>UNPREDICTABLE</td>
<td>Normal memory, Inner Non-cacheable</td>
</tr>
<tr>
<td>not 0b00</td>
<td>Device-nGnRE memory</td>
<td>Normal memory, Inner Write-Back Transient</td>
</tr>
<tr>
<td>0b01RW, RW</td>
<td>UNPREDICTABLE</td>
<td>Normal memory, Inner Write-Through Non-transient (RW=0b00)</td>
</tr>
<tr>
<td>not 0b00</td>
<td>Device-nGRE memory</td>
<td>Normal memory, Inner Write-Back Non-transient (RW=0b00)</td>
</tr>
<tr>
<td>0b10RW, RW</td>
<td>UNPREDICTABLE</td>
<td>Normal memory, Inner Write-Through Non-transient (RW=0b00)</td>
</tr>
<tr>
<td>not 0b00</td>
<td>Device-GRE memory</td>
<td>Normal memory, Inner Write-Back Non-transient</td>
</tr>
<tr>
<td>0b11RW, RW</td>
<td>UNPREDICTABLE</td>
<td>Normal memory, Inner Write-Back Non-transient</td>
</tr>
<tr>
<td>not 0b00</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

<table>
<thead>
<tr>
<th>R or W</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No Allocate</td>
</tr>
<tr>
<td>0b1</td>
<td>Allocate</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**Accessing the MAIR0**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>

MAIR1, Memory Attribute Indirection Register 1

The MAIR1 characteristics are:

**Purpose**

Along with MAIR0, provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations.

AttrIndx[2] indicates the MAIR register to be used:

- When AttrIndx[2] is 0, MAIR0 is used.
- When AttrIndx[2] is 1, MAIR1 is used.

**Configuration**

AArch32 System register MAIR1 bits [31:0] are architecturally mapped to AArch64 System register MAIR_EL1[63:32] when TTBCR.EAE == 1.

MAIR1 and NMRR are the same register, with a different view depending on the value of TTBCR.EAE:

- When it is set to 0, the register is as described in NMRR.
- When it is set to 1, the register is as described in MAIR1.

When EL3 is using AArch32, write access to MAIR1(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

MAIR1 is a 32-bit register.

**Field descriptions**

The MAIR1 bit assignments are:

When TTBCR.EAE == 1:

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Attr7 | Attr6 | Attr5 | Attr4 |

**Attr<n>, bits [8(n-4)+7:8(n-4)], for n = 4 to 7**

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIndx[2:0] gives the value of <n> in Attr<n>.
- AttrIndx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

<table>
<thead>
<tr>
<th>Attr&lt;n&gt;[7:4]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Device memory. See encoding of Attr&lt;n&gt;[3:0] for the type of Device memory.</td>
</tr>
<tr>
<td>0b00RW, RW</td>
<td>Normal memory, Outer Write-Through Transient.</td>
</tr>
<tr>
<td>not 0b00</td>
<td></td>
</tr>
<tr>
<td>0b0100</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01RW, RW</td>
<td>Normal memory, Outer Write-Back Transient.</td>
</tr>
<tr>
<td>not 0b01</td>
<td></td>
</tr>
<tr>
<td>0b10RW</td>
<td>Normal memory, Outer Write-Through Non-transient.</td>
</tr>
<tr>
<td>0b11RW</td>
<td>Normal memory, Outer Write-Back Non-transient.</td>
</tr>
</tbody>
</table>
R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

<table>
<thead>
<tr>
<th>Attr&lt;n&gt;[3:0]</th>
<th>Meaning when Attr&lt;n&gt;[7:4] is 0b0000</th>
<th>Meaning when Attr&lt;n&gt;[7:4] is not 0b0000</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Device-nGnRnE memory</td>
<td>UNPREDICTABLE</td>
</tr>
<tr>
<td>0b000RW, RW not 0b00</td>
<td>UNPREDICTABLE</td>
<td>Normal memory, Inner Write-Through Transient</td>
</tr>
<tr>
<td>0b0100</td>
<td>Device-nGnRE memory</td>
<td>Normal memory, Inner Non-cacheable</td>
</tr>
<tr>
<td>0b01RW, RW not 0b00</td>
<td>UNPREDICTABLE</td>
<td>Normal memory, Inner Write-Back Transient</td>
</tr>
<tr>
<td>0b1000</td>
<td>Device-nGRE memory</td>
<td>Normal memory, Inner Write-Through Non-transient (RW=0b00)</td>
</tr>
<tr>
<td>0b10RW, RW not 0b00</td>
<td>UNPREDICTABLE</td>
<td>Normal memory, Inner Write-Back Non-transient (RW=0b00)</td>
</tr>
<tr>
<td>0b1100</td>
<td>Device-GRE memory</td>
<td>Normal memory, Inner Write-Through Non-transient (RW=0b00)</td>
</tr>
<tr>
<td>0b11RW, RW not 0b00</td>
<td>UNPREDICTABLE</td>
<td>Normal memory, Inner Write-Back Non-transient</td>
</tr>
</tbody>
</table>

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

<table>
<thead>
<tr>
<th>R or W</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No Allocate</td>
</tr>
<tr>
<td>0b1</td>
<td>Allocate</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**Accessing the MAIR1**

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>}\ <\text{coproc}, \{#\}<\text{opc1}>, \ <\text{Rt}, \ <\text{CRn}, \ <\text{CRm}\{, \{#\}<\text{opc2}\}}
\]

<table>

    end

The MIDR characteristics are:

**Purpose**

Provides identification information for the PE, including an implementer code for the device and a device ID number.

**Configuration**

AArch32 System register MIDR bits [31:0] are architecturally mapped to AArch64 System register `MIDR_EL1[31:0]`.

AArch32 System register MIDR bits [31:0] are architecturally mapped to External register `MIDR_EL1[31:0]`.

Some fields of the MIDR are IMPLEMENTATION DEFINED. For details of the values of these fields for a particular Armv8 implementation, and any implementation-specific significance of these values, see the product documentation.

**Attributes**

MIDR is a 32-bit register.

**Field descriptions**

The MIDR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Implementer | Variant | Architecture | PartNum | Revision |

**Implementer, bits [31:24]**

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

<table>
<thead>
<tr>
<th>Hex representation</th>
<th>Implementer</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x00</td>
<td>Reserved for software use</td>
</tr>
<tr>
<td>0xC0</td>
<td>Ampere Computing</td>
</tr>
<tr>
<td>0x41</td>
<td>Arm Limited</td>
</tr>
<tr>
<td>0x42</td>
<td>Broadcom Corporation</td>
</tr>
<tr>
<td>0x43</td>
<td>Cavium Inc.</td>
</tr>
<tr>
<td>0x44</td>
<td>Digital Equipment Corporation</td>
</tr>
<tr>
<td>0x46</td>
<td>Fujitsu Ltd.</td>
</tr>
<tr>
<td>0x49</td>
<td>Infineon Technologies AG</td>
</tr>
<tr>
<td>0x40</td>
<td>Motorola or Freescale Semiconductor Inc.</td>
</tr>
<tr>
<td>0x4E</td>
<td>NVIDIA Corporation</td>
</tr>
<tr>
<td>0x50</td>
<td>Applied Micro Circuits Corporation</td>
</tr>
<tr>
<td>0x51</td>
<td>Qualcomm Inc.</td>
</tr>
<tr>
<td>0x56</td>
<td>Marvell International Ltd.</td>
</tr>
<tr>
<td>0x69</td>
<td>Intel Corporation</td>
</tr>
</tbody>
</table>

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

**Variant, bits [23:20]**

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.
The permitted values of this field are:

<table>
<thead>
<tr>
<th>Architecture</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>Armv4.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Armv4T.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Armv5 (obsolete).</td>
</tr>
<tr>
<td>0b0100</td>
<td>Armv5I.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Armv5TE.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Armv5TEJ.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Armv6.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Architectural features are individually identified in the ID.* registers, see 'ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section K12.5.3.</td>
</tr>
</tbody>
</table>

All other values are reserved.

PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.

Accessing the MIDR

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>

```
**MPI DR, Multiprocessor Affinity Register**

The MPIDR characteristics are:

**Purpose**

In a multiprocessor system, provides an additional PE identification mechanism for scheduling purposes.

**Configuration**

AArch32 System register MPIDR bits [31:0] are architecturally mapped to AArch64 System register `MPIDR_EL1[31:0]`.

In a uniprocessor system Arm recommends that each Aff<n> field of this register returns a value of 0.

**Attributes**

MPI DR is a 32-bit register.

**Field descriptions**

The MPIDR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| M  | U  | RES0| MT | Aff2|    | Aff1|    | Aff0|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**M, bit [31]**

Indicates whether this implementation includes the functionality introduced by the ARMv7 Multiprocessing Extensions. The possible values of this bit are:

<table>
<thead>
<tr>
<th>M</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This implementation does not include the ARMv7 Multiprocessing Extensions functionality.</td>
</tr>
<tr>
<td>0b1</td>
<td>This implementation includes the ARMv7 Multiprocessing Extensions functionality.</td>
</tr>
</tbody>
</table>

From Armv8, this bit is RAO.

**U, bit [30]**

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. The possible values of this bit are:

<table>
<thead>
<tr>
<th>U</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Processor is part of a multiprocessor system.</td>
</tr>
<tr>
<td>0b1</td>
<td>Processor is part of a uniprocessor system.</td>
</tr>
</tbody>
</table>

**Bits [29:25]**

Reserved, RES0.

**MT, bit [24]**

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of Aff0 for more information about affinity levels. The possible values of this bit are:
<table>
<thead>
<tr>
<th>MT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Performance of PEs at the lowest affinity level, or PEs with MPIDR.MT set to 1, different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent.</td>
</tr>
<tr>
<td>0b1</td>
<td>Performance of PEs at the lowest affinity level, or PEs with MPIDR.MT set to 1, different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.</td>
</tr>
</tbody>
</table>

**Aff2, bits [23:16]**

Affinity level 2. See the description of Aff0 for more information.

**Aff1, bits [15:8]**

Affinity level 1. See the description of Aff0 for more information.

**Aff0, bits [7:0]**

Affinity level 0. This is the affinity level that is most significant for determining PE behavior. Higher affinity levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

**Accessing the MPIDR**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b111</td>
<td>0b000</td>
<td>0b000</td>
<td>0b000</td>
<td>0b101</td>
</tr>
</tbody>
</table>

MVBAR, Monitor Vector Base Address Register

The MVBAR characteristics are:

**Purpose**

When EL3 is implemented and can use AArch32, holds the vector base address for any exception that is taken to Monitor mode.

Secure software must program the MVBAR with the required initial value as part of the PE boot sequence.

**Configuration**

It is **IMPLEMENTATION DEFINED** whether MVBAR[0] has a fixed value and ignored writes, or takes the last value written to it.

On a reset into EL3 using AArch32, the reset value of MVBAR is an **IMPLEMENTATION DEFINED** choice between:

- MVBAR[31:5] = a **IMPLEMENTATION DEFINED** value, which might be **UNKNOWN**.
- MVBAR[4:1] = **RES**0.
- MVBAR[0] = 0.

And:

- MVBAR[31:1] = a **IMPLEMENTATION DEFINED** value that is bits[31:1] of the AArch32 reset address.
- MVBAR[0] = 1.

**Attributes**

MVBAR is a 32-bit register.

**Field descriptions**

The MVBAR bit assignments are:

**When programmed with a vector base address:**

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  |  9  |  8  |  7  |  6  |  5  |  4  |  3  |  2  |  1  |  0  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

**Vector Base Address**

**Reserved**

**Bits [31:5]**

Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset.

**Reserved, bits [4:0]**

Reserved, see Configurations.

**Accessing the MVBAR**

Accesses to this register use the following encodings:

\[
\text{MRC}\{\langle c\rangle\}\{\langle q\rangle\} \langle\text{coproc}\rangle, \{\#\}\langle\text{opc1}\rangle, \langle\text{Rt}\rangle, \langle\text{CRn}\rangle, \langle\text{CRm}\rangle\{, \{\#\}\langle\text{opc2}\rangle\}
\]

The MVFR0 characteristics are:

**Purpose**

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with MVFR1 and MVFR2.

For general information about the interpretation of the ID registers see ‘Principles of the ID scheme for fields in ID registers’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G7.1.3.

**Configuration**

AArch32 System register MVFR0 bits [31:0] are architecturally mapped to AArch64 System register MVFR0_EL1[31:0].

Implemented only if the implementation includes Advanced SIMD and floating-point instructions.

**Attributes**

MVFR0 is a 32-bit register.

**Field descriptions**

The MVFR0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| FPRound | FPShVec | FPSqr | FPDivide | FPTrap | FPDP | FPSP | SIMDReg |

**FPRound, bits [31:28]**

Floating-Point Rounding modes. Indicates whether the floating-point implementation provides support for rounding modes. Defined values are:

<table>
<thead>
<tr>
<th>FPRound</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented, or only Round to Nearest mode supported, except that Round towards Zero mode is supported for VCVT instructions that always use that rounding mode regardless of the FPSCR setting.</td>
</tr>
<tr>
<td>0b0001</td>
<td>All rounding modes supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

**FPShVec, bits [27:24]**

Short Vectors. Indicates whether the floating-point implementation provides support for the use of short vectors. Defined values are:

<table>
<thead>
<tr>
<th>FPShVec</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Short vectors not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Short vector operation supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.
**FPSqrt, bits [23:20]**

Square Root. Indicates whether the floating-point implementation provides support for the ARMv6 VFP square root operations. Defined values are:

<table>
<thead>
<tr>
<th>FPSqrt</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>Not supported in hardware.</td>
</tr>
<tr>
<td>0001</td>
<td>Supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

The VSQRT.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VSQRT.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

**FPDivide, bits [19:16]**

Indicates whether the floating-point implementation provides support for VFP divide operations. Defined values are:

<table>
<thead>
<tr>
<th>FPDivide</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>Not supported in hardware.</td>
</tr>
<tr>
<td>0001</td>
<td>Supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

The VDIV.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VDIV.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

**FPTrap, bits [15:12]**

Floating Point Exception Trapping. Indicates whether the floating-point implementation provides support for exception trapping. Defined values are:

<table>
<thead>
<tr>
<th>FPTrap</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0001</td>
<td>Supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

A value of 0b0001 indicates that, when the corresponding trap is enabled, a floating-point exception generates an exception.

**FPDP, bits [11:8]**

Double Precision. Indicates whether the floating-point implementation provides support for double-precision operations. Defined values are:

<table>
<thead>
<tr>
<th>FPDP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>Not supported in hardware.</td>
</tr>
<tr>
<td>0001</td>
<td>Supported, VFPv2.</td>
</tr>
<tr>
<td>0010</td>
<td>Supported, VFPv3, VFPv4, or Armv8. VFPv3 and Armv8 add an instruction to load a double-precision floating-point constant, and conversions between double-precision and fixed-point values.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP double-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F64 is only available if the Square root field is 0b0001.
- VDIV.F64 is only available if the Divide field is 0b0001.
Conversion between double-precision and single-precision is only available if the single-precision field is nonzero.

**FPSP, bits [7:4]**

Single Precision. Indicates whether the floating-point implementation provides support for single-precision operations. Defined values are:

<table>
<thead>
<tr>
<th>FPSP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported in hardware.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported, VFPv2.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Supported, VFPv3 or VFPv4. VFPv3 adds an instruction to load a single-precision floating-point constant, and conversions between single-precision and fixed-point values.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP single-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F32 is only available if the Square root field is 0b0001.
- VDIV.F32 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the double-precision field is nonzero.

**SIMDReg, bits [3:0]**

Advanced SIMD registers. Indicates whether the Advanced SIMD and floating-point implementation provides support for the Advanced SIMD and floating-point register bank. Defined values are:

<table>
<thead>
<tr>
<th>SIMDReg</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The implementation has no Advanced SIMD and floating-point support.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The implementation includes floating-point support with 16 x 64-bit registers.</td>
</tr>
<tr>
<td>0b0010</td>
<td>The implementation includes Advanced SIMD and floating-point support with 32 x 64-bit registers.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

**Accessing the MVFR0**

Accesses to this register use the following encodings:

```
VMRS{<c>}{<q>} <Rt>, <spec_reg>
```

<table>
<thead>
<tr>

      return MVFR0;
  end if
else
return MVFR0;
end if
The MVFR1 characteristics are:

### Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation. Must be interpreted with MVFR0 and MVFR2.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G7.1.3.

### Configuration

AArch32 System register MVFR1 bits [31:0] are architecturally mapped to AArch64 System register MVFR1_EL1[31:0].

Implemented only if the implementation includes Advanced SIMD and floating-point instructions.

### Attributes

MVFR1 is a 32-bit register.

### Field descriptions

The MVFR1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>SIMDFMAC</td>
</tr>
<tr>
<td>30</td>
<td>FPHP</td>
</tr>
<tr>
<td>29</td>
<td>SIMDHP</td>
</tr>
<tr>
<td>28</td>
<td>SIMDSP</td>
</tr>
<tr>
<td>27</td>
<td>SIMDInt</td>
</tr>
<tr>
<td>26</td>
<td>SIMDLS</td>
</tr>
<tr>
<td>25</td>
<td>FPDNaN</td>
</tr>
<tr>
<td>24</td>
<td>FPftZ</td>
</tr>
</tbody>
</table>

#### SIMDFMAC, bits [31:28]

Advanced SIMD Fused Multiply-Accumulate. Indicates whether the Advanced SIMD implementation provides fused multiply accumulate instructions. Defined values are:

<table>
<thead>
<tr>
<th>SIMDFMAC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

The Advanced SIMD and floating-point implementations must provide the same level of support for these instructions.

#### FPHP, bits [27:24]

Floating Point Half Precision. Indicates the level of half-precision floating-point support. Defined values are:

<table>
<thead>
<tr>
<th>FPHP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Floating-point half-precision conversion instructions are supported for conversion between single-precision and half-precision.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds instructions for conversion between double-precision and half-precision.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0010, and adds support for half-precision floating-point arithmetic.</td>
</tr>
</tbody>
</table>
All other values are reserved.

In Armv8-A the permitted values are:

- \(0b0000\) in an implementation without floating-point support.
- \(0b0010\) in an implementation with floating-point support that does not include the ARMv8.2-FP16 extension.
- \(0b0011\) in an implementation with floating-point support that includes the ARMv8.2-FP16 extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the SIMDHP field, meaning the permitted values are:

<table>
<thead>
<tr>
<th>Half Precision instructions supported</th>
<th>FPHP</th>
<th>SIMDHP</th>
</tr>
</thead>
<tbody>
<tr>
<td>No support</td>
<td>0b0000</td>
<td>0b0000</td>
</tr>
<tr>
<td>Conversions only</td>
<td>0b0010</td>
<td>0b0001</td>
</tr>
<tr>
<td>Conversions and arithmetic</td>
<td>0b0011</td>
<td>0b0010</td>
</tr>
</tbody>
</table>

**SIMDHP, bits [23:20]**

Advanced SIMD Half Precision. Indicates the level of half-precision floating-point support. Defined values are:

<table>
<thead>
<tr>
<th>SIMDHP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SIMD half-precision conversion instructions are supported for conversion between single-precision and half-precision.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds support for half-precision floating-point arithmetic.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are:

- \(0b0000\) in an implementation without SIMD floating-point support.
- \(0b0010\) in an implementation with SIMD floating-point support that does not include the ARMv8.2-FP16 extension.
- \(0b0011\) in an implementation with SIMD floating-point support that includes the ARMv8.2-FP16 extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the FPHP field, meaning the permitted values are:

<table>
<thead>
<tr>
<th>Half Precision instructions supported</th>
<th>FPHP</th>
<th>SIMDHP</th>
</tr>
</thead>
<tbody>
<tr>
<td>No support</td>
<td>0b0000</td>
<td>0b0000</td>
</tr>
<tr>
<td>Conversions only</td>
<td>0b0010</td>
<td>0b0001</td>
</tr>
<tr>
<td>Conversions and arithmetic</td>
<td>0b0011</td>
<td>0b0010</td>
</tr>
</tbody>
</table>

**SIMDSP, bits [19:16]**

Advanced SIMD Single Precision. Indicates whether the Advanced SIMD and floating-point implementation provides single-precision floating-point instructions. Defined values are:

<table>
<thead>
<tr>
<th>SIMDSP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Implemented. This value is permitted only if the SIMDInt field is 0b0001.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

**SIMDInt, bits [15:12]**

Advanced SIMD Integer. Indicates whether the Advanced SIMD and floating-point implementation provides integer instructions. Defined values are:

<table>
<thead>
<tr>
<th>SIMDInt</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Implemented.</td>
</tr>
</tbody>
</table>

Page 2818
All other values are reserved.
In Armv8-A the permitted values are 0b0000 and 0b0001.

**SIMDLS, bits [11:8]**

Advanced SIMD Load/Store. Indicates whether the Advanced SIMD and floating-point implementation provides load/store instructions. Defined values are:

<table>
<thead>
<tr>
<th>SIMDLS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.
In Armv8-A the permitted values are 0b0000 and 0b0001.

**FPDNaN, bits [7:4]**

Default NaN mode. Indicates whether the floating-point implementation provides support only for the Default NaN mode. Defined values are:

<table>
<thead>
<tr>
<th>FPDNaN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented, or hardware supports only the Default NaN mode.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Hardware supports propagation of NaN values.</td>
</tr>
</tbody>
</table>

All other values are reserved.
In Armv8-A the permitted values are 0b0000 and 0b0001.

**FPFtZ, bits [3:0]**

Flush to Zero mode. Indicates whether the floating-point implementation provides support only for the Flush-to-Zero mode of operation. Defined values are:

<table>
<thead>
<tr>
<th>FPFtZ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented, or hardware supports only the Flush-to-Zero mode of operation.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Hardware supports full denormalized number arithmetic.</td>
</tr>
</tbody>
</table>

All other values are reserved.
In Armv8-A the permitted values are 0b0000 and 0b0001.

**Accessing the MVFR1**

Accesses to this register use the following encodings:

VMRS{<c>}{<q>} <Rt>, <spec_reg>

<table>
<thead>
<tr>
<th>reg</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>

MVFR2, Media and VFP Feature Register 2

The MVFR2 characteristics are:

**Purpose**

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with MVFR0 and MVFR1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G7.1.3.

**Configuration**

AArch32 System register MVFR2 bits [31:0] are architecturally mapped to AArch64 System register MVFR2_EL1[31:0].

Implemented only if the implementation includes Advanced SIMD and floating-point instructions.

**Attributes**

MVFR2 is a 32-bit register.

**Field descriptions**

The MVFR2 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

NMRR, Normal Memory Remap Register

The NMRR characteristics are:

**Purpose**

Provides additional mapping controls for memory regions that are mapped as Normal memory by their entry in the PRRR.

Used in conjunction with the PRRR.

**Configuration**

AArch32 System register NMRR bits [31:0] are architecturally mapped to AArch64 System register MAIR_EL1[63:32] when TTBCR.EAE == 0.

MAIR1 and NMRR are the same register, with a different view depending on the value of TTBCR.EAE:
- When it is set to 0, the register is as described in NMRR.
- When it is set to 1, the register is as described in MAIR1.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

NMRR is a 32-bit register.

**Field descriptions**

The NMRR bit assignments are:

**When TTBCR.EAE == 0:**

<table>
<thead>
<tr>
<th>OR&lt;n&gt;, bits [2n+17:2n+16]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Region is Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Region is Write-Back, Write-Allocate.</td>
</tr>
<tr>
<td>0b10</td>
<td>Region is Write-Through, no Write-Allocate.</td>
</tr>
<tr>
<td>0b11</td>
<td>Region is Write-Back, no Write-Allocate.</td>
</tr>
</tbody>
</table>

The meaning of the field with n = 6 is IMPLEMENTATIONDEFINED and might differ from the meaning given here. This is because the meaning of the attribute combination {TEX[0] = 1, C = 1, B = 0} is IMPLEMENTATIONDEFINED.

This field resets to an architecturally UNKNOWN value.

**IR<n>, bits [2n+1:2n], for n = 0 to 7**

Inner Cacheable property mapping for memory attributes n, if the region is mapped as Normal memory by the PRRR.TR<n> entry. n is the value of the TEX[0], C, and B bits concatenated. The possible values of this field are:
The meaning of the field with \( n = 6 \) is IMPLEMENTATION DEFINED and might differ from the meaning given here. This is because the meaning of the attribute combination \( \{ \text{TEX}[0] = 1, \ C = 1, \ B = 0 \} \) is IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

    end
NSACR, Non-Secure Access Control Register

The NSACR characteristics are:

### Purpose

When EL3 is implemented and can use AArch32, defines the Non-secure access permissions to Trace, Advanced SIMD and floating-point functionality. Also includes implementation defined bits that can define Non-secure access permissions for implementation defined functionality.

### Configuration

**Note**

In AArch64 state, the NSACR controls are replaced by controls in CPTR_EL3.

Some or all RW fields of this register have defined reset values. These apply whenever the register is accessible. This means they apply when the PE resets into EL3 using AArch32.

### Attributes

NSACR is a 32-bit register.

### Field descriptions

The NSACR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | NSTRCDIS | RES0 | IMPLEMENTATION DEFINED | NSASEDIS | RES0 | cp11 | cp10 | RES0 |

If EL3 is implemented and is using AArch64 then:

- Any read of the NSACR from Non-secure EL2 or Non-secure EL1 returns a value of 0x00000C00.
- Any read or write to NSACR from Secure EL1 is trapped as an exception to EL3.

If EL3 is not implemented, then any read of the NSACR from EL2 or EL1 returns a value of 0x00000C00.

**Bits [31:21]**

Reserved, RES0.

**NSTRCDIS, bit [20]**

Disables Non-secure System register accesses to all implemented trace registers.

<table>
<thead>
<tr>
<th>NSTRCDIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on:</td>
</tr>
<tr>
<td></td>
<td>• System register access to implemented trace registers.</td>
</tr>
<tr>
<td></td>
<td>• The behavior of CPACR_TRCDIS and HCPTR_TTA.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure System register accesses to all implemented trace registers are disabled, meaning:</td>
</tr>
<tr>
<td></td>
<td>• CPACR.TRCDIS behaves as RAO/WI in Non-secure state, regardless of its actual value.</td>
</tr>
<tr>
<td></td>
<td>• HCPTR.TTA behaves as RAO/WI, regardless of its actual value.</td>
</tr>
</tbody>
</table>
The implementation of this field must correspond to the implementation of the CPACR.TRCDIS field:

- If CPACR.TRCDIS is RAZ/WI, this field is RAZ/WI.
- If CPACR.TRCDIS is RW, this field is RW.

**Note**
- The ETMv4 architecture does not permit EL0 to access the trace registers. If the implementation includes an ETMv4 implementation, EL0 accesses to the trace registers are UNDEFINED.
- The architecture does not provide Non-secure access controls on trace register accesses through the optional memory-mapped external debug interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

In a system where the PE resets into EL3, this field resets to 0.

**Bit [19]**

Reserved, RES0.

**IMPLEMENTATION DEFINED, bits [18:16]**

IMPLEMENTATION DEFINED.

**NSASEDIS, bit [15]**

Disables Non-secure access to the Advanced SIMD functionality.

<table>
<thead>
<tr>
<th>NSASEDIS</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0      | This control has no effect on:  
|          | - Non-secure access to Advanced SIMD functionality.  
|          | - The behavior of CPACR.ASEDIS and HCPTR.TASE.  
| 0b1      | Non-secure access to the Advanced SIMD functionality is disabled, meaning:  
|          | - CPACR.ASEDIS behaves as RAO/WI in Non-secure state, regardless of its actual value.  
|          | - HCPTR.TASE behaves as RAO/WI, regardless of its actual value.  

The implementation of this field must correspond to the implementation of the CPACR.ASEDIS field:

- If CPACR.ASEDIS is RES0, this field is RES0. If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.
- If CPACR.ASEDIS is RAZ/WI, this field is RAZ/WI.
- If CPACR.ASEDIS is RW, this field is RW.

In a system where the PE resets into EL3, this field resets to 0.

**Bits [14:12]**

Reserved, RES0.

**cp11, bit [11]**

The value of this field is ignored. If this field is programmed with a different value to the cp10 field then this field is UNKNOWN on a direct read of the NSACR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.
Enable Non-secure access to the Advanced SIMD and floating-point features. Possible values of the fields are:

<table>
<thead>
<tr>
<th>cp10</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0  | Advanced SIMD and floating-point features can be accessed only from Secure state. Any attempt to access this functionality from Non-secure state is UNDEFINED. When the PE is in Non-secure state:  
  - The CPACR (cp11, cp10) fields ignore writes and read as 0b00, access denied.  
  - The HCPTR (TCP11, TCP10) fields behave as RAO/WI, regardless of their actual values. |
| 0b1  | Advanced SIMD and floating-point features can be accessed from both Security states. |

If Non-secure access to the Advanced SIMD and floating-point functionality is enabled, the CPACR must be checked to determine the level of access that is permitted.

The Advanced SIMD and floating-point features controlled by these fields are:

- Execution of any floating-point or Advanced SIMD instruction.
- Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
- Any access to the FPSCR, FPSID, MVFR0, MVFR1, MVFR2, or FPEXC System registers.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

**Bits [9:0]**

Reserved, RES0.

**Accessing the NSACR**

Accesses to this register use the following encodings:

end if;
PAR, Physical Address Register

The PAR characteristics are:

**Purpose**

Returns the output address (OA) from an Address translation instruction that executed successfully, or fault information if the instruction did not execute successfully.

**Configuration**

AArch32 System register PAR bits [63:0] are architecturally mapped to AArch64 System register PAR_EL1[63:0].

PAR is accessed as a 32-bit value:

- When the PE is not in Hyp mode and is using the Short-descriptor translation table format.
- When the PE is in Hyp mode and executes an ATS12NSOPR, ATS12NSOPW, ATS12NSOUR, or ATS12NSOUW instruction and the value of HCR.VM is 0 and the value of TTBCR.EAE is 0.

In these cases, PAR[63:32] is RES0.

Otherwise, the PAR is accessed as a 64-bit value, if any of the following is true:

- When using the Long-descriptor translation table format.
- If the stage 1 address translation is disabled and TTBCR.EAE is set to 1.
- In an implementation that includes EL2, for the result of an ATS1Cxx instruction performed from Hyp mode.

For PL1&0 stage 1 translations, TTBCR.EAE selects the translation table format.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits[31:0] and do not modify bits[63:32].

The Configurations section specifies the cases where each PAR format is used.

**Field descriptions**

The PAR bit assignments are:

**When the instruction returned a 32-bit value to the PAR, PAR.F==0:**

<table>
<thead>
<tr>
<th>63</th>
<th>62</th>
<th>61</th>
<th>60</th>
<th>59</th>
<th>58</th>
<th>57</th>
<th>56</th>
<th>55</th>
<th>54</th>
<th>53</th>
<th>52</th>
<th>51</th>
<th>50</th>
<th>49</th>
<th>48</th>
<th>47</th>
<th>46</th>
<th>45</th>
<th>44</th>
<th>43</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>PA</td>
<td>LPAE</td>
<td>NOS</td>
<td>NS</td>
<td>IMPLEMENTATION DEFINED</td>

<td>SS</td>
<td>F</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR can return a value that indicates the resulting attributes, rather than the values that appear in the translation table descriptors. More precisely:

- Memory attribute fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the translation table descriptors. This applies to the NOS, SH, Inner, and Outer fields.
- See the NS bit description for constraints on the value it returns.
**Bits [63:32]**

Reserved, RES0.

**PA, bits [31:12]**

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[31:12].

This field resets to an architecturally **UNKNOWN** value.

**LPAE, bit [11]**

When updating the PAR with the result of the translation operation, this bit is set as follows:

<table>
<thead>
<tr>
<th>LPAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Short-descriptor translation table format used. This means the PAR returned a 32-bit value.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**NOS, bit [10]**

Not Outer Shareable. When the returned value of PAR.SH is 1, indicates the Shareability attribute for the physical memory region:

<table>
<thead>
<tr>
<th>NOS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Memory region is Outer Shareable.</td>
</tr>
<tr>
<td>0b1</td>
<td>Memory region is Inner Shareable.</td>
</tr>
</tbody>
</table>

When the returned value of PAR.SH is 0 the value returned to this field is **UNKNOWN**.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

This field resets to an architecturally **UNKNOWN** value.

**NS, bit [9]**

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is **UNKNOWN**.

This field resets to an architecturally **UNKNOWN** value.

**IMPLEMENTATION DEFINED, bit [8]**

**IMPLEMENTATION DEFINED.**

This field resets to an architecturally **UNKNOWN** value.

**SH, bit [7]**

Shareability. Indicates whether the physical memory region is Non-shareable:

<table>
<thead>
<tr>
<th>SH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Memory is Non-shareable.</td>
</tr>
<tr>
<td>0b1</td>
<td>Memory is shareable, and PAR.NOS indicates whether the region is Outer Shareable or Inner Shareable.</td>
</tr>
</tbody>
</table>
The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

This field resets to an architecturally UNKNOWN value.

**Inner[2:0], bits [6:4]**

Inner cacheability attribute for the region. Permitted values are:

<table>
<thead>
<tr>
<th>Inner[2:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Non-cacheable.</td>
</tr>
<tr>
<td>0b001</td>
<td>Device-nGnRnE.</td>
</tr>
<tr>
<td>0b011</td>
<td>Device-nGnRE.</td>
</tr>
<tr>
<td>0b101</td>
<td>Write-Back, Write-Allocate.</td>
</tr>
<tr>
<td>0b110</td>
<td>Write-Through.</td>
</tr>
<tr>
<td>0b111</td>
<td>Write-Back, no Write-Allocate.</td>
</tr>
</tbody>
</table>

The values 0b010 and 0b100 are reserved.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

This field resets to an architecturally UNKNOWN value.

**Outer[1:0], bits [3:2]**

Outer cacheability attribute for the region. Permitted values are:

<table>
<thead>
<tr>
<th>Outer[1:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Write-Back, Write-Allocate.</td>
</tr>
<tr>
<td>0b10</td>
<td>Write-Through, no Write-Allocate.</td>
</tr>
<tr>
<td>0b11</td>
<td>Write-Back, no Write-Allocate.</td>
</tr>
</tbody>
</table>

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

This field resets to an architecturally UNKNOWN value.

**SS, bit [1]**

Supersection. Used to indicate if the result is a Supersection:

<table>
<thead>
<tr>
<th>SS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Result is not a Supersection. PAR[31:12] contains OA[31:12].</td>
</tr>
<tr>
<td>0b1</td>
<td>Result is a Supersection, and:</td>
</tr>
<tr>
<td></td>
<td>• PAR[31:24] contains OA[31:24].</td>
</tr>
<tr>
<td></td>
<td>• PAR[15:12] contains 0b0000.</td>
</tr>
<tr>
<td></td>
<td>If an implementation supports less than 40 bits of physical address,</td>
</tr>
<tr>
<td></td>
<td>the bits in the PAR field that correspond to physical address bits</td>
</tr>
<tr>
<td></td>
<td>that are not implemented are UNKNOWN.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**F, bit [0]**

Indicates whether the instruction performed a successful address translation.

<table>
<thead>
<tr>
<th>F</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Address translation completed successfully.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.
When the instruction returned a 32-bit value to the PAR, PAR.F==1:

<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12</td>
</tr>
<tr>
<td>58</td>
<td>11 10 9 8 7 6 5 4 3 2 1 0</td>
</tr>
</tbody>
</table>
This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR can return a value that indicates the resulting attributes, rather than the values that appear in the translation table descriptors. More precisely:

- Memory attribute fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the translation table descriptors. This applies to the ATTR and SH fields.

**ATTR, bits [63:56]**

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in MAIR0 and MAIR1.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

This field resets to an architecturally UNKNOWN value.

**Bits [55:40]**

Reserved, RES0.

**PA, bits [39:12]**

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[39:12].

This field resets to an architecturally UNKNOWN value.

**LPAE, bit [11]**

When updating the PAR with the result of the translation operation, this bit is set as follows:

<table>
<thead>
<tr>
<th>LPAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>Long-descriptor translation table format used. This means the PAR returned a 64-bit value.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**IMPLEMENTATION DEFINED, bit [10]**

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

**NS, bit [9]**

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

**SH, bits [8:7]**

Shareability attribute, for the returned output address. Permitted values are:
### SH

<table>
<thead>
<tr>
<th>Meaning</th>
<th>SH</th>
</tr>
</thead>
<tbody>
<tr>
<td>Non-shareable.</td>
<td>0b00</td>
</tr>
<tr>
<td>Outer Shareable.</td>
<td>0b10</td>
</tr>
<tr>
<td>Inner Shareable.</td>
<td>0b11</td>
</tr>
</tbody>
</table>

The value \(0b01\) is reserved.

---

**Note**

This field returns the value \(0b10\) for:

- Any type of Device memory.
- Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

This field resets to an architecturally \texttt{UNKNOWN} value.

---

**Bits [6:1]**

Reserved, 

**F, bit \([0]\)**

Indicates whether the instruction performed a successful address translation.

\[\text{F} \quad \text{Meaning}\]

<table>
<thead>
<tr>
<th>Meaning</th>
<th>F</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address translation completed successfully.</td>
<td>0b0</td>
</tr>
</tbody>
</table>

This field resets to an architecturally \texttt{UNKNOWN} value.

---

### When the instruction returned a 64-bit value to the PAR, PAR.F==1:

This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

**IMPLEMENTATION DEFINED, bits [63:56]**

**IMPLEMENTATION DEFINED.**

This field resets to an architecturally \texttt{UNKNOWN} value.

**IMPLEMENTATION DEFINED, bits [55:52]**

**IMPLEMENTATION DEFINED.**

This field resets to an architecturally \texttt{UNKNOWN} value.

**IMPLEMENTATION DEFINED, bits [51:48]**

**IMPLEMENTATION DEFINED.**

This field resets to an architecturally \texttt{UNKNOWN} value.
Bits [47:12]
Reserved, RES0.

LPAE, bit [11]
When updating the PAR with the result of the translation operation, this bit is set as follows:

<table>
<thead>
<tr>
<th>LPAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>Long-descriptor translation table format used. This means the PAR returned a 64-bit value.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Bit [10]
Reserved, RES0.

FSTAGE, bit [9]
Indicates the translation stage at which the translation aborted:

<table>
<thead>
<tr>
<th>FSTAGE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Translation aborted because of a fault in the stage 1 translation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Translation aborted because of a fault in the stage 2 translation.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

S2WLK, bit [8]
If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

This field resets to an architecturally UNKNOWN value.

Bit [7]
Reserved, RES0.

FST, bits [6:1]
Fault status field. Values are as in the DFSR.STATUS and IFSR.STATUS fields when using the Long-descriptor translation table format.

This field resets to an architecturally UNKNOWN value.

F, bit [0]
Indicates whether the instruction performed a successful address translation.

<table>
<thead>
<tr>
<th>F</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>Address translation aborted.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

PMCCFILTR, Performance Monitors Cycle Count Filter Register

The PMCCFILTR characteristics are:

**Purpose**

Determines the modes in which the Cycle Counter, PMCCNTR, increments.

**Configuration**

AArch32 System register PMCCFILTR bits [31:0] are architecturally mapped to AArch64 System register PMCCFILTR_EL0[31:0].

AArch32 System register PMCCFILTR bits [31:0] are architecturally mapped to External register PMCCFILTR_EL0[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMCCFILTR are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMCCFILTR is a 32-bit register.

**Field descriptions**

The PMCCFILTR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**P, bit [31]**

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR.NSK bit.

<table>
<thead>
<tr>
<th>P</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count cycles in EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count cycles in EL1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**U, bit [30]**

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR.NSU bit.

<table>
<thead>
<tr>
<th>U</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count cycles in EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count cycles in EL0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**NSK, bit [29]**
When HaveEL(EL3):

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.
If the value of this bit is equal to the value of PMCCFILTR.P, cycles in Non-secure EL1 are counted.
Otherwise, cycles in Non-secure EL1 are not counted.
On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NSU, bit [28]

When HaveEL(EL3):

Non-secure EL0 (Unprivileged) filtering. Controls counting in Non-secure EL0.
If the value of this bit is equal to the value of PMCCFILTR.U, cycles in Non-secure EL0 are counted.
Otherwise, cycles in Non-secure EL0 are not counted.
On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NSH, bit [27]

When HaveEL(EL2):

Non-secure EL2 (Hyp mode) filtering bit. Controls counting in Non-secure EL2.

<table>
<thead>
<tr>
<th>NSH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not count cycles in EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Count cycles in EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [26:0]

Reserved, RES0.

Accessing the PMCCFILTR

PMCCFILTR can also be accessed by using PMXEVTYPER with PMSELR SEL set to 0b11111.
Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>

The PMCCNTR characteristics are:

**Purpose**

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See 'Time as measured by the Performance Monitors cycle counter' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile for more information.

PMCCFILTR determines the modes and states in which the PMCCNTR can increment.

**Configuration**

AArch32 System register PMCCNTR bits [63:0] are architecturally mapped to AArch64 System register PMCCNTR_EL0[63:0].

AArch32 System register PMCCNTR bits [63:0] are architecturally mapped to External register PMCCNTR_EL0[63:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMCCNTR are UNDEFINED.

All counters are subject to any changes in clock frequency, including clock stopping caused by the WFI and WFE instructions. This means that it is CONSTRAINED UNPREDICTABLE whether or not PMCCNTR continues to increment when clocks are stopped by WFI and WFE instructions.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMCCNTR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

**Field descriptions**

The PMCCNTR bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

| CCNT |
| CCNT |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |

**CCNT, bits [63:0]**

Cycle count. Depending on the values of PMCR.\{LC,D\}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to PMCR.C sets this field to 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMCCNTR**

Accesses to this register use the following encodings:

The PMCEID0 characteristics are:

**Purpose**

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x0000 to 0x001F

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

**Note**

Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEIDn registers see The section describing 'Event numbers and common events' in chapter D5 'The Performance Monitors Extension' of the Arm Architecture Reference Manual, for Armv8-A architecture profile.

**Configuration**

AArch32 System register PMCEID0 bits [31:0] are architecturally mapped to AArch64 System register PMCEID0_EL0[31:0].

AArch32 System register PMCEID0 bits [31:0] are architecturally mapped to External register PMCEID0[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMCEID0 are UNDEFINED.

**Attributes**

PMCEID0 is a 32-bit register.

**Field descriptions**

The PMCEID0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

ID<\(n\)>, bit \([n]\), for \(n = 0 \) to \(31\)

ID\([n]\) corresponds to common event \(n\).

For each bit:

<table>
<thead>
<tr>
<th>ID&lt;(n)&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The common event is not implemented, or not counted.</td>
</tr>
<tr>
<td>0b1</td>
<td>The common event is implemented.</td>
</tr>
</tbody>
</table>

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

**Note**
Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

**Accessing the PMCEID0**

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>\{, \{#\}<\text{opc2}>\}
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b1001</td>
<td>0b1100</td>
<td>0b110</td>
</tr>
</tbody>
</table>

```c
if PSTATE.EL == EL0 then

  elsif PSTATE.EL == EL3 then
    return PMCEID0;
```
PMCEID1, Performance Monitors Common Event Identification register 1

The PMCEID1 characteristics are:

**Purpose**

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x0020 to 0x003F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

---

**Note**

Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

---

For more information about the common events and the use of the PMCEIDn registers see The section describing 'Event numbers and common events' in chapter D5 'The Performance Monitors Extension' of the Arm Architecture Reference Manual, for Armv8-A architecture profile.

**Configuration**

AArch32 System register PMCEID1 bits [31:0] are architecturally mapped to AArch64 System register PMCEID1_EL0[31:0].

AArch32 System register PMCEID1 bits [31:0] are architecturally mapped to External register PMCEID1[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMCEID1 are UNDEFINED.

**Attributes**

PMCEID1 is a 32-bit register.

**Field descriptions**

The PMCEID1 bit assignments are:

<table>
<thead>
<tr>
<th>ID31</th>
<th>ID30</th>
<th>ID29</th>
<th>ID28</th>
<th>ID27</th>
<th>ID26</th>
<th>ID25</th>
<th>ID24</th>
<th>ID23</th>
<th>ID22</th>
<th>ID21</th>
<th>ID20</th>
<th>ID19</th>
<th>ID18</th>
<th>ID17</th>
<th>ID16</th>
<th>ID15</th>
<th>ID14</th>
<th>ID13</th>
<th>ID12</th>
<th>ID11</th>
<th>ID10</th>
<th>ID9</th>
<th>ID8</th>
</tr>
</thead>
</table>

ID<n>, bit [n], for n = 0 to 31

ID[n] corresponds to common event (0x0020 + n).

For each bit:

<table>
<thead>
<tr>
<th>ID&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The common event is not implemented, or not counted.</td>
</tr>
<tr>
<td>0b1</td>
<td>The common event is implemented.</td>
</tr>
</tbody>
</table>

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

---

**Note**
Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID registers of that earlier version of the PMU architecture.

**Accessing the PMCEID1**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>

```

PMCEID1, Performance Monitors Common Event Identification register 1
PMCEID2, Performance Monitors Common Event Identification register 2

The PMCEID2 characteristics are:

**Purpose**

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x4000 to 0x401F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

**Note**

Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEIDn registers see The section describing ‘Event numbers and common events’ in chapter D5 ‘The Performance Monitors Extension’ of the Arm Architecture Reference Manual, for Armv8-A architecture profile.

**Configuration**

AArch32 System register PMCEID2 bits [31:0] are architecturally mapped to AArch64 System register PMCEID0_EL0[63:32].

AArch32 System register PMCEID2 bits [31:0] are architecturally mapped to External register PMCEID2[63:32].

This register is present only when ARMv8.1-PMU is implemented. Otherwise, direct accesses to PMCEID2 are UNDEFINED.

**Attributes**

PMCEID2 is a 32-bit register.

**Field descriptions**

The PMCEID2 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| \( \text{IDhi}^{\text{n}}, \text{bit} [n] \), for \( n = 0 \text{ to } 31 \) |

**\( \text{IDhi}^{\text{n}}, \text{bit} [n] \), for \( n = 0 \text{ to } 31 \)**

\( \text{IDhi}[n] \) corresponds to common event (0x4000 + n).

For each bit:

<table>
<thead>
<tr>
<th>( \text{\text{IDhi}^{\text{n}}} )</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>( 0b0 )</td>
<td>The common event is not implemented, or not counted.</td>
</tr>
<tr>
<td>( 0b1 )</td>
<td>The common event is implemented.</td>
</tr>
</tbody>
</table>

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

**Note**
Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID\(<n>\) registers of that earlier version of the PMU architecture.

### Accessing the PMCEID2

PMCEID3, Performance Monitors Common Event Identification register 3
PMCNTENCLR, Performance Monitors Count Enable Clear register

The PMCNTENCLR characteristics are:

**Purpose**

Disables the Cycle Count Register, PMCCNTR, and any implemented event counters PMEVCNTR<n>. Reading this register shows which counters are enabled.

PMCNTENCLR is used in conjunction with the PMCNTENSET register.

**Configuration**

AArch32 System register PMCNTENCLR bits [31:0] are architecturally mapped to AArch64 System register PMCNTENCLR_EL0[31:0].

AArch32 System register PMCNTENCLR bits [31:0] are architecturally mapped to External register PMCNTENCLR_EL0[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMCNTENCLR are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMCNTENCLR is a 32-bit register.

**Field descriptions**

The PMCNTENCLR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| C  | P<n>, bit [n] |

**C, bit [31]**

PMCCNTR disable bit. Disables the cycle counter register. Possible values are:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter is enabled. When written, disables the cycle counter.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P<n>, bit [n], for n = 0 to 30**

Event counter disable bit for PMEVCNTR<n>.

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in MDCR_EL2.HPMN if EL2 is using AArch64, or in HDCR_HPMN if EL2 is using AArch32. Otherwise, N is the value in PMCR_N.
When read, means that PMEVCNTR<\text{n}> is disabled. When written, has no effect.

When read, means that PMEVCNTR<\text{n}> is enabled. When written, disables PMEVCNTR<\text{n}>.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the PMCNTENCLR

```
PMCR, Performance Monitors Control Register

The PMCR characteristics are:

**Purpose**

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

**Configuration**

AArch32 System register PMCR bits [31:0] are architecturally mapped to AArch64 System register `PMCR_EL0[31:0]`.

AArch32 System register PMCR bits [7:0] are architecturally mapped to External register `PMCR_EL0[7:0]`.

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMCR are **UNDEFINED**.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

PMCR is a 32-bit register.

**Field descriptions**

The PMCR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>

<td>LC</td>
<td>DP</td>
<td>X</td>
<td>D</td>
<td>C</td>
<td>P</td>
<td>E</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**IMP, bits [31:24]**

Implementer code. This field has an **IMPLEMENTATION DEFINED** value.

If this field is zero, then PMCR.IDCODE is **RES0** and software must use `MIDR` to identify the PE.

Otherwise this field and PMCR.IDCODE identify the PMU implementation to software. The implementer codes are allocated by Arm. A non-zero value has the same interpretation as `MIDR` Implementer.

Access to this field is **RO**.

**IDCODE, bits [23:16]**

When PMCR.IMP != 0x00:

Identification code. This field has an **IMPLEMENTATION DEFINED** value.

Each implementer must maintain a list of identification codes that are specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.

Access to this field is **RO**.

Otherwise:

Reserved, **RES0**.
N, bits [15:11]

Indicates the number of event counters implemented. This value is in the range of 0b000000-0b111111. If the value is 0b000000 then only PMCCNTR is implemented. If the value is 0b111111 PMCCNTR and 31 event counters are implemented.

In an implementation that includes EL2:

- If EL2 is using AArch32, reads of this field from Non-secure EL1 and Non-secure EL0 return the value of HDCR.HPMN.
- If EL2 is using AArch64 and enabled in the current Security state, reads of this field from EL1 and EL0 return the value of MDCR_EL2.HPMN.

Access to this field is RO.

Bits [10:8]

Reserved, RES0.

LP, bit [7]

When ARMv8.5-PMU is implemented:

Long event counter enable. Determines when unsigned overflow is recorded by a counter overflow bit.

<table>
<thead>
<tr>
<th>LP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counter overflow on increment that causes unsigned overflow of PMEVCNTR&lt;n&gt;[31:0].</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counter overflow on increment that causes unsigned overflow of PMEVCNTR&lt;n&gt;[63:0].</td>
</tr>
</tbody>
</table>

If the highest implemented Exception level is using AArch32, it is IMPLEMENTATION DEFINED whether this bit is RW or RAZ/WI.

If EL2 is implemented and HDCR.HPMN or MDCR_EL2.HPMN is less than PMCR.N, this bit does not affect the operation of event counters in the range [HDCR.HPMN..(PMCR.N-1)] or [MDCR_EL2.HPMN..(PMCR.N-1)].

PMEVCNTR<n>[63:32] cannot be accessed directly in AArch32 state.

Note

The effect of HDCR.HPMN or MDCR_EL2.HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state. For more information, see the description of HDCR.HPMN or MDCR_EL2.HPMN.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

LC, bit [6]

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

<table>
<thead>
<tr>
<th>LC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR[31:0].</td>
</tr>
<tr>
<td>0b1</td>
<td>Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR[63:0].</td>
</tr>
</tbody>
</table>
Arm deprecates use of PMCR.LC = 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DP, bit [5]**

*When HaveEL(EL3) or (ARMv8.1-PMU is implemented and HaveEL(EL2)):*

Disable cycle counter when event counting is prohibited.

<table>
<thead>
<tr>
<th>DP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counting by PMCCNTR is not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>When event counting for counters in the range [0..(HDCR.HPMN-1)] or [0..(MDCR_EL2.HPMN-1)] is prohibited, cycle counting by PMCCNTR is disabled.</td>
</tr>
</tbody>
</table>

For more information about the interaction between the Performance Monitors and EL3, see 'Effect of EL3 and EL2’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile

On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**X, bit [4]**

*When the implementation includes an PMU event export bus:*

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

<table>
<thead>
<tr>
<th>X</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not export events.</td>
</tr>
<tr>
<td>0b1</td>
<td>Export events where not prohibited.</td>
</tr>
</tbody>
</table>

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL PE trace unit.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RAZ/WI.

**D, bit [3]**

Clock divider. The possible values of this bit are:

<table>
<thead>
<tr>
<th>D</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When enabled, PMCCNTR counts every clock cycle.</td>
</tr>
<tr>
<td>0b1</td>
<td>When enabled, PMCCNTR counts once every 64 clock cycles.</td>
</tr>
</tbody>
</table>

If PMCR.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR.D = 1.

On a Warm reset, this field resets to 0.
C, bit [2]

Cycle counter reset. The effects of writing to this bit are:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reset PMCCNTR to zero.</td>
</tr>
</tbody>
</table>

This bit is always RAZ.

**Note**

Resetting PMCCNTR does not change the cycle counter overflow bit.

The value of PMCR_EL0.LC is ignored, and bits [63:0] of all affected event counters are reset.

Access to this field is WO.

P, bit [1]

Event counter reset. The effects of writing to this bit are:

<table>
<thead>
<tr>
<th>P</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reset all event counters accessible in the current Exception level, not including PMCCNTR, to zero.</td>
</tr>
</tbody>
</table>

This bit is always RAZ.

In EL0 and EL1:

- If EL2 is implemented and enabled in the current Security state, and HDCR.HPMN or MDCR_EL2.HPMN is less than PMCR_EL0.N, a write of 1 to this bit does not reset event counters in the range [HDCR.HPMN..(PMCR.N-1)] or [MDCR_EL2.HPMN..(PMCR.N-1)].
- If EL2 is not implemented, EL2 is disabled in the current Security state, or HDCR.HPMN or MDCR_EL2.HPMN is equal to PMCR_EL0.N, a write of 1 to this bit resets all the event counters.

In EL2 and EL3, a write of 1 to this bit resets all the event counters.

**Note**

Resetting the event counters does not change the event counter overflow bits.

If ARMv8.5-PMU is implemented, the values of HDCR.HLP and PMCR.LP are ignored and bits [63:0] of all affected event counters are reset.

Access to this field is WO.

E, bit [0]

Enable.

<table>
<thead>
<tr>
<th>E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All event counters in the range [0..(PMN-1)] and PMCCNTR, are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>All event counters in the range [0..(PMN-1)] and PMCCNTR, are enabled by PMCNTENSET.</td>
</tr>
</tbody>
</table>

If EL2 is implemented then:

- If EL2 is using AArch32, PMN is HDCR.HPMN.
- If EL2 is using AArch64, PMN is MDCR_EL2.HPMN.
- If PMN is less than PMCR.N, this bit does not affect the operation of event counters in the range [PMN..(PMCR.N-1)].
If EL2 is not implemented, PMN is PMCR.N.

**Note**

The effect of MDCR_EL2.HPMN or HDCR.HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, regardless of whether EL2 is enabled in the current Security state. For more information, see the description of MDCR_EL2.HPMN or HDCR.HPMN.

On a Warm reset, this field resets to 0.

**Accessing the PMCR**

Accesses to this register use the following encodings:

\[

PMEVCNTR<n>, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n> characteristics are:

**Purpose**

Holds event counter n, which counts events, where n is 0 to 30.

**Configuration**

AArch32 System register PMEVCNTR<n> bits [31:0] are architecturally mapped to AArch64 System register PMEVCNTR<n>_EL0[31:0].

AArch32 System register PMEVCNTR<n> bits [31:0] are architecturally mapped to External register PMEVCNTR<n>_EL0[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMEVCNTR<n> are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMEVCNTR<n> is a 32-bit register.

**Field descriptions**

The PMEVCNTR<n> bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Event counter n</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

If ARMv8.5-PMU is implemented, the event counter is 64 bits and only the least-significant part of the event counter is accessible in AArch32 state:

- Reads from PMEVCNTR<n> return bits [31:0] of the counter.
- Writes to PMEVCNTR<n> update bits [31:0] and leave bits [63:32] unchanged.
- There is no means to access bits [63:32] directly from AArch32 state.
- If the implementation does not support AArch64 at any Exception level, bits [63:32] are not required to be implemented.

If ARMv8.5-PMU is not implemented, the event counter is 32 bits. On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMEVCNTR<n>**

PMEVCNTR<n> can also be accessed by using PMXEVCNTR with PMSELR.SEL set to the value of <n>.

If ARMv8.6-FGT is implemented, EL2 is implemented and enabled in the current Security state, and EL1 is using AArch64, for permitted reads and writes at EL0:
If \(<n>\) is an unimplemented event counter, the access is UNDEFINED.
Otherwise, if \(<n>\) is greater than or equal to \(\text{MDCR}_{\text{EL2}}.\text{HPMN}\), the access is trapped to EL2.

If ARMv8.6-FGT is not implemented, or the above behaviors do not apply:

If \(<n>\) is greater than or equal to the number of accessible counters, reads and writes of \(\text{PMEVCNTR}<n>\) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP
- If EL2 is implemented and enabled in the current Security state, and \(<n>\) is less than the number of implemented counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by \(\text{PMUSERENR}\).\{ER,EN\} or \(\text{PMUSERENR}_{\text{EL0}}.\{ER,EN\}\).

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, \(\text{HDCR}.\text{HPMN}\) identifies the number of accessible counters.
- If EL2 is using AArch64, \(\text{MDCR}_{\text{EL2}}.\text{HPMN}\) identifies the number of accessible counters.

Otherwise, the number of accessible counters is the number of implemented counters. See \(\text{HDCR}.\text{HPMN}\) and \(\text{MDCR}_{\text{EL2}}.\text{HPMN}\) for more details.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} \text{<coproc>}, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#\}<\text{opc2}>
\]

| P   | U   | NSK | NSU | NSH | RES0 | MT  | RES0 | evtCount[15:10] | evtCount[9:0] |

**P, bit [31]**

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER\(n\).NSK bit.

<table>
<thead>
<tr>
<th>P</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count events in EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count events in EL1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**U, bit [30]**

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER\(n\).NSU bit.

<table>
<thead>
<tr>
<th>U</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count events in EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count events in EL0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**NSK, bit [29]**
When HaveEL(EL3):

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of PMEVTYPER<n>.P, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**NSU, bit [28]**

When HaveEL(EL3):

Non-secure EL0 (Unprivileged) filtering. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of PMEVTYPER<n>.U, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**NSH, bit [27]**

When HaveEL(EL2):

Non-secure EL2 (Hyp mode) filtering bit. Controls counting in Non-secure EL2.

<table>
<thead>
<tr>
<th>NSH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not count events in EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Count events in EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Bit [26]**

Reserved, RES0.

**MT, bit [25]**

When ARMv8.6-MTPMU is implemented or IMPLEMENTATION DEFINED multi-threaded PMU Extension is implemented:

Multithreading.

<table>
<thead>
<tr>
<th>MT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count events only on controlling PE.</td>
</tr>
<tr>
<td>0b1</td>
<td>Count events from any PE with the same affinity at level 1 and above as this PE.</td>
</tr>
</tbody>
</table>
When the lowest level of affinity consists of logical PEs that are implemented using a multi-threading type approach, an implementation is described as multi-threaded. That is, the performance of PEs at the lowest affinity level is highly interdependent.

Events from a different thread of a multithreaded implementation are not attributable to the thread counting the event.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [24:16]**

Reserved, RES0.

evtCount[15:10], bits [15:10]

*When ARMv8.1-PMU is implemented:*

Extension to evtCount[9:0]. See evtCount[9:0] for more details.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count. The event number of the event that is counted by event counter PMEVCNTR<n>. Software must program this field with an event that is supported by the PE being programmed.

The ranges of event numbers allocated to each type of event are shown in Allocation of the PMU event number space.

If evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range 0x0000 to 0x003F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- If 16-bit evtCount is implemented, for the range 0x4000 to 0x403F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED events, it is UNPREDICTABLE what event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

**Note**

UNPREDICTABLE means the event must not expose privileged information.

Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include an event from a set of common IMPLEMENTATION DEFINED events, then no event is counted and the value read back on evtCount is the value written.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMEVTYPER<n>**

PMEVTYPER<n> can also be accessed by using PMXEVTYPER with PMSELR SEL set to n.
If ARMv8.6-FGT is implemented, EL2 is implemented and enabled in the current Security state, and EL1 is using AArch64, for permitted reads and writes at EL0:

- If \( n \) is an unimplemented event counter, the access is **UNDEFINED**.
- Otherwise, if \( n \) is greater than or equal to \( \text{MDCR\_EL2}.\text{HPMN} \), the access is trapped to EL2.

If ARMv8.6-FGT is not implemented, or the above behaviors do not apply:

If \( n \) is greater or equal to the number of accessible counters, reads and writes of \( \text{PMEVTYPER}\_n \) are **CONSTRAINED UNPREDICTABLE**, and the following behaviors are permitted:

- Accesses to the register are **UNDEFINED**.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a **NOP**.
- If EL2 is implemented and enabled in the current Security state, and \( n \) is less than the number of implemented counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

**Note**

In EL0, an access is permitted if it is enabled by \( \text{PMUSERENR}.\text{EN} \) or \( \text{PMUSERENR}\_\text{EL0}.\text{EN} \).

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, \( \text{HDCR}.\text{HPMN} \) identifies the number of accessible counters.
- If EL2 is using AArch64, \( \text{MDCR\_EL2}.\text{HPMN} \) identifies the number of accessible counters.

Otherwise, the number of accessible counters is the number of implemented counters. See \( \text{HDCR}.\text{HPMN} \) and \( \text{MDCR\_EL2}.\text{HPMN} \) for more details.

Accesses to this register use the following encodings:

\[
\text{MRC}\{c\}\{q\} \langle\text{coproc}\rangle, \{\#\}\langle\text{opc1}\rangle, \langle\text{Rt}\rangle, \langle\text{CRn}\rangle, \langle\text{CRm}\rangle\{, \{\#\}\langle\text{opc2}\rangle\}
\]

PMINTENCLR, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR characteristics are:

**Purpose**

Disables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR, and the event counters PMEVCNTR<n>. Reading the register shows which overflow interrupt requests are enabled.

PMINTENCLR is used in conjunction with the PMINTENSET register.

**Configuration**

AArch32 System register PMINTENCLR bits [31:0] are architecturally mapped to AArch64 System register PMINTENCLR_EL1[31:0].

AArch32 System register PMINTENCLR bits [31:0] are architecturally mapped to External register PMINTENCLR_EL1[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMINTENCLR are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMINTENCLR is a 32-bit register.

**Field descriptions**

The PMINTENCLR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>C</td>
<td>PMCCNTR overflow interrupt request disable bit. Possible values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>0</td>
<td>When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P<n>, bit [n], for n = 0 to 30**

Event counter overflow interrupt request disable bit for PMEVCNTR<n>.

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1, N is the value in MDCR_EL2.HPMN if EL2 is using AArch64, or in HDCR.HPMN if EL2 is using AArch32. Otherwise, N is the value in PMCR.N.

PMMIR, Performance Monitors Machine Identification Register

The PMMIR characteristics are:

**Purpose**

Describes Performance Monitors parameters specific to the implementation to software.

**Configuration**

This register is present only when ARMv8.4-PMU is implemented. Otherwise, direct accesses to PMMIR are UNDEFINED.

**Attributes**

PMMIR is a 32-bit register.

**Field descriptions**

The PMMIR bit assignments are:

```
   31  30  29  28  27  26  25  24  23  22  21  20  19  18  17  16  15  14  13  12  11  10   9   8   7   6   5   4   3   2   1   0
   RES0  SLOTS
```

**Bits [31:8]**

Reserved, RES0.

**SLOTS, bits [7:0]**

Operation width. The largest value by which the STALL_SLOT event might increment by in a single cycle. If the STALL_SLOT event is not implemented, this field might read as zero.

**Accessing the PMMIR**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>

PMOVSR, Performance Monitors Overflow Flag Status Register

The PMOVSR characteristics are:

**Purpose**

Contains the state of the overflow bit for the Cycle Count Register, \texttt{PMCCNTR}, and each of the implemented event counters \texttt{PMEVCNTR<n>}. Writing to this register clears these bits.

**Configuration**

AArch32 System register PMOVSR bits [31:0] are architecturally mapped to AArch64 System register \texttt{PMOVSCLR_EL0[31:0]}.

AArch32 System register PMOVSR bits [31:0] are architecturally mapped to External register \texttt{PMOVSCLR_EL0[31:0]}.

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMOVSR are \texttt{UNDEFINED}.

RW fields in this register reset to architecturally \texttt{UNKNOWN} values.

**Attributes**

PMOVSR is a 32-bit register.

**Field descriptions**

The PMOVSR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| C  | P<n>, bit [n] |

**C, bit [31]**

Cycle counter overflow clear bit. Possible values are:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter has not overflowed since this bit</td>
</tr>
<tr>
<td></td>
<td>was last cleared. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter has overflowed since this bit</td>
</tr>
<tr>
<td></td>
<td>was last cleared. When written, clears the cycle counter overflow</td>
</tr>
<tr>
<td></td>
<td>bit to 0.</td>
</tr>
</tbody>
</table>

\texttt{PMCR.LC} controls whether an overflow is detected from unsigned overflow of \texttt{PMCCNTR[31:0]} or unsigned overflow of \texttt{PMCCNTR[63:0]}.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

**P<n>, bit [n], for n = 0 to 30**

Event counter overflow clear bit for \texttt{PMEVCNTR<n>}.

If \(N\) is less than 31, then bits [30:3] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, \(N\) is the value in \texttt{MDCR_EL2.HPMN} if EL2 is using AArch64, or in \texttt{HDCR.HPMN} if EL2 is using AArch32. Otherwise, \(N\) is the value in \texttt{PMCR.N}.
<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that PMEVCNTR&lt;n&gt; has not overflowed since this bit was last cleared. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that PMEVCNTR&lt;n&gt; has overflowed since this bit was last cleared. When written, clears the PMEVCNTR&lt;n&gt; overflow bit to 0.</td>
</tr>
</tbody>
</table>

If ARMv8.5-PMU is implemented, MDCR_EL2.HLP, HDCR.HLP, and PMCR LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<n>[31:0] or unsigned overflow of PMEVCNTR<n>[63:0]. PMEVCNTR<n>[63:32] cannot be accessed directly in AArch32 state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMOVSR**

Accesses to this register use the following encodings:

\[ \text{MRC\{<c>\}{<q> \coproc\}, \{#<opc1>, \Rt, \CRn, \CRm\}, \{#<opc2>\}} \]

<table>
<thead>

PMOVSSET, Performance Monitors Overflow Flag Status Set register

The PMOVSSET characteristics are:

**Purpose**

Sets the state of the overflow bit for the Cycle Count Register, PMCCNTR, and each of the implemented event counters PMEVCNTR<n>.

**Configuration**

AArch32 System register PMOVSSET bits [31:0] are architecturally mapped to AArch64 System register PMOVSSET_EL0[31:0].

AArch32 System register PMOVSSET bits [31:0] are architecturally mapped to External register PMOVSSET_EL0[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMOVSSET are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMOVSSET is a 32-bit register.

**Field descriptions**

The PMOVSSET bit assignments are:

<table>

PMSELR, Performance Monitors Event Counter Selection Register

The PMSELR characteristics are:

**Purpose**

Selects the current event counter PMEVCNTR<\textit{n}> or the cycle counter, CCNT.

PMSELR is used in conjunction with PMXEVTYPER to determine the event that increments a selected event counter, and the modes and states in which the selected counter increments.

It is also used in conjunction with PMXEVCNTR, to determine the value of a selected event counter.

**Configuration**

AArch32 System register PMSELR bits [31:0] are architecturally mapped to AArch64 System register PMSELR_EL0[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMSELR are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMSELR is a 32-bit register.

**Field descriptions**

The PMSELR bit assignments are:

**Bits [31:5]**

Reserved, RES0.

**SEL, bits [4:0]**

Selects event counter, PMEVCNTR<\textit{n}>, where \textit{n} is the value held in this field. This value identifies which event counter is accessed when a subsequent access to PMXEVTYPER or PMXEVCNTR occurs.

This field can take any value from 0 (0b00000) to (PMCR.N)-1, or 31 (0b11111).

When PMSELR.SEL is 0b11111, it selects the cycle counter and:

- A read of the PMXEVTYPER returns the value of PMCCFILTR.
- A write of the PMXEVTYPER writes to PMCCFILTR.
- A read or write of PMXEVCNTR has CONSTRAINED UNPREDICTABLE effects. See PMXEVCNTR for more details.

For details of the results of accesses to event counters, see PMXEVTYPER and PMXEVCNTR.

For information about the number of counters accessible at each Exception level, see HDCR.HPMN and MDCR_EL2.HPMN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMSWINC, Performance Monitors Software Increment register

The PMSWINC characteristics are:

**Purpose**

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see ‘SW_INCR’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D5.

**Configuration**

AArch32 System register PMSWINC bits [31:0] are architecturally mapped to AArch64 System register PMSWINC_EL0[31:0].

AArch32 System register PMSWINC bits [31:0] are architecturally mapped to External register PMSWINC_EL0[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMSWINC are UNDEFINED.

**Attributes**

PMSWINC is a 32-bit register.

**Field descriptions**

The PMSWINC bit assignments are:

|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| RES0 | P<n>, bit [n] |

**Bit [31]**

Reserved, RES0.

**P<n>, bit [n], for n = 0 to 30**

Event counter software increment bit for PMEVCNTR<n>.

If N is less than 31, then bits [30:N] are WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in MDCR_EL2.HPMN if EL2 is using AArch64, or in HDCR.HPMN if EL2 is using AArch32. Otherwise, N is the value in PMCR.N.

PMUSERENR, Performance Monitors User Enable Register

The PMUSERENR characteristics are:

**Purpose**

Enables or disables User mode access to the Performance Monitors.

**Configuration**

AArch32 System register PMUSERENR bits [31:0] are architecturally mapped to AArch64 System register PMUSERENR_EL0[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMUSERENR are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMUSERENR is a 32-bit register.

**Field descriptions**

The PMUSERENR bit assignments are:

<table>

PMXEVCNTR, Performance Monitors Selected Event Count Register

The PMXEVCNTR characteristics are:

**Purpose**

Reads or writes the value of the selected event counter, \texttt{PMEVCNTR<n>}. \texttt{PMSELR}.SEL determines which event counter is selected.

**Configuration**

AArch32 System register PMXEV CNTR bits [31:0] are architecturally mapped to AArch64 System register \texttt{PMXEV CNTR_EL0[31:0]}. This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMXEV CNTR are \texttt{UNDEFINED}. RW fields in this register reset to architecturally \texttt{UNKNOWN} values.

**Attributes**

PMXEV CNTR is a 32-bit register.

**Field descriptions**

The PMXEV CNTR bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMSELRSEL</td>
<td>Performance Monitors Selected Event Count Register</td>
</tr>
<tr>
<td>PMXEV CNTR</td>
<td>Value of the selected event counter, \texttt{PMEVCNTR&lt;n&gt;}, where n is the value stored in \texttt{PMSELR}.SEL.</td>
</tr>
</tbody>
</table>

If ARMv8.5-PMU is implemented, the event counter is 64 bits and only the least-significant part of the event counter is accessible in AArch32 state:

- Reads from PMXEV CNTR return bits [31:0] of the counter.
- Writes to PMXEV CNTR update bits [31:0] and leave bits [63:32] unchanged.
- There is no means to access bits [63:32] directly from AArch32 state.
- If the implementation does not support AArch64 at any Exception level, bits [63:32] are not required to be implemented.

If ARMv8.5-PMU is not implemented, the event counter is 32 bits.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

**Accessing the PMXEV CNTR**

If ARMv8.6-FGT is implemented, EL2 is implemented and enabled in the current Security state, and EL1 is using AArch64, for permitted reads and writes at EL0:

- If \texttt{PMSELR}.SEL is an unimplemented event counter, the access is \texttt{UNDEFINED}.
- Otherwise, if \texttt{PMSELR}.SEL is greater than or equal to \texttt{MDCR_EL2}.HPMN, the access is trapped to EL2.

If ARMv8.6-FGT is not implemented, or the above behaviors do not apply:
If PMSELR_SEL is greater than or equal to the number of accessible counters then reads and writes of PMXEVCNTR are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP
- Accesses to the register behave as if PMSELR_SEL has an UNKNOWN value less than the number of counters accessible at the current Exception level and Security state.
- If EL2 is implemented and enabled in the current Security state, and PMSELR_SEL is less than the number of implemented counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

**Note**

In EL0, an access is permitted if it is enabled by PMUSERENR_EL0, {ER,EN} or PMUSERENR_EL0, {ER,EN}.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, HDCR_HPMN identifies the number of accessible counters.
- If EL2 is using AArch64, MDCR_EL2_HPMN identifies the number of accessible counters.

Otherwise, the number of accessible counters is the number of implemented counters. See HDCR_HPMN and MDCR_EL2_HPMN for more details.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} \text{<coproc>}, \{#\}<\text{opc1}>, \text{<Rt>}, \text{<CRn>}, \text{<CRm>}, \{#\}<\text{opc2}>\]

PMXEVTYPER, Performance Monitors Selected Event Type Register

The PMXEVTYPER characteristics are:

**Purpose**

When PMSELR SEL selects an event counter, this accesses a PMEVTYPER<n> register. When PMSELR_SEL selects the cycle counter, this accesses PMCCFILTR.

**Configuration**

AArch32 System register PMXEVTYPER bits [31:0] are architecturally mapped to AArch64 System register PMXEVTYPER_EL0[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMXEVTYPER are UNDEFINED.

**Attributes**

PMXEVTYPER is a 32-bit register.

**Field descriptions**

The PMXEVTYPER bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Event type register or PMCCFILTR**

**Bits [31:0]**

Event type register or PMCCFILTR.

When PMSELR_SEL == 31, this register accesses PMCCFILTR.

Otherwise, this register accesses PMEVTYPER<n> where n is the value in PMSELR_SEL.

**Accessing the PMXEVTYPER**

If ARMv8.6-FGT is implemented, EL2 is implemented and enabled in the current Security state, and EL1 is using AArch64, for permitted reads and writes at EL0:

- If PMSELR_SEL is an unimplemented event counter, the access is UNDEFINED.
- Otherwise, if PMSELR_SEL is not 31, and is greater than or equal to MDCR_EL2.HPMN, the access is trapped to EL2.

If ARMv8.6-FGT is not implemented, or the above behaviors do not apply:

If PMSELR_SEL is not 31, and is greater than or equal to the number of accessible counters then reads and writes of PMXEVTYPER are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP
- Accesses to the register behave as if PMSELR_SEL has an UNKNOWN value less than the number of counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if PMSELR_SEL is 31.
If EL2 is implemented and enabled in the current Security state, and PMSELR.SEL is less than the number of implemented counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

**Note**

In EL0, an access is permitted if it is enabled by PMUSERENR.EN or PMUSERENR_EL0.EN.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, HDCR.HPMN identifies the number of accessible counters.
- If EL2 is using AArch64, MDCR_EL2.HPMN identifies the number of accessible counters.

Otherwise, the number of accessible counters is the number of implemented counters. See HDCR.HPMN and MDCR_EL2.HPMN for more details.

Accesses to this register use the following encodings:

\[

PRRR, Primary Region Remap Register

The PRRR characteristics are:

**Purpose**

Controls the top level mapping of the TEX[0], C, and B memory region attributes.

**Configuration**

AArch32 System register PRRR bits [31:0] are architecturally mapped to AArch64 System register MAIR_EL1[31:0] when TTBCR.EAE == 0.

MAIR0 and PRRR are the same register, with a different view depending on the value of TTBCR.EAE:

- When it is set to 0, the register is as described in PRRR.
- When it is set to 1, the register is as described in MAIR0.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PRRR is a 32-bit register.

**Field descriptions**

The PRRR bit assignments are:

**When TTBCR.EAE == 0:**

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>12</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOS7</td>
<td>NOS6</td>
<td>NOS5</td>
<td>NOS4</td>
<td>NOS3</td>
<td>NOS2</td>
<td>NOS1</td>
<td>NOS0</td>
<td>RES0</td>
<td>NS1</td>
<td>NS0</td>
<td>DS1</td>
<td>DS0</td>
<td>TR7</td>
<td>TR6</td>
<td>TR5</td>
<td>TR4</td>
<td>TR3</td>
<td>TR2</td>
</tr>
</tbody>
</table>

**NOS<n>**, bit [n+24], for n = 0 to 7

Not Outer Shareable. NOS<n> is the Outer Shareable property for memory attributes n, if the region is mapped as Normal memory that is not Inner Non-cacheable, Outer Non-cacheable, and the appropriate PRRR.{NS0, NS1} field identifies the region as shareable. n is the value of the concatenation of the {TEX[0], C, B} bits from the translation table descriptor. The possible values of each NOS<n> field other than NOS6 are:

<table>
<thead>
<tr>
<th>NOS&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Memory region is Outer Shareable.</td>
</tr>
<tr>
<td>0b1</td>
<td>Memory region is Inner Shareable.</td>
</tr>
</tbody>
</table>

The value of this bit is ignored if the region is:

- Device memory
- Normal memory that is at least one of:
  - Inner Non-cacheable, Outer Non-cacheable.
  - Identified by the appropriate PRRR.{NS0, NS1} field as Non-shareable.

The meaning of the NOS6 field is IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

**Bits [23:20]**

Reserved, RES0.
NS1, bit [19]

Mapping of S = 1 attribute for Normal memory regions. This field is used in determining the Shareability of a memory region that is mapped to Normal memory and both:

- Is not Inner Non-cacheable, Outer Non-cacheable.
- Has the S bit in the translation table descriptor set to 1.

The possible values of this bit are:

<table>
<thead>
<tr>
<th>NS1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Region is Non-shareable.</td>
</tr>
<tr>
<td>0b1</td>
<td>Region is shareable. The value of the appropriate PRRR.NOS&lt;n&gt; field determines whether the region is Inner Shareable or Outer Shareable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

NS0, bit [18]

Mapping of S = 0 attribute for Normal memory regions. This field is used in determining the Shareability of a memory region that is mapped to Normal memory and both:

- Is not Inner Non-cacheable, Outer Non-cacheable.
- Has the S bit in the translation table descriptor set to 0.

The possible values of this bit are:

<table>
<thead>
<tr>
<th>NS0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Region is Non-shareable.</td>
</tr>
<tr>
<td>0b1</td>
<td>Region is shareable. The value of the appropriate PRRR.NOS&lt;n&gt; field determines whether the region is Inner Shareable or Outer Shareable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

DS1, bit [17]

Mapping of S = 1 attribute for Device memory. From Armv8, all types of Device memory are Outer Shareable, and therefore this bit is RES1.

This field resets to an architecturally UNKNOWN value.

DS0, bit [16]

Mapping of S = 0 attribute for Device memory. From Armv8, all types of Device memory are Outer Shareable, and therefore this bit is RES1.

This field resets to an architecturally UNKNOWN value.

TR<n>, bits [2n+1:2n], for n = 0 to 7

TR<n> is the primary TEX mapping for memory attributes n, and defines the mapped memory type for a region with attributes n. n is the value of the concatenation of the {TEX[0], C, B} bits from the translation table descriptor. The possible values for each field other than TR6 are:

<table>
<thead>
<tr>
<th>TR&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Device-nGnRnE memory</td>
</tr>
<tr>
<td>0b01</td>
<td>Device-nGnRE memory</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory</td>
</tr>
</tbody>
</table>

The value 0b11 is reserved. The effect of programming a field to 0b11 is CONSTRAINED UNPREDICTABLE, see ‘Unallocated values in fields of AArch32 System registers and translation table entries’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section K1.1.11.

The meaning of the TR6 field is IMPLEMENTATION DEFINED.
This field resets to an architecturally **UNKNOWN** value.

### Accessing the PRRR

    end
REVIDR, Revision ID Register

The REVIDR characteristics are:

**Purpose**

Provides implementation-specific minor revision information.

**Configuration**

AArch32 System register REVIDR bits [31:0] are architecturally mapped to AArch64 System register `REVIDR_EL1[31:0]`.

If REVIDR has the same value as `MIDR`, then its contents have no significance.

**Attributes**

REVIDR is a 32-bit register.

**Field descriptions**

The REVIDR bit assignments are:

```
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

IMPLEMENTATION DEFINED
```

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

**Accessing the REVIDR**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

```
coproc | opc1 | CRn | CRm | opc2
-------|------|-----|-----|-----
0b1111  | 0b000| 0b000| 0b000| 0b110
```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TID1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return REVIDR;
elsif PSTATE.EL == EL2 then
    return REVIDR;
elsif PSTATE.EL == EL3 then
    return REVIDR;
RMR, Reset Management Register

The RMR characteristics are:

**Purpose**

If EL1 or EL3 is the highest implemented Exception level and this register is implemented:

- A write to the register at the highest implemented Exception level can request a Warm reset.
- If the highest implemented Exception level can use AArch32 and AArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

**Configuration**

AArch32 System register RMR bits [31:0] are architecturally mapped to AArch64 System register RMR_EL1[31:0] when IsHighestEL(EL1).

AArch32 System register RMR bits [31:0] are architecturally mapped to AArch64 System register RMR_EL3[31:0] when HaveEL(EL3).

Only implemented if EL1 or EL3 is the highest implemented Exception level. In this case:

- If the highest implemented Exception level can use AArch32 and AArch64 then this register must be implemented.
- If the highest implemented Exception level cannot use AArch64 then it is IMPLEMENTATION DEFINED whether the register is implemented.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

RMR is a 32-bit register.

**Field descriptions**

The RMR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-20</td>
<td>Reserved</td>
<td>RES0</td>
</tr>
<tr>
<td>19</td>
<td>RR, bit [1]</td>
<td>Reset Request. Setting this bit to 1 requests a Warm reset. This field resets to 0.</td>
</tr>
<tr>
<td>0</td>
<td>AA64, bit [0]</td>
<td>When the highest implemented Exception level can use AArch64, determines which Execution state the PE boots into after a Warm reset:</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>AA64</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>AArch32.</td>
</tr>
<tr>
<td>0b1</td>
<td>AArch64.</td>
</tr>
</tbody>
</table>
On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If the highest implemented Exception level cannot use AArch64 this bit is RAZ/WI.

When implemented as a RW field, this field resets to 0 on a Cold reset.

**Accessing the RMR**

When EL3 is implemented, Arm deprecates accessing this register from any PE mode other than Monitor mode.

Accesses to this register use the following encodings:

\[
\begin{array}{|c|c|c|c|c|}
\hline
\text{coproc} & \text{opc1} & \text{CRn} & \text{CRm} & \text{opc2} \\
\hline
0b1111 & 0b000 & 0b1100 & 0b0000 & 0b010 \\
\hline
\end{array}
\]

if \text{PSTATE.EL IN \{EL3, EL1\}} && \text{IsHighestEL(PSTATE.EL)} then

\text{return RMR;}

else

\text{UNDEFINED;}

\[
\begin{array}{|c|c|c|c|c|}
\hline
\text{coproc} & \text{opc1} & \text{CRn} & \text{CRm} & \text{opc2} \\
\hline
0b1111 & 0b000 & 0b1100 & 0b0000 & 0b010 \\
\hline
\end{array}
\]

if \text{PSTATE.EL IN \{EL3, EL1\}} && \text{IsHighestEL(PSTATE.EL)} then

\text{RMR = R[t];}

else

\text{UNDEFINED;}
RVBAR, Reset Vector Base Address Register

The RVBAR characteristics are:

**Purpose**

If EL3 is not implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch32 state.

**Configuration**

This register is only implemented if the highest Exception level implemented is capable of using AArch32, and is not EL3.

**Attributes**

RVBAR is a 32-bit register.

**Field descriptions**

The RVBAR bit assignments are:

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  |  9  |  8  |  7  |  6  |  5  |  4  |  3  |  2  |  1  |  0  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |  RES1

**Bits [31:1]**

Reset Address[31:1]. Bits [31:1] of the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 32-bit state.

**Bit [0]**

Reserved, RES1.

**Accessing the RVBAR**

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b1100</td>
<td>0b0000</td>
<td>0b001</td>
</tr>
</tbody>
</table>

```
if PSTATE.EL IN {EL2, EL1} & IsHighestEL(PSTATE.EL) then
    return RVBAR;
else
    UNDEFINED;
```
The SCR characteristics are:

**Purpose**

When EL3 is implemented and can use AArch32, defines the configuration of the current Security state. It specifies:

- The Security state, either Secure or Non-secure.
- What mode the PE branches to if an IRQ, FIQ, or External abort occurs.
- Whether the CPSR.F or CPSR.A bits can be modified when SCR.NS==1.

**Configuration**

AArch32 System register SCR bits [31:0] can be mapped to AArch64 System register SCR_EL3[31:0], but this is not architecturally mandated.

Some or all RW fields of this register have defined reset values. These apply whenever the register is accessible. This means they apply when the PE resets into EL3 using AArch32.

**Attributes**

SCR is a 32-bit register.

**Field descriptions**

The SCR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>

<tr>
<td>0b1</td>
<td>Any attempt to execute a WFE instruction in any mode other than Monitor mode is trapped to Monitor mode, if the instruction would otherwise have caused the PE to enter a low-power state and the attempted execution does not generate an exception that is taken to EL1 or EL2 by SCTLR.nTWE or HCR.TWE. Any exception that is taken to EL1 or to EL2 has priority over this trap.</td>
</tr>
</tbody>
</table>

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

In a system where the PE resets into EL3, this field resets to 0.

TWI, bit [12]

Traps WFI instructions to Monitor mode.

<table>
<thead>
<tr>
<th>TWI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any attempt to execute a WFI instruction in any mode other than Monitor mode is trapped to Monitor mode, if the instruction would otherwise have caused the PE to enter a low-power state and the attempted execution does not generate an exception that is taken to EL1 or EL2 by SCTLR.nTWI or HCR.TWI. Any exception that is taken to EL1 or to EL2 has priority over this trap.</td>
</tr>
</tbody>
</table>

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

In a system where the PE resets into EL3, this field resets to 0.

Bits [11:10]

Reserved, RES0.
**SIF, bit [9]**

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from Non-secure memory. The possible values for this bit are:

<table>
<thead>
<tr>
<th>SIF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure state instruction fetches from Non-secure memory are permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure state instruction fetches from Non-secure memory are not permitted.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

In a system where the PE resets into EL3, this field resets to 0.

**HCE, bit [8]**

Hypervisor Call instruction enable. If EL2 is implemented, enables execution of HVC instructions at Non-secure EL1 and EL2.

<table>
<thead>
<tr>
<th>HCE</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0 | HVC instructions are:
| | • **UNDEFINED** at Non-secure EL1. The Undefined Instruction exception is taken from PL1 to PL1. |
| | • **UNPREDICTABLE** at EL2. Behavior is one of the following:
| | ◦ The instruction is **UNDEFINED**. |
| | ◦ The instruction executes as a NOP. |
| 0b1 | HVC instructions are enabled at Non-secure EL1 and EL2. |

**Note**

HVC instructions are always **UNDEFINED** at EL0 and in Secure state.

If EL2 is not implemented, this bit is RES0 and HVC is **UNDEFINED**.

In a system where the PE resets into EL3, this field resets to 0.

**SCD, bit [7]**

Secure Monitor Call disable. Disables SMC instructions.

<table>
<thead>
<tr>
<th>SCD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>SMC instructions are enabled.</td>
</tr>
</tbody>
</table>
| 0b1 | In Non-secure state, SMC instructions are **UNDEFINED**. The Undefined Instruction exception is taken from the current Exception level to the current Exception level. In Secure state, behavior is one of the following:
| | • The instruction is **UNDEFINED**. |
| | • The instruction executes as a NOP. |

**Note**

SMC instructions are always **UNDEFINED** at PL0.

In a system where the PE resets into EL3, this field resets to 0.

**nET, bit [6]**

Not Early Termination. This bit disables early termination. The possible values of this bit are:

<table>
<thead>
<tr>
<th>nET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Early termination permitted. Execution time of data operations can depend on the data values.</td>
</tr>
<tr>
<td>0b1</td>
<td>Disable early termination. The number of cycles required for data operations is forced to be independent of the data values.</td>
</tr>
</tbody>
</table>
This IMPLEMENTATION DEFINED mechanism can disable data dependent timing optimizations from multiplies and data operations. It can provide system support against information leakage that might be exploited by timing correlation types of attack.

On implementations that do not support early termination or do not support disabling early termination, this bit is RES0.

In a system where the PE resets into EL3, this field resets to 0.

**AW, bit [5]**

When the value of SCR.EA is 1 and the value of HCR.AMO is 0, this bit controls whether CPSR.A masks an External abort taken from Non-secure state, and the possible values of this bit are:

<table>
<thead>
<tr>
<th>AW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>External aborts taken from Non-secure state are not masked by CPSR.A, and are taken to EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>External aborts taken from Secure state are masked by CPSR.A.</td>
</tr>
</tbody>
</table>

When SCR.EA is 0 or HCR.AMO is 1, this bit has no effect.

In a system where the PE resets into EL3, this field resets to 0.

**FW, bit [4]**

When the value of SCR.FIQ is 1 and the value of HCR.FMO is 0, this bit controls whether CPSR.F masks an FIQ interrupt taken from Non-secure state, and the possible values of this bit are:

<table>
<thead>
<tr>
<th>FW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An FIQ taken from Non-secure state is not masked by CPSR.F, and is taken to EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>An FIQ taken from Secure state is masked by CPSR.F.</td>
</tr>
</tbody>
</table>

When SCR.FIQ is 0 or HCR.FMO is 1, this bit has no effect.

In a system where the PE resets into EL3, this field resets to 0.

**EA, bit [3]**

External Abort handler. This bit controls which mode takes External aborts. The possible values of this bit are:

<table>
<thead>
<tr>
<th>EA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>External aborts taken to Abort mode.</td>
</tr>
<tr>
<td>0b1</td>
<td>External aborts taken to Monitor mode.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL3, this field resets to 0.

**FIQ, bit [2]**

FIQ handler. This bit controls which mode takes FIQ exceptions. The possible values of this bit are:

<table>
<thead>
<tr>
<th>FIQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FIQs taken to FIQ mode.</td>
</tr>
<tr>
<td>0b1</td>
<td>FIQs taken to Monitor mode.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL3, this field resets to 0.

**IRQ, bit [1]**

IRQ handler. This bit controls which mode takes IRQ exceptions. The possible values of this bit are:
### IRQ

<table>
<thead>
<tr>
<th>IRQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IRQs taken to IRQ mode.</td>
</tr>
<tr>
<td>0b1</td>
<td>IRQs taken to Monitor mode.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL3, this field resets to 0.

### NS, bit [0]

Non-secure bit. Except when the PE is in Monitor mode, this bit determines the Security state of the PE:

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PE is in Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>PE is in Non-secure state.</td>
</tr>
</tbody>
</table>

If the HCR.TGE bit is set, an attempt to change from a Secure PL1 mode to a Non-secure EL1 mode by changing the SCR.NS bit from 0 to 1 results in the SCR.NS bit remaining as 0.

In a system where the PE resets into EL3, this field resets to 0.

### Accessing the SCR

Accesses to this register use the following encodings:

\[
\text{MRC}\{c\}\{q\} \ <\text{coproc}, \ \#<\text{opc1}, \ <\text{Rt}, \ <\text{CRn}, \ <\text{CRm}\}{, \ \#<\text{opc2}\}
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b0001</td>
<td>0b0001</td>
<td>0b000</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then

        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    else
        UNDEFINED;
    end if;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    SCR = R[t];
SCTLR, System Control Register

The SCTLR characteristics are:

**Purpose**

Provides the top level control of the system, including its memory system.

**Configuration**

AArch32 System register SCTLR bits [31:0] are architecturally mapped to AArch64 System register `SCTLR_EL1[31:0]`.

Some bits in the register are read-only. These bits relate to non-configurable features of an implementation, and are provided for compatibility with previous versions of the architecture.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 they apply only to the Secure instance of the register. Otherwise, RW fields in this register reset to architecturally `UNKNOWN` values.

**Attributes**

SCTLR is a 32-bit register.

**Field descriptions**

The SCTLR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSSBS</td>
<td>TE</td>
<td>AF</td>
<td>ET</td>
<td>RES0</td>
<td>EE</td>
<td>RES0</td>
<td>SPAN</td>
<td>RES1</td>
<td>RES0</td>
<td>UWXN</td>
<td>WXM</td>
<td>nTWE</td>
<td>RES0</td>
<td>nTWI</td>
<td>RES0</td>
<td>V</td>
<td>RES1</td>
<td>EnRCTX</td>
<td>RES0</td>
<td>SED</td>
<td>ITD</td>
<td>UNK</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**DSSBS, bit [31]**

When ARMv8.0-SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry. The defined values are:

<table>
<thead>
<tr>
<th>DSSBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PSTATE.SSBS is set to 0 on an exception to any mode in this security state except Hyp mode</td>
</tr>
<tr>
<td>0b1</td>
<td>PSTATE.SSBS is set to 1 on an exception to any mode in this security state except Hyp mode</td>
</tr>
</tbody>
</table>

**Note**

When EL3 is implemented and is using AArch32, this bit is banked between the two Security states.

This field resets to an IMPLEMENTATION DEFINED value.

**Otherwise:**

Reserved, RES0.
**TE, bit [30]**

T32 Exception Enable. This bit controls whether exceptions to an Exception Level that is executing at PL1 are taken to A32 or T32 state:

<table>
<thead>
<tr>
<th>TE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Exceptions, including reset, taken to A32 state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Exceptions, including reset, taken to T32 state.</td>
</tr>
</tbody>
</table>

This field resets to an IMPLEMENTATION DEFINED choice between:

- 0
- A value determined by an input configuration signal.

**AFE, bit [29]**

Access Flag Enable. When using the Short-descriptor translation table format for the PL1&0 translation regime, this bit enables use of the AP[0] bit in the translation descriptors as the Access flag, and restricts access permissions in the translation descriptors to the simplified model. The possible values of this bit are:

<table>
<thead>
<tr>
<th>AFE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>In the translation table descriptors, AP[0] is an access permissions bit. The full range of access permissions is supported. No Access flag is implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>In the translation table descriptors, AP[0] is the Access flag. Only the simplified model for access permissions is supported.</td>
</tr>
</tbody>
</table>

When using the Long-descriptor translation table format, the VMSA behaves as if this bit is set to 1, regardless of the value of this bit.

The AFE bit is permitted to be cached in a TLB.

This field resets to 0.

**TRE, bit [28]**

TEX remap enable. This bit enables remapping of the TEX[2:1] bits in the PL1&0 translation regime for use as two translation table bits that can be managed by the operating system. Enabling this remapping also changes the scheme used to describe the memory region attributes in the VMSA. The possible values of this bit are:

<table>
<thead>
<tr>
<th>TRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TEX remap disabled. TEX[2:0] are used, with the C and B bits, to describe the memory region attributes.</td>
</tr>
<tr>
<td>0b1</td>
<td>TEX remap enabled. TEX[2:1] are reassigned for use as bits managed by the operating system. The TEX[0], C, and B bits are used to describe the memory region attributes, with the MMU remap registers.</td>
</tr>
</tbody>
</table>

When the value of TTBCR.EAE is 1, this bit is RES1.

The TRE bit is permitted to be cached in a TLB.

This field resets to 0.

**Bits [27:26]**

Reserved, RES0.

**EE, bit [25]**

The value of the PSTATE.E bit on branch to an exception vector or coming out of reset, and the endianness of stage 1 translation table walks in the PL1&0 translation regime.

The possible values of this bit are:
Meaning

<table>
<thead>
<tr>
<th>EE</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Little-endian. PSTATE.E is cleared to 0 on taking an exception or coming out of reset. Stage 1 translation table walks in the PL1&amp;0 translation regime are little-endian.</td>
</tr>
<tr>
<td>0b1</td>
<td>Big-endian. PSTATE.E is set to 1 on taking an exception or coming out of reset. Stage 1 translation table walks in the PL1&amp;0 translation regime are big-endian.</td>
</tr>
</tbody>
</table>

If an implementation does not provide Big-endian support for data accesses at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support for data accesses at Exception Levels higher than EL0, this bit is RES1.

This field resets to an IMPLEMENTATION DEFINED choice between:

- 0
- A value determined by an input configuration signal.

**Bit [24]**

Reserved, RES0.

**SPAN, bit [23]**

When ARMv8.1-PAN is implemented:

Set Privileged Access Never, on taking an exception to EL1 from either Secure or Non-secure state, or to EL3 from Secure state when EL3 is using AArch32.

<table>
<thead>
<tr>
<th>SPAN</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0  | CPSR.PAN is set to 1 in the following situations:  

- In Non-secure state, on taking an exception to EL1.  
- In Secure state, when EL3 is using AArch64, on taking an exception to EL1.  
- In Secure state, when EL3 is using AArch32, on taking an exception to EL3. |
| 0b1  | The value of CPSR.PAN is left unchanged on taking an exception to EL1. |

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

**Bit [22]**

Reserved, RES1.

**Bit [21]**

Reserved, RES0.

**UWXN, bit [20]**

Unprivileged write permission implies PL1 XN (Execute-never). This bit can force all memory regions that are writable at PL0 to be treated as XN for accesses from software executing at PL1. The possible values of this bit are:

<table>
<thead>
<tr>
<th>UWXN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on memory access permissions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any region that is writable at PL0 forced to XN for accesses from software executing at PL1.</td>
</tr>
</tbody>
</table>
The UWXN bit is permitted to be cached in a TLB.

This field resets to 0.

**WXN, bit [19]**

Write permission implies XN (Execute-never). For the PL1&0 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

<table>
<thead>
<tr>
<th>WXN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on memory access permissions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any region that is writable in the PL1&amp;0 translation regime is forced to XN for accesses from software executing at PL1 or PL0.</td>
</tr>
</tbody>
</table>

This bit applies only when SCTLR.M bit is set.

The WXN bit is permitted to be cached in a TLB.

This field resets to 0.

**nTWE, bit [18]**

Traps EL0 execution of WFE instructions to Undefined mode.

<table>
<thead>
<tr>
<th>nTWE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a WFE instruction at EL0 is trapped to Undefined mode, if the instruction would otherwise have caused the PE to enter a low-power state.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

This field resets to 1.

**Bit [17]**

Reserved, RES0.

**nTWI, bit [16]**

Traps EL0 execution of WFI instructions to Undefined mode.

<table>
<thead>
<tr>
<th>nTWI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a WFI instruction at EL0 is trapped to Undefined mode, if the instruction would otherwise have caused the PE to enter a low-power state.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or
WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

This field resets to 1.

**Bits [15:14]**

Reserved, RES0.

**V, bit [13]**

Vectors bit. This bit selects the base address of the exception vectors for exceptions taken to a PE mode other than Monitor mode or Hyp mode:

<table>
<thead>
<tr>
<th>V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal exception vectors. Base address is held in <strong>VBAR</strong>.</td>
</tr>
<tr>
<td>0b1</td>
<td>High exception vectors (Hivecs), base address 0xFFFF0000. This base address cannot be remapped.</td>
</tr>
</tbody>
</table>

This field resets to an **IMPLEMENTATION DEFINED** choice between:

- 0
- A value determined by an input configuration signal.

**I, bit [12]**

Instruction access Cacheability control, for accesses at EL1 and EL0:

<table>
<thead>
<tr>
<th>I</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All instruction access to Normal memory from PL1 and PL0 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR.M is 0, instruction accesses from stage 1 of the PL1&amp;0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>All instruction access to Normal memory from PL1 and PL0 can be cached at all levels of instruction and unified cache. If the value of SCTLR.M is 0, instruction accesses from stage 1 of the PL1&amp;0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.</td>
</tr>
</tbody>
</table>

Instruction accesses to Normal memory from EL1 and EL0 are Cacheable regardless of the value of the SCTLR.I bit if either:

- EL2 is using AArch32 and the value of **HCR.DC** is 1.
- EL2 is using AArch64 and the value of **HCR_EL2.DC** is 1.

This field resets to 0.

**Bit [11]**

Reserved, RES1.

**EnRCTX, bit [10]**

When ARMv8.0-CSV2 is implemented:

Enable EL0 Access to the AArch32 CFPRCTX, DVPRCTX and CPPRCTX instructions. The defined values are:

<table>
<thead>
<tr>
<th>EnRCTX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 access to these instructions is disabled, and these instructions are trapped to EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 access to these instructions is enabled.</td>
</tr>
</tbody>
</table>
**Note**

When EL3 is implemented and is using AArch32, this bit is banked between the two Security states.

This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Bit [9]**

Reserved, RES0.

**SED, bit [8]**

SETEND instruction disable. Disables SETEND instructions at PL0 and PL1.

<table>
<thead>
<tr>
<th>SED</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>SETEND instruction execution is enabled at PL0 and PL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>SETEND instructions are <strong>UNDEFINED</strong> at PL0 and PL1.</td>
</tr>
</tbody>
</table>

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

This field resets to 0.

**ITD, bit [7]**

IT Disable. Disables some uses of IT instructions at PL1 and PL0.

<table>
<thead>
<tr>
<th>ITD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All IT instruction functionality is enabled at PL1 and PL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any attempt at PL1 or PL0 to execute any of the following is <strong>UNDEFINED</strong>:</td>
</tr>
<tr>
<td></td>
<td>• All encodings of the IT instruction with hw1[3:0]! = 1000.</td>
</tr>
<tr>
<td></td>
<td>• All encodings of the subsequent instruction with the following values for hw1:</td>
</tr>
<tr>
<td></td>
<td>◦ 11xxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.</td>
</tr>
<tr>
<td></td>
<td>◦ 1011xxxxxxxxxxxx: All instructions in Miscellaneous 16-bit instructions.</td>
</tr>
<tr>
<td></td>
<td>◦ 10100xxxxxxxxxxx: ADD Rd, PC, #imm</td>
</tr>
<tr>
<td></td>
<td>◦ 01001xxxxxxxxxxx: LDR Rd, [PC, #imm]</td>
</tr>
<tr>
<td></td>
<td>◦ 0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.</td>
</tr>
<tr>
<td></td>
<td>◦ 010001xxx1111xxx: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn.</td>
</tr>
</tbody>
</table>

These instructions are always **UNDEFINED**, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.

It is **IMPLEMENTATION DEFINED** whether the IT instruction is treated as:

- A 16-bit instruction, that can only be followed by another 16-bit instruction.
- The first half of a 32-bit instruction.

This means that, for the situations that are **UNDEFINED**, either the second 16-bit instruction or the 32-bit instruction is **UNDEFINED**. An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.
If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONstrained UNPREDICTABLE. For more information see 'Changes to an ITD control by an instruction in an IT block' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section E1.2.4.

ITD is optional, but if it is implemented in the SCTLRL then it must also be implemented in the SCTLRL_EL1. If it is not implemented then this bit is RAZ/WI.

This field resets to 0.

**UNK, bit [6]**

Writes to this bit are IGNORED. Reads of this bit return an UNKNOWN value.

This field resets to an architecturally UNKNOWN value.

**CP15BEN, bit [5]**

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from PL1 and PL0:

<table>
<thead>
<tr>
<th>CP15BEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PL0 and PL1 execution of the CP15DMB, CP15DSB, and CP15ISR instructions is UNDEFINED.</td>
</tr>
<tr>
<td>0b1</td>
<td>PL0 and PL1 execution of the CP15DMB, CP15DSB, and CP15ISR instructions is enabled.</td>
</tr>
</tbody>
</table>

CP15BEN is optional, but if it is implemented in the SCTLRL then it must also be implemented in the SCTLRL_EL1. If it is not implemented then this bit is RAZ/WI.

This field resets to 1.

**LSMAOE, bit [4]**

When ARMv8.2-LSMAOC is implemented:

Load Multiple and Store Multiple Atomicity and Ordering Enable.

<table>
<thead>
<tr>
<th>LSMAOE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For all memory accesses at EL1 or EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.</td>
</tr>
<tr>
<td>0b1</td>
<td>The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL1 or EL0 is as defined for Armv8.0.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

This field resets to 1.

**Otherwise:**

Reserved, RES1.

**nTLSMD, bit [3]**

When ARMv8.2-LSMAOC is implemented:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.
### nTLSMD

<table>
<thead>
<tr>
<th><strong>nTLSMD</strong></th>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>0b0</strong></td>
<td>All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL1 or EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.</td>
</tr>
<tr>
<td><strong>0b1</strong></td>
<td>All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL1 or EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

This field resets to 1.

**Otherwise:**

Reserved, RES1.

### C, bit [2]

Cacheability control, for data accesses at EL1 and EL0:

<table>
<thead>
<tr>
<th><strong>C</strong></th>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>0b0</strong></td>
<td>All data access to Normal memory from PL1 and PL0, and all accesses to the PL1&amp;0 stage 1 translation tables, are Non-cacheable for all levels of data and unified cache.</td>
</tr>
<tr>
<td><strong>0b1</strong></td>
<td>All data access to Normal memory from PL1 and PL0, and all accesses to the PL1&amp;0 stage 1 translation tables, can be cached at all levels of data and unified cache.</td>
</tr>
</tbody>
</table>

The PE ignores SCLTR.C for Non-secure state and data accesses to Normal memory from EL1 and EL0 are Cacheable if either:

- EL2 is using AArch32 and the value of HCR.DC is 1.
- EL2 is using AArch64 and the value of HCR_EL2.DC is 1.

This field resets to 0.

### A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at PL1 and PL0:

<table>
<thead>
<tr>
<th><strong>A</strong></th>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>0b0</strong></td>
<td>Alignment fault checking disabled when executing at PL1 or PL0. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.</td>
</tr>
<tr>
<td><strong>0b1</strong></td>
<td>Alignment fault checking enabled when executing at PL1 or PL0. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.</td>
</tr>
</tbody>
</table>

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

This field resets to 0.

### M, bit [0]

MMU enable for EL1 and EL0 stage 1 address translation. Possible values of this bit are:
Meaning

<table>
<thead>
<tr>
<th>M</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL1 and EL0 stage 1 address translation disabled.</td>
</tr>
<tr>
<td></td>
<td>See the SCTLR.I field for the behavior of instruction accesses to</td>
</tr>
<tr>
<td></td>
<td>Normal memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 and EL0 stage 1 address translation enabled.</td>
</tr>
</tbody>
</table>

In the Non-secure state the PE behaves as if the value of the SCTLR.M field is 0 for all purposes other than returning the value of a direct read of the field if either:

- EL2 is using AArch32 and the value of HCR \{DC, TGE\} is not \{0, 0\}.
- EL2 is using AArch64 and the value of HCR_EL2 \{DC, TGE\} is not \{0, 0\}.

This field resets to 0.

**Accessing the SCTLR**

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b0001</td>
<td>0b0000</td>
<td>0b000</td>
</tr>
</tbody>
</table>

    end if;
SDCR, Secure Debug Control Register

The SDCR characteristics are:

**Purpose**

Provides EL3 configuration options for self-hosted debug, trace, and the Performance Monitors Extension.

**Configuration**

AArch32 System register SDCR bits [31:0] can be mapped to AArch64 System register MDCR_EL3[31:0], but this is not architecturally mandated.

Some or all RW fields of this register have defined reset values. These apply whenever the register is accessible. This means they apply when the PE resets into EL3 using AArch32.

**Attributes**

SDCR is a 32-bit register.

**Field descriptions**

The SDCR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | MTPME | TDCC | RES0 | SCCD | RES0 | EPMAD | EDAD | TTRF | STE | RES0 | SPD | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 |

**Bits [31:29]**

Reserved, RES0.

**MTPME, bit [28]**

When ARMv8.6-MTPMU is implemented:

Multi-threaded PMU Enable. Enables use of the PMEVTYPER<n>.MT bits.

<table>
<thead>
<tr>
<th>MTPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ARMv8.6-MTPMU is disabled. The Effective value of PMEVTYPER&lt;n&gt;.MT is zero.</td>
</tr>
<tr>
<td>0b1</td>
<td>PMEVTYPER&lt;n&gt;.MT bits not affected by this bit.</td>
</tr>
</tbody>
</table>

If ARMv8.6-MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this bit is 0.

On a Cold reset, in a system where the PE resets into EL3, this field resets to 1.

Otherwise:

Reserved, RES0.

**TDCC, bit [27]**

When ARMv8.6-FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel in modes other than Monitor mode to Monitor mode.
TDCC

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any register accesses to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to the DCC registers in modes other than Monitor mode generate a Monitor Trap exception, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.</td>
</tr>
</tbody>
</table>

The DCC registers trapped by this control are:
- `DBGDTRRXext`, `DBGDTRTXext`, `DBGDSRint`, `DBGDCINT`, and, when the PE is in Non-debug state, `DBGDTRRXint` and `DBGDTRTXint`.

When the PE is in Debug state, SDCR.TDCC does not trap any accesses to:
- `DBGDTRRXint` and `DBGDTRTXint`.

In a system where the PE resets into EL3, this field resets to an architecturally `UNKNOWN` value.

**Otherwise:**

Reserved, RES0.

**Bits [26:24]**

Reserved, RES0.

**SCCD, bit [23]**

When ARMv8.5-PMU is implemented:

Secure Cycle Counter Disable. Prohibits `PMCCNTR` from counting in Secure state.

<table>
<thead>
<tr>
<th>SCCD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counting by <code>PMCCNTR</code> is not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Cycle counting by <code>PMCCNTR</code> is prohibited in Secure state.</td>
</tr>
</tbody>
</table>

This bit does not affect the CPU_CYCLES event or any other event that counts cycles.

In a system where the PE resets into EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bit [22]**

Reserved, RES0.

**EPMAD, bit [21]**

When ARMv8.4-Debug is implemented and PMUv3 is implemented:

External Performance Monitors Non-secure access disable. Controls Non-secure access to Performance Monitors registers by an external debugger.

<table>
<thead>
<tr>
<th>EPMAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure access to the Performance Monitors registers from an external debugger is permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure access to the Performance Monitors registers from an external debugger is not permitted.</td>
</tr>
</tbody>
</table>

If the Performance Monitors Extension does not support external debug interface accesses this bit is RES0.
Otherwise, if EL3 is not implemented and the Effective value of SCR.NS is \(0b0\), then the Effective value of this field is \(0b1\).

In a system where the PE resets into EL3, this field resets to \(0\).

**When PMUv3 is implemented:**

External Performance Monitors access disable. Controls access to Performance Monitors registers by an external debugger.

<table>
<thead>
<tr>
<th>EPMAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>(0b0)</td>
<td>Access to Performance Monitors registers from an external debugger is permitted.</td>
</tr>
<tr>
<td>(0b1)</td>
<td>Access to Performance Monitors registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.</td>
</tr>
</tbody>
</table>

If the Performance Monitors Extension does not support external debug interface accesses this bit is RES0.

Otherwise, if EL3 is not implemented and the Effective value of SCR.NS is \(0b0\), then the Effective value of this field is \(0b1\).

In a system where the PE resets into EL3, this field resets to \(0\).

**Otherwise:**

Reserved, RES0.

**EDAD, bit [20]**

**When ARMv8.4-Debug is implemented:**

External debug Non-secure access disable. Controls Non-secure access to breakpoint, watchpoint, and OSLAR_EL1 registers by an external debugger.

<table>
<thead>
<tr>
<th>EDAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>(0b0)</td>
<td>Non-secure access to debug registers from an external debugger is permitted.</td>
</tr>
<tr>
<td>(0b1)</td>
<td>Non-secure access to breakpoint registers, watchpoint registers, and OSLAR_EL1 from an external debugger is not permitted.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the Effective value of SCR.NS is \(0b0\), then the Effective value of this field is \(0b1\).

In a system where the PE resets into EL3, this field resets to \(0\).

**When ARMv8.2-Debug is implemented:**

External debug access disable. Controls access to breakpoint, watchpoint, and OSLAR_EL1 registers by an external debugger.

<table>
<thead>
<tr>
<th>EDAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>(0b0)</td>
<td>Access to debug registers from an external debugger is permitted.</td>
</tr>
<tr>
<td>(0b1)</td>
<td>Access to breakpoint registers, watchpoint registers and OSLAR_EL1 from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the Effective value of SCR.NS is \(0b0\), then the Effective value of this field is \(0b1\).

In a system where the PE resets into EL3, this field resets to \(0\).
Otherwise:

External debug access disable. Controls access to breakpoint, watchpoint, and optionally OSLAR_EL1 registers by an external debugger:

<table>
<thead>
<tr>
<th>EDAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to debug registers from an external debugger is permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access to breakpoint registers and watchpoint registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface. It is IMPLEMENTATION DEFINED whether access to the OSLAR_EL1 register from an external debugger is permitted or not permitted.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the Effective value of SCR.NS is 0b0, then the Effective value of this field is 0b1.

In a system where the PE resets into EL3, this field resets to 0.

**TTRF, bit [19]**

When ARMv8.4-Trace is implemented:

Trap Trace Filter controls. Controls whether accesses at EL2 and EL1 to the trace filter control registers are trapped to EL3.

<table>
<thead>
<tr>
<th>TTRF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to HTRFCR and TRFCR registers are not affected by this control bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>When not in Monitor mode, accesses to HTRFCR and TRFCR registers generate a Monitor Trap exception, unless the access generates a higher priority exception.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

**STE, bit [18]**

When ARMv8.4-Trace is implemented:

Secure Trace Enable. This bit enables tracing in Secure state and controls the level of authentication required by an external debugger to enable external tracing.

<table>
<thead>
<tr>
<th>STE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Trace is prohibited in Secure state unless overridden by the IMPLEMENTATION DEFINED authentication interface.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trace in Secure state is not affected by this bit.</td>
</tr>
</tbody>
</table>

This bit also controls the level of authentication required by an external debugger to enable external tracing. See ‘Register controls to enable self-hosted trace’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

If EL3 is not implemented and the Effective value of SCR.NS is 0b0, the PE behaves as if this bit is set to 0b1.

In a system where the PE resets into EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

**SPME, bit [17]**
**When ARMv8.2-Debug is implemented and PMUv3 is implemented:**

Secure Performance Monitors enable. This allows event counting in Secure state.

<table>
<thead>
<tr>
<th>SPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counting prohibited in Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counting allowed in Secure state.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the Effective value of SCR.NS is 0b0, then the Effective value of this bit is 0b1.

In a system where the PE resets into EL3, this field resets to 0.

**When PMUv3 is implemented:**

Secure Performance Monitors enable. This allows event counting in Secure state.

<table>
<thead>
<tr>
<th>SPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counting prohibited in Secure state, unless ExternalSecureNoninvasiveDebugEnabled() is TRUE.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counting allowed in Secure state.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the Effective value of SCR.NS is 0b0, then the Effective value of this bit is 0b1.

In a system where the PE resets into EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bit [16]**

Reserved, RES0.

**SPD, bits [15:14]**

AArch32 Secure self-hosted Privileged Debug. Enables or disables debug exceptions from EL3, other than Breakpoint Instruction exceptions

<table>
<thead>
<tr>
<th>SPD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Legacy mode. Debug exceptions from EL3 are enabled by the authentication interface.</td>
</tr>
<tr>
<td>0b10</td>
<td>Secure privileged debug disabled. Debug exceptions from EL3 are disabled.</td>
</tr>
<tr>
<td>0b11</td>
<td>Secure privileged debug enabled. Debug exceptions from EL3 are enabled.</td>
</tr>
</tbody>
</table>

Other values are reserved, and have the CONSTRAINED UNPREDICTABLE behavior that they must have the same behavior as 0b00. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field has no effect on Breakpoint Instruction exceptions. These are always enabled.

This field is ignored in Non-secure state.

If debug exceptions from EL3 are enabled, then debug exceptions from Secure EL0 are also enabled.

Otherwise, debug exceptions from Secure EL0 are enabled only if the value of SDER.SUIDEN is 0b1.

If EL3 is not implemented and the Effective value of SCR.NS is 0b0, then the Effective value of this field is 0b1.

In a system where the PE resets into EL3, this field resets to 0.
Bits [13:0]
Reserved, RES0.

Accessing the SDCR

Accesses to this register use the following encodings:

\[
\text{MRC\{}<c>\}\{}<q>\} <\text{coproc}, \{\}<\text{opc1}, <\text{Rt}, <\text{CRn}, <\text{CRm}\} \{\}, \{\}<\text{opc2}\}\}

SDER, Secure Debug Enable Register

The SDER characteristics are:

**Purpose**

Controls invasive and non-invasive debug in the Secure EL0 mode.

**Configuration**

AArch32 System register SDER bits [31:0] are architecturally mapped to AArch64 System register SDER32 EL3[31:0].

This register is present only when HaveEL(EL3) or the implemented Security state is Secure state. Otherwise, direct accesses to SDER are UNDEFINED.

This register is ignored by the PE when one or more of the following are true:

- The PE is in Non-secure state.
- EL1 is using AArch64.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

SDER is a 32-bit register.

**Field descriptions**

The SDER bit assignments are:

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0| SUNIDEN | SUIDEN |

**Bits [31:2]**

Reserved, RES0.

**SUNIDEN, bit [1]**

Secure User Non-Invasive Debug Enable.

<table>
<thead>
<tr>
<th>SUNIDEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This bit does not affect Performance Monitors event counting at Secure EL0</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL3 or EL1 is using AArch32, Performance Monitors event counting is allowed in Secure EL0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**SUIDEN, bit [0]**

Secure User Invasive Debug Enable.
**SDER, Secure Debug Enable Register**

<table>
<thead>
<tr>
<th>SUIDEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This bit does not affect the generation of debug exceptions at Secure EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL3 or EL1 is using AArch32, debug exceptions from Secure EL0 are enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

## Accessing the SDER

Accesses to this register use the following encodings:

\[
\text{MRC\{<c>\}{<q>} \{<opc1>\}, \{<CRn>\}, \{<CRm>\}\{<opc2>\}}
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b001</td>
<td>0b001</td>
<td>0b001</td>
</tr>
</tbody>
</table>

```c
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
  elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
    AArch32.TakeHypTrapException(0x03);
  elsif (!HaveEL(EL3) || !ELUsingAArch32(EL3)) && SCR_EL3.NS == '0' then
    return SDER;
  else
    UNDEFINED;
elsif PSTATE.EL == EL2 then
  UNDEFINED;
elsif PSTATE.EL == EL3 then
  return SDER;
end
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b001</td>
<td>0b001</td>
<td>0b001</td>
</tr>
</tbody>
</table>

```c
MCR\{<c>\}{<q>} \{<coproc>\}, \{<opc1>\}, \{<Rt>\}, \{<CRn>\}, \{<CRm>\}\{<opc2>\}
```

```c
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
  elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
    AArch32.TakeHypTrapException(0x03);
  elsif (!HaveEL(EL3) || !ELUsingAArch32(EL3)) && SCR_EL3.NS == '0' then
    SDER = R[t];
  else
    UNDEFINED;
elsif PSTATE.EL == EL2 then
  UNDEFINED;
elsif PSTATE.EL == EL3 then
  if SCR.NS == '0' && CP15SDISABLE2 == HIGH then
    UNDEFINED;
  else
    SDER = R[t];
```
SPSR, Saved Program Status Register

The SPSR characteristics are:

**Purpose**

Holds the saved process state for the current mode.

**Configuration**

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

SPSR is a 32-bit register.

**Field descriptions**

The SPSR bit assignments are:

```
  31  30  29  28  27  26  25  24  23  22  21  20  19  18  17  16  15  14  13  12  11  10  9  8  7  6  5  4  3  2  1  0
```

**N, bit [31]**

Set to the value of PSTATE.N on taking an exception to the current mode, and copied to PSTATE.N on executing an exception return operation in the current mode.

**Z, bit [30]**

Set to the value of PSTATE.Z on taking an exception to the current mode, and copied to PSTATE.Z on executing an exception return operation in the current mode.

**C, bit [29]**

Set to the value of PSTATE.C on taking an exception to the current mode, and copied to PSTATE.C on executing an exception return operation in the current mode.

**V, bit [28]**

Set to the value of PSTATE.V on taking an exception to the current mode, and copied to PSTATE.V on executing an exception return operation in the current mode.

**Q, bit [27]**

Set to the value of PSTATE.Q on taking an exception to the current mode, and copied to PSTATE.Q on executing an exception return operation in the current mode.

**IT[1:0], bits [26:25]**

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.
J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When ARMv8.0-SSBS is implemented:

Speculative Store Bypass Safe. This bit is set to the value of PSTATE.SSBS on taking an exception to the current mode, and copied to PSTATE.SSBS on executing an exception return operation in the current mode.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never. This bit is set to the value of PSTATE.PAN on taking an exception to the current mode, and copied to PSTATE.PAN on executing an exception return operation in the current mode.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When ARMv8.4-DIT is implemented:

Data Independent Timing. This bit is set to the value of PSTATE.DIT on taking an exception to the current mode, and copied to PSTATE.DIT on executing an exception return operation in the current mode.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

IT[7:2], bits [15:10]

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.
E, bit [9]

Endianness state bit. Controls the load and store endianness for data accesses:

<table>
<thead>
<tr>
<th>E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Little-endian operation</td>
</tr>
<tr>
<td>0b1</td>
<td>Big-endian operation</td>
</tr>
</tbody>
</table>

Instruction fetches ignore this bit.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

A, bit [8]

SError interrupt mask bit.

<table>
<thead>
<tr>
<th>A</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Exception not masked</td>
</tr>
<tr>
<td>0b1</td>
<td>Exception masked</td>
</tr>
</tbody>
</table>

I, bit [7]

IRQ mask bit.

<table>
<thead>
<tr>
<th>I</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Exception not masked</td>
</tr>
<tr>
<td>0b1</td>
<td>Exception masked</td>
</tr>
</tbody>
</table>

F, bit [6]

FIQ mask bit.

<table>
<thead>
<tr>
<th>F</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Exception not masked</td>
</tr>
<tr>
<td>0b1</td>
<td>Exception masked</td>
</tr>
</tbody>
</table>

T, bit [5]

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from.

<table>
<thead>
<tr>
<th>T</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Taken from A32 state</td>
</tr>
<tr>
<td>0b1</td>
<td>Taken from T32 state</td>
</tr>
</tbody>
</table>

M[4], bit [4]

Execution state that the exception was taken from.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>Exception taken from AArch32</td>
</tr>
</tbody>
</table>
M[3:0], bits [3:0]

AArch32 mode that an exception was taken from.

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>User.</td>
</tr>
<tr>
<td>0b0001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b0010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Supervisor.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Monitor (only valid in Secure state, if EL3 is implemented and can use AArch32).</td>
</tr>
<tr>

<td>Abort.</td>
</tr>
<tr>
<td>0b1010</td>
<td>Hyp.</td>
</tr>
<tr>
<td>0b1011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b1111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved.

Accessing the SPSR

SPSR can be read using the MRS instruction and written using the MSR (register) or MSR (immediate) instructions. For more details, see MRS, MSR (register), and MSR (immediate) in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
The SPSR_abt characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Abort mode.

**Configuration**

AArch32 System register SPSR_abt bits [31:0] are architecturally mapped to AArch64 System register SPSR_abt[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

SPSR_abt is a 32-bit register.

**Field descriptions**

The SPSR_abt bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Abort mode, and copied to PSTATE.N on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Abort mode, and copied to PSTATE.Z on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Abort mode, and copied to PSTATE.C on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Abort mode, and copied to PSTATE.V on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.
Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Abort mode, and copied to PSTATE.Q on executing an exception return operation in Abort mode.

This field resets to an architecturally **UNKNOWN** value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Abort mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Abort mode.

On executing an exception return operation in Abort mode SPSR_abt.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

**J, bit [24]**

RES0.

In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state. Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**SSBS, bit [23]**

*When ARMv8.0-SSBS is implemented:*

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Abort mode, and copied to PSTATE.SSBS on executing an exception return operation in Abort mode.

This field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**PAN, bit [22]**

*When ARMv8.1-PAN is implemented:*

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Abort mode, and copied to PSTATE.PAN on executing an exception return operation in Abort mode.

This field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**DIT, bit [21]**

*When ARMv8.4-DIT is implemented:*

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Abort mode, and copied to PSTATE.DIT on executing an exception return operation in Abort mode.

This field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Abort mode, and copied to PSTATE.IL on executing an exception return operation in Abort mode.

This field resets to an architecturally **UNKNOWN** value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Abort mode, and copied to PSTATE.GE on executing an exception return operation in Abort mode.

This field resets to an architecturally **UNKNOWN** value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Abort mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in Abort mode.

**SPSR_abt.IT** must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Abort mode, and copied to PSTATE.E on executing an exception return operation in Abort mode.

If the implementation does not support big-endian operation, SPSR_abt.E is RES0. If the implementation does not support little-endian operation, SPSR_abt.E is RES1. On executing an exception return operation in Abort mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_abt.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_abt.E is RES1.

This field resets to an architecturally **UNKNOWN** value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Abort mode, and copied to PSTATE.A on executing an exception return operation in Abort mode.

This field resets to an architecturally **UNKNOWN** value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Abort mode, and copied to PSTATE.I on executing an exception return operation in Abort mode.

This field resets to an architecturally **UNKNOWN** value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Abort mode, and copied to PSTATE.F on executing an exception return operation in Abort mode.

This field resets to an architecturally **UNKNOWN** value.
T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Abort mode, and copied to PSTATE.T on executing an exception return operation in Abort mode.

This field resets to an architecturally **UNKNOWN** value.

**M[4:0], bits [4:0]**

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Abort mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Abort mode.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10000</td>
<td>User.</td>
</tr>
<tr>
<td>0b10001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b10010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b10011</td>
<td>Supervisor.</td>
</tr>
<tr>
<td>0b10111</td>
<td>Abort.</td>
</tr>
<tr>
<td>0b11011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b11111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_abt.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Abort mode is an illegal return event, as described in 'Illegal return events from AArch32 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the SPSR_abt**

SPSR_abt is accessible in all modes other than User mode and Abort mode. For more details, see MRS (banked register) and MSR (banked register) in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Accesses to this register use the following encodings:

**MRS{<c>}{<q>} <Rd>, SPSR_abt**

<table>
<thead>
<tr>
<th>R</th>
<th>M</th>
<th>M1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>0b0100</td>
</tr>
</tbody>
</table>

**MSR{<c>}{<q>} SPSR_abt, <Rn>**

<table>
<thead>
<tr>
<th>R</th>
<th>M</th>
<th>M1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>0b0100</td>
</tr>
</tbody>
</table>
SPSR_fiq, Saved Program Status Register (FIQ mode)

The SPSR_fiq characteristics are:

Purpose

Holds the saved process state when an exception is taken to FIQ mode.

Configuration

AArch32 System register SPSR_fiq bits [31:0] are architecturally mapped to AArch64 System register SPSR_fiq[31:0]. RW fields in this register reset to architecturally UNKNOWN values.

Attributes

SPSR_fiq is a 32-bit register.

Field descriptions

The SPSR_fiq bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to FIQ mode, and copied to PSTATE.N on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to FIQ mode, and copied to PSTATE.Z on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to FIQ mode, and copied to PSTATE.C on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to FIQ mode, and copied to PSTATE.V on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to FIQ mode, and copied to PSTATE.Q on executing an exception return operation in FIQ mode.
SPSR_fiq, Saved Program Status Register (FIQ mode)

This field resets to an architecturally **UNKNOWN** value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to FIQ mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in FIQ mode.

On executing an exception return operation in FIQ mode SPSR_fiq.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

**J, bit [24]**

RES0.

In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state. Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**SSBS, bit [23]**

When Armv8.0-SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to FIQ mode, and copied to PSTATE.SSBS on executing an exception return operation in FIQ mode.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**PAN, bit [22]**

When Armv8.1-PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to FIQ mode, and copied to PSTATE.PAN on executing an exception return operation in FIQ mode.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**DIT, bit [21]**

When Armv8.4-DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to FIQ mode, and copied to PSTATE.DIT on executing an exception return operation in FIQ mode.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.
IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to FIQ mode, and copied to PSTATE.IL on executing an exception return operation in FIQ mode.

This field resets to an architecturally **UNKNOWN** value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to FIQ mode, and copied to PSTATE.GE on executing an exception return operation in FIQ mode.

This field resets to an architecturally **UNKNOWN** value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to FIQ mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in FIQ mode.

SPSR_fiq.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to FIQ mode, and copied to PSTATE.E on executing an exception return operation in FIQ mode.

If the implementation does not support big-endian operation, SPSR_fiq.E is **RES0**. If the implementation does not support little-endian operation, SPSR_fiq.E is **RES1**. On executing an exception return operation in FIQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_fiq.E is **RES0**, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_fiq.E is **RES1**.

This field resets to an architecturally **UNKNOWN** value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to FIQ mode, and copied to PSTATE.A on executing an exception return operation in FIQ mode.

This field resets to an architecturally **UNKNOWN** value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to FIQ mode, and copied to PSTATE.I on executing an exception return operation in FIQ mode.

This field resets to an architecturally **UNKNOWN** value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to FIQ mode, and copied to PSTATE.F on executing an exception return operation in FIQ mode.

This field resets to an architecturally **UNKNOWN** value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to FIQ mode, and copied to PSTATE.T on executing an exception return operation in FIQ mode.

This field resets to an architecturally **UNKNOWN** value.
**M[4:0], bits [4:0]**

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to FIQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in FIQ mode.

<tr>
<td>0b11111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_fiq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in FIQ mode is an illegal return event, as described in 'Illegal return events from AArch32 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the SPSR_fiq**

SPSR_fiq is accessible in all modes other than User mode and FIQ mode. For more details, see MRS (banked register) and MSR (banked register) in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Accesses to this register use the following encodings:

\[
\text{MRS\{<c>\}<q>\} <Rd>, SPSR_fiq}
\]

<table>

</table>
SPSR_hyp, Saved Program Status Register (Hyp mode)

The SPSR_hyp characteristics are:

Purpose

Holds the saved process state when an exception is taken to Hyp mode.

Configuration

AArch32 System register SPSR_hyp bits [31:0] are architecturally mapped to AArch64 System register SPSR_EL2[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

SPSR_hyp is a 32-bit register.

Field descriptions

The SPSR_hyp bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Hyp mode, and copied to PSTATE.N on executing an exception return operation in Hyp mode.

This field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Hyp mode, and copied to PSTATE.Z on executing an exception return operation in Hyp mode.

This field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Hyp mode, and copied to PSTATE.C on executing an exception return operation in Hyp mode.

This field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Hyp mode, and copied to PSTATE.V on executing an exception return operation in Hyp mode.

This field resets to an architecturally UNKNOWN value.
**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Hyp mode, and copied to PSTATE.Q on executing an exception return operation in Hyp mode.

This field resets to an architecturally **UNKNOWN** value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Hyp mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Hyp mode.

On executing an exception return operation in Hyp mode SPSR_hyp.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

**J, bit [24]**

RES0.

In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state. Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**SSBS, bit [23]**

When ARMv8.0-SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Hyp mode, and copied to PSTATE.SSBS on executing an exception return operation in Hyp mode.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**PAN, bit [22]**

When ARMv8.1-PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Hyp mode, and copied to PSTATE.PAN on executing an exception return operation in Hyp mode.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**DIT, bit [21]**

When ARMv8.4-DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Hyp mode, and copied to PSTATE.DIT on executing an exception return operation in Hyp mode.

This field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Hyp mode, and copied to PSTATE.IL on executing an exception return operation in Hyp mode.

This field resets to an architecturally **UNKNOWN** value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Hyp mode, and copied to PSTATE.GE on executing an exception return operation in Hyp mode.

This field resets to an architecturally **UNKNOWN** value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Hyp mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in Hyp mode.

SPSR_hyp.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to Hyp mode, and copied to PSTATE.E on executing an exception return operation in Hyp mode.

If the implementation does not support big-endian operation, SPSR_hyp.E is RES0. If the implementation does not support little-endian operation, SPSR_hyp.E is RES1. On executing an exception return operation in Hyp mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_hyp.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_hyp.E is RES1.

This field resets to an architecturally **UNKNOWN** value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Hyp mode, and copied to PSTATE.A on executing an exception return operation in Hyp mode.

This field resets to an architecturally **UNKNOWN** value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Hyp mode, and copied to PSTATE.I on executing an exception return operation in Hyp mode.

This field resets to an architecturally **UNKNOWN** value.

**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Hyp mode, and copied to PSTATE.F on executing an exception return operation in Hyp mode.

This field resets to an architecturally **UNKNOWN** value.
T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Hyp mode, and copied to PSTATE.T on executing an exception return operation in Hyp mode.

This field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Hyp mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Hyp mode.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>0b11111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_hyp.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Hyp mode is an illegal return event, as described in ‘Illegal return events from AArch32 state’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

Accessing the SPSR_hyp

SPSR_hyp is accessible only in Monitor mode. For more details, see MRS (banked register) and MSR (banked register) in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Accesses to this register use the following encodings:

**MRS{<c>}{<q>} <Rd>, SPSR_hyp**

```
<table>
<thead>
<tr>

<td>0b1</td>
<td>0b1110</td>
</tr>
</tbody>
</table>
```
SPSR_irq, Saved Program Status Register (IRQ mode)

The SPSR_irq characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to IRQ mode.

**Configuration**

AArch32 System register SPSR_irq bits [31:0] are architecturally mapped to AArch64 System register SPSR_irq[31:0]. RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

SPSR_irq is a 32-bit register.

**Field descriptions**

The SPSR_irq bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>

</tr>
</thead>
</table>

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to IRQ mode, and copied to PSTATE.N on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to IRQ mode, and copied to PSTATE.Z on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to IRQ mode, and copied to PSTATE.C on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to IRQ mode, and copied to PSTATE.V on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to IRQ mode, and copied to PSTATE.Q on executing an exception return operation in IRQ mode.
This field resets to an architecturally **UNKNOWN** value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to IRQ mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in IRQ mode.

On executing an exception return operation in IRQ mode SPSR_irq.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

**J, bit [24]**

RES0.

In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state. Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**SSBS, bit [23]**

When Armv8.0-SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to IRQ mode, and copied to PSTATE.SSBS on executing an exception return operation in IRQ mode.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**PAN, bit [22]**

When Armv8.1-PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to IRQ mode, and copied to PSTATE.PAN on executing an exception return operation in IRQ mode.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**DIT, bit [21]**

When Armv8.4-DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to IRQ mode, and copied to PSTATE.DIT on executing an exception return operation in IRQ mode.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.
IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to IRQ mode, and copied to PSTATE.IL on executing an exception return operation in IRQ mode.

This field resets to an architecturally **UNKNOWN** value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to IRQ mode, and copied to PSTATE.GE on executing an exception return operation in IRQ mode.

This field resets to an architecturally **UNKNOWN** value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to IRQ mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in IRQ mode.

SPSR_irq.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to IRQ mode, and copied to PSTATE.E on executing an exception return operation in IRQ mode.

If the implementation does not support big-endian operation, SPSR_irq.E is **RES0**. If the implementation does not support little-endian operation, SPSR_irq.E is **RES1**. On executing an exception return operation in IRQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_irq.E is **RES0**, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_irq.E is **RES1**.

This field resets to an architecturally **UNKNOWN** value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to IRQ mode, and copied to PSTATE.A on executing an exception return operation in IRQ mode.

This field resets to an architecturally **UNKNOWN** value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to IRQ mode, and copied to PSTATE.I on executing an exception return operation in IRQ mode.

This field resets to an architecturally **UNKNOWN** value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to IRQ mode, and copied to PSTATE.F on executing an exception return operation in IRQ mode.

This field resets to an architecturally **UNKNOWN** value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to IRQ mode, and copied to PSTATE.T on executing an exception return operation in IRQ mode.

This field resets to an architecturally **UNKNOWN** value.
M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to IRQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in IRQ mode.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10000</td>
<td>User.</td>
</tr>
<tr>
<td>0b10001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b10010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b10011</td>
<td>Supervisor.</td>
</tr>
<tr>
<td>0b11011</td>
<td>Abort.</td>
</tr>
<tr>
<td>0b11111</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b11111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_irq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in IRQ mode is an illegal return event, as described in 'Illegal return events from AArch32 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

Accessing the SPSR_irq

SPSR_irq is accessible in all modes other than User mode and IRQ mode. For more details, see MRS (banked register) and MSR (banked register) in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Accesses to this register use the following encodings:

**MRS{<c>}{<q>} <Rd>, SPSR_irq**

<table>

<td>0b1</td>
<td>0b0000</td>
</tr>
</tbody>
</table>
SPSR_mon, Saved Program Status Register (Monitor mode)

The SPSR_mon characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Monitor mode.

**Configuration**

AArch32 System register SPSR_mon bits [31:0] can be mapped to AArch64 System register $SPSR_{EL3}[31:0]$, but this is not architecturally mandated.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

SPSR_mon is a 32-bit register.

**Field descriptions**

The SPSR_mon bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Monitor mode, and copied to PSTATE.N on executing an exception return operation in Monitor mode.

This field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Monitor mode, and copied to PSTATE.Z on executing an exception return operation in Monitor mode.

This field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Monitor mode, and copied to PSTATE.C on executing an exception return operation in Monitor mode.

This field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Monitor mode, and copied to PSTATE.V on executing an exception return operation in Monitor mode.

This field resets to an architecturally UNKNOWN value.
Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Monitor mode, and copied to PSTATE.Q on executing an exception return operation in Monitor mode.

This field resets to an architecturally **UNKNOWN** value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Monitor mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Monitor mode.

On executing an exception return operation in Monitor mode SPSR_mon.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

**J, bit [24]**

RES0.

In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state. Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**SSBS, bit [23]**

*When Armv8.0-SSBS is implemented:*

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Monitor mode, and copied to PSTATE.SSBS on executing an exception return operation in Monitor mode.

This field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**PAN, bit [22]**

*When Armv8.1-PAN is implemented:*

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Monitor mode, and copied to PSTATE.PAN on executing an exception return operation in Monitor mode.

This field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**DIT, bit [21]**

*When Armv8.4-DIT is implemented:*

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Monitor mode, and copied to PSTATE.DIT on executing an exception return operation in Monitor mode.

This field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Monitor mode, and copied to PSTATE.IL on executing an exception return operation in Monitor mode.

This field resets to an architecturally **UNKNOWN** value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Monitor mode, and copied to PSTATE.GE on executing an exception return operation in Monitor mode.

This field resets to an architecturally **UNKNOWN** value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Monitor mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in Monitor mode.

SPSR_mon.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to Monitor mode, and copied to PSTATE.E on executing an exception return operation in Monitor mode.

If the implementation does not support big-endian operation, SPSR_mon.E is RES0. If the implementation does not support little-endian operation, SPSR_mon.E is RES1. On executing an exception return operation in Monitor mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_mon.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_mon.E is RES1.

This field resets to an architecturally **UNKNOWN** value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Monitor mode, and copied to PSTATE.A on executing an exception return operation in Monitor mode.

This field resets to an architecturally **UNKNOWN** value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Monitor mode, and copied to PSTATE.I on executing an exception return operation in Monitor mode.

This field resets to an architecturally **UNKNOWN** value.

**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Monitor mode, and copied to PSTATE.F on executing an exception return operation in Monitor mode.

This field resets to an architecturally **UNKNOWN** value.
T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Monitor mode, and copied to PSTATE.T on executing an exception return operation in Monitor mode.

This field resets to an architecturally **UNKNOWN** value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Monitor mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Monitor mode.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>User.</td>
</tr>
<tr>
<td>0b0001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b0010</td>

</tr>
<tr>
<td>0b1101</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b1111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_mon.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Monitor mode is an illegal return event, as described in ‘Illegal return events from AArch32 state’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the SPSR_mon**

SPSR_mon is only accessible in EL3 modes other than Monitor mode. For more details, see MRS (banked register) and MSR (banked register) in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Accesses to this register use the following encodings:

MRS{<c>}{<q>} <Rd>, SPSR_mon

<table>

</tbody>
</table>
SPSR_svc, Saved Program Status Register (Supervisor mode)

The SPSR_svc characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Supervisor mode.

**Configuration**

AArch32 System register SPSR_svc bits [31:0] are architecturally mapped to AArch64 System register SPSR_EL1[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

SPSR_svc is a 32-bit register.

**Field descriptions**

The SPSR_svc bit assignments are:

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
```

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Supervisor mode, and copied to PSTATE.N on executing an exception return operation in Supervisor mode.

This field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Supervisor mode, and copied to PSTATE.Z on executing an exception return operation in Supervisor mode.

This field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Supervisor mode, and copied to PSTATE.C on executing an exception return operation in Supervisor mode.

This field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Supervisor mode, and copied to PSTATE.V on executing an exception return operation in Supervisor mode.

This field resets to an architecturally UNKNOWN value.
Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Supervisor mode, and copied to PSTATE.Q on executing an exception return operation in Supervisor mode.

This field resets to an architecturally **UNKNOWN** value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Supervisor mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Supervisor mode.

On executing an exception return operation in Supervisor mode SPSR_svc.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**SSBS, bit [23]**

When ARMv8.0-SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Supervisor mode, and copied to PSTATE.SSBS on executing an exception return operation in Supervisor mode.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**PAN, bit [22]**

When ARMv8.1-PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Supervisor mode, and copied to PSTATE.PAN on executing an exception return operation in Supervisor mode.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**DIT, bit [21]**

When ARMv8.4-DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Supervisor mode, and copied to PSTATE.DIT on executing an exception return operation in Supervisor mode.

This field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Supervisor mode, and copied to PSTATE.IL on executing an exception return operation in Supervisor mode.

This field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Supervisor mode, and copied to PSTATE.GE on executing an exception return operation in Supervisor mode.

This field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Supervisor mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in Supervisor mode.

SPSR_svc.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Supervisor mode, and copied to PSTATE.E on executing an exception return operation in Supervisor mode.

If the implementation does not support big-endian operation, SPSR_svc.E is RES0. If the implementation does not support little-endian operation, SPSR_svc.E is RES1. On executing an exception return operation in Supervisor mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_svc.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_svc.E is RES1.

This field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Supervisor mode, and copied to PSTATE.A on executing an exception return operation in Supervisor mode.

This field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Supervisor mode, and copied to PSTATE.I on executing an exception return operation in Supervisor mode.

This field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Supervisor mode, and copied to PSTATE.F on executing an exception return operation in Supervisor mode.

This field resets to an architecturally UNKNOWN value.
**T, bit [5]**

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Supervisor mode, and copied to PSTATE.T on executing an exception return operation in Supervisor mode.

This field resets to an architecturally **UNKNOWN** value.

**M[4:0], bits [4:0]**

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Supervisor mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Supervisor mode.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10000</td>
<td>User.</td>
</tr>
<tr>
<td>0b10001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b10010</td>
<td>IRQ.</td>
</tr>

</tr>
<tr>
<td>0b11111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_svc.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Supervisor mode is an illegal return event, as described in 'Illegal return events from AArch32 state’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the SPSR_svc**

SPSR_svc is accessible in all modes other than User mode and Supervisor mode. For more details, see MRS (banked register) and MSR (banked register) in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Accesses to this register use the following encodings:

**MRS{<c>}{<q>} <Rd>, SPSR_svc**

<table>
<thead>
<tr>
<th>R</th>
<th>M</th>
<th>M1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>0b0010</td>
</tr>
</tbody>
</table>

**MSR{<c>}{<q>} SPSR_svc, <Rn>**

<table>
<thead>
<tr>
<th>R</th>
<th>M</th>
<th>M1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>0b0010</td>
</tr>
</tbody>
</table>
The SPSR_und characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Undefined mode.

**Configuration**

AArch32 System register SPSR_und bits [31:0] are architecturally mapped to AArch64 System register SPSR_und[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

SPSR_und is a 32-bit register.

**Field descriptions**

The SPSR_und bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>N</td>
<td>Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Undefined mode, and copied to PSTATE.N on executing an exception return operation in Undefined mode. This field resets to an architecturally UNKNOWN value.</td>
</tr>
<tr>
<td>30</td>
<td>Z</td>
<td>Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Undefined mode, and copied to PSTATE.Z on executing an exception return operation in Undefined mode. This field resets to an architecturally UNKNOWN value.</td>
</tr>
<tr>
<td>29</td>
<td>C</td>
<td>Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Undefined mode, and copied to PSTATE.C on executing an exception return operation in Undefined mode. This field resets to an architecturally UNKNOWN value.</td>
</tr>
<tr>
<td>28</td>
<td>V</td>
<td>Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Undefined mode, and copied to PSTATE.V on executing an exception return operation in Undefined mode. This field resets to an architecturally UNKNOWN value.</td>
</tr>
</tbody>
</table>
Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Undefined mode, and copied to PSTATE.Q on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

IT[1:0], bits [26:25]

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Undefined mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Undefined mode.

On executing an exception return operation in Undefined mode SPSR_und.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When ARMv8.0-SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Undefined mode, and copied to PSTATE.SSBS on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Undefined mode, and copied to PSTATE.PAN on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When ARMv8.4-DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Undefined mode, and copied to PSTATE.DIT on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Undefined mode, and copied to
PSTATE.IL on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Undefined mode, and copied to
PSTATE.GE on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Undefined mode, and copied to PSTATE.IT[7:2]
on executing an exception return operation in Undefined mode.

SPSR_und.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Undefined mode, and copied to PSTATE.E on
executing an exception return operation in Undefined mode.

If the implementation does not support big-endian operation, SPSR_und.E is RES0. If the implementation does not
support little-endian operation, SPSR_und.E is RES1. On executing an exception return operation in Undefined mode, if
the implementation does not support big-endian operation at the Exception level being returned to, SPSR_und.E is
RES0, and if the implementation does not support little-endian operation at the Exception level being returned to,
SPSR_und.E is RES1.

This field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Undefined mode, and copied to PSTATE.A on
executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Undefined mode, and copied to PSTATE.I
on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Undefined mode, and copied to PSTATE.F
on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.
T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Undefined mode, and copied to PSTATE.T on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Undefined mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Undefined mode.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10000</td>
<td>User.</td>
</tr>
<tr>
<td>0b10001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b10010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b10011</td>
<td>Supervisor.</td>
</tr>
<tr>
<td>0b10111</td>
<td>Abort.</td>
</tr>
<tr>
<td>0b11011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b11111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_und.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Undefined mode is an illegal return event, as described in ‘Illegal return events from AArch32 state’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

Accessing the SPSR_und

SPSR_und is accessible in all modes other than User mode and Undefined mode. For more details, see MRS (banked register) and MSR (banked register) in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Accesses to this register use the following encodings:

MRS{<c>}{<q>} <Rd>, SPSR_und

<table>

TCMTR, TCM Type Register

The TCMTR characteristics are:

**Purpose**

Provides information about the implementation of the TCM.

**Configuration**

If EL1 or above can use AArch32 then this register must be implemented.

**Attributes**

TCMTR is a 32-bit register.

**Field descriptions**

The TCMTR bit assignments are:

<table>

TLBIALL, TLB Invalidate All

The TLBIALL characteristics are:

**Purpose**

Invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
  - Would be required for the EL1&0 translation regime.
  - Match the current VMID, if EL2 is implemented and enabled in the current Security state.

- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.

- If executed at EL2, and if EL2 is enabled in the current Security state, the stage 1 or stage 2 translation table entries that would be required for the PL1&0 translation regime and matches the current VMID.

The invalidation only applies to the PE that executes this System instruction.

**Configuration**

**Attributes**

TLBIALL is a 32-bit System instruction.

**Field descriptions**

TLBIALL ignores the value in the register specified by the instruction encoding. Software does not have to write a value to the register before issuing this instruction.

**Executing the TLBIALL instruction**

Accesses to this instruction use the following encodings:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>

The TLBIALLH characteristics are:

**Purpose**

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime.

The invalidation only applies to the PE that executes this System instruction.

**Configuration**

**Attributes**

TLBIALLH is a 32-bit System instruction.

**Field descriptions**

TLBIALLH ignores the value in the register specified by the instruction encoding. Software does not have to write a value to the register before issuing this instruction.

**Executing the TLBIALLH instruction**

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is **CONSTRAINED UNPREDICTABLE**, and one of the following behaviors must occur:

- The instruction is **UNDEFINED**.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

        else
            TLBIALLH();
    ```
TLBIALLHIS, TLB Invalidate All, Hyp mode, Inner Shareable

The TLBIALLHIS characteristics are:

**Purpose**

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Configuration**

**Attributes**

TLBIALLHIS is a 32-bit System instruction.

**Field descriptions**

TLBIALLHIS ignores the value in the register specified by the instruction encoding. Software does not have to write a value to the register before issuing this instruction.

**Executing the TLBIALLHIS instruction**

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

TLBIALLNSNH, TLB Invalidate All, Non-Secure Non-Hyp

The TLBIALLNSNH characteristics are:

**Purpose**

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for stage 1 or stage 2 of the Non-secure PL1&0 translation regime, regardless of the associated VMID.

The invalidation only applies to the PE that executes this System instruction.

**Configuration**

**Attributes**

TLBIALLNSNH is a 32-bit System instruction.

**Field descriptions**

TLBIALLNSNH ignores the value in the register specified by the instruction encoding. Software does not have to write a value to the register before issuing this instruction.

**Executing the TLBIALLNSNH instruction**

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings:

\[
\text{MCR}\{<c>\}{<q>} <\text{coproc}>, \{#<\text{opc1}\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}\}{, \{#<\text{opc2}\}}
\]

TLBIALLNSNHIS, TLB Invalidate All, Non-Secure Non-Hyp, Inner Shareable

The TLBIALLNSNHIS characteristics are:

**Purpose**

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for stage 1 or stage 2 of the Non-secure PL1&0 translation regime, regardless of the associated VMID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Configuration**

**Attributes**

TLBIALLNSNHIS is a 32-bit System instruction.

**Field descriptions**

TLBIALLNSNHIS ignores the value in the register specified by the instruction encoding. Software does not have to write a value to the register before issuing this instruction.

**Executing the TLBIALLNSNHIS instruction**

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONstrained UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>

```
TLBIASID, TLB Invalidate by ASID match

The TLBIASID characteristics are:

**Purpose**

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

**Configuration**

**Attributes**

TLBIASID is a 32-bit System instruction.

**Field descriptions**

The TLBIASID input value bit assignments are:

<table>
<thead>

  elseif SCR.NS == '0' then
    //no operation
  else
    TLBIIPAS2(R[t]);
  endif
endif
```
The TLBIIPAS2LIS characteristics are:

**Purpose**

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- SCR NS is 1.
- The entry would be used for the specified IPA.
- The entry would be used with the current VMID.
- The entry would be required for the PL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Configuration**

**Note**

This System instruction is not implemented in architecture versions before Armv8.

**Attributes**

TLBIIPAS2LIS is a 32-bit System instruction.

**Field descriptions**

The TLBIIPAS2LIS input value bit assignments are:

<table>
<thead>
<tr>

  end
TLBIMVA, TLB Invalidate by VA

The TLBIMVA characteristics are:

**Purpose**

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

**Configuration**

**Attributes**

TLBIMVA is a 32-bit System instruction.

**Field descriptions**

The TLBIMVA input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>VA</td>
</tr>
<tr>
<td>30</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>29</td>
<td>ASID</td>
</tr>
</tbody>
</table>

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

**Executing the TLBIMVA instruction**

Accesses to this instruction use the following encodings:
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T8 == '1' then

    TLBIMVAIS(R[t]);
  else
    TLBIMVA(R[t]);
elsif PSTATE.EL == EL2 then
  TLBIMVA(R[t]);
elsif PSTATE.EL == EL3 then
  TLBIMVA(R[t]);
TLBIMVAA, TLB Invalidate by VA, All ASID

The TLBIMVAA characteristics are:

**Purpose**

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified address.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

**Configuration**

**Attributes**

TLBIMVAA is a 32-bit System instruction.

**Field descriptions**

The TLBIMVAA input value bit assignments are:

<table>

The TLBIMVAIS characteristics are:

**Purpose**

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Configuration**

**Attributes**

TLBIMVALID, TLB Invalidate by VA, Last level, Inner Shareable

The TLBIMVALID characteristics are:

**Purpose**

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Configuration**

This System instruction is not implemented in architecture versions before Armv8.

**Attributes**

TLBIMVALID is a 32-bit System instruction.

**Field descriptions**

The TLBIMVALID input value bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| VA | RES0 | ASID |

**VA, bits [31:12]**

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

**Bits [11:8]**

Reserved, RES0.

**ASID, bits [7:0]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.
Executing the TLBIMVALIS instruction

Accesses to this instruction use the following encodings:

\[
\text{MCR}\{<c>\}{<q>}\ <\text{coproc}>, \{#\}<\text{opc1}>, \ <\text{Rt}>, \ <\text{CRn}>, \ <\text{CRm}>{{}\{, \{#\}<\text{opc2}\}}}
\]

elsif PSTATE.EL == EL3 then
  TLBIMVAL(R[t]);
The TLBTR characteristics are:

**Purpose**

Provides information about the TLB implementation. The register must define whether the implementation provides separate instruction and data TLBs, or a unified TLB. Normally, the IMPLEMENTATION DEFINED information in this register includes the number of lockable entries in the TLB.

**Configuration**

**Attributes**

TLBTR is a 32-bit register.

**Field descriptions**

The TLBTR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
<tr>
<td>30</td>

</tr>
<tr>
<td>29</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
<tr>
<td>0</td>
<td>nU, bit [0]</td>
</tr>
</tbody>
</table>

nU, bit [0]

Not Unified TLB. Indicates whether the implementation has a unified TLB:

<table>
<thead>
<tr>
<th>nU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Unified TLB.</td>
</tr>
<tr>
<td>0b1</td>
<td>Separate Instruction and Data TLBs.</td>
</tr>
</tbody>
</table>

**Accessing the TLBTR**

Accesses to this register use the following encodings:

\[

eendif
TPIDRPRW, PL1 Software Thread ID Register

The TPIDRPRW characteristics are:

**Purpose**

Provides a location where software executing at EL1 or higher can store thread identifying information that is not visible to software executing at EL0, for OS management purposes.

The PE makes no use of this register.

**Configuration**

AArch32 System register TPIDRPRW bits [31:0] are architecturally mapped to AArch64 System register TPIDR_EL1[31:0].

**Note**

The PE never updates this register.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

TPIDRPRW is a 32-bit register.

**Field descriptions**

The TPIDRPRW bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>Thread ID. Thread identifying information stored by software running at this Exception level. This field resets to an architecturally UNKNOWN value.</td>
</tr>
</tbody>
</table>

**Accessing the TPIDRPRW**

Accesses to this register use the following encodings:

TPIDRURO, PL0 Read-Only Software Thread ID Register

The TPIDRURO characteristics are:

**Purpose**

Provides a location where software executing at EL1 or higher can store thread identifying information that is visible to software executing at EL0, for OS management purposes.

The PE makes no use of this register.

**Configuration**

AArch32 System register TPIDRURO bits [31:0] are architecturally mapped to AArch64 System register TPIDRRO_EL0[31:0].

**Note**

The PE never updates this register.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

TPIDRURO is a 32-bit register.

**Field descriptions**

The TPIDRURO bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Thread ID</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Thread ID. Thread identifying information stored by software running at this Exception level.

This field resets to an architecturally UNKNOWN value.

**Accessing the TPIDRURO**

TRFCR, Trace Filter Control Register

The TRFCR characteristics are:

**Purpose**

Provides EL1 controls for Trace.

**Configuration**

AArch32 System register TRFCR bits [31:0] are architecturally mapped to AArch64 System register TRFCR_EL1[31:0].

This register is present only when Armv8.4-Trace is implemented. Otherwise, direct accesses to TRFCR are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

TRFCR is a 32-bit register.

**Field descriptions**

The TRFCR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>RES0</td>
<td>TS</td>
</tr>
</tbody>
</table>

**Bits [31:7]**

Reserved, RES0.

**TS, bits [6:5]**

Timestamp Control. Controls which timebase is used for trace timestamps.

<table>
<thead>
<tr>
<th>TS</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>Virtual timestamp. The traced timestamp is the physical counter value, minus the value of CNTVOFF.</td>
<td>When ARMv8.6-ECV is implemented</td>
</tr>
<tr>
<td>0b10</td>
<td>Guest Physical timestamp. The traced timestamp is the physical counter value, minus the value of CNTPOFF_EL2.</td>
<td>When ARMv8.6-ECV is implemented</td>
</tr>
<tr>
<td>0b11</td>
<td>Physical timestamp. The traced timestamp is the physical counter value.</td>
<td></td>
</tr>
</tbody>
</table>

All other values are reserved.

This field is ignored if any of the following are true:

- SelfHostedTraceEnabled() == FALSE.
- HTRFCR.TS is not 0b00.

When EL2 is implemented and enabled in the current Security state, the physical counter uses a fixed physical offset of zero if either of the following are true:
• **CNTHCTL_EL2** ECV is 0.
• **SCR_EL3** ECVEn is 0.
• **HCR_EL2** {E2H, TGE} is {1, 1}.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [4:2]**

Reserved, **RES0**.

**E1TRE, bit [1]**

EL1 Trace Enable.

<table>
<thead>
<tr>
<th>E1TRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Tracing is prohibited in PL1 modes.</td>
</tr>
<tr>
<td>0b1</td>
<td>Tracing is allowed in PL1 modes.</td>
</tr>
</tbody>
</table>

This field is ignored if SelfHostedTraceEnabled() == FALSE.

On a Warm reset, this field resets to 0.

**E0TRE, bit [0]**

EL0 Trace Enable.

<table>
<thead>
<tr>
<th>E0TRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Tracing is prohibited at EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Tracing is allowed at EL0.</td>
</tr>
</tbody>
</table>

This field is ignored if any of the following are true:

- SelfHostedTraceEnabled() == FALSE.
- EL2 is implemented and enabled in the current security state and **HCR.TGE** == 1.

On a Warm reset, this field resets to 0.

**Accessing the TRFCR**

        UNDEFINED;
else
    TRFCR = R[t];
TTBCR, Translation Table Base Control Register

The TTBCR characteristics are:

**Purpose**

The control register for stage 1 of the PL1&0 translation regime. Its controls include:

- Where the VA range is split between addresses translated using TTBR0 and addresses translated using TTBR1.
- The translation table format used by this stage of translation.

From Armv8.2, when the value of TTBCR.{EAE, T2E} is {1, 1}, TTBCR is used with TTBCR2.

**Configuration**

AArch32 System register TTBCR bits [31:0] are architecturally mapped to AArch64 System register TCR_EL1[31:0].

The current translation table format determines which format of the register is used.

Some RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 then:

- The EAE bit resets to 0 in both the Secure and the Non-secure instances of the register.
- Other reset values apply only to the Secure instance of the register.

**Attributes**

TTBCR is a 32-bit register.

**Field descriptions**

The TTBCR bit assignments are:

**When TTBCR.EAE == 0:**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| EAE | RES0 | PD1 | PD0 | RES0 | N |

**EAE, bit [31]**

Extended Address Enable. The meanings of the possible values of this bit are:

<table>
<thead>
<tr>
<th>EAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 0</td>
<td>Use the VMSAv8-32 translation system with the Short-descriptor translation table format.</td>
</tr>
</tbody>
</table>

This field resets to 0.

**Bits [30:6]**

Reserved, RES0.

**PD1, bit [5]**

Translation table walk disable for translations using TTBR1. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR1. The encoding of this bit is:
**PD1**

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0  Perform translation table walks using TTBR1.</td>
</tr>
<tr>
<td>0b1  A TLB miss on an address that is translated using TTBR1 generates a Translation fault. No translation table walk is performed.</td>
</tr>
</tbody>
</table>

This field resets to 0.

**PD0, bit [4]**

Translation table walk disable for translations using TTBR0. This bit controls whether a translation table walk is performed on a TLB miss for an address that is translated using TTBR0. The encoding of this bit is:

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0  Perform translation table walks using TTBR0.</td>
</tr>
<tr>
<td>0b1  A TLB miss on an address that is translated using TTBR0 generates a Translation fault. No translation table walk is performed.</td>
</tr>
</tbody>
</table>

This field resets to 0.

**Bit [3]**

Reserved, RES0.

**N, bits [2:0]**

Indicate the width of the base address held in TTBR0. In TTBR0, the base address field is bits[31:14-N]. The value of N also determines:

- Whether TTBR0 or TTBR1 is used as the base address for translation table walks.
- The size of the translation table pointed to by TTBR0.

N can take any value from 0 to 7, that is, from 0b000 to 0b111.

When N has its reset value of 0, the translation table base is compatible with Armv5 and Armv6.

This field resets to 0.

**When TTBCR.EAE == 1:**

**EAE, bit [31]**

Extended Address Enable. The meanings of the possible values of this bit are:

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1  Use the VMSAv8-32 translation system with the Long-descriptor translation table format.</td>
</tr>
</tbody>
</table>

This field resets to 0.

**IMPLEMENTATION DEFINED, bit [30]**

IMPLEMENTATION DEFINED.

This field resets to 0.
SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using TTBR1. Defined values are:

<table>
<thead>
<tr>
<th>SH1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Unallocated values in fields of AArch32 System registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section K1.1.11.

This field resets to 0.

ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using TTBR1.

<table>
<thead>
<tr>
<th>ORGN1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
</tbody>
</table>
| 0b01   | Normal memory, Outer Write-Back Read-Allocate Write-
          Allocate Cacheable.                                  |
| 0b10   | Normal memory, Outer Write-Through Read-Allocate No Write-
          Allocate Cacheable.                                  |
| 0b11   | Normal memory, Outer Write-Back Read-Allocate No Write-
          Allocate Cacheable.                                  |

This field resets to 0.

IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using TTBR1.

<table>
<thead>
<tr>
<th>IRGN1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
</tbody>
</table>
| 0b01   | Normal memory, Inner Write-Back Read-Allocate Write-
          Allocate Cacheable.                                  |
| 0b10   | Normal memory, Inner Write-Through Read-Allocate No Write-
          Allocate Cacheable.                                  |
| 0b11   | Normal memory, Inner Write-Back Read-Allocate No Write-
          Allocate Cacheable.                                  |

This field resets to 0.

EPD1, bit [23]

Translation table walk disable for translations using TTBR1. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR1. The encoding of this bit is:

<table>
<thead>
<tr>
<th>EPD1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Perform translation table walks using TTBR1.</td>
</tr>
</tbody>
</table>
| 0b1    | A TLB miss on an address that is translated using TTBR1
          generates a Translation fault. No translation table walk
          is performed.                                     |

This field resets to 0.

A1, bit [22]

Selects whether TTBR0 or TTBR1 defines the ASID. The encoding of this bit is:

<table>
<thead>
<tr>
<th>A1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TTBR0 ASID defines the ASID.</td>
</tr>
<tr>
<td>0b1</td>
<td>TTBR1 ASID defines the ASID.</td>
</tr>
</tbody>
</table>
This field resets to 0.

**Bits [21:19]**

Reserved, RES0.

**T1SZ, bits [18:16]**

See 'Selecting between TTBR0 and TTBR1, VMSAv8-32 Long Descriptor translation table format' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile for how TTBCR, {T1SZ, T0SZ} determine the input address ranges and memory region sizes translated using TTBR0 and TTBR1.

This field resets to 0.

**Bits [15:14]**

Reserved, RES0.

**SH0, bits [13:12]**

Shareability attribute for memory associated with translation table walks using TTBR0.

<table>
<thead>
<tr>
<th>SH0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Unallocated values in fields of AArch32 System registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section K1.1.11.

This field resets to 0.

**ORGN0, bits [11:10]**

Outer cacheability attribute for memory associated with translation table walks using TTBR0.

<table>
<thead>
<tr>
<th>ORGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to 0.

**IRGN0, bits [9:8]**

Inner cacheability attribute for memory associated with translation table walks using TTBR0.

<table>
<thead>
<tr>
<th>IRGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to 0.
**EPD0, bit [7]**

Translation table walk disable for translations using **TTBR0**. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using **TTBR0**. The encoding of this bit is:

<table>
<thead>
<tr>
<th>EPD0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Perform translation table walks using <strong>TTBR0</strong>.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on an address that is translated using <strong>TTBR0</strong> generates a Translation fault. No translation table walk is performed.</td>
</tr>
</tbody>
</table>

This field resets to 0.

**T2E, bit [6]**

When **ARMv8.2-AA32HPD** is implemented:

TTBCR2 Enable.

<table>
<thead>
<tr>
<th>T2E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><strong>TTBCR2</strong> is disabled. The contents of <strong>TTBCR2</strong> are treated as 0 for all purposes other than reading or writing the register.</td>
</tr>
<tr>
<td>0b1</td>
<td><strong>TTBCR2</strong> is enabled.</td>
</tr>
</tbody>
</table>

If **TTBCR.EAE==0**, then the behavior is as if the bit is 0.

Otherwise:

Reserved, **RES0**.

**Bits [5:3]**

Reserved, **RES0**.

**T0SZ, bits [2:0]**

See 'Selecting between TTBR0 and TTBR1, VMSAv8-32 Long-descriptor translation table format' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile for how **TTBCR**.{T1SZ, T0SZ} determine the input address ranges and memory region sizes translated using **TTBR0** and **TTBR1**.

This field resets to 0.

**Accessing the TTBCR**

Accesses to this register use the following encodings:

\[
\text{MRC\{<c>\}{<q>} <coproc>, {},<opc1>,<Rt>,<CRn>,<CRm>{, {},<opc2>}}
\]

<table>
<thead>
<tr>

TTBCR2, Translation Table Base Control Register 2

The TTBCR2 characteristics are:

**Purpose**

The second control register for stage 1 of the PL1&0 translation regime.

If ARMv8.2-AA32HPD is not implemented then this register is not implemented and its encoding is UNDEFINED. Otherwise:

- When the value of TTBCR, {EAE, T2E} is not {1, 1} the contents of TTBCR2 are treated as zero for all purposes other than reading or writing the register.
- When the value of TTBCR, {EAE, T2E} is {1, 1} TTBCR2 is used with TTBCR.

**Configuration**

AArch32 System register TTBCR2 bits [31:0] are architecturally mapped to AArch64 System register $TCR_EL1[63:32]$.

This register is present only when ARMv8.2-AA32HPD is implemented. Otherwise, direct accesses to TTBCR2 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

TTBCR2 is a 32-bit register.

**Field descriptions**

The TTBCR2 bit assignments are:

<table>

</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of TTBCR.T2E is 0.

This field resets to an architecturally UNKNOWN value.

### Otherwise:

Reserved, RES0.
HWU060, bit [12]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR0.

<table>
<thead>
<tr>
<th>HWU060</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For translations using TTBR0, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>For translations using TTBR0, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of TTBCR.T2E is 0. This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU059, bit [11]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR0.

<table>
<thead>
<tr>
<th>HWU059</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For translations using TTBR0, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>For translations using TTBR0, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of TTBCR.T2E is 0. This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD1, bit [10]

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the translation tables pointed to by TTBR1.

<table>
<thead>
<tr>
<th>HPD1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hierarchical permissions are enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hierarchical permissions are disabled if TTBCR.T2E == 1.</td>
</tr>
</tbody>
</table>

When disabled, the permissions are treated as if the bits are 0.

The Effective value of this field is 0 if the value of TTBCR.T2E is 0. This field resets to an architecturally UNKNOWN value.
HPD0, bit [9]

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the translation tables pointed to by TTBR0.

<table>
<thead>
<tr>
<th>HPD0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hierarchical permissions are enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hierarchical permissions are disabled if TTBCR.T2E == 1.</td>
</tr>
</tbody>
</table>

When disabled, the permissions are treated as if the bits are 0.

The Effective value of this field is 0 if the value of TTBCR.T2E is 0.

This field resets to an architecturally UNKNOWN value.

Bits [8:0]

Reserved, RES0.

Accessing the TTBCR2

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>

TTBR0, Translation Table Base Register 0

The TTBR0 characteristics are:

**Purpose**

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the PL1&0 translation regime, and other information for this translation regime.

**Configuration**

AArch32 System register TTBR0 bits [63:0] are architecturally mapped to AArch64 System register TTBR0_EL1[63:0].

TTBCR.EAE determines which TTBR0 format is used:

- TTBCR.EAE == 0b0: 32-bit format is used. TTBR0[63:32] are ignored.
- TTBCR.EAE == 0b1: 64-bit format is used.

When EL3 is using AArch32, write access to TTBR0(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

Used in conjunction with the TTBCR. When the 64-bit TTBR0 format is used, cacheability and shareability information is held in the TTBCR, not in TTBR0.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

TTBR0 is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

**Field descriptions**

The TTBR0 bit assignments are:

**When TTBCR.EAE == 0:**

<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [63:32]

Reserved, RES0.

**TTB0, bits [31:7]**

Translation table base address, bits[31:x], where x is 14-(TTBCR.N). Register bits [x-1:7] are RES0, with the additional requirement that if these bits are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:7] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

This field resets to an architecturally UNKNOWN value.
**IRGN[0], bit [6]**

This field is bit[0] of IRGN[1:0].

Inner region bits. Bits [0,6] of this register together indicate the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

<table>
<thead>
<tr>
<th>IRGN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>01</td>
<td>Normal memory, Inner Write-Back Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>10</td>
<td>Normal memory, Inner Write-Through Cacheable.</td>
</tr>
<tr>
<td>11</td>
<td>Normal memory, Inner Write-Back no Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

**Note**

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for ARMv7 without the Multiprocessing Extensions can run unmodified on an implementation that includes the functionality introduced by the ARMv7 Multiprocessing Extensions.

The IRGN field is split as follows:

- IRGN[0] is TTBR0[6].
- IRGN[1] is TTBR0[0].

This field resets to an architecturally UNKNOWN value.

**NOS, bit [5]**

Not Outer Shareable. When the value of TTBR0.S is 1, indicates whether the memory associated with a translation table walk is Inner Shareable or Outer Shareable:

<table>
<thead>
<tr>
<th>NOS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Memory is Outer Shareable.</td>
</tr>
<tr>
<td>0b1</td>
<td>Memory is Inner Shareable.</td>
</tr>
</tbody>
</table>

This bit is ignored when the value of TTBR0.S is 0.

This field resets to an architecturally UNKNOWN value.

**RGN, bits [4:3]**

Region bits. Indicates the Outer cacheability attributes for the memory associated with the translation table walks:

<table>
<thead>
<tr>
<th>RGN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b1</td>
<td>Normal memory, Outer Write-Back Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back no Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**IMP, bit [2]**

The effect of this bit is IMPLEMENTATION DEFINED. If the translation table implementation does not include any IMPLEMENTATION DEFINED features this bit is RES0.

This field resets to an architecturally UNKNOWN value.

**S, bit [1]**

Shareable. Indicates whether the memory associated with the translation table walks is Non-shareable:
Meaning

<table>
<thead>
<tr>
<th>S</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Memory is Non-shareable.</td>
</tr>
<tr>
<td>0b1</td>
<td>Memory is shareable. The TTBR0.NOS field indicates whether the memory is Inner Shareable or Outer Shareable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally `UNKNOWN` value.

**IRGN[1], bit [0]**

This field is bit[1] of IRGN[1:0].

See IRGN[0] for the field description.

**When TTBCR.EAE == 1:**

<table>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [63:56]

Reserved, RES0.

**ASID, bits [55:48]**

An ASID for the translation table base address. The TTBCR.A1 field selects either TTBR0.ASID or TTBR1.ASID.

This field resets to an architecturally `UNKNOWN` value.

**BADDR, bits [47:1]**

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are constrained unpredictable, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of TTBCR.T0SZ as follows:

- If TTBCR.T0SZ is 0 or 1, x = 5 - TTBCR.T0SZ.
- If TTBCR.T0SZ is greater than 1, x = 14 - TTBCR.T0SZ.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

This field resets to an architecturally `UNKNOWN` value.

**CnP, bit [0]**

When ARMv8.2-TTCNP is implemented:

Common not Private. When TTBCR.EAE == 1, this bit indicates whether each entry that is pointed to by TTBR0 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0.CnP is 1.
The translation table entries pointed to by this instance of TTBR0, for the current ASID, are permitted to differ from corresponding entries for this instance of TTBR0 for other PEs in the Inner Shareable domain. This is not affected by:

- The value of TTBR0.CnP on those other PEs.
- The value of TTBCR.EAE on those other PEs.
- The value of the current ASID or, for the Non-secure instance of TTBR0, the value of the current VMID.

The translation table entries pointed to by this instance of TTBR0 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0.CnP is 1 for this instance of TTBR0 and all of the following apply:

- The translation table entries are pointed to by this instance of TTBR0.
- The value of the applicable TTBCR.EAE field is 1.
- The ASID is the same as the current ASID.
- For the Non-secure instance of TTBR0, the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

**Note**

If the value of the TTBR0.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Accessing the TTBR0**

Accesses to this register use the following encodings:

\[ \text{MRC}\{\langle c\rangle}\{\langle q\rangle\} \text{<coproc>, \{#<opc1>, <Rt>, <CRn>, <CRm>{, \{#<opc2>\}}) \]

        end
    end
TTBR1, Translation Table Base Register 1

The TTBR1 characteristics are:

**Purpose**

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the PL1&0 translation regime, and other information for this translation regime.

**Configuration**

AArch32 System register TTBR1 bits [63:0] are architecturally mapped to AArch64 System register TTBR1_EL1[63:0]. TTBCR.EAE determines which TTBR1 format is used:

- TTBCR.EAE == 0b0: 32-bit format is used. TTBR1[63:32] are ignored.
- TTBCR.EAE == 0b1: 64-bit format is used.

Used in conjunction with the TTBCR. When the 64-bit TTBR1 format is used, cacheability and shareability information is held in the TTBCR, not in TTBR1.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

TTBR1 is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

**Field descriptions**

The TTBR1 bit assignments are:

**When TTBCR.EAE == 0:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | TTB1 | RG[1] | NOS | RG1 | MP | S | RG[0] |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

**TTB1, bits [31:7]**

Translation table base address, bits[31:14]. Register bits [13:7] are RES0, with the additional requirement that if these bits are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [13:7] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

This field resets to an architecturally UNKNOWN value.
IRGN[1], bit [6]

This field is bit[1] of IRGN[1:0].

Inner region bits. IRGN[1:0] indicate the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

<table>
<thead>
<tr>
<th>IRGN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Inner Write-Back Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Inner Write-Through Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back no Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

Note

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for Armv7 without the Multiprocessing Extensions can run unmodified on an implementation that includes the functionality introduced by the ARMv7 Multiprocessing Extensions.

The IRGN field is split as follows:

- IRGN[1] is TTBR1[6].
- IRGN[0] is TTBR1[0].

This field resets to an architecturally UNKNOWN value.

NOS, bit [5]

Not Outer Shareable. When the value of TTBR1.S is 1, indicates whether the memory associated with a translation table walk is Inner Shareable or Outer Shareable:

<table>
<thead>
<tr>
<th>NOS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Memory is Outer Shareable.</td>
</tr>
<tr>
<td>0b1</td>
<td>Memory is Inner Shareable.</td>
</tr>
</tbody>
</table>

This bit is ignored when the value of TTBR1.S is 0.

This field resets to an architecturally UNKNOWN value.

RGN, bits [4:3]

Region bits. Indicates the Outer cacheability attributes for the memory associated with the translation table walks:

<table>
<thead>
<tr>
<th>RGN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back no Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

IMP, bit [2]

The effect of this bit is IMPLEMENTATION DEFINED. If the translation table implementation does not include any IMPLEMENTATION DEFINED features this bit is RES0.

This field resets to an architecturally UNKNOWN value.

S, bit [1]

Shareable. Indicates whether the memory associated with the translation table walks is Non-shareable:
Meaning

<table>
<thead>
<tr>
<th>S</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Memory is Non-shareable.</td>
</tr>
<tr>
<td>0b1</td>
<td>Memory is shareable. The TTBR1.NOS field indicates whether the</td>
</tr>
<tr>
<td></td>
<td>memory is Inner Shareable or Outer Shareable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**IRGN[0], bit [0]**

This field is bit[0] of IRGN[1:0].

See IRGN[1] for the field description.

**When TTBCR.EAE == 1:**

The field layout is as follows:

<table>
<thead>
<tr>
<th>Bits [63:56]</th>
<th>Bits [47:1]</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>ASID</td>
</tr>
<tr>
<td>BADDR</td>
<td></td>
</tr>
</tbody>
</table>

Reserved, RES0.

**ASID, bits [55:48]**

An ASID for the translation table base address. The TTBCR.A1 field selects either TTBR0.ASID or TTBR1.ASID.

This field resets to an architecturally **UNKNOWN** value.

**BADDR, bits [47:1]**

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are **CONSTRAINED UNPREDICTABLE**, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of TTBCR.T1SZ as follows:

- If TTBCR.T1SZ is 0 or 1, x = 5 - TTBCR.T1SZ.
- If TTBCR.T1SZ is greater than 1, x = 14 - TTBCR.T1SZ.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

This field resets to an architecturally **UNKNOWN** value.

**CnP, bit [0]**

**When ARMv8.2-TTCNP is implemented:**

Common not Private. When TTBCR.EAE == 1, this bit indicates whether each entry that is pointed to by TTBR1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1.CnP is 1.
**CnP**

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0 | The translation table entries pointed to by this instance of TTBR1, for the current ASID, are permitted to differ from corresponding entries for this instance of TTBR1 for other PEs in the Inner Shareable domain. This is not affected by:  
  - The value of TTBR1.CnP on those other PEs.  
  - The value of TTBCR.EAE on those other PEs.  
  - The value of the current ASID or, for the Non-secure instance of TTBR1, the value of the current VMID. |
| 0b1 | The translation table entries pointed to by this instance of TTBR1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1.CnP is 1 for this instance of TTBR1 and all of the following apply:  
  - The translation table entries are pointed to by this instance of TTBR1.  
  - The value of the applicable TTBCR.EAE field is 1.  
  - The ASID is the same as the current ASID.  
  - For the Non-secure instance of TTBR1, the VMID is the same as the current VMID. |

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

**Note**

If the value of the TTBR1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Accessing the TTBR1**

Accesses to this register use the following encodings:

\[
\text{MRC\{\langle c\rangle\}\{\langle q\rangle\} \langle coproc\rangle, \{\#\langle opc1\rangle, \langle Rt\rangle, \langle CRn\rangle, \langle CRm\rangle\}, \{\#\langle opc2\rangle\}}

The VBAR characteristics are:

**Purpose**

When high exception vectors are not selected, holds the vector base address for exceptions that are not taken to Monitor mode or to Hyp mode.

Software must program VBAR(NS) with the required initial value as part of the PE boot sequence.

**Configuration**

AArch32 System register VBAR bits [31:0] are architecturally mapped to AArch64 System register VBAR_EL1[31:0].

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 they apply only to the Secure instance of the register. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

VBAR is a 32-bit register.

**Field descriptions**

The VBAR bit assignments are:

![Vector Base Address Register](image)

**Bits [31:5]**

Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset.

This field resets to an IMPLEMENTATION DEFINED value.

**Bits [4:0]**

Reserved, RES0.

**Accessing the VBAR**

Accesses to this register use the following encodings:

VBAR, Vector Base Address Register
VDFSR, Virtual SError Exception Syndrome Register

The VDFSR characteristics are:

**Purpose**

Provides the syndrome value reported to software on taking a virtual SError interrupt exception to EL1, or on executing an ESB instruction at EL1.

When a virtual SError interrupt is taken, the syndrome value is reported in DFSR.AET, ExT and the remainder of the DFSR is set as defined by VMSAv8-32. For more information, see The AArch32 Virtual Memory System Architecture.

If the virtual SError interrupt is deferred by an ESB instruction, then the syndrome value is written to VDISR.

**Configuration**

AArch32 System register VDFSR bits [31:0] are architecturally mapped to AArch64 System register VSESR_EL2[31:0] when the highest implemented Exception level is using AArch64.

This register is present only when RAS is implemented. Otherwise, direct accesses to VDFSR are UNDEFINED.

If EL2 is not implemented, then VDFSR is RES0 from Monitor mode when SCR.NS == 1.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

VDFSR is a 32-bit register.

**Field descriptions**

The VDFSR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | AET | RES0 | ExT | RES0 |

**Bits [31:16]**

Reserved, RES0.

**AET, bits [15:14]**

When a virtual SError interrupt is taken to EL1 using AArch32, DFSR[15:4] is set to VDFSR.AET.

When a virtual SError interrupt is deferred by an ESB instruction, VDISR[15:4] is set to VDFSR.AET.

This field resets to an architecturally UNKNOWN value.

**Bit [13]**

Reserved, RES0.

**ExT, bit [12]**

When a virtual SError interrupt is taken to EL1 using AArch32, DFSR[12] is set to VDFSR.ExT.

When a virtual SError interrupt is deferred by an ESB instruction, VDISR[12] is set to VDFSR.ExT.
This field resets to an architecturally **UNKNOWN** value.

**Bits [11:0]**

Reserved, **RES0**.

**Accessing the VDFSR**

Direct reads and writes of VDFSR are **UNDEFINED** if EL3 is implemented and using AArch32 in all Secure privileged modes other than Monitor mode.

If EL2 is not implemented, then VDFSR is **RES0** from Monitor mode when **SCR.NS == 1**.

Accesses to this register use the following encodings:

VDISR, Virtual Deferred Interrupt Status Register

The VDISR characteristics are:

**Purpose**

Records that an SError interrupt has been consumed by an ESB instruction.

**Configuration**

AArch32 System register VDISR bits [31:0] are architecturally mapped to AArch64 System register VDISR_EL2[31:0]. This register is present only when RAS is implemented. Otherwise, direct accesses to VDISR are UNDEFINED.

If EL2 is not implemented, then VDISR is RES0 from Monitor mode when SCR.NS == 1.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

VDISR is a 32-bit register.

**Field descriptions**

The VDISR bit assignments are:

When TTBCR.EAE == 0:

**A, bit [31]**

Set to 1 when an ESB instruction defers a virtual SError interrupt.

This field resets to an architecturally UNKNOWN value.

**Bits [30:16]**

Reserved, RES0.

**AET, bits [15:14]**

The value copied from VDFSR.AET.

This field resets to an architecturally UNKNOWN value.

**Bit [13]**

Reserved, RES0.

**ExT, bit [12]**

The value copied from VDFSR.ExT.

This field resets to an architecturally UNKNOWN value.
Bit [11]

Reserved, RES0.

FS[4], bit [10]

This field is bit[4] of FS[4:0].

Fault status code. Set to 0b10110 when an ESB instruction defers a virtual SError interrupt.

<table>
<thead>
<tr>
<th>FS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10110</td>
<td>Asynchronous SError interrupt.</td>
</tr>
</tbody>
</table>

All other values are reserved.

The FS field is split as follows:

- FS[4] is VDISR[10].
- FS[3:0] is VDISR[3:0].

This field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

Format.

Set to TTBCR.EAE when an ESB instruction defers a virtual SError interrupt.

<table>
<thead>
<tr>
<th>LPAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Using the Short-descriptor translation table format.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Bits [8:4]

Reserved, RES0.

FS[3:0], bits [3:0]

This field is bits[3:0] of FS[4:0].

When TTBCR.EAE == 1:

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |
|-----------------------------------------------|-----------------------------------------------|
| A | RES0 | AET | RES0 | Ext | RES0 | LPAE | RES0 | STATUS |

A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.

This field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from VDFSR AET.
This field resets to an architecturally **UNKNOWN** value.

**Bit [13]**

Reserved, **RES0**.

**ExT, bit [12]**

The value copied from **VDFSR** ExT.

This field resets to an architecturally **UNKNOWN** value.

**Bits [11:10]**

Reserved, **RES0**.

**LPAE, bit [9]**

Format.

Set to **TTBCR.EAE** when an ESB instruction defers a virtual SError interrupt.

<table>
<thead>
<tr>
<th>LPAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>Using the Long-descriptor translation table format.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**Bits [8:6]**

Reserved, **RES0**.

**STATUS, bits [5:0]**

Fault status code. Set to 0b010001 when an ESB instruction defers a virtual SError interrupt.

<table>
<thead>
<tr>
<th>STATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b010001</td>
<td>Asynchronous SError interrupt.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the VDISR**

Direct reads and writes of VDFS are **UNDEFINED** if EL3 is implemented and using AArch32 in all Secure privileged modes other than Monitor mode.

An indirect write to VDISR made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of **DISR** occurring in program order after the ESB instruction.

If EL2 is not implemented, then VDISR is **RES0** from Monitor mode when **SCR.NS == 1**.

Accesses to this register use the following encodings:

\[

The VMPIDR characteristics are:

**Purpose**

Holds the value of the Virtualization Multiprocessor ID. This is the value returned by Non-secure EL1 reads of MPIDR.

**Configuration**

AArch32 System register VMPIDR bits [31:0] are architecturally mapped to AArch64 System register VMPIDR_EL2[31:0].

If EL2 is not implemented but EL3 is implemented, this register takes the value of the MPIDR.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

VMPIDR is a 32-bit register.

**Field descriptions**

The VMPIDR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**M, bit [31]**

Indicates whether this implementation includes the functionality introduced by the ARMv7 Multiprocessing Extensions. The possible values of this bit are:

<table>
<thead>
<tr>
<th>M</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This implementation does not include the ARMv7 Multiprocessing Extensions functionality.</td>
</tr>
<tr>
<td>0b1</td>
<td>This implementation includes the ARMv7 Multiprocessing Extensions functionality.</td>
</tr>
</tbody>
</table>

From Armv8 this bit is RES1.

**U, bit [30]**

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. The possible values of this bit are:

<table>
<thead>
<tr>
<th>U</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Processor is part of a multiprocessor system.</td>
</tr>
<tr>
<td>0b1</td>
<td>Processor is part of a uniprocessor system.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2 or EL3, this field resets to the value in MPIDR.U.

**Bits [29:25]**

Reserved, RES0.
MT, bit [24]
Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of Aff0 for more information about affinity levels. The possible values of this bit are:

<table>
<thead>
<tr>
<th>MT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Performance of PEs at the lowest affinity level is largely independent.</td>
</tr>
<tr>
<td>0b1</td>
<td>Performance of PEs at the lowest affinity level is very interdependent.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2 or EL3, this field resets to the value in MPIDR.MT.

Aff2, bits [23:16]
Affinity level 2. See the description of Aff0 for more information.
In a system where the PE resets into EL2 or EL3, this field resets to the value in MPIDR.Aff2.

Aff1, bits [15:8]
Affinity level 1. See the description of Aff0 for more information.
In a system where the PE resets into EL2 or EL3, this field resets to the value in MPIDR.Aff1.

Aff0, bits [7:0]
Affinity level 0. This is the affinity level that is most significant for determining PE behavior. Higher affinity levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.Aff2, Aff1, Aff0} or MPIDR_EL1.Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.
In a system where the PE resets into EL2 or EL3, this field resets to the value in MPIDR.Aff0.

<td>i</td>
<td>Intel Corporation</td>
</tr>
</tbody>
</table>

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

In a system where the PE resets into EL2 or EL3, this field resets to the value in MIDR, Implementer.

**Variant, bits [23:20]**

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.
In a system where the PE resets into EL2 or EL3, this field resets to the value in MIDR.Variant.

**Architecture, bits [19:16]**

The permitted values of this field are:

<table>
<thead>
<tr>
<th>Architecture</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>Armv4.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Armv4T.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Armv5 (obsolete).</td>
</tr>
<tr>
<td>0b0100</td>
<td>Armv5T.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Armv5TE.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Armv5TEJ.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Armv6.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Architectural features are individually identified in the ID_* registers, see ‘ID registers’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section K12.5.3.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In a system where the PE resets into EL2 or EL3, this field resets to the value in MIDR.Architecture.

**PartNum, bits [15:4]**

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

In a system where the PE resets into EL2 or EL3, this field resets to the value in MIDR.PartNum.

**Revision, bits [3:0]**

An IMPLEMENTATION DEFINED revision number for the device.

In a system where the PE resets into EL2 or EL3, this field resets to the value in MIDR.Revision.

**Accessing the VPIDR**

Accesses to this register use the following encodings:

```
MRC{<c>{<q>}} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

VTCR, Virtualization Translation Control Register

The VTCR characteristics are:

**Purpose**

The control register for stage 2 of the Non-secure PL1&0 translation regime.

**Note**

This stage of translation always uses the Long-descriptor translation table format.

**Configuration**

AArch32 System register VTCR bits [31:0] are architecturally mapped to AArch64 System register `VTCR_EL2[31:0]`.

If EL2 is not implemented, this register is `RES0` from EL3.

RW fields in this register reset to architecturally `UNKNOWN` values.

**Attributes**

VTCR is a 32-bit register.

**Field descriptions**

The VTCR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>

<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bit [31]**

Reserved, RES1.

**Bits [30:29]**

Reserved, RES0.

**HWU62, bit [28]**

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 2 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU62</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[62] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[62] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally `UNKNOWN` value.
Otherwise:

Reserved, RES0.

**HWU61, bit [27]**

**When ARMv8.2-TTPBHA is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 2 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU61</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[61] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[61] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HWU60, bit [26]**

**When ARMv8.2-TTPBHA is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 2 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU60</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[60] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[60] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HWU59, bit [25]**

**When ARMv8.2-TTPBHA is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 2 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU59</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[59] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[59] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

Bits [24:14]
Reserved, RES0.

SH0, bits [13:12]
Shareability attribute for memory associated with translation table walks using VTTBR.

<table>
<thead>
<tr>
<th>SH0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Unallocated values in fields of AArch32 System registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section K1.1.11.

This field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]
Outer cacheability attribute for memory associated with translation table walks using VTTBR.

<table>
<thead>
<tr>
<th>ORGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]
Inner cacheability attribute for memory associated with translation table walks using VTTBR.

<table>
<thead>
<tr>
<th>IRGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

SL0, bits [7:6]
Starting level for translation table walks using VTTBR.

<table>
<thead>
<tr>
<th>SL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Start at level 2</td>
</tr>
<tr>
<td>0b01</td>
<td>Start at level 1</td>
</tr>
</tbody>
</table>

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of T0SZ, then a stage 2 level 1 Translation fault is generated.
This field resets to an architecturally **UNKNOWN** value.

**Bit [5]**

Reserved, RES0.

**S, bit [4]**

Sign extension bit. This bit must be programmed to the value of T0SZ[3]. If it is not, then the behavior is **CONSTRAINED UNPREDICTABLE** and the stage 2 T0SZ value is treated as an **UNKNOWN** value, see 'Misprogramming VTCR.S' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally **UNKNOWN** value.

**T0SZ, bits [3:0]**

The size offset of the memory region addressed by VTTBR. The region size is $2^{(32-T0SZ)}$ bytes.

This field holds a four-bit signed integer value, meaning it supports values from -8 to 7.

---

**Note**

This is different from the other translation control registers, where TnSZ holds a three-bit unsigned integer, supporting values from 0 to 7.

---

If this field is programmed to a value that is not consistent with the programming of SL0 then a stage 2 level 1 Translation fault is generated.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the VTCR**

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>

        VTCR = R[t];
VTTBR, Virtualization Translation Table Base Register

The VTTBR characteristics are:

**Purpose**

Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the Non-secure PL1&0 translation regime, and other information for this translation regime.

**Configuration**

AArch32 System register VTTBR bits [63:0] are architecturally mapped to AArch64 System register VTTBR_EL2[63:0].

If EL2 is not implemented, this register is RES0 from EL3.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

VTTBR is a 64-bit register.

**Field descriptions**

The VTTBR bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:56]</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
</tr>
<tr>
<td>63  62  61  60  59  58  57  56  55  54  53  52  51  50  49  48  47  46  45  44  43  42  41  40  39  38  37  36  35  34  33  32</td>
</tr>
<tr>
<td>31  30  29  28  27  26  25  24  23  22  21  20  19  18  17  16  15  14  13  12  11  10  9   8   7   6   5   4   3   2   1   0</td>
</tr>
</tbody>
</table>

**Bits [63:56]**

Reserved, RES0.

**VMID, bits [55:48]**

The VMID for the translation table.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

**BADDR, bits [47:1]**

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of VTCR.SL0 and VTCR.T0SZ as follows:

- If VTCR.SL0 is 0b00, meaning that lookup starts at level 2, then x is 14 - VTCR.T0SZ.
- If VTCR.SL0 is 0b01, meaning that lookup starts at level 1, then x is 5 - VTCR.T0SZ.
- If VTCR.SL0 is either 0b10 or 0b11 then a stage 2 level 1 Translation fault is generated.
If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

In a system where the PE resets into EL2 or EL3, this field resets to an architecturally **UNKNOWN** value.

**CnP, bit [0]**

**When ARMv8.2-TTCNP is implemented:**

Common not Private. This bit indicates whether each entry that is pointed to by VTTBR is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VTTBR.CnP is 1.

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The translation table entries pointed to by VTTBR are permitted to differ from the entries for VTTBR for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.</td>
</tr>
<tr>
<td>0b1</td>
<td>The translation table entries pointed to by VTTBR are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VTTBR.CnP is 1 and the VMID is the same as the current VMID.</td>
</tr>
</tbody>
</table>

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

**Note**

If the value of the VTTBR.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VTTBRs do not point to the same translation table entries when the VMID value is the same as the current VMID, then the results of translations are **CONSTRAINED UNPREDICTABLE**, see ‘**CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values**’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

In a system where the PE resets into EL2 or EL3, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**Accessing the VTTBR**

Accesses to this register use the following encodings:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
